3.2.2

Tabulka B: Abecední seznam látek a předmětů ADR

Tento seznam je abecedním seznamem látek a předmětů, které jsou vyjmenovány v pořadí UN čísel v tabulce A v 3.2.1 netvoří nedílnou část ADR. Nebyl postoupen Pracovní skupině pro přepravu nebezpečných věcí Výboru pro vnitrozemskou dopravu ke kontrole a schválení, ani smluvním stranám ADR k formálnímu schválení. Byl připraven s potřebným úsilím sekretariátem Evropské hospodářské komise OSN s pomocí Mezinárodní unie silniční dopravy (IRU) k účelům usnadnění konzultací příloh A a B, ale nemůže v žádném případě nahradit platná ustanovení uvedených příloh, které jediné jsou v případě sporu považovány za platné. POUZE ADR A JEJÍ DODATKY MAJÍ PRÁVNÍ SÍLU (PLATNOST).

POZNÁMKA 1: Pro účel určení abecedního pořadí, byly následující informace ignorovány, přestože jsou součástí oficiálního pojmenování pro přepravu: čísla, řecká písmena, zkratky .sec" a "terc", písmena "N" (nitrogen), "n" (normální), "o" (ortho), "p" (para), "m" (meta) a J.N. (jinde nejmenované).

POZNÁMKA 2: Pojmenování látky nebo předmětu uvedené velkými písmeny je platné oficiální pojmenování pro přepravu (viz 3.1.2).

POZNÁMKA 3: Pojmenování látky nebo předmětu uvedené velkými písmeny následované slovem "viz" určuje možné alternativní oficiální pojmenování pro přepravu nebo část oficiálního pojmenování pro přepravu (kromě PCB), (viz 3.1.2.1).

POZNÁMKA 4: Položka napsaná malými písmeny, následovaná slovem "viz" určuje, že tato položka není oficiálním pojmenováním pro přepravu; je to synonymum.

POZNÁMKA 5: Je-li položka částečně napsána velkými písmeny a částečně malými písmeny, druhá část položky se nepovažuje za součást oficiálního pojmenování pro přepravu.

POZNÁMKA 6: Oficiální pojmenování pro přepravu je možné použít v jednotném i množném čísle, jak je to vhodné, pro účely dokumentace a označování kusů (viz 3.1.2.3).

POZNÁMKA 7: K přesnému stanovení oficiálního pojmenování pro přepravu viz 3.1.2.

KAPITOLA 3.3

ZVLÁŠTNÍ USTANOVENÍ PRO URČITÉ LÁTKY NEBO PŘEDMĚTY

- 3.3.1 V této kapitole jsou uvedena zvláštní ustanovení odpovídající číslům udaným ve sloupci (6) tabulky A kapitoly 3.2 pro látku nebo předmět, na které se tato zvláštní ustanovení vztahují.
- 16 Vzorky nových nebo již existujících výbušných látek nebo předmětů, které jsou přepravovány mimo jiné k pokusným, klasifikačním, výzkumným a vývojovým účelům, k účelům kontroly kvality nebo jako obchodní vzorky, smějí být přepravovány podle požadavků příslušného orgánu (viz odstavec 2.2.1.1.3). Hmotnost výbušných vzorků, které nejsou navlhčeny nebo znečtivěny, je omezena do 10 kg na malý kus podle požadavků příslušného orgánu. Hmotnost výbušných vzorků, které jsou navlhčeny nebo znečtivěny, je omezena do 25 kg.
- 23 Tato látka vykazuje nebezpečí hořlavosti, která se však projeví jen v případě velmi silného požáru v uzavřeném prostoru.
- 32 Tato látka nepodléhá předpisům ADR, pokud je v jakékoli jiné formě.
- 37 Tato látka nepodléhá předpisům ADR, jestliže je pokryta (potažena).
- 38 Tato látka nepodléhá předpisům ADR, jestliže obsahuje nejvýše 0,1 % karbidu vápenatého.
- 39 Tato látka nepodléhá předpisům ADR, jestliže obsahuje méně než 30 %, nebo nejméně 90 % křemíku.
- 43 Pokud jsou tyto látky podány k přepravě jako pesticidy, musí být přepravovány pod příslušnou položkou pro pesticidy a podle platných ustanovení pro pesticidy (viz odstavce 2.2.61.1.10 až 2.2.61.1.11.2).
- 45 Sulfidy a oxidy antimonu s obsahem nejvýše 0,5 % arzenu, vztaženo na celkovou hmotnost, nepodléhají předpisům ADR.
- 47 Ferrikyanidy a ferrokyanidy nepodléhají předpisům ADR.
- 48 Obsahuje-li tato látka více než 20 % kyanovodíku, není připuštěna k přepravě.
- 59 Tyto látky nepodléhají předpisům ADR, jestliže obsahují nejvýše 50 % hořčíku.
- 60 Činí-li koncentrace více než 72 %, není látka připuštěna k přepravě.
- 61 Technický název, kterým musí být doplněno oficiální pojmenování pro přepravu, musí být obvyklý název dovozený ISO (viz též normu ISO 1750 : 1981 "Pesticidy a jiné zemědělské chemikálie - obvyklé názvy" v platném znění), jiné názvy uvedené v publikaci Světové zdravotnické organizace (WHO) „Recommended Classification of Pesticides by Hazard and Guidelines to Classification“ anebo pojmenování aktivní látky (viz také odstavce 3.1.2.8.1 a 3.1.2.8.1.1).
- 62 Tato látka nepodléhá předpisům ADR, jestliže obsahuje nejvýše 4 % hydroxidu sodného.
- 65 Vodné roztoky peroxidu vodíku s méně než 8 % peroxidu vodíku nepodléhají předpisům ADR.
- 66 Rumělka nepodléhá ustanovením ADR.
- 103 Dusitany amonné a směsi anorganického dusitanu se solí amonnou nejsou připuštěny k přepravě.
- 105 Nitrocelulóza odpovídající popisům UN čísel 2556 nebo 2557 může být přiřazena ke třídě 4.1.
- 113 Chemicky nestálé směsi nejsou připuštěny k přepravě.

- 119 Chladicí stroje zahrnují stroje nebo jiná zařízení, které byly zkonstruovány ke specifickému účelu udržovat potraviny nebo jiné výrobky ve vnitřním prostoru na nízké teplotě, jakož i klimatizační jednotky. Chladicí stroje a součásti chladicích strojů nepodléhají předpisům ADR, pokud obsahují méně než 12 kg plynu třídy 2, skupiny A nebo O podle odstavce 2.2.2.1.3, nebo pokud obsahují méně než 12 litrů roztoku amoniaku (UN číslo 2672).
- 122 Vedlejší nebezpečí a popřípadě řízená teplota a kritická teplota, jakož i UN čísla (druhé položky) pro každý z již zařazených přípravků organických peroxidů jsou uvedeny v pododdílu 2.2.52.4, 4.1.4.2, pokynu pro balení IBC520 a 4.2.5.2.6, pokynu pro přemístitelné cisterny T23.
- 123 (Vyhrazeno)
- 127 Smí být použito jiné inertní látky nebo jiné inertní směsi látek, za předpokladu, že tyto látky mají stejné flegmatizační vlastnosti.
- 131 Flegmatizační látka musí být zřetelně méně citlivá než suchý PETN.
- 135 Hydratovaná sodná sůl kyseliny dichlorisokyanurové nesplňuje kritéria pro zařazení do třídy 5.1 a nepodléhá ustanovením ADR, pokud nesplňuje kritéria pro zařazení do jiné třídy.
- 138 p-brombenzylkyanid nepodléhá předpisům ADR.
- 141 Látky, které byly podrobeny dostatečnému tepelnému zpracování tak, že během přepravy nepředstavují žádné nebezpečí, nepodléhají předpisům ADR.
- 142 Moučka sójových bobů, která je extrahovaná rozpouštědlem, obsahující nejvýše 1,5 % oleje a 11 % vlhkosti a neobsahující prakticky žádné hořlavé rozpouštědlo, nepodléhá předpisům ADR.
- 144 Vodný roztok s nejvýše 24 % obj. alkoholu nepodléhá předpisům ADR.
- 145 Alkoholické nápoje obalové skupiny III nepodléhají předpisům ADR, jestliže jsou přepravovány v nádobách o vnitřním objemu nejvýše 250 litrů.
- 152 Zařazení této látky závisí na velikosti částic a obalu, mezní hodnoty však dosud nebyly zkouškami určeny. Odpovídající zařazení musí být provedeno podle požadavků oddílu 2.2.1.
- 153 Tato položka platí jen, jestliže bylo na základě zkoušek prokázáno, že tyto látky ve styku s vodou nejsou hořlavé, nevykazují tendenci k samovznícení a vyvinutá směs plynů není hořlavá.
- 162 (Vypuštěno)
- 163 Látka jmenovitě uvedená v tabulce A kapitoly 3.2 nesmí být přepravována pod touto položkou. Látky, které jsou přepravovány pod touto položkou, smějí obsahovat nejvýše 20 % nitrocelulózy, za podmínky, že nitrocelulóza neobsahuje více než 12,6 % dusíku (v suché hmotě).
- 168 Azbest, který je ponořen nebo fixován v přírodním nebo umělém pojivu (jako je cement, plast, asfalt, pryskyřice nebo minerály) tak, aby během přepravy nemohlo dojít k uvolnění nebezpečného množství vdechovatelných azbestových vláken, nepodléhá předpisům ADR. Hotové výrobky, které obsahují azbest a tento požadavek nesplňují, nepodléhají předpisům ADR, jestliže jsou zabaleny tak, že během přepravy nemůže dojít k uvolnění nebezpečného množství vdechovatelných azbestových vláken.
- 169 Anhydrid kyseliny ftalové v tuhém stavu a tetrahydroftalanhydridy s nejvýše 0,05 % maleinanhydridu nepodléhají předpisům ADR. Anhydrid kyseliny ftalové, roztavený při teplotě vyšší než je jeho bod vzplanutí, s nejvýše 0,05 % maleinanhydridu, musí být přiřazen k UN číslu 3256.
- 172 Má-li radioaktivní látka vedlejší nebezpečí:
- (a) radioaktivní látka musí být přiřazena k obalové skupině I, II nebo III, pokud je to náležité, za použití kritérií pro obalové skupiny obsažených v části 2 podle povahy převažujícího vedlejšího nebezpečí;

- (b) kusy musí být označeny bezpečnostními značkami odpovídajícími každému vedlejšímu nebezpečí představovanému touto látkou; odpovídající velké bezpečnostní značky musí být připevněny na vozidla nebo kontejnery v souladu s příslušným ustanovením oddílu 5.3.1;
- (c) pro účely dokumentace a označování kusů musí být oficiální pojmenování pro přepravu doplněno pojmenováním složek, které převažujícím způsobem přispívají k tomuto (těmto) vedlejšímu (vedlejším) nebezpečí(m) a které musí být uvedeny v závorkách;
- (d) v přepravním dokladu pro nebezpečné věci musí být uvedeno(a) číslo(a) vzoru(ů) bezpečnostních značek odpovídající každému vedlejšímu nebezpečí, v závorkách za číslem třídy „7“ a tam, kde je přiřazena, také obalová skupina, jak je vyžadováno podle 5.4.1.1.1 (d).

K balení viz také 4.1.9.1.5.

- 177 Siran barya nepodléhá předpisům ADR.
- 178 Toto pojmenování smí být použito jen se souhlasem příslušného orgánu země původu (viz odstavec 2.2.1.1.3) a jen tehdy, není-li v tabulce A kapitoly 3.2 obsaženo jiné vhodné pojmenování.
- 181 Kusy s touto látkou musí být opatřeny bezpečnostní značkou podle vzoru č. 1 (viz 5.2.2.2.2), ledaže by příslušný orgán země původu souhlasil s odchylkou pro specifický obal, neboť usoudil na základě výsledků zkoušek, že látka v takovém obalu nemá výbušnou povahu (viz odstavec 5.2.2.1.9).
- 182 Skupina alkalických kovů zahrnuje prvky lithium, sodík, draslík, rubidium a cesium.
- 183 Skupina kovů alkalických zemin zahrnuje prvky hořčík, vápník, stroncium a baryum.
- 186 Při určení obsahu dusičnanu amonného se musí všechny ionty dusičnanu, pro které je ve směsi k dispozici ekvivalentní množství iontů amonia, počítat jako dusičnan amonný.
- 188 Články a baterie podávané k přepravě nepodléhají jiným ustanovením ADR, jestliže jsou splněny následující požadavky:
- (a) pro článek s kovem lithia nebo slitinou lithia je obsah lithia nejvýše 1 g a pro článek s ionty lithia je watthodinová zatížitelnost nejvýše 20 Wh;
 - (b) pro baterii s kovem lithia nebo slitinou lithia je celkový obsah lithia nejvýše 2 g a pro baterii s ionty lithia je watthodinová zatížitelnost nejvýše 100 Wh. Baterie s ionty lithia podléhající tomuto ustanovení musí mít na vnější skříni vyznačenu watthodinovou zatížitelnost, kromě těch, které byly vyrobeny před 1. lednem 2009.
 - (c) každý článek nebo baterie splňuje ustanovení uvedená v 2.2.9.1.7 (a) a (e);
 - (d) články a baterie, s výjimkou těch, které jsou zabudovány v zařízeních, musí být zabaleny ve vnitřních obalech, které zcela uzavírají článek nebo baterii. Články a baterie musí být chráněny tak, aby se zamezilo zkratům. Toto zahrnuje ochranu proti dotyku s vodivými materiály uvnitř téhož obalu, který by mohl vést ke zkratu. Vnitřní obaly musí být zabaleny do pevných vnějších obalů, které vyhovují ustanovením pododdílů 4.1.1.1, 4.1.1.2 a 4.1.1.5;
 - (e) články a baterie, které jsou zabudovány v zařízeních, musí být chráněny před poškozením s zkratem a zařízení musí být vybaveno účinnými prostředky zabraňujícím jeho náhodnému uvedení do činnosti. Tento požadavek se nevztahuje na zařízení, která jsou záměrně aktivní v dopravě (vysílače vysokofrekvenční identifikace (RFID), hodiny, snímače atd.) a která nejsou schopna generovat nebezpečné vyvíjení tepla. Jsou-li baterie zabudovány v zařízeních, musí být tato zařízení zabalena do pevných vnějších obalů vyrobených z vhodného materiálu přiměřené pevnosti a konstrukce vzhledem k vnitřnímu objemu obalů a jejich zamýšlenému použití, ledaže je baterii poskytnuta rovnocenná ochrana zařízením, v němž je obsažena;
 - (f) S výjimkou kusů obsahujících knoflíkové baterie zabudované v zařízení (včetně obvodových desek), nebo nejvýše čtyři články zabudované v zařízení nebo nejvýše dvě baterie zabudované v zařízení musí mít každý kus následující označení:
 - (i) označení, že kus obsahuje články nebo baterie „LITHIUM KOV“ nebo „LITHIUM IONT“, jak je to náležité;

- (ii) upozornění, že se s kusem musí manipulovat opatrně a že při poškození kusu existuje nebezpečí hořlavosti;
 - (iii) upozornění, že se v případě poškození kusu musí použít speciální postupy, včetně prohlídky a přebalení, pokud je to nutné; a
 - (iv) telefonní číslo pro doplňkové informace;
- (g) Každá zásilka jednoho nebo více kusů označených podle (f) musí být doprovázena dokladem obsahujícím:
- (i) informaci, že kus obsahuje články nebo baterie „LITHIUM KOV“ nebo „LITHIUM IONT“, jak je to náležité;
 - (ii) upozornění, že se s kusem musí manipulovat opatrně a že při poškození kusu existuje nebezpečí hořlavosti;
 - (iii) upozornění, že se v případě poškození kusu musí použít speciální postupy, včetně prohlídky a přebalení, pokud je to nutné; a
 - (iv) telefonní číslo pro doplňkové informace;
- (h) S výjimkou případů, kdy jsou baterie zabudovány v zařízeních, musí být každý kus schopen odolat zkoušce volným pádem z výšky 1,2 m ve všech orientacích bez poškození článků nebo baterií v něm obsažených, bez posunutí obsahu, které by dovolilo, aby se dostaly do styku baterie s baterií (nebo článkem s článkem), a bez uvolnění obsahu; a
- (i) S výjimkou případů, kdy jsou baterie zabudovány v zařízeních nebo s nimi zabaleny, nesmějí kusy překročit 30 kg celkové (brutto) hmotnosti.

Ve výše uvedených požadavcích a v celé ADR se rozumí pod „obsahem lithia“ hmotnost lithia na anodě článku s kovem lithia nebo slitinou lithia.

Existují zvláštní položky pro baterie s kovem lithia a pro baterie s ionty lithia, aby se usnadnila přeprava těchto baterií jednotlivými způsoby přepravy a aby se umožnila aplikace rozdílných činností při zásazích v nouzových situacích.

- 190 Aerosoly musí být opatřeny ochranou proti neúmyslnému vyprázdnění. Aerosoly o vnitřním objemu nejvýše 50 ml, které obsahují jen netoxické látky, nepodléhají předpisům ADR.
- 191 Malé nádoby (kartuše) na plyn o vnitřním objemu nejvýše 50 ml, které obsahují jen netoxické látky, nepodléhají předpisům ADR.
- 194 Řízená teplota a kritická teplota, pokud je, jakož i UN číslo (druhá položka) pro každou již zařazenou samovolně se rozkládající látku jsou uvedeny v pododdílu 2.2.41.4.
- 196 Pod touto položkou smějí být přepravovány přípravky, které při laboratorních zkouškách nedetonují v kavitovaném stavu ani nedeflagrují, které nevykazují žádný účinek při zahřívání v uzavřeném prostoru a které neprojevují žádnou výbušnou sílu. Přípravek musí být také tepelně stálý (tj. SADT je 60°C nebo vyšší pro kus o 50 kg). Přípravky, které nesplňují tato kritéria, musí být přepravovány podle ustanovení třídy 5.2 (viz pododdíl 2.2.52.4).
- 198 Roztoky nitrocelulózy s nejvýše 20 % nitrocelulózy mohou být přepravovány jako barvy, kosmetické výrobky, popřípadě tiskařské barvy (viz UN čísla 1210, 1263, 1266, 3066, 3469 a 3470).
- 199 Sloučeniny olova, které, jsou-li smíchány v poměru 1 : 1000 s kyselinou solnou 0,07 M a míchají se po dobu jedné hodiny při teplotě 23 °C ± 2 °C, přičemž vykazují rozpustnost nejvýše 5 %, se považují za nerozpustné (viz normu ISO 3711 :1990 „Barviva na bázi chromátu a chromomolybdatu olova – požadavky a zkoušky“) se považují za nerozpustné a nepodléhají předpisům ADR, pokud nesplňují kritéria pro zařazení do jiné třídy.
- 201 Zapalovače a nádoby s náplní do zapalovačů musí splňovat předpisy státu, v němž byly naplněny. Musí být opatřeny ochranou proti neúmyslnému vyprázdnění. Kapalná část plynu nesmí překročit

85 % vnitřního objemu nádoby při 15 °C. Nádoby včetně svých uzávěrů musí být schopny odolat vnitřnímu tlaku, který se rovná dvojnásobku tlaku zkpalného ropného plynu při 55 °C. Ventilový mechanismus a zažehovací zařízení musí být bezpečným způsobem uzavřeny, přelepeny páskou nebo jinak upevněny, nebo zkonstruovány tak, aby se zamezilo činnosti nebo uniku obsahu během přepravy. Zapalovače nesmějí obsahovat více než 10 g zkpalného ropného plynu. Nádoby s náplní do zapalovačů nesmějí obsahovat více než 65 g zkpalného ropného plynu.

POZNÁMKA: *K odpadovým zapalovačům shromažďovaným jednotlivě viz kapitolu 3.3, zvláštní ustanovení 654.*

- 203 Tato položka nesmí být použita pro polychlorované bifenyly, kapalně, UN čísla 2315 a polychlorované bifenyly, tuhé, UN čísla 3432.
- 204 (Vypuštěno)
- 205 Tato položka nesmí být použita pro pentachlorfenol (UN číslo 3155).
- 207 Polymerové kuličky a plastové polymery pro odlévání mohou být vyrobeny z polystyrénu, polymethylmethakrylátu nebo jiného polymerického materiálu.
- 208 Obchodně běžná forma hnojiva na bázi dusičnanu vápenatého, sestávající zejména z dvojných solí (dusičnan vápenatý a dusičnan amonný), obsahující nejvýše 10 % dusičnanu amonného a nejméně 12 % krystalové vody, nepodléhá předpisům ADR.
- 210 Toxiny z rostlin, zvířat nebo bakterií, které obsahují infekční látky, nebo toxiny, které jsou obsaženy v infekčních látkách, musí být přiřazeny ke třídě 6.2.
- 215 Tato položka platí jen pro technicky čistou látku nebo přípravky s touto látkou, které mají SADT vyšší než 75 °C; nepatří proto pro přípravky, které jsou látkami samovolně se rozkládajícími (k samovolně se rozkládajícím látkám viz pododíl 2.2.41.4). Homogenní směsi obsahující nejvýše 35 % hm. azodikarbonamidu a nejméně 65 % inertní látky nepodléhají ustanovením ADR, ledaže jsou splněna kritéria jiných tříd.
- 216 Směsi tuhých látek, které nepodléhají předpisům ADR, s hořlavými kapalinami smějí být přepravovány pod touto položkou bez toho, aby byla předtím použita klasifikační kritéria třídy 4.1, za podmínky, že v době nakládky věci nebo v době uzavírání obalu, vozidla nebo kontejneru není viditelná žádná volná kapalina. Zatavené balíčky a předměty obsahující méně než 10 ml hořlavé kapaliny obalové skupiny II nebo III, absorbované v tuhém materiálu, nepodléhají ADR, za podmínky, že v balíčku nebo předmětu není žádná volná kapalina.
- 217 Směsi tuhých látek, které nepodléhají předpisům ADR, s toxickými kapalinami smějí být přepravovány pod touto položkou bez toho, aby byla předtím použita klasifikační kritéria třídy 6.1, za podmínky, že v době nakládky věci nebo v době uzavírání obalu, vozidla nebo kontejneru není viditelná žádná volná kapalina. Tato položka nesmí být použita pro tuhé látky, které obsahují kapalinu obalové skupiny I.
- 218 Směsi tuhých látek, které nepodléhají předpisům ADR, s žíravými kapalinami smějí být přepravovány pod touto položkou, bez toho, aby byla předtím použita klasifikační kritéria třídy 8, za podmínky, že v době nakládky věci nebo uzavírání obalu, vozidla nebo kontejneru není viditelná žádná volná kapalina.
- 219 Geneticky změněné mikroorganismy (GMMO) a geneticky změněné organismy (GMO) zabalené a označené podle pokynu pro balení P904 pododílu 4.1.4.1 nepodléhají žádným dalším ustanovením ADR.
- Jestliže GMMO nebo GMO splňují kritéria pro zařazení do třídy 6.1 nebo 6.2 (viz 2.2.61.1 a 2.2.62.1) vztahují se na ně ustanovení ADR pro přepravu toxických látek nebo infekčních látek.
- 220 Bezprostředně za oficiálním pojmenováním pro přepravu je nutno udat v závorce pouze technický název hořlavé kapaliny, která je součástí tohoto roztoku nebo směsi.

- 221 Látky, které spadají pod tuto položku, nesmějí náležet k obalové skupině I.
- 224 Látka musí zůstat za normálních přepravních podmínek kapalnou, ledaže by mohlo být zkouškami prokázáno, že látka není ve zmrzlém stavu citlivější než v kapalném stavu. Při teplotách vyšších než -15 °C nesmí zmrznout.
- 225 Hasicí přístroje, které spadají pod tuto položku, smějí být vybaveny ke svému uvedení do činnosti náložkami (náložky pro technické účely klasifikačního kódu 1.4C nebo 1.4 S) beze změny zařazení do třídy 2, skupiny A nebo O podle pododdílu 2.2.2.1.3, za podmínky, že celkové množství deflagrační (hnací) výbušné látky nepřekročí 3,2 g na hasicí přístroj. Hasicí přístroje musí být vyrobeny, odzkoušeny, schváleny a označeny podle předpisů platných v zemi výroby.
- POZNÁMKA:** „*Předpisy platné v zemi výroby*“ znamená předpisy platné v zemi výroby nebo předpisy platné v zemi použití.
- Hasicí přístroje pod touto položkou zahrnují:
- (a) přenosné hasicí přístroje pro ruční manipulaci a použití;
 - (b) hasicí přístroje pro instalaci do letadel;
 - (c) hasicí přístroje namontované na kolech pro ruční manipulaci;
 - (d) protipožární zařízení nebo přístroje namontované na kolech nebo na kolovém podvozku nebo na dopravním prostředku podobném (malému) přívěsu; a
 - (e) hasicí přístroje sestávající z nepojízdného tlakového sudu a příslušenství a manipulované např. vidlicovým vozíkem nebo jeřábem, jsou-li nakládány nebo vykládány.
- POZNÁMKA:** Tlakové nádoby, které obsahují plyny pro použití ve výše uvedených hasicích přístrojích nebo pro použití ve stacionárních protipožárních zařízeních, musí splňovat požadavky kapitoly 6.2 a všechny požadavky vztahující se na příslušný plyn, jsou-li tyto tlakové nádoby přepravovány samostatně.
- 226 Přípravky této látky, které obsahují nejméně 30 % neprchavého, nehořlavého flegmatizačního prostředku, nepodléhají předpisům ADR.
- 227 Při znečistivění vodou a anorganickou inertní látkou nesmí obsah dusičnanu močoviny překročit 75 % hm. a směs nesmí být možno přivést k výbuchu zkouškami typu a) série 1 Příručky zkoušek a kritérií, části I.
- 228 Směsi, které neodpovídají kritériím pro hořlavé plyny (viz odstavec 2.2.2.1.5), musí být přepravovány pod UN číslem 3163.
- 230 Lithiové články a baterie smějí být přepravovány pod touto položkou, jestliže splňují ustanovení uvedená v 2.2.9.1.7.
- 235 Tato položka platí pro předměty, které obsahují výbušné látky třídy 1 a které mohou obsahovat také nebezpečné věci jiných tříd. Tyto předměty jsou používány ke zvýšení bezpečnosti ve vozidlech, plavidlech nebo letadlech – např. plynové generátory airbagů, moduly airbagů, předpínače bezpečnostních pásů a pyromechanické prostředky.
- 236 Vícesložkové polyesterové pryskyřice sestávají ze dvou složek: základního materiálu (třída 3, obalová skupina II nebo III) a z aktivátoru (organický peroxid). Organický peroxid musí být typu D, E nebo F, nevyžadující řízení teploty. Obalová skupina je II nebo III podle kritérií třídy 3 platných pro základní materiál. Omezené množství uvedené ve sloupci (7a) tabulky A kapitoly 3.2 se vztahuje na základní materiál.
- 237 Membránové filtry, včetně oddělovacích papírových listů, povlaků nebo zesilujících materiálů atd., tak jak jsou podávány k přepravě, nesmějí být schopné přenést výbuch, jsou-li podrobeny jedné ze zkoušek série 1, typu a) Příručky zkoušek a kritérií, části 1.

Mimo to může příslušný orgán na základě výsledků vhodných zkoušek rychlosti hoření se zohledněním standardních zkoušek dle Příručky zkoušek a kritérií, části III, pododdílu 33.2.1 rozhodnout, že membránové filtry z nitrocelulózy ve formě, ve které jsou podávány k přepravě, nepodléhají platným ustanovením pro hořlavé tuhé látky třídy 4.1.

- 238 (a) Akumulátory se považují za bezpečné proti vytečení, jestliže jsou schopny odolat, bez úniku akumulátorové kapaliny, níže uvedené vibrační a tlakové zkoušky.

Vibrační zkouška: akumulátor je pevně přichycen na desce vibračního přístroje, která je vystavena jednoduchému sinusovému pohybu o amplitudě 0,8 mm (1,6 mm celkového výkyvu). Frekvence se bude měnit ve stupních po 1 Hz/min. mezi 10 Hz a 55 Hz. Celé pásmo frekvencí se projde v obou směrech v 95 ± 5 minutách pro každou upevňovací pozici akumulátoru (tj. pro každý směr vibrací). Akumulátor se zkouší ve třech vzájemně kolmých polohách (a zejména v poloze, při které se plnicí a odvzdušňovací otvory, pokud jsou, nacházejí v převrácené poloze) po tutéž dobu.

Tlaková zkouška: v návaznosti na vibrační zkoušku se akumulátor vystaví při teplotě $24\text{ °C} \pm 4\text{ °C}$ po dobu 6 hodin rozdílovému tlaku nejméně 88 kPa. Akumulátor se zkouší ve třech navzájem kolmých polohách (a zejména v poloze, při které se plnicí a odvzdušňovací otvory, pokud jsou, nacházejí v převrácené poloze) po dobu nejméně 6 hodin v každé poloze.

- (b) Akumulátory bezpečné proti vytečení nepodléhají předpisům ADR, jestliže při teplotě 55 °C elektrolyt nevyteče z rozbité nebo prasklé skříně a není žádná volná kapalina, která by mohla vytéct, a jsou-li póly akumulátorů, které jsou zabaleny pro přepravu, chráněny proti zkratu.

- 239 Akumulátory nebo články akumulátorů nesmějí obsahovat žádné nebezpečné látky kromě sodíku, síry nebo sloučenin sodíku (např. polysulfidů sodíku a tetrachlorhlinitanu sodného). Tyto akumulátory nebo články smějí být podány k přepravě při teplotě, při níž se může sodík v nich obsažený nacházet v kapalném stavu, pouze se schválením příslušného orgánu země původu a za podmínek jím stanovených. Není-li země původu smluvní stranou ADR, musí být schválení a stanovené podmínky uznány příslušným orgánem prvního státu smluvní strany ADR přicházejícího do styku se zásilkou.

Články musí sestávat z hermeticky uzavřených kovových pouzder, které nebezpečné látky úplně obklopují a jsou zkonstruovány a uzavřeny tak, že je zabráněno jakémukoli úniku těchto nebezpečných látek za normálních podmínek přepravy.

Akumulátory musí sestávat z článků, které jsou úplně uzavřeny a upevněny v kovové skříně, která je zkonstruována a uzavřena tak, že je zabráněno jakémukoli úniku těchto nebezpečných látek za normálních podmínek přepravy.

- 240 Viz poslední POZNÁMKU v 2.2.9.1.7.

- 241 Přípravek musí být vyroben tak, že zůstává homogenní a že v průběhu přepravy nenastane žádné oddělování fází. Předpisům ADR nepodléhají přípravky s nízkým obsahem nitrocelulózy, které nevykazují nebezpečné vlastnosti, jestliže jsou podrobeny zkouškám pro určení jejich detonacních, deflagračních nebo výbušných schopností při zahřátí pod uzavřením podle zkoušek typu a) série 1 nebo typů b) nebo c) série 2 části I Příručky zkoušek a kritérií a nechovají se jako hořlavá tuhá látka, pokud jsou podrobeny zkoušce č. 1 Příručky zkoušek a kritérií, části III, pododdílu 33.2.1.4 (pro tuto zkoušku musí být látka v destičkové formě, pokud je to nutné, rozdrcena a proseta, aby se velikost zrn zredukovala na méně než 1,25 mm).

- 242 Síra nepodléhá předpisům ADR, pokud je zformována do specifického tvaru (např. kuliček, pilulek, granulí, pastilek nebo vloček).

- 243 Benzin a palivo pro použití v zážehových motorech (např. v automobilech, stacionárních motorech a jiných motorech) musí být přiřazen k této položce bez ohledu na změny těkavosti.

- 244 Tato položka zahrnuje např. hliníkové stěry, hliníkové strusky, použité katody, použitou výstelku nádob a strusky hliníkových solí.

- 247 Alkoholické nápoje s více než 24 %, nejvýše však 70 % obj. alkoholu, smějí být přepravovány, pokud jde o přepravu v rámci výrobního procesu, v dřevěných sudech o vnitřním objemu větším než 250 litrů a nejvýše 500 litrů, které splňují všeobecné požadavky oddílu 4.1.1, pokud platí, za těchto podmínek:
- (a) dřevěné sudy musí být před naplněním zkontrolovány na těsnost,
 - (b) pro roztažení kapaliny musí být ponechán dostatečný volný plnicí prostor (nejméně 3 %),
 - (c) dřevěné sudy musí být přepravovány s otvory pro zátky směřujícími nahoru,
 - (d) dřevěné sudy musí být přepravovány v kontejnerech, které splňují požadavky Mezinárodní úmluvy o bezpečných kontejnerech (KBK), v jejím platném znění. Každý dřevěný sud musí být upevněn ve speciálním lůžku a zaklíněn pomocí vhodných prostředků tak, že je vyloučen jakýkoli jeho posun během přepravy.
- 249 Ferocer, stabilizovaný proti korozi, s obsahem železa nejméně 10 % nepodléhá předpisům ADR.
- 250 Tato položka smí být používána jen pro vzorky chemických látek, které jsou odebírány za účelem analýzy v souvislosti s použitím Úmluvy o zákazu vývoje, výroby, skladování a použití chemických zbraní a o jejich ničení. Přeprava látek, které pod tuto položku spadají, musí probíhat podle řetězového postupu pro ochranu a bezpečnost, který stanovila Organizace pro zákaz chemických zbraní.
- Chemický vzorek je možno přepravit až poté, co příslušný orgán nebo generální ředitel Organizace pro zákaz chemických zbraní udělil povolení pro přepravu a pokud vzorek odpovídá následujícím požadavkům:
- (a) musí být zabalen podle pokynu pro balení 623 (viz tabulku S-3-8 Doplnku) Technických pokynů ICAO; a
 - (b) při přepravě musí být k přepravnímu dokladu připojen jeden exemplář povolení pro přepravu, ve kterém jsou uvedena množstevní omezení a požadavky na balení.
- 251 Položka SOUPRAVA TESTOVACÍ, CHEMICKÁ nebo SOUPRAVA PRVNÍ POMOCI se vztahuje na skříňky, kazety atd., které obsahují malá množství různých nebezpečných věcí například pro lékařské, analytické nebo zkušební nebo opravářské účely. Tyto soupravy nesmějí obsahovat žádné nebezpečné věci, u kterých je ve sloupci (7a) tabulky A kapitoly 3.2 udán kód množství „0“
- Součásti těchto souprav nesmějí spolu nebezpečně reagovat (viz pojem „nebezpečná reakce“ v oddílu 1.2.1). Celkové množství nebezpečných věcí v jedné soupravě nesmí být větší než 1 litr nebo 1 kg. Obalovou skupinou, k níž je přiřazena celá souprava, musí být obalová skupina té látky obsažené v soupravě, která vyžaduje nepřísňší obalovou skupinu.
- Pokud souprava obsahuje pouze jen nebezpečné věci, jimž není přiřazena žádná obalová skupina, nemusí být v přepravním dokladu pro nebezpečné věci žádná obalová skupina uvedena.
- Soupravy, které jsou přepravovány ve vozidlech pro účely první pomoci nebo pro provozní účely, nepodléhají předpisům ADR.
- Soupravy testovací, chemické a soupravy první pomoci obsahující nebezpečné věci ve vnitřních obalech, které nepřekračují omezená množství platné pro jednotlivé látky, jak je uvedeno ve sloupci (7a) tabulky A kapitoly 3.2, smějí být přepravovány podle kapitoly 3.4.
- 252 Vodné roztoky dusičnanu amonného s nejvýše 0,2 % hořlavých látek a s koncentrací nejvýše 80 % nepodléhají předpisům ADR, pokud dusičnan amonný zůstane za všech přepravních podmínek v roztoku.
- 266 Tato látka nesmí být přepravována, jestliže obsahuje méně alkoholu, vody nebo flegmatizačního prostředku než je stanoveno, ledaže by příslušný orgán udělil zvláštní povolení (viz pododdíl 2.2.1.1).

- 267 Trhaviny typu C obsahující chlorečnany musí být odděleny od výbušných látek, které obsahují dusičnan amonný nebo jiné amonné soli.
- 270 Vodné roztoky anorganických tuhých dusičnanů třídy 5.1 se považují za látky neodpovídající kritériím třídy 5.1, jestliže koncentrace látek v roztoku při nejnižší teplotě, které může být dosaženo během přepravy, nepřekročí 80 % meze nasycení.
- 271 Laktóza, glukóza nebo podobné látky smějí být používány jako flegmatizační prostředek za podmínky, že látka obsahuje nejméně 90% hm. flegmatizačního prostředku. Příslušný orgán může na základě zkoušek typu c) série 6 Příručky zkoušek a kritérií, části 1 oddílu 16, které se provedou nejméně na třech obalech připravených k přepravě schválit přiřazení těchto směsí ke třídě 4.1. Směsi s nejméně 98 % hm. flegmatizačního prostředku nepodléhají předpisům ADR. Kusy, které obsahují směsi s nejméně 90 % hm. flegmatizačního prostředku, nemusí být opatřeny bezpečnostní značkou podle vzoru č. 6.1.
- 272 Tato látka smí být přepravována podle ustanovení pro třídu 4.1 jen se zvláštním povolením příslušného orgánu (viz UN číslo 0143 nebo 0150, jak je to vhodné).
- 273 Maneb stabilizovaný a maneb, přípravky stabilizované proti samozahřátí nemusí být přiřazeny ke třídě 4.2, pokud je možné zkouškami prokázat, že objem 1 m³ látky samovolně nevzplane a že teplota uprostřed vzorku nepřesáhne 2000 °C, jestliže je vzorek po dobu 24 hodin udržován na teplotě nejméně 75 °C ± 2 °C.
- 274 Platí ustanovení pododdílu 3.1.2.8.
- 278 Tyto látky smějí být zařazeny a přepravovány pouze se souhlasem příslušného orgánu na základě výsledků zkoušek série 2 a typu c) série 6 Příručky zkoušek a kritérií, části I, provedených na kusech připravených k přepravě (viz pododdíl 2.2.1.1). Příslušný orgán musí určit obalovou skupinu na základě kritérií oddílu 2.2.3 a typu obalu použitého pro zkoušku série 6(c).
- 279 Tato látka byla klasifikována nebo přiřazena k obalové skupině na základě jejich známých účinků na člověka, spíše než striktním použitím klasifikačních kritérií uvedených v ADR.
- 280 Tato položka se vztahuje na záchranné prostředky pro vozidla, plavidla nebo letadla – např. plynové generátory airbagů, moduly airbagů, předpínače bezpečnostních pásů a pyromechanické prostředky, které obsahují nebezpečné věci třídy 1 nebo jiných tříd, jsou-li přepravovány jako montážní díly a pokud tyto předměty, tak jak jsou podávány k přepravě, byly vyzkoušeny podle série zkoušek 6 (c) části I Příručky zkoušek a kritérií, přičemž nedošlo k výbuchu prostředku, roztržení pouzdra prostředku nebo tlakové nádoby, a neexistuje nebezpečí rozletu úlomků ani tepelných účinků, které by významným způsobem bránily hašení požáru nebo záchranným operacím v bezprostředním sousedství. Tato položka se nevztahuje na prostředky pro záchranu života popsané ve zvláštním ustanovení 296 (UN čísla 2990 a 3072).
- 282 (Vypuštěno)
- 283 Předměty obsahující plyn, které slouží jako tlumiče pérování, včetně zařízení pohlcujících nárazovou energii, nebo vzduchové pružiny, nepodléhají předpisům ADR, za podmínky:
- (a) že každý předmět má plynovou nádobu o vnitřním objemu nejvýše 1,6 litru a plnicí tlak nejvýše 280 barů, přičemž součin vnitřního objemu (v litrech) a plnicího tlaku (v barech) nepřekročí 80 (tj. plynová nádoba o vnitřním objemu 0,5 litru a plnicí tlak 160 barů nebo plynová nádoba o vnitřním objemu 1 litr a plnicí tlak 80 barů nebo plynová nádoba o vnitřním objemu 1,6 litru a plnicí tlak 50 barů nebo plynová nádoba o vnitřním objemu 0,28 litru a plnicí tlak 280 barů);
 - (b) že každý předmět má minimální tlak při protržení čtyřikrát vyšší než plnicí tlak při 20 °C, pokud vnitřní objem plynové nádoby nepřekračuje 0,5 litru, a pětikrát vyšší než plnicí tlak, je-li vnitřní objem tlakové nádoby větší než 0,5 litru;
 - (c) že každý předmět je zhotoven z výrobního materiálu, který se při protržení netříští;

protřzení nebo popraskání součástí, které jsou vystaveny tlaku zkapalněného plynu. Chladicí stroje a součásti chladicích strojů, které obsahují méně než 12 kg plynu, nepodléhají předpisům ADR.

292 (Vypuštěno)

293 Pro zápalky platí tyto definice:

- (a) větrové zápalky jsou zápalky, jejichž hlavičky jsou zhotoveny ze zápalné složky citlivé na tření a pyrotechnické složky, které hoří malým plamenem nebo bez plamene, avšak s velkou teplotou;
- (b) bezpečnostní zápalky jsou zápalky, které jsou spojeny nebo upevněny do knížečky, složky nebo krabičky a které je možno zapálit třením jen na připraveném povrchu;
- (c) zápalky „zápalné kdekoli“ jsou zápalky, které mohou být zapáleny třením na pevném povrchu;
- (d) voskové zápalky jsou zápalky, které mohou být zapáleny třením jak na připraveném, tak i na pevném povrchu.

295 Není nutné označovat každý jednotlivý akumulátor nápisy a bezpečnostními značkami, jsou-li odpovídající nápisy a bezpečnostní značky umístěny na paletě.

296 Tyto položky se vztahují na záchranné prostředky, jako jsou záchranné čluny, osobní plovací prostředky a samonafukovací skluzavky. UN číslo 2990 se vztahuje na samonafukovací prostředky a UN číslo 3072 se vztahuje na záchranné prostředky, které nejsou samonafukovací. Záchranné prostředky mohou obsahovat:

- (a) signální prostředky (třída 1), které mohou zahrnovat dýmotvorné a světelné signální prostředky, zabalené v obalech, které je chrání před neúmyslnou aktivací;
- (b) jen UN číslo 2990 smí zahrnovat náložky pro technické účely podtřídy 1.4, skupiny snášelnivosti S pro samonafukovací mechanismus a za podmínky, že množství výbušné látky na prostředek nepřekročí 3,2 g;
- (c) stlačené nebo zkapalněné plyny třídy 2, skupiny A nebo O podle odstavce 2.2.2.1.3;
- (d) elektrické akumulátory (třída 8) a lithiové baterie (třída 9);
- (e) soupravy první pomoci nebo opravářské soupravy obsahující malá množství nebezpečných věcí (např. látky třídy 3, 4.1, 5.2, 8 nebo 9); nebo
- (f) zápalky „zápalné kdekoli“ zabalené v obalech, které je chrání před neúmyslnou aktivací.

Záchranné prostředky zabalené v pevných tuhých vnějších obalech o nejvyšší celkové (brutto) hmotnosti 40 kg, neobsahující žádné jiné nebezpečné věci než stlačené nebo zkapalněné plyny třídy 2, skupiny A nebo skupiny O, v nádobách o vnitřním objemu nejvýše 120 ml, které jsou v záchranných prostředcích obsaženy pouze za účelem jejich aktivace, nepodléhají ustanovením ADR.

298 (Vypuštěno)

300 Rybí moučka, rybí odpad a „krill“ moučka nesmějí být nakládány, jestliže teplota v době nakládky překračuje 35 °C, nebo je o 5 °C nad teplotou okolí, podle toho, která z těchto teplot je vyšší.

302 Zaplynované nákladní dopravní (přepravní) jednotky, které neobsahují žádné jiné nebezpečné věci, podléhají pouze ustanovením oddílu 5.5.2.

303 Nádoby musí být přiřazeny ke klasifikačnímu kódu plynu nebo směsi plynů, který (kterou) obsahují, určenému podle ustanovení oddílu 2.2.2.

304 Tato položka smí být použita pouze pro přepravu neaktivovaných akumulátorů, které obsahují suchý hydroxid draselný a které jsou určeny k aktivaci před použitím přidáním patřičného množství vody do jednotlivých článků.

- 305 Tyto látky nepodléhají předpisům ADR, pokud jsou v koncentracích nejvýše 50 mg/kg.
- 306 Tato položka smí být použita pouze pro látky, které jsou příliš necitlivé pro zařazení do třídy 1, pokud byly vyzkoušeny podle série zkoušek 2 (viz Příručku zkoušek a kritérií, část I).
- 307 Tato položka smí být použita pouze pro homogenní směsi obsahující dusičnan amonný jako hlavní složku v rozmezí těchto mezních hodnot:
- (a) nejméně 90 % dusičnanu amonného s nejvýše 0,2 % hořlavých/organických látek vyjádřených jako ekvivalent uhlíku a popřípadě s přísadou, která je anorganická a inertní vůči dusičnanu amonnému; nebo
 - (b) méně než 90 %, ale více než 70 % dusičnanu amonného s jinými anorganickými látkami, nebo více než 80 %, ale méně než 90 % dusičnanu amonného ve směsi s uhličitánem vápenatým a/nebo dolomitem a/nebo minerálním síranem vápenatým a nejvýše 0,4 % hořlavých/organických látek vyjádřených jako ekvivalent uhlíku; nebo
 - (c) dusíkatá hnojiva na bázi dusičnanu amonného obsahující směsi dusičnanu amonného se síranem amonným s více než 45 %, ale méně než 70 % dusičnanu amonného a nejvýše 0,4 % hořlavých/organických látek vyjádřených jako ekvivalent uhlíku tak, že součet procentních podílů dusičnanu amonného a síranu amonného překročí 70 %.
- 309 Tato položka se vztahuje na neznecitlivěné emulze, suspenze a gely sestávající v prvé řadě ze směsi dusičnanu amonného a paliva, určené k výrobě trhaviny typu E teprve po dalším zpracování před použitím.
- Směs pro emulze mívá obvykle toto složení: 60 – 85 % dusičnanu amonného; 5 – 30 % vody; 2 – 8 % paliva; 0,5 – 4 % emulgátoru; 0 – 10 % rozpustných omezovačů plamene a stopové přísady. Část dusičnanu amonného může být nahrazena jinými anorganickými nitrátovými solemi.
- Směs pro suspenze a gely mívá obvykle toto složení: 60 – 85 % dusičnanu amonného; 0 – 5 % chloristanu sodného nebo draselného; 0 – 17 % hexaminonitrátu nebo monomethylaminonitrátu; 5 – 30 % vody; 2 – 15 % paliva; 0,5 – 4 % zahušťovadla, 0 – 10 % rozpustných omezovačů plamene a stopové přísady. Část dusičnanu amonného může být nahrazena jinými anorganickými nitrátovými solemi.
- Tyto látky musí vyhovět zkouškám 8 (a), (b) a (c) série zkoušek 8 Příručky zkoušek a kritérií, části I, oddílu 18 a musí být schváleny příslušným orgánem.
- 310 Zkušební předpisy pododdílu 38.3 Příručky zkoušek a kritérií se nevztahují na výrobní série sestávající z nejvýše 100 článků a baterií, ani na předvýrobní prototypy článků a baterií, jsou-li tyto prototypy přepravovány ke zkouškám, jestliže
- (a) články a baterie jsou přepravovány ve vnějším obalu, kterým je kovový, plastový nebo překližkový sud, nebo kovová, plastová nebo dřevěná bedna a který splňuje kritéria pro obalovou skupinu I; a
 - (b) každý článek a baterie je jednotlivě zabalen(a) ve vnitřním obalu uvnitř vnějšího obalu a je obklopen(a) fixačním materiálem, který je nehořlavý a nevodivý.
- 311 Látky nesmějí být přepravovány pod touto položkou, ledaže to schválil příslušný orgán na základě výsledků příslušných zkoušek podle části I Příručky zkoušek a kritérií. Obal musí zajistit, aby procentní podíl ředidla neklesl v žádném okamžiku během přepravy pod procentní podíl uvedený ve schválení příslušného orgánu.
- 312 (Vyhrazeno)
- 313 (Vypuštěno)
- 314 (a) Tyto látky jsou náchylné k exotermickému rozkladu při zvýšených teplotách. Rozklad může být vyvolán teplem nebo nečistotami (např. práškovými kovy (železo, mangan, kobalt, hořčík) a jejich sloučeninami);

(b) Během přepravy musí být tyto látky chráněny před přímým slunečním svitem a všemi zdroji tepla a musí být uloženy na dostatečně odvětrávaných místech.

315 Tato položka nesmí být použita pro látky třídy 6.1, které splňují kritéria toxicity při vdechnutí pro obalovou skupinu I, uvedená v odstavci 2.2.61.1.8.

316 Tato položka se vztahuje pouze na chlornan vápenatý, suchý pokud je přepravován ve formě nedrobných tablet.

317 „Štěpné-vyjmuté“ se vztahuje pouze na ty kusy, které splňují ustanovení pododdílu 6.4.11.2.

318 Pro účely dokumentace musí být oficiální pojmenování pro přepravu doplněno technickým názvem (viz pododdíl 3.1.2.8). Jsou-li infekční látky, které se mají přepravovat, neznámé, avšak existuje podezření, že splňují kritéria pro zařazení do kategorie A a přiřazení k UN číslu 2814 nebo 2900, musí být v přepravním dokladu uvedena v závorkách za oficiálním pojmenováním pro přepravu slova „podezření na infekční látku kategorie A“.

319 Látky zabalené a označené podle pokynu pro balení P650 nepodléhají žádným jiným ustanovením ADR.

320 (Vypuštěno)

321 Tyto akumulární systémy musí být vždy pokládány za systémy obsahující vodík.

322 Jsou-li tyto věci přepravovány ve formě nedrobných tablet, jsou přiřazeny k obalové skupině III.

323 (Vyhrazeno)

324 Tato látka musí být stabilizována, jestliže její koncentrace nepřekračuje 99 %.

325 V případě neštěpného nebo štěpného vyjmutého hexafluoridu uranu musí být látka zařazena pod UN číslo 2978.

326 V případě štěpného hexafluoridu uranu musí být látka zařazena pod UN číslo 2977.

327 Odpadové aerosoly zasílané podle 5.4.1.1.3 mohou být přepravovány pod touto položkou za účelem recyklace nebo likvidace. Nemusí být chráněny proti neúmyslnému vyprázdnění za podmínky, že jsou učiněna opatření, aby se zamezilo nebezpečnému nárůstu tlaku a nebezpečné atmosféře. Odpadové aerosoly, s výjimkou těch, které jsou netěsné nebo silně deformované, musí být baleny podle pokynu pro balení P207 a zvláštního ustanovení pro balení PP87 nebo pokynu pro balení LP02 a zvláštního ustanovení pro balení L2. Netěsné nebo silně deformované aerosoly musí být přepravovány v záchranných obalech za podmínky, že jsou učiněna vhodná opatření k tomu, aby nedošlo k nebezpečnému nárůstu tlaku.

POZNÁMKA: Pro přepravu po moři nesmějí být odpadové aerosoly přepravovány v uzavřených kontejnerech.

328 Tato položka se vztahuje na zásobníky do palivových článků včetně těch, které jsou obsaženy v zařízeních nebo jsou baleny se zařízeními. Zásobníky do palivových článků, které jsou zamontovány nebo jsou nedílnou součástí systému palivových článků, se považují za obsažené v zařízeních. Zásobník do palivových článků je nádoba, v níž je obsaženo palivo pro jeho vypouštění do palivového článku ventilem (ventily), který(é) řídí průtok paliva do palivového článku. Zásobníky do palivových článků, včetně těch, které jsou obsaženy v zařízeních, musí být zkonstruovány a vyrobeny tak, aby se zamezilo úniku paliva za normálních podmínek přepravy.

Konstrukční typy zásobníků do palivových článků používajících jako paliva kapaliny musí projít zkouškou vnitřním tlakem při tlaku 100 kPa (přetlak) bez úniku obsahu.

S výjimkou zásobníků do palivových článků obsahujících vodík v kovovém hydridu, které musí vyhovovat zvláštnímu ustanovení 339, musí každý konstrukční typ zásobníku do palivového článku

dokázat projít zkouškou volným pádem z výšky 1,2 metrů na tvrdý povrch v orientaci, při níž může nejpravděpodobněji dojít k selhání zádržného systému, bez jakéhokoli úniku obsahu.

Jsou-li baterie s kovem lithia nebo baterie s ionty lithia obsaženy v systému palivových článků, musí být zásilka odeslána pod touto položkou a pod náležitými položkami pro UN 3091 BATERIE LITHIOVÉ KOVOVÉ OBSAŽENÉ V ZAŘÍZENÍ nebo UN 3481 BATERIE LITHIUM-IONTOVÉ OBSAŽENÉ V ZAŘÍZENÍ.

- 329 (Vyhrazeno)
- 330 (Vypuštěno)
- 331 (Vyhrazeno)
- 332 Dusičnan hořečnatý, hexahydrát nepodléhá předpisům ADR.
- 333 Směsi ethanolu a benzínu pro použití v zážehových motorech (např. v automobilech, stacionárních motorech a jiných motorech) musí být přiřazeny k této položce bez ohledu na změny těkavosti.
- 334 Zásobník do palivových článků smí obsahovat aktivátor, pokud je vybaven dvěma nezávislými prostředky k zamezení neúmyslného smíchání s palivem během přepravy.
- 335 Směsi tuhých látek, které nepodléhají předpisům ADR, a kapalin nebo tuhých látek ohrožujících životní prostředí musí být zařazeny pod UN 3077 a smějí být přepravovány pod touto položkou, pokud není viditelná žádná volná kapalina v době, kdy je látka nakládána, nebo v době, kdy je uzavírán obal nebo vozidlo nebo kontejner. Každé vozidlo nebo kontejner musí být těsně, jsou-li použity pro přepravu látek ve volně loženém stavu. Je-li viditelná volná kapalina v době, kdy je směs nakládána, nebo v době, kdy je uzavírán obal nebo vozidlo nebo kontejner, musí být směs zařazena pod UN 3082. Těsně uzavřené balíčky a předměty obsahující méně než 10 ml kapaliny ohrožující životní prostředí, nasáklé v tuhém materiálu, ale bez volné kapaliny v balíčku nebo předmětu, nebo obsahující méně než 10 g tuhé látky ohrožující životní prostředí nepodléhají předpisům ADR.
- 336 Jeden kus s nehořlavou tuhou látkou LSA-II nebo LSA-III nesmí při přepravě leteckou dopravou obsahovat aktivitu větší než 3 000 A₂.
- 337 Kusy typu B(U) a typu B(M) nesmějí při přepravě leteckou dopravou obsahovat aktivity větší, než jsou ty následující:
- (a) pro nízkodisperzní radioaktivní látky: jak je dovoleno pro vzor kusu podle specifikace v osvědčení o schválení;
 - (b) pro radioaktivní látky zvláštní formy: 3 000 A₁ nebo 100 000 A₂, podle toho, která z těchto dvou hodnot je nižší;
 - (c) pro všechny ostatní radioaktivní látky: 3 000 A₂.
- 338 Každý zásobník do palivových článků přepravovaný pod touto položkou a zkonstruovaný k tomu, aby obsahoval zkapalněný hořlavý plyn, musí:
- (a) být schopen odolat bez úniku obsahu nebo prasknutí tlaku rovnajícimu se nejméně dvojnásobku rovnovážného tlaku obsahu při 55 °C;
 - (b) neobsahovat více než 200 ml zkapalněného hořlavého plynu, jehož tenze par nesmí překročit 1 000 kPa při 55 °C; a
 - (c) projít úspěšně zkouškou v lázni s horkou vodou předepsanou v 6.2.6.3.1.
- 339 Zásobníky do palivových článků obsahující vodík v kovovém hydridu přepravované pod touto položkou nesmějí mít hydraulický vnitřní objem větší než 120 ml.
- Tlak v zásobníku do palivových článků nesmí překročit 5 MPa při 55 °C. Konstrukční typ musí odolat bez úniku obsahu nebo roztržení tlaku rovnajícimu se dvojnásobku výpočtového tlaku zásobníku při

55 °C, nebo tlaku o 200 kPa vyššímu než je výpočtový tlak zásobníku při 55 °C, podle toho, který z nich je vyšší. Tlak, při kterém se tato zkouška provádí, je zmíněn ve zkoušce volným pádem a ve vodíkové cyklační zkoušce jako „minimální tlak při roztržení pláště“.

Zásobníky do palivových článků musí být plněny podle postupů stanovených výrobcem. Výrobce musí ke každému zásobníku do palivových článků poskytnout následující informace:

- (a) inspekční postupy, které je třeba provést před prvním plněním a před opakovaným plněním zásobníku do palivových článků;
- (b) bezpečnostní opatření a potenciální nebezpečí, které je třeba si uvědomit;
- (c) metodu pro určení okamžiku, kdy bylo dosaženo jmenovitého vnitřního objemu;
- (d) minimální a maximální tlakový rozsah;
- (e) minimální a maximální teplotní rozsah; a
- (f) jakékoli další požadavky, které je třeba dodržet při prvním plnění a opakovaném plnění včetně druhu zařízení, které je třeba používat pro první plnění a opakované plnění.

Zásobníky do palivových článků musí být konstruovány a vyrobeny tak, aby se zamezilo úniku paliva za normálních podmínek přepravy. Každý konstrukční typ zásobníku, včetně zásobníků, které jsou nedílnou součástí palivového článku, musí být s úspěchem podroben následujícím zkouškám:

Zkouška volným pádem

Zkouška volným pádem z výšky 1.8 metru na tvrdý povrch ve čtyřech různých orientacích:

- (a) vertikálně, na konec obsahující montážní jednotku s uzavíracím ventilem;
- (b) vertikálně, na konec protilehlý montážní jednotce s uzavíracím ventilem;
- (c) horizontálně, na ocelový hrot o průměru 38 mm, s ocelovým hrotem v poloze nahoru; a
- (d) pod úhlem 45° na konec obsahující montážní jednotku s uzavíracím ventilem.

Nesmí dojít k žádnému úniku, který se zjišťuje za použití roztoku mýdlových bublin nebo jinými rovnocennými prostředky na všech možných místech netěsnosti, když je zásobník naplněn na svůj jmenovitý plnicí tlak. Zásobník do palivových článků pak musí být hydrostaticky natlakován až do své destrukce. Zaznamenaný tlak při roztržení musí překročit 85 % minimálního tlaku při roztržení pláště.

Zkouška ohněm

Zásobník do palivových článků naplněný do svého jmenovitého vnitřního objemu vodíkem musí být podroben zkoušce vložením do ohně. Konstrukční typ zásobníku, který smí zahrnovat jako nedílnou součást pojistné odvětrávací zařízení, je považován za vyhovující při zkoušce ohněm, jestliže:

- (a) vnitřní tlak poklesne na nulový přetlak bez prasknutí zásobníku; nebo
- (b) zásobník odolá ohni po dobu nejméně 20 minut bez prasknutí.

Vodíková cyklační zkouška

Tato zkouška je určena k tomu, aby se zajistilo, že během používání zásobníku do palivových článků nebudou překročeny meze výpočtového napětí zásobníku.

Zásobník do palivových článků musí být podroben tlakovým cyklům od nejvýše 5 % jmenovité kapacity vodíku do nejméně 95 % jmenovité kapacity vodíku a zpět k nejvýše 5 % jmenovité kapacity vodíku. Pro plnění musí být použit jmenovitý plnicí tlak a teploty musí být udržovány v rozmezí provozních teplot. Musí být provedeno nejméně 100 tlakových cyklů.

Po cyklační zkoušce musí být zásobník do palivových článků naplněn a musí být změřen objem vody vytlačené zásobníkem. Konstrukční typ zásobníku se považuje za úspěšně prošlý vodíkovou

cyklační zkouškou, jestliže objem vody vytlačené cyklováním zásobníkem nepřevyšuje objem vody vytlačené necyklováním zásobníkem naplněným do 95 % jmenovité kapacity a natlakovaným do 75 % minimálního tlaku při roztržení pláště.

Zkouška těsnosti ve výrobě

Každý zásobník do palivových článků musí být podroben kontrolní zkoušce těsnosti při $15^{\circ}\text{C} \pm 5^{\circ}\text{C}$ za natlakování na jeho jmenovitý plnicí tlak. Nesmí dojít k žádnému úniku, který se zjišťuje za použití roztoku mýdlových bublin nebo jinými rovnocennými prostředky na všech možných místech netěsnosti.

Každý zásobník do palivových článků musí být trvale označen následujícími údaji:

- (a) jmenovitým plnicím tlakem v MPa;
- (b) sériovým číslem výrobce zásobníků do palivových článků nebo unikátním identifikačním číslem; a
- (c) datem ukončení použitelnosti založeném na maximální provozní životnosti (rok ve čtyřech číslicích; měsíc ve dvou číslicích).

340 Chemické soupravy, soupravy první pomoci a soupravy polyesterové pryskyřice obsahující nebezpečné věci ve vnitřních obalech, které nepřekračují množství limity pro vyňatá množství platné pro jednotlivé látky, jak je to udáno ve sloupci (7b) tabulky A kapitoly 3.2, smějí být přepravovány podle kapitoly 3.5. Látky třídy 5.2, i když nejsou jednotlivě dovoleny jako vyňatá množství ve sloupci (7b) tabulky A kapitoly 3.2, jsou dovoleny v takových soupravách a je jim přiřazen kód E2 (viz 3.5.1.2).

341 (Vyhrazeno)

342 Vnitřní nádoby ze skla (jako jsou ampule nebo kapsle) určené jen pro použití ve sterilizačních zařízeních, pokud obsahují méně než 30 ml ethylenoxidu na vnitřní obal s nejvýše 300 ml na vnější obal, smějí být přepravovány podle ustanovení v kapitole 3.5, bez ohledu na údaj „E0“ ve sloupci (7b) tabulky A kapitoly 3.2, za podmínky, že:

- (a) po naplnění byla každá vnitřní nádoba ze skla podrobena zkoušce těsnosti v lázni s horkou vodou při teplotě a na dobu, které jsou dostatečné k tomu, aby se zajistilo dosažení vnitřního tlaku rovnajícího se tenzi par ethylenoxidu při 55°C . Každá vnitřní nádoba ze skla vykazující stopy netěsnosti, deformace nebo jiného poškození při této zkoušce nesmí být přepravována podle tohoto zvláštního ustanovení;
- (b) kromě obalu vyžadovaného podle 3.5.2 je každá vnitřní nádoba ze skla vložena do zataveného pytle z plastu snášlivého s ethylenoxidem a schopného zadržet obsah v případě rozbití nebo netěsnosti vnitřní nádoby ze skla; a
- (c) každá vnitřní nádoba ze skla je chráněna prostředky proti propíchnutí pytle z plastu (např. pouzdry nebo vycpávkovým materiálem) v případě poškození obalu (např. promáčknutím).

343 Tato položka platí pro surovou ropu obsahující sirovodík v dostatečné koncentraci, takže páry uvolněné ze surové ropy mohou představovat nebezpečí při vdechování. Přiřazená obalová skupina se určí podle nebezpečí hořlavosti a nebezpečí při vdechování podle stupně představovaného nebezpečí.

344 Ustanovení uvedená v 6.2.6 musí být dodržena.

345 Tento plyn obsažený v otevřených kryogenních nádobách o vnitřním objemu nejvýše 1 litr vyrobených s dvojími stěnami ze skla, přičemž prostor mezi vnitřní a vnější stěnou je zbaven vzduchu (vakuová izolace), nepodléhá ustanovením ADR, pokud je každá nádoba přepravována ve vnějším obalu s vhodným fixačním nebo absorpčním materiálem, aby byla chráněna před poškozením při nárazu.

- 346 Otevřené kryogenní nádoby odpovídající požadavkům pokynu pro balení P203 pododdílu 4.1.4.1 a neobsahující žádné nebezpečné věci mimo UN 1977 dusík, hluboce zchlazený, kapalný, který je plně absorbován v porézním materiálu, nepodléhají žádným jiným ustanovením ADR.
- 347 Tato položka se použije pouze tehdy, jestliže výsledky série zkoušek 6 (d) části I Příručky zkoušek a kritérií prokázaly, že jakékoli nebezpečné účinky vyvolané činnostmi jsou omezeny na vnitřek kusu.
- 348 Baterie vyrobené po 31. prosinci 2011 musí mít na vnější skříni vyznačenu jmenovitou zatížitelnost ve watthodinách.
- 349 Směsi chlornanu s amonnou solí nejsou připuštěny k přepravě. UN 1791 chlornan, roztok je látkou třídy 8.
- 350 Bromičnan amonný a jeho vodné roztoky a směsi bromičnanu s amonnou solí nejsou připuštěny k přepravě.
- 351 Chlorečnan amonný a jeho vodné roztoky a směsi chlorečnanu s amonnou solí nejsou připuštěny k přepravě.
- 352 Chloritan amonný a jeho vodné roztoky a směsi chloritanu s amonnou solí nejsou připuštěny k přepravě.
- 353 Manganistan amonný a jeho vodné roztoky a směsi manganistanu s amonnou solí nejsou připuštěny k přepravě.
- 354 Tato látka je toxická při vdechování.
- 355 Kyslíkové láhve pro použití v nouzových situacích přepravované pod touto položkou smí zahrnovat zabudované spouštěcí náložky (náložky pro technické účely podtřídy 1.4, skupiny snášenlivosti C nebo S) beze změny klasifikace ve třídě 2, pokud celkové množství deflagrujících (hnacích) výbušných látek nepřekročí 3,2 g na kyslíkovou láhev. Láhve se zabudovanými spouštěcími náložkami připravené k přepravě musí mít účinné prostředky k zamezení nechtěné aktivace.
- 356 Zásobníkové systémy s hydridem kovu zabudované ve vozidlech, železničních vozech, plavidlech nebo letadlech nebo ve zkompletovaných dílech nebo určené k zabudování do vozidel, železničních vozů, plavidel nebo letadel musí být schváleny příslušným orgánem země výroby¹ před přijetím k přepravě. Přepravní doklad musí obsahovat zápis, že kus byl schválen příslušným orgánem země výroby¹, nebo každou zásilku musí doprovázet kopie schválení příslušného orgánu země výroby¹.
- 357 Surová ropa obsahující sirovodík v dostatečné koncentraci, takže páry uvolněné ze surové ropy mohou představovat nebezpečí při vdechování, musí být přepravována pod položkou UN 3494 ROPA SUROVÁ, KYSELÁ, HOŘLAVÁ, TOXICKÁ.
- 358 Nitroglycerin, roztok v alkoholu, s více než 1 %, ale nejvýše 5 % nitroglycerinu, smí být zařazen do třídy 3 a přiřazen k UN číslu 3064, pokud jsou dodrženy všechny požadavky pokynu pro balení P300 v 4.1.4.1.
- 359 Nitroglycerin, roztok v alkoholu, s více než 1 %, ale nejvýše 5 % nitroglycerinu, musí být zařazen do třídy 1 a přiřazen k UN číslu 0144, pokud nejsou dodrženy všechny požadavky pokynu pro balení P300 v 4.1.4.1.
- 360 Vozidla, která jsou poháněna jen bateriemi s kovem lithia nebo bateriemi s ionty lithia, musí být zařazena pod položku UN 3171 vozidlo na akumulátorový pohon.
- 361 Tato položka platí pro elektrické dvouvrstvé kondenzátory s kapacitou akumulace energie větší než 0,3 Wh. Kondenzátory s kapacitou akumulace energie 0,3 Wh nebo menší nepodléhají ADR.

¹ Není-li země výroby smluvní stranou ADR, musí být schválení uznáno příslušným orgánem smluvní strany ADR

Kapacitou akumulace energie se rozumí energie zadržená kondenzátorem, jak je vypočtena použitím jmenovitého elektrického napětí a kapacity. Všechny kondenzátory, pro něž tato položka platí, včetně kondenzátorů obsahujících elektrolyt, který nesplňuje klasifikační kritéria žádné třídy nebezpečných věcí, musí splňovat následující podmínky:

- (a) Kondenzátory, které nejsou zabudovány v zařízení, musí být přepravovány v nenabitěm stavu. Kondenzátory, které jsou zabudovány v zařízení, musí být přepravovány buď v nenabitěm stavu, nebo musí být chráněny proti zkratu;
- (b) Každý kondenzátor musí být chráněn proti potenciálnímu nebezpečí zkratu při přepravě takto:
 - (i) Je-li kapacita akumulace energie kondenzátoru nejvýše 10 Wh, nebo je-li kapacita akumulace energie každého kondenzátoru v modulu nejvýše 10 Wh, musí být kondenzátor nebo modul chráněn proti zkratu nebo být opatřen kovovým páskem spojujícím svorky; a
 - (ii) Je-li kapacita akumulace energie kondenzátoru nebo kondenzátoru v modulu větší než 10 Wh, musí být kondenzátor nebo modul opatřen kovovým páskem spojujícím svorky;
- (c) Kondenzátory obsahující nebezpečné věci musí být konstruovány tak, aby odolaly rozdílu tlaků 95 kPa;
- (d) Kondenzátory musí být konstruovány a vyrobeny tak, aby mohl být bezpečně snížen tlak, který může narůst během jejich používání, pomocí větracího otvoru nebo slabého místa v plášti kondenzátoru. Jakákoli kapalina, která se uvolní při větrání, musí být zadržena obalem nebo zařízením, v němž je kondenzátor zabudován; a
- (e) Na kondenzátorech musí být vyznačena jejich kapacita akumulace energie ve Wh.

Kondenzátory obsahující elektrolyt, který nesplňuje klasifikační kritéria žádné třídy nebezpečných věcí, i když jsou zabudovány v zařízení, nepodléhají jiným ustanovením ADR.

Kondenzátory obsahující elektrolyt, který splňuje klasifikační kritéria kterékoli třídy nebezpečných věcí, s kapacitou akumulace energie 10 Wh nebo méně, nepodléhají jiným ustanovením ADR, pokud jsou schopny v nezabaleném stavu odolat při zkoušce volným pádem z výšky 1,2 metru na pevný povrch bez ztráty obsahu.

Kondenzátory obsahující elektrolyt, splňující klasifikační kritéria kterékoli třídy nebezpečných věcí, které nejsou zabudovány v zařízení a s kapacitou akumulace energie větší než 10 Wh, podléhají ustanovením ADR.

Kondenzátory zabudované v zařízení a obsahující elektrolyt, který splňuje klasifikační kritéria kterékoli třídy nebezpečných věcí, nepodléhají jiným ustanovením ADR, pokud je zařízení zabalené v pevném vnějším obalu vyrobeném z vhodného materiálu a přiměřené pevnosti a konstrukce ve vztahu k zamýšlenému použití a takovým způsobem, aby se zamezilo náhodnému uvedení kondenzátorů do činnosti během přepravy. Velké robustní zařízení obsahující kondenzátory smí být podáno k přepravě nezabalené nebo na paletách, je-li kondenzátorům poskytována rovnocenná ochrana zařízením, v němž jsou obsaženy.

POZNÁMKA: Kondenzátory, které svou konstrukcí udržují elektrické napětí na svorkách (např. asymetrické kondenzátory), nepatří pod tuto položku.

362

(Vyhrazeno)

363

Tato položka platí také pro kapalná paliva, jiná než jsou kapalná paliva vyňatá z platnosti ustanovení ADR podle 1.1.3.3, nad množství stanovené ve sloupci (7a) tabulky A kapitoly 3.2, v nádržích, které jsou integrální součástí zařízení nebo stroje (např. generátory, kompresory, topné jednotky atd.) jako součást jejich původního konstrukčního typu. Nepodléhají žádným jiným ustanovením ADR, pokud splňují následující podmínky:

- (a) Nádrže splňují konstrukční požadavky příslušného orgánu země výroby²;
- (b) Všechny ventily nebo otvory (např. odvětrávací zařízení) nádrží obsahujících nebezpečné věci jsou během přepravy uzavřeny;
- (c) Stroj nebo zařízení je orientován(o) tak, aby se zamezilo nechtěnému úniku nebezpečných věcí, a zajištěn(o) prostředky schopnými zabránit stroji nebo zařízení v jakémkoli pohybu během přepravy, který by mohl změnit jejich orientaci nebo způsobit jejich poškození;
- (d) Pokud mají nádrže vnitřní objem větší než 60 litrů, nejvýše však 450 litrů, je stroj nebo zařízení označen(o) na jedné z vnějších stran bezpečnostními značkami podle 5.2.2 a pokud je vnitřní objem větší než 450 litrů, nejvýše však 1500 litrů, je stroj nebo zařízení označen(o) na všech čtyřech vnějších stranách bezpečnostními značkami podle 5.2.2; a
- (e) Pokud mají nádrže vnitřní objem větší než 1500 litrů, je stroj nebo zařízení označen(o) na všech čtyřech vnějších stranách velkými bezpečnostními značkami podle 5.3.1.1.1, požadavek uvedený v 5.4.1 platí a v přepravním dokladu je uveden následující dodatečný zápis: „Přeprava podle zvláštního ustanovení 363.
- 364 Tento předmět smí být přepravován podle ustanovení kapitoly 3.4, jestliže je kus ve stavu, jak je podáván k přepravě, schopen vyhovět při zkoušce podle Série zkoušek 6(d), části I Příručky zkoušek a kritérií, jak je stanoveno příslušným orgánem.
- 365 K vyrobeným nástrojům a předmětům obsahujícím rtuť viz UN číslo 3506.
- 366 Vyrobené nástroje a předměty obsahující nejvýše 1 kg rtuti nepodléhají ADR.
- 367 Pro účely dokumentace:
- Oficiální pojmenování pro přepravu „Látka pomocná k výrobě barev“ smí být použito pro zásilky kusů obsahujících „Barvu“ a „Látku pomocnou k výrobě barev“ v tomtéž kusu;
- Oficiální pojmenování pro přepravu „Látka pomocná k výrobě barev, žíravá, hořlavá“ smí být použito pro zásilky kusů obsahujících „Barvu, žíravou, hořlavou“ a „Látku pomocnou k výrobě barev, žíravou, hořlavou“ v tomtéž kusu;
- Oficiální pojmenování pro přepravu „Látka pomocná k výrobě barev, hořlavá, žíravá“ smí být použito pro zásilky kusů obsahujících „Barvu, hořlavou, žíravou“ a „Látku pomocnou k výrobě barev, hořlavou, žíravou“ v tomtéž kusu; a
- Oficiální pojmenování pro přepravu „Látka pomocná k výrobě tiskařských barev“ smí být použito pro zásilky kusů obsahujících „Barvu tiskařskou“ a „Látku pomocnou k výrobě tiskařských barev“ v tomtéž kusu.
- 368 V případě hexafluoridu uranu, neštěpného nebo štěpného vyjmutého, se látka zařadí pod UN číslo 3507 nebo UN číslo 2978.
- 369 Podle odstavce 2.1.3.5.3 (a) je tato radioaktivní látka ve vyjmutém kusu, mající žíravé vlastnosti, zařazena do třídy 8 s vedlejším nebezpečím radioaktivní látky.
- Hexafluorid uranu smí být zařazen pod tuto položku, jen pokud jsou splněny podmínky uvedené v 2.2.7.2.4.1.2, 2.2.7.2.4.1.5, 2.2.7.2.4.5.2 a pro vyjmuté štěpné látky v 2.2.7.2.3.6.
- Kromě ustanovení platných pro přepravu látek třídy 8 platí ustanovení uvedená v 5.1.3.2, 5.1.5.2.2, 5.1.5.4.1 (b), 7.5.11 CV33 (3.1), (5.1) až (5.4) a (6).
- Nevyžaduje se umístění žádné bezpečnostní značky pro třídu 7.

² Například dodržení příslušných ustanovení Směrnice 2006/42/ES Evropského parlamentu a Rady ze 17. května 2006 o strojích a pozměňující Směrnice 95/16/ES (Úřední věstník Evropské unie č. L 157z 9. června 2006, str. 0024-0086).

370

Tato položka se vztahuje na:

- dusičnan amonný s více než 0,2 % hořlavých látek, včetně jakékoli organické látky počítané jako uhlík, s vyloučením jakékoli přidané látky; a
- dusičnan amonný s nejvýše 0,2 % hořlavých látek, včetně jakékoli organické látky počítané jako uhlík, s vyloučením jakékoli přidané látky, který není příliš citlivý pro zařazení do třídy 1, jestliže byl odzkoušen podle série zkoušek 2 (viz Příručku zkoušek a kritérií, část I). Viz též UN číslo 1942.

371

(1) Tato položka se vztahuje také na předměty obsahující malé tlakové nádoby s vypouštěcím ventilem. Takové předměty musí splňovat následující požadavky:

- (a) Hydraulický vnitřní objem tlakové nádoby nesmí překročit 0,5 litru a provozní tlak nesmí překročit 25 barů při 15 °C;
- (b) Minimální tlak při roztržení tlakové nádoby musí být roven nejméně čtyřnásobku tlaku plynu při 15 °C;
- (c) Každý předmět musí být vyroben takovým způsobem, aby bylo vyloučeno neúmyslné vznícení nebo spuštění za normálních podmínek manipulace, balení, přepravy a použití. Toto může být splněno dodatečným uzamykacím zařízením spojeným s aktivátorem;
- (d) Každý předmět musí být vyroben takovým způsobem, aby se předešlo nebezpečným rozletům tlakové nádoby nebo částí tlakové nádoby;
- (e) Každá tlaková nádoba musí být vyrobena z materiálu, který se při jejím prasknutí nebude tříštit;
- (f) Konstrukční typ předmětu musí být podroben zkoušce v ohni. Pro tuto zkoušku se použijí ustanovení odstavců 16.6.1.2, kromě písmene g, 16.6.1.3.1 až 16.6.1.3.6, 16.6.1.3.7 (b) a 16.6.1.3.8 Příručky zkoušek a kritérií. Musí být prokázáno, že předmět uvolňuje svůj tlak pomocí těsnění degradujícího působením ohně nebo pomocí jiného zařízení pro vyrovnávání tlaku takovým způsobem, že se tlaková nádoba neroztříští a že předmět nebo fragmenty předmětu neodletí dále než 10 metrů;
- (g) Konstrukční typ předmětu musí být podroben následující zkoušce. Použije se stimulační mechanismus k iniciaci jednoho předmětu ve středu obalu. Nesmí dojít k nebezpečným účinkům vně kusu, jako je roztržení kusu, průnik kovových fragmentů nebo vlastní nádoby obalem.

(2) Výrobce musí pořídit technickou dokumentaci konstrukčního typu, výroby, jakož i zkoušek a jejich výsledků. Výrobce musí použít postupy k zajištění toho, aby předměty v sériové výrobě byly vyráběny v dobré kvalitě, podle konstrukčního typu a byly schopny splnit požadavky uvedené v (1). Výrobce musí na požádání poskytnout takové informace příslušnému orgánu.

372

Tato položka platí pro asymetrické kondenzátory s kapacitou akumulace energie větší než 0,3 Wh. Kondenzátory s kapacitou akumulace energie 0,3 Wh nebo nižší nepodléhají ADR.

Kapacitou akumulace energie se rozumí energie zadržená kondenzátorem, jak je vypočtena podle následující rovnice:

$$Wh = \frac{1}{2} C_N (U_R^2 - U_L^2) \times \left(\frac{1}{3600} \right)$$

za použití jmenovité kapacity (C_N), jmenovitého napětí (U_R) a jmenovité dolní meze napětí (U_L).

Všechny asymetrické kondenzátory, pro něž tato položka platí, musí splňovat následující podmínky:

- (a) Kondenzátory nebo moduly musí být chráněny proti zkratu;
- (b) Kondenzátory musí být konstruovány a vyrobeny tak, aby mohl být bezpečně snížen tlak, který může narůst během jejich používání, pomocí větracího otvoru nebo slabého místa v plášti kondenzátoru. Jakákoli kapalina, která se uvolní při větrání, musí být zadržena obalem nebo zařízením, v němž je kondenzátor zabudován;
- (c) Na kondenzátorech musí být vyznačena jejich kapacita akumulace energie ve Wh; a
- (d) Kondenzátory obsahující elektrolyt splňující klasifikační kritéria kterékoli třídy nebezpečných věcí musí být konstruovány tak, aby odolaly rozdílu tlaků 95 kPa;

Kondenzátory obsahující elektrolyt, který nesplňuje klasifikační kritéria žádné třídy nebezpečných věcí, i když jsou v sestavě modulu anebo jsou zabudovány v zařízení, nepodléhají jiným ustanovením ADR.

Kondenzátory obsahující elektrolyt, který splňuje klasifikační kritéria kterékoli třídy nebezpečných věcí, s kapacitou akumulace energie 20 Wh nebo méně, i když jsou v sestavě modulu, nepodléhají jiným ustanovením ADR, pokud jsou kondenzátory schopny v nezabaleném stavu odolat při zkoušce volným pádem z výšky 1,2 metru na pevný povrch bez ztráty obsahu.

Kondenzátory obsahující elektrolyt, splňující klasifikační kritéria kterékoli třídy nebezpečných věcí, které nejsou zabudovány v zařízení a s kapacitou akumulace energie větší než 20 Wh, podléhají ustanovením ADR.

Kondenzátory zabudované v zařízení a obsahující elektrolyt, který splňuje klasifikační kritéria kterékoli třídy nebezpečných věcí, nepodléhají jiným ustanovením ADR, pokud je zařízení zabaleno v pevném vnějším obalu vyrobeném z vhodného materiálu a přiměřené pevnosti a konstrukce ve vztahu k zamýšlenému použití a takovým způsobem, aby se zamezilo náhodnému uvedení kondenzátorů do činnosti během přepravy. Velké robustní zařízení obsahující kondenzátory smí být podáno k přepravě nezabalené nebo na paletách, je-li kondenzátorům poskytována rovnocenná ochrana zařízením, v němž jsou obsaženy.

POZNÁMKA: Bez ohledu na ustanovení tohoto zvláštního ustanovení musí být nikl-uhlíkové asymetrické kondenzátory obsahující alkalické elektrolyty třídy 8 přepravovány jako UN 2795 AKUMULÁTORY (BATERIE), NAPLNĚNÉ ALKALICKÝM KAPALNÝM ELEKTROLYTEM, elektrická akumulace.

373

Detektory neutronového záření obsahující nestlačený plyn fluorid boritý smí být přepravovány pod touto položkou, pokud jsou splněny následující podmínky:

- (a) Každý detektor neutronového záření musí splňovat následující podmínky:
 - (i) Tlak v každém detektoru nesmí překročit 105 kPa (absolutní tlak) při 20 °C;
 - (ii) Množství plynu nesmí překročit 13 g na detektor;
 - (iii) Každý detektor musí být vyroben v registrovaném programu zajištění kvality;

POZNÁMKA: ISO 9001:2008 smí být použita k tomuto účelu.

- (iv) Každý detektor neutronového záření musí být svařované kovové konstrukce s přechodovými konektory připojenými keramicko-kovovým pájením natvrdo. Tyto detektory musí mít minimální tlak při prasknutí 1800 kPa, jak je prokázáno při kvalifikační zkoušce konstrukčního typu, a
 - (v) Každý detektor musí být před naplněním odzkoušen na 1×10^{-10} cm³/s normy těsnosti.
- (b) Detektory neutronového záření přepravované jako samostatné komponenty musí být přepravovány následujícím způsobem:

- (i) Detektory musí být zabaleny do těsně uzavřených vložek z plastu sloužících jako meziobal, s dostatečným množstvím absorpčního materiálu, aby absorboval celý plyný obsah;
- (ii) Musí být zabaleny do pevného vnějšího obalu. Zkompletovaný kus musí být schopen odolat při zkoušce volným pádem z výšky 1,8 m bez jakéhokoli úniku plyného obsahu z detektorů;
- (iii) Celkové množství plynu ze všech detektorů na vnější obal nesmí překročit 52 g.
- (c) Zkompletované systémy měření neutronového záření obsahující detektory splňující podmínky odstavce (a) musí být přepravovány následujícím způsobem.
 - (i) Detektory musí být uloženy v pevném těsně uzavřeném vnějším pouzdru;
 - (ii) Pouzdro musí obsahovat dostatečné množství absorpčního materiálu, aby absorboval celý plyný obsah;
 - (iii) Zkompletované systémy musí být zabaleny do pevných vnějších obalů schopných odolat při zkoušce volným pádem z výšky 1,8 m bez úniku obsahu, pokud vnější pouzdro systému neposkytuje rovnocennou ochranu.

Pokyn pro balení P200 v 4.1.4.1 se nepoužije.

Přepravní doklad musí obsahovat tento zápis: „Přeprava podle zvláštního ustanovení 373.“

Detektory neutronového záření obsahující nejvýše 1 g fluoridu boritého, včetně těch, které mají těsnění z pájeného skla, nepodléhají ustanovením ADR, pokud splňují požadavky uvedené v odstavci (a) a jsou zabaleny podle odstavce (b). Systémy měření záření obsahující takové detektory nepodléhají ustanovením ADR, pokud jsou zabaleny podle odstavce (c).

374 (Vyhrazeno)

375 Tyto látky, pokud jsou přepravovány v samostatných nebo skupinových obalech obsahujících čisté množství na samostatný nebo vnitřní obal nejvýše 5 litrů pro kapaliny nebo mající čistou (netto) hmotnost na samostatný nebo vnitřní obal nejvýše 5 kg pro tuhé látky, nepodléhají žádným jiným ustanovením ADR, za podmínky, že obaly splňují všeobecná ustanovení uvedená v 4.1.1.1, 4.1.1.2 a 4.1.1.4 až 4.1.1.8.

376 Lithium-iontové články nebo baterie a lithiové kovové články nebo baterie, které jsou identifikovány jako poškozené nebo vadné tak, že neodpovídají typu odzkoušenému podle příslušných ustanovení Příručky zkoušek a kritérií, musí vyhovovat požadavkům tohoto zvláštního ustanovení.

Pro účely tohoto zvláštního ustanovení tyto články nebo baterie smějí zahrnovat, avšak nejsou omezeny jen na:

- články nebo baterie identifikované jako vadné z bezpečnostních důvodů;
- články nebo baterie, které vykazují známky úniku kapaliny nebo plynu;
- články nebo baterie, které nemohou být diagnostikovány před přepravou; nebo
- články nebo baterie, které utrpěly fyzické nebo mechanické poškození.

POZNÁMKA: Při posuzování, zda je baterie poškozená nebo vadná, je nutno vzít v úvahu druh baterie a její předchozí používání a popřípadě nevhodné používání.

Články a baterie musí být přepravovány podle ustanovení vztahujících se na UN čísla 3090, 3091, 3480 a 3481, kromě zvláštního ustanovení 230, a jak je jinak stanoveno v tomto zvláštním ustanovení.

Kusy musí být označeny nápisem „POŠKOZENÉ/VADNÉ LITHIUM-IONTOVÉ BATERIE“ nebo „POŠKOZENÉ/VADNÉ LITHIOVÉ KOVOVÉ BATERIE“, jak je to náležité.

Články a baterie musí být baleny podle pokynu pro balení P908 v 4.1.4.1 nebo LP904 v 4.1.4.3, jak je to náležité.

Články a baterie náchylné k rychlé demontáži, nebezpečné reakci, vzniku plamene nebo nebezpečnému vyvíjení tepla nebo nebezpečnému uvolňování toxických, žravých nebo hořlavých plynů nebo par za normálních podmínek přepravy nesmějí být přepravovány, vyjma za podmínek stanovených příslušným orgánem.

- 377 Lithium-iontové a lithiové kovové články a baterie a zařízení obsahující takové články a baterie přepravované k likvidaci nebo recyklaci, buď balené spolu s nelithiovými bateriemi, nebo bez nich, smějí být baleny podle pokynu pro balení P909 v 4.1.4.1.

Tyto články a baterie nepodléhají požadavkům uvedeným v 2.2.9.1.7 (a) až (e).

Kusy musí být označeny nápisem „LITHIOVÉ BATERIE K LIKVIDACI“ nebo „LITHIOVÉ BATERIE K RECYKLACI“.

Identifikované poškozené nebo vadné baterie musí být přepravovány podle zvláštního ustanovení 376 a baleny podle pokynu pro balení P908 v 4.1.4.1 nebo LP904 v 4.1.4.3, jak je to náležité.

- 378 - 499 (Vyhrazeno)

- 500 (Vypuštěno)

- 501 Naftalen, roztavený, viz UN číslo 2304.

- 502 UN 2006 plasty na bázi nitrocelulózy, schopné samoohřevu, j.n. a UN 2002 celuloid, odpad jsou látkami třídy 4.2.

- 503 Fosfor bílý, roztavený, viz UN číslo 2447.

- 504 UN 1847 sulfid draselný, hydratovaný, obsahující nejméně 30 % krystalové vody, UN 1849 sulfid sodný, hydratovaný, obsahující nejméně 30 % krystalové vody a UN 2949 hydrogensulfid sodný, obsahující nejméně 25 % krystalové vody jsou látkami třídy 8.

- 505 UN 2004 amid hořečnatý je látkou třídy 4.2.

- 506 Kovy alkalických zemin a slitiny kovů alkalických zemin v pyroforní formě jsou látkami třídy 4.2. UN 1869 hořčík nebo slitiny hořčíku s více než 50 % hořčíku, jako hrudky, třísky nebo pásy jsou látkami třídy 4.1.

- 507 UN 3048 pesticidy na bázi fosfidu hliníku s přísadami zamezujícími vyvíjení toxických hořlavých plynů jsou látkami třídy 6.1.

- 508 UN 1871 dihydrid titanu a UN 1437 hydrid zirkonia jsou látkami třídy 4.1. UN 2870 tetrahydridoboritan hlinitý je látkou třídy 4.2.

- 509 UN 1908 chloritan, roztok je látkou třídy 8.

- 510 UN 1755 kyselina chromová, roztok je látkou třídy 8.

- 511 UN 1625 dusičnan rtuťnatý, UN 1627 dusičnan rtuťný a UN 2727 dusičnan thallný jsou látkami třídy 6.1. Dusičnan thoričitý, tuhý, dusičnan uranylu hexahydrát-roztok a dusičnan uranylu, tuhý jsou látkami třídy 7.

- 512 UN 1730 chlorid antimoničný, kapalný, UN 1731 chlorid antimoničný, roztok, UN 1732 fluorid antimoničný a UN 1733 chlorid antimonitý jsou látkami třídy 8.

- 513 UN 0224 azid barnatý, suchý nebo vlhčený méně než 50 % hm. vody je látkou třídy 1. UN 1571 azid barnatý, vlhčený nejméně 50 % hm. vody je látkou třídy 4.1. UN 1854 slitiny barya, pyroforní, jsou látkami třídy 4.2. UN 1445 chlorečnan barnatý, tuhý, UN 1446 dusičnan barnatý, UN 1447 chloristan

- barnatý, tuhý, UN 1448 manganistan barnatý, UN 1449 peroxid barya, UN 2719 bromičnan barnatý, UN 2741 chlornan barnatý s více než 22 % aktivního chloru, UN 3405 chlorečnan barnatý, roztok a UN 3406 chloristan barnatý, roztok jsou látkami třídy 5.1. UN 1565 kyanid barnatý a UN 1884 oxid barnatý jsou látkami třídy 6.1.
- 514 UN 2464 dusičnan berylnatý je látkou třídy 5.1.
- 515 UN 1581 chlorpikrin a methylbromid, směs a UN 1582 chlorpikrin a methylchlorid, směs jsou látkami třídy 2.
- 516 UN 1912 methylchlorid a dichlormethan, směs je látkou třídy 2.
- 517 UN 1690 fluorid sodný, tuhý, UN 1812 fluorid draselný, tuhý UN 2505 fluorid amonný, UN 2674 hexafluorokřemičitan sodný a UN 2856 hexafluorokřemičitany, j.n., UN 3415 fluorid sodný, roztok a UN 3422 fluorid draselný, roztok jsou látkami třídy 6.1.
- 518 UN 1463 oxid chromový, bezvodý (kyselina chromová, tuhá) je látkou třídy 5.1.
- 519 UN 1048 bromovodík, bezvodý, je látkou třídy 2.
- 520 UN 1050 chlorovodík, bezvodý, je látkou třídy 2.
- 521 Tuhé chloritany a chlornany jsou látkami třídy 5.1.
- 522 UN 1873 kyselina chloristá, vodný roztok s více než 50 % hm., ale nejvýše 72 % hm. čisté kyseliny, je látkou třídy 5.1. Kyselina chloristá, vodný roztok s více než 72 % hm. čisté kyseliny, nebo směsi kyseliny chloristé s jinými kapalinami než vodou nejsou připuštěny k přepravě.
- 523 UN 1382 sulfid draselný, bezvodý a UN 1385 sulfid sodný, bezvodý, jakož i jejich hydráty s méně než 30 % krystalové vody, a UN 2318 hydrogensulfid sodný s méně než 25 % krystalové vody jsou látkami třídy 4.2.
- 524 UN 2858 hotové výrobky ze zirkonia s tloušťkou nejméně 18 µm jsou látkami třídy 4.1.
- 525 Roztoky anorganických kyanidů s celkovým obsahem iontů kyanidu vyšším než 30 % jsou přiřazeny k obalové skupině I, roztoky s celkovým obsahem iontů kyanidu vyšším než 3 %, nejvýše však 30 %, jsou přiřazeny k obalové skupině II a roztoky s celkovým obsahem iontů kyanidu vyšším než 0,3 %, nejvýše však 3 %, jsou přiřazeny k obalové skupině III.
- 526 UN 2000 celuloid je přiřazen ke třídě 4.1.
- 528 UN 1353 vlákna nebo tkaniny impregnované slabě nitrovanou celulózu, neschopné samoohřevu, jsou látkami třídy 4.1.
- 529 UN 0135 fulminát rtuťnatý, vlhčený nejméně 20 % hm. vody nebo směsí alkohol/ voda je látkou třídy 1. Chlorid rtuťný (kalomel) je látkou třídy 9 (UN číslo 3077).
- 530 UN 3293 hydrazin, vodný roztok s nejvýše 37 % hm. hydrazinu je látkou třídy 6.1.
- 531 Směsi s bodem vzplanutí pod 23° C, které obsahují více než 55 % nitrocelulózy s libovolným obsahem dusíku, nebo nejvýše 55 % nitrocelulózy s obsahem dusíku vyšším než 12,6 % (v suché hmotě) jsou látkami třídy 1 (viz UN číslo 0340 nebo 0342) nebo třídy 4.1.
- 532 UN 2672 amoniak (čpavek), roztok s více než 10 %, ale nejvýše 35 % amoniaku je látkou třídy 8.
- 533 UN 1198 formaldehyd, roztok, hořlavý je látkou třídy 3. Formaldehydové roztoky, nehořlavé, obsahující méně než 25 % formaldehydu nepodléhají předpisům ADR.
- 534 Ačkoliv benzin může mít za určitých klimatických podmínek tenzi par při 50 °C větší než 110 kPa (1,10 bar), nejvýše však 150 kPa (1,50 bar), musí zůstat zařazen jako látka, která má při 50 °C tenzi par nejvýše 110 kPa (1,10 bar).

- 535 UN 1469 dusičnan olovnatý, UN 1470 chloristan olovnatý, tuhý a UN 3408 chloristan olovnatý, roztok jsou látkami třídy 5.1.
- 536 Naftalen, tuhý, viz UN číslo 1334.
- 537 UN 2869 chlorid titanitý, směs, nesamozápalná je látkou třídy 8.
- 538 Síra (v tuhém stavu), viz UN číslo 1350.
- 539 Roztoky isokyanátů s bodem vzplanutí 23 °C nebo vyšším jsou látkami třídy 6.1.
- 540 UN 1326 hafnium, prášek, vlhčený nejméně 25 % vody, UN 1352 titan, prášek, vlhčený nejméně 25 % vody, nebo UN 1358 zirkonium, prášek, vlhčený, nejméně 25 % vody, jsou látkami třídy 4.1.
- 541 Směsi nitrocelulózy, jejichž obsah vody, alkoholu nebo plastifikačních činidel je nižší než předepsané mezní hodnoty, jsou látkami třídy 1.
- 542 Talek (mastek) s tremolitem a/nebo aktinolitem je látkou spadající pod tuto položku.
- 543 UN 1005 amoniak (čpavek), bezvodý, UN 3318 amoniak (čpavek), roztok s více než 50 % amoniaku a UN 2073 amoniak (čpavek), roztok s více než 35 %, avšak nejvýše 50 % amoniaku, jsou látky třídy 2. Roztoky amoniaku (čpavku) s nejvýše 10 % amoniaku nepodléhají předpisům ADR.
- 544 UN 1032 dimethylamin, bezvodý, UN 1036 ethylamin, UN 1061 methylamin, bezvodý a UN 1083 trimethylamin, bezvodý, jsou látkami třídy 2.
- 545 UN 0401 sulfid dipikrylu (sírník dipikrylu) suchý nebo vlhčený méně než 10 % hm. vody je látkou třídy 1.
- 546 UN 2009 zirkonium, suché, hotové plechy, pásy nebo stočený drát, o tloušťce menší než 18 µm, je látkou třídy 4.2. Zirkonium, suché, hotové plechy, pásy nebo stočený drát, o tloušťce nejméně 254 µm, nepodléhá předpisům ADR.
- 547 UN 2210 maneb nebo UN 2210 maneb, přípravky, ve formě schopné samoohřevu jsou látkami třídy 4.2.
- 548 Chlorsilany, které ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3.
- 549 Chlorsilany s bodem vzplanutí pod 23⁰ C, které ve styku s vodou nevyvíjejí žádné hořlavé plyny, jsou látkami třídy 3. Chlorsilany s bodem vzplanutí 23⁰ C nebo vyšším, které ve styku s vodou nevyvíjejí žádné hořlavé plyny, jsou látkami třídy 8.
- 550 UN 1323 cer, desky, pruty nebo tyče, je látkou třídy 4.1.
- 551 Roztoky těchto isokyanátů s bodem vzplanutí pod 23 °C jsou látkami třídy 3.
- 552 Kovy a slitiny kovů v práškové nebo jiné hořlavé formě, které jsou samozápalné, jsou látkami třídy 4.2. Kovy a slitiny v práškové nebo jiné hořlavé formě, které ve styku s vodou vyvíjejí hořlavé plyny, jsou látkou třídy 4.3.
- 553 Tyto směsi peroxidu vodíku a kyseliny peroctové nesmějí při laboratorních zkouškách (viz Příručku zkoušek a kritérií, část II, oddíl 20) vybuchnout v kavitovaném stavu, ani deflagrovat a nesmějí rovněž reagovat na zahřívání v uzavřeném prostoru, ani mít žádnou výbušnou sílu. Tento přípravek musí být tepelně stabilní (teplota samourychlujícího se rozkladu 60⁰ C nebo vyšší pro kus o hmotnosti 50 kg) a musí obsahovat jako prostředek k znečistlivění kapalinu, která se snáší s kyselinou peroctovou. Přípravky, které neodpovídají těmto kritériím, se považují za látky třídy 5.2 [viz Příručku zkoušek a kritérií, část II, odstavec 20.4.3 g)].
- 554 Hydridy kovů, které ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3 UN 2870 tetrahydridoboritan hlinitý nebo UN 2870 tetrahydridoboritan hlinitý v přístrojích je látkou třídy 4.2.

- 555 Prach a prášek kovů, netoxické, v nesamozápalné formě, které však ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3.
- 556 Organokovové sloučeniny a jejich roztoky, které jsou samozápalné, jsou látkami třídy 4.2. Hořlavé roztoky obsahující organokovové sloučeniny v takových koncentracích, že ve styku s vodou nevyvíjejí hořlavé plyny v nebezpečných množstvích, ani nejsou samozápalné, jsou látkami třídy 3.
- 557 Prach a prášek kovů v pyroforní formě jsou látkami třídy 4.2.
- 558 Kovy a slitiny kovů v pyroforní formě jsou látkami třídy 4.2. Kovy a slitiny kovů, které ve styku s vodou nevyvíjejí žádné hořlavé plyny, nejsou pyroforní ani schopné samoohřevu, ale snadno se zapálí, jsou látkami třídy 4.1.
- 559 (Vypuštěno)
- 560 Látka zahřátá, kapalná, j.n. přepravovaná při teplotě nejméně 1000 C (včetně roztavených kovů a roztavených solí), a, u látek s bodem vzplanutí, při teplotě pod jejich bodem vzplanutí, je látkou třídy 9 (UN čísla 3257).
- 561 Chlorformiáty s převažujícími žíravými vlastnostmi jsou látkami třídy 8.
- 562 Samozápalné organokovové sloučeniny jsou látkami třídy 4.2. Organokovové sloučeniny, hořlavé, reagující s vodou jsou látkami třídy 4.3.
- 563 UN 1905 kyselina selenová je látkou třídy 8.
- 564 UN 2443 trichlorid vanadydu, UN 2444 chlorid vanadičitý a UN 2475 chlorid vanaditý jsou látkami třídy 8.
- 565 K této položce jsou přiřazeny nespecifikované odpady, které pocházejí z lékařských/veterinárních ošetření lidí/zvířat nebo z biologického výzkumu, u kterých je malá pravděpodobnost, že obsahují látky třídy 6.2. Dekontaminované klinické odpady nebo odpady pocházející z biologického výzkumu, které dříve obsahovaly infekční látky, nepodléhají předpisům třídy 6.2.
- 566 UN 2030 hydrazin, vodný roztok s více než 37 % hm. hydrazinu je látkou třídy 8.
- 567 (Vypuštěno)
- 568 Azid barnatý s obsahem vody pod předepsanou mezní hodnotou je látkou třídy 1, UN čísla 0224.
- 569 - 579 (Vyhrazeno)
- 580 (Vypuštěno)
- 581 Tato položka zahrnuje směsi methylacetylenu a propadienu s uhlovodíky, které jako:
- Směs P1 obsahují nejvýše 63 % obj. methylacetylenu a propadienu a nejvýše 24 % obj. propanu a propyleny, přičemž procentní podíl nasycených uhlovodíků C4 činí nejméně 14 % obj.;
- Směs P2 obsahují nejvýše 48 % obj. methylacetylenu a propadienu a nejvýše 50 % obj. propanu a propyleny, přičemž procentní podíl nasycených uhlovodíků C4 činí nejméně 5 % obj.;
- jakož i směsi propadienu s 1 až 4% methylacetyleny.
- Ke splnění požadavků týkajících se údajů v přepravním dokladu (pododdíl 5.4.1.1) smí být popřípadě použito jako technického názvu pojmenování "Směs P1" nebo "Směs P2".

582 Tato položka zahrnuje mimo jiné směsi plynů označené písmenem R...., s následujícími vlastnostmi:

Směs	Maximální tenze par při 70 °C (MPa)	Minimální hustota při 50 °C (kg/l)	Dovolený technický název pro účely 5.4.1.1
F1	1,3	1,30	„Směs F1“
F2	1,9	1,21	„Směs F2“
F3	3,0	1,09	„Směs F3“

POZNÁMKA 1: Trichlorfluormethan (chladicí plyn R11), 1,1,2-trichlor-1,2,2-trifluorethan (chladicí plyn R113), 1,1,1-trichlor-2,2,2-trifluorethan (chladicí plyn R113a), 1-chlor-1,2,2-trifluorethan (chladicí plyn R133) a 1-chlor-1,1,2-trifluorethan (chladicí plyn R133b) nejsou látkami třídy 2. Mohou však být součástí směsí F1 až F3.

POZNÁMKA 2: Referenční hustoty odpovídají hustotám dichlorfluormethanu (1,30 kg/l), dichlordifluormethanu (1,21 kg/l) a chlordifluormethanu (1,09 kg/l).

583 Tato položka zahrnuje mimo jiné směsi plynů s následujícími vlastnostmi:

Směs	Maximální tenze par při 70 °C (MPa)	Minimální hustota při 50 °C (kg/l)	Dovolený technický název^a pro účely 5.4.1.1
A	1,1	0,525	„Směs A“ nebo „Butan“
A01	1,6	0,516	„Směs A01“ nebo „Butan“
A02	1,6	0,505	„Směs A02“ nebo „Butan“
A0	1,6	0,495	„Směs A0“ nebo „Butan“
A1	2,1	0,485	„Směs A1“
B1	2,6	0,474	„Směs B1“
B2	2,6	0,463	„Směs B2“
B	2,6	0,450	„Směs B“
C	3,1	0,440	„Směs C“ nebo „Propan“

^a Pro přepravu v cisternách smí být obchodní názvy „Butan“ nebo „Propan“ používány jen jako doplněk.

584 Tento plyn nepodléhá předpisům ADR, jestliže:

- je v plynném stavu,
- obsahuje nejvýše 0,5 % vzduchu v plynném stavu;
- je obsažen v kovových kapslích (sodors, sparklets), které jsou bez vad snižujících jejich pevnost;
- je zaručena těsnost uzávěrů kapslí;
- jedna kapsle obsahuje nejvýše 25 g tohoto plynu;
- jedna kapsle obsahuje nejvýše 0,75 g tohoto plynu na cm³ vnitřního objemu.

585 (Vypuštěno)

586 Prášky hafnia, titanu a zirkonia musí obsahovat viditelný přebytek vody. Prášky hafnia, titanu a zirkonia, navlhčené, mechanicky vyrobené, s velikostí částic nejmeně 53 μm, nebo chemicky vyrobené, s velikostí částic nejmeně 840 μm, nepodléhají předpisům ADR.

587 Baryumstearát a titaničitán barnatý nepodléhají předpisům ADR.

588 Bromid hlinitý a chlorid hlinitý v tuhé hydratované formě nepodléhají předpisům ADR.

589 (Vypuštěno)

- 590 Chlorid železitý, hexahydrát nepodléhá předpisům ADR.
- 591 Siran olovnatý s nejvýše 3 % volné kyseliny nepodléhá předpisům ADR.
- 592 Prázdné obaly, včetně prázdných IBC a prázdných velkých obalů, prázdná cisternová vozidla, prázdné snímatelné cisterny, prázdné přemístitelné cisterny, prázdné cisternové kontejnery a prázdné malé kontejnery, nevyčištěné, které obsahovaly tuto látku, nepodléhají předpisům ADR.
- 593 Tento plyn, který je určen ke chlazení např. lékařských nebo biologických vzorků, nepodléhá předpisům ADR, je-li obsažen v dvoustěnných nádobách, které odpovídají ustanovením pododdílu 4.1.4.1, pokynu pro balení P203, odstavci (6) pro otevřené kryogenní nádoby, pokud není stanoveno jinak v 5.5.3.
- 594 Následující předměty, vyrobené a naplněné podle předpisů platných v zemi výroby, nepodléhají ustanovením ADR:
- (a) UN 1044 hasicí přístroje vybavené ochranou proti nechtěnému uvedení do činnosti:
- jsou-li zabaleny v pevném vnějším obalu; nebo
 - jde-li o velké hasicí přístroje, které splňují požadavky zvláštního ustanovení pro balení PP91 pokynu pro balení P003 v 4.1.4.1;
- (b) UN 3164 předměty pod pneumatickým nebo hydraulickým tlakem, které jsou konstruovány tak, aby vydržely větší namáhání než je vnitřní tlak plynu na základě přenosu síly, strukturní pevnosti nebo konstrukce, když jsou zabaleny v pevném vnějším obalu.
- POZNÁMKA:** „Předpisy platné v zemi výroby“ znamená předpisy platné v zemi výroby nebo předpisy platné v zemi používání.
- 596 Kadmiová barviva, jako sulfidy kadmia, sulfoselenidy kadmia a kadmiové soli vyšších mastných kyselin (např. kadmiumstearát) nepodléhají předpisům ADR.
- 597 Kyselina octová, roztoky s nejvýše 10 % hm. čisté kyseliny nepodléhají předpisům ADR.
- 598 Následující předměty nepodléhají předpisům ADR:
- (a) Nové akumulátory, jestliže:
- jsou zajištěny proti posunu, pádu a poškození;
 - jsou opatřeny zařízením na přenášení, ledaže by byly stohovány, např. na paletách;
 - nevykazují na vnější straně nebezpečné stopy louhů nebo kyselin;
 - jsou chráněny proti zkratům.
- (b) Použité akumulátory, jestliže:
- jejich skříň nevykazují žádné poškození;
 - jsou zajištěny proti netěsnosti, posunu, pádu a poškození, např. stohováním na paletách;
 - nevykazují na vnější straně nebezpečné stopy louhů nebo kyselin;
 - jsou chráněny proti zkratům.
- “Použité akumulátory” jsou takové, které jsou přepravovány za účelem recyklace po normálním používání.
- 599 (Vypuštěno)

- 600 Oxid vanadičný, roztavený a ztuhlý, nepodléhá předpisům ADR.
- 601 Farmaceutické výrobky (léky) připravené k použití, které jsou látkami vyrobenými a zabalenými pro maloobchodní prodej nebo pro distribuci pro osobní potřebu nebo pro domácnost, nepodléhají předpisům ADR.
- 602 Sírníky fosforu obsahující žlutý nebo bílý fosfor nejsou připuštěny k přepravě.
- 603 Kyanovodík, bezvodý, který neodpovídá popisu pro UN číslo 1051 nebo UN číslo 1614, není připuštěn k přepravě. Kyanovodík (kyselina kyanovodíková) s méně než 3 % vody je stabilní, jestliže jeho hodnota pH činí $2,5 \pm 0,5$ a kapalina je čirá a bezbarvá.
- 604 (Vypuštěno)
- 605 (Vypuštěno)
- 606 (Vypuštěno)
- 607 Směsi dusičnanu draselného a dusitanu sodného se solí amonnou nejsou připuštěny k přepravě.
- 608 (Vypuštěno)
- 609 Tetranitromethan, který obsahuje hořlavé nečistoty, není připuštěn k přepravě.
- 610 Tato látka není připuštěna k přepravě, jestliže obsahuje více než 45 % kyanovodíku.
- 611 Dusičnan amonný s více než 0,2 % hořlavých látek (včetně organických látek jako ekvivalentů uhlíku) není připuštěn k přepravě, ledaže je součástí látek nebo předmětů třídy 1.
- 612 (Vyhrazeno)
- 613 Roztok kyseliny chlorečné s více než 10 % kyseliny chlorečné a směsi kyseliny chlorečné s jakoukoli kapalinou kromě vody nejsou k přepravě připuštěny.
- 614 2,3,7,8 - tetrachlordibenzo-p-dioxin (TCDD) v koncentracích považovaných podle kritérií pododdílu 2.2.61.1 za velmi toxické není připuštěn k přepravě.
- 615 (Vyhrazeno)
- 616 Látky obsahující více než 40 % kapalných esterů kyseliny dusičné musí vyhovět při zkoušce na výpotek, uvedené v oddílu 2.3.1.
- 617 Dodatečně k typu trhaviny je nutno uvést na kuse obchodní název dotyčné trhaviny.
- 618 V nádobách s 1,2 butadienem nesmí obsah kyslíku v plynné fázi překročit 50 ml/m³.
- 619 - 622 (Vyhrazeno)
- 623 UN 1829 oxid sírový musí být stabilizován přidáním inhibitorů. Oxid sírový, čistoty nejméně 99,95 %, smí být přepravován bez inhibitoru v cisternách, za podmínky, že jeho teplota je udržována na nejméně 32,5 °C. Při přepravě této látky v cisterně při teplotě nejméně 32,5 °C musí být v přepravním dokladu zápis "Přeprava při nejnižší teplotě produktu 32,5 °C".
- 625 Kusy obsahující tyto předměty musí být zřetelně označeny nápisem "UN 1950 AEROSOLY".
- 626 - 627 (Vyhrazeno)
- 632 Tato látka se považuje za samozápalnou (pyroforní).
- 633 Kusy a malé kontejnery s touto látkou musí být opatřeny následujícím nápisem: "Udržovat vzdálenost od zápalných zdrojů". Tento nápis musí být uveden v úředním jazyce země odeslání a kromě toho, jestliže tento jazyk není anglický, francouzský ani německý, také v anglickém,

francouzském nebo německém jazyce, pokud případné dohody uzavřené mezi státy dotčenými přepravou nestanoví něco jiného.

634 (Vypuštěno)

635 Kusy obsahující tyto předměty musí být opatřeny bezpečnostní značkou podle vzoru č. 9 pouze tehdy, jestliže jsou předměty plně uzavřeny v obalu, v latěni nebo jiných prostředcích, které brání rychlé identifikaci těchto předmětů.

636 (a) Články obsažené v zařízeních nesmí být možno během přepravy vybit tak, aby napětí v otevřeném obvodu kleslo pod 2 volty nebo pod dvě třetiny napětí nevybitého článku, podle toho, která hodnota je nižší.

(b) Až do mezilehlého zpracovatelského objektu lithiové články a baterie o celkové (brutto) hmotnosti nejvýše 500 g na každý článek nebo baterii nebo lithium-iontové články s wattodinovou zatížitelností nejvýše 20 Wh, lithium-iontové baterie s wattodinovou zatížitelností nejvýše 100 Wh, lithiové kovové články s obsahem lithia nejvýše 1 g a lithiové kovové baterie s celkovým obsahem lithia nejvýše 2 g, ať obsažené v zařízení nebo ne, shromážděné a podávané k přepravě za účelem jejich likvidace nebo recyklace, společně s jinými nelithiovými články nebo bateriemi, nebo bez nich, nepodléhají žádným jiným ustanovením ADR, včetně zvláštního ustanovení 376 a odstavce 2.2.9.1.7, pokud splňují následující podmínky:

(i) Jsou dodržena ustanovení pokynu pro balení P909 v 4.1.4.1, vyjma dodatečných požadavků 1 a 2;

(ii) Je zaveden systém zajištění kvality, aby bylo zajištěno, že celkové množství lithiových článků nebo baterií na dopravní jednotku nepřekročí 333 kg;

POZNÁMKA: Celkové množství lithiových článků a baterií ve smíšeném nákladu může být stanoveno pomocí statistické metody zahrnuté do systému zajištění kvality. Kopie záznamů ze zajištění kvality musí být na požádání poskytnuta příslušnému orgánu.

(iii) Kusy jsou označeny nápisem „LITHIOVÉ BATERIE K LIKVIDACI“ nebo „LITHIOVÉ BATERIE K RECYKLACI“, jak je to náležité.

637 Geneticky změněné mikroorganismy a geneticky změněné organismy jsou takové, které nejsou nebezpečné pro člověka ani zvířata, které by však mohly zvířata, rostliny, mikrobiologické látky a ekosystémy změnit takovým způsobem, který se nemůže v přírodě vyskytovat. Geneticky změněné mikroorganismy a geneticky změněné organismy nepodléhají ustanovením ADR, jsou-li schváleny k používání příslušnými orgány země původu, tranzitu a určení.³

Živých obratlovců ani bezobratlých živočichů nesmí být použito k tomu, aby přepravovali látky přiřazené pod toto UN číslo, ledaže by tyto látky nemohly být přepraveny jiným způsobem.

Pro přepravu snadno zkazitelných látek pod tímto UN číslem je nutno udat patřičné informace, např. „Chladit na + 2 °C/+4 °C“ nebo „Přeppravovat ve zmrzlém stavu“ nebo „Nenechat zmrznout“.

638 Tyto látky jsou příbuzné samovolně se rozkládajícím látkám (viz odstavec 2.2.41.1.19)

639 Viz pododdíl 2.2.2.3, klasifikační kód 2 F, UN 1965, poznámka 2.

640 Fyzikální a technické vlastnosti uvedené ve sloupci (2) tabulky A kapitoly 3.2 určují různé kódy cisteren pro přepravu látek těžce obalové skupiny v cisternách ADR.

³ Viz zejména díl C směrnice Evropského parlamentu a Rady 2001/18/ES o záměrném uvolňování geneticky modifikovaných organismů do životního prostředí a o zrušení směrnice Rady 90/220/EHS (Úřední věstník Evropských společenství č. L 106 ze 17. dubna 2001, str. 8 - 14), v němž je stanoven schvalovací postup pro Evropská společenství.

K identifikaci těchto fyzikálních a technických vlastností látky přepravované v cisterně je nutno údaje vyžadované v přepravním dokladu doplnit pouze v případě přepravy v cisternách ADR takto:

„Zvláštní ustanovení 640X“, kde „X“ je příslušné velké písmeno, které je uvedeno za odkazem na zvláštní ustanovení 640 ve sloupci (6) tabulky A kapitoly 3.2.

Od těchto doplňkových údajů je však možno upustit v případě přepravy v typu cisterny, který pro látky určité obalové skupiny určitého UN čísla splňuje alespoň nejpřísnější požadavky.

642 Pokud se to v rámci pododdílu 1.1.4.2 nepřipouští, nesmí se tato položka Vzorových předpisů OSN použít pro přepravu roztoku hnojiv s volným amoniakem (čpavkem).

643 Litý asfalt nepodléhá předpisům platným pro třídu 9.

644 Přeprava této látky je povolena za podmínky, že:

- hodnota pH naměřená v 10 % vodném roztoku přepravované látky je mezi 5 a 7;
- roztok neobsahuje hořlavé látky v množství větším než 0,2 % nebo sloučeniny chloru v takovém množství, že obsah chloru překročí 0,02 %.

645 Klasifikační kód uvedený ve sloupci (3b) tabulky A kapitoly 3.2 se smí použít jen se souhlasem příslušného orgánu smluvní strany ADR uděleným před přepravou. Schválení musí být vydáno písemně jako osvědčení o schválení klasifikace (viz 5.4.1.2.1 (g)) a musí obdržet jediné jednací číslo. Je-li přiřazení k podtřídě provedeno podle postupu uvedeného v 2.2.1.1.7.2, může příslušný orgán požadovat, aby byla nedostatečná klasifikace ověřena na základě údajů získaných ze zkoušek série 6 Příručky zkoušek a kritérií, části I, oddílu 16.

646 Uhlí vyrobené parním aktivačním procesem nepodléhá předpisům ADR.

647 Přeprava octa a kyseliny octové potravinářské kvality s nejvýše 25 % hm. čisté kyseliny podléhá pouze těmto požadavkům:

- (a) Obaly, včetně IBC a velkých obalů, a cisterny musí být vyrobeny z nerezové oceli nebo z plastu, který je trvale odolný proti žíravosti octa/kyseliny octové potravinářské kvality.
- (b) Obaly, včetně IBC a velkých obalů, a cisterny musí jejich vlastník podrobit nejméně jednou ročně vizuální inspekci. Výsledky inspekce musí být zaznamenány a záznamy uchovávány nejméně jeden rok. Poškozené obaly, včetně IBC a velkých obalů, a cisterny nesmějí být naplněny.
- (c) Obaly, včetně IBC a velkých obalů, a cisterny musí být plněny tak, aby produkt nepřetekl a neulpěl na vnějším povrchu.
- (d) Těsnění a uzávěry musí být odolné proti octu/kyselině octové potravinářské kvality. Obaly, včetně IBC a velkých obalů, a cisterny musí být hermeticky utěsněny baličem nebo plničem tak, aby za normálních podmínek přepravy nedošlo k úniku.
- (e) Smějí se používat skupinové obaly s vnitřními obaly ze skla nebo plastu (viz pokyn pro balení P001 v 4.1.4.1), které splňují všeobecná ustanovení pro balení v pododdílech 4.1.1.1, 4.1.1.2, 4.1.1.4, 4.1.1.5, 4.1.1.6, 4.1.1.7 a 4.1.1.8.

Ostatní ustanovení ADR se nepoužijí.

648 Předměty napuštěné tímto pesticidem, jako jsou lepenkové podložky, papírové proužky, kuličky vaty, plastové fólie, v hermeticky uzavřených obalech nepodléhají ustanovením ADR.

649 (Vypuštěno)

650 Odpady sestávající ze zbytků obalů, ztuhlých a kapalných zbytků barev mohou být přepravovány za podmínek obalové skupiny II. Kromě ustanovení UN čísla 1263, obalové skupiny II mohou být odpady baleny a přepravovány také za těchto podmínek:

- (a) Odpady mohou být baleny podle pokynu pro balení P002 pododdílu 4.1.4.1 nebo pokynu pro balení IBC06 pododdílu 4.1.4.2;
- (b) Odpady mohou být baleny do flexibilních IBC typů 13H3, 13H4 a 13H5 v přepravních obalových souborech s plnými stěnami;
- (c) Zkoušení obalů a IBC uvedených pod písmeny (a) nebo (b) se může provádět podle ustanovení kapitol 6.1, popřípadě 6.5, pro tuhé látky na úrovni parametrů obalové skupiny II;

Zkoušky musí být provedeny na obalech a IBC naplněných reprezentativním vzorkem odpadů, jak jsou připraveny k přepravě;
- (d) Přeprava ve volně loženém stavu je povolena ve vozidlech s plachtou, uzavřených kontejnerech nebo velkých kontejnerech s plachtou, vesměs plnostěnných. Nástavba vozidla nebo těleso kontejneru musí být těsné nebo musí být utěsněny, např. pomocí vhodného a dostatečně pevného vnitřního vyložení;
- (e) Jsou-li odpady přepravovány za podmínek tohoto zvláštního ustanovení, musí být podle odstavce 5.4.1.1.3 deklarovány v přepravním dokladu takto:

„UN 1263 ODPAD BARVA, 3, II, (D/E)“, nebo

„UN 1263 ODPAD BARVA, 3, OS II, (D/E)“.

651 Zvláštní ustanovení V2 (1) neplatí, jestliže čistá hmotnost výbušné látky na dopravní jednotku nepřekračuje 4000 kg, za podmínky, že čistá hmotnost výbušné látky na vozidlo nepřekročí 3000 kg.

652 Nádoby z austenitické nerezové oceli, ferritické a austenitické oceli (ocel Duplex) nebo svařovaného titanu, které nesplňují požadavky kapitoly 6.2, ale byly vyrobeny a schváleny podle vnitrostátních leteckých předpisů pro použití jako palivové nádrže pro horkovzdušný balon nebo horkovzdušnou vzducholod', uvedené do provozu (datum první inspekce) před 1. červencem 2004, mohou být přepravovány po silnici, pokud splňují tyto podmínky:

- (a) Všeobecná ustanovení v 6.2.1 musí být dodržena;
- (b) Konstrukce a výroba nádob musí být schváleny pro použití v letectví národním úřadem pro leteckou dopravu;
- (c) Odchylkou od 6.2.3.1.2 musí být výpočtový tlak odvozen od redukované nejvyšší okolní teploty +40 °C; v tomto případě:
 - (i) odchylkou od 6.2.5.1 mohou být láhve vyrobeny z válcovaného a temperovaného čistého titanu obchodní kvality splňujícího minimální požadavky $R_m > 450 \text{ MPa}$,
 $\epsilon_A > 20 \%$ (ϵ_A = prodloužení po přetržení);
 - (ii) láhve z austenitické nerezové oceli a ferritické a austenitické oceli (ocel Duplex) mohou být používány do úrovně napětí dosahující až 85 % minimální zaručené meze pružnosti (R_e) při výpočtovém tlaku odvozeném od redukované nejvyšší okolní teploty +40 °C;
 - (iii) nádoby musí být vybaveny zařízením pro vyrovnávání tlaku s nastaveným jmenovitým tlakem 26 barů; zkušební tlak těchto nádob musí být nejméně 30 barů;
- (d) Pokud se nepoužijí odchylky uvedené pod písmenem (c), musí být nádoby konstruovány pro základní teplotu 65 °C a musí být vybaveny zařízením pro vyrovnávání tlaku s nastaveným jmenovitým tlakem stanoveným příslušným orgánem země používání;
- (e) Hlavní těleso nádob musí být pokryto vnější vodovzdornou ochrannou vrstvou o tloušťce nejméně 25 mm, vyrobenou z konstrukční buněčné pěny nebo podobného materiálu;
- (f) Během přepravy musí být láhev dobře upevněna v koši nebo dodatečném zajišťovacím prostředku;
- (g) Nádoby musí být označeny jasně viditelnou značkou informující, že jsou určeny jen pro použití v horkovzdušných balonech nebo horkovzdušných vzducholodích;

(h) Doba používání (od data první inspekce) nesmí překročit 25 let.

653 Přeprava tohoto plynu v lahvích majících součin zkušebního tlaku a vnitřního objemu nejvýše 15,2 MPa.litr (152 bar.litr) nepodléhá ostatním ustanovením ADR, jsou-li splněny tyto podmínky:

- Ustanovení pro výrobu a zkoušení lahví jsou dodržena;
- Láhve jsou zabaleny do vnějších obalů, které splňují alespoň požadavky části 4 pro skupinové obaly. Všeobecná ustanovení pro balení v 4.1.1.1, 4.1.1.2 a 4.1.1.5 až 4.1.1.7 musí být dodržena;
- Láhve nejsou baleny společně s jinými nebezpečnými věcmi;
- Celková (brutto) hmotnost kusu nepřekračuje 30 kg; a
- Každý kus je zřetelně a trvanlivě označen nápisem „UN 1006“ pro argon, stlačený, „UN 1013“ pro oxid uhličitý, „UN 1046“ pro helium, stlačené nebo „UN 1066“ pro dusík, stlačený. Toto označení musí být umístěno ve čtverci postaveném na vrchol, který je ohraničen čarou o rozměrech nejméně 100 x 100 mm.

654 Odpadové zapalovače shromažďované jednotlivě a zasílané podle 5.4.1.1.3 smějí být přepravovány pod touto položkou za účelem likvidace. Nemusí být chráněny proti neúmyslnému vyprázdnění za podmínky, že jsou učiněna opatření, aby se zamezilo nebezpečnému nárůstu tlaku a nebezpečné atmosféře.

Odpadové zapalovače, s výjimkou těch, které jsou netěsné nebo silně deformované, musí být baleny podle pokynu pro balení P003. Kromě toho platí následující ustanovení:

- musí se používat jen tuhé obaly o maximálním vnitřním objemu 60 litrů;
- obaly musí být naplněny vodou nebo jakýmkoli jiným vhodným ochranným materiálem, aby se předešlo zapálení;
- za normálních podmínek přepravy musí být všechna zažehovací zařízení zapalovačů plně pokryta ochranným materiálem;
- obaly musí být dostatečně odvětrávány, aby se předešlo vytvoření hořlavé atmosféry a nárůstu tlaku;
- kusy musí být přepravovány jen v odvětrávaných nebo nekrytých vozidlech nebo kontejnerech.

Netěsné nebo silně deformované zapalovače musí být přepravovány v záchranných obalech za podmínky, že jsou učiněna vhodná opatření k tomu, aby nedošlo k nebezpečnému nárůstu tlaku.

POZNÁMKA: Na odpadové zapalovače se nevztahuje zvláštní ustanovení 201 ani zvláštní ustanovení pro balení PP84 a RR5 pokynu pro balení P002 v 4.1.4.1.

655 Láhve a jejich uzávěry zkonstruované, vyrobené, schválené a označené podle směrnice 97/23/ES⁴ a používané pro dýchací přístroje smějí být přepravovány, aniž by odpovídaly kapitole 6.2, za podmínky, že jsou podrobovány inspekčním a zkouškám uvedeným v 6.2.1.6.1 a interval mezi zkouškami uvedený v pokynu pro balení P200 v pododdílu 4.1.4.1 není překročen. Tlak používaný při hydraulické tlakové zkoušce je tlak vyznačený na lahvi podle směrnice 97/23/ES⁴.

656 (Vypuštěno)

⁴ Směrnice 97/23/ES Evropského parlamentu a Rady z 29. května 1997 o sbližování právních a správních předpisů členských států týkající se tlakových zařízení (PED) (Úřední věstník Evropských společenství č. L 181 z 9. července 1997, str. 1-55).

- 657 Tato položka se použije jen pro technicky čistou látku; ke směsím komponent LPG viz UN číslo 1965 nebo viz UN číslo 1075 ve spojení s POZNÁMKOU 2 v 2.2.2.3.
- 658 UN 1057 ZAPALOVAČE vyhovující normě EN ISO 9994:2006 + A1:2008 „Zapalovače – Bezpečnostní specifikace“ a UN 1057 NÁDOBKY S NÁPLNÍ DO ZAPALOVAČŮ smějí být přepravovány jen za dodržení ustanovení uvedených v 3.4.1 (a) až (h), 3.4.2 (s výjimkou celkové (brutto) hmotnosti 30 kg), 3.4.3 (s výjimkou celkové (brutto) hmotnosti 20 kg), 3.4.11 a 3.4.12, pokud jsou dodrženy následující podmínky:
- (a) Celková (brutto) hmotnost každého kusu je nejvýše 10 kg;
 - (b) Ve vozidle je přepravováno nejvýše 100 kg celkové (brutto) hmotnosti takových kusů; a
 - (c) Každý vnější obal je zřetelně a trvanlivě označen nápisem „UN 1057 ZAPALOVAČE“ nebo „UN 1057 NÁDOBKY S NÁPLNÍ DO ZAPALOVAČŮ“, jak je to náležité.
- 659 Látky, pro které je ve sloupci (9a) a sloupci (11) tabulky A v kapitole 3.2 uveden kód PP86 nebo TP7, a vyžadují tedy, aby byl z výparného prostoru odstraněn vzduch, nesmějí být přepravovány pod tímto UN číslem, nýbrž musí být přepravovány pod svými příslušnými UN čísly, jak jsou uvedena v tabulce A kapitoly 3.2.
- POZNÁMKA:** Viz též 2.2.2.1.7.
- 660 Pro přepravu plynových palivových soustav zkonstruovaných pro zabudování do motorových vozidel, které obsahují tento plyn, nemusí být použita ustanovení pododdílu 4.1.4.1, kapitoly 5.2, kapitoly 5.4 a kapitoly 6.2 ADR, pokud jsou dodrženy následující podmínky:
- (a) Plynové palivové soustavy musí splňovat požadavky Nařízení EHS č. 67, revize 2⁵, Nařízení EHS č. 110, revize 1⁶ nebo Nařízení EHS č. 115⁷ nebo Nařízení (ES) č. 79/2009⁸ ve spojení s Nařízením (EU) č. 406/2010⁹, jak je to náležité.
 - (b) Plynové palivové soustavy musí být těsné a nesmějí vykazovat žádné známky vnějšího poškození, které by mohlo ovlivnit jejich bezpečnost.
- POZNÁMKA 1:** Kritéria je možno nalézt v normě ISO 11623:2002 *Přepřítelné plynové láhve – Periodické inspekce a zkoušení kompozitních plynových lahví (nebo ISO DIS 19078 Plynové láhve – Inspekce instalace lahví a rekvalifikace vysokotlakých lahví pro skladování zemního plynu, používaného jako palivo pro samojízdná vozidla, v těchto vozidlech).*

⁵ Nařízení EHS č. 67 (Jednotná ustanovení týkající se: I. schvalování zvláštní výbavy motorových vozidel používajících zkapalněné ropné plyny ve svém pohonném systému; II. schvalování vozidel opatřených zvláštní výbavou pro používání zkapalněných ropných plynů v jejich pohonném systému s ohledem na instalaci takové výbavy).

⁶ Nařízení EHS č. 110 (Jednotná ustanovení týkající se schvalování: I. zvláštních komponentů motorových vozidel používajících stlačený zemní plyn (CNG) a/nebo zkapalněný zemní plyn (LNG) ve svém pohonném systému; II. vozidel s ohledem na instalaci zvláštních komponentů schváleného typu pro používání stlačeného zemního plynu (CNG) a/nebo zkapalněného zemního plynu (LNG) v jejich pohonném systému.)

⁷ Nařízení EHS č. 115 (Jednotná ustanovení týkající se schvalování: I. zvláštních upravených systémů pro LPG (zkapalněné ropné plyny) k instalaci do motorových vozidel pro použití LPG v jejich pohonném systému; II. zvláštních upravených systémů pro CNG (stlačený zemní plyn) k instalaci do motorových vozidel pro použití CNG v jejich pohonném systému).

⁸ Nařízení (ES) č. 79/2009 Evropského parlamentu a Rady ze 14. ledna 2009 o typovém schvalování motorových vozidel poháněných vodíkem a pozměňující Směrnice 2007/46/ES.

⁹ Nařízení Komise (EU) č. 406/2010 z 26. dubna 2010 zavádějící Nařízení (ES) č. 79/2009 Evropského parlamentu a Rady o typovém schvalování motorových vozidel poháněných vodíkem.

POZNÁMKA 2: Nejsou-li plynové palivové soustavy těsné nebo jsou nadměrně naplněné nebo vykazují poškození, které by mohlo ovlivnit jejich bezpečnost, směji být přepravovány jen v záchranných tlakových nádobách odpovídajících ADR.

- (c) Je-li plynová palivová soustava vybavena dvěma nebo více ventily v sérii, musí být dva ventily uzavřeny tak, aby byly za normálních podmínek přepravy plynotěsné. Existuje-li pouze jeden ventil, nebo jestliže jen jeden ventil funguje řádně, musí být všechny otvory, s výjimkou otvoru zařízení pro vyrovnávání tlaku, uzavřeny tak, aby byly za normálních podmínek přepravy plynotěsné.
- (d) Plynové palivové soustavy musí být přepravovány takovým způsobem, aby se zamezilo ucpání zařízení pro vyrovnávání tlaku nebo poškození ventilů nebo jakékoli jiné natlakované části plynové palivové soustavy a nechtěnému uvolnění plynu za normálních podmínek přepravy.

Plynová palivová soustava musí být zajištěna tak, aby se zamezilo jejímu sklouznutí, válení nebo vertikálnímu pohybu.

- (e) Plynové palivové soustavy musí splňovat ustanovení uvedená v 4.1.6.8 (a), (b), (c), (d) nebo (e).
- (f) Ustanovení kapitoly 5.2 o nápisech a bezpečnostních značkách musí být dodržena, ledaže jsou plynové palivové soustavy zasílány v manipulačním zařízení. V tomto případě musí být nápisy a bezpečnostní značky umístěny na manipulačním zařízení.
- (g) Dokumentace

Každá zásilka, která je přepravována podle tohoto zvláštního ustanovení, musí být doprovázena přepravním dokladem, obsahujícím alespoň následující údaje:

- (i) UN číslo plynu obsaženého v plynových palivových soustavách s předřazenými písmeny „UN“;
- (ii) Oficiální pojmenování pro přepravu plynu;
- (iii) Číslo vzoru bezpečnostní značky;
- (iv) Počet plynových palivových soustav;
- (v) V případě zkapalněných plynů čistá (netto) hmotnost v kg plynu každé plynové palivové soustavy a v případě stlačených plynů hydraulický vnitřní objem v litrech každé plynové palivové soustavy, následovaný jmenovitým provozním tlakem;
- (vi) Názvy a adresy odesílatele a příjemce.

Údaje podle (i) až (v) musí být uvedeny podle jednoho z následujících příkladů:

Příklad 1: UN 1971 plyn zemní, stlačený, 2.1, 1 plynová palivová soustava 50 l celkem, 200 barů

Příklad 2: UN 1965 uhlovodíky, plynné, směs, zkapalněná, j.n., 2.1, 3 plynové palivové soustavy, každá po 15 kg čisté (netto) hmotnosti plynu

POZNÁMKA: Všechna ostatní ustanovení ADR musí být dodržena.

661

(Vypuštěno)

662

Láhve neodpovídající ustanovením kapitoly 6.2, které jsou používány výlučně na plavidlech nebo v letadlech, směji být přepravovány za účelem plnění nebo inspekce a následného návratu, pokud jsou láhve zkonstruovány a vyrobeny podle normy uznané příslušným orgánem země schválení a všechny ostatní příslušné požadavky ADR jsou dodrženy včetně:

- (a) Láhve musí být přepravovány s ochranou ventilů podle 4.1.6.8;
- (b) Láhve musí být označeny nápisy a bezpečnostními značkami podle 5.2.1 a 5.2.2;

- (c) Všechny příslušné požadavky týkající se plnění v pokynu pro balení P200 v 4.1.4.1 musí být dodrženy.

Přepavní doklad musí obsahovat tento zápis: „Přeprava podle zvláštního ustanovení 662.

663

Tato položka smí být použita pouze pro obaly, velké obaly nebo IBC, nebo jejich části, které obsahovaly nebezpečné věci a které jsou přepravovány k likvidaci, recyklaci nebo rekuperaci jejich materiálu, s výjimkou jejich rekondicionování, opravy, běžné údržby, rekonstrukce nebo opětovného používání, a které byly vyprázdněny do té míry, že obsahují při podávání k přepravě jen zbytky nebezpečných věcí, které ulpěly na částech obalu.

Rozsah platnosti:

Zbytky obsažené v obalech, vyřazených, prázdných, nevyčištěných smějí být jen od nebezpečných věcí tříd 3, 4.1, 5.1, 6.1, 8 nebo 9. Kromě toho to nesmějí být:

- látky přiřazené k obalové skupině I nebo ty, které mají ve sloupci (7a) tabulky A kapitoly 3.2 uvedenu „0“; nebo
- látky klasifikované jako znečištěné výbušné látky třídy 3 nebo třídy 4.1; nebo
- látky klasifikované jako samovolně se rozkládající látky třídy 4.1; nebo
- radioaktivní látky; nebo
- azbest (UN 2212 a UN 2590), polychlorované bifenylly (UN 2315 a UN 3432) a polyhalogenované bifenylly nebo polyhalogenované terfenylly (UN 3151 a UN 3152).

Všeobecná ustanovení:

Obaly, vyřazené, prázdné, nevyčištěné se zbytky představujícími nebezpečí nebo vedlejší nebezpečí třídy 5.1 nesmějí být baleny společně s jinými obaly, vyřazenými, prázdnými, nevyčištěnými, nebo nakládány společně s jinými obaly, vyřazenými, prázdnými, nevyčištěnými do téhož kontejneru, vozidla nebo kontejneru pro volně ložené látky.

V místech nakládky musí být použity dokumentované třídící postupy, aby se zajistilo dodržení ustanovení platných pro tuto položku.

POZNÁMKA: Všechna ostatní ustanovení ADR platí.

664

Pokud jsou látky náležející pod tuto položku přepravovány v nesnímatelných cisternách (cisternových vozidlech) nebo snímatelných cisternách, smějí být tyto cisterny vybaveny aditivačními zařízeními.

Aditivační zařízení:

- jsou část provozní výstroje pro dávkování aditiv UN 1202, UN 1993 obalové skupiny III, UN 3082 nebo látek, které nejsou nebezpečné, během vyprazdňování cisterny;
- sestávají z prvků takových, jako jsou spojovací potrubí a hadice, uzavírací zařízení, čerpadla a dávkovací příslušenství, které jsou trvale připojeny k vyprazdňovacímu zařízení provozní výstroje cisteren;
- zahrnují nádoby, které jsou nedílnou součástí pláště, nebo jsou trvale připevněny k vnějšímu cisterně nebo k cisternovému vozidlu.

Alternativně mohou mít aditivační zařízení konektory pro spojení s obaly. V tomto posledním případě není vlastní obal považován za součást aditivačního zařízení.

Následující požadavky musí být splněny v závislosti na konstrukčním provedení:

- (a) Konstrukce nádob:

- (i) Jako nedílná součást pláště (např. komory cisterny) musí splňovat příslušná ustanovení kapitoly 6.8;
- (ii) Jsou-li trvale připevněny k vnějšku cisterny nebo k cisternovému vozidlu, nepodléhají konstrukčním ustanovením ADR, pokud splňují následující ustanovení:

Musí být vyrobeny z kovového materiálu a splňovat následující požadavky na minimální tloušťku stěn:

<i>Materiál</i>	<i>Minimální tloušťka stěn^a</i>
Austenitické nerezavějící oceli	2,5 mm
Jiné oceli	3 mm
Hliníkové slitiny	4 mm
Čistý hliník čistoty 99,80%	6 mm

^a Pro nádoby s dvojitými stěnami musí součet tlouštěk vnější kovové stěny a vnitřní kovové stěny odpovídat předepsané tloušťce stěny.

Svařování musí být provedeno v souladu s 6.8.2.1.23.

- (iii) Obaly, které jsou připojitelné k aditivačnímu zařízení, musí být kovové a musí splňovat příslušné konstrukční požadavky kapitoly 6.1, jak platí pro dotyčná aditiva.
- (b) Schvalování cisteren

Pro cisterny vybavené nebo určené k dovybavení aditivačními zařízeními, kde aditivační zařízení není zahrnuto do originálního typového schválení cisterny, musí být splněna ustanovení uvedená v 6.8.2.3.4.
- (c) Použití nádob a aditivačních zařízení
 - (i) V případě pod (a) (i) výše nejsou žádné dodatečné požadavky.
 - (ii) V případě pod (a) (ii) výše, celkový vnitřní objem nádob nesmí překročit 400 litrů na vozidlo.
 - (iii) V případě pod (a) (iii) výše se ustanovení v 7.5.7.5 a 8.3.3 nepoužijí. Obaly smějí být propojeny s aditivačním zařízením jen během vyprazdňování cisterny. Během přepravy musí být uzávěry a spojení uzavřeny tak, aby byly těsné.
- (d) Zkoušky aditivačních zařízení

Pro aditivační zařízení musí být použita ustanovení uvedená v 6.8.2.4. Avšak v případě pod (a)(ii) výše musí být v době první, meziperiodické a periodické inspekce cisterny nádoby aditivačního zařízení podrobeny jen vnější vizuální kontrole a zkoušce těsnosti. Zkouška těsnosti musí být provedena při zkušebním tlaku nejméně 0,2 baru.

POZNÁMKA: Pro obaly popsané v (a) (iii) výše platí příslušná ustanovení ADR.
- (e) Převážní doklad

Do převážního dokladu je třeba doplnit pro dotyčné aditivum pouze informace požadované podle 5.4.1.1.1 (a) a (d). V převážním dokladu musí být uveden tento dodatečný zápis: „Přeprava podle zvláštního ustanovením 664“.
- (f) Školení řidičů

Řidiči, kteří mají školení podle 8.2.1 pro přepravu této látky v cisternách nepotřebují žádné dodatečné školení pro přepravu aditiv.
- (g) Označování

Označování nesnímatelných cisteren (cisternových vozidel) nebo snímatelných cisteren pro přepravu látek pod touto položkou velkými bezpečnostními značkami a nápisy podle kapitoly 5.3 není nijak ovlivněno přítomností aditivačního zařízení ani aditivu v něm obsaženými.

KAPITOLA 3.4

NEBEZPEČNÉ VĚCI BALENÉ V OMEZENÝCH MNOŽSTVÍCH

- 3.4.1 Tato kapitola obsahuje ustanovení platná pro přepravu nebezpečných věcí určitých tříd balených v omezených množstvích. Platný množství limit pro vnitřní obal nebo předmět je uveden pro každou látku ve sloupci (7a) tabulky A kapitoly 3.2. Kromě toho je v tomto sloupci uvedeno množství „0“ pro každou položku nebezpečných věcí, které není dovoleno přepravovat podle této kapitoly.
- Nebezpečné věci balené v takových omezených množstvích, splňujících ustanovení této kapitoly, nepodléhají žádným jiným ustanovením ADR, kromě příslušných ustanovení:
- (a) části 1, kapitol 1.1, 1.2, 1.3, 1.4, 1.5, 1.6, 1.8, 1.9;
 - (b) části 2;
 - (c) části 3, kapitol 3.1, 3.2, 3.3 (mimo zvláštní ustanovení 61, 178, 181, 220, 274, 625, 633 a 650 (e));
 - (d) části 4, odstavců 4.1.1.1, 4.1.1.2, 4.1.1.4 až 4.1.1.8;
 - (e) části 5, 5.1.2.1 (a)(i) a (b), 5.1.2.2, 5.1.2.3, 5.2.1.9, 5.4.2;
 - (f) části 6, konstrukčních požadavků v 6.1.4 a odstavců 6.2.5.1 a 6.2.6.1 až 6.2.6.3;
 - (g) části 7, kapitoly 7.1 a 7.2.1, 7.2.2, 7.5.1 (mimo 7.5.1.4), 7.5.2.4, 7.5.7, 7.5.8 a 7.5.9;
 - (h) 8.6.3.3 a 8.6.4.
- 3.4.2 Nebezpečné věci musí být zabaleny jen do vnitřních obalů uložených ve vhodných vnějších obalech. Smějí být použity meziobaly. Kromě toho musí být pro předměty podtřídy 1.4, skupiny snášenlivosti S, plně dodržena ustanovení oddílu 4.1.5. Použití vnitřních obalů však není nutné pro přepravu předmětů, jako jsou aerosoly nebo „nádobky, malé, obsahující plyn“. Celková (brutto) hmotnost kusu nesmí překročit 30 kg.
- 3.4.3 S výjimkou předmětů podtřídy 1.4, skupiny snášenlivosti S, podložky se smršťovací nebo průtažnou fólií splňující podmínky uvedené v 4.1.1.1, 4.1.1.2 a 4.1.1.4 až 4.1.1.8 jsou dovoleny jako vnější obaly pro předměty nebo vnitřní obaly obsahující nebezpečné věci přepravované podle této kapitoly. Vnitřní obaly, které jsou náchylné k rozbití nebo snadnému propíchnutí, jako ty, které jsou vyrobeny ze skla, porcelánu, kameniny nebo některých plastů, musí být uloženy ve vhodných meziobalech splňujících ustanovení uvedená v 4.1.1.1, 4.1.1.2 a 4.1.1.4 až 4.1.1.8 a zkonstruovaných tak, aby splňovaly konstrukční požadavky uvedené v 6.1.4. Celková (brutto) hmotnost kusu nesmí překročit 20 kg.
- 3.4.4 Kapalné věci třídy 8, obalové skupiny II ve vnitřních obalech ze skla, porcelánu nebo kameniny musí být uzavřeny ve snášenlivém a tuhém meziobalu.
- 3.4.5 a 3.4.6 (Vyhrazeno)

3.4.7 Značka pro kusy obsahující omezená množství

3.4.7.1 S výjimkou letecké dopravy musí být kusy obsahující nebezpečné věci v omezených množstvích opatřeny značkou znázorněnou na obr. 3.4.7.1:

Obrázek 3.4.7.1

Značka pro kusy obsahující omezená množství

Tato značka musí být snadno viditelná, čitelná a schopna odolávat působení nepříznivého počasí bez podstatného snížení účinnosti.

Značka musí být ve tvaru čtverce postaveného na vrchol pod úhlem 45° (tvar diamantu). Horní a dolní část a obvodová čára musí být černé. Střední plocha musí být bílá nebo vhodně kontrastní k podkladu. Minimální rozměry musí být 100 mm x 100 mm a minimální tloušťka čáry tvořící čtverec postavený na vrchol musí být 2 mm. Pokud nejsou rozměry stanoveny, musí být všechny rozměry v přibližné proporci s uvedenými rozměry.

3.4.7.2 Jestliže to vyžaduje velikost kusu, smí být minimální vnější rozměry znázorněné na obr. 3.4.7.1 zmenšeny na nejméně 50 mm x 50 mm, pokud tato značka zůstane zřetelně viditelná. Minimální tloušťka čáry tvořící čtverec postavený na vrchol smí být zmenšena na nejméně 1 mm.

3.4.8 Značka pro kusy obsahující omezená množství podle části 3, kapitoly 4 Technických pokynů ICAO

3.4.8.1 Kusy obsahující nebezpečné věci zabalené podle ustanovení části 3, kapitoly 4 Technických pokynů ICAO musí být opatřeny značkou znázorněnou na obr. 3.4.8.1 k osvědčení souladu s těmito ustanoveními:

Obrázek 3.4.8.1

Značka pro kusy obsahující omezená množství podle části 3, kapitoly 4 Technických pokynů ICAO

Tato značka musí být snadno viditelná, čitelná a schopna odolávat působení nepříznivého počasí bez podstatného snížení účinnosti.

Značka musí být ve tvaru čtverce postaveného na vrchol pod úhlem 45° (tvar diamantu). Horní a dolní část a obvodová čára musí být černé. Střední plocha musí být bílá nebo vhodně kontrastní k podkladu. Minimální rozměry musí být 100 mm x 100 mm a minimální tloušťka čáry tvořící čtverec postavený na vrchol musí být 2 mm. Symbol „Y“ musí být umístěn ve středu značky a musí být zřetelně viditelný. Pokud nejsou rozměry stanoveny, musí být všechny rozměry v přibližné proporci s uvedenými rozměry.

- 3.4.8.2 Jestliže to vyžaduje velikost kusu, smí být minimální vnější rozměry znázorněné na obr. 3.4.8.1 zmenšeny na nejméně 50 mm x 50 mm, pokud tato značka zůstane zřetelně viditelná. Minimální tloušťka čáry tvořící čtverec postavený na vrchol smí být zmenšena na nejméně 1 mm. Symbol „Y“ musí zůstat v přibližné proporci se symbolem znázorněným na obr. 3.4.8.1.
- 3.4.9 Kusy obsahující nebezpečné věci opatřené značkou uvedenou v 3.4.8, s nebo bez dodatečných bezpečnostních značek a nápisů pro leteckou dopravu, se považují za kusy splňující ustanovení oddílu 3.4.1, jak je to náležité, a oddílů 3.4.2 až 3.4.4 a nemusí být opatřeny značkou uvedenou v 3.4.7.
- 3.4.10 Kusy obsahující nebezpečné věci v omezených množstvích opatřené značkou uvedenou v 3.4.7 a odpovídající ustanovením Technických pokynů ICAO, včetně všech potřebných nápisů a bezpečnostních značek uvedených v částech 5 a 6, se považují za kusy splňující ustanovení oddílu 3.4.1, jak je to náležité, a oddílů 3.4.2 až 3.4.4.
- 3.4.11 Pokud jsou kusy obsahující nebezpečné věci balené v omezených množstvích uloženy v přepravním obalovém souboru, platí ustanovení uvedená v 5.1.2. Kromě toho musí být přepravní obalový soubor označen značkami vyžadovanými touto kapitolou, ledaže jsou označení reprezentující všechny nebezpečné věci obsažené v přepravním obalovém souboru viditelná. Ustanovení uvedená v 5.1.2.1 (a)(ii) a 5.1.2.4 platí pouze v případě, že jsou v přepravním obalovém souboru obsaženy jiné nebezpečné věci, které nejsou baleny v omezených množstvích, a to pouze ve vztahu k těmto jiným nebezpečným věcem.
- 3.4.12 Před přepravou musí odesílatelé nebezpečných věcí balených v omezených množstvích předem informovat dopravce prokazatelnou formou o celkové (brutto) hmotnosti takových věcí, které se mají odesílat.

- 3.4.13 (a) Dopravní jednotky o největší povolené hmotnosti nad 12 tun přepravující nebezpečné věci balené v omezených množstvích musí být označeny podle 3.4.15 na přední a na zadní straně, s výjimkou případu, kdy dopravní jednotka obsahuje jiné nebezpečné věci, pro které je vyžadováno označení oranžovými tabulkami podle 5.3.2. V tomto posledním případě může být dopravní jednotka označena jen vyžadovaným označením oranžovými tabulkami, nebo jak označením oranžovými tabulkami podle 5.3.2, tak i označením podle 3.4.15.
- (b) Kontejnery přepravující nebezpečné věci balené v omezených množstvích na dopravních jednotkách o největší povolené hmotnosti nad 12 tun musí být označeny podle 3.4.15 na všech čtyřech stranách, s výjimkou případu, kdy kontejner obsahuje jiné nebezpečné věci, pro které je vyžadováno označení velkými bezpečnostními značkami podle 5.3.1. V tomto posledním případě může být kontejner označen jen vyžadovanými velkými bezpečnostními značkami, nebo jak velkými bezpečnostními značkami podle 5.3.1, tak i označením podle 3.4.15.

Dopravní jednotka nemusí být označena, s výjimkou případu, kdy označení kontejnerů není viditelné zvnějšku dopravní jednotky, kterou jsou přepravovány. V tomto případě musí být stejné označení umístěno na přední a na zadní straně dopravní jednotky.

- 3.4.14 Od označení uvedených v 3.4.13 může být upuštěno, jestliže celková (brutto) hmotnost přepravovaných kusů obsahujících nebezpečné věci balené v omezených množstvích nepřekračuje 8 tun na dopravní jednotku.

- 3.4.15 Označení musí sestávat ze značky vyžadované v 3.4.7, jejíž minimální rozměry však musí být 250 mm x 250 mm.

KAPITOLA 3.5

NEBEZPEČNÉ VĚCI BALENÉ VE VYŇATÝCH MNOŽSTVÍCH

3.5.1 Vyňatá množství

3.5.1.1 Vyňatá množství nebezpečných věcí určitých tříd, jiných než předmětů, splňující ustanovení této kapitoly nepodléhají žádným jiným ustanovením ADR s výjimkou:

- (a) předpisů o školení v kapitole 1.3;
- (b) klasifikačních postupů a kritérií pro obalové skupiny v části 2;
- (c) předpisů o balení v 4.1.1.1, 4.1.1.2, 4.1.1.4 a 4.1.1.6.

POZNÁMKA: V případě radioaktivních látek platí předpisy pro radioaktivní látky ve vyjmutých kusech v 1.7.1.5.

3.5.1.2 Nebezpečné věci, které smějí být přepravovány ve vyňatých množstvích podle ustanovení této kapitoly, jsou ukázány ve sloupci (7b) tabulky A kapitoly 3.2 pomocí následujícího alfanumerického kódu:

Kód	Nejvyšší čisté množství na vnitřní obal (v gramech pro tuhé látky a v ml pro kapaliny a plyny)	Nejvyšší čisté množství na vnější obal (v gramech pro tuhé látky a v ml pro kapaliny a plyny, nebo součet gramů a ml v případě smíšeného balení)
E0	Není dovoleno jako vyňaté množství	Není dovoleno jako vyňaté množství
E1	30	1000
E2	30	500
E3	30	300
E4	1	500
E5	1	300

Pro plyny se objemem udaným pro vnitřní obaly míní hydraulický vnitřní objem vnitřní nádoby a objemem udaným pro vnější obaly se míní celkový hydraulický vnitřní objem všech vnitřních obalů v jednom vnějším obalu.

3.5.1.3 Jsou-li nebezpečné věci ve vyňatých množstvích, jimž jsou přiděleny rozdílné kódy, baleny společně, musí být celkové množství na vnější obal omezeno na to množství, které odpovídá nejrestriktivnějšímu kódu.

3.5.1.4 Vyňatá množství nebezpečných věcí přiřazená ke kódům E1, E2, E4 a E5 s nejvyšším čistým množstvím nebezpečných věcí na vnitřním obal omezeným na 1 ml pro kapaliny a plyny a na 1 g pro tuhé látky a s nejvyšším čistým množstvím nebezpečných věcí na vnější obal, které nepřevyšuje 100 g pro tuhé látky nebo 100 ml pro kapaliny a plyny, podléhají pouze:

- (a) ustanovením uvedeným v 3.5.2, s výjimkou toho, že se nevyžaduje meziobal v případě, že jsou vnitřní obaly bezpečně zabaleny ve vnějším obalu s fixačním materiálem takovým způsobem, že za normálních podmínek přepravy nemohou prasknout, být propíchnuty nebo propouštět svůj obsah; a pro kapaliny vnější obal obsahuje dostatečné množství absorpčního materiálu, aby absorboval celý obsah vnitřních obalů; a
- (b) ustanovením uvedeným v 3.5.3.

3.5.2 Obaly

Obaly používané pro přepravu nebezpečných věcí ve vyňatých množstvích musí splňovat následující požadavky:

- (a) Musí být vnitřní obal a každý vnitřní obal musí být vyroben z plastu (s minimální tloušťkou 0,2 mm, je-li používán pro kapaliny) nebo ze skla, porcelánu, kameniny, keramického materiálu nebo kovu (viz též 4.1.1.2) a uzávěr každého vnitřního obalu musí být bezpečně držen na svém místě drátem, páskou nebo jiným účinným prostředkem; každá nádoba mající hrdlo s lisovanými šroubovými závitů musí mít těsné víčko závitového typu. Uzávěr musí být odolný vůči obsahu;
- (b) Každý vnitřní obal musí být bezpečně zabalen do meziobalu s fixačním materiálem takovým způsobem, aby se za normálních podmínek přepravy nemohl rozbít, být proražen nebo propouštět svůj obsah. Meziobal musí úplně udržet obsah v případě rozbití nebo úniku, bez ohledu na orientaci kusu. Pro kapaliny musí meziobal obsahovat dostatek absorpčního materiálu k pohlcení celého obsahu vnitřního obalu. V takových případech může být absorpčním materiálem fixační materiál. Nebezpečné věci nesmějí nebezpečně reagovat s fixačním nebo absorpčním materiálem ani s materiálem obalů, ani redukovat celistvost nebo funkci materiálů;
- (c) Meziobal musí být bezpečně zabalen do pevného tuhého vnějšího obalu (ze dřeva, lepenky nebo jiného stejně pevného materiálu);
- (d) Každý typ kusu musí vyhovovat ustanovením v 3.5.3;
- (e) Každý kus musí být takové velikosti, aby na něm byl dostatek místa pro všechna potřebná označení; a
- (f) Smějí se používat přepravní obalové soubory a smějí obsahovat také kusy s nebezpečnými věcmi nebo věci nepodléhající předpisům ADR.

3.5.3 Zkoušky pro kusy

3.5.3.1

Kompletní kus, tak jak je připraven k přepravě, s vnitřními obaly naplněnými do nejméně 95 % jejich vnitřního objemu pro tuhé látky nebo 98 % pro kapaliny, musí být schopen odolat, jak se dokáže zkouškou, která je náležitě zdokumentována, bez rozbití nebo úniku z kterékoliv vnitřního obalu a bez významného snížení účinnosti:

- (a) pádům na pevný, nepružný, rovný a vodorovný povrch z výšky 1,8 m:
 - (i) má-li vzorek tvar bedny, musí padnout v každé z následujících orientací:
 - naplocho na dno;
 - naplocho na víko (horní stranu);
 - naplocho na nejdelší stranu;
 - naplocho na nejkratší stranu;
 - na roh;
 - (ii) má-li vzorek tvar sudu, musí padnout v každé z následujících orientací:
 - diagonálně na horní hranu, s těžištěm přímo nad bodem nárazu;
 - diagonálně na hranu dna;
 - naplocho na boční stranu;

POZNÁMKA: Každý z výše uvedených pádů může být proveden na různých, ale identických kusech.

- (b) síle působící na horní povrch po dobu 24 hodin, rovnající se celkové hmotnosti identických kusů, jsou-li nastohovány do výšky 3 m (včetně vzorku).

3.5.3.2 Pro účely zkoušení smějí být látky, které se mají přepravovat v obalu, nahrazeny jinými látkami, pokud by to nezneškodnilo výsledky zkoušek. Je-li v případě tuhých látek použita jiná látka, musí mít stejné fyzikální charakteristiky (hmotnost, velikost zrn atd.) jako látka, která se má přepravovat. Je-li při zkouškách pádem pro kapaliny použita jiná látka, měly by být její relativní hustota (měrná hmotnost) a viskozita obdobné relativní hustotě (měrné hmotnosti) a viskozitě látky, která se má přepravovat.

3.5.4 Značení kusů

3.5.4.1 Kusy obsahující vyňatá množství nebezpečných věcí připravené podle této kapitoly musí být trvanlivě a čitelně označeny značkou uvedenou v pododdílu 3.5.4.2. První nebo jediné číslo bezpečnostní značky udané ve sloupci (5) tabulky A kapitoly 3.2 pro každou z nebezpečných věcí obsažených v kusu musí být uvedeno na této značce. Pokud není název odesílatele nebo příjemce uveden jinde na kusu, musí být tato informace uvedena na této značce.

3.5.4.2 Značka pro vyňatá množství

Obr. 3.5.4.2

Značka pro vyňatá množství

- * Na tomto místě musí být uvedeno první nebo jediné číslo bezpečnostní značky udané ve sloupci (5) tabulky A kapitoly 3.2.
- ** Na tomto místě musí být uveden název odesílatele nebo příjemce, pokud není uveden jinde na kusu.

Značka musí být ve tvaru čtverce. Šrafování a symbol musí být stejné barvy, černé nebo červené, na bílém nebo vhodném kontrastním podkladu. Minimální rozměry musí být 100 mm x 100 mm. Pokud nejsou rozměry stanoveny, musí být všechny rozměry v přibližné proporci s uvedenými rozměry.

3.5.4.3 Převážní obalový soubor obsahující nebezpečné věci ve vyňatých množstvích musí být opatřen označením vyžadovaným podle 3.5.4.1, pokud nejsou taková označení na kusech uvnitř přepravního obalového souboru jasně viditelná.

3.5.5 Maximální počet kusů ve vozidle nebo kontejneru

Počet kusů ve vozidle nebo kontejneru nesmí překročit 1000.

3.5.6 Dokumentace

Jestliže nebezpečné věci ve vyňatých množstvích doprovází doklad(y) (jako jsou nákladový list, letecký nákladní list nebo nákladní list CMR/CIM), musí alespoň jeden z těchto dokladů obsahovat prohlášení „NEBEZPEČNÉ VĚCI VE VYŇATÝCH MNOŽSTVÍCH“ a údaj o počtu kusů.

ČÁST 4

USTANOVENÍ O POUŽÍVÁNÍ OBALŮ A CISTEREN

KAPITOLA 4.1

POUŽITÍ OBALŮ, VČETNĚ IBC A VELKÝCH OBALŮ

4.1.1 Všeobecná ustanovení pro balení nebezpečných věcí do obalů, včetně IBC a velkých obalů

POZNÁMKA: Pro balení věcí tříd 2, 6.2 a 7 platí všeobecná ustanovení tohoto oddílu pouze tehdy, je-li to uvedeno v 4.1.8.2 (třída 6.2), 4.1.9.1.5 (třída 7) a v příslušných pokynech pro balení oddílu 4.1.4 (P 201a LP02 pro třídu 2 a P 620, P 621, IBC 620 a LP 621 pro třídu 6.2).

4.1.1.1

Nebezpečné věci musí být baleny do obalů, včetně IBC a velkých obalů, dobré kvality. Tyto musí být natolik pevné, aby odolávaly rázům a namáháním, které se mohou vyskytnout za normálních podmínek přepravy, včetně překládky mezi dopravními prostředky a mezi dopravními prostředky a sklady a rovněž při přemísťování z palet nebo přepravních obalových souborů k následně ruční nebo mechanizované manipulaci. Obaly, včetně IBC a velkých obalů, musí být vyrobeny a uzavřeny tak, aby bylo při normálních podmínkách přepravy zamezeno úniku obsahu z kusu připraveného k přepravě, zejména v důsledku vibrací, nebo změn teploty, vlhkosti nebo tlaku (např. z důvodu změny nadmořské výšky). Obaly, včetně IBC a velkých obalů, musí být uzavřeny v souladu s informacemi poskytnutými výrobcem. Na vnější straně obalů, IBC a velkých obalů nesmějí během přepravy ulpívat žádné nebezpečné zbytky. Tato ustanovení se vztahují na nové, opakovaně použitelné, obnovené nebo re-konstruované obaly, na nové, opakovaně použitelné, opravené nebo rekonstruované IBC a na nové opakovaně použitelné nebo rekonstruované velké obaly.

4.1.1.2

Části obalů, včetně IBC a velkých obalů, které přicházejí bezprostředně do styku s nebezpečnými věcmi:

- (a) nesmějí být těmito nebezpečnými věcmi narušovány ani významně zeslabovány;
- (b) nesmějí vyvolat žádný nebezpečný účinek, např. působit jako katalyzátor při reakci nebo reagovat s nebezpečnými věcmi; a
- (c) nesmějí dovolit propouštění nebezpečných věcí, které by mohlo představovat nebezpečí za normálních podmínek přepravy.

Je-li to nutné, musí být opatřeny vhodným vnitřním povlakem nebo úpravou.

POZNÁMKA: K chemické snášenlivosti plastových obalů, včetně IBC, vyrobených z polyetylénu viz pododdíl 4.1.1.21.

4.1.1.3

Pokud není v ADR stanoveno jinak, musí každý obal, včetně IBC a velkých obalů, s výjimkou vnitřních obalů, odpovídat konstrukčnímu typu, který vyhověl zkouškám podle odpovídajících předpisů oddílů 6.1.5, 6.3.5, 6.5.6 nebo 6.6.5. Obaly, pro které se zkoušky nevyžadují, jsou uvedeny v pododdílu 6.1.1.3.

4.1.1.4

U obalů, včetně IBC a velkých obalů, plněných kapalinami, musí zůstat dostatečný volný prostor, aby bylo zajištěno, že roztažnost kapaliny způsobená teplotami, které mohou nastat během přepravy, nezpůsobí ani únik kapaliny, ani trvalou deformaci obalu. Pokud nejsou předepsány specifické požadavky, obaly nesmějí být zcela naplněny kapalinami při teplotě 55 °C. Avšak v IBC musí být ponechán dostatečný volný prostor, aby se zajistilo, že při průměrné teplotě obsahu 50 °C nebude naplněna více než do 98 % svého hydraulického vnitřního objemu. Pokud není stanoveno jinak, nesmí nejvyšší stupeň plnění vztažený k plnicí teplotě 15 °C překročit buď:

(a)	Bod varu (začátek varu) látky ve °C	<60	≥ 60 < 100	≥ 100 < 200	≥ 200 < 300	≥300
	Stupeň plnění v % vnitřního objemu obalu	90	92	94	96	98

nebo

$$(b) \quad \text{stupeň plnění} = \frac{98}{1 + \alpha(50 - t_F)} \% \text{ vnitřního objemu obalu.}$$

V tomto vzorci značí α střední koeficient objemové roztažnosti kapaliny mezi 15 °C a 50 °C, to znamená pro maximální zvýšení teploty o 35 °C.

$$\alpha \text{ se vypočítá podle vzorce } \alpha = \frac{d_{15} - d_{50}}{35 \times d_{50}}$$

d_{15} a d_{50} značí relativní hustoty¹ kapaliny při 15 °C a 50 °C a t_F je střední teplota kapaliny při plnění.

4.1.1.5

Vnitřní obaly musí být zabaleny do vnějšího obalu tak, aby za normálních podmínek přepravy nedošlo k jejich rozbití nebo proděravění, nebo aby z nich nemohl obsah uniknout do vnějšího obalu. Vnitřní obaly obsahující kapaliny musí být zabaleny svými uzávěry směrem nahoru a musí být uloženy do vnějších obalů ve shodě s orientačními šipkami předepsanými v pododdíle 5.2.1.9. Křehké vnitřní obaly nebo takové, u kterých může snadno dojít k proděravění, jako jsou nádoby ze skla, porcelánu nebo kameniny nebo některých plastů atd., musí být zajištěny ve vnějších obalech vhodným fixačním materiálem. Při úniku obsahu nesmí dojít k podstatnému zhoršení ochranných vlastností fixačního materiálu ani vnějšího obalu.

4.1.1.5.1

Pokud byl vnější obal nebo velký obal s úspěchem podroben zkoušce s různými typy vnitřních obalů, mohou být takové druhy vnitřních obalů společně uloženy do tohoto vnějšího nebo velkého obalu. Kromě toho, pokud je dodržena rovnocenná úroveň provedení, jsou povoleny dále uvedené varianty bez dalšího zkoušení kusu:

- (a) Vnitřní obaly stejných nebo menších rozměrů mohou být používány, pokud:
 - (i) vnitřní obaly jsou podobné konstrukce jako zkoušené vnitřní obaly (např. kruhové, pravoúhlé atd.);
 - (ii) materiál konstrukce vnitřních obalů (sklo, plasty, kov atd.) poskytuje odolnost proti nárazu a stohovacím tlakům stejnou nebo vyšší než původně zkoušený vnitřní obal;
 - (iii) vnitřní obaly mají stejné nebo menší otvory a uzávěr je podobné konstrukce (např. šroubovací víčko, vtačné víčko atd.);
 - (iv) je použit dostatečný dodatečný fixační materiál k vyplnění volného prostoru a zabránění nekontrolovatelnému pohybu vnitřních obalů; a
 - (v) vnitřní obaly jsou orientovány ve vnějším obalu stejným způsobem jako ve zkoušeném kusu.
- (b) Menší počty zkoušených vnitřních obalů nebo alternativních typů vnitřních obalů uvedených výše v odstavci (a) mohou být používány, pokud je dostatečně doplněn fixační materiál k vyplnění volného prostoru a pro zabránění nekontrolovatelnému pohybu vnitřních obalů.

4.1.1.5.2

Použití dodatečných obalů ve vnějším obalu (např. meziobal nebo nádoba uvnitř vyžadovaného vnitřního obalu) navíc k tomu, co je vyžadováno pokyny pro balení, je dovoleno, za podmínky, že jsou splněny všechny příslušné požadavky, včetně požadavků uvedených v 4.1.1.3 a, pokud je to náležité, je použita vhodná fixace k zamezení pohybu v obalu.

4.1.1.6

Nebezpečné věci nesmějí být baleny společně do téhož vnějšího obalu nebo do velkého obalu s nebezpečnými nebo jinými věcmi, jestliže spolu mohou nebezpečně reagovat a způsobit:

- (a) hoření nebo vývin značného tepla;
- (b) vývin hořlavých, dusivých, hoření podporujících nebo toxických plynů;
- (c) tvoření žiravých látek; nebo
- (d) tvoření nestálých látek.

¹ Pojem "relativní hustota" (d) se považuje za synonymum pojmu "měrná hmotnost" (SG) a používá se všude v této kapitole.

POZNÁMKA: Ke zvláštním ustanovením pro společné balení viz oddíl 4.1.10.

- 4.1.1.7** Uzávěry obalů obsahujících navlhčené nebo zředěné látky musí být provedeny tak, aby procentuální podíl kapaliny (vody, rozpouštědla nebo flegmatizačního prostředku) neklesl v průběhu přepravy pod předepsané mezní hodnoty.
- 4.1.1.7.1** Pokud jsou velké nádoby pro volně ložené látky (IBC) vybaveny dvěma nebo více uzavíracími systémy za sebou, musí být uzavřen jako první ten, který je nejbližší k přepravované látce.
- 4.1.1.8** Jestliže může v obalu vzniknout tlak v důsledku uvolňování plynu z přepravované látky (vlivem zvýšení teploty nebo z jiného důvodu), může být obal nebo IBC, opatřen odvětrávacím zařízením, za podmínky, že uvolněný plyn nevyvolá nebezpečí například z důvodů své toxicity, své hořlavosti nebo uvolněného množství.

Vybavení odvětrávacím zařízením je nutné, jestliže může vzniknout nebezpečný přetlak v důsledku normálního rozkladu látek. Odvětrávací zařízení musí být takové konstrukce, aby se, pokud je obal nebo IBC v poloze určené pro přepravu, zabránilo úniku kapaliny a pronikání cizích látek za normálních podmínek přepravy.

POZNÁMKA: Odvětrávání kusu není dovoleno pro leteckou dopravu.

- 4.1.1.8.1** Kapaliny smějí být plněny jen do vnitřních obalů, které mají dostatečnou odolnost proti vnitřnímu tlaku, který může vzniknout za normálních podmínek přepravy.
- 4.1.1.9** Nové, rekonstruované nebo opakovaně použitelné obaly, včetně IBC a velkých obalů, nebo obnovené obaly a opravené nebo běžně udržované IBC musí být schopny vyhovět příslušným zkouškám předepsaným v oddílech 6.1.5, 6.3.5, 6.5.6 nebo 6.6.5. Před plněním a podáním k přepravě se musí každý obal, včetně IBC a velkých obalů, podrobit prohlídce, zda nevykazuje korozi, kontaminaci nebo jiné závady a všechny IBC musí být prohlédnuty s ohledem na správnou funkci provozní výstroje. Každý obal, který jeví známky snížené pevnosti oproti schválenému konstrukčnímu typu, nesmí být dále používán, nebo musí být obnoven tak, aby vyhověl zkouškám předepsaným pro konstrukční typ. Každá IBC, která jeví známky snížené pevnosti oproti vyzkoušenému konstrukčnímu typu, nesmí být dále používána, nebo musí být opravena nebo podrobena běžné údržbě tak, aby vyhověla zkouškám předepsaným pro konstrukční typ.
- 4.1.1.10** Kapaliny smějí být plněny jen do obalů, včetně IBC, které mají přiměřenou odolnost proti vnitřnímu tlaku, který může vzniknout za normálních podmínek přepravy. Obaly a IBC, na kterých je vyznačen hydraulický zkušební tlak, předepsaný v pododdílu 6.1.3.1 (d) a popřípadě v odstavci 6.5.2.2.1, musí být plněny jen kapalinou, jejíž tenze par:
- (a) je taková, že celkový přetlak v obalu nebo IBC (t.j. tenze par naplněné látky plus parciální tlak vzduchu nebo jiných inertních plynů, sníženo o 100 kPa) při 55 °C, zjištěný na základě nejvyššího stupně plnění dle pododdílu 4.1.1.4 a plnicí teploty 15 °C, nepřekračuje 2/3 vyznačeného zkušební tlaku; nebo
 - (b) je při 50 °C menší než 4/7 součtu vyznačeného zkušební tlaku plus 100 kPa; nebo
 - (c) je při 55 °C menší než 2/3 součtu vyznačeného zkušební tlaku plus 100 kPa.

IBC určené pro přepravu kapalin nesmějí být používány k přepravě kapalin, jejichž tenze par je vyšší než 110 kPa (1,1 baru) při teplotě 50 °C, nebo 130 kPa (1,3 baru) při teplotě 55 °C.

**Příklady zkušebních tlaků pro vyznačení na obaly, včetně IBC,
vypočítaných dle pododdílu 4.1.1.10 (c)**

UN Číslo	Pojmenování	Třída	Obalo- vá sku- pina	V_{p55} (kPa)	$(V_{p55} \times 1.5)$ (kPa)	$(V_{p55} \times 1.5)$ minus 100 (kPa)	Požadovaný nejnižší zkušební tlak (přetlak) podle 6.1.5.5.4.c)(kPa)	Nejnižší zkušební tlak (přetlak) pro vyznačení na obalu (kPa)
2056	Tetrahydrofuran	3	II	70	105	5	100	100
2247	n-Decan	3	III	1.4	2.1	-97.9	100	100
1593	Dichlormethan	6.1	III	164	246	146	146	150
1155	Diethylether	3	I	199	299	199	199	250

POZNÁMKA 1: Pro čisté kapaliny se tenze par při 55 °C (V_{p55}) často přebírá z tabulek uveřejněných ve vědecké literatuře.

POZNÁMKA 2: V tabulce uváděné nejnižší zkušební tlaky se vztahují pouze k údajům v pododdíle 4.1.1.10 (c), což znamená, že vyznačený zkušební tlak musí být větší než 1,5-násobek tenze par při 55 °C minus 100 kPa. Jestliže je například zkušební tlak pro n-dekan stanoven podle odstavce 6.1.5.5.4 (a), nejnižší vyznačený zkušební tlak může být nižší.

POZNÁMKA 3: Pro diethylether je požadovaný nejnižší zkušební tlak podle odstavce 6.1.5.5.5 250 kPa.

4.1.1.11 Prázdné obaly, včetně IBC a velkých obalů, které obsahovaly nebezpečné věci, podléhají stejným předpisům jako naplněné obaly, pokud nebyla přijata odpovídající opatření vylučující jakéhokoli riziko.

POZNÁMKA: Jsou-li takové obaly přepravovány k likvidaci, recyklaci nebo rekuperaci jejich materiálu, smějí být přepravovány také pod UN 3509, pokud jsou splněny podmínky zvláštního ustanovení 663 kapitoly 3.3.

4.1.1.12 Každý obal, specifikovaný v kapitole 6.1, určený pro kapaliny, musí úspěšně absolvovat vhodnou zkoušku těsnosti a být schopen splnit příslušnou úroveň zkoušky uvedenou v odstavci 6.1.5.4.3:

- (a) před prvním použitím pro přepravu;
- (b) po rekonstrukci nebo obnově obalu, před jeho opětovným použitím pro přepravu;

Pro tuto zkoušku nemusí být obal vybaven svými vlastními uzávěry. Vnitřní nádoba kompozitního obalu může být zkoušena bez vnějšího obalu, za podmínky, že výsledky zkoušek nebudou ovlivněny. Tato zkouška není povinná pro:

- vnitřní obaly skupinových obalů nebo velkých obalů;
- vnitřní nádoby kompozitních obalů (sklo, porcelán nebo kamenina) označených symbolem "RID/ADR" podle pododdílu 6.1.3.1 (a) (ii);
- obaly z jemného plechu označené symbolem "RID/ADR" podle pododdílu 6.1.3.1 (a) (ii).

4.1.1.13 Obaly, včetně IBC, používané pro tuhé látky, které mohou zkapat při teplotách vyskytujících se během přepravy, musí být rovněž použitelné pro tyto látky v kapalném stavu.

4.1.1.14 Obaly, včetně IBC, používané pro práškové nebo zrnité látky musí být prachotěsné, nebo musí být opatřeny vložkou.

4.1.1.15 Pokud příslušný orgán neschválí jinak, je pro plastové sudy a kanystry, IBC z tuhého plastu a kompozitní IBC s vnitřní nádobou z plastu dovolená doba jejich používání pro přepravu nebezpečných látek 5 roků od data jejich výroby, s výjimkou kratší doby používání stanovené z důvodu druhu přepravované látky.

4.1.1.16 Je-li led použit jako chladicí prostředek, nesmí ovlivnit neporušenost obalu.

- 4.1.1.17** Obaly, včetně IBC a velkých obalů, značené podle 6.1.3, 6.2.2.7, 6.2.2.8, 6.3.1, 6.5.2 nebo 6.6.3, avšak které byly schváleny ve státě, který není smluvní stranou ADR, mohou být rovněž používány pro přepravu dle ADR.
- 4.1.1.18** ***Výbušné látky a předměty, samovolně se rozkládající látky a organické peroxidy***
- Pokud není zvláštním ustanovením v ADR stanoveno jinak, musí obaly, včetně IBC a velkých obalů, používané pro věci třídy 1, samovolně se rozkládající látky třídy 4.1 a organické peroxidy třídy 5.2 splňovat ustanovení pro středně nebezpečnou skupinu (obalovou skupinu II).
- 4.1.1.19** ***Použití záchranných obalů a velkých záchranných obalů***
- 4.1.1.19.1** Poškozené, porušené nebo netěsné kusy nebo kusy, které neodpovídají předpisům, nebo nebezpečné věci, které se rozspaly nebo vytekly, mohou být přepravovány v záchranných obalech uvedených v odstavci 6.1.5.1.11 a ve velkých záchranných obalech uvedených v odstavci 6.6.5.1.9. To nebrání používání obalů, včetně IBC a velkých obalů, větších velikostí vhodného typu a úrovně provedení dle požadavků uvedených v odstavci 4.1.1.19.2 a 4.1.1.19.3.
- 4.1.1.19.2** Musí být učiněna vhodná opatření, která zamezí nadměrného pohybu poškozených nebo netěsných kusů uvnitř záchranného obalu nebo velkého záchranného obalu. Pokud záchranný obal nebo velký záchranný obal obsahuje kapaliny, musí být přidáno dostatečné množství inertního absorpčního materiálu pro eliminaci přítomnosti volné kapaliny.
- 4.1.1.19.3** Musí být učiněna vhodná opatření, aby se zamezilo nebezpečnému nárůstu tlaku.
- 4.1.1.20** ***Použití záchranných tlakových nádob***
- 4.1.1.20.1** V případě poškozených, vadných nebo netěsných tlakových nádob nebo tlakových nádob, které neodpovídají předpisům, je dovoleno použít záchranné tlakové nádoby podle 6.2.3.11.
- POZNÁMKA:*** Záchranná tlaková nádoba smí být použita jako přepravní obalový soubor podle 5.1.2. Je-li použita jako přepravní obalový soubor, musí být označena podle 5.1.2.1 namísto 5.2.1.3.
- 4.1.1.20.2** Tlakové nádoby musí být uloženy v záchranných tlakových nádobách přiměřené velikosti. Více než jedna tlaková nádoba smí být uložena v téže záchranné tlakové nádobě jen tehdy, jsou-li známy jejich obsahy a pokud spolu vzájemně nebezpečně nereagují (viz 4.1.1.6). Musí být učiněna vhodná opatření, aby se zamezilo pohybu tlakových nádob uvnitř záchranné tlakové nádoby, např. přepážkami, upevněním nebo fixačním (vycpávkovým) materiálem.
- 4.1.1.20.3** Tlaková nádoba smí být uložena v záchranné tlakové nádobě jestliže:
- (a) záchranná tlaková nádoba splňuje ustanovení uvedená v 6.2.3.11 a kopie schvalovacího osvědčení je k dispozici;
 - (b) části záchranné tlakové nádoby, které jsou nebo pravděpodobně budou v přímém styku s nebezpečnými věcmi, nebudou těmito nebezpečnými věcmi poškozovány nebo zeslabovány a nevyvolají nebezpečný účinek (např. katalytickou reakci nebo reakci s nebezpečnými věcmi); a
 - (c) obsahy uložených tlakových nádob jsou omezeny v tlaku a objemu tak, aby v případě jejich úplného vyprázdnění do záchranné tlakové nádoby tlak v záchranné tlakové nádobě při 65 °C nepřekročil zkušební tlak záchranné tlakové nádoby (pro plyny viz pokyn pro balení P200 (3) v 4.1.4.1). Zmenšení použitelného hydraulického vnitřního objemu záchranné tlakové nádoby, např. obsaženou výbavou nebo fixačním (vycpávkovým) materiálem, musí být vzato v úvahu.
- 4.1.1.20.4** Záchranná tlaková nádoba musí být pro přepravu opatřena nápisy obsahujícími oficiální pojmenování pro přepravu a UN číslo s předřazenými písmeny „UN“ a bezpečnostní značkou (značkami), jak jsou vyžadovány pro kusy v kapitole 5.2, vztahujícími se k nebezpečným věcem obsaženým v uložené tlakové nádobě (nádobách).
- 4.1.1.20.5** Záchranné tlakové nádoby musí být vyčištěny, odplyněny a vizuálně prohlédnuty zevnitř i zvenjšku po každém použití. Musí být podrobovány periodickým inspekčním a zkouškám podle 6.2.3.5 alespoň jednou za každých pět let.

4.1.1.21 **Ověřování chemické snášenlivosti plastových obalů, včetně IBC, přiřazením plnicích látek ke standardním kapalinám**

4.1.1.21.1 *Rozsah platnosti*

Pro obaly z polyetylenu uvedené v odstavci 6.1.5.2.6 a pro IBC z polyetylenu uvedené v odstavci 6.5.6.3.5 může být chemická snášenlivost s plnicí látkou ověřena přiřazením ke standardním kapalinám podle postupů stanovených v odstavcích 4.1.1.19.3 až 4.1.1.19.5 a použitím seznamu v tabulce 4.1.1.19.6, za předpokladu, že jednotlivé konstrukční typy byly vyzkoušeny s těmito standardními kapalinami podle oddílu 6.1.5 nebo 6.5.6 s přihlédnutím k oddílu 6.1.6 a že jsou splněny podmínky uvedené v odstavci 4.1.1.19.2. Pokud přiřazení podle tohoto pododdílu není možné, musí být chemická snášenlivost ověřena zkouškou konstrukčního typu podle odstavce 6.1.5.2.5 nebo laboratorními zkouškami podle odstavce 6.1.5.2.7 pro obaly a podle odstavce 6.5.6.3.3, popřípadě 6.5.6.3.6 pro IBC.

POZNÁMKA: Bez ohledu na ustanovení tohoto pododdílu podléhá použití obalů, včetně IBC, pro určité plnicí látky omezením tabulky A kapitoly 3.2 a pokynů pro balení v kapitole 4.1.

4.1.1.21.2 *Podmínky*

Relativní hustoty plnicích látek nesmějí překročit relativní hustoty použité ke stanovení výšky pro zkoušku volným pádem provedenou s úspěchem podle odstavce 6.1.5.3.5 nebo 6.5.6.9.4 a hmotnosti pro zkoušku stohováním provedenou s úspěchem podle pododdílu 6.1.5.6 nebo, kde je to nutné, podle pododdílu 6.5.6.6 s přiřazenou standardní kapalinou (kapalinami). Tenze par plnicích látek při 50°C nebo 55°C nesmějí překročit tenze par použité ke stanovení tlaku pro zkoušku vnitřním (hydraulickým) tlakem provedenou s úspěchem podle odstavce 6.1.5.5.4 nebo 6.5.6.8.4.2 s přiřazenou standardní kapalinou (kapalinami). V případě, že jsou plnicí látky přiřazeny ke kombinaci standardních kapalin, nesmějí odpovídající hodnoty plnicích látek překročit nejnižší hodnoty odvozené od použitých výšek pádu, stohovacích hmotností a vnitřních zkušebních tlaků.

Příklad: UN 1736 Benzylchlorid je přiřazen ke kombinaci standardních kapalin „Směs uhlovodíků a smáčecí roztok“. Benzylchlorid má tenzi par 0,34 kPa při 50 °C a relativní hustotu přibližně 1,2. Zkoušky konstrukčního typu pro plastové sudy a kanystry byly často prováděny na nejnižších požadovaných zkušebních úrovních. V praxi to znamená, že zkouška stohováním se obvykle provádí se stohovací zátěží odpovídající jen relativní hustotě 1,0 pro „Směs uhlovodíků“ a relativní hustotě 1,2 pro „Smáčecí roztok“ (viz definici standardních kapalin v oddílu 6.1.6). V důsledku toho by chemická snášenlivost takového zkoušeného konstrukčního typu nebyla ověřena pro benzylochlorid z důvodu neodpovídající zkušební úrovně konstrukčního typu se standardní kapalinou „směs uhlovodíků“. (Vzhledem ke skutečnosti, že ve většině případů je použitý vnitřní hydraulický zkušební tlak nejméně 100 kPa, měla by být tenze par benzylochloridu pokryta takovou zkušební úrovní podle pododdílu 4.1.1.10).

Všechny složky plnicí látky, která může být roztokem, směsí nebo přípravkem, jako jsou zvlhčovačla v čisticích a desinfekčních prostředcích, bez ohledu na to, zda jsou, nebo nejsou nebezpečné, musí být zahrnuty do přiřazovacího postupu.

4.1.1.21.3 *Přiřazovací postup*

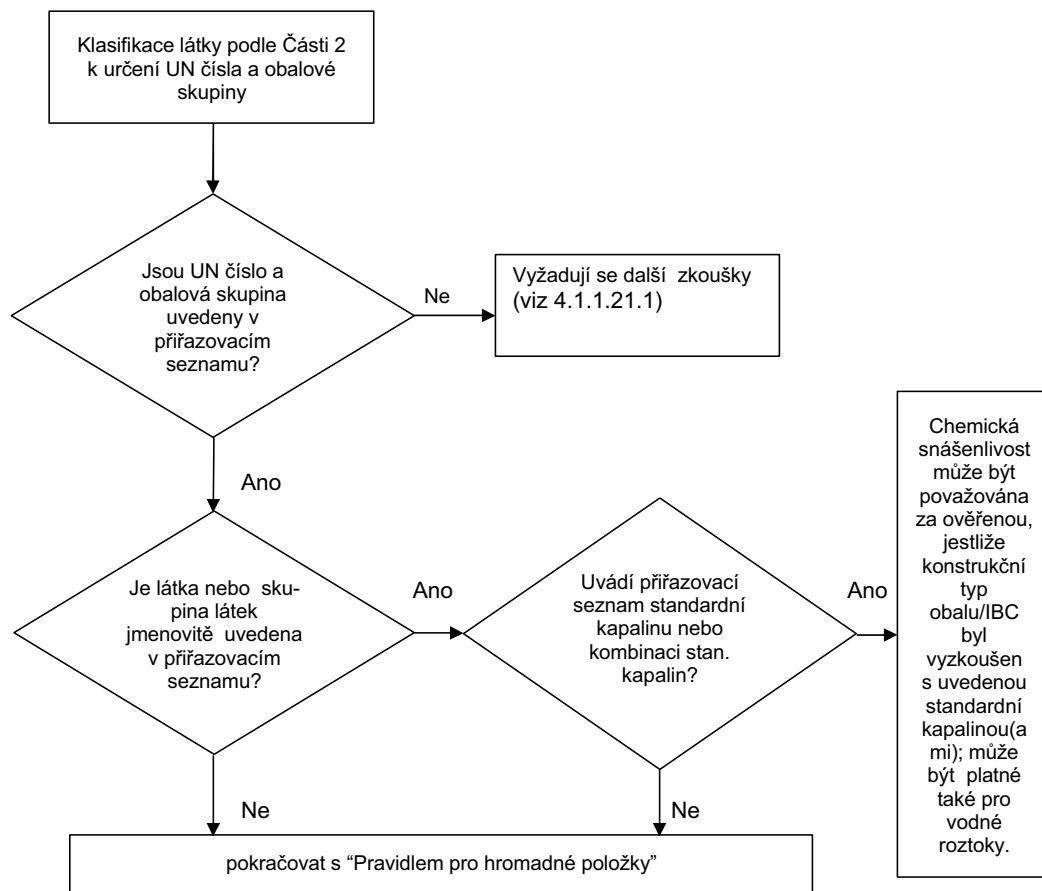

Pro přiřazení plnicích látek k látkám nebo skupinám látek uvedeným v odstavci 4.1.1.21.6 je nutno učinit následující kroky (viz též schéma v obr. 4.1.1.21.1):

- (a) Zařadit plnicí látku podle postupů a kritérií části 2 (určení UN čísla a obalové skupiny);
- (b) Najít UN číslo ve sloupci (1) tabulky 4.1.1.21.6, pokud je tam uvedeno;
- (c) Vybrat řádku, která odpovídá z hlediska obalové skupiny, koncentrace, bodu vzplanutí, přítomnosti složek, které nejsou nebezpečné, atd. pomocí informací uvedených ve sloupcích (2a), (2b) a (4), pokud pro toto UN číslo existuje více než jen jedna položka;

Pokud to není možné, musí být chemická snášenlivost ověřena podle odstavce 6.1.5.2.5 nebo 6.1.5.2.7 pro obaly a podle odstavce 6.5.6.3.3 nebo 6.5.6.3.6 pro IBC (avšak v případě vodných roztoků viz odstavec 4.1.1.21.4).

- (d) Jestliže UN číslo a obalová skupina plnicí látky určené podle písmene (a) nejsou uvedeny v přiřazovacím seznamu, musí být chemická snášenlivost prokázána podle odstavce 6.1.5.2.5 nebo 6.1.5.2.7 pro obaly a podle odstavce 6.5.6.3.3 nebo 6.5.6.3.6 pro IBC;
- (e) Použit „Pravidlo pro hromadné položky“ popsané v odstavci 4.1.1.21.5, pokud je to udáno ve sloupci (5) zvoleného řádku;
- (f) Chemická snášenlivost plnicí látky se může považovat s ohledem na odstavce 4.1.1.21.1 a 4.1.1.21.2 za ověřenou, pokud je standardní kapalina nebo kombinace standardních kapalin přiřazena ve sloupci (5) a konstrukční typ je schválen pro tuto/tyto standardní kapalinu(y).

Obrázek 4.1.1.21.1: Schéma pro přiřazování plnicích látek ke standardním kapalinám

4.1.1.21.4 Vodné roztoky

Vodné roztoky látek a skupin látek přiřazených ke specifické standardní kapalině(nám) podle odstavce 4.1.1.21.3 smějí být rovněž přiřazeny k této (těmto) standardní(m) kapalině(nám), pokud jsou splněny tyto podmínky:

- (a) vodný roztok může být přiřazen podle kritérií v pododdílu 2.1.3.3 k témuž UN číslu jako látka uvedená v přiřazovacím seznamu; a
- (b) vodný roztok není zvlášť jmenovitě uveden na jiném místě v přiřazovacím seznamu v odstavci 4.1.1.19.6; a
- (c) mezi nebezpečnou látkou a rozpouštěcí vodou neprobíhá žádná chemická reakce.

Příklad: Vodné roztoky UN 1120 terc-butanolu:

- *Samotný čistý terc-butanol je v přiřazovacím seznamu přiřazen ke standardní kapalině „kyselina octová“.*
- *Vodné roztoky terc-butanolu mohou být zařazeny pod položku UN 1120 BUTANOLY podle pododdílu 2.1.3.3, neboť vodný roztok terc-butanolu se neliší od položek čistých látek, pokud jde o třídu, obalovou skupinu(y) a fyzikální stav. Navíc není položka „1120 BUTANOLY“ výslovně omezena na čisté látky a vodné roztoky těchto látek nejsou zvlášť jmenovitě uvedeny jinde v tabulce A kapitoly 3.2, ani v přiřazovacím seznamu.*
- *UN 1120 BUTANOLY nereagují za normálních podmínek přepravy s vodou.*

V důsledku toho mohou být vodné roztoky UN 1120 terc-butanolu přiřazeny ke standardní kapalině „kyselina octová“.

4.1.1.21.5 Pravidlo pro hromadné položky

Pro přiřazení plnicích látek, u nichž je ve sloupci (5) uvedeno „Pravidlo pro hromadné položky“, musí být učiněny následující kroky a splněny následující podmínky (viz též schéma v obr. 4.1.1.21.2):

- (a) Provést přiřazovací postup pro každou nebezpečnou složku roztoku, směsi nebo přípravku podle odstavce 4.1.1.19.3 s přihlédnutím k podmínkám v odstavci 4.1.1.19.2. V případě druhových položek mohou být zanedbány složky, o nichž je známo, že nemají škodlivý vliv na polyetylén s vysokou molekulární hustotou (např. tuhé pigmenty v UN 1263 BARVA nebo LÁTKA POMOCNÁ K VÝROBĚ BAREV).
- (b) Rztok, směs nebo přípravek nemůže být přiřazen ke standardní kapalině, jestliže:
 - (i) UN číslo a obalová skupina jedné nebo více nebezpečných složek nejsou uvedeny v přiřazovacím seznamu, nebo
 - (ii) ve sloupci (5) přiřazovacího seznamu je pro jednu nebo více složek uvedeno „Pravidlo pro hromadné položky“, nebo
 - (iii) (s výjimkou UN 2059 NITROCELULÓZA, HOŘLAVÝ ROZTOK) klasifikační kód jedné nebo více nebezpečných složek se liší od klasifikačního kódu roztoku, směsi nebo přípravku.
- (c) Jestliže jsou všechny nebezpečné složky uvedeny v přiřazovacím seznamu a jejich klasifikační kódy jsou v souladu s klasifikačním kódem roztoku, směsi nebo přípravku samého a všechny nebezpečné složky jsou přiřazeny k téže standardní kapalině nebo kombinaci standardních kapalin ve sloupci (5), může být chemická snášenlivost roztoku, směsi nebo přípravku považována za ověřenou s ohledem na odstavce 4.1.1.21.1 a 4.1.1.21.2.

- (d) Jestliže jsou všechny nebezpečné složky uvedeny v přiřazovacím seznamu a jejich klasifikační kódy jsou v souladu s klasifikačním kódem roztoku, směsi nebo přípravku samého, ale ve sloupci (5) jsou uvedeny odlišné standardní kapaliny, může být chemická snášenlivost považována za ověřenou s ohledem na odstavce 4.1.1.21.1 a 4.1.1.21.2 jen pro následující kombinace standardních kapalin:
- (i) voda/kyselina dusičná 55 %; s výjimkou anorganických kyselin s klasifikačním kódem C1, které jsou přiřazeny ke standardní kapalině „voda“;
 - (ii) voda/smáčecí roztok;
 - (iii) voda/kyselina octová;
 - (iv) voda/směs uhlovodíků;
 - (v) voda/n-butylacetát – n-butylacetát-nasycený smáčecím roztokem.
- (e) V rozsahu platnosti tohoto pravidla se chemická snášenlivost nepovažuje za ověřenou pro jiné kombinace standardních kapalin než ty, které jsou uvedeny pod písmenem (d), ani pro všechny případy uvedené pod písmenem (b). V takových případech musí být chemická snášenlivost ověřena jiným způsobem (viz odstavec 4.1.1.21.3 (d)).

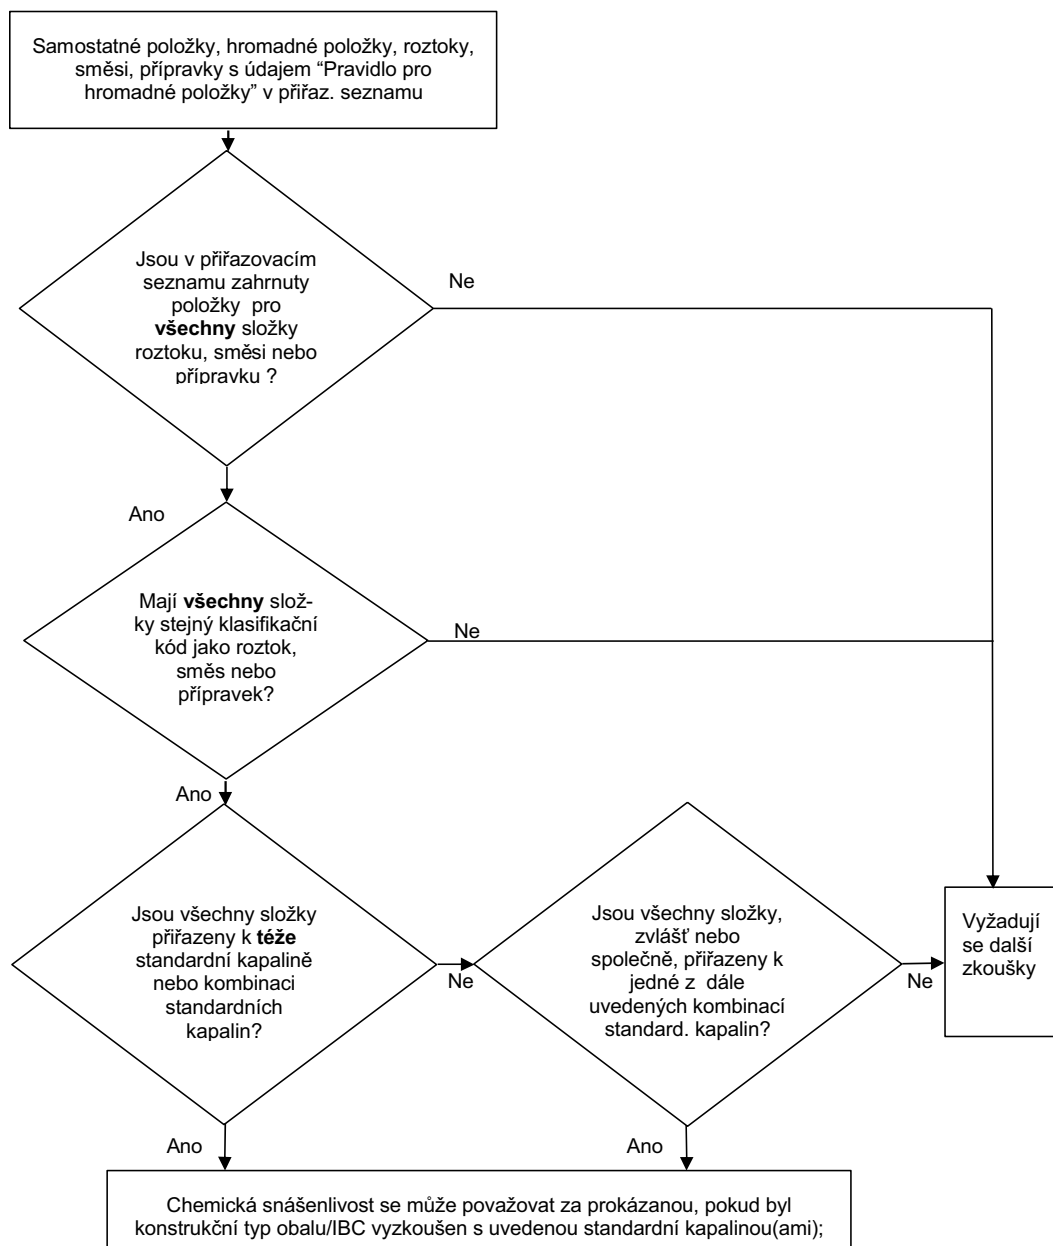

***Příklad 1:** Směs UN 1940 KYSELINY THIOGLYKOLOVÉ (50 %) a UN 2531 KYSELINY METHAKRYLOVÉ, STABILIZOVANÉ (50 %); klasifikace směsi: UN 3265 LÁTKA ŽÍRAVÁ, KAPALNÁ, KYSELÁ, ORGANICKÁ, J.N.*

- *Jak UN čísla složek, tak i UN číslo směsi jsou zahrnuta v přiřazovacím seznamu;*
- *Jak složky, tak i směs mají stejný klasifikační kód: C3;*
- *UN 1940 KYSELINA THIOGLYKOLOVÁ je přiřazena ke standardní kapalině „kyselina octová“ a UN 2531 KYSELINA METHAKRYLOVÁ, STABILIZOVANÁ je přiřazena ke standardní kapalině „n-butylacetát/n-butylacetát-saturovaný smáčecím roztokem“. Podle odstavce d) to není dovolená kombinace standardních kapalin. Chemická snášenlivost směsi musí být ověřena jiným způsobem.*

***Příklad 2:** Směs UN 1793 ISOPROPYLFOSFÁT (50 %) a UN 1803 KYSELINA FENOLSULFONOVÁ, KAPALNÁ (50 %); klasifikace směsi: UN 3265 LÁTKA ŽÍRAVÁ, KAPALNÁ, KYSELÁ, ORGANICKÁ, J.N.*

- *Jak UN čísla složek, tak i UN číslo směsi jsou zahrnuta v přiřazovacím seznamu;*
- *Jak složky, tak i směs mají stejný klasifikační kód: C3;*
- *UN 1793 ISOPROPYLFOSFÁT je přiřazen ke standardní kapalině „smáčecí roztok“ a UN 1803 KYSELINA FENOLSULFONOVÁ, KAPALNÁ je přiřazena ke standardní kapalině „voda“. Podle odstavce d) je toto jedna z dovolených kombinací standardních kapalin. V důsledku toho může být chemická snášenlivost pro tuto směs považována za ověřenou, za podmínky, že konstrukční typ obalu byl schválen pro standardní kapaliny „smáčecí roztok“ a „voda“.*

Obrázek 4.1.1.21.2: Schéma „Pravidla pro hromadné položky“

Dovolené kombinace standardních kapalin:

- voda/kyselina dusičná (55 %), kromě anorganických kyselin klasifikačního kódu C1, které jsou přiřazeny ke standardní kapalině "voda";
- voda/smáčecí roztok;
- voda/kyselina octová;
- voda/směs uhlovodíků;
- voda/n-butylocetát – n-butylocetát saturovaný smáčecím roztokem.

4.1.1.21.6 *Přířazovací seznam*

V následující tabulce (přířazovacím seznamu) jsou nebezpečné látky uvedeny v pořadí svých UN čísel. Zpravidla každý řádek se týká nebezpečné látky, samostatné položky nebo hromadné položky se specifickým UN číslem. Avšak některé po sobě jdoucí řádky mohou být použity pro totéž UN číslo, jestliže látky náležející k témuž UN číslu mají rozdílná pojmenování (např. jednotlivé isomery skupiny látek), rozdílné chemické vlastnosti, rozdílné fyzikální vlastnosti a/nebo rozdílné přepravní podmínky. V takových případech je samostatná položka nebo hromadná položka uvnitř určité obalové skupiny poslední z takových po sobě jdoucích řádků.

Sloupce (1) až (4) tabulky 4.1.1.21.6, v obdobné struktuře jako tabulka A kapitoly 3.2, jsou používány k identifikaci látky pro účely tohoto pododdílu. Poslední sloupec udává standardní kapalinu(y), ke které(ým) může být látka přiřazena.

Podrobné vysvětlivky k jednotlivým sloupcům:

Sloupec (1) UN číslo

Obsahuje UN číslo

- nebezpečné látky, pokud má tato látka své specifické UN číslo; nebo
- hromadné položky, k níž byly jmenovitě neuvedené nebezpečné látky přiřazeny podle kritérií („rozhodovacích stromů“) části 2.

Sloupec (2a) Oficiální pojmenování pro přepravu nebo technický název

Obsahuje pojmenování látky, pojmenování samostatné položky, která může zahrnovat různé isomery, nebo pojmenování hromadné položky samé.

Uvedené pojmenování se může lišit od příslušného oficiálního pojmenování pro přepravu.

Sloupec (2b) Popis

Obsahuje popisný text k vysvětlení rozsahu platnosti položky v těch případech, kdy klasifikace, přepravní podmínky a/nebo chemická snášenlivost látky mohou být proměnlivé.

Sloupec (3a) Třída

Obsahuje číslo třídy, pod jejíž název spadá nebezpečná látka. Toto číslo třídy se určí podle postupů a kritérií části 2.

Sloupec (3b) Klasifikační kód

Obsahuje klasifikační kód nebezpečné látky podle postupů a kritérií části 2.

Sloupec (4) Obalová skupina

Obsahuje číslo(a) obalové skupiny (obalových skupin) (I, II nebo III) přiřazené(ých) k nebezpečné látce na základě postupů a kritérií části 2. Některé látky nejsou přiřazeny k obalovým skupinám.

Sloupec (5) Standardní kapalina

Tento sloupec udává, jako konečnou informaci, buď jednu standardní kapalinu, nebo kombinaci standardních kapalin, k níž může být látka přiřazena, nebo odkaz na pravidlo pro hromadné položky v odstavci 4.1.1.21.5.

Tabulka 4.1.1.21.6: Přirázovací seznam

UN Číslo	Oficiální pojmenování pro přepravu nebo technický název	Popis	Třída	Klasifi- kační kód	Obalová skupina	Standardní kapalina
	3.1.2	3.1.2	2.2	2.2	2.1.1.3	
(1)	(2a)	(2b)	(3a)	(3b)	(4)	(5)
1090	ACETON		3	F1	II	směs uhlovodíků Poznámka: platí jen, pokud se prokáže, že úroveň propustnosti obalu vůči látce, která se má přepravovat, je přijatelná.
1093	AKRYLONITRIL, STABILIZOVANÝ		3	FT1	I	n-butylacetát/ smáčecí roztok nasycený n-butylacetátem
1104	AMYLACETÁTY	čisté isomery a směsi isomerů	3	F1	III	n-butylacetát/ smáčecí roztok nasycený n-butylacetátem
1105	PENTANOLY	čisté isomery a směsi isomerů	3	F1	II/III	n-butylacetát/ smáčecí roztok nasycený n-butylacetátem
1106	AMYLAMIN	čisté isomery a směsi isomerů	3	FC	II/III	směs uhlovodíků a smáčecí roztok
1109	AMYLFORMIÁTY	čisté isomery a směsi isomerů	3	F1	III	n-butylacetát/ smáčecí roztok nasycený n-butylacetátem
1120	BUTANOLY	čisté isomery a směsi isomerů	3	F1	II/III	kyselina octová
1123	BUTYLACETÁTY	čisté isomery a směsi isomerů	3	F1	II/III	n-butylacetát/ smáčecí roztok nasycený n-butylacetátem
1125	n-BUTYLAMIN		3	FC	II	směs uhlovodíků a smáčecí roztok
1128	n-BUTYLFORMIÁT		3	F1	II	n-butylacetát/ smáčecí roztok nasycený n-butylacetátem

*) Pro UN 1791: Zkouška se musí provést jen s odvodušňovací zařízení. Při provádění zkoušky s kyselinou dusičnou jako standardní kapalinou, musí být použito odvodušňovací zařízení a těsnění odolné proti kyselinám. Je-li zkouška prováděna s roztoky chlomanů, jsou dovolena rovněž odvodušňovací zařízení a těsnění stejného konstrukčního typu, odolná proti chlomanu (např. silikonový kaučuk), která nejsou odolná proti kyselině dusičné.

4.1.2 Dodatečná všeobecná ustanovení pro používání IBC

4.1.2.1 Pokud jsou IBC používány pro přepravu kapalin s bodem vzplanutí nejvýše 60°C (uzavřený kelímek) nebo sypkých látek náchylných k prachové explozi, musí být provedena opatření zabráňující nebezpečí elektrostatického výboje.

4.1.2.2 Každá kovová IBC, IBC z tuhého plastu a kompozitní IBC musí být podrobena příslušným prohlídkám a zkouškám podle pododdílů 6.5.4.4 nebo 6.5.4.5:

- před uvedením do používání;
- poté v intervalech nepřesahujících dva a půl nebo pět let jak je stanoveno;
- po opravě nebo rekonstrukci, před opětovným použitím pro přepravu.

IBC nesmějí být plněny a podávány k přepravě po datu uplynutí doby platnosti poslední periodické zkoušky nebo inspekce. Avšak IBC naplněná před datem uplynutí doby platnosti poslední periodické zkoušky nebo inspekce, může být přepravena v období nejvýše tří měsíců po uplynutí tohoto data. Kromě toho může být IBC přepravena po datu uplynutí doby platnosti poslední periodické zkoušky nebo inspekce:

- (a) po vyprázdnění, ale před vyčištěním, pro účely provedení předepsané zkoušky nebo inspekce před opětovným naplněním; a
- (b) pokud neschválí jinak příslušný orgán, v období nepřekračujícím šest měsíců po datu uplynutí lhůty platnosti poslední periodické zkoušky nebo inspekce, aby se umožnilo vrácení nebezpečných věcí nebo zbytků k jejich vhodné likvidaci nebo recyklaci.

POZNÁMKA: K údajům v přepravním dokladu viz odstavec 5.4.1.1.11.

4.1.2.3 IBC typu 31HZ2 musí být naplněny nejméně do 80% objemu vnějšího obalu.

4.1.2.4 S výjimkou běžné údržby kovových IBC, IBC z tuhého plastu, kompozitních a flexibilních IBC prováděné vlastníkem IBC, jehož stát a jméno nebo schválená značka jsou trvale vyznačeny na IBC, musí subjekt provádějící běžnou údržbu trvale označit IBC v blízkosti UN kódu výrobce těmito údaji:

- (a) státem, v němž byla běžná údržba provedena; a
- (b) jménem nebo schválenou značkou subjektu provádějícího běžnou údržbu.

4.1.3 Všeobecná ustanovení týkající se pokynů pro balení

4.1.3.1 Pokyny pro balení platné pro nebezpečné věci třídy 1 až 9 jsou specifikovány v oddílu 4.1.4. Člení se do tří pododdílů podle druhu obalů, kterých se týkají:

- | | |
|------------------|---|
| Pododdíl 4.1.4.1 | pro obaly jiné než IBC a velké obaly; tyto pokyny pro balení jsou označeny alfanumerickým kódem začínajícím písmenem "P", anebo pokud jde o obaly specifické pro RID a ADR, písmenem "R"; |
| Pododdíl 4.1.4.2 | pro IBC; tyto pokyny jsou označeny alfanumerickým kódem začínajícím písmeny "IBC"; |
| Pododdíl 4.1.4.3 | pro velké obaly; tyto pokyny pro balení jsou označeny alfanumerickým kódem začínajícím písmeny "LP". |

Všeobecně se v pokynech pro balení stanoví, že platí všeobecná ustanovení oddílů 4.1.1, 4.1.2 nebo 4.1.3, jak je to vhodné. Pokyny pro balení mohou též vyžadovat dodržení zvláštních ustanovení oddílů 4.1.5, 4.1.6, 4.1.7, 4.1.8 nebo 4.1.9, jak je to vhodné. Zvláštní ustanovení pro balení mohou být také specifikována v pokynech pro balení pro určité látky nebo předměty. Tato jsou rovněž označena alfanumerickým kódem začínajícím písmeny:

„PP“ pro obaly jiné než IBC a velké obaly, nebo „RR“, pokud jde o zvláštní ustanovení pro balení specifická pro RID a ADR;

„B“ pro IBC, nebo „BB“, pokud jde o zvláštní ustanovení pro balení specifická pro RID a ADR;

„L“ pro velké obaly“ nebo „LL“ pro zvláštní ustanovení pro balení specifická pro ADR;

Pokud není stanoveno jinak, každý obal musí splňovat odpovídající požadavky části 6. Obecně neřikají pokyny pro balení nic o snášenlivosti, proto uživatel nesmí zvolit obal bez ověření, že látka je snášenlivá se zvoleným obalovým materiálem (např. skleněné nádoby jsou nevhodné pro většinu fluoridů). Pokud jsou v pokynech pro balení dovoleny skleněné nádoby, jsou dovoleny rovněž obaly z porcelánu, užitkové keramiky a kameniny.

4.1.3.2 Sloupec (8) tabulky A kapitoly 3.2 uvádí pro každý předmět nebo látku pokyn (pokyny) pro balení, který(é) musí být použit(y). Ve sloupci (9a) jsou udána zvláštní ustanovení pro balení a ve sloupci (9b) zvláštní ustanovení pro společné balení (viz oddíl 4.1.10) vztahující se na jednotlivé látky nebo předměty.

4.1.3.3 V každém pokynu pro balení jsou uvedeny, pokud je to vhodné, informace o dovolených samostatných a skupinových obalech. Pro skupinové obaly jsou uvedeny dovolené vnější a vnitřní obaly, a pokud je to vhodné, rovněž nejvyšší množství dovolené pro každý vnitřní nebo vnější obal. Nejvyšší čistá (netto) hmotnost a nejvyšší vnitřní objem jsou definovány v oddílu 1.2.1.

4.1.3.4 Následující obaly nesmějí být použity, pokud jsou látky, které se mají přepravovat, náchylné ke zkapalnění během přepravy:

Obaly

Sudy:	1D a 1G
Bedny:	4A, 4B, 4C1, 4C2, 4D, 4F, 4G, 4H1 a 4H2
Pytle:	5L1, 5L2, 5L3, 5H1, 5H2, 5H3, 5H4, 5M1 a 5M2
Kompozitní obaly:	6HC, 6HD2, 6HG1, 6HG2, 6HD1, 6PC, 6PD1, 6PD2, 6PG1, 6PG2 a 6PH1

Velké obaly:

flexibilní plast	51H (vnější obal)
------------------	-------------------

IBC

Pro látky obalové skupiny I: všechny typy IBC

Pro látky obalové skupiny II a III:

dřevěné:	11C, 11D a 11F
lepenkové:	11G
flexibilní:	13H1, 13H2, 13H3, 13H4, 13H5, 13L1, 13L2, 13L3, 13L4, 13M1 a 13M2
kompozitní:	11HZ2 a 21HZ2.

Pro účely tohoto pododdílu jsou látky a směsi látek mající bod tání nejvýše 45 °C považovány za tuhé látky náchylné ke zkapalnění během přepravy.

4.1.3.5 Pokud pokyny pro balení v této kapitole dovolují použití určitého typu obalu (např. 4G, 1A2), mohou být použity rovněž obaly, které mají stejný identifikační kód, následovaný písmeny "V", "U" nebo "W", označené podle předpisů části 6 (např. 4GV, 4GU nebo 4GW; 1A2V, 1A2U nebo 1A2W), za stejných podmínek a omezení, jaké platí pro použití tohoto typu obalu podle příslušných pokynů pro balení. Například skupinový obal označený kódem obalu "4GV" může být použit kdykoli je dovolen skupinový obal označený "4G", pokud jsou splněny požadavky příslušného pokynu pro balení ve vztahu k druhům vnitřních obalů a množstevním omezením.

4.1.3.6 Tlakové nádoby pro kapaliny a tuhé látky

4.1.3.6.1 Pokud není v ADR uvedeno jinak, jsou tlakové nádoby splňující:

- (a) příslušné požadavky kapitoly 6.2; nebo
- (b) národní nebo mezinárodní normy pro konstrukci, výrobu, zkoušky a prohlídky používané zemí, v níž se tlakové nádoby vyrábějí, za podmínky, že jsou splněna ustanovení pododdílu 4.1.3.6 a že u kovových lahví, trubkových nádob, tlakových sudů, svazků lahví a záchranných tlakových nádob je konstrukce taková, že je minimální poměr mezi tlakem při roztržení a zkušebním tlakem:
 - (i) 1,50 pro opakovaně plnitelné tlakové nádoby;
 - (ii) 2,00 pro tlakové nádoby, které nejsou opakovaně plnitelné,

dovoleny pro přepravu jakékoli kapalné nebo tuhé látky, kromě výbušnin, tepelně nestálých látek, organických peroxidů, samovolně se rozkládajících látek, látek, které mohou způsobit chemickou reakci, významný nárůst tlaku uvnitř obalu, a radioaktivních látek (jiných, než jsou dovoleny v oddíle 4.1.9).

Tento pododdíl se nevztahuje na látky uvedené v pododdíle 4.1.4.1, pokynu pro balení P200, tabulce 3.

4.1.3.6.2 Každý konstrukční typ tlakové nádoby musí být schválen příslušným orgánem země výroby, nebo jak je uvedeno v kapitole 6.2.

4.1.3.6.3 Není-li stanoveno jinak, musí se používat tlakové nádoby s nejnižším zkušebním tlakem 0,6 MPa.

4.1.3.6.4 Není-li uvedeno něco jiného, mohou být tlakové nádoby opatřeny nouzovým zařízením pro vyrovnávání tlaku zkonstruovaným pro zamezení roztržení nádoby v případě přeplnění nebo požáru.

Ventily tlakových nádob musí být zkonstruovány a vyrobeny takovým způsobem, aby byly schopny samy odolat poškození bez úniku obsahu, nebo musí být chráněny před poškozením, které by mohlo způsobit nežádoucí únik obsahu tlakové nádoby, jednou z metod popsanych v pododdíle 4.1.6.8 (a) až (e).

4.1.3.6.5 Tlaková nádoba nesmí být naplněna více než do 95 % svého vnitřního objemu při 50 °C. V nádobě musí být ponechán dostatečný volný prostor (dutina), aby bylo zaručeno, že tlaková nádoba nebude plná kapaliny při teplotě 55 °C.

4.1.3.6.6 Není-li uvedeno něco jiného, musí být tlakové nádoby podrobeny periodické prohlídce a zkoušce každých 5 let. Periodická prohlídka musí zahrnovat vnější prohlídku, vnitřní prohlídku nebo alternativní metodu se souhlasem příslušného orgánu, tlakovou zkoušku nebo rovnocennou nedestruktivní zkoušku se souhlasem příslušného orgánu, včetně kontroly veškerého příslušenství (např. těsnost ventilů, nouzové zařízení pro vyrovnávání tlaku nebo tavné prvky). Tlakové nádoby nesmějí být naplněny poté, kdy prošla lhůta pro provedení periodické prohlídky a zkoušky, ale smějí být přepraveny po vypršení této lhůty. Opravy tlakových nádob musí splňovat požadavky uvedené v pododdíle 4.1.6.11.

4.1.3.6.7 Před naplněním musí balič provést kontrolu tlakové nádoby a přesvědčit se, že je tlaková nádoba dovolena pro látku, která se má přepravovat, a že jsou splněny požadavky ADR. Uzavírací ventily se musí po naplnění uzavřít a musí zůstat během přepravy uzavřeny. Odesílatel musí ověřit těsnost uzávěrů a výstroje.

4.1.3.6.8 Opakovaně plnitelné tlakové nádoby nesmějí být plněny látkou odlišnou od látky, kterou obsahovaly předtím, ledaže byly provedeny operace potřebné pro změnu použití nádoby.

4.1.3.6.9 Značení tlakových nádob pro kapaliny a tuhé látky podle pododdílu 4.1.3.6 (neodpovídajících požadavkům kapitoly 6.2) musí být v souladu s požadavky příslušného orgánu země výroby.

4.1.3.7 Obaly nebo IBC, které nejsou výslovně dovoleny příslušným pokynem pro balení, nesmějí být použity k přepravě látek nebo předmětů, ledaže jsou mezi smluvními stranami dohodnuty dočasné odchylky podle oddílu 1.5.1.

4.1.3.8 Nebalené předměty, kromě předmětů třídy 1

4.1.3.8.1 Pokud velké a robustní předměty nemohou být zabaleny podle předpisů kapitol 6.1 nebo 6.6 a musí být přepravovány prázdné, nevyčištěné a nezabalené, může příslušný orgán země původu² schválit takovou přepravu. Přitom musí příslušný orgán vzít v úvahu, že:

- (a) Velké a robustní předměty musí být dostatečně pevné, aby odolaly rázům a namáháním obvyklým během přepravy, včetně překládky mezi dopravními jednotkami a mezi dopravními jednotkami a sklady, jakož i při přemísťování z palety pro následnou ruční nebo mechanickou manipulaci;
- (b) Všechny uzávěry a otvory musí být utěsněny tak, aby nedošlo k úniku obsahu, který by mohl být za normálních podmínek přepravy způsoben vibracemi nebo změnami teploty, vlhkosti nebo tlaku (např. z důvodu změny nadmořské výšky). Na vnější straně velkých a robustních předmětů nesmějí ulpívat žádné nebezpečné zbytky;
- (c) Části velkých a robustních předmětů, které jsou v přímém styku s nebezpečnými věcmi:
 - (i) nesmějí být těmito nebezpečnými věcmi narušovány ani významně zeslabovány; a
 - (ii) nesmějí vyvolat žádný nebezpečný účinek, např. působit jako katalyzátor při reakci nebo reagovat s nebezpečnými věcmi;
- (d) Velké a robustní předměty obsahující kapaliny musí být uloženy a zajištěny tak, aby bylo zaručeno, že během přepravy nedojde ani k úniku obsahu, ani k trvalé deformaci předmětu;
- (e) Musí být upevněny v lůžkách nebo latěni nebo jiných manipulačních zařízeních nebo v dopravní jednotce nebo v kontejneru takovým způsobem, aby se nemohly uvolnit za normálních podmínek přepravy.

4.1.3.8.2 Nebalené předměty schválené příslušným orgánem podle ustanovení uvedených v odstavci 4.1.3.8.1 podléhají postupům pro odesílání části 5. Kromě toho musí odesílatel takových předmětů zajistit, aby kopie jakéhokoli takového schválení byla přiložena k přepravnímu dokladu.

POZNÁMKA: Velký a robustní předmět může zahrnovat flexibilní palivové nádržové systémy, vojenskou výbavu, stroje nebo zařízení obsahující nebezpečné věci nad omezená množství podle oddílu 3.4.1.

4.1.4 Přehled pokynů pro balení

POZNÁMKA: Ačkoli následující pokyny pro balení používají stejný číselný systém, jaký je použit v IMDG Code a ve Vzorových předpisech OSN, mohou být v případě ADR v některých detailech rozdíly.

² Pokud země původu není smluvní stranou ADR, příslušný orgán prvního státu smluvní strany ADR, který přijde do styku se zásilkou.

4.1.4.1 Pokyny pro balení týkající se použití obalů (s výjimkou IBC a velkých obalů)

P 001		POKYN PRO BALENÍ (KAPALINY)			P 001
Jsou dovoleny následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:

^{*)} Jsou dovoleny pouze látky s viskozitou vyšší než 2 680 mm ² /s.				
Tlakové nádoby pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6., mohou být používány.				
Dodatečný požadavek Pro látky třídy 3, obalovou skupinu III, které vylučují malá množství oxidu uhličitého nebo dusíku, musí být obaly odvětrávány.				
Zvláštní ustanovení pro balení:				
PP 1	Pro UN čísla 1133, 1210, 1263 a 1866 a pro lepidla, tiskařské barvy, pomocné látky k výrobě tiskařských barev, barvy, pomocné látky k výrobě barev a roztoky pryskyřic, které jsou přiřazeny k UN 3082, nemusí kovové nebo plastové obaly pro látky obalových skupin II a III v množstvích nejvýše 5 litrů na obal vyhovět zkouškám kapitoly 6.1, pokud jsou přepravovány: (d) na paletách, v paletových bednách nebo jiných manipulačních jednotkách, např. samostatné obaly uložené nebo stohované na paletě a zajištěné přepásáním, průtažnou nebo smršťovací fólií nebo jiným vhodným způsobem, nebo (e) jako vnitřní obaly skupinových obalů, jejichž čistá (netto) hmotnost nepřesahuje 40 kg.			
PP 2	Pro UN číslo 3065 mohou být použity dřevěné sudy o nejvyšším vnitřním objemu 250 litrů, které nesplňují ustanovení kapitoly 6.1.			
PP 4	Pro UN číslo 1774 musí obaly splňovat parametry obalové skupiny II.			
PP 5	Pro UN číslo 1204 musí být obaly konstruovány tak, aby se zamezilo výbuchu z důvodu nárůstu vnitřního tlaku. Pro tyto látky nesmějí být použity lahve, trubkové nádoby a tlakové sudy.			
PP 6	<i>(Vypuštěno)</i>			
PP 10	Pro UN číslo 1791, obalovou skupinu II, musí mít obal odvětrávací zařízení.			
PP 31	Pro UN číslo 1131 musí být obaly hermeticky uzavřeny.			
PP 33	Pro UN číslo 1308, obalové skupiny I a II, jsou dovoleny jen skupinové obaly o nejvyšší celkové (brutto) hmotnosti 75 kg.			
PP 81	Pro UN číslo 1790 s více než 60 %, nejvýše však 85 % fluorovodíku a UN číslo 2031 s více než 55 % kyseliny dusičné je dovolená doba používání plastových sudů a kanystrů jako samostatných obalů dva roky od data jejich výroby.			
Zvláštní ustanovení pro balení, specifické pro RID a ADR:				
RR 2	Pro UN číslo 1261 nejsou dovoleny obaly s odnímatelným víkem.			

P 002		POKYN PRO BALENÍ (TUHÉ LÁTKY)			P 002	
Jsou dovoleny následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3.

^e Tyto obaly nesmějí být použity pro látky, které mohou zkapalet během přepravy (viz pododdíl 4.1.3.4).				
Tlakové nádoby mohou být používány, pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6.				
Zvláštní ustanovení pro balení				
PP 6	(Vypuštěno)			
PP 7	Pro UN číslo 2000 smí být celuloid přepravován též bez obalu na paletách, obalený plastovou fólií a upevněný vhodnými prostředky, jako jsou ocelové pásy, jako vozová zásilka v uzavřených vozidlech nebo kontejnerech. Celková (brutto) hmotnost palety nesmí překročit 1000 kg.			
PP 8	Pro UN číslo 2002 musí být obaly konstruovány tak, aby se zamezilo výbuchu vlivem nárůstu vnitřního tlaku. Pro tyto látky nesmějí být použity lahve, trubkové nádoby a tlakové sudy.			
PP 9	Pro UN čísla 3175, 3243 a 3244 musí obaly odpovídat konstrukčnímu typu, který vyhověl při zkoušce těsnosti pro obalovou skupinu II. Pro UN 3175 se nevyžaduje zkouška těsnosti, pokud jsou kapaliny úplně nasáklé v tuhé látce a jsou v těsně uzavřených pytlích.			
PP 11	Pro UN číslo 1309, obalovou skupinu III, a UN číslo 1362 jsou dovoleny pytle 5H1, 5L1 a 5M1, pokud jsou zabaleny v plastových pytlích a jsou uloženy na paletách pod smršťovací nebo průtažnou fólií.			
PP 12	Pro UN čísla 1361, 2213 a UN číslo 3077 jsou dovoleny pytle 5H1, 5L1 a 5M1, pokud jsou přepravovány v uzavřených vozidlech nebo kontejnerech.			
PP 13	Pro předměty spadající pod UN číslo 2870 jsou dovoleny pouze skupinové obaly vyhovující parametrům obalové skupiny I.			
PP 14	Pro UN čísla 2211, 2698 a 3314 nemusí obaly nutně vyhovět zkouškám obalů dle kapitoly 6.1.			
PP 15	Pro UN čísla 1324 a 2623 musí obaly vyhovovat parametrům obalové skupiny III.			
PP 20	Pro UN číslo 2217 může být použita každá prachotěsná a proti roztržení odolná nádoba.			
PP 30	Pro UN číslo 2471 nejsou dovoleny vnitřní obaly z papíru nebo lepenky.			
PP 34	Pro UN číslo 2969 (celá zrna) jsou dovoleny pytle 5H1, 5L1 a 5M1.			
PP 37	Pro UN čísla 2590 a 2212 jsou dovoleny pytle 5M1. Všechny pytle jakéhokoli druhu musí být přepravovány v uzavřených vozidlech nebo kontejnerech nebo být uloženy v uzavřených tuhých přepravních obalových souborech.			
PP 38	Pro UN číslo 1309, obalovou skupinu II, jsou pytle dovoleny pouze v uzavřených vozech nebo kontejnerech.			
PP 84	Pro UN číslo 1057 se musí použít tuhé vnější obaly splňující parametry obalové skupiny II. Obaly musí být zkonstruovány, vyrobeny a upraveny tak, aby se zabránilo pohybu, neúmyslnému zážehu prostředků nebo náhodnému uvolnění hořlavého plynu nebo kapaliny. POZNÁMKA: K odpadovým zapalovačům shromažďovaným jednotlivě viz kapitolu 3.3, zvláštní ustanovení 654.			
Zvláštní ustanovení pro balení, specifické pro RID a ADR				
RR 5	Bez ohledu na zvláštní ustanovení pro balení PP 84 musí být dodržena jen všeobecná ustanovení uvedená v pododdílech 4.1.1.1, 4.1.1.2 a 4.1.1.5 až 4.1.1.7, jestliže je celková (brutto) hmotnost kusu nejvýše 10 kg. POZNÁMKA: K odpadovým zapalovačům shromažďovaným jednotlivě viz kapitolu 3.3, zvláštní ustanovení 654.			

P 003	POKYN PRO BALENÍ	P 003
	<p>Nebezpečné věci musí být uloženy do vhodných vnějších obalů. Obaly musí vyhovovat ustanovením uvedeným v pododdílech 4.1.1.1, 4.1.1.2, 4.1.1.4, 4.1.1.8 a v oddílu 4.1.3 a zkonstruovány tak, aby splnily konstrukční požadavky oddílu 6.1.4. Musí být použity vnější obaly vyrobené z vhodného materiálu a přiměřené pevnosti a konstrukce vzhledem k jejich vnitřnímu objemu a zamýšlenému použití. Pokud se tento pokyn pro balení použije pro přepravu předmětů nebo vnitřních obalů skupinových obalů, musí být obal zkonstruován a vyroben tak, aby se předešlo nezamýšlenému vypadnutí předmětů během normálních podmínek přepravy.</p>	
	Zvláštní ustanovení pro balení	
PP 16	<p>Pro UN číslo 2800 musí být akumulátory chráněny před zkraty a musí být bezpečně zabaleny v pevných vnějších obalech.</p> <p>Poznámka 1: Akumulátory chráněné proti vytečení, které jsou nedílnou součástí mechanického nebo elektronického zařízení, nebo jsou nezbytné pro jeho provoz, musí být bezpečně upevněny v držáku akumulátoru na těchto zařízeních a chráněny proti poškození a zkratům.</p> <p>Poznámka 2: K použitým akumulátorům (UN číslo 2800) viz P 801a.</p>	
PP17	Pro UN číslo 2037 nesmí čistá (netto) hmotnost kusů překročit 55 kg pro lepenkové obaly nebo 125 kg pro ostatní obaly.	
PP 19	Pro látky UN čísel 1364 a 1365 je dovolena přeprava v žocích.	
PP 20	Látky UN čísel 1363, 1386, 1408 a 2793 mohou být přepravovány v každé prachotěsné a proti roztržení odolné nádobě.	
PP 32	Látky UN čísel 2857 a 3358 mohou být přepravovány bez obalu v latěních nebo ve vhodných přepravních obalových souborech.	
PP 87	(Vypuštěno)	
PP 88	(Vypuštěno)	
PP90	Pro UN číslo 3506 musí být použity hermeticky uzavřené vnitřní vložky nebo pytle z pevného nepropustného a vůči propíchnutí odolného materiálu, nepropouštějícího rtuť, které zabrání úniku látky z kusu bez ohledu na polohu nebo orientaci kusu.	
PP91	Pro UN 1044 smějí být velké hasicí přístroje přepravovány také bez obalu, pokud jsou splněny požadavky uvedené v 4.1.3.8.1 (a) až (e), ventily jsou chráněny jednou z metod podle 4.1.6.8 (a) až (d) a jiné příslušenství namontované na hasicím přístroji je chráněno tak, aby se zamezilo náhodné aktivaci. Pro účely tohoto zvláštního ustanovení pro balení „velké hasicí přístroje“ jsou hasicí přístroje popsány v odsečích (c) až (e) zvláštního ustanovení 225 kapitoly 3.3.	
	Zvláštní ustanovení pro balení specifická pro RID a ADR:	
RR6	Pro UN číslo 2037 mohou být v případě přepravy vozové zásilky kovové předměty baleny také následujícím způsobem: Předměty musí být seskupeny do jednotek na podložkách a drženy na místě vhodným plastovým krytem; tyto jednotky musí být nastohovány a vhodně zajištěny na paletách.	
RR9	<p>Pro UN 3509 nemusí obaly splňovat požadavky uvedené v 4.1.1.3.</p> <p>Musí být použity obaly splňující požadavky uvedené v 6.1.4, vyrobené jako těsné nebo opatřené těsně uzavřenou vložkou nebo pytle, odolnými proti proražení</p> <p>Jsou-li jedinými obsaženými zbytky tuhé látky, které nejsou náchylné ke zkapalnění při pravděpodobných teplotách během přepravy, smějí být použity flexibilní obaly.</p> <p>Jsou-li přítomné kapalné zbytky, musí být použity tuhé obaly se zádržnými prostředky (např. absorpčním materiálem).</p> <p>Před naplněním a podáním k přepravě musí být každý obal prohlédnut, aby se zajistilo, že je bez koroze, kontaminace nebo jiného poškození. Každý obal vykazující známky snížené pevnosti již nesmí být použit (menší promáčknutí nebo škrábance nejsou považovány za snižující pevnost obalu).</p> <p>Obaly určené pro přepravu obalů, vyřazených, prázdných, nevyčištěných se zbytky věci třídy 5.1 musí být zkonstruovány nebo upraveny tak, aby věci nemohly přijít do styku se dřevem nebo jakýmkoli jiným hořlavým materiálem.</p>	

P 004	POKYN PRO BALENÍ	P 004
Tento pokyn platí pro UN čísla 3473, 3476, 3477, 3478 a 3479.		
Jsou dovoleny následující obaly:		
(1) Pro zásobníky do palivových článků pokud jsou dodržena všeobecná ustanovení v 4.1.1.1, 4.1.1.2, 4.1.1.3, 4.1.1.6 a 4.1.3:		
Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G);		
Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);		
Kanystry (3A2, 3B2, 3H2).		
Obaly musí vyhovovat parametrům obalové skupiny II.		
(2) Pro zásobníky do palivových článků balené se zařízením: pevné vnější obaly, které splňují všeobecná ustanovení v 4.1.1.1, 4.1.1.2, 4.1.1.6 a 4.1.3.		
Jsou-li zásobníky do palivových článků baleny se zařízením, musí být zabaleny do vnitřních obalů, nebo uloženy ve vnějším obalu s fixačním materiálem nebo dělicí stěnou (stěnami) tak, aby zásobníky do palivových článků byly chráněny proti poškození, které může být způsobeno pohybem nebo rozmístěním obsahu ve vnějším obalu.		
Zařízení musí být zajištěno proti pohybu uvnitř vnějšího obalu.		
Pro účely tohoto pokynu pro balení „zařízení“ znamená přístroj, vyžadující zásobníky do palivových článků, s nimiž je balen, ke své činnosti.		
(3) Pro zásobníky do palivových článků obsažené zařízení: pevné vnější obaly, které splňují všeobecná ustanovení v 4.1.1.1, 4.1.1.2, 4.1.1.6 a 4.1.3.		
Velká robustní zařízení (viz 4.1.3.8) obsahující zásobníky do palivových článků smějí být přepravována bez obalu. Pro zásobníky do palivových článků obsažené v zařízení musí být celý systém chráněn proti zkratu a nechtěnému uvedení do činnosti.		

P 010		POKYN PRO BALENÍ		P 010
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení dle 4.1.1 a 4.1.3:				
Skupinové obaly				
Vnitřní obaly		Vnější obaly	Nejvyšší čistá (netto) hmotnost (viz 4.1.3.3)	
Sklo 1 litr Ocel 40 litrů		Sudy z oceli (1A1, 1A2) z plastu (1H1, 1H2) z překližky (1D) z lepenky (1G)	400 kg 400 kg 400 kg 400 kg	
		Bedny z oceli (4A) z přírodního dřeva (4C1, 4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z pěnového plastu (4H1) z tuhého plastu (4H2)	400 kg 400 kg 400 kg 400 kg 400 kg 60 kg 400 kg	
Samostatné obaly:			Nejvyšší vnitřní objem (viz 4.1.3.3)	
Sudy z oceli, s neodnímatelným víkem (1A1)			450 litrů	
Kanistry z oceli, s neodnímatelným víkem (3A1)			60 litrů	
Kompozitní obaly plastová nádoba v ocelových sudech (6HA1)			250 litrů	
Ocelové tlakové nádoby , pokud jsou dodržena všeobecná ustanovení v 4.1.3.6.				

P 099	POKYN PRO BALENÍ	P 099
Mohou být použity jen obaly schválené pro tyto věci příslušným orgánem. Kopie schválení příslušného orgánu musí doprovázet každou zásilku, nebo přepravní doklad musí obsahovat zápis, že byl obal schválen příslušným orgánem.		

P 101	POKYN PRO BALENÍ	P 101
Mohou být použity jen obaly schválené příslušným orgánem v zemi původu. Pokud země původu není smluvní stranou ADR, musí být obal schválen příslušným orgánem prvního státu, který je smluvní stranou ADR, do něhož zásilka dorazila. V přepravním dokladu musí být uvedena rozlišovací značka státu, používaná pro silniční motorová vozidla v mezinárodním provozu, pro který příslušný orgán plní svou funkci, a to takto: "Obal schválen příslušným orgánem " (viz 5.4.1.2.1 (e))		

P 110(a)	POKYN PRO BALENÍ (VYHRAZENO)	P 110(a)
POZNÁMKA: Tento pokyn pro balení, uvedený ve Vzorových předpisech OSN, není dovolen pro přepravy dle ADR.		

P 110(b)	POKYN PRO BALENÍ		P 110(b)
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly	Meziobaly	Vnější obaly	
Nádoby z kovu ze dřeva z pryže, vodivé z plastu, vodivého Pytle z pryže, vodivé z plastu, vodivého	Dělicí přepážky z kovu ze dřeva z plastu z lepenky	Bedny z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F)	
Zvláštní ustanovení pro balení PP 42 Pro UN čísla 0074, 0113, 0114, 0129, 0130, 0135 a 0224, musí být splněny následující podmínky: (a) Vnitřní obaly nesmějí obsahovat více než 50 g výbušné látky (množství odpovídající suché látce); (b) Komory vytvořené dělicími přepážkami nesmějí obsahovat více než jeden vnitřní obal, pevně uložený; a (c) Vnější obal může být rozdělen až na 25 komor.			

P 111	POKYN PRO BALENÍ		P 111
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly	Meziobaly	Vnější obaly	
Pytle z vodotěsného papíru z plastu z pogumované textilní tkaniny Nádoby ze dřeva Balící materiály z plastu z pogumované textilní tkaniny	nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z pěnového plastu (4H1) z tuhého plastu (4H2) Sudy z oceli, s odnímatelným víkem (1A2) z hliníku, s odnímatelným víkem (1B2) z překližky (1D) z lepenky (1G) z plastu, s odnímatelným víkem (1H2)	
Zvláštní ustanovení pro balení			
PP 43	Pro UN číslo 0159 se nevyžadují vnitřní obaly, pokud se jako vnější obaly použijí kovové (1A1, 1A2, 1B1, 1B2, 1N1 nebo 1N2) nebo plastové (1H1 nebo 1H2) sudy.		

P 112(a)	POKYN PRO BALENÍ (vlhčené tuhé látky 1.1D)		P 112(a)
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly	Meziobaly	Vnější obaly	
Pytle z vícevrstvého vodovzdorného papíru z plastu z textilní tkaniny z pogumované textilní tkaniny z plastové tkaniny Nádoby z kovu z plastu	Pytle z plastu z textilní tkaniny, s povlakem nebo vložkou z plastu Nádoby z kovu z plastu ze dřeva	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z pěnového plastu (4H1) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)	
Dodatečný požadavek Meziobaly nejsou vyžadovány, pokud jsou jako vnější obal použity těsné sudy s odnímatelným víkem.			
Zvláštní ustanovení pro balení			
PP 26	Pro UN čísla 0004, 0076, 0078, 0154, 0219 a 0394 musí být obaly bez olova.		
PP 45	Pro UN čísla 0072 a 0226 se nevyžadují meziobaly.		

P 112(b)	POKYN PRO BALENÍ (suché tuhé látky, jiné než práškovité 1.1D)		P 112(b)
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly	Meziobaly	Vnější obaly	
Pytle z kraftového papíru z vícevrstvého vodovzdorného papíru z plastu z textilní tkaniny z pogumované textilní tkaniny z plastové tkaniny	Pytle (jen pro UN číslo 0150) z plastu z textilní tkaniny, s povlakem nebo vložkou z plastu	Pytle z plastové tkaniny, prachotěsné (5H2) z plastové tkaniny, vodovzdorné (5H3) z plastové folie (5H4) z textilní tkaniny, prachotěsné (5L2) vodovzdorné (5L3) z vícevrstvého papíru, vodovzdorné (5M2) Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z pěnového plastu (4H1) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)	
Zvláštní ustanovení pro balení			
PP 26	Pro UN čísla 0004, 0076, 0078, 0154, 0216, 0219 a 0386 musí být obaly bez olova.		
PP 46	Pro UN číslo 0209 se pro vločkovitý nebo hrudkovitý TNT v suchém stavu doporučují prachotěsné pytle (5H2) a nejvyšší čistá (netto) hmotnost 30 kg.		
PP 47	Pro UN číslo 0222 nejsou vyžadovány vnitřní obaly, pokud je vnějším obalem pytel.		

P 112(c)	POKYN PRO BALENÍ (suché tuhé látky práškovité 1.1D)		P 112(c)
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Pytle z vícevrstvého vodovzdorného papíru z plastu z plastové tkaniny Nádoby z lepenky z kovu z plastu ze dřeva	Pytle z vícevrstvého vodovzdorného papíru, s vnitřním povlakem z plastu Nádoby z kovu z plastu ze dřeva	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)	
Dodatečné požadavky 1. Vnitřní obaly nejsou vyžadovány, pokud jsou jako vnější obaly použity sudy. 2. Obaly musí být prachotěsné.			
Zvláštní ustanovení pro balení			
PP 26	Pro UN čísla 0004, 0076, 0078, 0154, 0216, 0219 a 0386 musí být obaly bez olova.		
PP 46	Pro UN číslo 0209 se pro vločkovitý nebo hrudkovitý TNT v suchém stavu doporučují prachotěsné pytle (5H2) a nejvyšší čistá (netto) hmotnost 30 kg.		
PP 48	Pro UN číslo 0504 se nesmějí použít kovové obaly.		

P 113	POKYN PRO BALENÍ	P 113
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:		
Vnitřní obaly	Meziobaly	Vnější obaly
Pytle z papíru z plastu z pogumované textilní tkaniny Nádoby z lepenky z kovu z plastu ze dřeva	nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)
Dodatečný požadavek Tyto obaly musí být prachotěsné.		
Zvláštní ustanovení pro balení		
PP 49	Pro UN čísla 0094 a 0305 nesmí vnitřní obal obsahovat více než 50 g látky.	
PP 50	Pro UN číslo 0027 nejsou nutné vnitřní obaly, pokud jsou jako vnější obaly použity sudy.	
PP 51	Pro UN číslo 0028 mohou být použity jako vnitřní obaly archy kraftového nebo voskovaného papíru.	

P 114(a)	POKYN PRO BALENÍ (vlhčené tuhé látky)		P 114(a)
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Pytle z plastu z textilní tkaniny z plastové tkaniny Nádoby z kovu z plastu ze dřeva	Pytle z plastu z textilní tkaniny, s povlakem nebo vložkou z plastu Nádoby z kovu z plastu Dělicí přepážky ze dřeva	Bedny z oceli (4A) z kovu, jiného než ocel nebo hliník (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z lepenky (1G) z plastu (1H1, 1H2)	
Dodatečný požadavek Meziobaly se nevyžadují, pokud jsou jako vnější obaly použity těsné sudy s odnímatelným víkem.			
Zvláštní ustanovení pro balení			
PP 26	Pro UN čísla 0077, 0132, 0234, 0235 a 0236 musí být obaly bez olova.		
PP 43	Pro UN číslo 0342 se nevyžadují vnitřní obaly, pokud se jako vnější obaly použijí kovové (1A1, 1A2, 1B1, 1B2, 1N1 nebo 1N2) nebo plastové (1H1 nebo 1H2) sudy.		

P 114(b)	POKYN PRO BALENÍ (suché tuhé látky)		P 114(b)
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Pytle z kraftového papíru z plastu z prachotěsné textilní tkaniny z prachotěsné plastové tkaniny Nádoby z lepenky z kovu z papíru z plastu z prachotěsné plastové tkaniny ze dřeva		nejsou nutné	Bedny z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)
Zvláštní ustanovení pro balení			
PP 26	Pro UN čísla 0077, 0132, 0234, 0235 a 0236 musí být obaly bez olova.		
PP 48	Pro UN čísla 0508 a 0509 se nesmějí používat kovové obaly.		
PP 50	Pro UN čísla 0160, 0161 a 0508 nejsou nutné vnitřní obaly, pokud jsou jako vnější obaly použity sudy.		
PP 52	Pro UN čísla 0160 a 0161, pokud je použito kovových sudů (1A1, 1A2, 1B1, 1B2, 1N1 nebo 1N2) jako vnějších obalů, musí být kovové obaly konstruovány tak, aby se předešlo riziku výbuchu z důvodu nárůstu vnitřního tlaku z vnitřních nebo vnějších příčin.		

P 115	POKYN PRO BALENÍ	P 115
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:		
Vnitřní obaly	Meziobaly	Vnější obaly
Nádoby z plastu ze dřeva	Pytle z plastu v kovových nádobách Sudy z kovu Nádoby ze dřeva	Bedny z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)
Zvláštní ustanovení pro balení		
PP 45	Pro UN číslo 0144 se nevyžadují meziobaly.	
PP 53	Pro UN čísla 0075, 0143, 0495 a 0497, jsou-li jako vnější obaly použity bedny, musí být vnitřní obaly uzavřeny zakrytými šroubovými uzávěry a nesmějí mít vnitřní objem větší než 5 litrů každý. Vnitřní obaly musí být obklopeny nehořlavými absorpčními fixačními materiály. Množství absorpčních fixačních materiálů musí být dostatečné k absorbování veškerého kapalného obsahu. Kovové nádoby musí být navzájem proloženy fixačním materiálem. Čistá (netto) hmotnost pohonné látky je omezena do 30kg na jeden kus, pokud jsou vnější obaly bedny.	
PP 54	Pro UN čísla 0075, 0143, 0495 a 0497, jsou-li jako vnější obaly použity sudy a jako meziobaly sudy, musí být tyto obklopeny nehořlavým fixačním materiálem v dostatečném množství k absorbování veškerého kapalného obsahu. Kompozitní obal, sestávající z plastové nádoby v kovovém sudu, může být použit namísto vnitřního obalu a meziobalu. Čistý objem pohonné látky na jeden kus nesmí překročit 120 litrů.	
PP 55	Pro UN číslo 0144 musí být vložen absorpční fixační materiál.	
PP 56	Pro UN číslo 0144 mohou být jako vnitřní obaly použity kovové nádoby.	
PP 57	Pro UN čísla 0075, 0143, 0495 a 0497 musí být jako meziobaly použity pytle, pokud jsou jako vnější obaly použity bedny.	
PP 58	Pro UN čísla 0075, 0143, 0495 a 0497 musí být jako meziobaly použity sudy, pokud jsou jako vnější obaly použity také sudy.	
PP 59	Pro UN číslo 0144 mohou být použity jako vnější obaly lepenkové bedny (4G)	
PP 60	Pro UN číslo 0144 nesmějí být použity hliníkové sudy (1B1 a 1B2) ani kovové sudy z jiného kovu než oceli nebo hliníku (1N1 a 1N2).	

P 116	POKYN PRO BALENÍ	P 116
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:		
Vnitřní obaly	Meziobaly	Vnější obaly
Pytle z vodovzdorného a olejovzdorného papíru z plastu z textilní tkaniny, s povlakem nebo vložkou z plastu z prachotěsné plastové tkaniny Nádoby z vodovzdorné lepenky z kovu z plastu ze dřeva, prachotěsné Balicí materiály z vodovzdorného papíru z voskovaného papíru z plastu	není nutný	Pytle z plastové tkaniny (5H1, 5H2, 5H3) z vícevrstvého vodovzdorného papíru (5M2) z plastové folie (5H4) z prachotěsné textilní tkaniny (5L2) z vodovzdorné textilní tkaniny (5L3) Bedny z oceli (4A) z hliníku (4B) jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2) Kanystry z oceli (3A1, 3A2) z plastu (3H1, 3H2)
Zvláštní ustanovení pro balení		
PP 61	Pro UN čísla 0082, 0241, 0331 a 0332 se nevyžadují vnitřní obaly, pokud jsou jako vnější obaly použity těsné sudy s odnímatelným víkem.	
PP 62	Pro UN čísla 0082, 0241, 0331 a 0332 se nevyžadují vnitřní obaly, pokud je výbušná látka obsažena v materiálu nepropustném pro kapaliny.	
PP 63	Pro UN číslo 0081 se nevyžadují vnitřní obaly, pokud je látka obsažena v tuhém plastu, nepropustném pro estery kyseliny dusičné.	
PP 64	Pro UN číslo 0331 se nevyžadují vnitřní obaly, pokud jsou jako vnější obaly použity pytle (5H2, 5H3 nebo 5H4).	
PP 65	(Vypuštěno)	
PP 66	Pro UN číslo 0081 nesmějí být jako vnější obaly použity pytle.	

P 130	POKYN PRO BALENÍ		P 130
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly	Meziobaly	Vnější obaly	
nejsou nutné	nejsou nutné	Bedny z oceli (4A) z hliníku (4B) jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z pěnového plastu (4H1) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)	
Zvláštní ustanovení pro balení			
PP 67	Následující ustanovení platí pro UN čísla 0006, 0009, 0010, 0015, 0016, 0018, 0019, 0034, 0035, 0038, 0039, 0048, 0056, 0137, 0138, 0168, 0169, 0171, 0181, 0182, 0183, 0186, 0221, 0243, 0244, 0245, 0246, 0254, 0280, 0281, 0286, 0287, 0297, 0299, 0300, 0301, 0303, 0321, 0328, 0329, 0344, 0345, 0346, 0347, 0362, 0363, 0370, 0412, 0424, 0425, 0434, 0435, 0436, 0437, 0438, 0451, 0488 a 0502: Rozměrné a robustní výbušné předměty, obvykle určené pro vojenské použití, bez svých rozněcovacích prostředků, nebo jejichž rozněcovací prostředky jsou opatřeny alespoň dvěma účinnými pojistnými zařízeními, mohou být přepravovány bez obalu. Pokud takové předměty mají hnací náplně, nebo jsou samohnací, jejich zapalovací systémy musí být chráněny proti namáháním za normálních podmínek přepravy. Negativní výsledek zkoušek série 4 provedených na nezabaleném předmětu ukazuje, že předmět může být uvažován pro přepravu bez obalu. Takové nezabalené předměty mohou být uchyceny v lůžkách nebo uloženy v latěných nebo jiných vhodných manipulačních prostředcích.		

P 131	POKYN PRO BALENÍ		P 131
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Pytle z papíru z plastu Nádoby z lepenky z kovu z plastu ze dřeva Cívky		nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z tuhého plastu (4H2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)
Zvláštní ustanovení pro balení			
PP 68	Pro UN čísla 0029, 0267 a 0455 nesmějí být pytle a cívky použity jako vnitřní obaly.		

P 132(a)	POKYN PRO BALENÍ (Předměty sestávající z uzavřených kovových, plastových nebo lepenkových pouzder, která obsahují výbušnou trhavinu, nebo sestávají z plastem spojených výbušných trhavin)		P 132(a)
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
nejsou nutné		nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2)

P 132(b)	POKYN PRO BALENÍ (Předměty bez uzavřených pouzder)		P 132(b)
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílů 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Nádoby z lepenky z kovu z plastu ze dřeva Balicí materiály z papíru z plastu		nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2)

P 133	POKYN PRO BALENÍ		P 133
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly	Meziobaly	Vnější obaly	
Nádoby z lepenky z kovu z plastu ze dřeva Fixační podložky vybavené dělicími přepážkami z lepenky z plastu ze dřeva	Nádoby z lepenky z kovu z plastu ze dřeva	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2)	
Dodatečný požadavek Nádoby se nevyžadují jako meziobaly, pokud jsou vnitřními obaly fixační podložky.			
Zvláštní ustanovení pro balení			
PP 69	Pro UN čísla 0043, 0212, 0225, 0268 a 0306 nesmějí být jako vnitřní obaly použity fixační podložky.		

P 134	POKYN PRO BALENÍ		P 134
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Pytle vodovzdorné	nejsou nutné		Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z pěnového plastu (4H1) z tuhého plastu (4H2)
Nádoby z lepenky z kovu z plastu ze dřeva			
Balicí materiály z vlnité lepenky			
Tuby z lepenky			
			Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)

P 135	POKYN PRO BALENÍ		P 135
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Pytle z papíru z plastu Nádoby z lepenky z kovu z plastu ze dřeva Balicí materiály z papíru z plastu		nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z pěnového plastu (4H1) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)

P 136	POKYN PRO BALENÍ		P 136
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly	Meziobaly	Vnější obaly	
Pytle z plastu z textilní tkaniny Bedny z lepenky z plastu ze dřeva Dělicí přepážky ve vnějších obalech	nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)	

P 137	POKYN PRO BALENÍ		P 137
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly	Meziobaly	Vnější obaly	
Pytle z plastu Bedny z lepenky Pouzdra z lepenky z kovu z plastu Dělicí přepážky ve vnějších obalech	nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z tuhého plastu (4H2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)	
Zvláštní ustanovení pro balení			
PP 70	Pro UN čísla 0059, 0439, 0440 a 0441, pokud jsou kumulativní nálože baleny jednotlivě, musí kónické dutiny směřovat dolů a obal musí být označen "TOUTO STRANOU NAHORU". Pokud jsou kumulativní nálože baleny po párech, musí kónické dutiny směřovat proti sobě, aby se minimalizoval tryskový efekt v případě náhodného roznětu.		

P 138	POKYN PRO BALENÍ		P 138
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Pytle z plastu		nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)
Dodatečný požadavek Pokud jsou konce předmětů těsně uzavřeny, nejsou vnitřní obaly nezbytné.			

P 139	POKYN PRO BALENÍ		P 139
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obal
Pytle z plastu Nádoby z lepenky z kovu z plastu ze dřeva Cívky Balicí materiály z papíru z plastu		nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)
Zvláštní ustanovení pro balení			
PP 71	Pro UN čísla 0065, 0102, 0104, 0289 a 0290 musí být konce bleskovice utěsněny, např. pevně uchycenou zátkou tak, aby se výbušnina nemohla vysypat. Konce ohebné bleskovice musí být bezpečně upevněny.		
PP 72	Pro UN čísla 0065 a 0289 se nevyžadují vnitřní obaly, pokud jsou předměty ve svítcích.		

P 140	POKYN PRO BALENÍ		P 140
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Pytle z plastu Nádoby ze dřeva Cívky Balicí materiály z kraftového papíru z plastu		nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)
Zvláštní ustanovení pro balení			
PP 73	Pro UN číslo 0105 se nevyžaduje žádný vnitřní obal, pokud jsou konce předmětů utěsněny.		
PP 74	Pro UN číslo 0101 musí být obal prachotěsný, ledaže je rozbuška v papírovém pouzdra a oba konce pouzdra jsou zakryty odnímatelnými čepičkami.		
PP 75	Pro UN číslo 0101 se nesmějí použít bedny nebo sudy z oceli, hliníku nebo jiného kovu.		

P 141	POKYN PRO BALENÍ		P 141
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly	Meziobaly	Vnější obaly	
Nádoby z lepenky z kovu z plastu ze dřeva Fixační podložky vybavené dělicími přepážkami z plastu ze dřeva Dělicí přepážky ve vnějších obalech	nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)	

P 142	POKYN PRO BALENÍ		P 142
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Pytle z papíru z plastu Nádoby z lepenky z kovu z plastu ze dřeva Balicí materiály z papíru Fixační podložky vybavené dělicími přepážkami z plastu	nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)	

P 143	POKYN PRO BALENÍ		P 143
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení v oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Pytle z kraftového papíru z plastu z textilní tkaniny z pogumované textilní tkaniny Nádoby z lepenky z kovu z plastu ze dřeva Fixační podložky vybavené dělicími přepážkami z plastu ze dřeva		nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) z přírodního dřeva, prachotěsné (4C2) z překližky (4D) z rekonstituovaného dřeva (4F) z lepenky (4G) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z překližky (1D) z lepenky (1G) z plastu (1H1, 1H2)
Dodatečný požadavek Namísto zde uvedených vnitřních a vnějších obalů mohou být použity kompozitní obaly (6HH2) (plastová nádoba s vnější bednou z tuhého plastu).			
Zvláštní ustanovení pro balení			
PP 76	Pro UN čísla 0271, 0272, 0415 a 0491, pokud je použito kovových obalů, musí být tyto kovové obaly konstruovány tak, aby se zamezilo riziku výbuchu z důvodu nárůstu vnitřního tlaku z vnitřních nebo vnějších příčin.		

P 144	POKYN PRO BALENÍ		P 144
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:			
Vnitřní obaly		Meziobaly	Vnější obaly
Nádoby z lepenky z kovu z plastu ze dřeva Dělicí přepážky ve vnějších obalech		nejsou nutné	Bedny z oceli (4A) z hliníku (4B) z jiného kovu (4N) z přírodního dřeva, jednoduché (4C1) s kovovou vložkou z překližky (4D) s kovovou vložkou z rekonstituovaného dřeva (4F) s kovovou vložkou z pěnové hmoty (4H1) z tuhého plastu (4H2) Sudy z oceli (1A1, 1A2) z hliníku (1B1, 1B2) z jiného kovu (1N1, 1N2) z plastu (1H1, 1H2)
Zvláštní ustanovení pro balení			
PP 77	Pro UN čísla 0248 a 0249 musí být obaly chráněny proti vniknutí vody. Pokud jsou zařízení aktivovatelná vodou přepravována bez obalu, musí být opatřena nejméně dvěma nezávislými ochrannými prostředky proti vniknutí vody.		

P 200	POKYN PRO BALENÍ	P 200
Druhy obalů: Lahve, trubkové nádoby, tlakové sudy a svazky lahví		
Láhev, trubkové nádoby, tlakové sudy a svazky lahví jsou dovoleny za podmínky, že jsou dodržena zvláštní ustanovení pro balení oddílu 4.1.6, ustanovení uvedená dále v odstavcích (1) až (9) a, je-li na ně odkázáno ve sloupci „Zvláštní ustanovení pro balení“ tabulek 1, 2 nebo 3, příslušná zvláštní ustanovení pro balení uvedená dále v odstavci (10), jsou splněna.		
Všeobecně		
(1) Tlakové nádoby musí být uzavřeny a být těsné tak, aby se zamezilo úniku plynů.		
(2) Tlakové nádoby obsahující toxické látky s LC ₅₀ nejvýše 200 ml/m ³ (ppm), jak je uvedeno v tabulce, nesmějí být vybaveny žádným zařízením na vyrovnávání tlaku. Zařízeními pro vyrovnávání tlaku musí být vybaveny UN tlakové nádoby používané pro přepravu UN 1013 oxidu uhličitého a UN 1070 oxidu dusného (rajského plynu).		
(3) Následující tři tabulky zahrnují stlačené plyny (tabulka 1), zkapalněné a rozpuštěné plyny (tabulka 2) a látky nespádající do třídy 2 (tabulka 3). Obsahují:		
(a) UN číslo, pojmenování a popis a klasifikační kód látky;		
(b) LC ₅₀ pro toxické látky;		
(c) druhy tlakových nádob dovolených pro látku, označené písmenem „X“;		
(d) maximální lhůta pro periodickou inspekci tlakových nádob;		
POZNÁMKA: Pro tlakové nádoby, u nichž jsou použity kompozitní materiály, musí být periodická periodických inspekci stanovena příslušným orgánem nebo organizací pověřenou tímto orgánem, který (která) udělil(a) typové schválení.		
(e) nejnižší zkušební tlak tlakových nádob;		
(f) nejvyšší provozní tlak tlakových nádob pro stlačené plyny nebo nejvyšší stupeň (stupně) plnění pro zkapalněné a rozpuštěné plyny;		
(g) zvláštní ustanovení pro balení, která jsou specifická pro určitou látku.		
Zkušební tlak, stupeň plnění a požadavky na plnění		
(4) Požadovaný nejnižší zkušební tlak je 1 MPa (10 barů).		
(5) Tlakové nádoby nesmějí být v žádném případě plněny nad mezní hodnotu dovolenou v následujících ustanoveních:		
(a) Pro stlačené plyny nesmí být provozní tlak vyšší než dvě třetiny zkušebního tlaku tlakových nádob. Omezení horní mezní hodnoty provozního tlaku jsou udána zvláštním ustanovením pro balení „o“. Vnitřní tlak při 65 °C nesmí v žádném případě překročit zkušební tlak.		
(b) Pro vysokotlaké zkapalněné plyny musí být stupeň plnění takový, aby ustálený tlak při 65 °C nepřekročil zkušební tlak tlakových nádob.		
Použití jiných zkušebních tlaků a stupňů plnění než těch, které jsou uvedeny v tabulce je dovoleno, s výjimkou případů, kdy platí zvláštní ustanovení pro balení „o“, za podmínky, že		
(i) je splněno kritérium zvláštního ustanovení pro balení „r“, pokud platí; nebo		
(ii) je splněno výše uvedené kritérium ve všech ostatních případech.		
Pro vysokotlaké zkapalněné plyny a směsi plynů, pro něž nejsou k dispozici příslušné údaje, se nejvyšší stupeň plnění (FR) určí takto:		
$FR = 8,5 \times 10^{-4} \times d_g \times P_h$		
Kde		
FR = nejvyšší stupeň plnění		
d_g = hustota plynu (při 15°C, 1 bar) (v kg/m ³)		
P_h = nejnižší zkušební tlak (v barech).		

P 200	POKYN PRO BALENÍ (pokračování)	P 200
	<p>Pokud není známa hustota plynu, určí se nejvyšší stupeň plnění následovně:</p> $FR = \frac{P_h \times MM \times 10^{-3}}{R \times 338}$ <p>kde</p> <p>FR = nejvyšší stupeň plnění (v kg . l⁻¹) P_h = nejnižší zkušební tlak (v barech) MM = molekulární hmotnost (v g.mol⁻¹) R = 8,31451 x 10⁻² bar.l.mol⁻¹.K⁻¹ (plynová konstanta).</p> <p>Pro směsi plynů se průměrná molekulární hmotnost určuje v závislosti na objemových koncentracích jednotlivých komponentů.</p> <p>(c) Pro nízkotlaké zkvalněné plyny se nejvyšší hmotnost obsahu na litr hydraulického vnitřního objemu musí rovnat 0,95 násobku hustoty kapalně fáze při 50 °C; vedle toho, kapalná fáze nesmí naplnit tlakovou nádobu při teplotě do 60 °C. Zkušební tlak tlakové nádoby musí být nejméně roven tenzi par (absolutní) kapaliny při 65°C, minus 100 kPa (1 bar).</p> <p>Pro nízkotlaké zkvalněné plyny a směsi plynů, pro něž nejsou k dispozici příslušné údaje, se nejvyšší stupeň plnění určí následovně:</p> $FR = (0,0032 \times BP - 0,24) \times d_1$ <p>kde</p> <p>FR= nejvyšší stupeň plnění (v kg/l) BP= bod varu (ve stupních K) d₁= hustota kapaliny při bodu varu (v kg/l).</p> <p>(d) Pro UN 1001 acetylen, rozpuštěný a UN 3374 acetylen, bez rozpouštědla, viz (10), zvláštní ustanovení pro balení „p“.</p> <p>(6) Jiný zkušební tlak a stupeň plnění smí být použity, pokud jsou splněny všeobecné požadavky uvedené v odstavcích (4) a (5) výše.</p> <p>(7) (a) Plnění tlakových nádob smí být prováděno pouze speciálně vybavenými středisky s kvalifikovaným personálem používajícím vhodné postupy.</p> <p>Tyto postupy by měly zahrnovat ověření:</p> <ul style="list-style-type: none"> - zda nádoby a jejich výstroj odpovídají předpisům; - zda jsou kompatibilní s látkou, která se má přepravovat; - zda nejsou poškozeny tak, že by mohly ohrozit bezpečnost; - zda je dodržen stupeň plnění, popřípadě plnicí tlak; - zda značení a identifikace nádob odpovídá předpisům. <p>(b) LPG, který se má plnit do nádob, musí být vysoké kvality; toto se považuje za splněné, jestliže je tento LPG v souladu s mezemi korozivity, jak je stanoveno v normě ISO 9162:1989.</p> <p>Periodické inspekce</p> <p>(8) Opakovaně plnitelné tlakové nádoby musí být podrobeny periodickým inspekcím podle ustanovení pododdílu 6.2.1.6 a popřípadě 6.2.3.5.</p> <p>(9) Pokud nejsou v následujících tabulkách uvedena zvláštní ustanovení vztahující se k určitým látkám, musí být periodické inspekce prováděny:</p> <p>(a) každých 5 let v případě tlakových nádob určených pro přepravu plynů klasifikačních kódů 1T, 1TF, 1TO, 1TC, 1TFC, 1TOC, 2T, 2TO, 2TF, 2TC, 2TFC, 2TOC, 4A, 4F a 4TC;</p>	

P 200	POKYN PRO BALENÍ (pokračování)	P 200
	<p>(b) každých 5 let v případě tlakových nádob určených pro přepravu látek jiných tříd;</p> <p>(c) každých 10 let v případě tlakových nádob určených pro přepravu plynů klasifikačních kódů 1A, 1O, 1F, 2A, 2O a 2F.</p> <p>Odchylně od tohoto odstavce, musí být periodické prohlídky tlakových nádob vyrobených z kompozitních materiálů (kompozitní tlakové nádoby) prováděny ve lhůtách určených příslušným orgánem nebo organizací pověřenou tímto orgánem, který (která) udělil(a) typové schválení.</p> <p>Zvláštní ustanovení pro balení:</p> <p>(10) Snášlivost materiálů</p> <p>a: Tlakové nádoby ze slitiny hliníku se nesmějí použít</p> <p>b: Ventily z mědi se nesmějí používat.</p> <p>c: Kovové díly, které přicházejí do styku s obsahem, nesmějí obsahovat více než 65 % mědi.</p> <p>d: Jsou-li používány ocelové tlakové nádoby, jsou dovoleny pouze ty, které mají značku „H“ podle 6.2.2.7.4 (p).</p> <p>Předpisy pro toxické látky s LC₅₀ nejvýše 200 ml/m³ (ppm)</p> <p>k: Otvory ventilů musí být opatřeny plynotěsnými zátkami nebo kloboučky zadržujícími tlak se závitů hodícími se k závitům otvorů ventilů. Tyto zátky nebo kloboučky musí být vyrobeny z materiálu, na který nemůže obsah tlakové nádoby negativně působit.</p> <p>Každá lahev ve svazku lahví musí být opatřena vlastním ventilem, který musí být během přepravy uzavřen. Po naplnění musí být sběrné potrubí vyprázdněno, pročištěno a uzavřeno zátkou.</p> <p>Svazky obsahující UN 1045 fluor, stlačený, mohou být vybaveny uzavíracím ventilem pro skupinu lahví nepřekračující 150 litrů celkového hydraulického vnitřního objemu, namísto uzavíracího ventilu na každé lahvi.</p> <p>Láhve a jednotlivé lahve ve svazku musí mít zkušební tlak nejméně 200 barů a minimální tloušťku stěny 3,5 mm pro slitinu hliníku nebo 2 mm pro ocel. Jednotlivé lahve nesplňující tento požadavek musí být přepravovány v tuhém vnějším obalu schopném účinně chránit láhve a jejich příslušenství a vyhovujícím parametřům obalové skupiny I. Tlakové sudy musí mít minimální tloušťku stěny stanovenou příslušným orgánem.</p> <p>Tlakové nádoby nesmějí být opatřeny zařízením pro vyrovnávání tlaku.</p> <p>Lahve a jednotlivé lahve ve svazku mají nejvyšší hydraulický vnitřní objem omezen na 85 litrů.</p> <p>Každý ventil musí být schopen odolat zkušebnímu tlaku tlakové nádoby a musí být spojen přímo s tlakovou nádobou buď kuželovým závitěm, nebo jinými prostředky, které splňují požadavky normy ISO 10692-2:2001.</p> <p>Každý ventil musí být buď bez těsnění s neperforovanou membránou, nebo musí být typu, který zamezí úniku těsněním nebo kolem těsnění.</p> <p>Přeprava v pouzdrech není dovolena.</p> <p>Každá tlaková nádoba musí být po naplnění přezkoušena na těsnost.</p>	

P 200	POKYN PRO BALENÍ (pokračování)	P 200
	<p>Specifická ustanovení pro plyny</p> <p>l: UN 1040 ethylenoxid smí být balen též do hermeticky uzavřených vnitřních obalů ze skla nebo z kovu uložených s vhodným fixačním materiálem do lepenkových, dřevěných nebo kovových beden, které splňují parametry obalové skupiny I. Nejvyšší dovolené množství ve vnitřním obalu ze skla je 30 g a nejvyšší dovolené množství ve vnitřním obalu z kovu je 200 g. Po naplnění musí být každý vnitřní obal přezkoušena těsnost tím, že se vloží do horké vodní lázně při teplotě a na dobu, které jsou dostatečné k tomu, aby se zajistilo dosažení vnitřního tlaku rovnajícího se tenzi par ethylenoxidu při 55 °C. Nejvyšší čistá (netto) hmotnost ve vnějším obalu nesmí překročit 2,5 kg.</p> <p>m: Tlakové nádoby se plní do provozního tlaku nepřevyšujícího 5 barů.</p> <p>n: Láhve a jednotlivé láhve ve svazku lahví nesmějí obsahovat více než 5 kg plynu. Jsou-li svazky lahví obsahující UN 1045 fluor, stlačený rozděleny do skupin lahví podle zvláštního ustanovení pro balení „k“, smí každá skupina obsahovat nejvýše 5 kg plynu.</p> <p>o: Provozní tlak ani stupeň plnění uvedené v tabulkách nesmějí být v žádném případě překročeny.</p> <p>p: Pro UN 1001 acetylen, rozpuštěný a UN 3374 acetylen, bez rozpouštědla: lahve musí být naplněny homogenním monolitickým porézním materiálem; provozní tlak a množství acetyleny nesmějí překročit hodnoty předepsané ve schválení nebo popřípadě v normách ISO 3807-1:2000 nebo ISO 3807-2:2000.</p> <p>Pro UN 1001 acetylen, rozpuštěný: lahve musí obsahovat množství acetonu nebo vhodného rozpouštědla, jak je stanoveno ve schválení (viz ISO 3807-1:2000 nebo ISO 3807-2:2000); lahve opatřené zařízeními pro vyrovnávání tlaku nebo spojené navzájem sběrným potrubím musí být přepravovány ve svislé poloze.</p> <p>Alternativně pro UN 1001 acetylen, rozpuštěný: lahve, které nejsou tlakovými nádobami certifikovanými podle UN, smějí být naplněny nemonolitickým porézním materiálem; provozní tlak, množství acetyleny a množství rozpouštědla nesmějí překročit hodnoty předepsané ve schválení. Maximální lhůta pro periodickou inspekci lahví nesmí překročit pět let.</p> <p>Zkušební tlak 52 barů se použije pouze u lahví odpovídajících normě ISO 3807-2:2000.</p> <p>q: Otvory ventilů tlakových nádob pro pyroforní plyny nebo pro hořlavé směsi plynů obsahující více než 1 % pyroforních sloučenin musí být opatřeny plynotěsnými zátkami nebo kloboučky, které musí být vyrobeny z materiálu, na který nemůže obsah tlakové nádoby negativně působit. Jsou-li tyto tlakové nádoby spojeny sběrným potrubím do svazku, musí být každá z těchto tlakových nádob opatřena vlastním ventilem, který musí být během přepravy uzavřen, a otvor ventilu sběrné trubky musí být opatřen plynotěsnou zátkou nebo kloboučkem zadržujícím tlak. Plynotěsné zátky nebo kloboučky musí mít závit, který se hodí k závitům otvorů ventilů. Přeprava v pouzdrech není dovolena.</p> <p>r: Stupeň plnění tohoto plynu musí být omezen tak, aby v případě, že dojde k úplnému rozkladu, tlak nepřekročil dvě třetiny zkušební tlaku tlakové nádoby.</p> <p>ra: Tento plyn smí být balen též do pouzder za následujících podmínek:</p> <ul style="list-style-type: none"> (a) Hmotnost plynu nesmí překročit 150 g na pouzdro; (b) Pouzdra musí být bez kazů, které by mohly zhoršit pevnost; (c) Těsnost uzávěru musí být zajištěna dodatečným prostředkem (kloboučkem, korunkou, zaplombováním, ovázáním atd.); schopným zabránit jakémukoliv úniku z uzávěrového systému během přepravy. (d) Pouzdra musí být vložena do vnějšího obalu dostatečné pevnosti. Kus nesmí vážit více než 75 kg. <p>s: Tlakové nádoby z hliníkových slitin musí být:</p> <ul style="list-style-type: none"> - vybaveny jen ventily z mosazi nebo z nerezové oceli; a - vyčištěny od uhlovodíkové kontaminace a nekontaminovány olejem. Tlakové nádoby certifikované podle UN musí být vyčištěny podle normy ISO 11621:1997. 	

P 200	POKYN PRO BALENÍ (pokračování)	P 200
	<p>ta: Jiná kritéria mohou být použita pro plnění svařovaných ocelových láhví určených pro přepravu látek UN čísla 1965:</p> <p>(a) se souhlasem příslušných orgánů států, kde se přeprava uskutečňuje, a</p> <p>(b) při vyhovění ustanovením vnitrostátního předpisu nebo normy uznávaným příslušnými orgány.</p> <p>Pokud se kritéria pro plnění liší od kritérií uvedených v P200 (5), musí přepravní doklad obsahovat prohlášení „Přeprava podle pokynu pro balení P200, zvláštního ustanovení pro balení t“ a údaj základní teploty použité pro výpočet stupně plnění.</p>	
Periodická inspekce		
	<p>u: Interval mezi periodickými zkouškami může být prodloužen na 10 let u tlakových nádob z hliníkových slitin. Tato odchylka se může použít pro UN tlakové nádoby jen tehdy, pokud byla slitina tlakové nádoby podrobena zkoušce napěťové koroze, jak je uvedeno v normě ISO 7866:2012.</p> <p>ua: Interval mezi periodickými zkouškami může být prodloužen na 15 let pro láhve a svazky takových lahví z hliníkové slitiny, jsou-li použita ustanovení odstavce (13) tohoto pokynu pro balení. Toto neplatí pro láhve vyrobené z hliníkové slitiny AA 6351. Pro směsi se toto ustanovení „ua“ smí použít jen tehdy, pokud všechny jednotlivé plyny ve směsi mají v tabulce 1 nebo v tabulce 2 uvedeno „ua“.</p> <p>v: (1) Interval mezi inspekcemi ocelových lahví, kromě opakovaně plnitelných svařovaných ocelových lahví na plyny UN čísel 1011, 1075, 1965, 1969 nebo 1978, smí být prodloužen na 15 let:</p> <p>(a) se souhlasem příslušného orgánu (orgánů) země (zemí), kde se provádí periodická inspekce a přeprava; a</p> <p>(b) podle požadavků technického předpisu nebo normy uznávaných příslušným orgánem.</p> <p>(2) Pro opakovaně plnitelné svařované ocelové láhve na plyny UN čísel 1011, 1075, 1965, 1969 nebo 1978 smí být interval mezi inspekcemi prodloužen na 15 let, jestliže jsou použita ustanovení odstavce (12) tohoto pokynu pro balení.</p>	
	<p>va Pro bezešvé ocelové láhve, které jsou vybaveny ventily zbytkového tlaku (RPV) (viz POZNÁMKU dále) zkonstruovanými a vyzkoušenými podle normy EN ISO 15996:2005 + A1:2007 a pro svazky bezešvých ocelových lahví vybavených hlavním(i) ventilem (ventily) se zařízením zbytkového tlaku vyzkoušeným podle normy EN ISO 15996:2005 + A1:2007, může být interval mezi periodickými zkouškami prodloužen na 15 let, jsou-li použita ustanovení odstavce (13) tohoto pokynu pro balení. Pro směsi se toto ustanovení „va“ smí použít jen tehdy, pokud všechny jednotlivé plyny ve směsi mají v tabulce 1 nebo v tabulce 2 uvedeno „va“.</p> <p>POZNÁMKA: „Ventil zbytkového tlaku“ (RPV) znamená uzávěr se zařízením zbytkového tlaku, které zamezuje vnikání nečistot udržováním pozitivního rozdílu mezi tlakem uvnitř láhve a tlakem ve výpustném otvoru ventilu. K zamezení zpětného toku tekutin do láhve ze zdroje vyššího tlaku musí být funkce „zpětného uzávěru“ (NRV) buď zahrnuta do zařízení zbytkového tlaku, nebo musí být ventil láhve opatřen dodatečným zařízením, např. regulátorem.</p>	
Předpisy pro J.N. položky a pro směsi		
	<p>z: Výrobní materiály tlakových nádob a jejich výstroje se musí snášet s jejich obsahem a nesmějí s ním reagovat za vytváření škodlivých nebo nebezpečných sloučenin.</p> <p>Zkušební tlak a stupeň plnění musí být vypočteny podle příslušných ustanovení odstavce (5).</p> <p>Toxické látky s LC₅₀ nejvýše 200 ml/m³ nesmějí být přepravovány v trubkových nádobách, tlakových sudech nebo MEGC a musí splňovat požadavky zvláštního ustanovení pro balení „k“. Avšak směs oxidu dusnatého a oxidu dusičitého (UN 1975) smí být přepravována v tlakových sudech.</p> <p>U tlakových nádob obsahujících pyroforní plyny nebo hořlavé směsi plynů s více než 1 % pyroforních sloučenin musí být splněny požadavky zvláštního ustanovení pro balení „q“.</p> <p>Musí se učinit potřebné kroky k zamezení nebezpečným reakcím (tj. polymeraci nebo rozkladu) během přepravy. Pokud je to nutné, vyžaduje se stabilizace nebo přidání inhibitoru.</p> <p>Směsi obsahující UN 1911 diboran se plní do takového tlaku, aby v případě úplného rozkladu diboranu nebyly překročeny dvě třetiny zkušební tlaku tlakové nádoby.</p>	

P 200	POKYN PRO BALENÍ (pokračování)		P 200
Směsi obsahující UN 2192 german, jiné než směsi do 35% germanu ve vodíku nebo dusíku nebo do 28 % germanu v heliu nebo argonu, musí být plněny do takového tlaku, aby v případě, že dojde k úplnému rozkladu germanu, nebyly překročeny dvě třetiny zkušební tlaku tlakové nádoby.			
Předpisy pro látky nespádající do třídy 2			
ab: Tlakové nádoby musí splňovat tyto podmínky:			
(i) Tlaková zkouška musí zahrnovat prohlídku vnitřku tlakových nádob a kontrolu výstroje;			
(ii) Navíc musí být každé dva roky zkontrolována vhodnými prostředky (např. ultrazvukem) odolnost proti korozi a ověřen stav výstroje;			
(iii) Tloušťka stěn nesmí být menší než 3 mm.			
ac: Zkoušky a inspekce musí být provedeny pod dohledem znalce schváleného příslušným orgánem.			
ad: Tlakové nádoby musí splňovat tyto podmínky:			
(i) Tlakové nádoby musí být zkonstruovány pro výpočtový tlak nejméně 2,1 MPa (21 barů) (přetlak);			
(ii) Kromě značení pro opakovaně plnitelné nádoby musí být na tlakových nádobách uvedeny jasně čitelnými a trvanlivými písmeny a číslicemi následující údaje:			
- UN číslo a oficiální pojmenování pro přepravu látky podle oddílu 3.1.2;			
- nejvyšší dovolená hmotnost při plnění a vlastní hmotnost tlakové nádoby, včetně výstroje, která je na nádobě během plnění, nebo celková (brutto) hmotnost.			
(11) Příslušné požadavky tohoto pokynu pro balení jsou splněny při použití následujících norem:			
Příslušný požadavek	Číslo	Název normy	
(7)	EN 1919:2000	Přepravitelné plynové lahve – Lahve na plyny (kromě acetyleny a LPG). Inspekce v době plnění

P 200	POKYN PRO BALENÍ (pokračování)	P 200
	<p>(12) Interval 15 let pro periodickou inspekci opakovaně plnitelných svařovaných ocelových lahví smí být povolen podle zvláštního ustanovení pro balení v (2) odstavce (10), jsou-li použita následující ustanovení.</p> <p>1. Všeobecná ustanovení</p> <p>1.1 K aplikaci tohoto oddílu nesmí příslušný orgán přenést své úkoly a povinnosti na organizace Xb (inspekční organizace typu B) ani na organizace IS (vlastní inspekční služby).</p> <p>1.2 Vlastník lahví musí požádat příslušný orgán o povolení intervalu 15 let a musí prokázat, že jsou splněny požadavky pododstavců 2, 3 a 4.</p> <p>1.3 Láhve vyrobené od 1. ledna 1999 musely být vyrobeny ve shodě s následujícími normami:</p> <ul style="list-style-type: none"> - EN 1442; nebo - EN 13322-1; nebo - Příloha I, části 1 až 3 směrnice Rady 84/527/EHS^a <p>jak jsou platné podle tabulky v 6.2.4 ADR.</p> <p>Jiné láhve vyrobené před 1. lednem 2009 v souladu s ADR podle technického předpisu přijatého národním příslušným orgánem smějí být schváleny pro interval 15 let, pokud představují úroveň bezpečnosti rovnocennou s úrovní bezpečnosti lahví odpovídajících ustanovením ADR platným v době podání žádosti.</p> <p>1.4 Vlastník musí poskytnout příslušnému orgánu dokumentaci prokazující, že láhve vyhovují ustanovením pododstavce 1.3. Příslušný orgán musí ověřit, že jsou tyto podmínky splněny.</p> <p>1.5 Příslušný orgán musí přezkontrolovat, zda byla ustanovení pododstavců 2 a 3 splněna a správně použita. Jsou-li všechna ustanovení splněna, povolí interval 15 let pro láhve. V tomto povolení musí být jasně identifikován typ láhve (jak je uveden v typovém schválení) nebo skupina lahví (viz POZNÁMKU), na něž se povolení vztahuje. Povolení musí být vydáno vlastníkově; příslušný orgán si ponechá kopii. Vlastník musí uchovávat dokumenty dokud platí pro láhve povolení intervalu 15 let.</p> <p>POZNÁMKA: Skupina lahví je definována daty výroby identických lahví po dobu, během níž se platná ustanovení ADR a technického předpisu přijatého příslušným orgánem ve svém technickém obsahu nezměnila. Příklad: Láhve identické konstrukce a objemu, které byly vyráběny podle ustanovení ADR platných mezi 1. lednem 1985 a 31. prosincem 1988 v kombinaci s technickým předpisem přijatým příslušným orgánem platným po totéž období, tvoří jednu skupinu ve smyslu ustanovení tohoto odstavce.</p> <p>1.6 Příslušný orgán musí kontrolovat vlastníka lahví z hlediska dodržování ustanovení ADR a uděleného povolení podle potřeby, avšak alespoň každé tři roky, nebo když dojde ke změnám v postupech.</p> <p>2. Provozní ustanovení</p> <p>2.1 Láhve, jimž bylo uděleno povolení intervalu 15 let pro periodickou inspekci, musí být plněny jen v plnicích střediscích používajících dokumentovaný systém kvality, aby bylo zajištěno, že všechna ustanovení odstavce (7) tohoto pokynu pro balení a požadavky a odpovědnosti uvedené v normě EN 1439:2008 jsou splněny a správně použity.</p> <p>2.2 Příslušný orgán musí ověřit, zda jsou tyto požadavky splněny, a kontrolovat to podle potřeby, avšak alespoň každé tři roky, nebo když dojde ke změnám v postupech.</p> <p>2.3 Vlastník musí poskytnout příslušnému orgánu dokumentaci prokazující, že plnicí středisko vyhovuje ustanovením pododstavce 2.1.</p> <p>2.4 Je-li plnicí středisko usídleno v jiné smluvní straně ADR, musí vlastník dodatečnou dokumentací prokázat, že je toto plnicí středisko patřičně kontrolováno příslušným orgánem této smluvní strany ADR.</p> <p>2.5 K zabránění vnitřní korozi musí být láhve plněny pouze plyny vysoké kvality s velmi nízkou potenciální kontaminací. Toto se považuje za splněné, jestliže plyny odpovídají mezím korozivity, jak je stanoveno v normě ISO 9162:1989.</p>	

^a Směrnice Rady o sbližování zákonů členských států týkající se svařovaných plynových lahví z nelegované oceli, uveřejněná v Úředním věstníku Evropských společenství, č. L 300 ze dne 19.11.1984.

P 200	POKYN PRO BALENÍ (pokračování)	P 200
<p>3. Ustanovení pro kvalifikaci a periodickou inspekci</p> <p>3.1 Láhve typu nebo skupiny, které jsou již v používání, pro něž byl povolen interval 15 let a u nichž se interval 15 let aplikuje, musí být podrobovány periodické inspekci podle 6.2.3.5.</p> <p>POZNÁMKA: K definici skupiny lahví viz POZNÁMKU k pododstavci 1.5.</p> <p>3.2 Jestliže láhev s intervalem 15 let nevyhoví při hydraulické tlakové zkoušce během periodické inspekce, např. dojde k roztržení nebo úniku, musí vlastník provést analýzu a vypracovat zprávu o příčině nevyhovění a zda jsou dotčeny jiné láhve (např. téhož typu nebo skupiny). V tomto posledním případě musí vlastník informovat příslušný orgán. Příslušný orgán musí poté rozhodnout o náležitých opatřeních a informovat příslušné orgány všech ostatních smluvních stran ADR.</p> <p>3.3 Jestliže byla zjištěna vnitřní koroze, jak je definována v použité normě (viz pododstavec 1.3), musí být láhev stažena z užívání a nesmí jí být poskytnuta žádná další lhůta pro plnění a přepravu.</p> <p>3.4 Láhve, jimž byl povolen interval 15 let, musí být vybaveny jen ventily zkonstruovanými a vyrobenými pro minimální období 15 let používání podle EN 13152:2001 + A1:2003 nebo EN 13153:2001 + A1:2003, EN ISO 14245:2010 nebo EN ISO 15995:2010. Po periodické inspekci musí být láhev opatřena novým ventilem, s výjimkou toho, že ručně ovládané ventily, které byly renovovány nebo prohlédnuty podle EN 14912:2005, smějí být znovu namontovány, pokud jsou vhodné k používání pro další období 15 let. Renovace nebo prohlídka musí být provedeny jen výrobcem ventilů, nebo podle jeho technických pokynů podnikem kvalifikovaným pro takovou práci a pracujícím pod dokumentovaným systémem kvality.</p> <p>4. Značení</p> <p>Láhve, jimž byl povolen interval 15 let pro periodickou inspekci podle tohoto odstavce, musí být dodatečně opatřeny jasným a čitelným označením „P15Y“. Toto označení musí být odstraněno, jestliže láhev již nemá povolen interval 15 let.</p> <p>POZNÁMKA: Toto značení se nevztahuje na láhve podléhající přechodnému ustanovení v 1.6.2.9, 1.6.2.10 nebo ustanovením zvláštního ustanovení pro balení v (1) odstavce (10) tohoto pokynu pro balení.</p>		
<p>(13) Interval 15 let pro periodické inspekce bezešvých ocelových lahví a lahví z hliníkové slitiny, jakož i svazků takových lahví, může být povolen podle zvláštních ustanovení pro balení „ua“ nebo „va“ odstavce (10), jsou-li použita následující ustanovení:</p> <p>1. Všeobecná ustanovení</p> <p>1.1 Pro aplikaci tohoto odstavce nesmí příslušný orgán přenést své úkoly a povinnosti na organizace Xb (inspekční organizace typu B) ani na organizace IS (vlastní inspekční služby).</p> <p>1.2 Vlastník lahví nebo svazků lahví musí požádat příslušný orgán o povolení intervalu 15 let a musí prokázat, že jsou splněny požadavky pododstavců 2, 3 a 4.</p> <p>1.3 Láhve vyrobené od 1. ledna 1999 musely být vyrobeny podle jedné z následujících norem:</p> <ul style="list-style-type: none"> - EN 1964-1 nebo EN 1964-2; nebo - EN 1975; nebo - EN ISO 9809-1 nebo EN ISO 9809-2; nebo - EN ISO 7866; nebo - Příloha I, části 1 až 3 Směrnice Rady 84/525/EHS^b a 84/526/EHS^c jak platily v době výroby (viz též tabulku v 6.2.4.1). <p>Pro jiné láhve vyrobené před 1. lednem 2009 ve shodě s ADR podle technického předpisu přijatého národním příslušným orgánem může být povolen interval 15 let pro periodické inspekce, pokud vykazují rovnocennou bezpečnost s ustanoveními ADR platnými v době podání žádosti.</p>		

^b Směrnice Rady o sblížování právních a správních předpisů členských států týkajících se bezešvých ocelových plynových lahví, uveřejněná v Úředním věstníku Evropských společenství č. L 300 z 19.11.1984.

^c Směrnice Rady o sblížování právních a správních předpisů členských států týkajících se bezešvých plynových lahví z čistého hliníku a hliníkové slitiny, uveřejněná v Úředním věstníku Evropských společenství č. L 300 z 19.11.1984.

P 200	POKYN PRO BALENÍ (pokračování)	P 200
	<p>POZNÁMKA: Toto ustanovení se považuje za splněné, pokud byla láhev nově posouzena postupem pro nové posuzování shody popsaným v Příloze III Směrnice 2010/35/EU z 16. června 2010 nebo v Příloze IV, části II Směrnice 1999/36/ES z 29. dubna 1999.</p> <p>Pro láhve a svazky lahví označené znakem Spojených národů pro obaly, uvedeným v 6.2.2.7.2 (a), nesmí být povolen interval 15 let pro periodické inspekce.</p> <p>1.4 Svazky lahví musí být konstruovány tak, aby dotyk mezi láhvemi podél podélné osy lahví nezpůsobil vnější korozi. Klece a zádržné popruhy musí být takové, aby se minimalizovalo nebezpečí koroze lahví. Materiály pro tlumení nárazů používané v klecích jsou dovoleny pouze tehdy, pokud byly ošetřeny tak, že je vyloučeno pohlcování vody. Příklady vhodných materiálů jsou vodovzdorné pásy a guma.</p> <p>1.5 Vlastník musí předložit příslušnému orgánu dokumentaci prokazující, že láhve splňují ustanovení pododstavce 1.3. Příslušný orgán musí ověřit, že jsou tyto podmínky splněny.</p> <p>1.6 Příslušný orgán musí přezkontrolovat, zda byla ustanovení pododstavců 2 a 3 dodržena a správně použita. Jestliže byla všechna ustanovení dodržena, povolí interval 15 let pro periodické inspekce lahví nebo svazků lahví. V tomto povolení musí být jasně identifikována skupina lahví (viz POZNÁMKU dále), již se povolení týká. Povolení musí být doručeno vlastníkov; příslušný orgán si ponechá jeho kopii. Vlastník musí uchovávat dokumentaci, dokud pro láhve platí povolení intervalu 15 let.</p> <p>POZNÁMKA: Skupina lahví je definována daty výroby identických lahví po dobu, během níž se příslušná ustanovení ADR a technického předpisu přijatého příslušným orgánem ve svém technickém obsahu nezměnila. Příklad: Láhev identické konstrukce a objemu, které byly vyrobeny podle ustanovení ADR platných mezi 1. lednem 1985 a 31. prosincem 1988 v kombinaci s technickým předpisem přijatým příslušným orgánem platným pro totéž období, tvoří skupinu ve smyslu ustanovení tohoto odstavce.</p> <p>1.7 Vlastník musí zajistit dodržení ustanovení ADR a autorizace a musí to prokázat příslušnému orgánu na jeho žádost, nejméně však každé 3 roky, nebo dojde-li k významným změnám v postupech.</p> <p>2. Provozní ustanovení</p> <p>2.1 Láhve nebo svazky lahví, kterým byl povolen interval 15 let pro periodické inspekce, musí být plněny jen v plnicích centrech používajících dokumentovaný a certifikovaný systém kvality, aby bylo zajištěno, že všechna ustanovení odstavce (7) tohoto pokynu pro balení a požadavky a odpovědnosti uvedené v normách EN 1919:2000, EN 1920:2000 nebo EN 13365:2002 budou dodržena a správně použita. Systém kvality, podle série norem ISO 9000 nebo rovnocenné normy, musí být certifikován akreditovanou nezávislou organizací uznanou příslušným orgánem. Toto zahrnuje postupy pro kontroly před a po plnění a proces plnění pro láhve, svazky lahví a ventily.</p> <p>2.2 Láhve z hliníkové slitiny a svazky takových lahví bez RPV, kterým byl povolen interval 15 let pro periodické inspekce, musí být před každým plněním zkontrolovány podle zdokumentovaného postupu, který musí zahrnovat alespoň následující operace:</p> <ul style="list-style-type: none"> • Otevřít ventil láhve nebo hlavní ventil svazku lahví ke kontrole zbytkového tlaku; • Pokud vychází plyn, smí být láhev nebo svazek lahví naplněn(a); • Pokud nevychází žádný plyn, musí být zkontrolován vnitřní stav láhve nebo svazku lahví na kontaminaci; • Pokud není zjištěna žádná kontaminace, smí být láhev nebo svazek lahví naplněn(a); <p>Pokud je zjištěna kontaminace, je nutno provést nápravné opatření.</p>	

P 200	POKYN PRO BALENÍ (pokračování)	P 200
	<p>2.3 Bezešvé ocelové láhve vybavené RPV a svazky bezešvých ocelových lahví vybavené hlavním(i) ventilem (ventily) se zařízením zbytkového tlaku, kterým byl povolen interval 15 let pro periodické inspekce, musí být před každým plněním zkontrolovány podle zdokumentovaného postupu, který musí zahrnovat alespoň následující operace:</p> <ul style="list-style-type: none"> • Otevřít ventil láhve nebo hlavní ventil svazku lahví ke kontrole zbytkového tlaku; • Pokud vychází plyn, smí být láhev nebo svazek lahví naplněn(a); • Pokud nevychází žádný plyn, musí být zkontrolována funkčnost zařízení zbytkového tlaku; • Pokud kontrola ukáže, že zařízení zbytkového tlaku zadrželo tlak, smí být láhev nebo svazek lahví naplněn(a); • Pokud kontrola ukáže, že zařízení zbytkového tlaku nezadrželo tlak, musí být zkontrolován vnitřní stav láhve nebo svazku lahví na kontaminaci; <ul style="list-style-type: none"> - Pokud není zjištěna žádná kontaminace, smí být láhev nebo svazek lahví naplněn(a) po opravě nebo výměně zařízení zbytkového tlaku; - Pokud je zjištěna kontaminace, je nutno provést nápravná opatření. <p>2.4 K zamezení vnitřní koroze musí být láhve a svazky lahví plněny pouze plyny vysoké kvality s velmi nízkým kontaminačním potenciálem. Toto se považuje za splněné, je-li kompatibilita plynů s materiálem přijatelná podle norem EN ISO 11114-1:2012 a EN 11114-2:2013 a kvalita plynu splňuje specifikace v normě EN ISO 14175:2008 nebo, pro plyny, které nejsou v normě uvedeny, mají-li tyto plyny minimální čistotu 99,5 % objemu a maximální vlhkost obsahu 40 ml/m³ (ppm). Pro oxid dusný musí být tyto hodnoty: minimální čistota 98 % objemu a maximální vlhkost obsahu 70 ml/m³ (ppm).</p> <p>2.5 Vlastník musí zajistit dodržení požadavků uvedených ve 2.1 až 2.4 a musí to příslušnému orgánu prokázat dokumentací na jeho žádost, nejméně však každé 3 roky, nebo dojde-li k významným změnám v postupech.</p> <p>2.6 Pokud plnicí centrum sídlí ve státě jiné smluvní strany ADR, musí vlastník poskytnout příslušnému orgánu na jeho žádost dodatečnou dokumentaci prokazující, že je plnicí centrum odpovídajícím způsobem monitorováno příslušným orgánem této smluvní strany ADR. Viz též 1.2.</p> <p>3. Ustanovení pro kvalifikaci a periodické inspekce</p> <p>3.1 Láhve a svazky lahví, které jsou již používány a pro něž byly splněny požadavky pododstavce 2 od data poslední periodické inspekce ke spokojenosti příslušného orgánu, smějí mít svůj inspekční interval prodloužen na 15 let od data poslední periodické inspekce. Jinak musí být změna zkušební periody z deseti na patnáct let provedena v době periodické inspekce. Ve zprávě o periodické inspekci musí být uvedeno, že tato láhev nebo tento svazek lahví musí být vybaven zařízením zbytkového tlaku. Příslušný orgán může přijmout i jinou dokumentaci osvědčující tuto skutečnost.</p> <p>3.2 Jestliže láhev s intervalem 15 let nevyhoví při tlakové zkoušce a dojde k jejímu roztržení nebo uniknutí jejího obsahu, nebo je nedestruktivní zkouškou (NDT) během periodické inspekce zjištěna vážná závada, musí vlastník provést analýzu a vypracovat zprávu o příčině neúspěšné zkoušky a zda se to týká i jiných lahví (např. téhož druhu nebo skupiny). V tomto posledním případě musí vlastník informovat příslušný orgán. Příslušný orgán musí poté rozhodnout o náležitých opatřeních a informovat příslušné orgány všech ostatních smluvních stran ADR.</p> <p>3.3 Jestliže byla zjištěna vnitřní koroze a jiné závady, jak jsou definovány v normách pro periodické inspekce, na něž jsou odvolávky uvedeny v 6.2.4, musí být láhev stažena z používání a nesmí jí být poskytnuta žádná další lhůta pro plnění a přepravu.</p> <p>3.4 Láhve nebo svazky lahví, kterým byl povolen interval 15 let pro periodické inspekce, musí být vybaveny jen ventily zkonstruovanými a vyzkoušenými podle normy EN 849 nebo EN ISO 10297, jak platily v době výroby (viz též tabulku v 6.2.4.1). Po periodické inspekci musí být namontován nový ventil, s výjimkou toho, že ventily, které byly renovovány nebo podrobeny inspekci podle normy EN ISO 22434:2011, smějí být znovu namontovány.</p> <p>4. Značení</p> <p>Láhve a svazky lahví, kterým byl povolen interval 15 let pro periodické inspekce podle tohoto odstavce, musí mít vyznačeno datum (rok) příští periodické inspekce, jak je vyžadováno v pododdlílu 5.2.1.6 (c), a současně musí být dodatkově opatřeny zřetelným a čitelným označením „P15Y“. Toto označení musí být odstraněno, jakmile láhev nebo svazek lahví již nemá povolen interval 15 let pro periodické inspekce.</p>

^a Netýká se tlakových nádob z kompozitních materiálů.

^b Pro směsi plynů UN čísla 1965 je maximální dovolená hmotnost náplně na litr vnitřního objemu následující:

^c Je považován za pyroforní.

^d Je považován za toxický. Hodnotu LC₅₀ je třeba ještě určit.

P 201	POKYN PRO BALENÍ	P 201
Tento pokyn se použije pro UN čísla 3167, 3168 a 3169.		
Dovoleny jsou následující obaly:		
(1) Láhve a plynové nádoby vyhovující konstrukčním, zkušebním a plnicím požadavkům schváleným příslušným orgánem;		
(2) Následující skupinové obaly, za podmínky, že jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3:		
Vnější obaly:		
Sudy (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G);		
Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);		
Kanystry (3A1, 3A2, 3B1, 3B2, 3H1, 3H2).		
Vnitřní obaly:		
(a) Pro netoxické plyny hermeticky uzavřené vnitřní obaly ze skla nebo kovu s nejvyšším vnitřním objemem 5 litrů na kus;		
(b) Pro toxické plyny hermeticky uzavřené vnitřní obaly ze skla nebo kovu s nejvyšším vnitřním objemem 1 litr na kus.		
Obaly musí splňovat parametry obalové skupiny III.		

P 202	POKYN PRO BALENÍ	P 202
(Vyhrazeno)		

P 203	POKYN PRO BALENÍ	P 203
Tento pokyn se použije pro hluboce zchladené zkapalněné plyny třídy 2.		
Požadavky na uzavřené kryogenní nádoby:		
(1)	Musí být splněna zvláštní ustanovení pro balení oddílu 4.1.6.	
(2)	Požadavky kapitoly 6.2 musí být splněny.	
(3)	Uzavřené kryogenní nádoby musí být izolovány tak, aby se nemohly ojit.	
(4)	Zkušební tlak	
Hluboce zchladené kapaliny musí být plněny do uzavřených kryogenních nádob s následujícími nejnižšími zkušebními tlaky:		
(a)	pro uzavřené kryogenní nádoby s vakuovou izolací nesmí být zkušební tlak nižší než 1,3 násobek součtu nejvyššího vnitřního tlaku naplněné nádoby, včetně tlaku během plnění a vyprazdňování, plus 100 kPa (1 bar);	
(b)	pro jiné uzavřené kryogenní nádoby nesmí být zkušební tlak nižší než 1,3 násobek nejvyššího vnitřního tlaku naplněné nádoby, s přihlédnutím k tlaku vyvinutému během plnění a vyprazdňování.	
(5)	Stupeň plnění	
Pro nehořlavé, netoxické hluboce zchladené zkapalněné plyny (klasifikačních kódů 3A a 3O) nesmí objem kapalné fáze při plnicí teplotě a při tlaku 100 kPa (1 bar) překročit 98 % hydraulického vnitřního objemu tlakové nádoby.		
Pro hořlavé hluboce zchladené zkapalněné plyny (klasifikačního kódu 3F) musí stupeň plnění zůstat pod hodnotou, při níž, je-li obsah zahřátý na teplotu, při které je tenze par rovna otevíracímu tlaku pojistného ventilu, by objem kapalné fáze dosáhl 98% hydraulického vnitřního objemu při této teplotě.		
(6)	Zařízení pro vyrovnávání tlaku	
Uzavřené kryogenní nádoby musí být vybaveny alespoň jedním zařízením pro vyrovnávání tlaku.		
(7)	Snášlivost	
Materiály použité k zajištění těsnosti spojů nebo pro údržbu uzávěrů musí být snášlivé s obsahem. U nádob určených pro přepravu plynů podporujícím hoření (klasifikační kód 3O) nesmějí tyto materiály reagovat s těmito plyny nebezpečným způsobem.		
(8)	Periodické inspekce	
(a)	Interval mezi periodickými inspekcemi a zkouškami ventilů pro vyrovnávání tlaku podle 6.2.1.6.3 nesmí překročit pět let.	
(b)	Intervaly mezi periodickými inspekcemi a zkouškami uzavřených kryogenních nádob neodpovídajících UN podle 6.2.3.5.2 nesmí překročit 10 let.	
Požadavky na otevřené kryogenní nádoby:		
V otevřených kryogenních nádobách smí být přepravovány jen následující hluboce zchladené zkapalněné plyny, které nepodporují hoření, klasifikačního kódu 3A: UN 1913, 1951, 1963, 1970, 1977, 2591, 3136 a 3158.		
Otevřené kryogenní nádoby musí být vyrobeny za splnění následujících požadavků:		
(1)	Nádoby musí být zkonstruovány, vyrobeny, odzkoušeny a vybaveny takovým způsobem, aby odolaly všem podmínkám, včetně únavy, jimž budou vystaveny během normálního používání a během normálních podmínek přepravy.	
(2)	Vnitřní objem nesmí být větší než 450 litrů.	
(3)	Nádoba musí být konstruována s dvojitou stěnou, přičemž prostor mezi vnitřní a vnější stěnou je zbaven vzduchu (vakuová izolace). Izolace musí zabránit tvoření jinovatky na vnějšku nádoby.	
(4)	Konstrukční materiály musí mít vhodné mechanické vlastnosti při provozní teplotě.	
(5)	Materiály, které jsou v přímém styku s nebezpečnými věcmi, nesmějí být napadány nebo zeslabovány nebezpečnými věcmi, které se mají přepravovat, a nesmějí způsobit nebezpečný účinek, např. katalyticky urychlovat reakci nebo reagovat s nebezpečnými věcmi.	
(6)	Nádoby ze skla s konstrukcí dvojité stěny musí mít vnější obal s vhodnými fixačními nebo absorpčními materiály, které odolávají tlakům a nárazům, které mohou vyskytnout za normálních podmínek přepravy.	
(7)	Nádoby musí být zkonstruovány tak, aby během přepravy zůstaly ve stojaté poloze, např. mít podstavu, jejíž menší horizontální rozměr je větší než výška těžiště při naplnění nádoby do jejího vnitřního objemu nebo být upevněny ve výkvných uloženích.	
(8)	Otvory nádob musí být opatřeny prostředky dovolujícími únik plynů, zabraňujícími vystříknutí kapaliny a zkonstruovanými tak, aby během přepravy zůstaly na svém místě.	
(9)	Otevřené kryogenní nádoby musí být opatřeny následujícími údaji trvale vyznačenými např. vyražením, vyrytím nebo vyleptáním:	
- název a adresa výrobce;		
- typové číslo nebo název;		
- sériové číslo výrobní šarže;		
- UN číslo a oficiální pojmenování pro přepravu plynů, pro něž je nádoba určena;		
- vnitřní objem nádoby v litrech.		

P 204	POKYN PRO BALENÍ	P 204
<i>(Vypuštěno)</i>		

P 205	POKYN PRO BALENÍ	P 205
Tento pokyn se použije pro UN číslo 3468.		
(1) Pro zásobníkové systémy s hydridem kovu musí být dodržena zvláštní ustanovení pro balení v 4.1.6.		
(2) Tento pokyn pro balení se vztahuje pouze na tlakové nádoby, jejichž hydraulický vnitřní objem nepřekračuje 150 litrů a které mají maximální vyvinutý tlak nepřekračující 25 MPa.		
(3) Zásobníkové systémy s hydridem kovu splňující příslušné požadavky na výrobu a zkoušení tlakových nádob obsahujících plyn kapitoly 6.2 jsou dovoleny jen pro přepravu vodíku.		
(4) Pokud jsou používány ocelové tlakové nádoby nebo kompozitní tlakové nádoby s ocelovými vložkami, musí se používat jen ty, které jsou označeny značkou „H“ podle 6.2.2.9.2 (j).		
(5) Zásobníkové systémy s hydridem kovu musí splňovat provozní podmínky, konstrukční kritéria, jmenovitý vnitřní objem, typové zkoušky, zkoušky výrobních šarží, výrobní kusové zkoušky, zkušební tlak, jmenovitý plnicí tlak a ustanovení pro zařízení pro vyrovnávání tlaku pro přepravitelné zásobníkové systémy s hydridem kovu uvedené v normě ISO 16111:2008 (Přepravitelná zásobníková zařízení na plyn – Vodík pohlcený v reverzibilním kovovém hydridu) a jejich shoda a schválení musí být posouzeny podle 6.2.2.5.		
(6) Zásobníkové systémy s hydridem kovu musí být plněny vodíkem při tlaku nepřekračujícím jmenovitý plnicí tlak udaný na permanentním značení systému, jak je uvedeno v normě ISO 16111:2008.		
(7) Požadavky na periodické zkoušky pro zásobníkové systémy s hydridem kovu musí být v souladu s normou ISO 16111:2008 a musí být prováděny podle 6.2.2.6 a interval mezi periodickými inspekcemi nesmí překročit pět let.		

P 206	POKYN PRO BALENÍ	P 206
Tento pokyn se použije pro UN čísla 3500, 3501, 3502, 3503, 3504 a 3505.		
Pokud není v ADR stanoveno jinak, jsou dovoleny láhve a tlakové sudy splňující příslušné požadavky kapitoly 6.2.		
(1) Zvláštní ustanovení pro balení v 4.1.6 musí být dodržena.		
(2) Maximální perioda mezi zkouškami pro periodickou inspekci musí být 5 let.		
(3) Láhve a tlakové sudy musí být plněny tak, aby při 50 °C neplynná fáze nepřekročila 95 % jejich hydraulického vnitřního objemu a aby nebyly úplně naplněny při 60 °C. Po naplnění nesmí vnitřní tlak při 65 °C překročit zkušební tlak lahví a tlakových sudů. Tenze par a objemová roztažnost všech látek v lahvích a tlakových sudech musí být vzaty v úvahu.		
(4) Nejnižší zkušební tlak musí odpovídat pokynu pro balení P200 pro hnací látku, avšak nesmí být nižší než 20 barů.		
Dodatečný požadavek: Láhve a tlakové sudy nesmějí být podávány k přepravě, jsou-li spojeny s rozstřikovacím zařízením, jako je ohebná hadice a proudnice.		
Zvláštní ustanovení pro balení:		
PP89	Bez ohledu na ustanovení uvedená v 4.1.6.9 (b) smějí mít láhve pro jedno použití používané pro UN čísla 3501, 3502, 3503, 3504 a 3505 hydraulický vnitřní objem v litrech nepřekračující 1000 litrů, podělený zkušebním tlakem vyjádřeným v barech, za podmínky, že omezení vnitřního objemu a tlaku konstrukční normy jsou v souladu s normou ISO 11118:1999, která omezuje nejvyšší vnitřní objem na 50 litrů.	

P 207	POKYN PRO BALENÍ		P 207
Tento pokyn se použije pro UN číslo 1950.			
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:			
(a) Sudy (1A1,1A2, 1B1, 1B2, 1N1,1N2, 1H1, 1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Obaly musí vyhovovat parametrům obalové skupiny II.			
(b) Tuhé vnější obaly s následující nejvyšší čistou (netto) hmotností: Lepenka 55 kg Jiný materiál než lepenka 125 kg Ustanovení uvedená v 4.1.1.3 nemusí být dodržena			
Obaly musí být zkonstruovány a vyrobeny tak, aby zamezily pohybu aerosolů a jejich neúmyslnému vyprázdnění za normálních podmínek přepravy			
Zvláštní ustanovení pro balení:			
PP87	Pro UN 1950 odpadové aerosoly přepravované podle zvláštního ustanovení 327, musí mít obaly prostředky pro zadržení jakékoli volné kapaliny, která by mohla uniknout během přepravy, např. absorpční materiál. Obaly musí být přiměřeně odvětrávány, aby se zamezilo vytvoření hořlavého prostředí a nárůstu tlaku.		
Zvláštní ustanovení pro balení, specifické pro RID a ADR:			
RR6	Pro UN 1950 v případě přepravy vozových zásilek smějí být kovové předměty baleny také následujícím způsobem: Předměty musí být seskupeny do jednotek na podložkách a drženy v této pozici pláštěm z plastu; tyto jednotky musí být stohovány a vhodně upevněny na paletách.		

P208	POKYN PRO BALENÍ	P208
Tento pokyn platí pro adsorbované plyny třídy 2.		
(1)	Následující obaly jsou dovoleny, pokud jsou dodrženy všeobecné předpisy pro balení uvedené v 4.1.6.1: Láhve specifikované v kapitole 6.2 a podle ISO 11513:2011 nebo ISO 9809-1:2010.	
(2)	Tlak každé naplněné láhve musí být nižší než 101,3 kPa při 20 °C a nižší než 300 kPa při 50 °C.	
(3)	Nejnižší zkušební tlak láhve musí být 21 barů.	
(4)	Nejnižší tlak při roztržení láhve musí být 94,5 barů.	
(5)	Vnitřní tlak při 65 °C naplněné láhve nesmí překročit zkušební tlak láhve.	
(6)	Adsorbční materiál musí být kompatibilní s lahví a nesmí vytvářet škodlivé nebo nebezpečné sloučeniny s plynem, který má být adsorbován. Plyn v kombinaci s adsorbčním materiálem nesmí působit na láhev ani ji zeslabovat nebo vyvolat nebezpečnou reakci (např. katalyzující reakci).	
(7)	Kvalita adsorbčního materiálu musí být ověřena v době každého plnění, aby se zajistilo, že požadavky týkající se tlaku a chemické stability tohoto pokynu pro balení jsou dodrženy vždy, kdy je kus s adsorbovaným plynem podáván k přepravě.	
(8)	Adsorbční materiál nesmí splňovat kritéria žádné ze tříd ADR.	
(9)	Požadavky na láhve a uzávěry obsahující toxické plyny s LC50 nejvýše 200 ml/m ³ (ppm) (viz tabulka 1) musí být následující:	
	(a) Otvory ventilů musí být opatřeny plynotěsnými zátkami nebo kloboučky zadržujícími tlak se závitými hodicími se k závitům otvorů ventilů.	
	(b) Každý ventil musí být buď typu bez těsnění s neperforovanou membránou, nebo musí být typu, který zamezí uniku těsněním nebo kolem těsnění.	
	(c) Každá láhev a uzávěr musí být po naplnění přezkoušeny na těsnost.	
	(d) Každý ventil musí být schopen odolat zkušebnímu tlaku láhve a musí být spojen přímo s lahví buď kuželovým závitem, nebo jinými prostředky, které splňují požadavky normy ISO 10692-2:2001.	
	(e) Láhve a ventily nesmějí být opatřeny zařízením pro vyrovnávání tlaku.	
(10)	Otvory ventilů lahví obsahujících pyroforní plyny musí být opatřeny plynotěsnými zátkami nebo kloboučky se závitými hodicími se k závitům otvorů ventilů.	
(11)	Postup plnění musí odpovídat Příloze A normy ISO 11513:2011.	
(12)	Maximální lhůta pro periodické inspekce musí být 5 let.	
(13)	Zvláštní ustanovení pro balení, která jsou specifická pro látku (viz tabulku 1).	
	<i>Kompatibilita materiálu</i>	
	a: Láhve ze slitiny hliníku se nesmějí používat.	
	d: Jsou-li používány ocelové láhve, jsou povoleny jen ty, které mají ve značení podle 6.2.2.7.4 (p) obsaženo písmeno „H“.	
	<i>Specifická ustanovení pro plyn</i>	
	r: Plnění tohoto plynu musí být omezeno tak, že dojde-li k úplnému rozkladu, tlak nepřekročí dvě třetiny zkušební tlaku láhve.	
	<i>Kompatibilita materiálu pro J.N. položky adsorbovaných plynů</i>	
	z: Výrobní materiály lahví a jejich výstroje se musí snášet s jejich obsahem a nesmějí s ním reagovat za vytváření škodlivých nebo nebezpečných sloučenin.

P 209	POKYN PRO BALENÍ	P 209
Tento pokyn se použije pro UN 3150 přístroje malé, poháněné plyným uhlovodíkem, nebo nádoby s plyným uhlovodíkem, opakovaně plnitelné, pro malé přístroje, s odběrným ventilem.		
(1)	Zvláštní ustanovení pro balení oddílu 4.1.6, pokud jsou použitelná, musí být dodržena.	
(2)	Tyto předměty musí splňovat předpisy státu, v němž byly naplněny.	
(3)	Přístroje a nádoby musí být zabaleny ve vnějších obalech splňujících požadavky oddílu 6.1.4 a vyzkoušených a schválených podle kapitoly 6.1 pro obalovou skupinu II.	

P 300	POKYN PRO BALENÍ	P 300
Tento pokyn se použije pro UN číslo 3064.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
Skupinové obaly sestávající s vnitřních kovových nádob (plechovek) s vnitřním objemem každé z nich nejvýše 1 litr a z vnějších dřevěných beden (4C1, 4C2, 4D nebo 4F) obsahujících nejvýše 5 litrů roztoku.		
Dodatečné požadavky:		
(1)	Kovové obaly (plechovky) musí být úplně obklopeny absorpčním fixačním materiálem.	
(2)	Dřevěné bedny musí být celé opatřeny vložkou z vhodného materiálu nepropouštějícího vodu a nitroglycerin.	

P 301	POKYN PRO BALENÍ	P 301
Tento pokyn se použije pro UN číslo 3165.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
(1)	<p>Hliníková tlaková nádoba vyrobená z trubky a mající přivařená dna.</p> <p>Základní jímavost paliva uvnitř této nádoby je zajištěna jinou svařovanou hliníkovou nádobou s nejvyšším vnitřním objemem 46 litrů.</p> <p>Vnější nádoba musí mít nejnižší výpočtový tlak 1275 kPa (přetlak) a nejnižší tlak při roztržení 2755 kPa (přetlak).</p> <p>Každá nádoba musí být zkontrolována na těsnost během výroby a před odesláním; musí být shledána těsnou (bez úniku).</p> <p>Celá vnitřní nádoba musí být bezpečně zabalena s nehořlavým fixačním materiálem, jako je vermikulit, do pevného a hermeticky uzavřeného kovového vnějšího obalu, který bude přiměřeně chránit celou výstroj.</p> <p>Nejvyšší množství paliva na nádobu a kus je 42 litrů.</p>	
(2)	<p>Hliníková tlaková nádoba</p> <p>Základní jímavost paliva uvnitř této nádoby je zajištěna parotěsnou svařovanou komorou s elastickým měchýřem majícím maximální vnitřní objem 46 litrů.</p> <p>Tlaková nádoba musí mít nejnižší výpočtový tlak 2860 kPa (přetlak) a nejnižší tlak při roztržení 5170 kPa (přetlak).</p> <p>Každá nádoba musí být zkontrolována na těsnost během výroby a před odesláním a musí být bezpečně zabalena s nehořlavým fixačním materiálem, jako je vermikulit, do pevného a hermeticky uzavřeného kovového vnějšího obalu, který bude přiměřeně chránit celou výstroj.</p> <p>Nejvyšší množství paliva na nádobu a kus je 42 litrů.</p>	

P 302	POKYN PRO BALENÍ	P 302
Tento pokyn se použije pro UN číslo 3269.		
Dovoleny jsou následující skupinové obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
Vnější obaly:		
<p>Sudy (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G);</p> <p>Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);</p> <p>Kanistry (3A1, 3A2, 3B1, 3B2, 3H1, 3H2).</p>		
Vnitřní obaly:		
<p>Každý vnitřní obal smí obsahovat nejvýše 125 ml aktivátoru (organického peroxidu), je-li tento aktivátor kapalný, a nejvýše 500 gramů, je-li tuhý.</p> <p>Základní materiál a aktivátor musí být zabaleny každý zvlášť ve vnitřních obalech.</p>		
<p>Komponenty mohou být uloženy v tomtéž vnějším obalu za podmínky, že v případě úniku spolu nebudou vzájemně nebezpečně reagovat.</p> <p>Obaly musí splňovat parametry obalové skupiny II nebo III podle kritérií pro třídu 3 vztahujících se na základní materiál.</p>		

P 400	POKYN PRO BALENÍ	P 400
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
(1)	Tlakové nádoby, pokud jsou dodržena všeobecná ustanovení v 4.1.3.6, mohou být používány. Musí být vyrobeny z oceli a musí být podrobeny první zkoušce a potom periodickým zkouškám každých 10 let tlakem nejméně 1 MPa (10 barů, přetlak). Během přepravy musí být kapalina pod vrstvou inertního plynu s přetlakem nejméně 20 kPa (0.2 baru).	
(2)	Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F nebo 4G), sudy (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1D nebo 1G) nebo kanystry (3A1, 3A2, 3B1 nebo 3B2) obsahující hermeticky uzavřené kovové nádoby (plechovky) s vnitřními obaly ze skla nebo kovu, s vnitřním objemem nepřesahujícím jednotlivě 1 litr, mající šroubové uzávěry opatřené těsněním. Vnitřní obaly musí být obloženy ze všech stran suchým absorpčním nehořlavým fixačním materiálem v dostatečném množství, aby pohltil celý obsah. Vnitřní obaly nesmějí být plněny více než do 90% svého vnitřního objemu. Vnější obaly musí mít nejvyšší čistou (netto) hmotnost 125 kg.	
(3)	Ocelové, hliníkové nebo kovové sudy (1A1,1A2, 1B1, 1B2, 1N1 nebo 1N2), kanystry (3A1, 3A2, 3B1 nebo 3B2), nebo bedny (4A, 4B nebo 4N) s nejvyšší čistou (netto) hmotností 150 kg každý(á), s hermeticky uzavřenými vnitřními kovovými nádobami (plechovkami), z nichž každá může mít vnitřní objem nejvýše 4 litry, se šroubovými uzávěry opatřenými těsněním. Vnitřní obaly musí být obloženy ze všech stran suchým absorpčním nehořlavým fixačním materiálem v dostatečném množství, aby pohltil celý obsah. Každá vrstva vnitřních obalů musí být oddělena dělicí přepážkou, navíc k fixačnímu materiálu. Vnitřní obaly nesmějí být plněny více než do 90% svého vnitřního objemu.	
Zvláštní ustanovení pro balení:		
PP 86	Pro UN čísla 3392 a 3394 musí být vzduch z parního prostoru odstraněn dusíkem nebo jinými prostředky.	

P 401	POKYN PRO BALENÍ	P 401
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
(1)	Tlakové nádoby, pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6, mohou být používány. Musí být vyrobeny z oceli a musí být podrobeny první zkoušce a potom periodickým zkouškám každých 10 let tlakem nejméně 0,6 MPa (6 barů, přetlak). Během přepravy musí být kapalina pod vrstvou inertního plynu s přetlakem nejméně 20 kPa (0,2 baru).	
	Vnitřní obal	Vnější obal
(2) Skupinové obaly Vnější obaly: Sudy (1A1, 1A2, 1B1, 1B2, 1N1,1N2,1H1,1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1,4H2); Kanystry (3A1, 3A2, 3B1, 3B2, 3H1, 3H2) Vnitřní obaly: Sklo, kov nebo plast, opatřené šroubovými uzávěry, s nejvyšším vnitřním objemem 1 litr. Každý vnitřní obal musí být obložen inertním absorpčním fixačním materiálem v množství dostatečném k pohlcení celého obsahu.	1litr	30 kg nejvyšší čistá (netto) hmotnost
Nejvyšší čistá (netto) hmotnost na vnější obal nesmí překročit 30 kg.		
Zvláštní ustanovení pro balení specifické pro RID a ADR:		
RR 7 Pro UN čísla 1183, 1242, 1295 a 2988 však musí být tlakové nádoby podrobeny zkouškám každých pět let.“		

P 402		POKYN PRO BALENÍ		P 402
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 (viz také tabulku v pododdílu 4.1.4.4):				
(1) Tlakové nádoby, pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6, mohou být používány. Musí být vyrobeny z oceli a musí být podrobeny první zkoušce a potom periodickým zkouškám každých 10 let tlakem nejméně 0,6 MPa (6 barů, přetlak). Během přepravy musí být kapalina pod vrstvou inertního plynu s přetlakem nejméně 20 kPa (0,2 baru).				
(2) Skupinové obaly		Nejvyšší čistá (netto) hmotnost		
		Vnitřní obal		Vnější obal
		10 kg (sklo)		125 kg
Vnější obaly: Sudy (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kanistry (3A1, 3A2, 3B1, 3B2, 3H1, 3H2).		15 kg (kov nebo plast)		125 kg
Vnitřní obaly s následující nejvyšší čistou (netto) hmotností: Sklo 10 kg Kov nebo plast 15 kg				
Každý vnitřní obal musí být opatřen šroubovými uzávěry.				
Každý vnitřní obal musí být obložen inertním absorpčním fixačním materiálem v množství dostatečném k pohlcení celého obsahu. Nejvyšší čistá (netto) hmotnost na vnější obal nesmí překročit 125 kg.				
(3) Ocelové sudy (1A1) s nejvyšším vnitřním objemem 250 litrů.				
(4) Kompozitní obaly sestávající z plastové nádoby s vnějším sudem z oceli nebo hliníku (6HA1 nebo 6HB1) s nejvyšším vnitřním objemem 250 litrů.				
Zvláštní ustanovení pro balení specifické pro RID a ADR:				
RR4	Pro UN číslo 3130 musí být otvory nádob hermeticky uzavřeny pomocí dvou zařízení umístěných za sebou, z nichž alespoň jedno musí být šroubovací nebo zajištěné ekvivalentním způsobem.			
RR7	Pro UN číslo 3129 však musí být tlakové nádoby podrobeny zkouškám každých pět let.			
RR8	Pro UN čísla 1389, 1391, 1411, 1421, 1928, 3129, 3130, 3148 a 3482 však musí být tlakové nádoby podrobeny první zkoušce a periodickým zkouškám při zkušebním tlaku nejméně 1 MPa (10 barů).			

P 403	POKYN PRO BALENÍ	P 403
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
Skupinové obaly:		
Vnitřní obaly	Vnější obaly	Nejvyšší čistá (netto) hmotnost
ze skla 2 kg z plastu 15 kg z kovu 20 kg Vnitřní obaly musí být hermeticky uzavřeny (např. přelepením páskou nebo šroubovými uzávěry)	Sudy z oceli (1A1, 1A2) 400 kg z hliníku (1B1, 1B2) 400 kg z jiného kovu (1N1, 1N2) 400 kg z plastu (1H1, 1H2) 400 kg z překližky (1D) 400 kg z lepenky (1G) 400 kg Bedny z oceli (4A) 400 kg z hliníku (4B) 400 kg z jiného kovu (4N) 400 kg z přírodního dřeva (4C1) 250 kg z přírodního dřeva, prachotěsné (4C2) 250 kg z překližky (4D) 250 kg z rekonstituovaného dřeva (4F) 125 kg z lepenky (4G) 125 kg z pěnového plastu (4H1) 60 kg z tuhého plastu (4H2) 250 kg Kanistry z oceli (3A1, 3A2) 120 kg z hliníku (3B1, 3B2) 120 kg z plastu (3H1, 3H2) 120 kg	
Samostatné obaly:		Nejvyšší čistá (netto) hmotnost
Sudy ocel (1A1, 1A2) 250 kg hliník (1B1, 1B2) 250 kg kov, jiný než ocel nebo hliník (1N1, 1N2) 250 kg plast (1H1, 1H2) 250 kg Kanistry ocel (3A1, 3A2) 120 kg hliník (3B1, 3B2) 120 kg plast (3H1, 3H2) 120 kg Kompozitní obaly plastová nádoba s vnějším ocelovým nebo hliníkovým sudem (6HA1 nebo 6HB1) 250 kg plastová nádoba s vnějším lepenkovým, plastovým nebo překližkovým sudem (6HG1, 6HH1 nebo 6HD1) 75 kg plastová nádoba s vnějším ocelovým nebo hliníkovým košem nebo bednou nebo s vnější bednou z přírodního dřeva, překližky, lepenky nebo tuhého plastu (6HA2, 6HB2, 6HC, 6HD2, 6HG2 nebo 6HH2) 75 kg		
Tlakové nádoby pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6, mohou být používány.		
Dodatečný požadavek:		
Obaly musí být hermeticky uzavřené.		
Zvláštní ustanovení pro balení		
PP 83 Pro UN číslo 2813 smějí být baleny pro přepravu vodotěsné pytle obsahující nejvýše 20 g látky pro účely vytváření tepla. Každý vodotěsný pytel musí být zataven v plastovém pytli a vložen do meziobalu. Žádný vnější obal nesmí obsahovat více než 400 g látky. V obalu nesmí být obsažena voda ani žádná kapalina, která může reagovat s látkou reagující s vodou.		

P 404	POKYN PRO BALENÍ	P 404
Tento pokyn se použije pro pyroforní tuhé látky UN čísel: 1383, 1854, 1855, 2008, 2441, 2545, 2546, 2846, 2881, 3200, 3391 a 3393.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3:		
(1)	Skupinové obaly	
	Vnější obaly: (1A1,1A2,1B1,1B2,1N1,1N2,1H1,1H2,1D,1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G nebo 4H2)	
	Vnitřní obaly: Kovové nádoby, každá s nejvyšší čistou (netto) hmotností 15 kg. Vnitřní obaly musí být hermeticky uzavřeny a mít šroubové uzávěry.	
	Skleněné nádoby, každá s nejvyšší čistou (netto) hmotností 1 kg, mající šroubové uzávěry s těsněními, obložené ze všech stran vycpávkami a uložené v hermeticky uzavřených kovových nádobách.	
	Vnější obaly musí mít nejvyšší čistou (netto) hmotnost 125 kg.	
(2)	Kovové obaly: (1A1, 1A2, 1B1, 1N1, 1N2, 3A1, 3A2, 3B1 a 3B2)	
	Nejvyšší celková (brutto) hmotnost: 150kg;	
(3)	Kompozitní obaly: Plastová nádoba s vnějším ocelovým nebo hliníkovým sudem (6HA1 nebo 6HB1)	
	Nejvyšší celková (brutto) hmotnost: 150kg.	
Tlakové nádoby		
pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6, mohou být používány.		
Zvláštní ustanovení pro balení		
PP 86	Pro UN čísla 3391 a 3393 musí být vzduch z parního prostoru odstraněn dusíkem nebo jinými prostředky.	

P 405	POKYN PRO BALENÍ	P 405
Tento pokyn se použije pro UN číslo 1381.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3:		
(1)	<p>Pro UN 1381 fosfor, pod vodou:</p> <p>(a) Skupinové obaly</p> <p>Vnější obaly: (4A, 4B, 4N, 4C1, 4C2, 4D nebo 4F)</p> <p>Nejvyšší čistá (netto) hmotnost: 75 kg</p> <p>Vnitřní obaly:</p> <p>(i) hermeticky uzavřené plechovky o nejvyšší čisté (netto) hmotnosti 15 kg; nebo</p> <p>(ii) skleněné vnitřní obaly, obložené ze všech stran suchým absorpčním nehořlavým fixačním materiálem v dostatečném množství k pohlcení celého obsahu o nejvyšší čisté (netto) hmotnosti 2 kg, nebo</p> <p>(b) Sudy (1A1, 1A2, 1B1, 1B2, 1N1 nebo 1N2); nejvyšší čistá (netto) hmotnost: 400 kg</p> <p>Kanistry (3A1 nebo 3B1); nejvyšší čistá (netto) hmotnost: 120 kg.</p> <p>Tyto obaly musí být způsobilé vyhovět zkoušce těsnosti definované v pododdílu 6.1.5.4 pro obalovou skupinu II.</p>	
(2)	<p>Pro UN 1381 fosfor, suchý:</p> <p>(a) v roztavené formě: sudy (1A2, 1B2 nebo 1N2) o nejvyšší čisté (netto) hmotnosti jednoho sudu 400 kg; nebo</p> <p>(b) v projektilích nebo v předmětech s tvrdým pláštěm, pokud se přepravují bez komponentů třídy 1: obaly stanovené příslušným orgánem.</p>	

P 406	POKYN PRO BALENÍ	P 406
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
<p>(1) Skupinové obaly vnější obaly:(4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2, 1G, 1D, 1H1,1H2, 3H1 nebo 3H2) vnitřní obaly:vodovzdorné obaly;</p> <p>(2) Plastové, překližkové nebo lepenkové sudy (1H2, 1D nebo 1G) nebo bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G a 4H2) s vnitřním vodovzdorným pytle, vnitřní vložkou z plastové fólie nebo vodovzdorným povlakem;</p> <p>(3) Kovové sudy (1A1, 1A2, 1B1, 1B2, 1N1 nebo 1N2), plastové sudy (1H1 nebo 1H2), kovové kanistry (3A1, 3A2, 3B1 nebo 3B2), plastové kanistry (3H1 nebo 3H2), plastové nádoby s vnějšími ocelovými nebo hliníkovými sudy (6HA1 nebo 6HB1), plastové nádoby s vnějšími lepenkovými, plastovými nebo překližkovými sudy (6HG1, 6HH1 nebo 6HD1), plastové nádoby s vnějšími ocelovými nebo hliníkovými koši nebo bednami nebo s vnějšími bednami z přírodního dřeva, překližky, lepenky nebo tuhého plastu (6HA2, 6HB2, 6HC, 6HD2, 6HG2 nebo 6HH2).</p>		
Dodatečné požadavky:		
<p>1. Obaly musí být konstruovány a vyrobeny tak, aby se zabránilo úniku vody, alkoholu nebo flegmatizačního prostředku.</p> <p>2. Obaly musí být tak vyrobeny a uzavřeny aby se zamezilo výbušnému přetlaku nebo tlaku vyššímu než 300 kPa (3 bary).</p>		
Zvláštní ustanovení pro balení:		
PP 24 Pro UN čísla 2852, 3364, 3365, 3366, 3367, 3368 a 3369 nesmí přepravované množství překročit 500 g na kus.		
PP 25 Pro UN číslo 1347 nesmí přepravované množství překročit 15 kg na kus.		
PP 26 Pro UN čísla 1310, 1320, 1321, 1322, 1344, 1347, 1348, 1349, 1517, 2907, 3317 a 3376 musí být obaly prosté olova.		
PP 48 Pro UN číslo 3474 nesmějí být používány kovové obaly.		
PP 78 Pro UN číslo 3370 nesmí přepravované množství překročit 11,5 kg na kus.		
PP 80 Pro UN číslo 2907 musí obaly splňovat parametry obalové skupiny II. Obaly splňující zkušební kritéria obalové skupiny I se nesmějí použít.		

P 407	POKYN PRO BALENÍ	P 407
Tento pokyn se použije pro UN čísla 1331, 1944, 1945 a 2254.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
<p>Vnější obaly:</p> <p>Sudy (1A1, 1A2, 1B1, 1B2, 1N1,1N2,1H1,1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1,4H2); Kanistry (3A1, 3A2, 3B1, 3B2, 3H1, 3H2).</p> <p>Vnitřní obaly:</p> <p>Zápalky musí být pevně zabaleny do bezpečně uzavřených vnitřních obalů tak, aby se zamezilo náhodnému vznícení za normálních podmínek přepravy.</p> <p>Nejvyšší celková (brutto) hmotnost kusu nesmí překročit 45 kg, s výjimkou lepenkových beden, u nichž nesmí překročit 30 kg.</p> <p>Obaly musí splňovat parametry obalové skupiny III.</p>		
Zvláštní ustanovení pro balení:		
PP 27 UN 1331 zápalky, zápalné „kdekoli“ nesmějí být zabaleny do téhož vnějšího obalu s jinými nebezpečnými věcmi, s výjimkou bezpečnostních zápalek nebo voskových zápalek, které musí být zabaleny v jiných vnitřních obalech. Vnitřní obaly nesmějí obsahovat více než 700 zápalek, zápalných „kdekoli“.		

P 408	POKYN PRO BALENÍ	P 408
Tento pokyn se použije pro UN číslo 3292.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
(1)	<p>Pro články:</p> <p>Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kanystry (3A2, 3B2, 3H2).</p> <p>Musí být dostatečné množství fixačního materiálu, aby se zabránilo vzájemnému dotyku mezi články a mezi články a vnitřními povrchy vnějšího obalu, jakož i každému nebezpečnému pohybu článků uvnitř vnějšího obalu během přepravy.</p> <p>Obaly musí vyhovovat parametrům obalové skupiny II.</p>	
(2)	<p>Baterie mohou být přepravovány bez obalu nebo v ochranných obalech (např. plně uzavřených ochranných obalech nebo v dřevěných latěních). Svorky nesmějí být zatíženy hmotností jiných baterií nebo materiálů zabalených s bateriemi.</p> <p>Obaly nemusí vyhovovat požadavkům uvedeným v 4.1.1.3.</p>	
Dodatečný požadavek:		
Články a baterie musí být chráněny proti zkratu a musí být izolovány takovým způsobem, aby se zabránilo zkratům.		

P 409	POKYN PRO BALENÍ	P 409
Tento pokyn se použije pro UN čísla 2956, 3242 a 3251.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
(1)	Lepenkové sudy (1G), které mohou být opatřeny vnitřní vložkou nebo povlakem; nejvyšší čistá (netto) hmotnost: 50 kg;	
(2)	Skupinové obaly: Lepenková bedna (4G) s jednotlivým vnitřním plastovým pytlíkem; nejvyšší čistá (netto) hmotnost: 50 kg;	
(3)	Skupinové obaly: Lepenková bedna (4G) nebo lepenkový sud (1G) s vnitřními plastovými obaly, z nichž každý obsahuje nejvýše 5 kg; nejvyšší čistá (netto) hmotnost: 25 kg.	

P 410	POKYN PRO BALENÍ		P 410
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:			
Skupinové obaly:			
Vnitřní obaly	Vnější obaly	Nejvyšší čistá (netto) hmotnost

^d Tyto obaly mohou být použity pro látky obalové skupiny II, pouze pokud jsou přepravovány v uzavřených vozidlech nebo kontejnerech.

P 410	POKYN PRO BALENÍ (pokračování)		P 410
Kompozitní obaly			
Plastová nádoba s vnějším ocelovým, hliníkovým překližkovým, lepenkovým nebo plastovým sudem (6HA1, 6HB1, 6HG1, 6HD1 nebo 6HH1)	400 kg	400 kg	
Plastová nádoba s vnějším ocelovým nebo hliníkovým košem nebo bednou nebo s vnější bednou z přírodního dřeva, překližky, lepenky nebo tuhého plastu (6HA2, 6HB2, 6HC, 6HD2, 6HG2 nebo 6HH2)	75 kg	75 kg	
Skleněná nádoba s vnějším ocelovým, hliníkovým, překližkovým nebo lepenkovým sudem (6PA1, 6PB1, 6PD1 nebo 6PG1) nebo s vnějším ocelovým nebo hliníkovým košem nebo bednou nebo s vnější bednou z přírodního dřeva nebo lepenky nebo s vnějším proutěným košem (6PA2, 6PB2, 6PC, 6PD2, nebo 6PG2) nebo s vnějším obalem z tuhého plastu nebo pěnového plastu (6PH1 nebo 6PH2).	75 kg	75 kg	
Tlakové nádoby pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6, mohou být používány.			
Zvláštní ustanovení pro balení:			
PP 39 Pro UN číslo 1378 se u kovových obalů vyžaduje odvětrávací zařízení.			
PP 40 Pro UN čísla 1326, 1352, 1358, 1395, 1396, 1436, 1437, 1871, 2805 a 3182, obalové skupiny II nejsou dovoleny pytle.			
PP 83 Pro UN číslo 2813 smějí být baleny pro přepravu vodotěsné pytle obsahující nejvýše 20 g látky pro účely vytváření tepla. Každý vodotěsný pytel musí být zataven v plastovém pytli a vložen do meziobalu. Žádný vnější obal nesmí obsahovat více než 400 g látky. V obalu nesmí být obsažena voda ani žádná kapalina, která může reagovat s látkou reagující s vodou.			

P 411	POKYN PRO BALENÍ	P 411
Tento pokyn platí pro UN číslo 3270.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kanystry (3A2, 3B2, 3H2); za podmínky, že není možný výbuch z důvodů nárůstu vnitřního tlaku.		
Nejvyšší čistá (netto) hmotnost nesmí překročit 30 kg.		

P 500	POKYN PRO BALENÍ	P 500
Tento pokyn platí pro UN číslo 3356.		
<p>Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3:</p> <p>Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kanystry (3A2, 3B2, 3H2).</p> <p>Obaly musí vyhovovat parametrům obalové skupiny II.</p> <p>Generátor(y) musí být přepravován(y) v kusu, který musí v případě, že je uvnitř kusu jeden generátor spuštěný, splňovat následující požadavky:</p> <p>(a) Jiné generátory v kusu nebudou spuštěny;</p> <p>(b) Materiál obalu se nevznítí; a</p> <p>(c) Teplota vnějšího povrchu kompletního kusu nesmí překročit 100 °C.</p>		

P 501		POKYN PRO BALENÍ		P 501
Tento pokyn se použije pro UN číslo 2015.				
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:				
Skupinové obaly:		Vnitřní obal	Vnější obal	
		Nejvyšší vnitřní objem	Nejvyšší čistá (netto) hmotnost	
(1)	bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4H2) sudy (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D) nebo kanystry (3A1, 3A2, 3B1, 3B2, 3H1, 3H2) se skleněnými, plastovými nebo kovovými vnitřními obaly	5 litrů	125 kg	
(2)	Lepenkové bedny (4G) nebo lepenkové sudy (1G), s plastovými nebo kovovými vnitřními obaly, každý v plastovém pytli	2 litry	50 kg	
Samostatné obaly:		Nejvyšší vnitřní objem

z hliníku, neodnímatelné víko (3B1)		60 l
z hliníku, odnímatelné víko (3B2)		60 l
z plastu, neodnímatelné víko (3H1)		60 l
z plastu, odnímatelné víko (3H2)		60 l
Kompozitní obaly		
plastová nádoba s vnějším ocelovým nebo hliníkovým sudem (6HA1 nebo 6HB1)		250 l
plastová nádoba s vnějším lepenkovým, plastovým nebo překližkovým sudem (6HG1, 6HH1 nebo 6HD1)		120 l
plastová nádoba s vnějším ocelovým nebo hliníkovým košem nebo bednou nebo s vnější bednou z přírodního dřeva, překližky, lepenky nebo tuhého plastu (6HA2, 6HB2, 6HC, 6HD2, 6HG2 nebo 6HH2)		60 l
skleněná nádoba s vnějším sudem z oceli, hliníku, lepenky nebo překližky (6PA1, 6PB1, 6PD1 nebo 6PG1) nebo s vnější bednou z oceli, hliníku, dřeva nebo lepenky nebo s vnějším proutěným košem (6PA2, 6PB2, 6PC, 6PG2 nebo 6PD2) nebo s vnějším obalem z tuhého nebo pěnového plastu (6PH1, 6PH2).		60 l
Zvláštní ustanovení pro balení:		
PP 10 Pro UN čísla 2014, 2984 a 3149 musí být obaly opatřeny odvětrávacím zařízením.		

P505 POKYN PRO BALENÍ P505		
Tento pokyn platí pro UN číslo 3375		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3:		
Skupinové obaly:	Vnitřní obal Nejvyšší vnitřní objem	Vnější obal Nejvyšší čistá (netto) hmotnost
Bedny (4B, 4C1, 4C2, 4D, 4G, 4H2) nebo sudy (1B2, 1G, 1N2, 1H2, 1D) nebo kanystry (3B2, 3H2) s vnitřními obaly ze skla, plastu nebo kovu	5 l	125 kg
Samostatné obaly:	Nejvyšší vnitřní objem	
Sudy		
z hliníku (1B1, 1B2)	250 l	
z plastu (1H1, 1H2)	250 l	
Kanystry		
z hliníku (3B1, 3B2)	60 l	
z plastu (3H1, 3H2)	60 l	
Kompozitní obaly		
plastová nádoba s vnějším hliníkovým sudem (6HB1)	250 l	
plastová nádoba s vnějším lepenkovým, plastovým nebo překližkovým sudem (6HG1, 6HH1, 6HD1)	250 l	
Kompozitní obaly		
plastová nádoba s vnějším hliníkovým sudem (6HB1)	250 l	
plastová nádoba s vnějším lepenkovým, plastovým nebo překližkovým sudem (6HG1, 6HH1, 6HD1)	250 l	
plastová nádoba s vnějším hliníkovým košem nebo bednou nebo plastová nádoba s vnější bednou ze dřeva, překližky lepenky nebo tuhého plastu (6HB2, 6HC, 6HD2, 6HG2 nebo 6HH2)	60 l	
skleněná nádoba s vnějším sudem z hliníku, lepenky nebo překližky (6PB1, 6PG1, 6PD1) nebo s vnějšími nádobami z pěnového nebo tuhého plastu (6PH1 nebo 6PH2) nebo s vnějším hliníkovým košem nebo bednou nebo s vnější dřevěnou nebo lepenkovou bednou nebo s vnějším proutěným košem (6PB2, 6PC, 6PG2 nebo 6PD2)	60 l	

P 520		POKYN PRO BALENÍ						P 520	
Tento pokyn se použije pro organické peroxidy třídy 5.2 a samovolně se rozkládající látky třídy 4.1									
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení pododdílu 4.1.7.1.									
Způsoby balení jsou označeny OP1 až OP8. Způsoby balení příslušející jednotlivým organickým peroxidům a samovolně se rozkládajícím látkám jsou uvedeny v 2.2.41.4 a 2.2.52.4. Množství specifikovaná pro každý způsob balení jsou nejvyšší dovolená množství na kus. Dovoleny jsou následující obaly:									
(1) Skupinové obaly, jejichž vnějším obalem je bedna (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1 a 4H2), sud (1A1, 1A2, 1B1, 1B2, 1G, 1H1, 1H2 a 1D) nebo kanystr (3A1, 3A2, 3B1, 3B2, 3H1 a 3H2);									
(2) Samostatné obaly sestávající ze sudu (1A1, 1A2, 1B1, 1B2, 1G, 1H1, 1H2 a 1D) nebo kanystru (3A1, 3A2, 3B1, 3B2, 3H1 a 3H2);									
(3) Kompozitní obaly s vnitřními nádobami z plastu (6HA1, 6HA2, 6HB1, 6HB2, 6HC, 6HD1, 6HD2, 6HG1, 6HG2, 6HH1 a 6HH2).									
Nejvyšší množství na obal/kus ^a pro způsoby balení OP1 až OP8									
Způsob balení		OP1	OP2 ^a	OP3	OP4 ^a	OP5	OP6	OP7	OP8
Nejvyšší Množství									
Nejvyšší hmotnost (v kg) pro tuhé látky a pro skupinové obaly (kapalné a tuhé látky)		0,5	0,5/10	5	5/25	25	50	50	400 ^b
Nejvyšší obsah v litrech pro kapaliny. ^c		0,5	-	5	-	30	60	60	225 ^d
^a Pokud jsou udány dvě hodnoty, první platí pro nejvyšší čistou (netto) hmotnost na vnitřní obal a druhá pro nejvyšší čistou (netto) hmotnost celého kusu.									
^b 60 kg pro kanystry/200 kg pro bedny a, pro tuhé látky, 400 kg ve skupinových obalech s bednami jako vnějšími obaly (4C1, 4C2, 4D, 4F, 4G, 4H1 a 4H2) a s vnitřními obaly z plastu nebo lepenky s nejvyšší čistou (netto) hmotností 25 kg.									
^c Viskózní látky musí být považovány za tuhé látky, pokud nesplňují kritéria uvedená v definici pojmu „kapalina“ v oddíle 1.2.1.									
^d 60 litrů pro kanystry.									
Dodatečné požadavky:									
1 Kovové obaly, včetně vnitřních obalů skupinových obalů a vnějších obalů skupinových nebo kompozitních obalů, mohou být použity jen pro způsoby balení OP7 a OP8.									
2. Ve skupinových obalech mohou být skleněné nádoby použity pouze jako vnitřní obaly, přičemž nejvyšší množství na nádobu je 0,5 kg pro tuhé látky a 0,5 litru pro kapalné látky.									
3. Ve skupinových obalech nesmějí být fixační materiály, které jsou snadno hořlavé.									
4. Obal organického peroxidu nebo samovolně se rozkládající látky, který musí být opatřen bezpečnostní značkou pro vedlejší nebezpečí "VÝBUŠNÝ(A)" viz 5.2.2.2.2, musí splňovat také ustanovení uvedená v pododdílech 4.1.5.10 a 4.1.5.11.									
Zvláštní ustanovení pro balení:									
PP 21 Pro určité samovolně se rozkládající látky typu B nebo C (UN čísel 3221, 3222, 3223, 3224, 3231, 3232, 3233, a 3234) se musí použít menší obal než je ten, který je uveden ve způsobech balení OP5 nebo OP6 (viz oddíl 4.1.6 a pododdíl 2.2.41.4).									
PP 22 UN 3241 2-brom-2-nitropropan-1,3-diol musí být balen podle způsobu balení OP6.									

P 600	POKYN PRO BALENÍ	P 600
Tento pokyn se použije pro UN čísla 1700, 2016 a 2017.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
Vnější obaly (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H2) splňující parametry obalové skupiny II. Předměty musí být baleny jednotlivě a odděleny jeden od druhého za použití příček, přepážek, vnitřních obalů nebo fixačního materiálu, aby se zamezilo jakémukoli náhodnému spuštění za normálních podmínek přepravy.		
Nejvyšší čistá (netto) hmotnost: 75 kg		

P 601	POKYN PRO BALENÍ	P 601
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a obaly jsou hermeticky uzavřeny:		
(1) Skupinové obaly o nejvyšší celkové (brutto) hmotnosti 15 kg sestávající z		
<ul style="list-style-type: none"> - jednoho nebo více skleněných vnitřních obalů s množstvím 1 litru v každém z nich a naplněných nejvýše do 90 % jejich vnitřního objemu; jejichž uzávěr(y) musí být fyzicky držen(y) v pozici jakýmkoliv způsobem schopných zabránit uražení nebo uvolnění uzávěru nárazem nebo vibracemi během přepravy, vložených jednotlivě do - kovových nádob společně s fixačním a absorpčním materiálem v dostatečném množství, aby pohltil celý obsah skleněného(y) vnitřního(ch) obalu(ů), dále zabalených do - vnějších obalů: 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G nebo 4H2; 		
(2) Skupinové obaly sestávající z vnitřních obalů z kovu nebo plastu, o nejvyšším vnitřním objemu 5 litrů, jednotlivě balených s absorpčním materiálem v dostatečném množství, schopném pohltit celý obsah, a s inertním fixačním materiálem do vnějšího obalu (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G nebo 4H2) o nejvyšší celkové (brutto) hmotnosti 75 kg. Vnitřní obaly nesmějí být plněny více než do 90% svého vnitřního objemu. Uzávěr každého vnitřního obalu musí být fyzicky držen v pozici jakýmkoliv způsobem schopných zabránit uražení nebo uvolnění uzávěru nárazem nebo vibracemi během přepravy;		
(3) Obaly sestávající z:		
Vnější obaly:		
Ocelové nebo plastové sudy (1A1, 1A2, 1H1 nebo 1H2), vyzkoušené v souladu ze zkušebními požadavky v oddíle 6.1.5 při hmotnosti odpovídající hmotnosti sestaveného kusu, buď jako obal určený pro vložení vnitřních obalů, nebo jako samostatný obal určený pro tuhé látky nebo kapaliny, a příslušně značené;		
Vnitřní obaly:		
Sudy a kompozitní obaly (1A1, 1B1, 1N1, 1H1 nebo 6HA1) splňující předpisy kapitoly 6.1 pro samostatné obaly, podléhající následujícím požadavkům:		
(a) Hydraulická tlaková zkouška musí být prováděna tlakem nejméně 0,3 MPa (přetlak);		
(b) Zkoušky těsnosti ve stadiu vývoje a výroby musí být prováděny zkušebním tlakem 30 kPa;		
(c) Musí být izolovány od vnějšího sudu inertním fixačním materiálem pohlcujícím nárazy, který obklopuje vnitřní obaly ze všech stran;		
(d) Jejich vnitřní objem nesmí překročit 125 litrů; a		
(e) Uzávěry musí být šroubového kloboučkového provedení, které jsou:		
(i) fyzicky drženy v pozici jakýmkoliv způsobem schopných zabránit uražení nebo uvolnění uzávěru nárazem nebo vibracemi během přepravy, a		
(ii) opatřeny víčkovým těsněním;		

P 601	POKYN PRO BALENÍ (pokračování)	P 601
	<p>(f) Vnější a vnitřní obaly musí být podrobeny pravidelně v intervalech nejvýše dva a půl roku zkoušce těsnosti podle písmene (b);</p> <p>(g) Kompletní obal musí být vizuálně zkontrolován, ke spokojenosti příslušného orgánu, alespoň každé 3 roky;</p> <p>(h) Na vnějším a vnitřním obalu musí být dobře čitelné a trvanlivé údaje:</p> <p>(i) datum (měsíc, rok) první zkoušky a poslední periodické inspekce a zkoušky;</p> <p>(ii) značka znalce, který provedl prohlídku a zkoušku.</p> <p>(4) Tlakové nádoby, pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6, mohou být používány. Musí být podrobeny první zkoušce a potom periodickým zkouškám každých 10 let tlakem nejméně 1 MPa (10 barů) (přetlak). Tlakové nádoby nesmějí být vybaveny zařízením pro vyrovnávání tlaku. Každá tlaková nádoba obsahující kapalinu toxickou při vdechnutí s LC₅₀ nejvýše 200 ml/m³ (ppm) musí být uzavřena zátkou nebo ventilem vyhovujícím těmto požadavkům:</p> <p>(a) Každá zátká nebo ventil musí mít přímé závitové spojení s tlakovou nádobou a být schopen(na) odolat zkušebnímu tlaku tlakové nádoby bez nebezpečí poškození nebo úniku;</p> <p>(b) Každý ventil musí být v provedení bez utěsnění s neperforovanou membránou, s výjimkou toho, že pro žíravé látky může být ventil utěsněného typu, přičemž se plynotěsnost montážního celku zajistí těsným ochranným krytem upevněným s těsněním na těleso ventilu nebo tlakové nádoby, aby se zamezilo úniku látky kolem těsnění;</p> <p>(c) Každý vývod ventilu musí být opatřen šroubovacím kloboučkem nebo pevnou šroubovací zátkou a inertním materiálem zajišťujícím těsnost nádob;</p> <p>(d) Výrobní materiály pro tlakové nádoby, ventily, zátky, kloboučky vývodů, těsnicí prostředky a těsnění musí být snášelivé navzájem a s obsahem tlakové nádoby.</p> <p>Každá tlaková nádoba s tloušťkou stěny v kterémkoli bodě menší než 2,0 mm a každá tlaková nádoba, jejíž ventily nejsou chráněny, musí být přepravována ve vnějším obalu. Tlakové nádoby nesmějí být spojeny mezi sebou sběrným potrubím ani vzájemně propojeny.</p>	
Zvláštní ustanovení pro balení		
PP 82	(Vypuštěno)	
Zvláštní ustanovení pro balení, specifické pro RID a ADR		
RR3	(Vypuštěno)	
RR7	Pro UN číslo 1251 však musí být tlakové nádoby podrobeny zkouškám každých pět let.	
RR10	Látky UN čísla 1614, pokud jsou úplně pohlceny inertním porézním materiálem, musí být zabaleny do kovových nádob o vnitřním objemu nejvýše 7,5 litrů, vložených do dřevěných beden takovým způsobem, aby nemohly přijít do styku jedna s druhou. Nádoby musí být zcela vyplněny porézním materiálem, který se nesmí setřást nebo vytvořit nebezpečné dutiny ani po dlouhodobém používání nebo nárazem, ani při teplotách až do 50 °C.	

P 602	POKYN PRO BALENÍ	P 602
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a obaly jsou hermeticky uzavřeny:		
(1)	Skupinové obaly o nejvyšší celkové (brutto) hmotností 15 kg sestávající z	
	<ul style="list-style-type: none">- jednoho nebo více skleněných vnitřních obalů s množstvím 1 litru v každém z nich a naplněných nejvýše do 90 % jejich vnitřního objemu; jejichž uzávěr(y) musí být fyzicky držen(y) v pozici jakýmkoliv způsobem schopných zabránit uražení nebo uvolnění uzávěru nárazem nebo vibracemi během přepravy, vložených jednotlivě do- kovových nádob společně s fixačním a absorpčním materiálem v dostatečném množství, aby pohltil celý obsah skleněného(ých) vnitřního(ch) obalu(ů), dále zabalených do- vnějších obalů: 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G nebo 4H2.;	
(2)	Skupinové obaly sestávající z vnitřních obalů z kovu nebo plastu jednotlivě balených s absorpčním materiálem v dostatečném množství, schopném pohltit celý obsah, a s inertním fixačním materiálem do vnějšího obalu (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G nebo 4H2) o nejvyšší celkové (brutto) hmotností 75 kg. Vnitřní obaly nesmějí být plněny více než do 90% svého vnitřního objemu. Uzávěr každého vnitřního obalu musí být fyzicky držen v pozici jakýmkoliv způsobem schopných zabránit uražení nebo uvolnění uzávěru nárazem nebo vibracemi během přepravy. Vnitřní objem vnitřních obalů nesmí přesáhnout 5 litrů.	
(3)	Sudy a kompozitní obaly (1A1, 1B1, 1N1, 1H1, 6HA1 nebo 6HH1), podléhají následujícím požadavkům:	
	<ul style="list-style-type: none">(a) Hydraulická tlaková zkouška musí být prováděna tlakem nejméně 0,3 MPa (přetlak);(b) Zkoušky těsnosti ve stadiu vývoje a výroby musí být prováděny zkušebním tlakem 30 kPa; a(c) Uzávěry musí být šroubového kloboučkového provedení, které jsou:<ul style="list-style-type: none">(i) fyzicky drženy v pozici jakýmkoliv způsobem schopných zabránit uražení nebo uvolnění uzávěru nárazem nebo vibracemi během přepravy, a(ii) opatřeny víčkovým těsněním;	
(4)	Tlakové nádoby, pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6, mohou být používány. Musí být podrobeny první zkoušce a potom periodickým zkouškám každých 10 roků tlakem nejméně 1 MPa (10 barů) (přetlak). Tlakové nádoby nesmějí být vybaveny zařízením pro vyrovnávání tlaku. Každá tlaková nádoba obsahující kapalinu toxickou při vdechnutí s LC ₅₀ nejvýše 200 ml/m ³ (ppm) musí být uzavřena zátkou nebo ventilem vyhovujícím těmto požadavkům:	
	<ul style="list-style-type: none">(a) Každá zátká nebo ventil musí mít přímé závitové spojení s tlakovou nádobou a být schopen(na) odolat zkušebnímu tlaku tlakové nádoby bez nebezpečí poškození nebo úniku;(b) Každý ventil musí být v provedení bez utěsnění s neperforovanou membránou, s výjimkou toho, že pro žíravé látky může být ventil utěsněného typu, přičemž se plynutěsnost montážního celku zajistí těsným ochranným krytem upevněným s těsněním na těleso ventilu nebo tlakové nádoby, aby se zamezilo úniku látky kolem těsnění;(c) Každý vývod ventilu musí být opatřen šroubovacím kloboučkem nebo pevnou šroubovací zátkou a inertním materiálem zajišťujícím těsnost nádob;(d) Výrobní materiály pro tlakové nádoby, ventily, zátky, kloboučky vývodů, těsnicí prostředky a těsnění musí být snášetlivé navzájem a s obsahem tlakové nádoby.	
Každá tlaková nádoba s tloušťkou stěny v kterémkoli bodě menší než 2,0 mm a každá tlaková nádoba, jejíž ventily nejsou chráněny, musí být přepravována ve vnějším obalu. Tlakové nádoby nesmějí být spojeny mezi sebou sběrným potrubím ani vzájemně propojeny.		

P 620	POKYN PRO BALENÍ	P 620
Tento pokyn se použije pro UN čísla 2814 a 2900.		
Dovoleny jsou následující obaly, pokud jsou dodržena zvláštní ustanovení pro balení oddílu 4.1.8:		
Obaly splňující předpisy kapitoly 6.3 a podle těchto předpisů schválené, sestávající z:		
<p>(a) Vnitřních obalů, které se skládají z:</p> <ul style="list-style-type: none"> (i) jedné nebo více nepropustných primárních nádob; (ii) nepropustného sekundárního obalu; (iii) s výjimkou tuhých infekčních látek - absorpčního materiálu v dostatečném množství pro pohlcení celého vnitřního obsahu vloženého mezi primární nádobu(y) a sekundární obal; pokud je více primárních nádob uloženo v jednom sekundárním obalu, musí být buď jednotlivě zabaleny, nebo odděleny tak, aby se předešlo jejich vzájemnému dotyku; <p>(b) tuhého vnějšího obalu:</p> <p>Sudy (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G);</p> <p>Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2);</p> <p>Kanistry (3A1, 3A2, 3B1, 3B2, 3H1, 3H2).</p> <p>Nejmenší vnější rozměr nesmí být menší než 100 mm.</p>		
Dodatečné požadavky:		
<p>1. Vnitřní obaly obsahující infekční látky nesmějí být seskupeny s jinými vnitřními obaly, které obsahují nepřibuzný druh věcí. Kompletní kusy mohou být vloženy do přepravního obalového souboru podle ustanovení oddílů 1.2.1 a 5.1.2. Tento přepravní obalový soubor může obsahovat suchý led.</p> <p>2. Kromě výjimečných zásilek, jako jsou celé orgány, které vyžadují speciální obal, platí následující dodatečné požadavky:</p> <ul style="list-style-type: none"> (a) Látky odesílané při teplotě okolí nebo při vyšší teplotě: Primární nádoby musí být ze skla, kovu nebo plastu. Musí být použity účinné prostředky k zajištění těsného uzavření, např. tepelný spoj, lemovaná zátka nebo kovový uzávěr s obrubou. Pokud jsou použity šroubovací korunkové uzávěry, musí být zajištěny účinnými prostředky, např. páskou, parafinovou lepicí páskou nebo zvlášť pro tento účel zhotoveným uzamykatelným uzávěrem; (b) Látky odesílané ve zchlazeném nebo zmrazeném stavu: Led, suchý led nebo jiná chladicí látka musí být umístěna kolem sekundárního obalu (sekundárních obalů) nebo v přepravním obalovém souboru s jedním nebo více kompletními kusy označenými podle pododdílu 6.3.3. Vnitřní rozpěrky musí udržet sekundární obal(y) nebo kusy v pozici poté, co led odtál nebo se suchý led odpařil. Pokud je použito ledu, musí být vnější obal nebo přepravní obalový soubor nepropustný. Pokud je použito suchého ledu, musí vnější obal nebo přepravní obalový soubor umožnit únik plynného oxidu uhličitého. Primární nádoba a sekundární obal si musí zachovat svou neporušenost při teplotě použitého chladicího prostředku; (c) Látky odesílané v kapalném dusíku: Musí být použito primárních plastových nádob schopných odolávat velmi nízkým teplotám. Sekundární obal musí být také schopen odolávat velmi nízkým teplotám, a ve většině případů bude nezbytné, aby byl individuálně vytvářen kolem celé primární nádoby. Je rovněž nutno dodržet ustanovení týkající se přepravy kapalného dusíku. Primární nádoba a sekundární obal si musí zachovat svoji neporušenost při teplotě kapalného dusíku.; (d) Lyofilizační látky mohou být přepravovány také v primárních nádobách, kterými jsou plamenem zatavené skleněné ampule nebo skleněné lahvičky a pryžovou zátkou, utěsněné kovovým uzávěrem. <p>3. Ať jsou předpokládány teploty zásilky jakékoli, primární nádoba nebo sekundární obal musí být schopné odolat, bez úniku obsahu, vnitřnímu tlaku vytvářejícímu tlakový rozdíl nejméně 95 kPa a teplotám v rozmezí od -40 °C do +55 °C.</p> <p>4. Jiné nebezpečné věci nesmějí být baleny do téhož obalu s infekčními látkami třídy 6.2, pokud nejsou nutné pro udržování životaschopnosti, stabilizaci nebo zamezení degradaci nebo pro neutralizaci nebezpečí představovaných infekčními látkami. Množství nejvýše 30 ml nebezpečných věcí spadajících do tříd 3, 8 nebo 9 smí být zabaleno do každé primární nádoby obsahující infekční látky. Tato malá množství nebezpečných věcí tříd 3, 8 nebo 9 nepodléhají žádným dodatečným požadavkům ADR, pokud jsou zabalena podle tohoto pokynu pro balení.</p> <p>5. Alternativní obaly pro přepravu zvířecího materiálu smějí být povoleny příslušným orgánem země původu^a podle ustanovení pododdílu 4.1.8.7.</p>		

^a Není-li země původu členským státem ADR, příslušný orgán prvního členského státu ADR dotčeného zásilkou.

P 621	POKYN PRO BALENÍ	P 621
Tento pokyn se použije pro UN číslo 3291.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 (kromě 4.1.1.15) a 4.1.3:		
(1) Za podmínky, že je v obalu dostatečné množství absorpčního materiálu k pohlcení celého množství kapaliny přítomné v obalu a že obal sám má schopnost udržet kapalinu: Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kanystry (3A2, 3B2, 3H2).		
Obaly musí vyhovovat požadavkům na úrovni parametrů obalové skupiny II pro tuhé látky.		
(2) Pro kusy obsahující větší množství kapaliny: Sudy (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G); Kanystry (3A1, 3A2, 3B1, 3B2, 3H1, 3H2); Kompozitní obaly (6HA1, 6HB1, 6HG1, 6HH1, 6HD1, 6HA2, 6HB2, 6HC, 6HD2, 6HG2, 6HH2, 6PA1, 6PB1, 6PG1, 6PD1, 6PH1, 6PH2, 6PA2, 6PB2, 6PC, 6PG2 nebo 6PD2).		
Obaly musí vyhovovat požadavkům na úrovni parametrů obalové skupiny II pro kapaliny.		
Dodatečný požadavek:		
Obaly určené pro ostré nebo špičaté předměty, jako jsou skleněné střepy a jehly, musí být odolné proti propíchnutí a musí udržet kapalinu za zkušebních podmínek kapitoly 6.1.		

P 650	POKYN PRO BALENÍ	P 650
Tento pokyn se použije pro UN číslo 3373.		
(1) Obal musí být dobré kvality, dostatečně pevný, aby odolal nárazům a namáháním, k nimž normálně dochází během přepravy, včetně překládky mezi vozidly nebo kontejnery a mezi vozidly nebo kontejnery a sklady, jakož i snímání (vyjímání) z palety nebo přepravního obalového souboru pro následnou ruční nebo mechanickou manipulaci. Obaly musí být vyrobeny a uzavřeny tak, aby se zamezilo jakémukoli úniku jejich obsahu, který by mohl být za normálních podmínek přepravy způsoben vibrací nebo změnami teploty, vlhkosti nebo tlaku.		
(2) Obal musí sestávat alespoň ze tří komponentů: a) primární nádoby, b) sekundárního obalu, a c) vnějšího obalu, z nichž buď sekundární, nebo vnější obal musí být tuhý.		
(3) Primární nádoby musí být zabaleny do sekundárních obalů takovým způsobem, aby za normálních podmínek přepravy nemohly prasknout, být prodávány nebo propouštět svůj obsah do sekundárního obalu. Sekundární obaly musí být zajištěny ve vnějších obalech vhodným fixačním materiálem. Žádný únik obsahu nesmí narušit celistvost fixačního materiálu ani vnějšího obalu.		
(4) Pro přepravu musí být na vnějším povrchu vnějšího obalu, na pozadí s kontrastní barvou, umístěna značka vyobrazená dole, která musí být jasně viditelná a čitelná. Značka musí mít formu čtverce postaveného na vrchol pod úhlem 45° s minimálními rozměry 50 mm x 50 mm; tloušťka čáry musí být nejméně 2 mm; písmena a číslice musí mít výšku nejméně 6 mm. Na vnějším obalu vedle této značky musí být uvedeno oficiální pojmenování pro přepravu „BIOLOGICKÁ LÁTKA, KATEGORIE B“ písmeny o výšce nejméně 6 mm.		
		

P 650	POKYN PRO BALENÍ (pokračování)	P 650
	<p>(5) Alespoň jeden povrch vnějšího obalu musí mít minimální rozměry 100 mm x 100 mm.</p> <p>(6) Kompletní kus musí být schopen úspěšně projít zkouškou volným pádem podle pododdílu 6.3.5.3, jak je uvedeno v pododdílu 6.3.5.2, při výšce pádu 1,2 m. Po uvedení série pádů nesmí být zpozorován žádný únik z primární(ch) nádob(y), které musí zůstat chráněny absorpčním materiálem, je-li předepsán, v sekundárním obalu.</p> <p>(7) Obaly pro kapalné látky:</p> <ul style="list-style-type: none"> (a) Primární nádoba (nádob) musí být nepropustná (nepropustné); (b) Sekundární obal musí být nepropustný; (c) Pokud je několik křehkých primárních nádob vloženo do jednoho sekundárního obalu, musí být buď jednotlivě zabaleny, nebo navzájem odděleny, aby se zamezilo jejich vzájemnému dotyku; (d) Mezi primární nádobu (nádob) a sekundární obal musí být vložen absorpční materiál. Absorpční materiál musí být v množství dostatečném pro pohlcení celého obsahu primární(ch) nádoby (nádob) tak, aby únik kapalné látky nenarušil celistvost fixačního materiálu nebo vnějšího obalu; (e) Primární nádoba nebo sekundární obal musí být schopné odolat bez úniku obsahu vnitřnímu tlaku 95 kPa (0,95 baru). <p>(8) Obaly pro tuhé látky:</p> <ul style="list-style-type: none"> (a) Primární nádoba (nádob) musí být prachotěsná (prachotěsné); (b) Sekundární obal musí být prachotěsný; (c) Pokud je několik křehkých primárních nádob vloženo do jednoho sekundárního obalu, musí být buď jednotlivě zabaleny, nebo navzájem odděleny, aby se zamezilo jejich vzájemnému dotyku. (d) Není-li možno vyloučit přítomnost zbytkové kapaliny v primární nádobě během přepravy, musí se použít obal vhodný pro kapaliny včetně absorpčního materiálu. <p>(9) Zchladené nebo zmrazené vzorky: Led, suchý led a kapalný dusík:</p> <ul style="list-style-type: none"> (a) Je-li použito jako chladiva suchého ledu nebo kapalného dusíku, musí být dodrženy požadavky uvedené v 5.5.3. Je-li použit led, musí být umístěn vně sekundárních obalů nebo ve vnějším obalu nebo přepravním obalovém souboru. Musí se použít vnitřní podpěry, aby byly sekundární obaly zajištěny v původní poloze. Je-li použit led, musí být vnější obal nebo přepravní obalový soubor nepropustný. (b) Primární nádoba a sekundární obal si musí zachovat svou celistvost při teplotě chladiva, jakož i teplotách a tlacích, které by mohly vzniknout při ztrátě chlazení. <p>(10) Jsou-li kusy uloženy v přepravním obalovém souboru, musí být označení kusů vyžadované tímto pokynem pro balení buď přímo viditelné, nebo musí být reprodukováno na vnější straně přepravního obalového souboru.</p> <p>(11) Infekční látky přiřazené k UN číslu 3373, které jsou zabaleny, a kusy, které jsou označeny podle tohoto pokynu pro balení, nepodléhají žádným dalším ustanovením ADR.</p> <p>(12) Výrobci obalů a jejich následní distributoři musí dát odesílateli nebo osobě, která připravuje kus (např. pacient), jasné pokyny pro plnění a uzavírání takových obalů a umožnit tak správně připravit kus k přepravě.</p> <p>(13) Jiné nebezpečné věci nesmějí být baleny do téhož obalu jako infekční látky třídy 6.2, pokud nejsou nutné k udržení životaschopnosti infekčních látek, k jejich stabilizaci nebo k zamezení jejich degradace nebo pro neutralizaci nebezpečí, které představují. Množství nejvýše 30 ml nebezpečných věcí tříd 3, 8 nebo 9 může být zabaleno do každé primární nádoby obsahující infekční látky. Jsou-li tato malá množství nebezpečných věcí balena s infekčními látkami v souladu s tímto pokynem pro balení, není třeba dodržet žádná jiná ustanovení ADR.</p> <p>(14) Jestliže látka unikla a rozlila (rozsypala) se ve vozidle nebo kontejneru, nesmí být toto vozidlo nebo kontejner znovu použit (použito), dokud nebyl důkladně vyčištěn, a pokud je to potřebné, dezinfikován a dekontaminován. Všechny ostatní věci a předměty přepravované v tomtéž vozidle nebo kontejneru musí být prohlédnuty kvůli případnému znečištění.</p> <p>Dodatečný požadavek:</p> <p>Alternativní obaly pro přepravu zvířecího materiálu smějí být povoleny příslušným orgánem země původu^a podle ustanovení pododdílu 4.1.8.7</p>	

^a Není-li země původu členským státem ADR, příslušný orgán prvního členského státu ADR dotčeného zásilkou.

P 800	POKYN PRO BALENÍ		P 800
Tento pokyn se použije pro UN čísla 2803 a 2809.			
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:			
(1) Tlakové nádoby pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6; nebo			
(2) Ocelové lahvičky nebo lahve se šroubovými uzávěry o vnitřním objemu nepřesahujícím 3 litry; nebo			
(3) Skupinové obaly, které splňují následující požadavky:			
(a) Vnitřními obaly musí být obaly ze skla, kovu nebo tuhého plastu, určené pro kapaliny, o nejvyšší čisté (netto) hmotnosti 15 kg každý;			
(b) Vnitřní obaly musí být baleny s dostatečným množstvím fixačního materiálu k zamezení jejich rozbití;			
(c) Jak vnitřní obal, tak i vnější obal musí být opatřeny vnitřní vložkou nebo vaky z pevného materiálu, odolného proti únikům a proražení, nepropouštějícími obsah a úplně jej obklopujícími a zabraňujícími jeho úniku, bez ohledu na polohu nebo orientaci kusu;			
(d) Dovoleny jsou následující vnější obaly a nejvyšší čisté (netto) hmotnosti:			
Vnější obaly:		Nejvyšší čistá (netto) hmotnost	
Sudy			
z oceli (1A1, 1A2)		400 kg	
z kovu, jiného než ocel nebo hliník (1N1, 1N2)		400 kg	
z plastu (1H1, 1H2)		400 kg	
z překližky (1D)		400 kg	
z lepenky (1G)		400 kg	
Bedny			
ocel (4A)		400 kg	
kov, jiný než ocel nebo hliník (4N)		400 kg	
přírodní dřevo (4C1)		250 kg	
přírodní dřevo, prachotěsné (4C2)		250 kg	
překližka (4D)		250 kg	
rekonstituované dřevo (4F)		125 kg	
lepenka (4G)		125 kg	
pěnový plast (4H1)		60 kg	
tuhý plast (4H2)		125 kg	
Zvláštní ustanovení pro balení:			
PP 41 Pro UN číslo 2803, pokud je nezbytné přepravovat galium při nízkých teplotách pro jeho udržení zcela v tuhém stavu, mohou být výše uvedené obaly zabaleny do pevného vodovzdorného vnějšího obalu, který obsahuje suchý led nebo jiný chladicí prostředek. Pokud je použito chladicího prostředku, musí být všechny výše uvedené materiály použité pro balení galia chemicky a fyzicky odolné vůči chladicímu prostředku a musí mít dostatečnou odolnost proti nárazům při nízkých teplotách použitého chladicího prostředku. Pokud je použit suchý led, musí vnější obal umožnit únik plynného oxidu uhličitého.			

P 801	POKYN PRO BALENÍ	P 801
Tento pokyn se použije pro nové a použité akumulátory UN čísel 2794, 2795 nebo 3028.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1, kromě 4.1.1.3 a 4.1.3:		
(1) Pevné vnější obaly; (2) Dřevěná latění; (3) Palety.		
Dodatečné požadavky:		
1. Akumulátory musí být chráněny proti zkratům. 2. Navrstvené akumulátory musí být přiměřeně zajištěny ve vrstvách, oddělených vrstvou nevodivého materiálu. 3. Svorky akumulátorů nesmějí nést váhu jiných navrstvených jednotek. 4. Akumulátory musí být zabaleny nebo zajištěny tak, aby se zamezilo náhodnému pohybu. Jakýkoli použitý fixační materiál musí být inertní.		

P 801a	POKYN PRO BALENÍ	P 801a
Tento pokyn se použije pro použité akumulátory UN čísel 2794, 2795, 2800 a 3028.		
Bedny pro akumulátory z nerezové oceli nebo tuhého plastu o nejvyšším vnitřním objemu 1 m ³ jsou dovoleny za těchto podmínek:		
(1) Bedny pro akumulátory musí být odolné proti žíravým látkám obsaženým v akumulátorech; (2) Za normálních podmínek přepravy nesmí z beden pro akumulátory vytékat žádné žíravé látky, ani se do nich nesmí dostat žádná jiná látka (např. voda). Žádné nebezpečné zbytky žíravých látek obsažených v akumulátorech nesmějí ulpět na vnějšku beden pro akumulátory; (3) Ložná výška akumulátorů nesmí přesáhnout horní okraj bočních stěn beden pro akumulátory; (4) Do bedny pro akumulátory se nesmí uložit žádný akumulátor obsahující látku nebo jiné nebezpečné věci, které by spolu mohly vzájemně nebezpečně reagovat; (5) Bedny pro akumulátory musí být: (a) buď zakryty; (b) nebo přepravovány v uzavřených vozidlech nebo vozidlech s plachtou, nebo v uzavřených kontejnerech nebo kontejnerech s plachtou.		

P 802	POKYN PRO BALENÍ	P 802
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
(1)	Skupinové obaly: Vnější obaly: 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G nebo 4H2; Nejvyšší čistá (netto) hmotnost: 75 kg. Vnitřní obaly: skleněné nebo plastové; nejvyšší vnitřní objem: 10 litrů;	
(2)	Skupinové obaly: Vnější obaly: 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G nebo 4H2; Nejvyšší čistá (netto) hmotnost: 125 kg. Vnitřní obaly: kov; nejvyšší vnitřní objem: 40 litrů;	
(3)	Kompozitní obaly: skleněná nádoba s vnějším sudem z oceli, hliníku nebo překližky (6PA1, 6PB1 nebo 6PD1) nebo s vnějším bednou z oceli, hliníku nebo dřeva nebo s vnějším proutěným košem (6PA2, 6PB2, 6PC nebo 6PD2) nebo s vnějším obalem z tuhého plastu (6PH2); nejvyšší vnitřní objem: 60 litrů.	
(4)	Sudy z oceli (1A1) o nejvyšším vnitřním objemu 250 litrů;	
(5)	Tlakové nádoby, pokud jsou dodržena všeobecná ustanovení v pododdíle 4.1.3.6, mohou být používány.	

P 803	POKYN PRO BALENÍ	P 803
Tento pokyn se použije pro UN číslo 2028.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
(1)	Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G);	
(2)	Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H2).	
Nejvyšší čistá (netto) hmotnost: 75kg.		
Předměty musí být jednotlivě zabaleny a navzájem odděleny použitím příček, přepážek, vnitřních obalů nebo fixačního materiálu k zamezení náhodnému spuštění za normálních podmínek přepravy.		

P 804	POKYN PRO BALENÍ	P 804
Tento pokyn se použije pro UN číslo 1744.		
Jsou dovoleny následující obaly, pokud jsou dodržena všeobecná ustanovení oddílů 4.1.1 a 4.1.3 a obaly jsou hermeticky utěsněny:		
(1)	<p>Skupinové obaly o nejvyšší celkové (brutto) hmotnosti 25 kg sestávající z</p> <ul style="list-style-type: none"> - jednoho nebo více skleněných vnitřních obalů o nejvyšším vnitřním objemu každého z nich 1,3 litru, naplněných do nejvýše 90 % jejich vnitřního objemu, jejichž uzávěry musí být drženy na svém místě prostředky schopnými zabránit jejich povolení nebo uvolnění v důsledku nárazu nebo vibrací během přepravy, po jednom uložených - do nádob z kovu nebo tuhého plastu spolu s fixačním a savým materiálem dostatečným k tomu, aby pohltil celý obsah skleněného vnitřního obalu (obalů), dále zabalených do - do vnějších obalů 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G nebo 4H2. 	
(2)	<p>Skupinové obaly sestávající z vnitřních obalů z kovu nebo z polyvinylidenfluoridu (PVDF) o vnitřním objemu nepřesahujícím 5 litrů, jednotlivě zabalených se savým materiálem dostatečným k tomu, aby pohltil obsah, a s inertním fixačním materiálem do vnějších obalů 1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G, 4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G nebo 4H2 o nejvyšší celkové (brutto) hmotnosti 75 kg. Vnitřní obaly nesmějí být naplněny více než do 90 % svého vnitřního objemu. Uzávěr každého vnitřního obalu musí být fyzicky držen na svém místě prostředky schopnými zabránit jeho povolení nebo uvolnění v důsledku nárazu nebo vibrací během přepravy.</p>	
(3)	<p>Obaly sestávající z:</p> <p>vnějších obalů:</p> <p>Ocelové nebo plastové sudy (1A1, 1A2, 1H1 nebo 1H2), odzkoušené podle požadavků na zkoušky v 6.1.5 s hmotností odpovídající hmotnosti zkompletovaného kusu, buď jako obal určený k vložení vnitřních obalů, nebo jako samostatný obal určený pro tuhé látky nebo kapaliny, a náležitě označené;</p> <p>vnitřních obalů:</p> <p>Sudy a kompozitní obaly (1A1, 1B1, 1N1, 1H1 nebo 6HA1) splňující požadavky kapitoly 6.1 pro samostatné obaly, za dodržení následujících podmínek:</p>	
(a)	Zkouška hydraulickým tlakem musí být provedena tlakem nejméně 300 kPa (3 bary) (přetlak);	
(b)	Konstrukční a výrobní zkoušky těsnosti musí být provedeny zkušebním tlakem 30 kPa (0,3 baru);	
(c)	Musí být izolovány od vnějšího sudu použitím inertního, nárazy tlumícího fixačního materiálu, který obklopuje vnitřní obal ze všech stran;	
(d)	Jejich vnitřní objem nesmí přesáhnout 125 litrů;	
(e)	Uzávěry musí být šroubového typu, které jsou:	
(i)	fyzicky drženy na svém místě prostředky schopnými zabránit povolení nebo uvolnění uzávěru v důsledku nárazu nebo vibrací během přepravy;	
(ii)	opatřeny těsnicím víčkem;	
(f)	Vnější a vnitřní obaly musí být periodicky podrobeny prohlídce vnitřku a zkoušce těsnosti podle pododstavce	
(b)	v intervalech nejvýše dva a půl roku; a	
(g)	Vnější a vnitřní obaly musí být opatřeny jasně čitelným a trvalým značením obsahujícím:	
(i)	datum (měsíc, rok) první zkoušky a poslední periodické zkoušky a prohlídky vnitřního obalu; a	
(ii)	jméno nebo autorizovanou značku znalce, který provedl zkoušky a prohlídky;	
(4)	Tlakové nádoby, pokud jsou dodržena všeobecná ustanovení 4.1.3.6.	
(a)	Musí být podrobeny první zkoušce a periodickým zkouškám každých 10 let tlakem nejméně 1MPa (10 barů) (přetlak);	
(b)	Musí být podrobeny periodicky prohlídce vnitřku a zkoušce těsnosti v intervalech nejvýše dva a půl roku;	
(c)	Nesmějí být vybaveny zařízením pro vyrovnávání tlaku;	
(d)	Každá tlaková nádoba musí být uzavřena zátkou nebo ventilem (ventily) opatřenými sekundárním uzavíracím prostředkem; a	
(e)	Výrobní materiály pro tlakové nádoby, ventily, zátky, výpustné kloboučky a těsnění se musí snášet mezi sebou navzájem a s obsahem.	

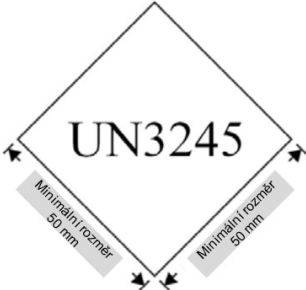

P805	POKYN PRO BALENÍ	P805
Tento pokyn se použije pro UN číslo 3507		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení pro balení v 4.1.9.1.2, 4.1.9.1.4 a 4.1.9.1.7: Obaly sestávající z:		
(a) kovové nebo plastové primární nádoby (nádoby); v (b) těsném tuhém sekundárním obalu (obalech); v (c) tuhém vnějším obalu: Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G); Bedny (4A, 4B, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kanystry (3A2, 3B2, 3H2).		
Dodatečné požadavky: 1. Primární vnitřní nádoby musí být zabaleny do sekundárních obalů takovým způsobem, aby za normálních podmínek přepravy nemohly prasknout, být proděravěny nebo propouštět svůj obsah do sekundárního obalu. Sekundární obaly musí být zajištěny ve vnějších obalech vhodným fixačním materiálem, aby se zamezilo pohybu. Je-li více primárních nádob uloženo v jednom sekundárním obalu, musí být buď jednotlivě zabaleny, nebo odděleny tak, aby se zamezilo jejich vzájemnému dotyku. 2. Obsah musí splňovat ustanovení uvedená v 2.2.7.2.4.5.2 3. Ustanovení pododdílu 6.4.4 musí být dodržena.		
Zvláštní ustanovení pro balení: V případě vyjmutých štěpných látek musí být dodrženy meze uvedené v 2.2.7.2.3.5 a 6.4.11.2.		

P 900	POKYN PRO BALENÍ	P 900
(Vyhrazeno)		

P 901	POKYN PRO BALENÍ	P 901
Tento pokyn se použije pro UN číslo 3316.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
Sudy (1A1, 1A2, 1B1, 1B2, 1N1, 1N2, 1H1, 1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kanystry (3A1, 3A2, 3B1, 3B2, 3H1, 3H2).		
Obaly musí splňovat parametry odpovídající obalové skupině, ke které je přiřazena souprava jako celek (viz zvláštní ustanovení 251 kapitoly 3.3). Pokud souprava obsahuje jen nebezpečné věci, jimž nebyla přiřazena žádná obalová skupina, musí obaly splňovat parametry obalové skupiny II.		
Největší množství nebezpečných věcí na vnější obal: 10 kg, s vyloučením hmotnosti oxidu uhličitého, tuhého (suchý led) použitého jako chladicí prostředek.		
Dodatečný požadavek: Nebezpečné věci v soupravách musí být zabaleny do vnitřních obalů, které smějí obsahovat nejvýše 250 ml nebo 250 g a musí být chráněny před ostatními materiály obsaženými v soupravě.		

P 902	POKYN PRO BALENÍ	P 902
Tento pokyn se použije pro UN číslo 3268.		
Balené předměty: Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3: Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kanystry (3A2, 3B2, 3H2). Obaly musí vyhovovat parametrům obalové skupiny III. Obaly musí být zkonstruovány a vyrobeny tak, aby zamezilo pohybu předmětů a nechtěné činnosti za normálních podmínek přepravy.		
Nebalené předměty: Předměty mohou být přepravovány také nezabalené v jednoúčelových manipulačních zařízeních, vozidlech nebo kontejnerech, jsou-li přemísťovány z místa své výroby do kompletačního závodu.		
Dodatečný požadavek: Jakákoli tlaková nádoba musí splňovat požadavky příslušného orgánu pro látku (látky) obsaženou (obsažené) v tlakové nádobě (nádobách).		

P 903	POKYN PRO BALENÍ	P 903
Tento pokyn se použije pro UN čísla 3090, 3091, 3480 a 3481.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
(1)	<p>Pro články a baterie:</p> <p>Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G); Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2); Kanystry (3A2, 3B2, 3H2).</p> <p>Články nebo baterie musí být zabaleny v obalech tak, aby byly články nebo baterie chráněny proti poškození, které může být způsobeno pohybem nebo rozmístěním článků nebo baterií uvnitř obalu.</p> <p>Obaly musí vyhovovat parametrům obalové skupiny II.</p>	
	<p>(2) Kromě toho pro články nebo baterie o celkové (brutto) hmotnosti nejméně 12 kg v pevných, proti nárazu odolných vnějších skříních a sestavy takových článků nebo baterií:</p> <p>(a) Pevné vnější obaly, (b) Ochranné klece (např. plně uzavřených nebo ve formě dřevěných latění); nebo (c) Palety nebo jiné manipulační prostředky.</p> <p>Články nebo baterie musí být zajištěny tak, aby se zabránilo jejich neúmyslnému pohybu, a jejich svorky nesmějí přenášet hmotnost jiných, na nich uložených součástí.</p> <p>Obaly nemusí splňovat požadavky uvedené v 4.1.1.3.</p>	
	<p>(3) Pro články nebo baterie balené se zařízením:</p> <p>Obaly odpovídající požadavkům uvedeným v odstavci (1) tohoto pokynu pro balení, poté uložené se zařízením do vnějšího obalu; nebo</p> <p>Obaly, které plně obklopují články nebo baterie, poté uložené se zařízením do obalu, který odpovídá požadavkům uvedeným v odstavci (1) tohoto pokynu pro balení.</p> <p>Zařízení musí být zajištěno proti pohybu uvnitř vnějšího obalu.</p> <p>Pro účely tohoto pokynu pro balení „zařízení“ znamená přístroj vyžadující lithiové kovové nebo lithium-iontové články nebo baterie, s nimiž je balen, ke své činnosti.</p>	
	<p>(4) Pro články nebo baterie obsažené v zařízení:</p> <p>Pevné vnější obaly vyrobené z vhodného materiálu a přiměřené pevnosti a konstrukce s ohledem na vnitřní objem obalu a jeho zamýšlené použití. Musí být vyrobeny takovým způsobem, aby se zabránilo nechtěné činnosti během přepravy. Obaly nemusí splňovat požadavky uvedené v 4.1.1.3.</p> <p>Velké zařízení může být podáváno k přepravě bez obalu nebo na paletách, pokud je článkům nebo bateriím poskytována rovnocenná ochrana zařízením, v němž jsou obsažena.</p> <p>Přístroje, jako jsou vysílače vysokofrekvenční identifikace (RFID), hodiny a registrační snímače teploty, které nejsou schopné generovat nebezpečné vyvíjení tepla, smějí být přepravovány, pokud jsou záměrně aktivní, v pevných vnějších obalech.</p>	
<p>Dodatečný požadavek:</p> <p>Články nebo baterie musí být chráněny proti zkratu.</p>		
P 903a	POKYN PRO BALENÍ	P 903a
(Vypuštěno)		
P 903b	POKYN PRO BALENÍ	P 903b
(Vypuštěno)		

P 904	POKYN PRO BALENÍ	P 904
Tento pokyn se použije pro UN číslo 3245.		
Dovoleny jsou následující obaly:		
<p>(1) Obaly splňující ustanovení uvedená v 4.1.1.1, 4.1.1.2, 4.1.1.4, 4.1.1.8 a 4.1.3 a zkonstruované tak, aby splňovaly konstrukční požadavky uvedené v 6.1.4. Musí být použity vnější obaly vyrobené z vhodného materiálu a přiměřené pevnosti a konstrukce ve vztahu k vnitřnímu objemu obalu a jeho zamýšlenému použití. Pokud se tento pokyn pro balení používá pro přepravu vnitřních obalů skupinových obalů, musí být obal zkonstruován a vyroben tak, aby zamezil náhodnému vyprázdnění za normálních podmínek přepravy.</p>		
<p>(2) Obaly, které nemusí vyhovět předpisům pro zkoušky obalů části 6, ale splňující následující požadavky:</p>		
<p>(a) Vnitřní obal zahrnující:</p>		
<p>(i) primární nádobu (nádoby) a sekundární obal; primární nádoba (nádoby) nebo sekundární obal musí být vodotěsné pro kapaliny nebo prachotěsné pro tuhé látky;</p>		
<p>(ii) pro kapaliny absorpční materiál vložený mezi primární nádobu(y) a sekundární obal. Absorpční materiál musí být v dostatečném množství, aby pohltil celý obsah primární nádoby (primárních nádob) tak, aby únik kapalné látky nenarušil celistvost fixačního materiálu ani vnějšího obalu;</p>		
<p>(iii) je-li více křehkých primárních nádob uloženo v jednom sekundárním obalu, musí být jednotlivě zabaleny nebo odděleny tak, aby se předešlo jejich vzájemnému dotyku;</p>		
<p>(b) Vnější obal musí být dostatečně pevný s ohledem na svůj vnitřní objem, hmotnost a zamýšlené použití a s nejmenším vnějším rozměrem nejméně 100 mm.</p>		
<p>Pro přepravu musí být na vnějším povrchu vnějšího obalu, na podkladu kontrastní barvy, umístěna dále vyobrazená značka, která musí být jasně viditelná a čitelná. Tato značka musí mít tvar čtverce postaveného na vrchol pod úhlem 45°, jehož každá strana má délku nejméně 50 mm; šířka čáry musí být nejméně 2 mm a písmena a čísla musí být nejméně 6 mm vysoká.</p>		
		
Dodatečný požadavek:		
<u>Led, suchý led a kapalný dusík</u>		
<p>Je-li použito jako chladiwa suchého ledu nebo kapalného dusíku, musí být dodrženy požadavky uvedené v 5.5.3. Je-li použit led, musí být umístěn vně sekundárních obalů nebo ve vnějším obalu nebo přepravním obalovém souboru. Musí se použít vnitřní podpěry, aby byly sekundární obaly zajištěny v původní poloze. Je-li použit led, musí být vnější obal nebo přepravní obalový soubor nepropustný.</p>		

P 905	POKYN PRO BALENÍ	P 905
Tento pokyn se použije pro UN čísla 2990 a 3072.		
Dovoleno je každý vhodný obal, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3, s výjimkou toho, že obaly nemusí nutně vyhovět předpisům části 6.		
Pokud jsou záchranné prostředky vyrobeny k zabudování do pevných, proti počasi odolných pouzder, nebo jsou v nich obsaženy (takových jako pro záchranné čluny), mohou být přepravovány bez obalu.		
Dodatečné požadavky:		
1.Všechny nebezpečné látky a předměty obsažené jako výbava v zařízeních musí být zajištěny k zamezení nahodilého pohybu a mimo to: <ul style="list-style-type: none"> (a) Signální prostředky třídy 1 musí být zabaleny v plastových nebo lepenkových vnitřních obalech; (b) Nehořlavé netoxické plyny musí být v lahvích schválených příslušným orgánem, které mohou být připojeny k zařízení; (c) Elektrické akumulátory (třídy 8) a lithiové baterie (třídy 9) musí být odpojeny nebo elektricky odizolovány a zajištěny proti vylití kapaliny, a (d) Malá množství jiných nebezpečných látek (např. tříd 3, 4.1 a 5.2) musí být zabalena v pevných vnitřních obalech. 2.Příprava pro přepravu a balení musí zahrnovat opatření k zamezení jakéhokoliv náhodného nafouknutí zařízení.		

P 906	POKYN PRO BALENÍ	P 906
Tento pokyn se použije pro UN čísla 2315, 3151, 3152 a 3432.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
(1) Pro kapaliny a tuhé látky obsahující nebo kontaminované PCB nebo polyhalogenovanými bifenylly nebo terfenylly: Obaly podle pokynu pro balení P001 nebo P002, podle vhodnosti;		
(2) Pro transformátory, kondenzátory a jiná zařízení: <ul style="list-style-type: none"> (a) Obaly podle pokynů pro balení P001 nebo P002. Předměty musí být zajištěny vhodným fixačním materiálem k zamezení nechtěnému pohybu během normálních podmínek přepravy; nebo (b) Nepropustné obaly, které jsou schopny pojmout navíc k zařízením nejméně 1,25 násobek objemu kapalných PBC, polyhalogenovaných bifenylů nebo terfenylů, které jsou v nich obsaženy. V obalech musí být dostatečné množství absorpčního materiálu k pohlcení alespoň 1,1 násobku objemu kapaliny, která je obsažena v zařízeních. Všeobecně musí být transformátory a kondenzátory přepravovány v nepropustných kovových obalech, které jsou schopné zadržet, kromě transformátorů a kondenzátorů, nejméně 1,25 násobek objemu kapaliny v nich obsažené. Nehledě k výše uvedenému, mohou být kapaliny a tuhé látky, které nejsou zabaleny podle pokynů pro balení P 001 nebo P 002, jakož i transformátory a kondenzátory bez obalu, přepravovány dopravními jednotkami vybavenými nepropustnou kovovou vanou o výšce nejméně 800 mm, obsahující dostatek inertního absorpčního materiálu k pohlcení nejméně 1,1 násobku objemu jakékoliv volné kapaliny.		
Dodatečný požadavek:		
Musí být provedena vhodná opatření k zajištění těsnosti transformátorů a kondenzátorů, aby se zabránilo jakémukoli úniku za normálních podmínek přepravy.		

P 908	POKYN PRO BALENÍ	P 908
Tento pokyn se použije pro poškozené nebo vadné lithium-iontové články a baterie a poškozené nebo vadné lithiové kovové články a baterie, včetně těch, které jsou obsaženy v zařízeních, UN čísel 3090, 3091, 3480 a 3481.		
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3: Pro články a baterie a zařízení obsahující články a baterie: Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G) Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H1, 4H2) Kanystry (3A2, 3B2, 3H2) Obaly musí vyhovovat parametrům obalové skupiny II.		
1. Každý poškozený nebo vadný článek nebo baterie nebo zařízení obsahující takové články nebo baterie musí být jednotlivě zabaleny do vnitřního obalu a vloženy do vnějšího obalu. Vnitřní obal nebo vnější obal musí být nepropustné, aby se předešlo potenciálnímu úniku elektrolytu.		
2. Každý vnitřní obal musí být obklopen nehořlavým a nevodivým materiálem, zajišťujícím dostatečnou tepelnou izolaci k jeho ochraně proti nebezpečnému vývoji tepla.		
3. Těsně uzavřené obaly musí být vybaveny ventilačním zařízením, je-li potřebné.		
4. Musí být učiněna vhodná opatření k tomu, aby se minimalizovaly účinky vibrací a nárazů a aby se předešlo pohybu článků nebo baterií uvnitř obalu, což by mohlo vést k dalšímu poškození a nebezpečným podmínkám během přepravy. Ke splnění tohoto požadavku je možno použít také nehořlavý a nevodivý fixační materiál.		
5. Nehořlavost musí být posouzena podle normy uznané v zemi, kde je obal konstruován nebo vyráběn.		
Pro netěsnící články nebo baterie musí být do vnitřního nebo vnějšího obalu přidáno dostatečné množství inertního absorpčního materiálu, aby pohltilo jakýkoli únik elektrolytu. Je-li čistá (netto) hmotnost jednoho článku nebo baterie větší než 30 kg, smí být do vnějšího obalu uložen(a) jen jeden článek nebo baterie.		
Dodatečný požadavek:		
Články nebo baterie musí být chráněny proti zkratu.		

P 909	POKYN PRO BALENÍ	P 909
Tento pokyn se použije pro UN čísla 3090, 3091, 3480 a 3481 přepravovaná k likvidaci nebo recyklaci, balená buď s nelithiovými bateriemi, nebo bez nich.		
<p>(1) Články a baterie musí být baleny podle následujících ustanovení:</p> <p>(a) Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:</p> <p>Sudy (1A2, 1B2, 1N2, 1H2, 1D, 1G);</p> <p>Bedny (4A, 4B, 4N, 4C1, 4C2, 4D, 4F, 4G, 4H2); a</p> <p>Kanistry (3A2, 3B2, 3H2).</p> <p>(b) Obaly musí vyhovovat parametrům obalové skupiny II.</p> <p>(c) Kovové obaly musí být opatřeny nevodivým vložkovým materiálem (např. plastem), přiměřené pevnosti vzhledem k zamýšlenému použití.</p> <p>(2) Avšak lithium-iontové články s wattodinovou zatížitelností nejvýše 20 Wh, lithium-iontové baterie s wattodinovou zatížitelností nejvýše 100 Wh, lithiové kovové články s obsahem lithia nejvýše 1 g a lithiové kovové baterie s celkovým obsahem lithia nejvýše 2 g smějí být baleny podle následujících ustanovení:</p> <p>(a) Do pevných vnějších obalů až do 30 kg celkové (brutto) hmotnosti splňujících všeobecná ustanovení oddílů 4.1.1, kromě 4.1.1.3, a 4.1.3:</p> <p>(b) Kovové obaly musí být opatřeny nevodivým vložkovým materiálem (např. plastem), přiměřené pevnosti vzhledem k zamýšlenému použití.</p> <p>(3) Pro články nebo baterie obsažené v zařízeních smějí být používány pevné vnější obaly vyrobené z vhodného materiálu a přiměřené pevnosti a konstrukce vzhledem k vnitřnímu objemu obalu a jeho zamýšlenému použití. Obaly nemusí splňovat požadavky uvedené v 4.1.1.3. Velká zařízení smějí být podávána k přepravě bez obalu nebo na paletách, pokud je článkům nebo bateriím poskytována rovnocenná ochrana zařízeními, v nichž jsou obsažena.</p> <p>(4) Kromě toho smějí být pro články nebo baterie s celkovou (brutto) hmotností nejméně 12 kg s pevným vnějším pláštěm odolným proti nárazu používány pevné vnější obaly vyrobené z vhodného materiálu a přiměřené pevnosti a konstrukce vzhledem k vnitřnímu objemu obalu a jeho zamýšlenému použití. Obaly nemusí splňovat požadavky uvedené v 4.1.1.3.</p>		
<p>Dodatečné požadavky:</p> <p>1. Články a baterie musí být zkonstruovány nebo zabaleny tak, aby se zamezilo zkratům a nebezpečnému vývoji tepla.</p> <p>2. Ochrana proti zkratům a nebezpečnému vývoji tepla zahrnuje, avšak není omezena jen na:</p> <ul style="list-style-type: none"> – individuální ochranu svorek baterie, – vnitřní obal k zamezení dotyku mezi články a bateriemi, – baterie se zapuštěnými svorkami zkonstruovanými k ochraně proti zkratům, nebo – použití nevodivého a nehořlavého fixačního materiálu k vyplnění prázdného prostoru mezi články nebo bateriemi v obalu. <p>3. Články a baterie musí být zajištěny ve vnějším obalu, aby se zamezilo nadměrnému pohybu během přepravy (např. použitím nehořlavého a nevodivého fixačního materiálu nebo použitím pevně uzavřeného plastového pytle).</p>		

R 001	POKYN PRO BALENÍ			R 001
Dovoleny jsou následující obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:				
Obaly z jemného plechu	Nejvyšší vnitřní objem/nejvyšší čistá (netto) hmotnost			
	Obalová skupina I	Obalová skupina II	Obalová skupina III	
ocel, neodnímatelné víko (0A1)	Není dovoleno	40 litrů/50 kg	40 litrů/50 kg	
ocel, odnímatelné víko (0A2) ^a	Není dovoleno	40 litrů/50 kg	40 litrů/50 kg	
^a Není dovoleno pro UN 1261 NITROMETHAN				
Poznámka 1: Tento pokyn se použije pro tuhé látky a kapaliny (za podmínky, že konstrukční typ byl vyzkoušen a příslušným způsobem označen).				
Poznámka 2: V případě třídy 3, obalové skupiny II, mohou být tyto obaly použity jen pro látky bez vedlejšího nebezpečí a s tenzí par nejvýše 110 kPa při 50 °C a pro slabě toxické pesticidy.				

4.1.4.2 Pokyny pro balení týkající se použití IBC

IBC 01	POKYN PRO BALENÍ	IBC 01
Dovoleny jsou následující IBC, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1, 4.1.2 a 4.1.3: Kovové IBC (31A, 31B a 31N).		
Zvláštní ustanovení pro balení, specifické pro RID a ADR:		
BB1	Pro UN číslo 3130: otvory nádob pro tuto látku musí být těsně uzavřeny, a to dvěma prostředky v sérii, z nichž jeden musí být šroubový, nebo zajištěný rovnocenným způsobem.	

IBC 02	POKYN PRO BALENÍ	IBC 02
Dovoleny jsou následující IBC, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1, 4.1.2 a 4.1.3:		
(1) Kovové IBC (31A, 31B a 31N);		
(2) IBC z tuhého plastu (31H1 a 31H2);		
(3) Kompozitní IBC (31HZ1).		
Zvláštní ustanovení pro balení:		
B5	Pro UN čísla 1791, 2014, 2984 a 3149 musí být IBC vybaveny zařízením umožňujícím odvětrávání během přepravy. Vstup odvětrávacího zařízení musí být umístěn v parním prostoru IBC v podmínkách maximálního naplnění během přepravy.	
B7	Pro UN čísla 1222 a 1865 nejsou dovoleny IBC s vnitřním objemem větším než 450 litrů z důvodu náchylnosti látek k výbuchu při jejich přepravě ve velkých objemech.	
B8	Čistá forma této látky nesmí být přepravována v IBC, neboť je známo, že má tenzi par vyšší než 110 kPa při 50°C, nebo 130 kPa při 55 °C.	
B15	Pro látky UN čísla 2031 s více než 55 % kyseliny dusičné je povolená doba používání IBC z tuhého plastu a kompozitních IBC s vnitřní nádobou z tuhého plastu dva roky od data jejich výroby.	
B16	Pro UN 3375 nejsou IBC typu 31A a 31N dovoleny bez schválení příslušného orgánu.	
Zvláštní ustanovení pro balení specifické pro RID a ADR:		
BB 2	Pro UN číslo 1203 mohou být, bez ohledu na zvláštní ustanovení 534 (viz oddíl 3.3.1), IBC používány, jen je-li skutečná tenze par nejvýše 110 kPa při 50 °C, nebo nejvýše 130 kPa při 55 °C.	
BB4	Pro UN čísla 1133, 1139, 1169, 1197, 1210, 1263, 1266, 1286, 1287, 1306, 1866, 1993 a 1999, přiřazená k obalové skupině III podle 2.2.3.1.4, nejsou dovoleny IBC s vnitřním objemem větším než 450 litrů.	

IBC 03	POKYN PRO BALENÍ	IBC 03
Dovoleny jsou následující IBC, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1, 4.1.2 a 4.1.3:		
(1) Kovové IBC (31A, 31B a 31N);		
(2) IBC z tuhého plastu (31H1 a 31H2);		
(3) Kompozitní IBC (31HZ1, 31HA2, 31HB2, 31HN2, 31HD2 a 31HH2).		
Zvláštní ustanovení pro balení:		
B8 Čistá forma této látky nesmí být přepravována v IBC, neboť je známo, že má tenzi par vyšší než 110 kPa při 50 °C, nebo 130 kPa při 55 °C.		

IBC 04	POKYN PRO BALENÍ	IBC 04
Dovoleny jsou následující IBC, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1, 4.1.2 a 4.1.3:		
Kovové IBC (11A, 11B, 11N, 21A, 21B, 21N, 31A, 31B a 31N).		

IBC 05	POKYN PRO BALENÍ	IBC 05
Dovoleny jsou následující IBC, pokud jsou splněna všeobecná ustanovení v oddílů 4.1.1, 4.1.2 a 4.1.3:		
(1) Kovové IBC (11A, 11B, 11N, 21A, 21B, 21N, 31A, 31B a 31N);		
(2) IBC z tuhého plastu (11H1, 11H2, 21H1, 21H2, 31H1 a 31H2);		
(3) Kompozitní IBC (11HZ1, 21HZ1 a 31HZ1).		

IBC 06	POKYN PRO BALENÍ	IBC 06
Dovoleny jsou následující IBC, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1, 4.1.2 a 4.1.3:		
(1) Kovové IBC (11A, 11B, 11N, 21A, 21B, 21N, 31A, 31B a 31N);		
(2) IBC tuhého plastu (11H1, 11H2, 21H1, 21H2, 31H1 a 31H2);		
(3) Kompozitní IBC (11HZ1, 11HZ2, 21HZ1, 21HZ2 a 31HZ1).		
Dodatečný požadavek:		
Je-li tuhá látka náchylná ke zkapalnění během přepravy, viz 4.1.3.4.		
Zvláštní ustanovení pro balení:		
B12 Pro UN číslo 2907 musí IBC splňovat parametry obalové skupiny II. IBC splňující zkušební kritéria obalové skupiny I se nepoužijí.		

IBC 07	POKYN PRO BALENÍ	IBC 07
Dovoleny jsou následující IBC, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1, 4.1.2 a 4.1.3:		
(1) Kovové IBC (11A, 11B, 11N, 21A, 21B, 21N, 31A, 31B a 31N);		
(2) IBC z tuhého plastu (11H1, 11H2, 21H1, 21H2, 31H1 a 31H2);		
(3) Kompozitní IBC (11HZ1, 11HZ2, 21HZ1, 21HZ2 a 31HZ1);		
(4) Dřevěné IBC (11C, 11D a 11F).		
Dodatečný požadavek:		
1. Je-li tuhá látka náchylná ke zkapalnění během přepravy, viz 4.1.3.4.		
2. Vložky dřevěných IBC musí být prachotěsné.		

IBC 08	POKYN PRO BALENÍ	IBC 08
Dovoleny jsou následující IBC, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1, 4.1.2 a 4.1.3:		
(1) Kovové IBC (11A, 11B, 11N, 21A, 21B, 21N, 31A, 31B a 31N);		
(2) IBC z tuhého plastu (11H1, 11H2, 21H1, 21H2, 31H1 a 31H2);		
(3) Kompozitní IBC (11HZ1, 11HZ2, 21HZ1, 21HZ2 a 31HZ1);		
(4) Lepenkové IBC (11G);		
(5) Dřevěné IBC (11C, 11D a 11F);		
(6) Flexibilní IBC (13H1, 13H2, 13H3, 13H4, 13H5, 13L1, 13L2, 13L3, 13L4, 13M1 a 13M2).		
Dodatečný požadavek:		
Je-li tuhá látka náchylná ke zkapalnění během přepravy, viz 4.1.3.4.		
Zvláštní ustanovení pro balení:		
B3	Flexibilní IBC musí být prachotěsné a vodovzdorné, nebo musí být opatřeny prachotěsnou a vodovzdornou vložkou.	
B4	Flexibilní, lepenkové nebo dřevěné IBC musí být prachotěsné a vodovzdorné, nebo musí být opatřeny prachotěsnou a vodovzdornou vložkou.	
B6	Pro UN čísla 1363, 1364, 1365, 1386, 1408, 1841, 2211, 2217, 2793 a 3314 se nevyžaduje, aby IBC vyhověly zkušebním požadavkům kapitoly 6.5.	
B13	Poznámka: Pro UN čísla 1748, 2208, 2880, 3485, 3486 a 3487 je přeprava po moři ve velkých nádobách IBC podle IMDG Code zakázána.	
Zvláštní ustanovení pro balení specifické pro RID a ADR:		
BB3	Pro UN 3509 nemusí IBC splňovat požadavky uvedené v 4.1.1.3.	
	Musí se používat IBC splňující požadavky uvedené v 6.5.5, vyrobené jako těsné nebo opatřené těsně uzavřenou vložkou nebo pytle, odolnými proti proražení.	
	Jsou-li jedinými zbytky tuhé látky, které nejsou náchylné ke zkapalnění při pravděpodobných teplotách během přepravy, smějí být použity flexibilní IBC.	
	Jsou-li přítomné kapalné zbytky, musí být použity tuhé IBC se zádržnými prostředky (např. absorpčním materiálem).	
	Před naplněním a podáním k přepravě musí být každá IBC prohlédnuta, aby se zajistilo, že je prosta koroze, kontaminace nebo jiné závady. Každá IBC vykazující známky snížené pevnosti již nesmí být použita (menší promáčknutí nebo škrábance se nepovažují za závady snižující pevnost IBC).	
	IBC určené pro přepravu obalů, vyřazených, prázdných, nevyčištěných se zbytky věci třídy 5.1 musí být zkonstruovány nebo upraveny tak, aby věci nemohly přijít do styku se dřevem nebo jakýmkoli jiným hořlavým materiálem.	

IBC 99	POKYN PRO BALENÍ	IBC 99
Smějí se použít pouze IBC schválené pro tyto věci příslušným orgánem. Kopie schválení příslušného orgánu musí doprovázet každou zásilku, nebo přepravní doklad musí obsahovat zápis, že byl obal schválen příslušným orgánem.		

IBC 100	POKYN PRO BALENÍ	IBC 100
Tento pokyn se použije pro UN čísla 0082, 0222 0241, 0331 a 0332.		
Dovoleny jsou následující IBC, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1, 4.1.2 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:		
(1)	Kovové IBC (11A, 11B, 11N, 21A, 21B, 21N, 31A, 31B a 31N);	
(2)	Flexibilní IBC (13H2, 13H3, 13H4, 13L2, 13L3, 13L4 a 13M2);	
(3)	IBC z tuhého plastu (11H1, 11H2, 21H1, 21H2, 31H1 a 31H2);	
(4)	Kompozitní IBC (11HZ1, 11HZ2, 21HZ1, 21HZ2, 31HZ1 a 31HZ2).	
Dodatečné požadavky:		
1.	IBC smějí být použity jen pro volně sypké látky.	
2.	Flexibilní IBC smějí být použity jen pro tuhé látky.	
Zvláštní ustanovení pro balení:		
B3	Pro UN 0222 musí být flexibilní IBC prachotěsné a vodovzdorné, nebo musí být opatřeny prachotěsnou a vodovzdornou vložkou.	
B9	Pro UN číslo 0082 může být tento pokyn pro balení použit, jen pokud jsou tyto látky směsí dusičnanu amonného nebo jiných anorganických dusičnanů s jinými hořlavými látkami, které nejsou výbušnými složkami. Takové výbušné látky nesmějí obsahovat nitroglycerin, podobné kapalné organické dusičnany nebo chlorečnany. Kovové IBC nejsou dovoleny.	
B10	Pro UN číslo 0241 může být tento pokyn pro balení použit jen pro látky složené z vody, jako základní složky, a vysokého podílu dusičnanu amonného nebo jiných okysličujících látek, z nichž některé nebo všechny jsou v roztoku. Jiné složky mohou zahrnovat uhlovodíky nebo práškový hliník, ale nesmějí obsahovat nitroderiváty, jako je trinitrotoluen. Kovové IBC nejsou dovoleny.	
B17	Pro UN 0222 nejsou dovoleny kovové IBC.	

IBC 520		POKYN PRO BALENÍ			IBC 520
Tento pokyn se použije pro organické peroxidy a samovolně se rozkládající látky typu F.					
Následující IBC jsou dovoleny pro uvedené přípravky, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1, 4.1.2 a 4.1.3, a zvláštní ustanovení pododdílu 4.1.7.2.					
Pro přípravky, které nejsou v tomto seznamu uvedeny, mohou být použity jen IBC schválené příslušným orgánem (viz 4.1.7.2.2).					
UN číslo	Organický peroxid	Typ IBC	Maximální množství (litry/kg)	Rízená teplota	Kritická teplota
3109	ORGANICKÝ PEROXID TYP F, KAPALNÝ	31A	1250

		31A	1250	- 25 °C	- 15 °C	
3120	ORGANICKÝ PEROXID TYP F, TUHÝ, ŘÍZENÁ TEPLOTA Neuvedený					

Dodatečné požadavky:

1. IBC musí být vybaveny zařízením umožňujícím odvětrávání během přepravy. Vstup zařízení pro vyrovnávání tlaku musí být umístěn v parním prostoru IBC za podmínek maximálního naplnění během přepravy.
2. Aby se předešlo výbušnému roztržení kovové IBC nebo kompozitní IBC s celokovovým pláštěm, musí být nouzové zařízení pro odlehčení tlaku zkonstruováno tak, aby odvětralo všechny produkty rozkladu a páry vyvinuté během samourychlujícího se rozkladu nebo během časového úseku nejméně jedné hodiny zachycení ohněm, jak je vypočítáno podle vzorce v 4.2.1.13.8. Řízená a kritická teplota uvedené v tomto pokynu pro balení jsou vypočítány na základě neizolované IBC. Jestliže se odesílá organický peroxid v IBC podle tohoto pokynu pro balení, je odpovědností odesílatele se ujistit že:
 - (a) tlak zařízení pro vyrovnávání tlaku a nouzového zařízení pro odlehčení tlaku instalovaných na IBC je navržen s příslušným ohledem k samourychlujícímu se rozkladu organického peroxidu a průniku plamene, a
 - (b) popřípadě, že řízená a kritická teplota jsou příslušně indikovány, s přihlédnutím ke konstrukci (např. izolaci) použité IBC.

IBC 620	POKYN PRO BALENÍ	IBC 620
Tento pokyn se použije pro UN číslo 3291.		
Dovoleny jsou následující IBC, pokud jsou splněna všeobecná ustanovení v oddílů 4.1.1 (kromě 4.1.1.15), 4.1.2 a 4.1.3 :		
Pevné nepropustné IBC splňující parametry obalové skupiny II.		
Dodatečné požadavky:		
<ol style="list-style-type: none"> 1. V IBC musí být dostatek absorpčního materiálu k pohlcení celého množství kapaliny obsažené v IBC. 2. IBC musí být schopny udržet kapaliny. 3. IBC, u kterých se předpokládá, že budou obsahovat ostré předměty, jako jsou skleněné střepy a jehly, musí být odolné proti proražení. 		

4.1.4.3 Pokyny pro balení týkající se použití velkých obalů

LP 01	POKYN PRO BALENÍ (kapaliny)				LP 01
Dovoleny jsou následující velké obaly, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3:					
Vnitřní obaly	Vnější velké obaly	Obalová skupina I	Obalová skupina II	Obalová skupina III	
ze skla 10 litrů z plastu 30 litrů z kovu 40 litrů	z oceli (50A) z hliníku (50B) z kovu, jiného než ocel nebo hliník (50N) z tuhého plastu (50H) z přírodního dřeva (50C) z překližky (50D) z rekonstituovaného dřeva (50F) z lepenky (50G)	Není dovoleno	Není dovoleno	Nejvyšší vnitřní objem: 3 m³	

LP 02	POKYN PRO BALENÍ (tuhé látky)				LP 02
Dovoleny jsou následující velké obaly, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3:					
Vnitřní obaly		Vnější velké obaly	Obalová skupina I	Obalová skupina II	Obalová skupina III
ze skla	10 kg	z oceli (50A)	Není dovoleno	Není dovoleno	Nejvyšší vnitřní objem: 3 m ³
z plastu ^b	50 kg	z hliníku (50B)			
z kovu	50 kg	z kovu, jiného než ocel nebo hliník (50N)			
z papíru ^{a, b}	50 kg	z tuhého plastu (50H)			
z lepenky ^{a, b}	50 kg	z přírodního dřeva (50C)			
		z překližky (50D)			
		z rekonstruovaného dřeva (50F)			
		z lepenky (50G)			
		z flexibilního plastu (51H) ^c			

^a Tyto vnitřní obaly nesmějí být použity, jestliže přepravovaná látka může během přepravy zkapat.

^b Tyto vnitřní obaly musí být prachotěsné.

^c Smějí se použít jen s flexibilními vnitřními obaly.

Zvláštní ustanovení pro balení

L2 Pro UN 1950 aerosoly musí velké obaly vyhovovat parametrům obalové skupiny III. Velké obaly pro odpadové aerosoly přepravované podle zvláštního ustanovení 327 musí mít kromě toho prostředky k zadržení veškeré volné kapaliny, která by mohla uniknout během přepravy, např. absorpční materiál.

L3 **POZNÁMKA:** Pro UN čísla 2208 a 3486 je přeprava po moři ve velkých obalech zakázána.

Zvláštní ustanovení pro balení specifické pro RID a ADR:

LL1 Pro UN 3509 nemusí velké obaly splňovat požadavky uvedené v 4.1.1.3.

Musí se používat velké obaly splňující požadavky uvedené v 6.5.4, vyrobené jako těsné nebo opatřené těsně uzavřenou vložkou nebo pytlkem, odolnými proti proražení.

Jsou-li jedinými zbytky tuhé látky, které nejsou náchylné ke zkapaření při pravděpodobných teplotách během přepravy, smějí být použity flexibilní velké obaly.

Jsou-li přítomné kapalné zbytky, musí být použity tuhé velké obaly se zádržnými prostředky (např. absorpčním materiálem).

Před naplněním a podáním k přepravě musí být každý velký obal prohlédnut, aby se zajistilo, že je prost koroze, kontaminace nebo jiné závady. Každý velký obal vykazující známky snížené pevnosti již nesmí být použit (menší promáčknutí nebo škrábance se nepovažují za závady snižující pevnost velkého obalu).

Velké obaly určené pro přepravu obalů, vyřazených, prázdných, nevyčištěných se zbytky věci třídy 5.1 musí být zkonstruovány nebo upraveny tak, aby věci nemohly přijít do styku se dřevem nebo jakýmkoli jiným hořlavým materiálem.

LP 99	POKYN PRO BALENÍ	LP 99
Použity mohou být pouze velké obaly schválené pro tyto věci příslušným orgánem. Kopie schválení příslušného orgánu musí doprovázet každou zásilku, nebo přepravní doklad musí obsahovat zápis, že byl obal schválen příslušným orgánem.		

LP 101	POKYN PRO BALENÍ	LP 101
Dovoleny jsou následující velké obaly, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:		
Vnitřní obaly	Meziobaly	Velké obaly
Nejsou nutné	Nejsou nutné	z oceli (50A) z hliníku (50B) z kovu, jiného než ocel nebo hliník (50N) z tuhého plastu (50H) z přírodního dřeva (50C) z překližky (50D) z rekonstituovaného dřeva (50F) z lepenky (50G)
Zvláštní ustanovení pro balení:		
L1 Pro UN čísla 0006, 0009, 0010, 0015, 0016, 0018, 0019, 0034, 0035, 0038, 0039, 0048, 0056, 0137, 0138, 0168, 0169, 0171, 0181, 0182, 0183, 0186, 0221, 0243, 0244, 0245, 0246, 0254, 0280, 0281, 0286, 0287, 0297, 0299, 0300, 0301, 0303, 0321, 0328, 0329, 0344, 0345, 0346, 0347, 0362, 0363, 0370, 0412, 0424, 0425, 0434, 0435, 0436, 0437, 0438, 0451, 0488 a 0502: Velké a robustní výbušné předměty, běžně určené pro vojenské použití, bez svých rozněcovacích prostředků, nebo se svými rozněcovacími prostředky obsahujícími nejméně dvě účinná pojistná zařízení, mohou být přepravovány bez obalu. Pokud takové předměty obsahují hnací náplně, nebo jsou s vlastním pohonem, jejich spouštěcí systémy musí být chráněny proti stimulovanému spuštění během normálních podmínek přepravy. Negativní výsledek zkoušky série 4 na nezabaleném předmětu prokazuje, že tento předmět může být uvažován pro přepravu bez obalu. Takovéto nezabalené předměty mohou být fixovány v lůžkách nebo uloženy v latních nebo jiných vhodných manipulačních prostředcích.		

LP 102	POKYN PRO BALENÍ	LP 102
Dovoleny jsou následující velké obaly, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3 a zvláštní ustanovení oddílu 4.1.5:		
Vnitřní obaly	Meziobaly	Vnější obaly
Pytle vodovzdorné Nádoby z lepenky z kovu z plastu ze dřeva Balicí materiály z lepenky, vlnité Trubkové nádoby z lepenky	Není nutný	z oceli (50A) z hliníku (50B) z kovu, jiného než ocel nebo hliník (50N) z tuhého plastu (50H) z přírodního dřeva (50C) z překližky (50D) z rekonstituovaného dřeva (50F) z lepenky (50G)

LP 621	POKYN PRO BALENÍ	LP 621
Tento pokyn se použije pro UN číslo 3291.		
Dovoleny jsou následující velké obaly, pokud jsou splněna všeobecná ustanovení oddílů 4.1.1 a 4.1.3:		
<p>(1) Pro klinický odpad uložený ve vnitřních obalech: Pevné nepropustné velké obaly vyhovující požadavkům kapitoly 6.6 pro tuhé látky, na úrovni parametrů obalové skupiny II, za podmínky dostatečného množství absorpčního materiálu k pohlcení celého množství kapaliny obsažené ve velkém obalu a za podmínky, že velký obal je schopen udržet kapaliny;</p> <p>(2) Pro obaly obsahující větší množství kapalin: Pevné velké obaly splňující požadavky kapitoly 6.6, na úrovni parametrů obalové skupiny II, pro kapaliny.</p>		
Dodatečný požadavek:		
Velké obaly určené pro ostré předměty, jako skleněné střepy a jehly, musí být odolné proti proražení a udržet kapaliny podle zkušebních podmínek kapitoly 6.6.		

LP 902	POKYN PRO BALENÍ	LP 902
Tento pokyn se použije pro UN číslo 3268.		
Balené předměty		
Dovoleny jsou následující velké obaly, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
Obaly vyhovující parametrům obalové skupiny III. Obaly musí být zkonstruovány a vyrobeny tak, aby zabránily pohybu předmětů a jejich nechtěné činnosti za normálních podmínek přepravy.		
Nebalené předměty		
Předměty smějí být přepravovány také nebalené v jednoúčelových manipulačních zařízeních, vozidlech nebo kontejnerech, pokud jsou přepravovány z místa své výroby do kompletačního závodu.		
Dodatečný požadavek:		
Jakákoli tlaková nádoba musí splňovat požadavky příslušného orgánu pro látku (látky) obsaženou (obsažené) v tlakové nádobě (nádobách).		

LP 903	POKYN PRO BALENÍ	LP 903
Tento pokyn se použije pro UN čísla 3090, 3091, 3480 a 3481.		
Následující velké obaly jsou dovoleny pro jednotlivou baterii, včetně baterie obsažené v zařízení, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
Tuhé velké obaly vyhovující parametrům obalové skupiny II, vyrobené:		
<ul style="list-style-type: none"> z oceli (50A); z hliníku (50B); z jiného kovu, než ocel nebo hliník (50N); z tuhého plastu (50H); z přírodního dřeva (50C); z překližky (50D); z rekonstituovaného dřeva (50F); z tuhé lepenky (50G). 		
Baterie musí být zabalena tak, aby byla chráněna proti poškození, které by mohlo být způsobeno jejím pohybem nebo uložením ve velkém obalu.		
Dodatečný požadavek:		
Baterie musí být chráněny proti zkratu.		

LP 904	POKYN PRO BALENÍ	LP 904
Tento pokyn se použije pro jednotlivé poškozené nebo vadné baterie UN čísel 3090, 3091, 3480 a 3481, včetně těch, které jsou obsažené v zařízeních.		
Následující velké obaly jsou dovoleny pro jednotlivou poškozenou nebo vadnou baterii a pro jednotlivou poškozenou nebo vadnou baterii obsaženou v zařízení, pokud jsou splněna všeobecná ustanovení pro balení oddílů 4.1.1 a 4.1.3:		
Pro baterie a zařízení obsahující baterie velké obaly vyrobené: <ul style="list-style-type: none"> z oceli (50A); z hliníku (50B); z jiného kovu, než ocel nebo hliník (50N); z tuhého plastu (50H); z překližky (50D); 		
Obaly musí vyhovovat parametrům obalové skupiny II.		
<ol style="list-style-type: none"> 1. Každá poškozená nebo vadná baterie nebo zařízení obsahující takovou baterii musí být jednotlivě zabalena(o) do vnitřního obalu a vložena(o) do vnějšího obalu. Vnitřní obal nebo vnější obal musí být nepropustný, aby se předešlo potenciálnímu úniku elektrolytu. 2. Každý vnitřní obal musí být obklopen nehořlavým a nevodivým materiálem, zajišťujícím dostatečnou tepelnou izolaci k jeho ochraně proti nebezpečnému vývoji tepla. 3. Těsně uzavřené obaly musí být vybaveny ventilačním zařízením, je-li potřebné. 4. Musí být učiněna vhodná opatření k tomu, aby se minimalizovaly účinky vibrací a nárazů a aby se předešlo pohybu baterie uvnitř obalu, což by mohlo vést k dalšímu poškození a nebezpečným podmínkám během přepravy. Ke splnění tohoto požadavku je možno použít také nehořlavý a nevodivý fixační materiál. 5. Nehořlavost musí být posouzena podle normy uznané v zemi, kde je obal konstruován nebo vyráběn. 		
Pro netěsnící baterie musí být do vnitřního nebo vnějšího obalu přidáno dostatečné množství inertního absorpčního materiálu, aby pohltilo jakýkoli únik elektrolytu.		
Dodatečný požadavek:		
Baterie musí být chráněny proti zkratu.		

4.1.4.4 (Vypuštěno)

4.1.5 Zvláštní ustanovení pro balení věcí třídy 1

4.1.5.1 Musí být splněna všeobecná ustanovení oddílu 4.1.1.

4.1.5.2 Všechny obaly pro věci třídy 1 musí být zkonstruovány a vyrobeny tak, že:

- (a) chrání výbušné látky a předměty, zabraňují jejich unikání a nezvyšují riziko neúmyslného zážehu nebo roznětu za normálních podmínek přepravy, včetně předvídatelných změn teploty, vlhkosti a tlaku;
- (b) umožní, aby úplné kusy byly za normálních podmínek přepravy bezpečně manipulovatelné; a
- (c) kusy budou odolné vůči předpokládaným tlakům při stohování, které mohou nastat během přepravy, udrží daný stav, bez toho, že by zvyšovalo výchozí riziko představované výbušnými látkami a předměty, bez toho, že by se snížila ochranná schopnost obalů a bez toho, že by se kusy zdeformovaly takovým způsobem nebo v takovém rozsahu, že by snížila jejich pevnost, nebo to způsobilo nestabilitu stohovaných kusů.

4.1.5.3 Všechny výbušné látky a předměty, které jsou připraveny k přepravě, musí být zatříděny ve shodě s postupy podrobně uvedenými v oddílu 2.2.1.

4.1.5.4 Věci třídy 1 musí být baleny podle příslušného pokynu pro balení udaného ve sloupci (8) tabulky A kapitoly 3.2, s použitím obalů a způsobů balení podrobně popsanych v oddílu 4.1.4.

4.1.5.5 Pokud není v ADR uvedeno jinak, musí obaly, včetně IBC a velkých obalů, odpovídat požadavkům kapitol 6.1, 6.5 nebo 6.6, jak je to náležité, a musí splňovat jejich požadavky na zkoušky pro obalovou skupinu II.

4.1.5.6 Uzavírací zařízení obalů obsahujících kapalně výbušné látky musí být zajištěna dvojí ochranou proti netěsnosti (úniku).

4.1.5.7 Uzavírací zařízení kovových sudů musí mít vhodné těsnění; pokud je uzavírací zařízení se závitem, musí být zabráněno prostupu výbušných látek do závitu.

4.1.5.8 Obaly pro látky rozpustné ve vodě musí být odolné proti vodě. Obaly pro znečistitelné nebo flegmatizované látky musí být uzavřeny tak, aby bylo zabráněno změnám koncentrace během přepravy.

4.1.5.9 Jestliže obal zahrnuje dvojitý plášť naplněný vodou, která může během přepravy zmrznout, musí být do vody přidáno postačující množství prostředku proti zamrznání. Prostředek proti zamrznání, který by mohl vzhledem ke své hořlavosti vytvořit nebezpečí požáru, nesmí být použit.

4.1.5.10 Hřebíky, sponky a jiná uzavírací zařízení vyrobené z kovu bez ochranného potahu nesmějí proniknout dovnitř vnějšího obalu, ledaže vnitřní obal dostatečně účinně chrání výbušné látky a předměty proti styku s kovem.

4.1.5.11 Vnitřní obaly, fixační prvky a fixační materiály a umístění výbušných látek nebo předmětů v kusech musí být takové, aby výbušná látka nemohla za normálních podmínek přepravy uniknout do vnějšího obalu. Kovové části předmětů musí být zajištěny proti možnému styku s kovovými obaly. Předměty obsahující výbušné látky, které nejsou uloženy ve vnějším obalu, musí být odděleny jeden od druhého způsobem zabraňujícím tření a nárazu. Pro tento účel mohou být použity vycpávky, fixační podložky, dělicí přepážky ve vnitřním nebo vnějším obalu, výlisky nebo nádoby.

4.1.5.12 Obaly musí být vyrobeny z materiálů snášlivých s výbušnými látkami nebo předměty obsaženými v kusu a vůči nim nepropustných tak, aby ani vzájemné působení mezi těmito látkami nebo předměty a materiály obalu, ani jejich únik z obalu nezpůsobily, že se výbušné látky a předměty stanou nebezpečnými pro přepravu nebo dojde ke změně podtřídy nebo skupiny snášlivosti.

4.1.5.13 Musí být zabráněno vniknutí výbušných látek do meziprostorů spojovacích přehybů kovových obalů.

- 4.1.5.14** Plastové obaly nesmějí být náchylné k vytváření nebo akumulaci statické elektřiny v takovém množství, aby výboj mohl způsobit roznět nebo zážeh zabalených výbušných látek nebo předmětů nebo jejich uvedení do činnosti.
- 4.1.5.15** Rozměrné a robustní výbušné předměty, normálně určené pro vojenské použití, bez rozněcovacích prostředků, nebo s rozněcovacími prostředky opatřenými nejméně dvěma účinnými pojistnými zařízeními mohou být přepravovány bez obalu. Pokud mají takovéto předměty hnací náplň, nebo jsou samohnací, musí být jejich zapalovací systémy chráněny proti stimulaci nárazy a zatížením, které mohou nastat za normálních podmínek přepravy. Negativní výsledek zkoušek série 4 provedených na nezabaleném předmětu ukazuje, že předmět může být uvažován pro přepravu bez obalu. Takové nezabalené předměty mohou být uchyceny v lůžkách nebo uloženy v latěních nebo jiných vhodných manipulačních, skladovacích nebo vystřelovacích prostředcích tak, aby se za normálních podmínek přepravy nemohly uvolnit.
- Pokud takové velké výbušné předměty podléhají v rámci své provozní bezpečnosti a zkoušek vhodnosti zkušebnímu režimům, které splňují intence ADR a pokud takové zkoušky byly s úspěchem provedeny, může příslušný orgán schválit přepravu takových předmětů podle ADR.
- 4.1.5.16** Výbušné látky nesmějí být baleny do vnitřních nebo vnějších obalů, jestliže by rozdíly ve vnitřních a vnějších tlacích, v důsledku tepelných nebo jiných účinků, mohly vyvolat výbuch nebo roztržení kusu.
- 4.1.5.17** Pokud volné výbušné látky nebo výbušná látka v nezabaleném nebo částečně zabaleném předmětu mohou přijít do styku s vnitřním povrchem kovových obalů (1A1, 1A2, 1B1, 1B2, 4A, 4B a kovové nádoby), musí být kovový obal opatřen vnitřní vložkou nebo povlakem (viz pododdíl 4.1.1.2).
- 4.1.5.18** Pokyn pro balení P101 smí být použit pro každou výbušnou látku nebo předmět, pokud je obal schválen příslušným orgánem bez ohledu na to, zda obal vyhovuje pokynu pro balení, který je udán ve sloupci (8) tabulky A kapitoly 3.2.
- 4.1.6 Zvláštní ustanovení pro balení věcí třídy 2 a věcí jiných tříd přiřazených k pokynu pro balení P200**
- 4.1.6.1** Tento oddíl obsahuje všeobecné předpisy platné pro používání tlakových nádob a otevřených kryogenních nádob pro přepravu látek třídy 2 a věcí jiných tříd přiřazených k pokynu pro balení P200 (např. UN 1051 kyanovodík, stabilizovaný). Tlakové nádoby musí být vyrobeny a uzavřeny tak, aby zabránily jakémukoli úniku obsahu, který by mohl být způsoben za normálních podmínek přepravy, včetně vibrací nebo změn teploty, vlhkosti nebo tlaku (vyplývajících například ze změny nadmožské výšky).
- 4.1.6.2** Části tlakových nádob a otevřených kryogenních nádob, které jsou v přímém styku s nebezpečnými látkami, nesmějí být poškozovány ani zeslabovány těmito nebezpečnými látkami a nesmějí způsobit žádný nebezpečný účinek (např. katalytickou reakci nebo reakci s nebezpečnými látkami) (viz též tabulku norem na konci tohoto oddílu).
- 4.1.6.3** Tlakové nádoby, včetně jejich uzávěrů, a otevřené kryogenní nádoby musí být zvoleny pro plyn nebo směs plynů podle požadavků uvedených v pododdílu 6.2.1.2 a požadavků příslušných pokynů pro balení v pododdílu 4.1.4.1. Tento pododdíl se vztahuje také na tlakové nádoby, které jsou součástími MEGC a bateriových vozidel.
- 4.1.6.4** Změna použití opakovaně plnitelné nádoby musí zahrnovat vyprazdňovací, čistící a odplynovací činnosti v rozsahu nezbytném pro bezpečné použití (viz též tabulku norem na konci tohoto oddílu). Kromě toho nesmí být tlaková nádoba, která předtím obsahovala žíravou látku třídy 8 nebo látku jiné třídy s vedlejším nebezpečím žíravosti, použita pro přepravu látky třídy 2, pokud nebyla provedena inspekce a zkoušky předepsané v pododdílu 6.2.1.6 a popřípadě 6.2.3.5.
- 4.1.6.5** Před plněním musí balič provést kontrolu tlakové nádoby nebo otevřené kryogenní nádoby a přesvědčit se, že může obsahovat látku, a v případě chemické látky pod tlakem hnací látku, která se má přepravovat, a že jsou splněny všechny příslušné předpisy. Po naplnění nádoby se musí

uzavírací ventily uzavřít a během přepravy zůstat uzavřeny. Odesílatel musí ověřit těsnost uzávěrů a výstroje.

POZNÁMKA: Uzavírací ventily namontované na jednotlivé láhve ve svazku lahví mohou být během přepravy otevřeny, pokud přepravovaná látka nepodléhá zvláštnímu ustanovení pro balení „k“ nebo „q“ v pokynu pro balení P200.

- 4.1.6.6** Tlakové nádoby a otevřené kryogenní nádoby musí být plněny podle provozních tlaků, stupňů plnění a ustanovení uvedených v příslušném pokynu pro balení pro konkrétní látku, která je plněna. Reaktivní plyny a směsi plynů musí být plněny takovým tlakem, aby v případě úplného rozkladu plynu nebyl překročen provozní tlak tlakové nádoby. Svazky lahví nesmějí být plněny tlakem, který překračuje nejnižší provozní tlak kterékoli láhve ve svazku.
- 4.1.6.7** Nádoby, včetně svých uzávěrů, musí vyhovovat konstrukčním, výrobním, kontrolním a zkušebním požadavkům podrobně uvedeným v kapitole 6.2. Pokud jsou předepsány vnější obaly, tlakové nádoby a otevřené kryogenní nádoby v nich musí být pevně zajištěny. Pokud není stanoveno jinak v příslušných pokynech pro balení, může být jeden nebo více vnitřních obalů uzavřeno v jednom vnějším obalu.
- 4.1.6.8** Ventily musí být zkonstruovány a vyrobeny takovým způsobem, aby byly schopné odolat poškození bez úniku plynu, nebo musí být chráněny proti poškození, které by mohlo způsobit nechtěný únik obsahu tlakové nádoby, jedním z následujících způsobů (viz též tabulku norem na konci tohoto oddílu):
- (a) Ventily jsou umístěny uvnitř hrdla tlakové nádoby a chráněny šroubovací zátkou nebo kloboučkem;
 - (b) Ventily jsou chráněny kloboučky. Tyto kloboučky musí mít odvětrávací otvory dostatečného příčného průřezu k odstranění plynu v případě jeho úniku ventily;
 - (c) Ventily jsou chráněny límcí nebo kryty;
 - (d) Tlakové nádoby jsou přepravovány v rámech (např. svazky lahví); nebo
 - (e) Tlakové nádoby jsou přepravovány v ochranných bednách. Pro UN tlakové nádoby musí být obal, tak jak je připraven k přepravě, schopen vyhovět při zkoušce volným pádem uvedené v 6.1.5.3 parametrům obalové skupiny I.
- 4.1.6.9** Tlakové nádoby, které nejsou opakovaně plnitelné:
- (a) musí být přepravovány ve vnějším obalu, jako je bedna nebo koš, nebo na podložkách se smršťovací nebo průtažnou fólií;
 - (b) nesmějí mít hydraulický vnitřní objem větší než 1,25 litrů, pokud jsou naplněny hořlavým nebo toxickým plynem;
 - (c) nesmějí být používány pro toxické plyny s LC_{50} nejvýše 200 ml/m³; a
 - (d) nesmějí být po uvedení do používání opravovány.
- 4.1.6.10** Opakovaně plnitelné tlakové nádoby, jiné než kryogenní nádoby, musí být podrobovány periodickým inspekcím podle ustanovení v 6.2.1.6, nebo v 6.2.3.5.1 pro nádoby neodpovídající UN, a pokynu pro balení P200, P205 nebo P206. Ventily pro vyrovnávání tlaku u uzavřených kryogenních nádob musí být podrobovány periodickým inspekcím a zkouškám podle ustanovení uvedených v 6.2.1.6.3 a v pokynu pro balení P203. Tlakové nádoby nesmějí být plněny po uplynutí lhůty pro provedení periodické inspekce, avšak smějí být přepravovány po vypršení termínu za účelem provedení inspekce nebo jejich likvidace, včetně mezilehlých přeprav.
- 4.1.6.11** Opravy musí vyhovovat výrobním a zkušebním požadavkům platných norem pro konstrukci a výrobu a jsou dovoleny jen podle norem vztahujících se na periodické inspekce, které jsou uvedeny v kapitole 6.2. Na tlakových nádobách, jiných než je plášť uzavřených kryogenních nádob, nesmějí být opravovány:
- (a) praskliny nebo jiné defekty svarů;
 - (b) praskliny stěn;
 - (c) netěsnosti nebo vady materiálu stěny, čela nebo dna.

4.1.6.12 Nádoby nesmějí být předány k naplnění:

- (a) jsou-li poškozeny v takovém rozsahu, že tím může utrpět neporušenost nádoby nebo její provozní výstroje;
- (b) pokud nádoba a její provozní výstroj nebyly prohlédnuty a shledány v dobrém provozním stavu;
- (c) pokud vyžadovaná značení nádoby, týkající se certifikace, přezkoušení a plnění nejsou čitelná.

4.1.6.13 Naplněné nádoby nesmějí být předány k přepravě:

- (a) jsou-li netěsné;
- (b) jsou-li poškozeny v takovém rozsahu, že tím může utrpět neporušenost tlakové nádoby nebo její provozní výstroje;
- (c) pokud nádoba a její provozní výstroj nebyly prohlédnuty a shledány v dobrém provozním stavu;
- (d) pokud vyžadovaná značení nádoby, týkající se certifikace, přezkoušení a plnění nejsou čitelná.

4.1.6.14 Vlastníci musí, na základě odůvodněné žádosti od příslušného orgánu, poskytnout tomuto příslušnému orgánu všechny informace potřebné k prokázání shody tlakové nádoby v jazyce, jemuž příslušný orgán snadno rozumí. Musí spolupracovat s příslušným orgánem, na jeho žádost, při jakékoli akci směřující k vyloučení neshody tlakových nádob, které vlastní.**4.1.6.15** Pro UN tlakové nádoby platí normy ISO uvedené dále. Pro jiné tlakové nádoby se požadavky oddílu 4.1.6 považují za splněné, pokud byly použity příslušné následující normy:

Použitelné odstavce	Číslo	Název dokumentu
4.1.6.2	ISO 11114-1:2012	Plynové lahve – Snášlivost materiálů lahví a ventilů s plynným obsahem – část 1: Kovové materiály
	ISO 11114-2: 2000	Přepavitelné plynové lahve – Snášlivost materiálů lahví a ventilů s plynným obsahem – část 1: Nekovové materiály
4.1.6.4	ISO 11621:1997	Plynové lahve – Postupy pro změnu druhu plynu POZNÁMKA: EN verze této normy ISO splňuje požadavky a smí být rovněž použita.
4.1.6.8 Ventily s integrovanou ochranou	Příloha A k ISO 10297:2006	Plynové lahve - Ventily opakovaně plnitelných plynových lahví - Specifikace a zkoušky konstrukčního typu POZNÁMKA: EN verze této normy ISO splňuje požadavky a smí být rovněž použita.

4.1.7 Zvláštní ustanovení pro balení organických peroxidů (třídy 5.2) a samovolně se rozkládajících látek třídy 4.1

4.1.7.0.1 V případě organických peroxidů musí být všechny nádoby „účinně uzavřeny“. Pokud se může v kusu, v důsledku uvolňování plynu, vyvinout značný vnitřní tlak, může být opatřen odvětrávacím zařízením, za podmínky, že vypouštěný plyn nevyvolá nebezpečí, jinak musí být omezen stupeň plnění. Jakékoli odvětrávací zařízení musí být vyrobeno tak, aby kapalina neunikla, je-li kus v poloze nastojato, a musí být schopno zamezit vniknutí nečistot. Vnější obal, pokud je, musí být zkonstruován tak, aby nebránil činnosti odvětrávacího zařízení.

4.1.7.1 Použití obalů (kromě IBC)

4.1.7.1.1 Obaly pro organické peroxidy a samovolně se rozkládající látky musí odpovídat požadavkům kapitoly 6.1 a musí splňovat její požadavky na zkoušky pro obalovou skupinu II.

4.1.7.1.2 Způsoby balení organických peroxidů a samovolně se rozkládajících látek jsou uvedeny v pokynu pro balení 520 a jsou označeny OP1 až OP8. Množství stanovená pro každý způsob balení jsou nejvyšší množství dovolená pro kus.

4.1.7.1.3 Způsoby balení vhodné pro jednotlivé již zařazené organické peroxidy a samovolně se rozkládající látky jsou uvedeny v tabulkách pododdílů 2.2.41.4 a 2.2.52.4.

4.1.7.1.4 Pro nové organické peroxidy, nové samovolně se rozkládající látky nebo nové přípravky již zařazených organických peroxidů nebo samovolně se rozkládajících látek musí být použit následující postup pro přiřazení vhodného způsobu balení:

(a) ORGANICKÝ PEROXID TYPU B nebo SAMOVOLNĚ SE ROZKLÁDAJÍCÍ LÁTKA TYPU B:

Použit musí být způsob balení OP5, pokud organický peroxid (nebo samovolně se rozkládající látka) splňuje kritéria odstavce 20.4.3 (b) (resp. 20.4.2 (b)) Příručky zkoušek a kritérií v obalu dovoleném tímto způsobem balení. Pokud organický peroxid (nebo samovolně se rozkládající látka) splňuje tato kritéria pouze v menším obalu než těch, které jsou dovoleny způsobem balení OP5 (tj. jeden z obalů uvedených pro OP1 až OP4), musí se použít způsob balení s nižším OP číslem;

(b) ORGANICKÝ PEROXID TYPU C nebo SAMOVOLNĚ SE ROZKLÁDAJÍCÍ LÁTKA TYPU C:

Použit musí být způsob balení OP6, pokud organický peroxid (nebo samovolně se rozkládající látka) splňuje kritéria odstavce 20.4.3 (c) (resp. 20.4.2 (c)) Příručky zkoušek a kritérií v obalu dovoleném tímto způsobem balení. Pokud organický peroxid (nebo samovolně se rozkládající látka) splňuje tato kritéria pouze v menším obalu než těch, které jsou dovoleny způsobem balení OP6 (tj. jeden z obalů uvedených pro OP1 až OP5), musí se použít způsob balení s nižším OP číslem;

(c) ORGANICKÝ PEROXID TYPU D nebo SAMOVOLNĚ SE ROZKLÁDAJÍCÍ LÁTKA TYPU D:

Pro tento typ organického peroxidu nebo samovolně se rozkládající látky je nutno použít způsob balení OP7;

(d) ORGANICKÝ PEROXID TYPU E nebo SAMOVOLNĚ SE ROZKLÁDAJÍCÍ LÁTKA TYPU E:

Pro tento typ organického peroxidu nebo samovolně se rozkládající látky je nutno použít způsob balení OP8;

(e) ORGANICKÝ PEROXID TYPU F nebo SAMOVOLNĚ SE ROZKLÁDAJÍCÍ LÁTKA TYPU F:

Pro tento typ organického peroxidu nebo samovolně se rozkládající látky je nutno použít způsob balení OP8;

4.1.7.2 Použití velkých nádob pro volně ložené látky (IBC)

4.1.7.2.1 Již zařazené organické peroxidy, jmenovitě uvedené v pokynu pro balení IBC520, mohou být přepravovány v IBC podle tohoto pokynu pro balení. IBC musí odpovídat požadavkům kapitoly 6.5 a musí splňovat její požadavky na zkoušky pro obalovou skupinu II.

4.1.7.2.2 Jiné organické peroxidy a samovolně se rozkládající látky typu F smějí být přepravovány v IBC za podmínek stanovených příslušným orgánem země původu, pokud se příslušný orgán na základě vhodných zkoušek přesvědčí, že taková přeprava může být bezpečně provedena. Provedené zkoušky musí umožnit:

- (a) prokázat, že organický peroxid (nebo samovolně se rozkládající látka) vyhovují zásadám klasifikace uvedeným v odstavcích 20.4.3 (f) (resp. 20.4.2 (f)) Příručky zkoušek a kritérií, výsledné políčko F obrázku 20.1 (b) Příručky;
- (b) prokázat snášlivost všech materiálů, které jsou normálně ve styku s látkou během přepravy;
- (c) stanovit, kdy je to použitelné, řízenou a kritickou teplotu pro uvažovanou přepravu látky v dotyčné IBC, v závislosti na SADT;
- (d) navrhnout, pokud je to použitelné, charakteristiky zařízení pro vyrovnávání tlaku a nouzového zařízení pro odlehčení tlaku; a
- (e) určit případná zvláštní opatření, nutná pro bezpečnou přepravu látky.

Jestliže země původu není smluvní stranou ADR, musí být klasifikace a přepravní podmínky uznány příslušným orgánem prvního státu smluvní strany ADR, se kterým zásilka přijde do styku.

4.1.7.2.3 Je nutno počítat se samourychlujícím se rozkladem a se zachycením ohněm. Aby se předešlo výbušnému roztržení kovové IBC nebo kompozitní IBC s celokovovým pláštěm, musí být nouzová zařízení pro odlehčení tlaku zkonstruována tak, aby odvětrala všechny produkty rozkladu a páry vyvinuté během samourychlujícího se rozkladu nebo během časového úseku nejméně jedné hodiny úplného zachycení ohněm, jak je vypočítáno podle rovnic uvedených v 4.2.1.13.8.

4.1.8 Zvláštní ustanovení pro balení infekčních látek (třída 6.2)

4.1.8.1 Odesílatel infekčních látek musí zaručit, že kusy jsou připraveny takovým způsobem, že dojedou do místa určení v dobrém stavu a nebudou představovat žádné nebezpečí pro osoby nebo zvířata během přepravy.

4.1.8.2 Definice v oddíle 1.2.1 a všeobecná ustanovení pro balení v pododdílech 4.1.1.1 až 4.1.1.17, kromě pododdílů 4.1.1.3, 4.1.1.9 až 4.1.1.12 a 4.1.1.15, platí pro kusy s infekčními látkami. Avšak kapaliny musí být plněny jen do obalů, které mají odpovídající odolnost proti vnitřnímu tlaku, který se může vyvinout za normálních podmínek přepravy.

4.1.8.3 Mezi sekundárním a vnějším obalem musí být vložen podrobný seznam obsahu kusu. Pokud jsou infekční látky, které se mají přepravovat, neznámé, avšak existuje podezření, že splňují kritéria pro zařazení do kategorie A, je nutno uvést v závorkách za oficiálním pojmenováním pro přepravu na dokladu vloženém do vnějšího obalu slova „podezření na infekční látku kategorie A“.

4.1.8.4 Před tím než se prázdný obal vrátí k odesílateli, nebo bude zaslán jinam, musí být vydesinfikován nebo aby se odstranilo jakékoli nebezpečí; všechny bezpečnostní značky a nápisy informující, že obsahoval infekční látku, musí být odstraněny nebo smazány.

4.1.8.5 Pokud je dodržena rovnocenná úroveň provedení, jsou dovoleny následující varianty primárních nádob umístěných v sekundárním obalu, aniž by bylo třeba provést další zkoušení jednotky přepravního balení (kompletního kusu):

- (a) Primární nádoby stejných nebo menších rozměrů, než mají zkoušené nádoby, mohou být použity pokud:
- (i) primární nádoby jsou podobné konstrukce jako zkoušené (např. tvaru: kruhového, pravoúhlého atd.);
 - (ii) materiál konstrukce primárních nádob (např. sklo, plasty, kov) poskytuje odolnost proti nárazu a stohovacím silám stejnou nebo lepší než odzkoušené nádoby;
 - (iii) primární nádoby mají stejné nebo menší otvory a uzávěr je rovnocenné konstrukce (např. šroubovací čepička, třecí víčko, atd.);
 - (iv) přiměřený dodatečný fixační materiál je použit pro vyplnění prázdných prostorů a pro zabránění nekontrolovatelnému pohybu prvotních nádob; a
 - (v) primární nádoby jsou orientovány v sekundárních obalech tak jako v zkoušeném kusu;
- (b) Menší počet zkoušených primárních nádob nebo alternativních typů primárních nádob uvedených výše v odstavci (a) může být používán, pokud je dostatečně doplněna fixace zaplňující volný(é) prostor(y) a zabírající nekontrolovatelnému pohybu primárních nádob.

4.1.8.6 Pododdíly 4.1.8.1 až 4.1.8.5 se vztahují pouze na infekční látky kategorie A (UN čísel 2814 a 2900). Nevztahují se na UN 3373 BIOLOGICKÁ LÁTKA, KATEGORIE B (viz pokyn pro balení P 650 v 4.1.4.1), ani na UN 3291 ODPAD KLINICKÝ, NESPECIFIKOVANÝ, J.N. nebo ODPAD (BIO)MEDICINSKÝ, J.N. nebo ODPAD MEDICINSKÝ REGULOVANÝ, J.N.

4.1.8.7 Pro přepravu zvířecího materiálu nesmí být používány obaly nebo IBC, které nejsou konkrétně dovoleny v příslušném pokynu pro balení pro přepravu látky nebo předmětu, pokud nejsou zvlášť schváleny příslušným orgánem země původu² a za podmínky, že

- (a) alternativní obal splňuje všeobecná ustanovení této části;
- (b) pokud tak stanoví pokyn pro balení udaný ve sloupci (8) tabulky A kapitoly 3.2, alternativní obal splňuje ustanovení části 6;
- (c) příslušný orgán země původu² rozhodne, že alternativní obal poskytuje alespoň stejnou úroveň bezpečnosti, jako kdyby látka byla zabalena podle metody uvedené v příslušném pokynu pro balení, udaném ve sloupci (8) tabulky A kapitoly 3.2; a
- (d) kopie schválení příslušného orgánu doprovází každou zásilku, nebo přepravní doklad obsahuje zápis, že alternativní obal byl schválen příslušným orgánem.

4.1.9 Zvláštní ustanovení pro balení radioaktivních látek

4.1.9.1 Všeobecně

4.1.9.1.1 Radioaktivní látky, obaly a kusy musí splňovat požadavky kapitoly 6.4. Množství radioaktivních látek v kusu nesmí překročit mezní hodnoty uvedené v 2.2.7.2.2, 2.2.7.2.4.1, 2.2.7.2.4.4, 2.2.7.2.4.5, 2.2.7.2.4.6, zvláštní ustanovení 336 kapitoly 3.3 a 4.1.9.3.

Typy kusů radioaktivních látek dle ADR jsou

- (a) Vyjmutý kus (viz 1.7.1.5);
- (b) Průmyslový kus typu 1(Typ IP-1);
- (c) Průmyslový kus typu 2(Typ IP-2);
- (d) Průmyslový kus typu 3(Typ IP-3);
- (e) Kus typu A;
- (f) Kus typu B(U);
- (g) Kus typu B(M);
- (h) Kus typu C.

Kusy obsahující štěpný materiál nebo hexafluorid uranu jsou předmětem dodatečných požadavků.

² Není-li země původu členským státem ADR, příslušný orgán prvního členského státu ADR dotčeného zásilkou.

- 4.1.9.1.2** Nestálé kontaminace vnějších povrchů kusů obalu musí být co nejnižší jak je prakticky možné a za běžných podmínek dopravy nesmí překročit následující mezní hodnoty:
- (a) 4 Bq/cm² pro beta a gama zářiče a nízkotoxické alfa zářiče; a
 - (b) 0,4 Bq/cm² pro všechny ostatní alfa zářiče.
- Tato mezní hodnoty platí, pokud prochází plochou o 300 cm² kterékoliv části povrchu.
- 4.1.9.1.3** Kusy nesmí obsahovat žádné jiné položky než ty, které jsou nezbytné pro používání radioaktivní látky. Za podmínek přepravy odpovídajících konstrukčnímu vzoru kusu, nesmí vzájemné působení mezi těmito položkami a kusem snižovat bezpečnost kusu.
- 4.1.9.1.4** Pokud není předepsáno jinak v oddílu 7.5.11, zvláštním ustanovením CV33, úroveň nestálých kontaminací vnějších a vnitřních povrchů přepravních obalových souborů, kontejnerů, cisteren, IBC a vozidel nesmí přesáhnout mezní hodnoty stanovené v 4.1.9.1.2.
- 4.1.9.1.5** Pro radioaktivní látky mající jiné nebezpečné vlastnosti musí konstrukce kusu vzít v úvahu tyto vlastnosti. Radioaktivní látky s vedlejším nebezpečím zabalené do kusů, které nevyžadují schválení příslušného orgánu, musí být přepravovány v obalech, IBC, cisternách nebo kontejnerech pro volně ložené látky, které plně vyhovují ustanovením příslušných kapitol části 6, jakož i příslušným ustanovením kapitol 4.1, 4.2 nebo 4.3 pro toto vedlejší nebezpečí.
- 4.1.9.1.6** Před prvním použitím obalu k přepravě radioaktivní látky, musí být potvrzeno, že byl vyroben ve shodě se specifikacemi vzoru, aby se zajistilo dodržení příslušných ustanovení ADR a jakéhokoli platného schvalovacího osvědčení. Musí být splněny také následující požadavky, je-li to náležité:
- (a) přesahuje-li projektovaný přetlak zádržného systému 35 kPa, musí být zajištěno, aby zádržný systém každého obalu odpovídal schváleným požadavkům projektu vzhledem ke schopnosti tohoto systému zachovat si celistvost při vystavení takovému tlaku;
 - (b) pro každý obal určený k použití jako kus typu B(U), typu B(M) nebo typu C a pro každý obal určený pro štěpné látky musí být zajištěno, aby efektivnost stínění a zádržného systému, a pokud je to zapotřebí, vlastnosti přenosu tepla a účinnost omezujícího systému, byly v rámci mezních hodnot, použitelných pro schválený konstrukční typ nebo v něm popsány;
 - (c) pro každý obal určený pro štěpné látky musí být zajištěno, že účinnost prvků bezpečné podkritičnosti je uvnitř mezi platných nebo stanovených pro vzor, a zejména když jsou za účelem dodržení požadavků uvedených v 6.4.11.1 zvlášť přidány neutronové jedy, musí být provedeny kontroly k potvrzení přítomnosti a rozmístění těchto neutronových jedů.
- 4.1.9.1.7** Před každým odesláním kusu musí být zajištěno, že kus neobsahuje
- (a) jiné radionuklidy než ty, které jsou specifikovány pro vzor kusu; ani
 - (b) obsah v jiné formě nebo v jiném fyzikálním nebo chemickém stavu, než jsou ty, které jsou specifikovány pro vzor kusu.
- 4.1.9.1.8** Před každým odesláním kusu musí být zajištěno, že všechny požadavky stanovené v příslušných ustanoveních ADR a v platných schvalovacích osvědčeních jsou dodrženy. Musí být splněny také následující požadavky, je-li to náležité:
- (a) Musí být zajištěno, aby všechny zdvihací úchyty, které nesplňují požadavky uvedené v 6.4.2.2, byly odstraněny, nebo jiným způsobem učiněny neschopnými použití pro zdvihání kusu v souladu s 6.4.2.3;
 - (b) Žádný kus typu B(U), typu B(M) a typu C nesmí být odeslán dříve, než dosáhne podmínek dostatečně blízkých rovnovážnému stavu, aby mohla být prokázána shoda s požadavky na teplotu a tlak, pokud nejde o výjimku z těchto požadavků obsaženou v jednostranném schválení;

- (c) Pro každý kus typu B(U), typu B(M) a typu C musí být inspekci a/nebo vhodnými zkouškami ověřeno, že všechny uzávěry, ventily a jiné otvory kontejnmentového systému, jimiž by mohl uniknout radioaktivní obsah, jsou řádně uzavřeny a popřípadě utěsněny způsobem, u něhož bylo prokázáno, že splňuje požadavky uvedené v 6.4.8.8 a 6.4.10.3;
- (d) Pro kusy obsahující štěpné látky musí být provedeno měření popsané v 6.4.11.5 (b) a zkoušky k prokázání uzavřenosti každého kusu, jak je stanoveno v 6.4.11.8.

4.1.9.1.9 Odesílatel musí mít k dispozici kopii všech pokynů s ohledem na správné uzavření kusu a všech opatření pro přípravu přepravy dříve, než bude přeprava provedena podle podmínek rozhodnutí o povolení.

4.1.9.1.10 S výjimkou přepravy za výlučného použití žádný kus nebo přepravní obalový soubor nesmí překročit přepravní index 10 a nesmí překročit index bezpečné podkritičnosti 50.

4.1.9.1.11 S výjimkou přepravy kusů a přepravních obalových souborů za podmínek výlučného použití specifikovaných v 7.5.11 v CV 33 (3.5) (a) nesmí příkon dávkového ekvivalentu kusu nebo přepravního obalového souboru překročit 2 mSv/h.

4.1.9.1.12 Maximální hodnota příkonu dávkového ekvivalentu na jakémkoliv místě vnějšího povrchu kusu nebo přepravního obalového souboru nesmí překročit 10 mSv/h.

4.1.9.2 ***Požadavky a kontrolní opatření pro přepravu radioaktivních látek s malou specifickou aktivitou (LSA-látky) a povrchově kontaminované předměty (SCO-předměty)***

4.1.9.2.1 Množství LSA látky nebo SCO-předmětů v jednotlivém průmyslovém kusu Typu 1 (Typ IP-1), průmyslovém kusu Typu 2 (Typ IP-2), průmyslovém kusu Typu 3 (Typ IP-3), nebo předmětu nebo souboru předmětů, jakkoli je vhodné, musí být omezeno tak, že vnější radiační úroveň 3m od nestíněné látky nebo předmětu nebo souboru předmětů nebude vyšší než 10 mSv/h.

4.1.9.2.2 Pro LSA látky a SCO předměty, které jsou štěpnými látkami nebo takové látky obsahují a které nejsou vyjmuty podle 2.2.7.2.3.5, musí být dodrženy příslušné požadavky uvedené v 7.5.11, CV33 (4.1) a (4.2).

4.1.9.2.3 Pro LSA látky a SCO předměty, které jsou štěpnými látkami nebo takové látky obsahují, musí být dodrženy příslušné požadavky uvedené v 6.4.11.1.

4.1.9.2.4 LSA-látky materiál a SCO-předměty ve skupinách LSA-I a SCO-I mohou být přepravovány nezabalené za následujících podmínek:

- (a) všechny nezabalené látky, s výjimkou rud, obsahující výlučně radionuklidy vyskytující se v přírodě, musí být přepravovány takovým způsobem, že za běžných podmínek přepravy nedojde k úniku radioaktivního obsahu z vozu a neztratí se clonění;
- (b) každé vozidlo musí být pod výlučným použitím (výlučně použit) s výjimkou, pokud přepravuje výhradně SCO-I-předměty, u kterých není kontaminace přístupného i nepřístupného povrchu větší než 10x než jsou hodnoty udávané v pododdílu 2.2.7.1.2;
- (c) lze-li u SCO-I-předmětů předpokládat, na existenci nestálé kontaminace u nepřístupných povrchů, která převyšující hodnoty uvedené v pododdílu 2.2.7.2.3.2 (a) (i), musí být učiněna opatření, která zajistí, že radioaktivní látky nemohou uniknout do vozidla.
- (d) Nezabalené štěpné látky musí splňovat požadavky uvedené v 2.2.7.2.3.5 (e).

4.1.9.2.5 LSA-látky a SCO-předměty jsou, pokud není v 4.1.9.2.4 stanoveno jinak, jsou typy kusů baleny v souladu s následující tabulkou:

Tabulka 4.1.9.2.5: Požadavky pro LSA látky a SCO-předměty průmyslových kusů

Radioaktivní obsahy	Druh průmyslového kusu	
	Výlučné použití	Ne pod výlučným použitím
LSA-I Tuhé ^a Kapalné	Typ IP-1 Typ IP-1	Typ IP-1 Typ IP-2
LSA-II Tuhé Kapalné a plynné	Typ IP-2 Typ IP-2	Typ IP-2 Typ IP-3
LSA-III	Typ IP-2	Typ IP-3
SCO-I ^a	Typ IP-1	Typ IP-1
SCO-II	Typ IP-2	Typ IP-2

^a Za podmínek stanovených v 4.1.9.2.4, LSA-I-látky a SCO-I-předměty mohou být přepravovány nezabalené.

4.1.9.3 Kusy obsahující štěpné látky

Obsah kusů obsahujících štěpné látky musí takový, jak je stanoven pro vzor kusu buď přímo v ADR, nebo v osvědčení o schválení.

4.1.10 Zvláštní ustanovení pro společné balení

4.1.10.1 Pokud je na základě ustanovení tohoto oddílu dovoleno společné balení, mohou být různé nebezpečné věci, nebo nebezpečné věci a jiné věci baleny společně do skupinových obalů podle pododdílu 6.1.4.21, za podmínky, že spolu vzájemně nebezpečně nereagují a že jsou dodržena všechna ostatní příslušná ustanovení této kapitoly.

POZNÁMKA 1: Viz též pododdíly 4.1.1.5 a 4.1.1.6.

POZNÁMKA 2: K věcem radioaktivním látkám viz oddíl 4.1.9.

4.1.10.2 S výjimkou kusů, které obsahují pouze věci třídy 1, nebo pouze látky třídy 7, nesmí kus, který obsahuje různé věci balené společně, vážit více než 100 kg, pokud jsou jako vnější obaly použity dřevěné nebo lepenkové bedny.

4.1.10.3 Pokud příslušné zvláštní ustanovení v pododdílu 4.1.10.4 nestanoví jinak, smějí být společně baleny nebezpečné věci téže třídy a téhož klasifikačního kódu.

4.1.10.4 Je-li pro danou položku uveden údaj ve sloupci (9b) tabulky A kapitoly 3.2, použije se následujících zvláštních ustanovení pro společné balení věcí přiřazených k této položce s jinými věcmi do jednoho kusu.

- MP 1 Mohou být baleny společně jenom s věcmi stejného druhu stejné skupiny snášenlivosti.
- MP 2 Nesmějí být baleny společně s jinými věcmi.
- MP 3 Společné balení UN čísla 1873 s UN číslem 1802 je dovoleno.

- MP 4 Nesmějí být baleny společně s věcmi jiných tříd, nebo s věcmi, které nepodléhají ustanovením ADR. Nicméně, je-li organický peroxid tužidlem nebo vícesložkovým systémem pro látky třídy 3, je dovoleno společné balení s těmito látkami třídy 3.
- MP 5 UN čísla 2814 a 2900 mohou být balena společně do skupinového obalu podle pokynu pro balení P620. Nesmějí být baleny společně s jinými věcmi; toto se netýká látek biologických, kategorie B (UN číslo 3373), balených podle pokynu pro balení P650, nebo látek přidávaných jako chladiva, např. led, suchý led nebo hluboce zchlazený zkapalněný dusík.
- MP 6 Nesmějí být baleny společně s jinými věcmi. Toto se netýká látek přidávaných jako chladiva, např. led, suchý led nebo hluboce zchlazený zkapalněný dusík.
- MP 7 Pokud množství nepřevyší 5 litrů na vnitřní obal, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:
- s věcmi stejné třídy zahrnutými pod jiné klasifikační kódy, je-li společné balení dovoleno též pro tyto věci; nebo
 - s věcmi, které nepodléhají ustanovením ADR,
- pod podmínkou, že spolu vzájemně nebezpečně nereagují.
- MP 8 Pokud množství nepřevyší 3 litry na vnitřní obal, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:
- s věcmi stejné třídy zahrnutými pod jiné klasifikační kódy, je-li společné balení dovoleno též pro tyto věci; nebo
 - s věcmi, které nepodléhají ustanovením ADR,
- pod podmínkou, že spolu vzájemně nebezpečně nereagují.
- MP 9 Mohou být baleny společně do vnějšího obalu pro skupinové obaly podle pododdílu 6.1.4.21:
- s jinými věcmi třídy 2;
 - s věcmi jiných tříd, je-li společné balení dovoleno též pro tyto věci; nebo
 - s věcmi, které nepodléhají ustanovením ADR,
- pod podmínkou, že spolu vzájemně nebezpečně nereagují.
- MP 10 Pokud množství nepřevyší 5 kg na vnitřní obal, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:
- s věcmi stejné třídy zahrnutými pod jiné klasifikační kódy, nebo s věcmi jiných tříd, je-li společné balení dovoleno též pro tyto věci; nebo
 - s věcmi, které nepodléhají ustanovením ADR,
- pod podmínkou, že spolu vzájemně nebezpečně nereagují.
- MP 11 Pokud množství nepřevyší 5 kg na vnitřní obal, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:
- s věcmi stejné třídy zahrnutými pod jiné klasifikační kódy, nebo s věcmi jiných tříd (kromě látek obalové skupiny I nebo II třídy 5.1), je-li společné balení dovoleno též pro tyto věci; nebo
 - s věcmi, které nepodléhají ustanovením ADR,

pod podmínkou, že spolu vzájemně nebezpečně nereagují.

MP 12 Pokud množství nepřevyší 5 kg na vnitřní obal, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:

- s věcmi stejné třídy zahrnutými pod jiné klasifikační kódy, nebo s věcmi jiných tříd (kromě látek obalové skupiny I nebo II třídy 5.1.), je-li společné balení dovoleno též pro tyto věci; nebo
- s věcmi, které nepodléhají ustanovením ADR,

pod podmínkou, že spolu vzájemně nebezpečně nereagují.

Hmotnost kusu nesmí být větší než 45 kg. Jestliže jsou jako vnější obaly použity lepenkové bedny, potom kus nesmí vážit více než 27 kg.

MP 13 Pokud množství nepřevyší 3 kg na vnitřní obal a na kus, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:

- s věcmi stejné třídy zahrnutými pod jiné klasifikační kódy, nebo s věcmi jiných tříd, je-li společné balení dovoleno též pro tyto věci; nebo
- s věcmi, které nepodléhají ustanovením ADR,

pod podmínkou, že spolu vzájemně nebezpečně nereagují.

MP 14 Pokud množství nepřevyší 6 kg na vnitřní obal, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:

- s věcmi stejné třídy zahrnutými pod jiné klasifikační kódy, nebo s věcmi jiných tříd, je-li společné balení dovoleno též pro tyto věci; nebo
- s věcmi, které nepodléhají ustanovením ADR,

pod podmínkou, že spolu vzájemně nebezpečně nereagují.

MP 15 Pokud množství nepřevyší 3 litry na vnitřní obal, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:

- s věcmi stejné třídy zahrnutými pod jiné klasifikační kódy, nebo s věcmi jiných tříd, je-li společné balení dovoleno též pro tyto věci; nebo
- s věcmi, které nepodléhají ustanovením ADR,

pod podmínkou, že spolu vzájemně nebezpečně nereagují.

MP 16 Pokud množství nepřevyší 3 litry na vnitřní obal a na kus, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:

- s věcmi stejné třídy zahrnutými pod jiné klasifikační kódy, nebo s věcmi jiných tříd, je-li společné balení dovoleno též pro tyto věci; nebo
- s věcmi, které nepodléhají ustanovením ADR,

pod podmínkou, že spolu vzájemně nebezpečně nereagují.

MP 17 Pokud množství nepřevyší 0,5 litru na vnitřní obal a 1 litr na kus, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:

- s věcmi jiných tříd, kromě třídy 7, je-li společné balení dovoleno též pro tyto věci; nebo

- s věcmi, které nepodléhají ustanovením ADR,
pod podmínkou, že spolu vzájemně nebezpečně nereagují.
- MP 18 Pokud množství nepřevyšší 0,5 kg na vnitřní obal a 1 kg na kus, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:
- s věcmi nebo předměty jiných tříd, kromě třídy 7, je-li společné balení dovoleno též pro tyto věci; nebo
 - s věcmi, které nepodléhají ustanovením ADR,
pod podmínkou, že spolu vzájemně nebezpečně nereagují.
- MP 19 Pokud množství nepřevyšší 5 litrů na vnitřní obal, mohou být baleny společně do skupinového obalu podle pododdílu 6.1.4.21:
- s věcmi stejné třídy zahrnutými pod jiné klasifikační kódy, nebo s věcmi jiných tříd, je-li společné balení dovoleno též pro tyto věci; nebo
 - s věcmi, které nepodléhají ustanovením ADR,
pod podmínkou, že spolu vzájemně nebezpečně nereagují.
- MP 20 Mohou být baleny společně s látkami zahrnutými pod stejné UN číslo.
- Nesmějí být baleny společně s věcmi 1, které mají rozdílná UN čísla, pokud to není stanoveno zvláštním ustanovením MP 24.
- Nesmějí být baleny společně s věcmi jiných tříd, nebo s věcmi, které nepodléhají ustanovením ADR.
- MP 21 Mohou být baleny společně s předměty zahrnutými pod stejné UN číslo.
- Nesmějí být baleny společně s věcmi třídy 1, které mají rozdílná UN čísla, kromě
- (a) svých vlastních rozněcovacích prostředků, pod podmínkou, že
 - (i) rozněcovací prostředky se neuvedou do činnosti za normálních podmínek přepravy; nebo
 - (ii) takovéto prostředky mají nejméně dvě účinná pojistná zařízení, která zabrání výbuchu předmětu v případě náhodného uvedení rozněcovacích prostředků do činnosti; nebo
 - (iii) u rozněcovacích prostředků, které nemají dvě účinná pojistná zařízení (tj. rozněcovací prostředky přiřazené ke skupině snášenlivosti B), nezpůsobí podle názoru příslušného orgánu země původu³ náhodné uvedení rozněcovacího zařízení v činnost výbuch předmětu za normálních podmínek přepravy;
 - (b) předmětů skupin snášenlivosti C, D a E.
- Nesmějí být baleny společně s věcmi jiných tříd, nebo s věcmi, které nepodléhají ustanovením ADR.
- Pokud jsou věci baleny společně podle tohoto zvláštního ustanovení, je nutno vzít v úvahu možnost změny klasifikace kusů v souladu s pododdílem 2.2.1.1. K popisu věcí v přepravním dokladu viz 5.4.1.2.1 (b).

³ Není-li země původu smluvní stranou ADR, je vyžadováno schválení příslušným orgánem prvního členského státu ADR, do něhož zásilka vstoupí.

- MP 22 Mohou být baleny společně s předměty zahrnutými pod stejné UN číslo.
- Nesmějí být baleny společně s věcmi třídy 1, které mají rozdílná UN čísla, s výjimkou
- (a) svých vlastních rozněcovacích prostředků, pod podmínkou, že se rozněcovací prostředky neuvedou do činnosti za normálních podmínek přepravy; nebo
 - (b) předmětů skupin snášenlivosti C, D a E; nebo
 - (c) je-li to stanoveno zvláštním ustanovením MP 24.
- Nesmějí být baleny společně s věcmi jiných tříd, nebo s věcmi, které nepodléhají ustanovením ADR.
- Pokud jsou věci baleny společně podle tohoto zvláštního ustanovení, je nutno vzít v úvahu možnost změny klasifikace kusů v souladu s pododdílem 2.2.1.1. K popisu věcí v přepravním dokladu viz 5.4.1.2.1 (b).
- MP 23 Mohou být baleny společně s předměty zahrnutými pod stejné UN číslo.
- Nesmějí být baleny společně s věcmi třídy 1, které mají rozdílná UN čísla, avšak s výjimkou
- (a) svých vlastních rozněcovacích prostředků, pod podmínkou, že se tyto rozněcovací prostředky neuvedou v činnost za normálních podmínek přepravy; nebo
 - (b) je-li to stanoveno zvláštním ustanovením MP 24.
- Nesmějí být baleny společně s věcmi jiných tříd, nebo s věcmi, které nepodléhají ustanovením ADR.
- Pokud jsou věci balené společně podle tohoto zvláštního ustanovení, je nutno vzít v úvahu možnost změny klasifikace kusů v souladu s pododdílem 2.2.1.1. K popisu věcí v přepravním dokladu viz 5.4.1.2.1 (b).
- MP 24 Mohou být baleny společně s věcmi UN čísel uvedených níže v tabulce, za následujících podmínek:
- pokud je v tabulce uvedeno písmeno A, věci s těmito UN čísly mohou být baleny společně do jednoho kusu bez jakéhokoli zvláštního omezení hmotnosti;
 - pokud je v tabulce uvedeno písmeno B, věci s těmito UN čísly mohou být baleny společně do jednoho kusu až do celkové hmotnosti 50 kg výbušných látek.
- Pokud jsou věci baleny společně podle tohoto zvláštního ustanovení, je nutno vzít v úvahu možnost změny klasifikace kusů v souladu s pododdílem 2.2.1.1. K popisu věcí v přepravním dokladu viz 5.4.1.2.1 (b).

UN číslo	000112	000114	000116	000118	000120	000122	000124	000126	000128	000130	000132	000134	000136	000138	000140	000142	000144	000146	000148	000150	000152	000154	000156	000158	000160	000162	000164	000166	000168	000170	000172	000174	000176	000178	000180	000182	000184	000186	000188	000190	000192	000194	000196	000198	000200	000202	000204	000206	000208	000210	000212	000214	000216	000218	000220	000222	000224	000226	000228	000230	000232	000234	000236	000238	000240	000242	000244	000246	000248	000250	000252	000254	000256	000258	000260	000262	000264	000266	000268	000270	000272	000274	000276	000278	000280	000282	000284	000286	000288	000290	000292	000294	000296	000298	000300	000302	000304	000306	000308	000310	000312	000314	000316	000318	000320	000322	000324	000326	000328	000330	000332	000334	000336	000338	000340	000342	000344	000346	000348	000350	000352	000354	000356	000358	000360	000362	000364	000366	000368	000370	000372	000374	000376	000378	000380	000382	000384	000386	000388	000390	000392	000394	000396	000398	000400	000402	000404	000406	000408	000410	000412	000414	000416	000418	000420	000422	000424	000426	000428	000430	000432	000434	000436	000438	000440	000442	000444	000446	000448	000450	000452	000454	000456	000458	000460	000462	000464	000466	000468	000470	000472	000474	000476	000478	000480	000482	000484	000486	000488	000490	000492	000494	000496	000498	000500	000502	000504	000506	000507

KAPITOLA 4.2

POUŽÍVÁNÍ PŘEMÍSTITELNÝCH CISTEREN A UN VÍCEČLÁNKOVÝCH KONTEJNERŮ NA PLYN (MEGC)

POZNÁMKA 1: Pro nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby s nádržemi vyrobenými z kovových materiálů, bateriová vozidla a vícečlánekové kontejnery na plyn (MEGC) viz kapitola 4.3; pro cisterny z vyztužených plastů viz kapitola 4.4; pro cisterny pro podtlakové vyčerpávání odpadů viz kapitola 4.5.

POZNÁMKA 2: Přemístitelné cisterny a UN MEGC označené podle příslušných ustanovení kapitoly 6.7, avšak které byly schváleny ve státě, který není smluvní stranou ADR, mohou být přesto používány pro přepravu podle ADR.

4.2.1 Všeobecná ustanovení pro používání přemístitelných cisteren pro přepravu látek třídy 1 a tříd 3 až 9.

4.2.1.1 Tento oddíl obsahuje všeobecná ustanovení vztahující se na používání přemístitelných cisteren pro přepravu látek tříd 1, 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 6.2, 7, 8 a 9. Kromě těchto všeobecných ustanovení musí přemístitelné cisterny splňovat požadavky na konstrukci, výrobu, kontrolu a zkoušení uvedené v oddíle 6.7.2. Látky musí být přepravovány v přemístitelných cisternách splňujících pokyny pro přemístitelné cisterny uvedené ve sloupci (10) tabulky A kapitoly 3.2, popsané v 4.2.5.2.6 (T1 až T23) a zvláštní ustanovení o přemístitelných cisternách uvedená ke každé látce ve sloupci (11) tabulky A kapitoly 3.2 a popsaná v pododdíle 4.2.5.3.

4.2.1.2 Přemístitelné cisterny musí být během přepravy přiměřeně chráněny proti poškození nádrže a provozní výstroje následkem podélného a příčného nárazu a převrácení. Jestliže jsou nádrž a provozní výstroj konstruovány tak, že odolávají nárazu nebo převrácení, tato ochrana se nevyžaduje. Příklady takové ochrany jsou uvedeny v 6.7.2.17.5.

4.2.1.3 Určité látky jsou chemicky nestálé. Tyto látky jsou připuštěny k přepravě pouze v tom případě, byla-li učiněna nezbytná opatření zabráňující nebezpečnému rozkladu, přeměně nebo polymerizaci během přepravy. Proto musí být věnována pozornost zejména tomu, aby nádrže neobsahovaly látky, které jsou schopné podporovat tyto reakce.

4.2.1.4 Teplota vnějšího povrchu nádrže, vyjma otvorů a jejich uzávěrů nebo tepelné izolace, nesmí během přepravy přesáhnout 70 °C. Pokud je to nezbytné, nádrž musí být tepelně izolována.

4.2.1.5 Prázdné nevyčištěné a neodplyněné přemístitelné cisterny musí splňovat tytéž požadavky jako přemístitelné cisterny naplněné předchozí látkou.

4.2.1.6 Látky, které mohou spolu nebezpečně reagovat (viz definice pro „nebezpečnou reakci“ v oddíle 1.2.1), nesmějí být přepravovány v těch samých nebo v sousedních komorách nádrží.

4.2.1.7 Osvědčení o schválení typu, zkušební protokol a osvědčení obsahující výsledky první inspekce a zkoušky každé přemístitelné cisterny vydané příslušným orgánem nebo jím pověřenou organizací, musí být uloženy u příslušného orgánu nebo jím pověřené organizace a u držitele. Držitelé musí být schopni předložit tuto dokumentaci na požádání jakéhokoli příslušného orgánu.

4.2.1.8 Pokud pojmenování přepravované(ých) látky(ek) není uvedeno na kovovém štítku uvedeném v 6.7.2.20.2, kopie osvědčení uvedeného v 6.7.2.18.1 musí být předložena na požádání příslušnému orgánu nebo jím pověřené instituci odesílatelem, příjemcem nebo zaslátelelem.

4.2.1.9 Stupeň plnění

4.2.1.9.1 Před plněním musí odesílatel zajistit, že bude použita vhodná přemístitelná cisterna a že tato cisterna nebude naplněna látkami, které při styku s materiálem nádrže, těsněními, provozní výstrojí a případným ochranným vnitřním povlakem nejsou náchylné nebezpečně s nimi reagovat tvořením nebezpečných látek nebo značným zeslabením materiálů. Odesílatel musí v případě potřeby požádat výrobce látky ve spojení s příslušným orgánem o pokyny týkající se snášenlivosti látky s materiálem přemístitelné cisterny.

4.2.1.9.1.1 Přemístitelné cisterny nesmějí být plněny nad limity uvedené v 4.2.1.9.2 až 4.2.1.9.6. Uplatňování 4.2.1.9.2, 4.2.1.9.3 nebo 4.2.1.9.5.1 na jednotlivé látky je uvedeno v příslušných pokynech pro přemístitelné cisterny nebo ve zvláštních ustanoveních v 4.2.5.2.6 nebo pododdíle 4.2.5.3 a sloupcích (10) nebo (11) tabulky A kapitoly 3.2.

4.2.1.9.2 Pro všeobecné použití se stanoví nejvyšší stupeň plnění (v %) podle tohoto vzorce:

$$\text{Stupeň plnění} = \frac{97}{1 + \alpha (t_r - t_f)}$$

4.2.1.9.3 Nejvyšší stupeň plnění (v %) pro kapaliny třídy 6.1 a 8 pro obalové skupiny I a II, jakož i pro kapaliny s absolutním tlakem par vyšším než 175 kPa (1,75 bar) při 65 °C se stanoví podle tohoto vzorce:

$$\text{Stupeň plnění} = \frac{95}{1 + \alpha (t_r - t_f)}$$

4.2.1.9.4 V tomto vzorci α znamená střední součinitel objemové roztažnosti kapaliny mezi střední teplotou kapaliny během plnění (t_f) a nejvyšší střední teplotou naplněné látky během přepravy (t_r) (obě ve °C). Pro kapaliny přepravované za okolních podmínek může být α vypočten individuálně podle vzorce:

$$\alpha = \frac{d_{15} - d_{50}}{35 d_{50}}$$

ve kterém d_{15} a d_{50} jsou hustoty kapaliny při 15 °C, resp. 50 °C.

4.2.1.9.4.1 Nejvyšší střední teplota naplněné látky (t_r) musí být uvažována 50 °C, kromě přeprav při řízené teplotě nebo přeprav při extrémních klimatických podmínkách, kdy zainteresované příslušné orgány mohou souhlasit s nižší nebo mohou požadovat vyšší teplotu, pokud je to vhodné.

4.2.1.9.5 Ustanovení 4.2.1.9.2 až 4.2.1.9.4.1 se nevztahují na přemístitelné cisterny, které obsahují látky udržované během přepravy při teplotě vyšší než 50 °C (např. ohřívacím zařízením). Pro přemístitelné cisterny vybavené ohřívacím zařízením musí být použit tepelný regulátor pro zajištění, že nejvyšší stupeň plnění nepřekročí nikdy 95 % během přepravy.

4.2.1.9.5.1 Nejvyšší stupeň plnění (v %) pro tuhé látky přepravované při teplotě vyšší, než je jejich bod tání, a pro kapaliny přepravované při zvýšené teplotě se stanoví podle tohoto vzorce:

$$\text{Stupeň plnění} = 95 \frac{d_r}{d_f}$$

ve kterém d_r a d_f jsou hustoty kapaliny při střední teplotě kapaliny během plnění a případně nejvyšší střední teplotě naplněné látky během přepravy.

4.2.1.9.6 Přemístitelné cisterny nesmějí být předány k přepravě:

- (a) jestliže stupeň plnění, u kapalin majících viskozitu menší než 2680 mm²/s při 20 °C nebo nejvyšší teplotu látky během přepravy v případě zahřáté látky, je vyšší než 20 %, ale menší než 80 %, ledaže by nádrže přemístitelných cisteren byly rozděleny přepážkami nebo peřejníky na komory o vnitřním objemu nejvýše 7500 litrů;
- (b) se zbytkem látek v ní předtím přepravovaných, ulpívajícím na vnějším povrchu nádrže nebo provozní výstroje;

- (c) pokud netěsní nebo jsou poškozeny takovým způsobem, že může být ovlivněna celistvost přemístitelné cisterny nebo jejich zvedacích nebo upevňovacích zařízení a
- (d) pokud provozní výstroj nebyla přezkoušena a shledána v dobrém provozním stavu.

4.2.1.9.7 Kapsy pro zvedací vidlice u přemístitelných cisteren musí být během plnění cisteren uzavřeny. Toto ustanovení se nevztahuje na přemístitelné cisterny, jejichž kapsy pro zvedací vidlice nemusí být podle 6.7.2.17.4 opatřeny uzávěry.

4.2.1.10 *Dodatečná ustanovení pro přepravu látek třídy 3 v přemístitelných cisternách*

4.2.1.10.1 Všechny přemístitelné cisterny určené pro přepravu hořlavých kapalných látek musí být uzavřeny a opatřeny zařízeními pro vyrovnávání tlaku podle pododdílů 6.7.2.8 až 6.7.2.15.

4.2.1.10.1.1 U přemístitelných cisteren určených pouze pro pozemní dopravu smí být použity otevřené větrací systémy, pokud je to dovoleno podle kapitoly 4.3.

4.2.1.11 *Dodatečná ustanovení vztahující se na přepravu látek tříd 4.1 (kromě samovolně se rozkládajících látek), 4.2 nebo 4.3 v přemístitelných cisternách*

(Vyhrazeno)

POZNÁMKA: Pro samovolně se rozkládající látky třídy 4.1 viz 4.2.1.13.1.

4.2.1.12 *Dodatečná ustanovení vztahující se na přepravu látek třídy 5.1 v přemístitelných cisternách*

(Vyhrazeno)

4.2.1.13 *Dodatečná ustanovení vztahující se na přepravu látek třídy 5.2 a samovolně se rozkládajících látek třídy 4.1 v přemístitelných cisternách*

4.2.1.13.1 Každá látka musí být zkoušena a zpráva předána příslušnému orgánu země původu ke schválení. Sdělení o tom musí být zasláno příslušnému orgánu země určení. Sdělení musí obsahovat relevantní přepravní informace a zprávu s výsledky zkoušek. Provedené zkoušky musí zahrnovat nejméně:

- (a) Prokázání snášenlivosti všech materiálů přicházejících normálně do styku s látkou během přepravy;
- (b) Získání údajů pro konstrukci zařízení pro vyrovnávání tlaku a nouzových pojistných zařízení s přihlédnutím ke konstrukčním charakteristikám přemístitelné cisterny.

Jakékoli dodatečné požadavky nezbytné pro bezpečnou přepravu látky musí být jasně popsány ve zprávě.

4.2.1.13.2 Následující ustanovení se vztahují na přemístitelné cisterny určené pro přepravu organických peroxidů typu F nebo samovolně se rozkládajících látek typu F s teplotou samourychlujícího se rozkladu (SADT) 55 °C nebo vyšší. V případě odlišnosti těchto ustanovení upřednostňují se tato před ustanoveními uvedenými v oddílu 6.7.2. Nouzové situace, které musí být vzaty v úvahu, jsou i samourychlující se rozklad látky a požár jak je popsáno v 4.2.1.13.8.

4.2.1.13.3 Dodatečné požadavky pro přepravu organických peroxidů nebo samovolně se rozkládajících látek s teplotou SADT menší než 55°C v přemístitelných cisternách musí být stanoveny příslušným orgánem země původu. Sdělení o tom musí být zasláno příslušnému orgánu země určení.

4.2.1.13.4 Přemístitelná cisterna musí být konstruována pro zkušební tlak nejméně 0,4 MPa (4 bary).

4.2.1.13.5 Přemístitelné cisterny musí být opatřeny přístroji snímajícími teplotu.

4.2.1.13.6 Přemístitelné cisterny musí být opatřeny zařízeními pro vyrovnávání tlaku a nouzovými pojistnými zařízeními. Podtlaková pojistná zařízení mohou být též použita. Zařízení pro vyrovnávání tlaku musí fungovat při tlacích stanovených jednak podle vlastností látky a jednak podle konstrukčních charakteristik přemístitelné cisterny. Tavné prvky v nádrži nejsou dovoleny.

4.2.1.13.7 Zařízení pro vyrovnávání tlaku musí tvořit pružinové ventily, určené k zamezení výrazného nárůstu tlaku v přemístitelné cisterně vlivem produktů rozkladu a par, které se uvolňují při teplotě 50 °C. Průtok a otevírací tlak pojistných ventilů musí být stanoven na základě výsledků zkoušek uvedených v 4.2.1.13.1. Otevírací tlak však musí být takový, že v žádném případě nesmí unikat kapalina z ventilu(ů), jestliže se přemístitelná cisterna převráti.

4.2.1.13.8 Nouzové pojistné zařízení smí být pružinového nebo průtržného typu nebo kombinací obou, konstruované pro odvětrání všech produktů rozkladu a par vyvíjejících se během doby nejméně jedné hodiny působení ohně, což se vypočte podle tohoto vzorce:

$$q = 701961 \times F \times A^{0,82}$$

kde:

q = absorpce tepla (W)
 A = mokrá plocha [m²]
 F = izolační faktor [-]
 = 1 pro neizolované nádrže, nebo

$$F = \frac{U (923 - T)}{47032} \quad \text{pro izolované nádrže}$$

kde:

K = tepelná vodivost izolační vrstvy [Wm⁻¹K⁻¹]
 L = tloušťka izolační vrstvy [m]
 U = K/L = koeficient prostupu tepla izolace [Wm⁻²K⁻¹]
 T = teplota látky při odlehčených podmínkách [K]

Otevírací tlak nouzového(ých) pojistného(ých) zařízení musí být větší než tlak uvedený v 4.2.1.13.7 a stanoven na základě výsledků zkoušek uvedených v 4.2.1.13.1. Nouzová pojistná zařízení musí být dimenzována takovým způsobem, aby nejvyšší tlak v přemístitelné cisterně nikdy nepřekročil zkušební tlak cisterny.

POZNÁMKA: Příklad metody pro stanovení rozměrů nouzového pojistného zařízení je uveden v dodatku 5 Příručky zkoušek a kritérií.

4.2.1.13.9 Pro izolované přemístitelné cisterny průtok a nastavení nouzového(ých) pojistného(ých) zařízení musí být určeny se započtením ztráty izolace o velikosti 1 % celkové plochy povrchu.

4.2.1.13.10 Podtlakové pojistné vakuové ventily a pružinové ventily musí být vybaveny pojistkou proti prošlehnutí plamene. Povinně musí být věnována pozornost omezení nouzového průtoku způsobenému pojistkou proti prošlehnutí plamene.

4.2.1.13.11 Provozní výstroj, jako jsou ventily a vnější potrubí, musí být uspořádány tak, aby v nich nezůstala žádná látka po naplnění přemístitelné cisterny.

4.2.1.13.12 Přemístitelné cisterny mohou být buď izolovány, nebo chráněny slunečním štítem. Jestliže teplota SADT látky v přemístitelné cisterně je 55 °C nebo méně, nebo je-li přemístitelná cisterna vyrobena z hliníku, pak musí být kompletně izolovaná. Vnější povrch musí mít bílý nátěr nebo musí být proveden ze světlého kovu.

4.2.1.13.13 Stupeň plnění nesmí překročit 90 % při 15 °C.

4.2.1.13.14 Značení předepsané v 6.7.2.20.2 musí zahrnovat UN číslo a technický název se schválenou koncentrací dotyčné látky.

4.2.1.13.15 Organické peroxidy a samovolně se rozkládající látky zvláště uvedené v pokynu pro přemístitelné cisterny T23 v 4.2.5.2.6 smí být přepravovány v přemístitelných cisternách.

4.2.1.14 *Dodatečná ustanovení vztahující se na přepravu látek třídy 6.1 v přemístitelných cisternách*

(Vyhrazeno)

4.2.1.15 *Dodatečná ustanovení vztahující se na přepravu látek třídy 6.2 v přemístitelných cisternách*

(Vyhrazeno)

4.2.1.16 *Dodatečná ustanovení vztahující se na přepravu látek třídy 7 v přemístitelných cisternách*

4.2.1.16.1 Přemístitelné cisterny používané pro přepravu radioaktivních látek nesmějí být používány pro přepravu jiných věcí.

4.2.1.16.2 Stupeň plnění přemístitelných cisteren nesmí překročit 90 % nebo případně jinou hodnotu schválenou příslušným orgánem.

4.2.1.17 *Dodatečná ustanovení vztahující se na přepravu látek třídy 8 v přemístitelných cisternách*

4.2.1.17.1 Zařízení pro vyrovnávání tlaku přemístitelných cisteren používaných pro přepravu látek třídy 8 musí být podrobena kontrolám ve lhůtách nepřesahujících jeden rok.

4.2.1.18 *Dodatečná ustanovení vztahující se na přepravu látek třídy 9 v přemístitelných cisternách*

(Vyhrazeno)

4.2.1.19 *Dodatečná ustanovení vztahující se na přepravu tuhých látek při teplotě vyšší, než je jejich bod tání*

4.2.1.19.1 Tuhé látky přepravované nebo podávané k přepravě při teplotě vyšší, než je jejich bod tání, které nemají přiřazen pokyn pro přemístitelné cisterny ve sloupci (10) tabulky A kapitoly 3.2 nebo pokud se uvedený pokyn pro přemístitelné cisterny nevztahuje na přepravu při teplotě vyšší, než je jejich bod tání, mohou být přepravovány v přemístitelných cisternách, pokud jsou tuhé látky zařazeny ve třídách 4.1, 4.2, 4.3, 5.1, 6.1, 8 nebo 9 a nepředstavující žádné vedlejší nebezpečí, kromě nebezpečí třídy 6.1 nebo třídy 8, a jsou v obalové skupině II nebo III.

4.2.1.19.2 Pokud není v tabulce A kapitoly 3.2 uvedeno jinak, přemístitelné cisterny používané pro přepravu těchto tuhých látek při teplotě vyšší, než je jejich bod tání, musí odpovídat ustanovením pokynu pro přemístitelné cisterny T4 pro tuhé látky obalové skupiny III nebo T7 pro tuhé látky obalové skupiny II. Přemístitelná cisterna, která zaručuje rovnocennou nebo vyšší úroveň bezpečnosti, může být vybrána podle 4.2.5.2.5. Nejvyšší stupeň plnění (v %) se stanoví podle 4.2.1.9.5 (TP3).

4.2.2 *Všeobecná ustanovení pro používání přemístitelných cisteren pro přepravu nezchlazených zkapalněných plynů a chemických látek pod tlakem*

4.2.2.1 Tento oddíl obsahuje všeobecná ustanovení vztahující se na používání přemístitelných cisteren pro přepravu nezchlazených zkapalněných plynů a chemických látek pod tlakem.

4.2.2.2 Přemístitelné cisterny musí splňovat požadavky pro konstrukci, výrobu, inspekci a zkoušky uvedené v oddíle 6.7.3. Nezchlazené zkapalněné plyny a chemické látky pod tlakem musí být přepravovány v přemístitelných cisternách odpovídajících pokynu pro přemístitelné cisterny T50 popsanému v 4.2.5.2.6 a všem zvláštním ustanovením pro přemístitelné cisterny uvedeným pro nezchlazené zkapalněné plyny ve sloupci (11) tabulky A kapitoly 3.2 a popsaným v pododdíle 4.2.5.3.

4.2.2.3 Během přepravy musí být přemístitelné cisterny přiměřeně chráněny proti poškození nádrže a provozní výstroje při podélném a příčném nárazu a při převrácení. Pokud nádrž a provozní výstroj jsou konstruovány tak, že odolávají nárazům a převrácení, pak taková ochrana není třeba. Příklady takové ochrany jsou uvedeny v 6.7.3.13.5.

4.2.2.4 Určité nezchlazené zkapalněné plyny jsou chemicky nestálé. Ty jsou připuštěny k přepravě pouze tehdy, byla-li učiněna nezbytná opatření pro zabránění jejich nebezpečnému rozkladu, přeměny nebo polymerizace během přepravy. Proto musí být zejména věnována pozornost tomu, aby přemístitelné cisterny neobsahovaly žádné nezchlazené zkapalněné plyny náchylné podporovat tyto reakce.

4.2.2.5 Pokud název přepravovaného(ých) plynu(ů) není uveden na kovovém štítku popsaném v 6.7.3.16.2, musí být na požádání příslušného orgánu předložena odesilatelem, příjemcem nebo zasilatelem kopie osvědčení uvedeného v 6.7.3.14.1.

4.2.2.6 Prázdné nevyčištěné a neodplyněné přemístitelné cisterny musí splňovat stejné požadavky jako přemístitelné cisterny naplněné předešlým nezchlazeným zkapalněným plynem.

4.2.2.7 *Plnění*

4.2.2.7.1 Před plněním přemístitelné cisterny musí být cisterna zkontrolována, aby se zajistilo, že je schválena pro přepravu nezchlazeného zkapalněného plynu nebo hnací látky chemické látky pod tlakem a že nebude naplněna nezchlazeným zkapalněným plynem nebo chemickými látkami pod tlakem, který při styku s materiály nádrže, těsnění, provozní výstroje a jakéhokoli ochranného vnitřního povlaku je náchylný nebezpečně s nimi reagovat a tvořit s nimi nebezpečné látky nebo značně zeslabovat tyto materiály. Během plnění musí být teplota nezchlazeného zkapalněného plynu nebo hnací látky chemických látek pod tlakem v rozsahu limitů konstrukčních teplot.

4.2.2.7.2 Nejvyšší hmotnost nezchlazeného zkapalněného plynu na litr vnitřního objemu nádrže (kg/l) nesmí překročit hustotu nezchlazeného zkapalněného plynu při 50 °C vynásobenou 0,95. Kromě toho nádrž nesmí být zcela naplněna kapalinou při 60 °C.

4.2.2.7.3 Přemístitelné cisterny nesmějí být plněny nad svou nejvyšší dovolenou celkovou hmotnost a nad nejvyšší dovolenou užitečnou hmotnost stanovenou pro každý přepravovaný plyn.

4.2.2.8 Přemístitelné cisterny nesmějí být předány k přepravě:

- (a) s neúplným naplněním, při kterém vlnění obsahu může způsobit vytváření nepřípustných hydraulických sil v nádrži;
- (b) při netěsnosti;
- (c) při poškození v takovém rozsahu, že může být ovlivněna celistvost cisterny nebo jejích zvedacích nebo upevňovacích zařízení; a
- (d) pokud provozní výstroj nebyla přezkoušena a shledána v dobrém provozním stavu.

4.2.2.9 Kapsy pro zvedací vidlice u přemístitelných cisteren musí být během plnění cisteren uzavřeny. Toto ustanovení se nevztahuje na přemístitelné cisterny, které podle 6.7.3.13.4 nemusí být opatřeny uzavěry kapes pro zvedací vidlice.

4.2.3 *Všeobecná ustanovení pro používání přemístitelných cisteren pro přepravu hluboce zchlazených zkapalněných plynů*

4.2.3.1 Tento oddíl obsahuje všeobecná ustanovení vztahující se na používání přemístitelných cisteren pro přepravu hluboce zchlazených zkapalněných plynů.

4.2.3.2 Přemístitelné cisterny musí splňovat konstrukční, výrobní, kontrolní a zkušební požadavky uvedené v oddíle 6.7.4. Hluboce zchlazené zkapalněné plyny musí být přepravovány v přemístitelných cisternách odpovídajících pokynu pro přemístitelné cisterny T75 popsanému v 4.2.5.2.6 a zvláštním ustanovením pro přemístitelné cisterny uvedeným pro každý plyn ve sloupci (11) tabulky A kapitoly 3.2 a popsaným v pododdílu 4.2.5.3.

4.2.3.3 Přemístitelné cisterny musí být během přepravy přiměřeně chráněny proti poškození nádrže a provozní výstroje následkem podélného a příčného nárazu a převrácení. Pokud nádrž a provozní výstroj jsou konstruovány tak, že odolávají nárazům a převrácení, potom taková ochrana není potřebná. Příklady takové ochrany jsou uvedeny v 6.7.4.12.5.

4.2.3.4 Pokud název přepravovaného(-ých) plynu(-ů) není uveden na kovovém štítku popsaném v 6.7.4.15.2, musí být předložena příslušnému orgánu na jeho žádost odesílatelem, příjemcem nebo zaslátele kopie osvědčení uvedeného v 6.7.4.13.1.

4.2.3.5 Prázdné nevyčištěné a neodplyněné přemístitelné cisterny musí splňovat stejné požadavky jako přemístitelné cisterny naplněné předešlou látkou.

4.2.3.6 *Plnění*

4.2.3.6.1 Před plněním přemístitelné cisterny musí být cisterna zkontrolována, aby se zajistilo, že je schválena pro přepravu hluboce zchlazeného zkvalněného plynu a že nebude naplněna hluboce zchlazenými zkvalněnými plyny, které při styku s materiály nádrže, těsnění, provozní výstroje a jakéhokoli ochranného vnitřního povlaku jsou náchylné s nimi nebezpečně reagovat a tvořit s nimi nebezpečné látky nebo značně zeslabovat tyto materiály. Během plnění musí být teplota hluboce zchlazeného zkvalněného plynu v rozsahu limitů konstrukčních teplot.

4.2.3.6.2 Při hodnocení prvního stupně plnění musí být uvažován nezbytný čas pro předpokládanou přepravu včetně jakýchkoli zpoždění, která by mohla nastat. S výjimkou ustanovení v 4.2.3.6.3 a 4.2.3.6.4, musí být první stupeň plnění takový, aby při nárůstu teploty obsahu, kromě helia, při které tenze par se rovná nejvyššímu dovolenému provoznímu tlaku, vnitřní objem zaplněný kapalinou nepřesáhl 98 %.

4.2.3.6.3 Nádrže určené pro přepravu helia mohou být plněny do úrovně vstupu, avšak nikoliv nad vstup do zařízení pro vyrovnávání tlaku.

4.2.3.6.4 Vyšší první stupeň plnění může být povolen schválením příslušným orgánem, pokud očekávané trvání přepravy je podstatně kratší než doba, po kterou je přemístitelná cisterna naplněna.

4.2.3.7 *Skutečná zádržná doba*

4.2.3.7.1 Skutečná zádržná doba musí být vypočtena pro každou jízdu podle postupu uznaného příslušným orgánem na základě následujících faktorů:

- (a) referenční zádržná doba pro přepravovaný hluboce zchlazený zkvalněný plyn (viz 6.7.4.2.8.1) (jak je uvedeno na štítku zmíněném v 6.7.4.15.1);
- (b) skutečná plnicí hustota;
- (c) skutečný plnicí tlak;
- (d) nejnižší nastavený tlak zařízení pro omezení tlaku.

4.2.3.7.2 Skutečná zádržná doba musí být vyznačena buď na přemístitelné cisterně samé, nebo na kovovém štítku pevně připevněném na přemístitelné cisterně v souladu s 6.7.4.15.2.

4.2.3.8 Přemístitelné cisterny nesmějí být předány k přepravě:

- (a) s neúplným naplněním, při kterém vlnění obsahu může způsobit vytváření nepřípustných hydraulických sil v nádrži;
- (b) při netěsnosti;
- (c) při poškození v takovém rozsahu, že může být ovlivněna celistvost cisterny nebo jejího zvedacího nebo upevňovacího zařízení;
- (d) jestliže provozní výstroj nebyla přezkoušena a shledána v dobrém provozním stavu;
- (e) pokud skutečná zádržná doba pro přepravovaný hluboce zchlazený zkvalněný plyn nebyla stanovena v souladu s pododdílem 4.2.3.7 a přemístitelná cisterna není označena podle 6.7.4.15.2; a

- (f) pokud doba přepravy, při zvážení všech možných zdržení, která by mohla nastat, přesáhne skutečnou zádržnou dobu.

4.2.3.9 Kapsy pro zvedací vidlice u přemístitelných cisteren musí být během plnění cisteren uzavřeny. Toto ustanovení se nevztahuje na přemístitelné cisterny, které podle 6.7.4.12.4 nemusí být opatřeny uzávěry kapes pro zvedací vidlice.

4.2.4 Všeobecná ustanovení pro používání UN vícečlánekových kontejnerů na plyn (MEGC)

4.2.4.1 Tento oddíl obsahuje všeobecné požadavky vztahující se na používání vícečlánekových kontejnerů na plyn (MEGC) pro přepravu nechlazených plynů uvedených v oddílu 6.7.5.

4.2.4.2 MEGC musí splňovat konstrukční, výrobní, kontrolní a zkušební požadavky uvedené v oddílu 6.7.5. Články MEGC musí být periodicky kontrolovány podle ustanovení uvedených v pokynu pro balení P200 pododdílu 4.1.4.1 a v pododdílu 6.2.1.6;

4.2.4.3 MEGC musí být během přepravy chráněny proti poškození článků a provozní výstroje při podélných a příčných nárazech a převrácení. Pokud jsou články a provozní výstroj konstruovány tak, že odolávají nárazům a převrácení, není je třeba tímto způsobem chránit. Příklady takové ochrany jsou uvedeny v 6.7.5.10.4.

4.2.4.4 Požadavky na periodickou zkoušku a inspekci MEGC jsou stanoveny v pododdílu 6.7.5.12. MEGC nebo jejich články nesmějí být nakládány nebo plněny poté, co měly být podrobeny periodické inspekci, avšak mohou být přepravovány po uplynutí předepsané časové lhůty pro její provedení.

4.2.4.5 Plnění

4.2.4.5.1 Před plněním MEGC musí být zkontrolováno, že je schválen pro plyn určený k přepravě a že splňuje příslušná ustanovení ADR.

4.2.4.5.2 Články MEGC musí být plněny podle provozních tlaků, stupňů plnění a ustanovení pro plnění stanovených v pokynu pro balení P200 pododdílu 4.1.4.1 pro specifický plyn plněný do každého článku. V žádném případě nesmí být MEGC nebo skupina článků plněna jako jednotka nad nejnižší provozní tlak jakéhokoli daného článku.

4.2.4.5.3 MEGC nesmějí být plněny nad svou nejvyšší dovolenou celkovou hmotnost.

4.2.4.5.4 Izolační ventily musí být uzavřeny po naplnění a musí zůstat uzavřeny během přepravy. Toxické plyny (plyny skupin T, TF, TC, TO, TFC a TOC) smějí být přepravovány pouze v MEGC, kde je každý článek vybaven izolačním ventilem.

4.2.4.5.5 Otvor(y) pro plnění musí být uzavřeny čepičkami nebo zátkami. Těsnost uzávěrů a výstroje musí být ověřena plničem po naplnění.

4.2.4.5.6 MEGC nesmějí být přistaveny k plnění,

- (a) pokud jsou poškozeny v takovém rozsahu, že může být ovlivněna celistvost tlakových nádob (článků) nebo jejich konstrukční a provozní výstroje;
- (b) pokud prohlídka tlakové nádoby a její konstrukční a provozní výstroje prokázala jejich nevyhovující stav; a
- (c) pokud není čitelné předepsané označení týkající se schválení, periodické zkoušky a plnění.

4.2.4.6 Naplněné MEGC nesmějí být předány k přepravě,

- (a) pokud jsou netěsné;
- (b) pokud jsou poškozeny v takovém rozsahu, že může být ovlivněna celistvost tlakových nádob (článků) nebo jejich konstrukční nebo provozní výstroje;

- (c) pokud prohlídka tlakové nádoby a její konstrukční a provozní výstroje prokázala jejich nevyhovující stav; a
- (d) pokud není čitelné předepsané označení týkající se schválení, periodické zkoušky a plnění.

4.2.4.7 Prázdné MEGC, které nebyly vyčištěny a odplyněny, musí splňovat tytéž požadavky jako MEGC naplněné předchozí látkou.

4.2.5 Pokyny a zvláštní ustanovení pro přemístitelné cisterny

4.2.5.1 Všeobecně

4.2.5.1.1 Tento oddíl obsahuje pokyny pro přemístitelné cisterny a zvláštní ustanovení vztahující se na nebezpečné věci, jejichž přeprava je povolena v přemístitelných cisternách. Každý pokyn pro přemístitelné cisterny je identifikován alfa-numerickým kódem (např. T1). Sloupec (10) tabulky A kapitoly 3.2 uvádí pokyn pro přemístitelné cisterny, který musí být použit pro každou látku, kterou je dovoleno přepravovat v přemístitelné cisterně. Jestliže pro určitou látku není ve sloupci (10) uveden žádný pokyn pro přemístitelné cisterny pak tuto látku není dovoleno přepravovat v přemístitelných cisternách, ledaže příslušný orgán vydal povolení, jak je uvedeno v pododdíle 6.7.1.3. Zvláštní ustanovení pro přemístitelné cisterny vztahující se na určité nebezpečné věci jsou uvedena ve sloupci (11) tabulky A kapitoly 3.2. Každé zvláštní ustanovení pro přemístitelné cisterny je identifikováno alfa-numerickým kódem (např. TP1). Přehled zvláštních ustanovení pro přemístitelné cisterny je uveden v pododdíle 4.2.5.3.

***Poznámka:** Plyny povolené pro přepravu v MEGC jsou uvedeny s písmenem (M) ve sloupci (10) tabulky A kapitoly 3.2.*

4.2.5.2 Pokyny pro přemístitelné cisterny

4.2.5.2.1 Pokyny pro přemístitelné cisterny se vztahují na nebezpečné věci tříd 1 až 9. Pokyny pro přemístitelné cisterny obsahují zvláštní informace týkající se ustanovení pro přemístitelné cisterny vztahující se na určité látky. Tato ustanovení musí být dodržena jako doplňující k všeobecným ustanovením uvedeným v této kapitole a v kapitole 6.7.

4.2.5.2.2 Pro látky tříd 1 a 3 až 9 pokyny pro přemístitelné cisterny uvádějí nejnižší zkušební tlak, minimální tloušťku stěny nádrže (z referenční oceli), požadavky na spodní otvory a požadavky na zařízení pro vyrovnávání tlaku. V pokynu pro přemístitelné cisterny T23 jsou uvedeny samovolně se rozkládající látky třídy 4.1 a organické peroxidy třídy 5.2, které je dovoleno přepravovat v přemístitelných cisternách, s příslušnými řízeními a kontrolními teplotami.

4.2.5.2.3 Na nezchlazené zkvalněné plyny se vztahuje pokyn pro přemístitelné cisterny T50. T50 uvádí nejvyšší dovolené provozní tlaky, požadavky na otvory pod hladinou kapaliny, požadavky na zařízení pro vyrovnávání tlaku a požadavky na nejvyšší hustotu plnění nezchlazených zkvalněných plynů, jejichž přeprava v přemístitelných cisternách je povolena.

4.2.5.2.4 Na hluboce zchlazené zkvalněné plyny se vztahuje pokyn pro přemístitelné cisterny T75.

4.2.5.2.5 Určení odpovídajících pokynů pro přemístitelné cisterny

Jestliže je ve sloupci (10) tabulky A kapitoly 3.2 u určité položky nebezpečných věcí uveden určitý pokyn pro přemístitelné cisterny, mohou být kromě toho používány také přemístitelné cisterny s vyššími minimálními zkušebními tlaky, většími tloušťkami stěn, přísnějšími požadavky na spodní otvory a zařízení pro vyrovnávání tlaku. Následující pokyny se vztahují na stanovení vhodných přemístitelných cistern, které mohou být používány pro přepravu jednotlivých látek:

Pokyn pro přemístitelné cisterny	Další dovolené pokyny pro přemístitelné cisterny
T1	T2, T3, T4, T5, T6, T7, T8, T9, T10, T11, T12, T13, T14, T15, T16, T17, T18, T19, T20, T21, T22

4.2.5.2.6*Pokyny pro přemístitelné cisterny*

Pokyny pro přemístitelné cisterny stanoví požadavky vztahující se na přemístitelné cisterny, pokud jsou používány pro přepravu určitých látek. Pokyny pro přemístitelné cisterny T1 až T 22 stanoví příslušné nejnižší zkušební tlaky, minimální tloušťku nádrže (v mm referenční oceli), požadavky na zařízení pro vyrovnávání tlaku a požadavky na spodní otvory.

T1 - T22		POKYNY PRO PŘEMÍSTITELNÉ CISTERNY		T1 - T22
Tyto pokyny pro přemístitelné cisterny se vztahují na kapalné a tuhé látky třídy 1 a tříd 3 až 9. Všeobecná ustanovení oddílu 4.2.1 a požadavky oddílu 6.7.2 musí být dodrženy.				
Pokyn pro přemístitelné cisterny	Nejnižší zkušební tlak (bar)	Minimální tloušťka nádrže (v mm referenční oceli) (viz 6.7.2.4)	Požadavky na zařízení pro vyrovnávání tlaku ^a (viz 6.7.2.8)	Požadavky na spodní otvory ^b (viz 6.7.2.6)

T21	10	10 mm	Normální	Nedovolený
T22	10	10 mm	Viz 6.7.2.8.3	Nedovolený

^a Pokud je uvedeno slovo „Normální“, musí být splněny všechny požadavky uvedené v pododdílu 6.7.2.8, kromě požadavků uvedených v 6.7.2.8.3.

^b Pokud je v tomto sloupci uvedeno „Nedovolený“, nejsou spodní otvory dovoleny, je-li látka, která se má přepravovat, látkou kapalnou (viz 6.7.2.6.1). Pokud je látka, která se má přepravovat, látkou tuhou při všech teplotách, které se mohou vyskytnout za normálních podmínek přepravy, jsou spodní otvory odpovídající požadavkům uvedeným v 6.7.2.6.2 dovoleny.

T23 POKYN PRO PŘEMÍSTITELNÉ CISTERNY T23								
<p><i>Tento pokyn pro přemístitelné cisterny se vztahuje na samovolně se rozkládající látky třídy 4.1 a na organické peroxidy třídy 5.2. Všeobecná ustanovení oddílu 4.2.1 a požadavky oddílu 6.7.2 musí být dodrženy. Dodatečná ustanovení pro samovolně se rozkládající látky třídy 4.1 a organické peroxidy třídy 5.2 v 4.2.1.13 musí být též dodržena.</i></p>

T75 POKYN PRO PŘEMÍSTITELNÉ CISTERNY T75	
<i>Tento pokyn pro přemístitelné cisterny se vztahuje na hluboce zchlazené zkpalněné plyny. Všeobecná ustanovení oddílu 4.2.3 a požadavky oddílu 6.7.4 musí být dodrženy.</i>	

- ^a „Malý“ platí pro cisterny s nádrží o průměru nejvýše 1,5 m ;
 „Neizolovaný“ platí pro nádrže o průměru větším než 1,5 m bez izolace nebo slunečního štítu (viz 6.7.3.2.12);
 „Sluneční štít“ platí pro cisterny s nádrží o průměru větším než 1,5 m se slunečním štítem (viz 6.7.3.2.12);
 „Izolovaný“ platí pro cisterny s nádrží o průměru větším než 1,5 m s izolací (viz 6.7.3.2.12); /Viz definici „Konstrukční referenční teplota“ v 6.7.3.1).
- ^b Slovo „Normální“ ve sloupci Požadavky na zařízení pro vyrovnávání tlaku značí, že se nevyžaduje průtržný kotouč, jak je uvedeno v 6.7.3.7.3.
- ^c Pro UN čísla 3500, 3501, 3502, 3503, 3504 a 3505 se musí namísto na nejvyšší stupeň plnění brát zřetel na stupeň plnění.

4.2.5.3 Zvláštní ustanovení pro přemístitelné cisterny

Zvláštní ustanovení pro přemístitelné cisterny se vztahují na určité látky a uvádějí ustanovení, která jsou doplňková nebo nahrazují ty, která jsou uvedena v pokynech pro přemístitelné cisterny, nebo požadavky uvedené v kapitole 6.7. Zvláštní ustanovení pro přemístitelné cisterny jsou označena použitím alfanumerického kódu začínajícího písmeny „TP“ (tank provisions) a jsou přiřazena k určitým látkám ve sloupci (11) tabulky A kapitoly 3.2. Dále je uveden seznam zvláštních ustanovení pro přemístitelné cisterny:

TP1 Stupeň plnění předepsaný v 4.2.1.9.2 nesmí být překročen.

$$(\text{Stupeň plnění} = \frac{97}{1 + \alpha (t_r - t_f)})$$

TP2 Stupeň plnění předepsaný v 4.2.1.9.3 nesmí být překročen.

$$(\text{Stupeň plnění} = \frac{95}{1 + \alpha (t_r - t_f)})$$

TP3 Nejvyšší stupeň plnění (v %) pro tuhé látky přepravované při teplotě vyšší, než je jejich bod tání, a pro kapaliny přepravované při zvýšené teplotě se stanoví podle 4.2.1.9.5.

$$(\text{Stupeň plnění} = 95 \frac{d_r}{d_f})$$

TP4 Stupeň plnění nesmí překročit 90% nebo jinou hodnotu schválenou příslušným orgánem (viz 4.2.1.16.2).

TP5 Stupeň plnění předepsaný v pododdílu 4.2.3.6 musí být dodržen.

TP6 Pro zabránění roztržení cisterny při jakékoli události, včetně zachvácení požárem, musí být cisterna vybavena zařízením pro vyrovnávání tlaku, která jsou přiměřená ve vztahu k vnitřnímu objemu cisterny a povaze přepravované látky. Zařízení musí být též snášetlivá s přepravovanou látkou.

TP7 Vzduch musí být odstraněn z výparného prostoru dusíkem nebo jinými prostředky.

TP8 Zkušební tlak může být snížen na 1,5 baru, je-li bod vzplanutí přepravované látky vyšší než 0 °C.

TP9 Látka podle tohoto popisu smí být přepravována v přemístitelné cisterně pouze po schválení příslušným orgánem.

TP10 Vyžaduje se olovený vnitřní povlak o tloušťce nejméně 5 mm, který musí být každoročně zkoušen, nebo vnitřní povlak z jiného vhodného materiálu schváleného příslušným orgánem.

TP12 (Vypuštěno)

TP13 (Vyhrazeno)

TP16 Cisterna musí být vybavena zvláštním zařízením pro ochranu před podtlakem a přetlakem za normálních přepravních podmínek.

Toto zařízení musí být schváleno příslušným orgánem. Požadavky na zařízení pro vyrovnávání tlaku jsou uvedeny v 6.7.2.8.3, aby se zabránilo krystalizaci látky v tlakovém pojistném ventilu.

TP17 Pro tepelnou izolaci cisterny smějí být používány pouze anorganické nehořlavé materiály.

- TP18 Teplota musí být udržována mezi 18 °C a 40 °C. Přemístitelné cisterny obsahující ztuhlou kyselinu methakrylovou nesmějí být během přepravy znovu zahřívány.
- TP19 Vypočtená tloušťka stěny nádrže musí být zvětšena o 3 mm. Tloušťka stěny nádrže musí být ověřena ultrazvukem v polovičních lhůtách mezi periodickými hydraulickými zkouškami.
- TP20 Tato látka smí být přepravována pouze v izolovaných cisternách pod vrstvou dusíku.
- TP21 Tloušťka stěny nádrže nesmí být menší než 8 mm. Cisterny musí být podrobeny hydraulické zkoušce a prohlídce vnitřku ve lhůtách nepřekračujících 2,5 roku.
- TP22 Mazadla pro těsnění nebo jiná zařízení musí být snášitelná s kyslíkem.
- TP23 Přeprava povolena za zvláštních podmínek předepsaných příslušným orgánem.
- TP24 Přemístitelné cisterny mohou být vybaveny zařízením umístěným při maximálních plnicích podmínkách ve výparném prostoru nádrže, aby se zabránilo zvýšení tlaku v důsledku pomalého rozkladu přepravované látky. Toto zařízení musí též v případě převrácení cisterny zabránit nepřípustnému úniku kapaliny nebo vniknutí cizích látek do cisterny. Toto zařízení musí být schváleno příslušným orgánem nebo jím pověřenou organizací.
- TP25 Oxid siřičitý čistoty nejméně 99,95 % smí být přepravován v cisternách bez inhibitoru za podmínky, že je udržován na teplotě nejméně 32,5 °C.
- TP26 Při přepravě v zahřátém stavu musí být ohřívací zařízení upevněno na vnějšku nádrže. Na látky UN 3176 se vztahuje tento požadavek pouze tehdy, pokud látka reaguje nebezpečně s vodou.
- TP27 Přemístitelná cisterna mající minimální zkušební tlak 4 bary smí být používána, jestliže se prokáže, že podle definice zkušební tlaku v pododdlu 6.7.2.1 je přípustný zkušební tlak 4 bar nebo menší.
- TP28 Přemístitelná cisterna mající minimální zkušební tlak 2,65 bar smí být používána, jestliže se prokáže, že podle definice zkušební tlaku v pododdlu 6.7.2.1 je přípustný zkušební tlak 2,65 bar nebo menší.
- TP29 Přemístitelná cisterna mající minimální zkušební tlak 1,5 bar smí být používána, jestliže se prokáže, že podle definice zkušební tlaku v pododdlu 6.7.2.1 je přípustný zkušební tlak 1,5 bar nebo menší.
- TP30 Tato látka musí být přepravována v tepelně izolovaných cisternách.
- TP31 Tato látka smí být přepravována v cisternách jen v tuhém stavu.
- TP32 Pro UN čísla 0331, 0332 a 3375 mohou být používány přemístitelné cisterny splňující tyto podmínky:
- (a) Aby se zabránilo zbytečnému uzavírání, každá přemístitelná cisterna vyrobená z kovu musí být vybavena zařízením pro vyrovnávání tlaku, které může být opětne uzavíratelného pružinového typu, průtržným kotoučem nebo tavným prvkem. Nastavení vyprazdňovacího tlaku nebo tlaku pro roztržení, pokud je to vhodné, nesmí být vyšší než 2,65 baru pro přemístitelné cisterny s minimálními zkušebními tlaky vyššími než 4 bary.
 - (b) Jen pro UN 3375, vhodnost pro přepravu v cisternách musí být prokázána. Jednou metodou pro hodnocení této vhodnosti je zkouška 8(d) v sérii zkoušek 8 (viz Příručka zkoušek a kritérií, část 1, pododíl 18.7).
 - (c) Není dovoleno ponechat látky v přemístitelné cisterně po dobu, za kterou by v ní mohly ztvrdnout. Musí být učiněna vhodná opatření, aby se zabránilo usazení a ztuhnutí látek v cisterně (např. vyčištění atd.).
- TP33 Pokyny pro přemístitelné cisterny přiřazené k této látce se vztahují na zrnité a práškové tuhé látky a na tuhé látky, které jsou plněny a vyprazdňovány při teplotách vyšších, než je jejich bod tání, které jsou zchlazeny a přepravovány jako tuhá hmota. Pro tuhé látky, které jsou přepravovány při teplotě vyšší, než je jejich bod tání, viz pododíl 4.2.1.19.

- TP34 Přemístitelné cisterny nemusí být podrobeny zkoušce nárazem uvedené v 6.7.4.14.1, pokud jsou tyto cisterny označeny nápisem „ŽELEZNIČNÍ DOPRAVA ZAKÁZÁNA“ na štítku uvedeném v 6.7.4.15.1 a současně písmeny nejméně 10 cm vysokými na obou stranách vnějšího pláště.
- TP 35 Pokyny pro přemístitelné cisterny T14 předepsané v ADR platné do 31. prosince 2008 mohou se dále používat až do 31. prosince 2014.
- TP36 U přemístitelných cisteren směji být používány tavné prvky v parním prostoru.
- TP37 Pokyn pro přemístitelné cisterny T14 smí být dále používán až do 31. prosince 2016, s výjimkou toho, že do tohoto data:
- (a) pro UN 1810, 2474 a 2668 smí být používán T7;
 - (b) pro UN 2486 smí být používán T8; a
 - (c) pro UN 1838 smí být používán T10.
- TP38 Pokyn pro přemístitelné cisterny T9 předepsaný v ADR platné do 31. prosince 2012 smí být dále používán až do 31. prosince 2018.
- TP39 Pokyn pro přemístitelné cisterny T4 předepsaný v ADR platné do 31. prosince 2012 smí být dále používán až do 31. prosince 2018.
- TP40 Přemístitelné cisterny nesmějí být přepravovány, jsou-li spojeny s rozstřikovacím zařízením.
- TP41 Se souhlasem příslušného orgánu smí být od 2.5 roční vnitřní prohlídky upuštěno, nebo může být nahrazena jinými zkušebními metodami nebo inspekčními postupy, pokud je přemístitelná cisterna určena výhradně pro přepravu organokovových látek, jimž bylo toto zvláštní ustanovení pro cisterny přiřazeno. Avšak tato prohlídka je vyžadována, jsou-li splněny podmínky uvedené v 6.7.2.19.7.

KAPITOLA 4.3

**POUŽÍVÁNÍ NESNÍMATELNÝCH CISTEREN (CISTERNOVÝCH VOZIDEL),
SNÍMATELNÝCH CISTEREN, CISTERNOVÝCH KONTEJNERŮ
A CISTERNOVÝCH VÝMĚNNÝCH NÁSTAVEB, JEJICHŽ NÁDRŽE JSOU
VYROBENY Z KOVOVÝCH MATERIÁLŮ, A BATERIOVÝCH VOZIDEL
A VÍCEČLÁNKOVÝCH KONTEJNERŮ NA PLYN (MEGC)**

POZNÁMKA: Pro přemístitelné cisterny a UN MEGC viz kapitola 4.2, pro cisterny z vyztužených plastů viz kapitola 4.4; pro cisterny pro podtlakové vyčerpávání odpadů viz kapitola 4.5.

4.3.1 Rozsah použití

4.3.1.1 Ustanovení, která jsou uvedena v celé šíři stránky, se vztahují jak na nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla, tak i na cisternové kontejnery, cisternové výměnné nástavby a MEGC. Ustanovení uvedená pouze v jednom sloupci se vztahují jen na:

- nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla (levý sloupec);
- cisternové kontejnery, cisternové výměnné nástavby a MEGC (pravý sloupec).

4.3.1.2 Tato ustanovení se vztahují na:

nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla	cisternové kontejnery, cisternové výměnné nástavby a MEGC
---	--

používané pro přepravu plyných, kapalných, práškovitých a zrnitých látek.

4.3.1.3 V oddílu 4.3.2 jsou uvedena ustanovení, která se vztahují na nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby určené pro přepravu látek všech tříd a na bateriová vozidla a MEGC určená k přepravě plynů třídy 2. Oddíly 4.3.3 a 4.3.4 obsahují zvláštní ustanovení, která doplňují nebo mění ustanovení oddílu 4.3.2.

4.3.1.4 Požadavky na konstrukci, vstroj, schválení typu, zkoušky a značení viz kapitola 6.8.

4.3.1.5 Pro přechodná ustanovení týkající se použití této kapitoly viz oddíl

1.6.3	1.6.4
-------	-------

4.3.2 Ustanovení vztahující se na všechny třídy

4.3.2.1 Použití

4.3.2.1.1 Látka podléhající ADR může být přepravována v nesnímatelných cisternách (cisternových vozidlech), snímatelných cisternách, bateriových vozidlech, cisternových kontejnerech, cisternových výměnných nástavbách a MEGC pouze tehdy, pokud je ve sloupci (12) tabulky A v kapitole 3.2 uveden kód cisterny podle 4.3.3.1.1. a 4.3.4.1.1.

4.3.2.1.2 Požadovaný typ cisterny, bateriového vozidla a MEGC je uveden v kódované formě ve sloupci (12) tabulky A v kapitole 3.2. Uvedené identifikační kódy se skládají z písmen a číslic ve stanoveném pořadí. Vysvětlivky k významu čtyř částí kódu jsou uvedeny v 4.3.3.1.1 (pokud látka, která se má přepravovat, patří do třídy 2) a v 4.3.4.1.1 (pokud látka, která se má přepravovat, patří do tříd 1 a 3 až 9)^a.

4.3.2.1.3 Požadovaný typ podle 4.3.2.1.2 odpovídá nejméně přísným konstrukčním požadavkům, které jsou přijatelné pro příslušnou nebezpečnou látku, pokud není v této kapitole nebo v kapitole 6.8 stanoveno jinak. Smějí být používány také cisterny odpovídající kódům, které předepisují vyšší minimální výpočtový tlak nebo přísnější požadavky na plnicí nebo vyprazdňovací otvory nebo pojistné ventily/zařízení (viz 4.3.3.1.1 pro třídu 2 a 4.3.4.1.1 pro třídy 3 až 9).

^a Výjimka platí pro cisterny určené pro přepravu látek tříd 1, 5.2 nebo 7 (viz 4.3.4.1.3).

- 4.3.2.1.4** Na cisterny, bateriová vozidla a MEGC pro určité látky se vztahují dodatečná ustanovení, která jsou uvedena jako zvláštní ustanovení ve sloupci (13) tabulky A v kapitole 3.2.
- 4.3.2.1.5** Cisterny, bateriová vozidla a MEGC nesmějí být plněny jinými nebezpečnými látkami než těmi, pro jejichž přepravu byly schváleny podle 6.8.2.3.1 a které při styku s materiály nádrží, těsnění, výstroje a ochranných vnitřních povlaků nejsou náchylné s nimi nebezpečně reagovat (viz definice nebezpečné reakce v oddíle 1.2.1) a tvořit nebezpečné látky nebo tyto materiály výrazně zeslabovat^b.
- 4.3.2.1.6** Potraviny nesmějí být přepravovány v cisternách používaných pro nebezpečné látky, pokud nebyly učiněny nezbytné kroky, aby se zabránilo ohrožení veřejného zdraví.
- 4.3.2.1.7** Dokumentace cisterny musí být uložena u vlastníka nebo provozovatele, který musí být schopen tuto dokumentaci předložit na požádání příslušného orgánu. Dokumentace cisterny musí být udržována po dobu životnosti cisterny a archivována po dobu 15 měsíců po vyřazení cisterny z provozu.

Pokud dojde ke změně vlastníka nebo provozovatele v době životnosti cisterny, dokumentace cisterny musí být předána novému vlastníku nebo provozovateli.

Kopie dokumentace cisterny nebo všechny nezbytné doklady musí být přístupné znalci pro prohlídky a zkoušky cisteren podle 6.8.2.4.5 nebo 6.8.3.4.16 při periodických prohlídkách a zkouškách nebo mimořádných prohlídkách a zkouškách.

4.3.2.2 **Stupeň plnění**

4.3.2.2.1 Následující stupně plnění cisteren určených pro přepravu kapalin při teplotách okolí nesmějí být překročeny:

- (a) pro hořlavé látky, látky ohrožující životní prostředí a hořlavé látky ohrožující životní prostředí, bez dalších nebezpečných vlastností (např. toxicity nebo žíravosti), v cisternách s odvězdušňovacími zařízeními nebo s pojistnými ventily (také s předřazeným průtržným kotoučem):

$$\text{stupeň plnění} = \frac{100}{1 + \alpha (50 - t_F)} \% \text{ vnitřního objemu}$$

- (b) pro toxické nebo žíravé látky (ať hořlavé nebo ohrožující životní prostředí, nebo ne) v cisternách s odvězdušňovacími zařízeními nebo s pojistnými ventily (také s předřazeným průtržným kotoučem):

$$\text{stupeň plnění} = \frac{98}{1 + \alpha (50 - t_F)} \% \text{ vnitřního objemu}$$

- (c) pro hořlavé látky, látky ohrožující životní prostředí a lehce toxické nebo žíravé látky (ať hořlavé nebo ohrožující životní prostředí, nebo ne) v hermeticky uzavřených cisternách bez pojistného zařízení:

$$\text{stupeň plnění} = \frac{97}{1 + \alpha (50 - t_F)} \% \text{ vnitřního objemu}$$

- (d) pro velmi toxické, toxické, velmi žíravé nebo žíravé látky (ať hořlavé nebo ohrožující životní prostředí, nebo ne) v hermeticky uzavřených cisternách bez pojistného zařízení:

$$\text{stupeň plnění} = \frac{95}{1 + \alpha (50 - t_F)} \% \text{ vnitřního objemu}$$

4.3.2.2.2 V těchto vzorcích znamená α střední koeficient objemové roztažnosti kapaliny mezi 15 °C a 50 °C, tj. pro zvýšení teploty nejvýše o 35 °C.

α se vypočte podle vzorce:

$$\alpha = \frac{d_{15} - d_{50}}{35 d_{50}}$$

přičemž d_{15} a d_{50} znamená relativní hustoty kapaliny při 15 °C a 50 °C.

t_F střední teplotu kapaliny při plnění.

^b Někdy může být nezbytné konzultovat s výrobcem látky a příslušným orgánem snášenlivost látky s materiály cisteren, bateriových vozidel nebo MEGC.

4.3.2.2.3 Ustanovení 4.3.2.2.1(a) až (d) se nevztahují na cisterny, jejichž obsah je udržován během přepravy ohřívacím zařízením na teplotě vyšší než 50 °C. V tomto případě musí být stupeň plnění na začátku přepravy stanoven a teplota řízena tak, aby cisterna nebyla během přepravy naplněna více než do 95 % svého vnitřního objemu a plnicí teplota nebyla překročena.

4.3.2.2.4 Nádrže určené pro přepravu látek v kapalném stavu nebo hluboce zchlazených zkapalněných plynů, které nejsou rozděleny přepážkami nebo peřejníky do komor s vnitřním objemem nejvýše 7500 litrů, musí být plněny nejméně na 80 % nebo nejvýše do 20 % jejich objemu.

Toto ustanovení se nevztahuje na:

- kapaliny s kinematickou viskozitou při 20 °C nejméně 2680 mm²/s;
- roztavené látky s kinematickou viskozitou při teplotě plnění nejméně 2680 mm²/s;
- UN 1963 HELIUM, HLUBOCE ZCHLAZENÉ, KAPALNÉ a UN 1966 VODÍK, HLUBOCE ZCHLAZENÝ, KAPALNÝ.

4.3.2.3 **Provoz**

4.3.2.3.1 Tloušťka stěn nádrže se nesmí během celé doby používání cisterny zmenšit pod nejmenší hodnotu, která je předepsána v:

6.8.2.1.17 až 6.8.2.1.21 | 6.8.2.1.17 až 6.8.2.1.20

4.3.2.3.2 Cisternové kontejnery/MEGC musí být při přepravě naloženy na nosném vozidle tak, aby byly dostatečně chráněny zařízením nosného vozidla nebo samotného cisternového kontejneru/MEGC proti podélným a příčným nárazům a proti převrácení³. Jsou-li cisternové kontejnery/MEGC, včetně provozní výstroje, konstruovány tak, že mohou odolat nárazům nebo převrácení, pak není nutné je tímto způsobem chránit.

4.3.2.3.3 Během plnění a vyprazdňování cisteren, bateriových vozidel a MEGC musí být učiněna náležitá opatření, aby se zabránilo uvolnění nebezpečného množství plynů a par. Cisterny, bateriová vozidla a MEGC musí být uzavřeny tak, aby nemohlo dojít k samovolnému úniku obsahu. Spodní výpusti cisteren musí být uzavřeny čepičkami se šroubením, slepými přírubami nebo jinými stejně účinnými zařízeními. Po naplnění se musí plnič přesvědčit, že všechny uzávěry cisteren, bateriových vozidel a MEGC jsou v uzavřené poloze a že nedochází k žádnému úniku. Toto ustanovení se vztahuje také na horní část ponorné trubky.

4.3.2.3.4 Je-li několik uzávěrů zabudováno za sebou, musí se nejdříve uzavřít ten, který je nejbližší k přepravované látce.

4.3.2.3.5 Během přepravy nesmějí na vnější straně cisteren lpět žádné zbytky naplněné látky.

4.3.2.3.6 Látky, které spolu mohou nebezpečně reagovat, nesmějí být přepravovány v sousedních komorách cisteren.

Látky, které spolu mohou nebezpečně reagovat, smějí být přepravovány v sousedních komorách cisteren, pokud jsou tyto komory od sebe odděleny přepážkou, která má stejnou nebo větší tloušťku, než má sama cisterna. Tyto látky smějí být přepravovány také v komorách jedné cisterny, pokud jsou jimi naplněné komory od sebe odděleny prázdným meziprostorem nebo prázdnou komorou.

4.3.2.4 **Prázdné nevyčištěné cisterny, bateriová vozidla a MEGC**

POZNÁMKA: Pro prázdné nevyčištěné cisterny, bateriová vozidla a MEGC mohou být použita zvláštní ustanovení TU1, TU2, TU4, TU16 a TU35 oddílu 4.3.5.

4.3.2.4.1 Během přepravy nesmějí na vnější straně cisteren lpět žádné zbytky naplněné látky.

4.3.2.4.2 Pro připuštění k přepravě musí být prázdné nevyčištěné cisterny, bateriová vozidla a MEGC uzavřeny a utěsněny stejně, jako kdyby byly plné.

³ Příklady pro ochranu nádrží:

- Ochranu proti bočnímu nárazu mohou tvořit např. podélné nárazníky po obou stranách ve výši střední roviny nádrže.
- Ochranu proti převrácení mohou tvořit např. výztužné prstence nebo nárazníky upevněné příčně ve vztahu k rámu.
- Ochranu proti nárazu zezadu může tvořit např. nárazník nebo rám.

4.3.2.4.3 Nejsou-li prázdné nevyčištěné cisterny, bateriová vozidla a MEGC uzavřeny tak hermeticky jako v naplněném stavu a nemohou-li být dodržena ustanovení ADR, pak musí být přepraveny za dostatečných bezpečnostních opatření při přepravě do nejbližšího vhodného místa, kde může být provedeno vyčištění nebo oprava. Za dostatečnou bezpečnost při přepravě se považuje, pokud jsou učiněna odpovídající opatření, která zabezpečí bezpečnost odpovídající ustanovením ADR a zabrání nekontrolovatelnému úniku nebezpečných věcí.

4.3.2.4.4 Prázdné nevyčištěné nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, bateriová vozidla, cisternové kontejnery, cisternové výměnné nástavby a MEGC se smějí přepravovat i po uplynutí lhůt stanovených v 6.8.2.4.2 a 6.8.2.4.3 k provedení inspekce.

4.3.3 Zvláštní ustanovení pro třídu 2

4.3.3.1 Kódování a hierarchie cisteren

4.3.3.1.1 Kódování cisteren, bateriových vozidel a MEGC

Čtyři části kódů (kódů cisteren) uvedených ve sloupci (12) tabulky A v kapitole 3.2 mají následující význam:

Část	Popis	Kód cisterny
1	Druhy cisterny, bateriového vozidla nebo MEGC	C = cisterna, bateriové vozidlo nebo MEGC pro stlačené plyny; P = cisterna, bateriové vozidlo nebo MEGC pro zkapalněné nebo rozpuštěné plyny; R = cisterna pro hluboce zchlazené zkapalněné plyny;
2	Výpočtový tlak	X = hodnota příslušného nejnižšího zkušebního tlaku podle tabulky v 4.3.3.2.5; nebo 22 = nejnižší výpočtový tlak v barech;
3	Otvory (viz pododdíly 6.8.2.2 a 6.8.3.2)	B = cisterna se spodními plnicími nebo vyprazdňovacími otvory se 3 uzávěry; nebo bateriové vozidlo nebo MEGC s otvory pod hladinou kapaliny nebo pro stlačené plyny; C = cisterna s horními plnicími nebo vyprazdňovacími otvory se 3 uzávěry, jen s otvory pro čištění pod hladinou kapaliny; D = cisterna s horními plnicími nebo vyprazdňovacími otvory se 3 uzávěry; nebo bateriové vozidlo nebo MEGC bez otvorů pod hladinou kapaliny;
4	Pojistné ventily/zařízení	N = cisterna, bateriové vozidlo nebo MEGC s pojistným ventilem podle 6.8.3.2.9 nebo 6.8.3.2.10, která není hermeticky uzavřena; H = hermeticky uzavřená cisterna, bateriové vozidlo nebo MEGC (viz oddíl 1.2.1).

POZNÁMKA 1: U některých plynů uváděné zvláštní ustanovení TU17 ve sloupci (13) tabulky A v kapitole 3.2 znamená, že plyn může být přepravován jen v bateriových vozidlech nebo MEGC, jehož články jsou tvořeny nádobami.

POZNÁMKA 2: Zvláštní ustanovení TU40 uvedené ve sloupci (13) tabulky A kapitoly 3.2 pro určité plyny znamená, že tento plyn smí být přepravován jen v bateriových vozidlech nebo MEGC, jejichž články jsou tvořeny bezešvými nádobami.

POZNÁMKA 3: Tlaky uvedené na cisterně samé nebo na tabulce nesmějí být menší než hodnota pro "X" nebo nejnižší výpočtový tlak.

4.3.3.1.2

Hierarchie cisteren

Kód cisterny	Další kód(y) cisterny(en) povolený(é) pro látky pod tímto kódem
C*BN	C#BN, C#CN, C#DN, C#BH, C#CH, C#DH
C*BH	C#BH, C#CH, C#DH
C*CN	C#CN, C#DN, C#CH, C#DH
C*CH	C#CH, C#DH
C*DN	C#DN, C#DH
C*DH	C#DH
P*BN	P#BN, P#CN, P#DN, P#BH, P#CH, P#DH
P*BH	P#BH, P#CH, P#DH
P*CN	P#CN, P#DN, P#CH, P#DH
P*CH	P#CH, P#DH
P*DN	P#DN, P#DH
P*DH	P#DH
R*BN	R#BN, R#CN, R#DN
R*CN	R#CN, R#DN
R*DN	R#DN

Číslice zastoupená značkou “#” musí být rovna nebo větší než číslice zastoupená značkou “*“.

POZNÁMKA: Tato hierarchie nebere v úvahu zvláštní ustanovení (viz. oddíly 4.3.5 a 6.8.4) pro každou položku.

4.3.3.2

Podmínky plnění a zkušební tlaky

4.3.3.2.1

Zkušební tlak pro cisterny určené pro přepravu stlačených plynů musí být nejméně 1,5 násobek provozního tlaku, jak je definován v oddílu 1.2.1 pro tlakové nádoby.

4.3.3.2.2

Zkušební tlak pro cisterny určené pro přepravu:

- vysokotlakých zkapalněných plynů; a
- rozpuštěných plynů.

musí být takový, aby po naplnění nádrže na nejvyšší stupeň plnění tlak dosažený v nádrži látkou při teplotě 55 °C pro cisterny s tepelnou izolací nebo při teplotě 65 °C pro cisterny bez tepelné izolace nepřekročil zkušební tlak.

4.3.3.2.3

Zkušební tlak pro cisterny určené pro přepravu nízkotlakých zkapalněných plynů bude:

- (a) jsou-li cisterny opatřeny tepelnou izolací, nejméně roven tenzi par kapaliny při 60 °C, snížený o 0,1 MPa (1 bar), nejméně však 1 MPa (10 barů);
- (b) nejsou-li cisterny opatřeny tepelnou izolací, nejméně roven tenzi par kapaliny při 65 °C, snížený o 0,1 MPa (1 bar), nejméně však 1 MPa (10 barů).

Nejvyšší dovolená hmotnost obsahu na litr vnitřního objemu se vypočte takto:

Nejvyšší dovolená hmotnost obsahu na litr vnitřního objemu = 0,95 x hustota kapalná fáze při 50 °C (v kg/l);

Kromě toho nesmí plynná fáze pod 60 °C vymizet.

Je-li průměr nádrží nejvýše 1,5 m, musí být použity hodnoty zkušební tlaku a nejvyšší dovolená hmotnost obsahu na litr vnitřního objemu podle pokynu pro balení P200 v pododdílu 4.1.4.1.

4.3.3.2.4

Zkušební tlak pro cisterny určené pro přepravu hluboce zchlazených zkvalněných plynů musí být nejméně 1,3 násobek nejvyššího dovoleného provozního tlaku vyznačeného na cisterně, avšak nejméně 300 kPa (3 bary) (přetlak); pro cisterny s vakuovou izolací musí být zkušební tlak nejméně 1,3 násobek nejvyššího dovoleného provozního tlaku zvýšený o 100 kPa (1 bar).

4.3.3.2.5

Tabulka plynů a směsí plynů, které mohou být přepravovány v nesnímatelných cisternách (cisternových vozidlech), bateriových vozidlech, snímatelných cisternách, cisternových kontejnerech nebo MEGC uvádějící nejnižší zkušební tlak pro cisterny a případně nejvyšší dovolenou hmotnost obsahu na litr vnitřního objemu.

U plynů a směsí plynů zařazených pod j.n. položky musí být hodnoty zkušební tlaku a nejvyšší dovolená hmotnost obsahu na litr vnitřního objemu předepsány znalcem schváleným příslušným orgánem.

Pokud byly cisterny pro stlačené nebo vysokotlaké zkvalněné plyny vystaveny nižšímu zkušebnímu tlaku než tlaku uvedenému v tabulce a cisterny jsou opatřeny tepelnou izolací, může znalec schválený příslušným orgánem předepsat nižší maximální hmotnost za předpokladu, že tlak dosažený v cisterně látkou při teplotě 55 °C nepřekročí zkušební tlak vyražený na cisterně.

^a Dovoleno, pokud LC50 je rovno nebo větší než 200 ppm.

^b Považováno za pyroforní.

4.3.3.3 Provoz

4.3.3.3.1 Pokud jsou cisterny, bateriová vozidla nebo MEGC schváleny pro různé plyny, pak změna jejich použití vyžaduje jejich vyprázdnění, vyčištění a odplynování v takovém rozsahu, aby byla zajištěna bezpečnost jejich provozu.

4.3.3.3.2 Při předávání cisteren, bateriových vozidel nebo MEGC k přepravě smějí být viditelné jen údaje pro skutečně naplněný, nebo pokud jsou prázdné, pro posledně naplněný plyn, uvedené v 6.8.3.5.6; všechny údaje týkající se jiných plynů musí být zakryty.

4.3.3.3.3 Všechny články bateriového vozidla nebo MEGC smějí obsahovat jen jeden a tentýž plyn.

4.3.3.3.4 Jestliže by vnější přetlak mohl být vyšší, než je odolnost cisterny vůči vnějšímu tlaku (např. v důsledku nízkých teplot okolí), musí být přijata přiměřená opatření k ochraně cisteren přepravujících nízkotlaké zkapalněné plyny proti nebezpečí deformace, např. jejich naplněním dusíkem nebo jiným inertním plynem, aby se udržel dostatečný tlak uvnitř cisterny.

4.3.3.4 (Vyhrazeno)

4.3.4 Zvláštní ustanovení pro třídy 1 a 3 až 9

4.3.4.1 Kódování, racionální přiřazování a hierarchie cisteren

4.3.4.1.1 Kódování cisteren

Čtyři části kódů (kódů cisteren) uvedené ve sloupci (12) tabulky A v kapitole 3.2 mají následující význam:

Část	Popis	Kód cisterny
1	Druhy cisterny	L = cisterna pro látky v kapalném stavu (kapaliny nebo tuhé látky podávané k přepravě v roztaveném stavu); S = cisterna pro látky v tuhém stavu (práškovém nebo zrnitém);
2	Výpočtový tlak	G = nejnižší výpočtový tlak podle všeobecných požadavků v 6.8.2.1.14; nebo 1,5; 2,65; 4; 10; 15 nebo 21= nejnižší výpočtový tlak v barech (viz 6.8.2.1.14);
3	Otvory (viz 6.8.2.2.2)	A = cisterna se spodními plnicími a spodními vyprazdňovacími otvory se 2 uzávěry; B = cisterna se spodními plnicími a spodními vyprazdňovacími otvory se 3 uzávěry; C = cisterna s horními plnicími a vyprazdňovacími otvory, jen s čistícími otvory pod hladinou kapaliny; D = cisterna s horními plnicími a vyprazdňovacími otvory, bez jakýchkoliv otvorů pod hladinou kapaliny;
4	Pojistné ventily/ zařízení	V = cisterna s výdechovým zařízením podle 6.8.2.2.6, ale bez zařízení chránící proti prošlehnutí plamene; nebo cisterna, která není odolná proti tlaku vyvolanému výbuchem; F = cisterna s výdechovým zařízením podle 6.8.2.2.6 se zařízením chránícím proti prošlehnutí plamene; nebo cisterna, která je odolná proti tlaku vyvolanému výbuchem; N = cisterna bez výdechového zařízení podle 6.8.2.2.6 a která není hermeticky uzavřena; H = hermeticky uzavřená cisterna (viz 1.2.1).

4.3.4.1.2

Racionální přiřazování kódů cisteren ke skupinám látek a hierarchie cisteren

POZNÁMKA: Některé látky a skupiny látek nejsou uvedeny v tomto racionálním přiřazování, viz 4.3.4.1.3.

Hierarchie cisteren

Cisterny s kódy cisteren odlišnými od kódů uvedených v této tabulce nebo v tabulce A kapitoly 3.2 mohou být též používány, pokud jakákoli část (číslice nebo písmeno) částí 1 až 4 těchto kódů cisteren odpovídá úrovni bezpečnosti nejméně rovnocenné odpovídající části kódu cisterny uvedeného v tabulce A kapitoly 3.2, a to podle následujícího vzestupného pořadí:

Část 1: Typy cisteren

S → L

Část 2: Výpočtový tlak

G → 1,5 → 2,65 → 4 → 10 → 15 → 21 bar

Část 3: Otvory

A → B → C → D

Část 4: Pojistné ventily / zařízení

V → F → N → H

Například

- cisterna s kódem cisterny L10CN je dovolena pro přepravu látky, ke které byl přiřazen kód cisterny L4BN;
- cisterna s kódem cisterny L4BN je dovolena pro přepravu látky, ke které byl přiřazen kód cisterny SGAN.

POZNÁMKA: Hierarchie nebere v úvahu zvláštní ustanovení (viz oddíly 4.3.5 a 6.8.4) pro každou položku.

4.3.4.1.3

Následující látky a skupiny látek, u kterých je ve sloupci (12) tabulky A v kapitole 3.2 uvedeno za kódem cisterny znaménko „(+)“, podléhají zvláštním ustanovením. V tomto případě je dovoleno alternativní použití cisteren pro jiné látky a skupiny látek pouze tehdy, pokud je to uvedeno v osvědčení o schválení typu. Cisterny vyšší hodnoty podle ustanovení na konci tabulky v 4.3.4.1.2 mohou být použity se zřetelem ke zvláštním ustanovením uvedeným ve sloupci (13) tabulky A v kapitole 3.2.

(a) Třída 1

Podtřída 1.5, UN 0331 trhavina, typ B: kód S2,65AN;

(b) Třída 4.1:

UN 2448 síra, roztavená: kód LGBV;

(c) Třída 4.2:

UN 1381 fosfor, bílý nebo žlutý, suchý nebo pod vodou nebo v roztoku a UN 2447 fosfor, bílý, roztavený: kód L10DH;

UN 1402 karbid vápenatý, obalová skupina I: kód S2,65AN;

- (d) Třída 4.3:
- UN 1389 amalgam alkalických kovů; kapalný;
UN 1391 disperze alkalických kovů nebo disperze kovů alkalických zemin;
UN 1392 amalgam kovů alkalických zemin; kapalný;
UN 1415 lithium;
UN 1420 slitiny draslíku, kovové; kapalné;
UN 1421 slitina alkalických kovů, kapalná, j. n.;
UN 1422 slitiny draslíku a sodíku; kapalné;
UN 1428 sodík; a
UN 2257 draslík: kód L10BN;
UN 3401 amalgam alkalických kovů, tuhý;
UN 3402 amalgam kovů alkalických zemin, tuhý;
UN 3404 slitiny draslíku a sodíku, tuhé a UN 3482 disperze alkalických kovů, hořlavá
nebo UN 3482 disperze kovů alkalických zemin, hořlavá;
UN 3404 slitiny draslíku a sodíku, tuhé: kód L10BN;
UN 1407 cesium a
UN 1423 rubidium: kód L10CH;
- (e) Třída 5.1:
- UN 1873 kyselina chloristá, roztok s více než 50 % hmot., ale nejvýše 72 % hmot. čisté kyseliny: kód L4DN;
- UN 2015 peroxid vodíku, vodný roztok, stabilizovaný s více než 70 % peroxidu vodíku: kód L4DV;
- UN 2015 peroxid vodíku, vodný roztok, stabilizovaný s více než 60 %, ale nejvýše 70 % peroxidu vodíku: kód L4BV;
- UN 2014 peroxid vodíku, vodný roztok s nejméně 20 %, ale nejvýše 60 % peroxidu vodíku a UN 3149 peroxid vodíku a kyselina peroctová, směs, stabilizovaná: kód L4BV;
- UN 2426 dusičnan amonný, kapalný, horký koncentrovaný roztok v koncentraci vyšší než 80 %, ale nepřesahující 93 %: kód L4BV;
- UN 3375 dusičnan amonný, emulze, suspenze nebo gel, kapalný: kód LGAV;
- UN 3375 dusičnan amonný, emulze, suspenze nebo gel, tuhý: kód SGAV;
- (f) Třída 5.2:
- UN 3109 peroxid organický, typ F, kapalný a UN 3119 peroxid organický, typ F, kapalný, řízená teplota: kód L4BN;
- UN 3110 peroxid organický, typ F, tuhý a UN 3120 peroxid organický, typ F, tuhý, řízená teplota: kód S4AN;
- (g) Třída 6.1:
- UN 1613 kyanovodík, vodný roztok (kyselina kyanovodíková) a UN 3294 kyanovodík, alkoholický roztok: kód L15DH;
- (h) Třída 7:
- Všechny látky: speciální cisterny;
- Minimální požadavky pro kapaliny: kód L2,65CN; pro tuhé látky: kód S2,65AN;
- Odchylně od všeobecných požadavků tohoto odstavce cisterny používané pro radioaktivní látky mohou být používány také pro přepravu jiných věcí, pokud jsou splněny požadavky pododdílu 5.1.3.2;

(i) Třída 8:

UN 1052 fluorovodík, bezvodý a UN 1790 kyselina fluorovodíková, roztok, obsahující více než 85 % kyseliny fluorovodíkové: kód L21DH;

UN 1744 brom nebo brom, roztok: kód L21DH;

UN 1791 chlornan, roztok a UN 1908 chloritan, roztok: kód L4BV.

4.3.4.1.4 Cisterny určené pro přepravu kapalných odpadů splňující požadavky kapitoly 6.10 a vybavené dvěma uzávěry podle pododdílu 6.10.3.2 musí být přiřazeny ke kódu cisterny L4AH. Pokud jsou tyto cisterny vybaveny pro alternativní přepravu kapalných a tuhých látek, musí být přiřazeny ke kombinovaným kódům cisteren L4AH+S4AH.

4.3.4.2 Všeobecná ustanovení

4.3.4.2.1 V případě nakládky zahřátých látek nesmí teplota na vnějším povrchu cisterny nebo její tepelné izolace během přepravy překročit 70 °C.

4.3.4.2.2 Spojovací potrubí mezi nezávislými, ale navzájem propojenými cisternami dopravní jednotky musí být během přepravy vyprázdněné. Flexibilní plnicí a vyprazdňovací potrubí, které není permanentně připojeno k nádržím, musí být během přepravy vyprázdněné.

4.3.4.2.3 (Vyhrazeno)

4.3.5 Zvláštní ustanovení

Následující zvláštní ustanovení se musí použít, pokud jsou uvedena u příslušné položky ve sloupci (13) tabulky A v kapitole 3.2:

TU1 Cisterny nesmějí být podány k přepravě před úplným ztuhnutím látky a jejím pokrytím inertním plynem. Nevyčištěné prázdné cisterny, které tyto látky obsahovaly, musí být naplněny inertním plynem.

TU2 Látka musí být pokryta inertním plynem. Nevyčištěné prázdné cisterny, které tyto látky obsahovaly, musí být naplněny inertním plynem.

TU3 Vnitřek nádrže a všechny části, které mohou přijít do styku s látkou, musí být udržovány v čistotě. Pro čerpadla, ventily a ostatní zařízení se nesmí používat žádná maziva, která se mohou s látkou nebezpečně slučovat.

TU4 Během přepravy musí být tyto látky pokryty vrstvou inertního plynu, jehož tlak musí činit nejméně 50 kPa (0,5 baru).

Nevyčištěné prázdné cisterny, které obsahovaly tyto látky, musí být při podání k přepravě naplněny inertním plynem o tlaku nejméně 50 kPa (0,5 baru).

TU5 (Vyhrazeno)

TU6 Není dovoleno přepravovat v cisternách, bateriových vozidlech a MEGC, pokud je hodnota LC₅₀ nižší než 200 ppm.

TU7 Materiály používané k utěsnění spojů nebo k údržbě uzávěrů musí být snášetlivé s obsahem.

TU8 Cisterny z hliníkových slitin se nesmějí používat k přepravě, ledaže jsou výlučně vyhrazeny pro takovou přepravu a acetaldehyd neobsahuje kyselinu.

TU9 UN 1203 benzín s tenzí par při 50 °C vyšší než 110 kPa (1,1 baru), ale nejvýše 150 kPa (1,5 baru) smí být přepravován také v cisternách konstruovaných podle 6.8.2.1.14(a) a jejichž výstroj odpovídá 6.8.2.2.6.

TU10 (Vyhrazeno)

- TU11 Během plnění nesmí teplota této látky překročit 60 °C. Nejvyšší plnicí teplota 80 °C je dovolena, pokud se zabrání vzniku doutnajících míst a jsou splněny dále uvedené podmínky. Po ukončení plnění musí být cisterny natlakovány (např. stlačeným vzduchem), aby se zkontrolovala jejich těsnost. Musí se zabezpečit, aby během přepravy nedošlo ke vzniku podtlaku. Před vyprázdněním se musí zkontrolovat, jestli tlak v cisternách je stále vyšší než tlak atmosférický. Pokud tomu tak není, musí se před započítím vyprazdňování do cisteren zavést inertní plyn.
- TU12 Při změně používání musí být z nádrže a výstroje před a po přepravě této látky dokonale vyčištěny všechny zbytky této látky.
- TU13 Cisterny musí být při plnění prosty všech nečistot. Provozní výstroj, jako ventily a vnější potrubí, musí být po naplnění nebo vyprázdnění cisterny vyprázdněny.
- TU14 Ochranné kryty uzávěrů musí být během přepravy uzamčeny.
- TU15 Cisterny se nesmějí použít k přepravě potravin, poživatin a krmiv.
- TU16 Nevyčištěné prázdné cisterny musí být při podání k přepravě:
- buď naplněny dusíkem,
 - nebo naplněny vodou nejméně na 96 % a nejvíce na 98 % svého vnitřního objemu; v době od 1. října do 31. března musí voda obsahovat dostatečné množství ochranného prostředku proti zamrznutí, aby nemohla voda během přepravy zamrznout. Ochranný prostředek proti zamrznutí nesmí mít žádné korozivní účinky a nesmí reagovat s fosforem.
- TU17 Smí se přepravovat jen v bateriových vozidlech nebo MEGC, jejichž články jsou nádoby.
- TU18 Stupeň plnění cisteren musí být stanoven tak, aby při zahřátí obsahu na teplotu, při níž se tenze par rovná otevíracímu tlaku pojistného ventilu, objem kapaliny dosáhl 95 % vnitřního objemu cisterny při této teplotě. Ustanovení 4.3.2.3.4 se nepoužije.
- TU19 Cisterny smějí být naplněny do 98% při plnicí teplotě a tlaku. Ustanovení 4.3.2.3.4 se nepoužije.
- TU20 (Vyhrazeno)
- TU21 Látka musí být v době plnění, je-li použita voda jako ochranný prostředek, pokryta vrstvou nejméně 12 cm vody; stupeň plnění při teplotě 60 °C nesmí překročit 98 %. Je-li použit dusík jako ochranný prostředek, stupeň plnění při teplotě 60 °C nesmí překročit 96 %. Zbýlý prostor musí být naplněn dusíkem tak, aby ani po ochlazení neklesl tlak nikdy pod atmosférický tlak. Cisterna musí být uzavřena tak, aby nemohlo dojít k úniku plynu.
- TU22 Cisterny smějí být plněny nejvýše do 90 % svého vnitřního objemu; při střední teplotě kapaliny 50 °C musí zůstat v nádrži z hlediska bezpečnosti ještě prázdný prostor 5 % pro kapaliny.
- TU23 Stupeň plnění nesmí překročit 0,93 kg na litr vnitřního objemu, plní-li se hmotnostně. Plní-li se objemově, nesmí stupeň plnění překročit 85 %.
- TU24 Stupeň plnění nesmí překročit 0,95 kg na litr vnitřního objemu, plní-li se hmotnostně. Plní-li se objemově, nesmí stupeň plnění překročit 85 %.
- TU25 Stupeň plnění nesmí překročit 1,14 kg na litr vnitřního objemu, plní-li se hmotnostně. Plní-li se objemově, nesmí stupeň plnění překročit 85 %.
- TU26 Stupeň plnění nesmí překročit 85 %.
- TU27 Cisterny smějí být plněny nejvýše do 98 % svého vnitřního objemu.
- TU28 Cisterny smějí být plněny při referenční teplotě 15 °C nejvýše do 95% svého vnitřního objemu.
- TU29 Cisterny smějí být plněny nejvýše do 97 % svého vnitřního objemu a nejvyšší teplota po naplnění nesmí překročit 140 °C.
- TU30 Cisterny musí být plněny podle zkušebního protokolu pro schválení konstrukčního typu cisterny, avšak nejvýše do 90 % svého vnitřního objemu.
- TU31 Cisterny smějí být plněny nejvýše do 1 kg na litr vnitřního objemu.
- TU32 Cisterny smějí být plněny nejvýše do 88 % svého vnitřního objemu.
- TU33 Cisterny smějí být plněny nejméně do 88 % a nejvýše do 92 % svého vnitřního objemu, nebo do 2,86 kg na litr svého vnitřního objemu.
- TU34 Cisterny smějí být plněny nejvýše do 0,84 kg na litr svého vnitřního objemu.

- TU35 Prázdné nevyčištěné nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a cisternové kontejnery, které obsahovaly tyto látky, nepodléhají požadavkům ADR, pokud byla provedena přiměřená opatření k vyloučení jakéhokoli nebezpečí.
- TU36 Stupeň plnění podle pododdílu 4.3.2.2 nesmí při referenční teplotě 15 °C překročit 93 % svého vnitřního objemu.
- TU37 Přeprava v cisternách je omezena na látky obsahující původce nemocí, které nepředstavují vážné nebezpečí a proti kterým, přestože při expozici mohou způsobit vážnou nákazu, jsou k dispozici účinný léčebný postup i preventivní opatření a nebezpečí přenosu nákazy je omezené (tj. mírné nebezpečí pro jednotlivce a malé nebezpečí pro společnost).
- TU38 (Vyhrazeno)
- TU39 Vhodnost látky pro přepravu v cisternách musí být prokázána. Metoda hodnocení vhodnosti musí být schválena příslušným orgánem. Jedna z metod je zkouška 8(d) v sérii zkoušek 8 (viz Příručka zkoušek a kritérií, část 1, pododdíl 18.7).
- Není dovoleno ponechat látky v cisterně po dobu, za kterou by v ní mohly ztvrdnout. Musí být učiněna vhodná opatření, aby se zabránilo usazení a ztuhnutí látek v cisterně (např. vyčištění atd.).
- TU 40 Smějí být přepravovány jen v bateriových vozidlech nebo MEGC, jejichž články jsou tvořeny bezešvými nádobami.
- TU 41 Vhodnost látky pro přepravu v cisternách musí být prokázána ke spokojenosti příslušného orgánu každé země, přes kterou nebo do které je přeprava prováděna.
- Metoda vyhodnocení této vhodnosti musí být schválena příslušným orgánem kterékoli smluvní strany ADR, který může také uznat schválení udělené příslušným orgánem země, která není smluvní stranou ADR, za podmínky, že toto schválení bylo uděleno v souladu s postupy platnými podle ADR, RID, ADN nebo IMDG Code.
- Látkám nesmí být dovoleno zůstat v cisterně po dobu, která by mohla vést k jejich spékání. Musí být učiněna vhodná opatření, aby se zamezilo shromažďování a usazování látek v cisterně (např. čištění).

KAPITOLA 4.4

POUŽÍVÁNÍ NESNÍMATELNÝCH CISTEREN (CISTERNOVÝCH VOZIDEL), SNÍMATELNÝCH CISTEREN, CISTERNOVÝCH KONTEJNERŮ A CISTERNOVÝCH VÝMĚNNÝCH NÁSTAVEB Z VYZTUŽENÝCH PLASTŮ (FRP)

POZNÁMKA: Pro přemístitelné cisterny a UN MEGC viz kapitola 4.2; pro nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby s nádržemi vyrobenými z kovových materiálů, bateriová vozidla a vícečláňkové kontejnery na plyn (MEGC), jiné než UN MEGC, viz kapitola 4.3; pro kontejnery pro podtlakové vyčerpávání odpadů viz kapitola 4.5.

4.4.1 Všeobecná ustanovení

Převaha nebezpečných látek v cisternách z vyztužených plastů (FRP) je povolena, pouze pokud jsou splněny následující podmínky:

- (a) látky jsou zařazeny ve třídě 3, 5.1, 6.1, 6.2, 8 nebo 9;
- (b) nejvyšší tenze par (absolutní tlak) při 50 °C látky nepřevyšuje 110 kPa (1.1 baru);
- (c) přeprava látky v kovových cisternách je povolena podle 4.3.2.1.1;
- (d) výpočtový tlak stanovený pro tuto látku v části 2 kódu cisterny uvedeného ve sloupci (12) tabulky A v kapitole 3.2 nepřevyšuje 4 bary (viz též 4.3.4.1.1), a
- (e) cisterna odpovídá ustanovením kapitoly 6.9 vztahujícím se na přepravu dané látky.

4.4.2 Provoz

4.4.2.1 Ustanovení 4.3.2.1.5 až 4.3.2.2.4, 4.3.2.3.3 až 4.3.2.3.6, 4.3.2.4.1, 4.3.2.4.2 a 4.3.4.1 a 4.3.4.2 musí být splněna.

4.4.2.2 Teplota přepravované látky nesmí v době plnění převýšit nejvyšší provozní teplotu uvedenou na štítku cisterny, který je uveden v oddílu 6.9.6.

4.4.2.3 Pokud platí pro přepravu v kovových cisternách, platí také zvláštní ustanovení (TU) oddílu 4.3.5 uvedená ve sloupci (13) tabulky A v kapitole 3.2.

KAPITOLA 4.5

POUŽÍVÁNÍ CISTEREN PRO PODTLAKOVÉ VYČERPÁVÁNÍ ODPADŮ

POZNÁMKA: Pro přemístitelné cisterny a UN MEGC viz kapitola 4.2; pro nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby s nádržími vyrobenými z kovových materiálů, bateriová vozidla a vícečlánkové kontejnery na plyn (MEGC), jiné než UN MEGC, viz kapitola 4.3; pro cisterny z vyztužených plastů viz kapitola 4.4.

4.5.1 Používání

4.5.1.1 Odpady tvořené látkami tříd 3, 4.1, 5.1, 6.1, 6.2, 8 a 9 mohou být přepravovány v cisternách pro podtlakové vyčerpávání odpadů odpovídajících kapitole 6.10, pokud jejich přeprava v nesnímatelných cisternách, snímatelných cisternách, cisternových kontejnerech a cisternových výměnných nástavbách je povolena podle kapitoly 4.3. Odpady sestávající z látek přiřazených kódu cisterny L4BH ve sloupci (12) tabulky A kapitoly 3.2 nebo jinému kódu cisterny dovolenému podle hierarchie uvedené v 4.3.4.1.2 smějí být přepravovány v cisternách pro podtlakové odčerpávání odpadů s písmenem „A“ nebo „B“ ve třetí části kódu cisterny, který je uveden v bodu 9.5 osvědčení o schválení vozidla odpovídajícího vzoru v 9.1.3.5.

4.5.1.2 Jiné látky než odpady smějí být přepravovány v cisternách pro podtlakové vyčerpávání odpadů za stejných podmínek, jaké jsou uvedeny v 4.5.1.1.

4.5.2 Provoz

4.5.2.1 Ustanovení kapitoly 4.3, kromě ustanovení uvedených v 4.3.2.2.4 a 4.3.2.3.3, se vztahují na přepravu v cisternách pro podtlakové odčerpávání odpadů a jsou doplněna ustanoveními pododdílů 4.5.2.2 až 4.5.2.6 uvedených níže.

4.5.2.2 Pro přepravu kapalin, které svým bodem vzplanutí odpovídají kritériím třídy 3, musí být cisterny pro podtlakové vyčerpávání odpadů plněny plnicím zařízením, které vyúsťuje v cisterně na její spodní úrovni. Musí být učiněna opatření, aby bylo minimalizováno rozstřikování.

4.5.2.3 Při vyprazdňování hořlavých kapalin s bodem vzplanutí nižším než 23°C tlakem vzduchu je nejvyšší dovolený tlak 100 kPa (1 bar).

4.5.2.4 Použití cisteren vybavených vnitřním pístem fungujícím jako stěna komory je dovoleno pouze tehdy, pokud látky na kterékoli straně stěny (pístu) nereagují nebezpečně navzájem jedna s druhou (viz 4.3.2.3.6).

4.5.2.5 (Vyhrazeno)

4.5.2.6 Je-li k plnění nebo vyprazdňování hořlavých kapalin používána vakuová čerpací nebo odsávací jednotka, která může poskytnout zápalný zdroj, musí být učiněna opatření, aby se zamezilo vznícení látky nebo aby se zamezilo šíření účinků vznícení mimo vlastní cisternu.

KAPITOLA 4.6

(Vyhrazeno)

KAPITOLA 4.7

POUŽÍVÁNÍ MOBILNÍCH JEDNOTEK PŘIPRAVUJÍCÍCH VÝBUŠNINY (MEMU)

POZNÁMKA 1: Pro kusy viz kapitola 4.1; pro přemístitelné cisterny viz kapitola 4.2; pro nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby s nádržemi vyrobenými z kovových materiálů viz kapitola 4.3; pro cisterny z vyztužených plastů viz kapitola 4.4; pro cisterny pro podtlakové vyčerpávání odpadů viz kapitola 4.5.

POZNÁMKA 2: Pro požadavky na konstrukci, výstroj, schválení typu, zkoušky a značení viz kapitoly 6.7, 6.8, 6.9, 6.11 a 6.12.

4.7.1 Používání

4.7.1.1 Látky tříd 3, 5.1, 6.1 a 8 mohou být přepravovány v MEMU odpovídajících kapitole 6.12, v přemístitelných cisternách, pokud jejich přeprava je povolena podle kapitoly 4.2; nebo ve snímatelných cisternách, cisternových kontejnerech nebo cisternových výměnných nástavbách, pokud jejich přeprava je povolena podle kapitoly 4.3; nebo v cisternách z vyztužených plastů, pokud jejich přeprava je povolena podle kapitoly 4.4; nebo v kontejnerech pro volně ložené látky, pokud jejich přeprava je povolena podle kapitoly 7.3.

4.7.1.2 Výbušné látky nebo předměty třídy 1 podléhající schválení příslušného orgánu (viz 7.5.5.2.3) mohou být přepravovány v kusech, ve zvláštních komorách odpovídajících oddílu 6.12.5, pokud obal je dovolen podle kapitoly 4.1 a jejich přeprava je povolena podle kapitoly 7.2 a 7.5.

4.7.2 Provoz

4.7.2.1 Následující ustanovení se vztahují na provoz cisteren podle kapitoly 6.12:

- (a) Pro cisterny s vnitřním objemem 1 000 litrů nebo větším, ustanovení kapitoly 4.2, kapitoly 4.3, kromě 4.3.1.4, 4.3.2.3.1, 4.3.3 a 4.3.4, nebo kapitoly 4.4 se vztahují na přepravu v MEMU, a jsou doplněna níže uvedenými ustanoveními 4.7.2.2, 4.7.2.3 a 4.7.2.4.
- (b) Pro cisterny s vnitřním objemem menším než 1 000 litrů, ustanovení kapitoly 4.2, kapitoly 4.3, kromě 4.3.1.4, 4.3.2.1, 4.3.2.3.1, 4.3.3 a 4.3.4, nebo kapitoly 4.4 se vztahují na přepravu v MEMU, a jsou doplněny níže uvedenými ustanoveními 4.7.2.2, 4.7.2.3 a 4.7.2.4.

4.7.2.2 Tloušťka stěn nádrže během celé doby jejího používání se nesmí snížit pod nejmenší hodnotu předepsanou v příslušných konstrukčních předpisech.

4.7.2.3 Ohebné vypouštěcí potrubí, stabilně připojené nebo nepřipojené, a výsypky musí být během přepravy prázdné bez směsných nebo znečištěných výbušných látek.

4.7.2.4 Pokud jsou použitelná pro přepravu v cisternách, musí se též použít zvláštní ustanovení (TU) 4.3.5 uvedená ve sloupci (13) tabulky A kapitoly 3.2.

4.7.2.5 Dopravce musí zajistit, že zámky uvedené v 9.8.9 jsou během přepravy používány.

ČÁST 5

POSTUPY PŘI ODESÍLÁNÍ

KAPITOLA 5.1

VŠEOBECNÁ USTANOVENÍ

5.1.1 Rozsah použití a všeobecná ustanovení

Tato část obsahuje ustanovení pro odesílání nebezpečných věcí týkající se nápisů, bezpečnostních značek a dokladů a případně povolení pro odeslání a předběžné oznámení.

5.1.2 Použití přepravních obalových souborů

5.1.2.1

(a) Přepravní obalový soubor musí být:

- (i) označen nápisem „PŘEPRAVNÍ OBALOVÝ SOUBOR“; a
- (ii) označen UN číslem s předřazenými písmeny „UN“, jak je vyžadováno pro kusy v 5.2.1.1 a 5.2.1.2, opatřen bezpečnostními značkami, jak je vyžadováno pro kusy v 5.2.2, a označen značkou pro látky ohrožující životní prostředí, jak je vyžadováno pro kusy v 5.2.1.8, pro každou položku nebezpečných věcí obsaženou v přepravním obalovém souboru;

ledaže jsou UN čísla, bezpečnostní značky a značka pro látky ohrožující životní prostředí, charakterizující všechny nebezpečné věci obsažené v přepravním obalovém souboru, zvnějšku viditelné, s výjimkou požadavků uvedených v 5.2.2.1.11. Je-li pro různé kusy vyžadováno stejné UN číslo, stejná bezpečnostní značka nebo značka pro látky ohrožující životní prostředí, může být umístěno (umístěna) na přepravním obalovém souboru pouze jednou.

Výška písmen nápisu „PŘEPRAVNÍ OBALOVÝ SOUBOR“ musí být alespoň 12 mm. Nápis „PŘEPRAVNÍ OBALOVÝ SOUBOR“ musí být snadno viditelný a čitelný, musí být v úředním jazyce země původu a také, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud případné dohody uzavřené mezi státy dotčenými přepravou nestanoví jinak.

- (b) Orientační šipky znázorněné v 5.2.1.9 musí být umístěny na dvou protilehlých stranách přepravního obalového souboru obsahujícího kusy, které musí být označeny v souladu s 5.2.1.9, pokud označení nezůstane viditelné.

5.1.2.2

Každý kus s nebezpečnými věcmi uložený v přepravním obalovém souboru musí odpovídat všem relevantním ustanovením ADR. Předpokládaná funkce každého kusu nesmí být negativně ovlivněna přepravním obalovým souborem.

5.1.2.3

Každý kus, který je opatřen orientačními šípkami předepsanými v pododdíle 5.2.1.9 a který je uložen do přepravního obalového souboru nebo do velkého obalu, musí být orientován v souladu s tímto označením.

5.1.2.4

Zákaz společné nakládky se vztahuje též na tyto přepravní obalové soubory.

5.1.3 Prázdné nevyčištěné obaly (včetně IBC a velkých obalů), cisterny, MEMU, vozidla a kontejnery pro přepravu ve volně loženém stavu

5.1.3.1

Prázdné nevyčištěné obaly (včetně IBC a velkých obalů), cisterny (včetně cisternových vozidel, bateriových vozidel, snímatelných cisteren, přemístitelných cisteren, cisternových kontejnerů, MEGC, MEMU), vozidla a kontejnery pro přepravu ve volně loženém stavu, které obsahovaly nebezpečné látky jiných tříd než třídy 7, musí být označeny nápisy a bezpečnostními značkami, jako by byly plné.

POZNÁMKA: O dokladech viz kapitola 5.4.

5.1.3.2

Kontejnery, cisterny, IBC, včetně ostatních obalů a přepravních obalových souborů, používané pro přepravu radioaktivních látek nesmějí být používány pro skladování nebo přepravu jiných

věci, ledaže by byly dekontaminovány pod úroveň 0,4 Bq/cm² pro beta a gama zářiče, jakož i pro nízkotoxické alfa zářiče a pod úroveň 0,04 Bq/cm² pro všechny ostatní alfa zářiče.

5.1.4 Společné balení

Pokud jsou dvě nebo více nebezpečných věcí zabaleny do téhož vnějšího obalu, musí být tento kus opatřen nápisem a bezpečnostní značkou předepsanou pro každou látku nebo předmět. Jestliže je pro různé věci požadována stejná bezpečnostní značka, může být použita pouze jedna.

5.1.5. Všeobecná ustanovení pro třídu 7

5.1.5.1 Povolení pro odeslání a oznamování

5.1.5.1.1 Všeobecně

Kromě schválení konstrukcí kusu popsaného v kapitole 6.4 vyžaduje se též za určitých okolností vícestranné schválení (5.1.5.1.2 a 5.1.5.1.3). Za některých okolností je též nezbytné informovat příslušné orgány o odeslání (5.1.5.1.4).

5.1.5.1.2 Povolení odeslání

Vícestranné povolení se vyžaduje pro:

- (a) odeslání kusů typu B(M), které nesplňují požadavky uvedené v pododdílu 6.4.7.5 nebo jsou konstruovány tak, že dovolují řízené občasné odvětrávání;
- (b) odeslání kusů typu B(M) obsahujících radioaktivní látku, jejíž aktivita je větší než 3000 A₁ nebo 3000 A₂, případně 1000 TBq, podle toho, která hodnota je nižší; a
- (c) odeslání kusů obsahujících štěpné látky, jestliže součet indexů kritické bezpečnosti kusů v jednom voze nebo kontejneru překročí 50;

s výjimkou toho, že příslušný orgán může povolit přepravu do svého státu nebo přes svůj stát bez schválení odeslání podle zvláštního ustanovení v jeho schválení konstrukce (viz 5.1.5.2.1).

5.1.5.1.3 Povolení odeslání podle zvláštního ujednání

Příslušný orgán může schválit ustanovení, podle kterých může být zásilka nesplňující všechny příslušné požadavky ADR přepravena podle zvláštního ujednání (viz 1.7.4).

5.1.5.1.4 Oznamování

Oznámení příslušným orgánům se vyžaduje v následujících případech:

- (a) Před prvním odesláním každého kusu, které vyžaduje povolení příslušného orgánu, musí odesílatel zajistit, aby kopie každého vhodného osvědčení příslušného orgánu, která se týkají konstrukce kusu, byla předložena příslušnému orgánu země původu zásilky a příslušnému orgánu každého státu, kterým nebo do kterého má být zásilka přepravována. Odesílatel nemusí vyčkat na potvrzení příslušného orgánu, ani příslušný orgán není povinen vydat potvrzení o příjmu osvědčení;
- (b) Při každém z následujících typů odeslání:
 - (i) kusů typu C obsahujících radioaktivní látku s aktivitou větší než 3000 A₁ nebo popřípadě 3000 A₂, nebo 1000 TBq, podle toho, která hodnota je nižší;
 - (ii) kusů typu B(U) obsahujících radioaktivní látku s aktivitou větší než 3000 A₁ nebo popřípadě 3000 A₂, nebo 1000 TBq podle toho, která hodnota je nižší;
 - (iii) kusů typu B(M);
 - (iv) odeslání podle zvláštního ujednání;

Odesílatel musí zaslat oznámení příslušnému orgánu země původu zásilky a příslušnému orgánu každého státu, do kterého nebo kterým se má zásilka přepravovat. Toto oznámení musí dostat každý příslušný orgán před začátkem odeslání zásilky a podle možností 7 dnů předem;

- (c) Odesílatel nemusí odeslat samostatné oznámení, pokud požadované informace jsou uvedeny v žádosti o povolení odeslání;

- (d) Oznámení o odeslání zásilky musí obsahovat:
- (i) dostatečné údaje umožňující identifikaci kusu nebo kusů, včetně všech vhodných čísel osvědčení a identifikačních značek;
 - (ii) údaje o datu odeslání, předpokládaném datu příjezdu a navrhované trase;
 - (iii) pojmenování radioaktivní(ch) látky(ek) nebo nuklidu(ů);
 - (iv) popisy fyzikálního a chemického stavu radioaktivní látky nebo údaje, že se jedná o radioaktivní látku zvláštní formy nebo o málo rozpustitelnou radioaktivní látku; a
 - (v) nejvyšší aktivitu radioaktivního obsahu během přepravy vyjádřenou v becquerelech (Bq) s příslušným symbolem předpony SI (viz 1.2.2.1). U štěpných látek smí být místo aktivity udána hmotnost štěpných látek (nebo každého štěpného nuklidu pro směsi, pokud je to náležité) v gramech (g) nebo jejich násobku.

5.1.5.2 Osvědčení vydávaná příslušným orgánem

5.1.5.2.1 Osvědčení vydávaná příslušným orgánem se vyžadují pro:

- (a) Konstrukce pro:
- (i) radioaktivní látky zvláštní formy;
 - (ii) málo rozpustitelné radioaktivní látky;
 - (iii) štěpné látky vyřáté podle 2.2.7.2.3.5 (f);
 - (iv) kusy obsahující 0,1 kg nebo více hexafluoridu uranu;
 - (v) kusy obsahující štěpné látky, pokud nejsou vyřaty podle pododdílu 2.2.7.2.3.5, 6.4.11.2 nebo 6.4.11.3;
 - (vi) kusy typu B(U) a kusy typu B(M);
 - (vii) kusy typu C;
- (b) Zvláštní ujednání;
- (c) Určitá odeslání (viz 5.1.5.1.2),
- (d) Stanovení základní hodnoty aktivity radionuklidu uvedených v 2.2.7.2.2.1 pro jednotlivé radionuklidy, které nejsou uvedeny v tabulce 2.2.7.2.2.1 (viz 2.2.7.2.2.2 (a));
- (e) Jiné limity aktivity pro vyjmuté zásilky přístrojů nebo výrobků (viz 2.2.7.2.2.2 (b)).

Osvědčení musí potvrzovat, že příslušné požadavky jsou splněny a že pro schválení konstrukce byla konstrukci přidělena identifikační značka.

Osvědčení o schválení konstrukce kusu a osvědčení o povolení odeslání mohou být spojena do jednoho osvědčení.

Osvědčení a žádosti o tato osvědčení musí být v souladu s požadavky uvedenými v oddílu 6.4.23.

5.1.5.2.2 Odesílatel musí vlastnit kopii každého příslušného osvědčení.

5.1.5.2.3 Pro konstrukci kusu, u které není vyžadováno, aby příslušný orgán vydal osvědčení o schválení, musí odesílatel na požádání předložit příslušnému orgánu, ke kontrole dokumentární evidenci o souladu konstrukce kusu se všemi příslušnými požadavky.

5.1.5.3 Určení přepravního indexu (TI) a indexu kritické bezpečnosti (CSI)

5.1.5.3.1 Přepravní index (TI) pro kus, přepravní obalový soubor nebo kontejner, nebo pro nezabalenou látku LSA-I nebo nezabalený předmět SCO-I je číslo, které se určí tímto postupem:

- (a) Zjistí se nejvyšší dávková intenzita v jednotkách milisiervty za hodinu (mSv/h) ve vzdálenosti 1 m od vnějších povrchů kusu, přepravního obalového souboru, kontejneru, nebo nezabalených látek LSA-I a předmětů SCO-I. Takto zjištěná hodnota se vynásobí 100 a výsledné číslo je přepravní index. U uranových a thoriových rud a jejich koncentrátů smějí být vzaty následující hodnoty pro nejvyšší dávkovou intenzitu v každém bodě vzdáleném 1 m od vnějšího povrchu nákladu:

0,4 mSv/h pro rudy a fyzikální koncentráty uranu a thoria;

0,3 mSv/h pro chemické koncentráty thoria;

0,02 mSv/h pro chemické koncentráty uranu, kromě hexafluoridu uranu;

- (b) Pro cisterny, kontejnery a nezabalené látky LSA-I a předměty SCO-I musí být hodnota zjištěná v kroku podle (a) výše vynásobena multiplikačním faktorem z tabulky 5.1.5.3.1;
- (c) Hodnota zjištěná v krocích podle (a) a (b) výše se zaokrouhuje nahoru na první desetinné místo (např. z 1,13 bude 1,2), s výjimkou toho, že hodnota 0,05 nebo nižší smí být považována za nulu.

Tabulka 5.1.5.3.1: Multiplikační faktory pro cisterny, kontejnery a nebalené LSA-I a SCO-I

Velikost nákladu ^a	Multiplikační faktor
velikost nákladu $\leq 1 \text{ m}^2$	1
$1 \text{ m}^2 < \text{velikost nákladu} \leq 5 \text{ m}^2$	2
$5 \text{ m}^2 < \text{velikost nákladu} \leq 20 \text{ m}^2$	3
$20 \text{ m}^2 < \text{velikost nákladu}$	10

^a největší naměřená plocha příčného průřezu nákladu

- 5.1.5.3.2** Převážní index pro každý přepravní obalový soubor, každý kontejner nebo každé vozidlo se určí buď součtem přepravních indexů všech obsažených kusů, nebo přímým měřením dávkové intenzity, kromě případu netuhých přepravních obalových souborů, pro které musí být přepravní index určen pouze součtem přepravních indexů všech kusů.
- 5.1.5.3.3** Index kritické bezpečnosti (CSI) pro každý přepravní obalový soubor nebo kontejner se určí jako součet CSI všech obsažených kusů. Stejný postup se musí použít pro určení celkového součtu CSI v zásilce nebo ve vozidle.
- 5.1.5.3.4** Kusy, přepravní obalové soubory nebo kontejnery musí být zařazeny do jedné z kategorií I-BÍLÁ, II-ŽLUTÁ nebo III-ŽLUTÁ v souladu s podmínkami stanovenými v tabulce 5.1.5.3.4 a podle následujících ustanovení:
- (a) Při určení příslušné kategorie pro kus, přepravní obalový soubor nebo kontejner musí být zohledněn jak přepravní index, tak dávková intenzita na povrchu. Splňuje-li přepravní index podmínky pro jednu kategorii, ale dávková intenzita na povrchu podmínky pro jinou kategorii, potom se kus, přepravní obalový soubor nebo kontejner zařadí do vyšší kategorie. Pro tento účel se nahlíží na kategorii I-BÍLÁ jako na nejnižší kategorii;
- (b) Přepravní index se určuje postupy stanovenými v odstavcích 5.1.5.3.1 a 5.1.5.3.2;
- (c) Je-li dávková intenzita na povrchu větší než 2 mSv/h, musí být kus nebo přepravní obalový soubor přepravován za vylučného použití a podle ustanovení oddílu 7.5.11, CV33 (1.3) a (3.5) (a);
- (d) Je-li kus přepravován na základě zvláštního ujednání, musí být zařazen do kategorie III-ŽLUTÁ, podle ustanovení uvedených v 5.1.5.3.5;
- (e) Přepravní obalový soubor nebo kontejner, který obsahuje kusy přepravované na základě zvláštního ujednání, musí být zařazen do kategorie III-ŽLUTÁ, podle ustanovení uvedených v 5.1.5.3.5.

Tabulka 5.1.5.3.4 Kategorie kusů a přepravních obalových souborů

Podmínky		Kategorie
Přepravní index	Nejvyšší dávková intenzita v kterémkoli bodě vnějšího povrchu	
0 ^a	nejvýše 0,005 mSv/h	I-BÍLÁ
více než 0, avšak nejvýše 1 ^a	více než 0,005 mSv/h, avšak nejvýše 0,5 mSv/h	II-ŽLUTÁ
více než 1, avšak nejvýše 10	více než 0,5 mSv/h, avšak nejvýše 2 mSv/h	III-ŽLUTÁ
více než 10	více než 2 mSv/h, avšak nejvýše 10 mSv/h	III-ŽLUTÁ ^b

^a *Není-li naměřený přepravní index větší než 0,05, smí být jeho hodnota v souladu s 5.1.5.3.1 (c) zaokrouhlена na nulu.*

^b *Musí být přepravován také za vylučného použití.*

5.1.5.3.5 Ve všech případech mezinárodní přepravy kusů vyžadujících schválení konstrukčního vzoru kusu nebo odeslání příslušným orgánem, pro něž se používají v různých zemích, jichž se přeprava týká, různé druhy schválení, musí být kategorizace v souladu s osvědčením země původu konstrukčního vzoru kusu.

5.1.5.4 Zvláštní ustanovení pro vyjmuté kusy s radioaktivními látkami třídy 7

5.1.5.4.1 Vyjmuté kusy s radioaktivními látkami třídy 7 musí být na vnější straně obalu čitelně a trvanlivě označeny těmito údaji:

- (a) UN číslem s předřazenými písmeny „UN“;
- (b) identifikací buď odesilatele, nebo příjemce, nebo obou; a
- (c) povolenou hrubou (brutto) hmotností, jestliže překračuje 50 kg.

5.1.5.4.2 Požadavky na dokumentaci kapitoly 5.4 se na vyjmuté kusy s radioaktivními látkami třídy 7 nevztahují, kromě toho, že:

- (a) UN číslo s předřazenými písmeny „UN“ a jméno a adresa odesilatele a příjemce a, pokud je to vhodné, také identifikační značka každého schvalovacího osvědčení příslušného orgánu (viz 5.4.1.2.5.1 (g)), musí být uvedeno na přepravním dokladu jako je nákladní list, letecký nákladní list nebo nákladní list CMR nebo CIM;
- (b) pokud je to náležité, platí požadavky pododdílů 5.4.1.2.5.1 (g), 5.4.1.2.5.3 a 5.4.1.2.5.4;
- (c) platí požadavky oddílů 5.4.2 a 5.4.4.

5.1.5.4.3 Pokud je to náležité, platí požadavky pododdílů 5.2.1.7.8 a 5.2.2.1.11.5.

5.1.5.5 Přehled požadavků na schválení a oznámení před odesláním

POZNÁMKA 1: Před prvním odesláním každého kusu vyžadujícího schválení konstrukce příslušným orgánem musí odesílatel zajistit, aby kopie schvalovacího osvědčení této konstrukce byla zaslána příslušnému orgánu každého dotyčného státu, jímž bude přeprava probíhat (viz 5.1.5.1.4 (a)).

POZNÁMKA 2: Oznámení se vyžaduje, pokud obsah převyšuje $3 \times 10^3 A_1$ nebo $3 \times 10^3 A_2$ nebo 1000 TBq (viz 5.1.5.1.4 (b)).

POZNÁMKA 3: Vícestranné schválení odeslání se vyžaduje, pokud obsah převyšuje $3 \times 10^3 A_1$ nebo $3 \times 10^3 A_2$ nebo 1000 TBq nebo jestliže je povoleno občasné řízené odvětrání (viz 5.1.5.1).

POZNÁMKA 4: Viz ustanovení o schválení a oznámení před odesláním vhodného kusu pro přepravu této látky.

^c Konstrukce kusů pro štěpné látky mohou též vyžadovat schválení podle jednoho z jiných předmětů tabulky.

^d Pro odeslání se však mohou vyžadovat schválení podle jednoho z jiných předmětů tabulky.

KAPITOLA 5.2

NÁPISY A BEZPEČNOSTNÍ ZNAČKY

5.2.1 Značení kusů

POZNÁMKA: Pro značení s ohledem na konstrukci, zkoušení a schvalování obalů, velkých obalů, nádob na plyn a IBC, viz část 6.

5.2.1.1 Pokud není v ADR jinak předepsáno, musí být každý kus zřetelně a trvanlivě označen UN číslem odpovídajícím obsaženým nebezpečným věcem, kterému jsou předřazena písmena "UN". UN číslo a písmena „UN“ musí být nejméně 12 mm vysoká, s výjimkou kusů o vnitřním objemu nejvýše 30 litrů nebo 30kg nejvyšší čisté (netto) hmotnosti a pro láhve nejvýše 60 litrů hydraulického vnitřního objemu, kdy musí být nejméně 6 mm vysoká, a s výjimkou kusů velikosti nejvýše 5 litrů nebo 5 kg, kdy musí být přiměřené velikosti. U nezabalených předmětů musí být označení umístěno na předmět, na jeho podstavec nebo na jeho manipulační, úložné nebo spouštěcí zařízení.

5.2.1.2 Všechna označení kusů požadovaná touto kapitolou musí být:

- (a) být zřetelně viditelná a čitelná;
- (b) odolná vůči vlivu povětrnosti bez podstatného zhoršení jejich čitelnosti.

5.2.1.3 Záchranné obaly a záchranné tlakové nádoby musí být kromě toho opatřeny slovem "ZÁCHRANNÝ". Výška písmen slova „ZÁCHRANNÝ“ musí být alespoň 12 mm.

5.2.1.4 Velké nádoby pro volně ložené látky (IBC) s vnitřním objemem větším než 450 litrů a velké obaly musí být označeny na dvou protilehlých stranách.

5.2.1.5 **Dodatečná ustanovení pro věci třídy 1**

Kusy s věcmi třídy 1 musí být kromě toho označeny oficiálním pojmenováním pro přepravu podle oddílu 3.1.2. Toto označení musí být dobře čitelné a nesmazatelné a musí být uvedeno v úředním jazyce země odeslání, a pokud tento jazyk není angličtina, francouzština nebo němčina, ještě v angličtině nebo francouzštině nebo němčině, pokud jiné dohody uzavřené mezi dotýcnými státy nestanoví jinak.

5.2.1.6 **Dodatečná ustanovení pro věci třídy 2**

Opakovaně plnitelné nádoby musí být opatřeny následujícími zřetelně čitelnými a trvanlivými údaji:

- (a) UN číslo a oficiální pojmenování pro přepravu plynu nebo směsi plynů, jak jsou uvedeny v oddílu 3.1.2.
U plynů přiřazených pod J.N. položku musí být dodatečně k UN číslu uveden pouze technický název¹.
U směsí plynů není třeba udávat více než dva komponenty, které představují největší nebezpečí;
- (b) u stlačených plynů plněných hmotnostně a u zkapalněných plynů buď nejvyšší dovolená hmotnost plnění a vlastní hmotnost nádoby, včetně výbavy a příslušenství upevněných v době plnění, nebo celková (brutto) hmotnost;
- (c) datum (rok) příští periodické inspekce.

¹ Namísto technického názvu je povoleno použít jedno z následujících pojmenování:

- Pro UN 1078 plyn jako chladicí prostředek, j.n.: směs F1, směs F2, směs F3;
- Pro UN 1060 methylacetylen a propadien, směsí, stabilizované: směs P1, směs P2;
- Pro UN 1965 uhlovodíky plynné, směs, zkapalněná, j.n.: směs A nebo butan, směs A01 nebo butan, směs A02 nebo butan, směs A0 nebo butan, směs A1, směs B1, směs B2, směs B, směs C nebo propan.
- Pro UN číslo 1010 butadieny, stabilizované: 1,2-butadien, stabilizovaný, 1,3-butadien, stabilizovaný.

Toto označení může být buď vyraženo, nebo uvedeno na trvanlivém štítku nebo bezpečnostní značce upevněných na nádobě nebo uvedeno nalepeným a zřetelně čitelným nápisem, např. vytištěným nebo provedeným jiným rovnocenným způsobem.

POZNÁMKA 1: Viz také 6.2.2.7.

POZNÁMKA 2: Pro nádoby pro jedno použití, viz 6.2.2.8.

5.2.1.7 Ustanovení o zvláštním značení pro radioaktivní látky

5.2.1.7.1 Každý kus musí být označen na vnější straně obalu čitelně a trvale identifikací buď odesilatele, nebo příjemce nebo obou. Každý přepravní obalový soubor musí být na vnější straně čitelně a trvanlivě označen identifikací buď odesilatele nebo příjemce nebo obou, pokud označení každého kusu z přepravního obalového souboru nezůstanou jasně viditelná.

5.2.1.7.2 Kromě vyjmutých kusů musí být každý kus na vnější straně obalu označen čitelně a trvale UN číslem s předřazenými písmeny "UN" a oficiálním pojmenováním pro přepravu. Označení vyjmutých kusů musí být odpovídat označení vyžadovanému podle 5.1.5.4.1.

5.2.1.7.3 Každý kus s celkovou (brutto) hmotností větší než 50 kg musí mít na vnější straně obalu čitelně a trvale uvedenu dovolenou celkovou (brutto) hmotnost.

5.2.1.7.4 Každý kus, který odpovídá

- (a) konstrukci kusu typu IP-1, kusu typu IP-2 nebo kusu typu IP-3, musí být na vnější straně obalu označen čitelně a trvale nápisem "TYP IP-1", "TYP IP-2" nebo případně "TYP IP-3";
- (b) konstrukci kusu typu A, musí být na vnější straně kusu čitelně a trvale označen nápisem "TYP A";
- (c) konstrukci kusu typu IP-2, kusu typu IP-3 nebo kusu typu A, musí být na vnější straně obalu označen čitelně a trvanlivě mezinárodním registračním kódem vozidla (VRI Code)² země původu konstrukčního vzoru kusu a buď jménem výrobce, nebo jinou identifikací obalu stanovenou příslušným orgánem země původu konstrukčního vzoru kusu.

5.2.1.7.5 Každý obal, který odpovídá konstrukci schválené podle jednoho nebo více pododdílů 1.6.6.2.1, 5.1.5.2.1, 6.4.22.1 až 6.4.22.4 a 6.4.23.4 až 6.4.23.7, musí být na vnější straně obalu čitelně a trvale označen následujícími údaji:

- (a) identifikační značkou přidělenou konstrukci příslušným orgánem;
- (b) sériovým číslem jednoznačně identifikujícím každý obal, který odpovídá této konstrukci;
- (c) V případě konstrukce kusu typu B(U), B(M) nebo typu C, údajem „TYP B(U)“, „TYP B(M)“ nebo „TYP C“.

5.2.1.7.6 Každý kus, který odpovídá konstrukci kusu typu B(U), typu B(M) nebo typu C, musí být označen na vnější straně nejzevnější nádoby odolné vůči ohni a vodě vyrytím, vyražením nebo jiným způsobem odolným vůči ohni a vodě trojlístkovým symbolem uvedeným na obrázku níže.

² Rozlišovací značka pro motorová vozidla v mezinárodním provozu předepsaná Úmluvou o silničním provozu (Videň, 1968).

Základní symbol trojlístku s rozměry
vycházejícími ze střední kružnice o poloměru X.
Nejmenší dovolený rozměr X musí být 4 mm.

- 5.2.1.7.7** Jestliže jsou látky LSA-I nebo SCO-I obsaženy v nádobách nebo obalových materiálech a jsou přepravovány za výlučného použití dovoleného podle 4.1.9.2.4, vnější povrch těchto nádob nebo obalových materiálů smí být opatřen označením "RADIOAKTIVNÍ LSA-I" nebo "RADIOAKTIVNÍ SCO-I".
- 5.2.1.7.8** Ve všech případech mezinárodní přepravy kusů vyžadující schválení konstrukčního vzoru kusu nebo povolení odeslání příslušným orgánem, pro které se užívají různé typy schválení nebo povolení v různých zemích, jichž se přeprava týká, musí být označení v souladu s osvědčením země původu konstrukčního vzoru kusu.
- 5.2.1.8 Ustanovení o zvláštním označení pro látky ohrožující životní prostředí**
- 5.2.1.8.1** Kusy obsahující látky ohrožující životní prostředí splňující kritéria uvedená v 2.2.9.1.10 musí být trvanlivě označeny značkou pro látky ohrožující životní prostředí vyobrazenou v 5.2.1.8.3, s výjimkou samostatných obalů a skupinových obalů, pokud takové samostatné obaly nebo vnitřní obaly takových skupinových obalů mají:
- množství nejvýše 5 litrů pro kapaliny, nebo
 - čistou hmotnost nejvýše 5 kg pro tuhé látky.
- 5.2.1.8.2** Značka pro látky ohrožující životní prostředí musí být umístěna v bezprostřední blízkosti označení vyžadovaného podle 5.2.1.1. Požadavky uvedené v 5.2.1.2 a 5.2.1.4 musí být splněny.

5.2.1.8.3 Značka pro látky ohrožující životní prostředí musí odpovídat Obrázku 5.2.1.8.3

Obrázek 5.2.1.8.3

Značka pro látky ohrožující životní prostředí

Značka musí mít tvar čtverce postaveného na vrchol pod úhlem 45° (tvar diamantu). Symbol (ryba a strom) musí být černý na bílém nebo vhodném kontrastním podkladu. Minimální rozměry musí být 100 x 100 mm a minimální šířka čáry tvořící diamant musí být 2 mm. Jestliže to vyžaduje velikost kusu, rozměry/tloušťka čáry mohou být zmenšeny, pokud označení zůstane jasně viditelné. Tam, kde nejsou udány rozměry, musí všechny prvky proporčně odpovídat uvedenému obrázku.

POZNÁMKA: Ustanovení o označování bezpečnostními značkami v 5.2.2 platí dodatečně k jakémukoli požadavku na označení kusů značkou pro látky ohrožující životní prostředí.

5.2.1.9 Orientační šipky

5.2.1.9.1 S výjimkou ustanovení v 5.2.1.9.2:

- skupinové obaly s vnitřními obaly obsahujícími kapaliny;
- samostatné obaly opatřené odvětrávacími otvory; a
- kryogenní nádoby určené k přepravě hluboce zchlazených zkapalněných plynů,

musí být zřetelně označeny orientačními šípkami, které jsou podobné vyobrazením uvedeným níže nebo které odpovídají specifikacím v normě ISO 780:1997. Orientační šipky musí být umístěny na dvou protilehlých svislých stranách kusu se šípkami směřujícími správně směrem nahoru. Musí být pravoúhlé a velikosti, která je zřetelně viditelná s ohledem na velikost kusu. Vyznačení pravoúhlého orámování kolem šipek je nepovinné.

Obrázek 5.2.1.9.1.1

Obrázek 5.2.1.9.1.2

nebo

Dvě černé nebo červené šipky na bílém nebo vhodném kontrastním podkladu.

Pravoúhlé orámování není povinné.

Všechny prvky musí být v přibližné proporci k uvedenému obrázku.

- 5.2.1.9.2** Orientační šipky se nevyžadují:
- (a) na vnějších obalech obsahujících tlakové nádoby, s výjimkou kryogenních nádob;
 - (b) na vnějších obalech obsahujících nebezpečné věci ve vnitřních obalech, z nichž každý obsahuje nejvýše 120 ml, s dostatečným množstvím absorpčního materiálu mezi vnitřními a vnějšími obaly, aby zcela pohltil kapalný obsah;
 - (c) na vnějších obalech obsahujících infekční látky třídy 6.2 v primárních nádobách, z nichž každá obsahuje nejvýše 50 ml;
 - (d) na kusech typu IP-2, IP-3, Typu A, Typu B(U), Typu B(M) nebo Typu C obsahujících radioaktivní látky třídy 7;
 - (e) na vnějších obalech obsahujících předměty, které jsou těsné v každé poloze (např. alkohol nebo rtuť v teploměrech, aerosoly atd.); nebo
 - (f) na vnějších obalech obsahujících nebezpečné věci v hermeticky uzavřených vnitřních obalech, z nichž každý obsahuje nejvýše 500 ml.

5.2.1.9.3 Orientační šipky pro jiné účely než pro udání správné orientace kusu nesmějí být na kuse označeném podle tohoto pododdílu použity.

5.2.2 Označování kusů

5.2.2.1 *Ustanovení o označování bezpečnostními značkami*

5.2.2.1.1 Pro každý předmět nebo látku uvedené v tabulce A kapitoly 3.2 musí být pro označení použity bezpečnostní značky uvedené ve sloupci (5), pokud není stanoveno jinak zvláštním ustanovením uvedeným ve sloupci (6).

5.2.2.1.2 Místo bezpečnostních značek mohou být použita nesmazatelná označení nebezpečí odpovídající přesně předepsaným vzorům bezpečnostních značek.

**5.2.2.1.3 až
5.2.2.1.5**

(Vyhrazeno)

5.2.2.1.6 S výhradou ustanovení uvedených v 5.2.2.1.2, musí být všechny bezpečnostní značky:

- (a) umístěny na tentýž povrch kusu, pokud to dovolují rozměry kusu; u kusů třídy 1 nebo 7 musí být v blízkosti oficiálního pojmenování pro přepravu;
- (b) umístěny na kusu tak, aby je nezakrývala nebo nezastiňovala jiná část nebo příslušenství obalu nebo jiná bezpečnostní značka nebo nápis;
- (c) umístěny přímo jedna vedle druhé, pokud se vyžaduje více než jedna bezpečnostní značka.

Jestliže je kus nepravidelného tvaru nebo je malých rozměrů, takže bezpečnostní značka nemůže být umístěna uspokojivým způsobem, může být bezpečnostní značka bezpečně připevněna např. provázkem nebo jiným vhodným prostředkem.

5.2.2.1.7 Velké nádoby pro volně ložené látky (IBC) s vnitřním objemem větším než 450 litrů a velké obaly musí být opatřeny bezpečnostními značkami na dvou protilehlých stranách.

5.2.2.1.8 *(Vyhrazeno)*

5.2.2.1.9 *Zvláštní ustanovení pro označování samovolně se rozkládajících látek a organických peroxidů bezpečnostními značkami*

- (a) Bezpečnostní značka podle vzoru č. 4.1 také ukazuje, že produkt může být hořlavý a proto se nevyžaduje žádná bezpečnostní značka podle vzoru č. 3. Kromě toho musí být použita bezpečnostní značka podle vzoru č. 1 pro samovolně se rozkládající látky typu B, ledaže příslušný orgán povolil nepoužití této bezpečnostní značky vzhledem ke

zvláštnímu obalu, protože zkušební výsledky prokázaly, že samovolně se rozkládající látka v takovém obalu nevykazuje výbušnou vlastnost.

- (b) Bezpečnostní značka podle vzoru č. 5.2 ukazuje také, že produkt může být hořlavý a proto se nevyžaduje žádná bezpečnostní značka podle vzoru č. 3. Kromě toho se musí použít následující bezpečnostní značky:
- (i) Bezpečnostní značka podle vzoru č. 1 pro organické peroxidy typu B, ledaže příslušný orgán povolil nepoužití této bezpečnostní značky vzhledem ke zvláštnímu obalu, protože zkušební výsledky prokázaly, že organický peroxid v takovém obalu nevykazuje výbušnou vlastnost.
 - (ii) Bezpečnostní značka podle vzoru č. 8 se vyžaduje, pokud jsou splněna kritéria pro obalovou skupinu I nebo II třídy 8.

Bezpečnostní značky, které musí být použity pro jmenovitě uvedené samovolně se rozkládající látky a organické peroxidy, jsou uvedeny v seznamu v pododdílu 2.2.41.4, popřípadě 2.2.52.4.

5.2.2.1.10 *Zvláštní ustanovení pro označování kusů obsahujících infekční látky bezpečnostními značkami*

Kromě bezpečnostní značky podle vzoru č. 6.2 musí být kusy obsahující infekční látky označeny jakoukoli jinou požadovanou bezpečnostní značkou podle povahy jejich obsahu.

5.2.2.1.11 *Zvláštní ustanovení pro označování kusů obsahujících radioaktivní látky bezpečnostními značkami*

5.2.2.1.11.1 S výjimkou případů, kdy jsou použity zvětšené bezpečnostní značky podle 5.3.1.1.3, každý kus, přepravní obalový soubor a kontejner obsahující radioaktivní látku, musí být opatřen bezpečnostními značkami odpovídajícími vzorům č. 7A, 7B a 7C podle příslušné kategorie. Bezpečnostní značky musí být umístěny vně na dvě protilehlé strany kusu nebo přepravního obalového souboru nebo na všechny čtyři strany kontejneru nebo cisterny. Bezpečnostní značky musí být umístěny vně na dvě protilehlé strany kusu nebo na všechny čtyři strany kontejneru. Kromě toho každý kus, přepravní obalový soubor a kontejner obsahující štěpnou látku, jinou než štěpnou látku vyňatou podle ustanovení 2.2.7.2.3.5, musí být opatřeny navíc bezpečnostními značkami v souladu se vzorem č. 7E; pokud je potřebné, musí být tyto bezpečnostní značky umístěny bezprostředně vedle bezpečnostních značek pro radioaktivní látky. Bezpečnostní značky nesmějí zakrývat označení uvedená v oddílu 5.2.1. Všechny bezpečnostní značky, musí být tyto bezpečnostní značky umístěny bezprostředně vedle bezpečnostních značek odpovídajících použitelnému vzoru č. 7A, 7B nebo 7C.

5.2.2.1.11.2 Každá bezpečnostní značka podle použitelného vzoru č. 7A, 7B nebo 7C musí být doplněna následujícími údaji:

- (a) *Obsah:*
- (i) Kromě látek LSA-I oficiální pojmenování radionuklidu(ů) převzatých z tabulky 2.2.7.2.2.1 s použitím symbolů v ní předepsaných. Pro směsi radionuklidů musí být uvedeny nuklidy s nejomezenější hodnotou, pokud to dovoluje místo v řádku. Za oficiálním pojmenováním radionuklidu(ů) musí být uvedena skupina LSA nebo SCO. Pro tento účel se musí použít označení "LSA-II", "LSA-III", "SCO-I" a "SCO-II".
 - (ii) Pro látky LSA-I je nezbytné jen označení "LSA-I"; oficiální pojmenování radionuklidu není nutné.
- (b) *Aktivita:* Maximální aktivita radioaktivního obsahu během přepravy vyjádřená v becquerelech (Bq) s příslušným symbolem SI předpony (viz 1.2.2.1). U štěpných látek může být udána místo aktivity celková hmotnost štěpných nuklidů v gramech (g) nebo jejich násobcích.
- (c) U přepravních obalových souborů a kontejnerů musí být údaje "Obsah" a "Aktivita" požadované v odstavcích (a) a (b) výše uvedeny na bezpečnostní značce, přičemž celkový obsah přepravního obalového souboru nebo kontejneru se počítá, výjimkou jsou bezpečnostní značky pro přepravní obalové soubory a kontejnery obsahující smíšené náklady kusů s různými radionuklidy, jejichž údaje mohou znít "Viz přepravní doklady".
- (d) *Přepravní index:* viz číslo určené podle 5.1.5.3.1 a 5.1.5.3.2 (pro kategorii I-BILÁ se nevyžaduje žádný přepravní index).

- 5.2.2.1.11.3 Každá bezpečnostní značka podle vzoru č. 7E musí být doplněna kritickým bezpečnostním indexem (CSI), jak je uvedeno v osvědčení o schválení platného ve státech přes které nebo do kterých je zásilka přepravovaná vydaného příslušným orgánem nebo jak je uvedeno v 6.4.11.2 nebo 6.4.11.3.
- 5.2.2.1.11.4 U přepravního obalového souboru a kontejneru musí být na bezpečnostní značce č. 7E uveden součet kritických bezpečnostních indexů všech kusů obsažených uvnitř.
- 5.2.2.1.11.5 Ve všech případech mezinárodní přepravy kusů vyžadující schválení konstrukčního vzoru kusu nebo povolení odeslání příslušným orgánem, pro které se užívají různé typy schválení nebo povolení v různých zemích, jichž se přeprava týká, musí být označení bezpečnostními značkami v souladu s osvědčením země původu konstrukčního vzoru kusu.

5.2.2.2 Ustanovení o bezpečnostních značkách

- 5.2.2.2.1 Bezpečnostní značky musí splňovat dále uvedená ustanovení a odpovídat barvami, symboly a tvarem vzorům uvedeným v 5.2.2.2.2. Odpovídající vzory vyžadované pro jiné druhy dopravy, s menšími modifikacemi, které neovlivňují zřejmý význam bezpečnostní značky, jsou také dovoleny.

POZNAMKA: V určitých případech jsou bezpečnostní značky v odstavci 5.2.2.2.2 znázorněny s vytečkovaným vnějším orámováním dle odstavce 5.2.2.1.1. Toto se nevyžaduje, je-li bezpečnostní značka umístěna na podkladu v kontrastní barvě.

- 5.2.2.2.1.1 Bezpečnostní značky musí odpovídat Obrázku 5.2.2.2.1.1

Obrázek 5.2.2.2.1.1

Bezpečnostní značka pro označování kusů

- * V dolním rohu musí být uvedeno číslo třídy nebo, pro třídy 4.1, 4.2 a 4.3 číslice „4“, nebo pro třídy 6.1 a 6.2 číslice „6“
- ** V dolní polovině musí být (pokud je to povinné) nebo smí být (pokud je to nepovinné) uveden dodatečný text/číslo/písmena.
- *** V horní polovině musí být uveden symbol třídy nebo pro podtřídy 1.4, 1.5 a 1.6 číslo podtřídy a pro vzor č. 7E nápis „FISSILE“

- 5.2.2.2.1.1.1 Bezpečnostní značky musí být umístěny na podkladu v kontrastní barvě nebo musí být orámovány buď vytečkovanou, nebo plnou čarou.
- 5.2.2.2.1.1.2 Bezpečnostní značka musí mít tvar čtverce postaveného na vrchol pod úhlem 45° (tvar diamantu). Minimální rozměry musí být 100 x 100 mm a minimální šířka vnitřní čáry tvořící diamant musí být 2 mm. Vnitřní okraj značky musí být rovnoběžný s vnějším okrajem a musí od něj být vzdálen 5 mm. V horní polovině bezpečnostní značky musí mít vnitřní čára stejnou barvu jako symbol a v dolní polovině musí mít stejnou barvu jako číslo třídy nebo podtřídy v dolním rohu. Tam, kde nejsou udány rozměry, musí všechny prvky proporčně odpovídat uvedenému obrázku.

- 5.2.2.2.1.1.3 Jestliže to vyžaduje velikost kusu, smí být rozměry bezpečnostní značky zmenšeny, pokud zůstanou symboly a další prvky bezpečnostní značky zřetelně viditelné. Vnitřní čára značky musí zůstat vzdálena 5 mm od vnějšího okraje. Minimální šířka vnitřní čáry tvořící diamant musí být 2 mm. Rozměry bezpečnostních značek pro tlakové nádoby musí být v souladu s pododdílem 5.2.2.2.1.2.
- 5.2.2.2.1.2 Láhve pro třídu 2 mohou být vzhledem ke svému tvaru, pozici a fixačním systémům pro přepravu, opatřeny bezpečnostními značkami představujícími smysl bezpečnostních značek uvedených v tomto oddílu a značkami pro látky ohrožující životní prostředí, je-li to náležité, jejichž rozměry byly zmenšeny podle rozměrů uvedených v mezinárodní normě ISO 7225:2005 "Gas cylinders - Precautionary labels" (Plynové lahve - Výstražné bezpečnostní značky), aby mohly být umístěny na necylindrickou část takových lahví (hrdla).
- Nehledě na ustanovení v 5.2.2.1.6 se bezpečnostní značky a značka pro látky ohrožující životní prostředí (viz 5.2.1.8.3) mohou překrývat v rozsahu stanoveném normou ISO 7225:2005. Avšak ve všech případech bezpečnostní značka hlavního nebezpečí a číslice uvedené na jakékoli bezpečnostní značce musí zůstat plně viditelné a symboly rozeznatelné.
- Prázdné nevyčištěné tlakové nádoby pro plyny třídy 2 mohou být přepravovány se zastaralými nebo poškozenými bezpečnostními značkami za účelem nového naplnění, popřípadě prohlídky a umístění nové bezpečnostní značky v souladu s platnými předpisy, nebo likvidace tlakové nádoby.
- 5.2.2.2.1.3 S výjimkou bezpečnostních značek pro podtřídy 1.4, 1.5 a 1.6 třídy 1 musí horní polovina bezpečnostní značky obsahovat obrazový symbol a dolní polovina musí obsahovat:
- (a) pro třídy 1, 2, 3, 5.1, 5.2, 7, 8 a 9 číslo třídy;
 - (b) pro třídy 4.1, 4.2 a 4.3 číslici „4“;
 - (c) pro třídy 6.1 a 6.2 číslici „6“.
- Bezpečnostní značky smějí obsahovat text, jako je UN číslo nebo slova popisující nebezpečí (např. „flammable“) podle 5.2.2.2.1.5, pokud tento text nezakrývá nebo nesnižuje význam jiných informací, které musí být na bezpečnostní značce.
- 5.2.2.2.1.4 Kromě toho musí být na bezpečnostních značkách pro třídu 1, s výjimkou podtříd 1.4, 1.5 a 1.6, uvedeno v jejich dolní polovině, nad číslem třídy, číslo podtřídy a písmeno skupiny snášenlivosti pro látku nebo předmět. Na bezpečnostních značkách pro podtřídy 1.4, 1.5 a 1.6 musí být v jejich horní polovině uvedeno číslo podtřídy a v dolní polovině číslo třídy a písmeno skupiny snášenlivosti.
- 5.2.2.2.1.5 Na bezpečnostních značkách, s výjimkou bezpečnostních značek pro třídu 7, uvedení jakéhokoli případného textu (jiného než číslo třídy) v prostoru pod symbolem musí být omezeno na údaje o povaze nebezpečí a o bezpečnostních opatřeních při manipulaci.
- 5.2.2.2.1.6 Symboly, text a čísla musí být dobře čitelné a nesmazatelné a na všech bezpečnostních značkách musí být uvedeny v černé barvě kromě:
- (a) bezpečnostní značky třídy 8, na které jsou eventuelní text a číslo uvedeny v barvě bílé;
 - (b) bezpečnostních značek se zeleným, červeným nebo modrým podkladem, na kterých symboly, text a čísla mohou být uvedeny v barvě bílé.
 - (c) bezpečnostní značky třídy 5.2, na které smí být symbol v bílé barvě; a
 - (d) bezpečnostní značky podle vzoru č. 2.1 umístěné na lahve a malé nádoby obsahující plyny UN čísel 1011, 1075, 1965 a 1978, kde mohou být uvedeny na podkladové barvě nádoby, jestliže je zajištěn jejich dostatečný kontrast.
- 5.2.2.2.1.7 Všechny bezpečnostní značky musí být schopné odolat povětrnostním účinkům bez podstatného snížení jejich čitelnosti.

5.2.2.2.2 Vzory bezpečnostních značek

NEBEZPEČÍ TŘÍDY 1**Výbušné látky a předměty**

(č. 1)

Podtřídy 1.1, 1.2 a 1.3

Symbol (vybuchující puma): černý;
podklad: oranžový; číslice "1" v dolním rohu

(č. 1.4)

Podtřída 1.4

Podklad: oranžový; číslice: černé; výška číslic musí být asi 30 mm a tloušťka čáry asi 5 mm
(u bezpečnostní značky o rozměrech 100 mm x 100 mm); číslice "1" v dolním rohu

(č. 1.5)

Podtřída 1.5

(č. 1.6)

Podtřída 1.6

** Údaj podtřídy – neudává se, je-li výbušnost vedlejším nebezpečím

* Údaj skupiny snášenlivosti – neudává se, je-li výbušnost vedlejším nebezpečím

NEBEZPEČÍ TŘÍDY 2**Plyny**

(č. 2.1)

Hořlavé plyny

Symbol (plamen): černý nebo bílý;
(kromě provedení podle 5.2.2.2.1.6(d))
podklad: červený; číslice "2" v dolním rohu

(č. 2.2)

Nehořlavé, netoxické plyny

Symbol (plynová lahev): černý nebo bílý;
podklad: zelený; číslice "2" v dolním rohu**NEBEZPEČÍ TŘÍDY 3****Hořlavé kapaliny**

(č. 2.3)

Toxické plyny

Symbol (lebka na zkřížených kostech): černý;
podklad: bílý; číslice "2" v dolním rohu

(č. 3)

Symbol (plamen): černý nebo bílý;
podklad: červený; číslice "3" v dolním rohu

NEBEZPEČÍ TŘÍDY 4.1

Hořlavé tuhé látky, samovolně se rozkládající látky a znečištěné tuhé výbušné látky

(č. 4.1)
Symbol (plamen): černý;
podklad: bílý se sedmi svislými
červenými pruhy;
číslice "4" v dolním rohu

NEBEZPEČÍ TŘÍDY 4.2

Samozápalné látky

(č. 4.2)
Symbol (plamen): černý;
podklad: horní polovina bílá a dolní
polovina červená;
číslice "4" v dolním rohu

NEBEZPEČÍ TŘÍDY 4.3

Látky, které ve styku s vodou vyvíjejí hořlavé plyny

(č. 4.3)
Symbol (plamen): černý nebo bílý;
podklad: modrý;
číslice "4" v dolním rohu

NEBEZPEČÍ TŘÍDY 5.1

Látky podporující hoření

(č. 5.1)
Symbol (plamen nad kruhem): černý;
podklad: žlutý;
číslice "5.1" v dolním rohu

NEBEZPEČÍ TŘÍDY 5.2

Organické peroxidy

(č. 5.2)
Symbol (plamen): černý nebo bílý;
podklad: horní polovina červená; dolní polovina žlutá;
číslice "5.2" v dolním rohu

NEBEZPEČÍ TŘÍDY 6.1

Toxické látky

(č. 6.1)
Symbol (lebka na zkřížených kostech): černý;
podklad: bílý; číslice "6" v dolním rohu

NEBEZPEČÍ TŘÍDY 6.2

Infekční látky

(č. 6.2)
V dolní polovině bezpečnostní značky mohou být uvedeny nápisy: "INFEKČNÍ LÁTKA"
a "Při poškození nebo úniku uvědomte neprodleně veřejné zdravotnické orgány";
Symbol (kruh, který je překryt třemi srpky měsíce) a údaje: černé;
podklad: bílý; číslice "6" v dolním rohu

NEBEZPEČÍ TŘÍDY 7

Radioaktivní látky

(č. 7A)
Kategorie I – BÍLÁ
Symbol záření (trojlístek): černý;
podklad: bílý;
text (předepsaný) : černý v dolní polovině bezpečnostní značky:
"RADIOACTIVE"
"CONTENTS ..."
"ACTIVITY ...";
za výrazem "RADIOACTIVE" následuje svislý červený pruh;
číslice "7" v dolním rohu

(č. 7B)
Kategorie II – ŽLUTÁ
Symbol záření (trojlístek): černý;
podklad: horní polovina žlutá s bílým okrajem, dolní polovina bílá;
text (předepsaný): černý v dolní polovině bezpečnostní značky:
"RADIOACTIVE"
"CONTENTS ..."
"ACTIVITY ...";
v černě orámovaném poli: "TRANSPORT INDEX"
za výrazem "RADIOACTIVE" následují dva svislé červené pruhy;
číslice "7" v dolním rohu

(č. 7C)
Kategorie III - ŽLUTÁ

(č. 7E)
Štěpné látky třídy 7
Podklad bílý;
text (předepsaný) : černá v horní polovině bezpečnostní značky: "FISSILE";
v černě orámovaném poli v doní polovině bezpečnostní značky:
"CRITICALITY SAFETY INDEX";
číslice «7» v dolním rohu

NEBEZPEČÍ TŘÍDY 8

Žiravé látky

(č. 8)
Symbol (kapky padající z jedné zkumavky na kov a z druhé zkumavky na ruku): černý;
Podklad: horní polovina: bílá; dolní polovina: černá s bílým okrajem;
číslice "8" v dolním rohu

NEBEZPEČÍ TŘÍDY 9

Jiné nebezpečné látky a předměty

(č. 9)
Symbol (sedm svislých pruhů v horní polovině): černý; podklad: bílý;
podtržená číslice "9" v dolním rohu

KAPITOLA 5.3

OZNAČOVÁNÍ KONTEJNERŮ, MEGC, MEMU, CISTERNOVÝCH KONTEJNERŮ, PŘEMÍSTITELNÝCH CISTEREN A VOZIDEL VELKÝMI BEZPEČNOSTNÍMI ZNAČKAMI, ORANŽOVÝMI TABULKAMI A NÁPISY

POZNÁMKA: *K označování kontejnerů MEGC, cisternových kontejnerů a přemístitelných cisteren nápisy a velkými bezpečnostními značkami pro přepravu v přepravním řetězci zahrnujícím námořní dopravu viz též 1.1.4.2.1. Jestliže se použijí ustanovení 1.1.4.2.1 (c), smí se použít pouze ustanovení 5.3.1.3 a 5.3.2.1.1 této kapitoly.*

5.3.1 Označování velkými bezpečnostními značkami

5.3.1.1 Všeobecná ustanovení

5.3.1.1.1 Pokud to vyžadují ustanovení tohoto oddílu, musí být velké bezpečnostní značky umístěny na vnější povrch kontejnerů, MEGC, MEMU, cisternových kontejnerů, přemístitelných cisteren a vozidel. Velké bezpečnostní značky musí odpovídat bezpečnostním značkám požadovaným ve sloupci (5) a popřípadě sloupci (6) tabulky A kapitoly 3.2 pro nebezpečné věci obsažené v kontejneru, MEGC, MEMU, cisternovém kontejneru, přemístitelné cisterně nebo vozidle a současně odpovídat specifikacím uvedeným v pododdílu 5.3.1.7. Velké bezpečnostní značky musí být umístěny na podkladu v kontrastní barvě, nebo musí být ohraničeny buď vytečkovanou, nebo plnou čarou.

5.3.1.1.2 Pro třídu 1 nemusí být na velkých bezpečnostních značkách uvedeny skupiny snášenlivosti, pokud vozidlo, kontejner nebo zvláštní komory MEMU přepravují látky nebo předměty spadající do dvou nebo více skupin snášenlivosti. Vozidla, kontejnery nebo zvláštní komory MEMU přepravující látky nebo předměty různých podtříd musí být označeny pouze velkými bezpečnostními značkami odpovídajícími vzoru nejnebezpečnější podtřídy v tomto pořadí:

1.1 (nejnebezpečnější), 1.5, 1.2, 1.3, 1.6, 1.4 (nejméně nebezpečné).

Jsou-li látky klasifikačního kódu 1.5 D přepravovány s látkami nebo předměty podtřídy 1.2, musí být dopravní jednotka nebo kontejner označeny velkou bezpečnostní značkou pro podtřídu 1.1.

Velké bezpečnostní značky se nevyžadují pro přepravu výbušných látek a předmětů podtřídy 1.4, skupiny snášenlivosti S.

5.3.1.1.3 Pro třídu 7 musí velká bezpečnostní značka pro hlavní nebezpečí odpovídat vzoru č. 7 D popsanému v 5.3.1.7.2. Tato velká bezpečnostní značka se nevyžaduje pro vozidla nebo kontejnery přepravující vyjmuté kusy a pro malé kontejnery.

Pokud je předepsáno pro třídu 7 umístění jak bezpečnostních značek, tak také velkých bezpečnostních značek na vozidla, kontejnery, MEGC, cisternové kontejnery nebo přemístitelné cisterny, mohou být označeny zvětšenou bezpečnostní značkou odpovídající požadované bezpečnostní značce podle vzoru č. 7A, 7B nebo 7C namísto velké bezpečnostní značky podle vzoru č. 7D, aby se splnily oba účely. V tomto případě nesmí být rozměry menší než 250 x 250 mm.

5.3.1.1.4 Kontejnery, MEGC, MEMU, cisternové kontejnery, přemístitelné cisterny nebo vozidla, které přepravují věci více tříd, nemusí být opatřeny velkou bezpečnostní značkou pro vedlejší nebezpečí, jestliže nebezpečí označené touto velkou bezpečnostní značkou je již uvedeno velkou bezpečnostní značkou pro hlavní nebo vedlejší nebezpečí.

5.3.1.1.5 Velké bezpečnostní značky, která se nevztahují na přepravované nebezpečné věci nebo jejich zbytky, musí být odstraněny nebo zakryty.

5.3.1.1.6 Jsou-li velké bezpečnostní značky připevněny na sklopných panelech, musí být konstruovány a zajištěny tak, aby se nemohly rozevřít nebo se uvolnit z držáku během přepravy (zejména jako výsledek rázů nebo neúmyslných činností).

5.3.1.2 Umístění velkých bezpečnostních značek na kontejnery, MEGC, cisternové kontejnery a přemístitelné cisterny

POZNÁMKA: Tento pododdíl se nevztahuje na výměnné nástavby, kromě cisternových výměnných nástaveb nebo výměnných nástaveb přepravovaných v kombinované železniční/silniční dopravě.

Velké bezpečnostní značky se umísťují na obě podélné strany a na každý konec kontejneru, MEGC, cisternového kontejneru nebo přemístitelné cisterny.

Vícekomorový cisternový kontejner nebo vícekomorová přemístitelná cisterna, kterými se přepravují dvě nebo více nebezpečných látek, musí být opatřeny příslušnými velkými bezpečnostními značkami na obou bočních stranách příslušných komor a na obou koncích velkou bezpečnostní značkou každého vzoru, jímž jsou opatřeny jednotlivé komory na bocích.

5.3.1.3 Umístění velkých bezpečnostních značek na vozidla přepravující kontejnery, MEGC, cisternové kontejnery a přemístitelné cisterny

POZNÁMKA: Tento pododdíl se nevztahuje na umístění velkých bezpečnostních značek na vozidla přepravující výměnné nástavby, jiné než cisternové výměnné nástavby nebo výměnné nástavby přepravované v kombinované železniční/silniční dopravě; pro taková vozidla viz 5.3.1.5.

Pokud velké bezpečnostní značky umístěné na kontejnerech, MEGC, cisternových kontejnerech nebo na přemístitelných cisternách nejsou viditelné zvnějšku je přepravujících vozidel, tytéž velké bezpečnostní značky musí být umístěny na obou bočních stranách a na zadní straně vozidla. Jinak nemusí být na nosném vozidle žádná velká bezpečnostní značka.

5.3.1.4 Umístění velkých bezpečnostních značek na vozidla pro přepravu ve volně loženém stavu, na cisternová vozidla, bateriová vozidla, MEMU a vozidla se snímatelnými cisternami

5.3.1.4.1 Velké bezpečnostní značky musí být umístěny na obou bočních stranách a na zadní straně vozidla.

Vícekomorové cisternové vozidlo nebo vícekomorová snímatelná cisterna přepravovaná na vozidle, kterými se přepravují dvě nebo více nebezpečných látek, musí být opatřeny příslušnými velkými bezpečnostními značkami na každé straně příslušné komory a na zadní straně velkou bezpečnostní značkou každého vzoru, jímž jsou opatřeny jednotlivé komory na bocích. Avšak v případě, že všechny komory musí být označeny stejnými velkými bezpečnostními značkami, tyto velké bezpečnostní značky mohou být umístěny pouze po jedné na každé boční straně a na zadní straně vozidla.

Pokud je požadováno více než jedna velká bezpečnostní značka na jednu a tutéž komoru, musí být tyto velké bezpečnostní značky umístěny bezprostředně vedle sebe.

POZNÁMKA: Pokud je v průběhu přepravy podléhající ADR nebo po jejím ukončení cisternový návěs odpojen od svého tahače pro naložení na námořní nebo říční plavidlo, velké bezpečnostní značky musí být umístěny též na přední straně návěsu.

5.3.1.4.2 MEMU s cisternami a kontejnery pro volně ložené látky musí být opatřeny velkými bezpečnostními značkami podle 5.3.1.4.1 pro látky, které obsahují. Pro cisterny o vnitřním objemu menším než 1 000 litrů směji být velké bezpečnostní značky nahrazeny bezpečnostními značkami podle 5.2.2.2.

5.3.1.4.3 Na MEMU přepravujících kusy obsahující látky nebo předměty třídy 1 (kromě podtřídy 1.4, skupiny snášenlivosti S) musí být velké bezpečnostní značky umístěny na obou bočních stranách a na zadní straně MEMU.

Zvláštní komory pro výbušniny musí být označeny velkými bezpečnostními značkami podle ustanovení v 5.3.1.1.2. Poslední věta v 5.3.1.1.2 se nepoužije.

5.3.1.5 **Umístění velkých bezpečnostních značek na vozidla přepravující pouze kusy**

POZNÁMKA: Tento pododdíl se vztahuje též na vozidla přepravující výměnné nástavby obsahující kusy, s výjimkou kombinované dopravy železnice/silnice; ke kombinované dopravě železnice/silnice viz 5.3.1.2 a 5.3.1.3.

5.3.1.5.1 Na vozidlech přepravujících kusy obsahující látky nebo předměty třídy 1 (jiné než látky nebo předměty podtřídy 1.4, skupiny snášenlivosti S) musí být velké bezpečnostní značky umístěny na obou bočních stranách a na zadní straně vozidla.

5.3.1.5.2 Na vozidlech přepravujících radioaktivní látky třídy 7 v kusech nebo IBC (kromě vyjmutých kusů) musí být velké bezpečnostní značky umístěny na obou bočních stranách a na zadní straně vozidla.

5.3.1.6 **Umístění velkých bezpečnostních značek na prázdná cisternová vozidla, bateriová vozidla, MEGC, MEMU, cisternové kontejnery, přemístitelné cisterny a prázdná vozidla a kontejnery pro přepravu ve volně loženém stavu**

5.3.1.6.1 Cisternová vozidla, vozidla se snímatelnými cisternami, bateriová vozidla, MEGC, MEMU, cisternové kontejnery a přemístitelné cisterny, vesměs prázdné, nevyčištěné a neodplyněné, jakož i vozidla a kontejnery pro přepravu ve volně loženém stavu, prázdné a nevyčištěné, musí být označena(y) velkými bezpečnostními značkami vyžadovanými pro předchozí náklad.

5.3.1.7 **Specifikace velkých bezpečnostních značek**

5.3.1.7.1 Kromě velké bezpečnostní značky pro třídu 7 specifikované v 5.3.1.7.2 a značky pro látky ohrožující životní prostředí specifikované v 5.3.6.2, musí velká bezpečnostní značka odpovídat Obrázku 5.3.1.7.1.

Obrázek 5.3.1.7.1.

Velká bezpečnostní značka (kromě třídy 7)

Velká bezpečnostní značka musí mít tvar čtverce postaveného na vrchol pod úhlem 45° (tvar diamantu). Minimální rozměry musí být 250 x 250 mm (k okrajům značky). Vnitřní okraj značky musí být rovnoběžný s vnějším okrajem a musí od něj být vzdálen 12,5 mm. Symbol a vnitřní čáry musí odpovídat barvě bezpečnostní značky pro příslušnou nebezpečnou látku. Symbol/číslice třídy nebo podtřídy musí být umístěny a dimenzovány v rozměrech dle 5.2.2.2 pro odpovídající třídu nebo podtřídu příslušných nebezpečných věcí. Na bezpečnostní značce musí být číslo třídy nebo podtřídy (a pro věci třídy 1, písmeno skupiny snášenlivosti) příslušných nebezpečných věcí způsobem předepsaným v 5.2.2.2 pro odpovídající bezpečnostní značku, s velikostí písma ne menším než 25 mm. Tam, kde nejsou udány rozměry, musí všechny prvky proporčně odpovídat uvedenému obrázku.

5.3.1.7.2

Velká bezpečnostní značka pro třídu 7 nesmí být menší než 250 mm x 250 mm a černá čára, která probíhá paralelně s okraji uvnitř, musí být od okraje ve vzdálenosti 5 mm; jinak musí velká bezpečnostní značka odpovídat níže uvedenému vyobrazení (vzor č. 7D). Číslice „7“ musí mít výšku nejméně 25 mm. Podkladová barva horní poloviny velké bezpečnostní značky musí být žlutá a spodní polovina bílá, barva trojlístku a nápisu musí být černá. Použití výrazu „RADIOACTIVE“ ve spodní polovině je dobrovolné, aby bylo možno použít toto místo k uvedení příslušného UN čísla zásilky.

Velká bezpečnostní značka pro radioaktivní látky třídy 7

(Vzor 7 D)

Symbol (trojlístek): černý; podklad: horní polovina žlutá s bílým okrajem, spodní polovina bílá;

Ve spodní polovině musí být uvedeno slovo „RADIOACTIVE“ nebo alternativně, příslušné UN číslo, a číslice „7“ v dolním rohu.

5.3.1.7.3

Pro cisterny s vnitřním objemem nejvýše 3 m³ a malé kontejnery mohou být velké bezpečnostní značky nahrazeny bezpečnostními značkami odpovídajícími pododdílu 5.2.2.2. Nejsou-li tyto bezpečnostní značky zvnějšku nosného vozidla viditelné, musí být na obou bočních stranách a na zadní straně vozidla umístěny také velké bezpečnostní značky podle 5.3.1.7.1.

5.3.1.7.4

Pro třídy 1 a 7, jestliže rozměry a konstrukce vozidla jsou takové, že disponibilní plocha povrchu je nedostačující pro umístění předepsaných velkých bezpečnostních značek, jejich rozměry mohou být zmenšeny až na 100 mm na každé straně.

5.3.2 Označování oranžovými tabulkami

5.3.2.1 Všeobecná ustanovení pro označování oranžovými tabulkami

5.3.2.1.1 Dopravní jednotky přepravující nebezpečné věci musí být opatřeny dvěma pravoúhlými oranžovými tabulkami podle 5.3.2.2.1, umístěnými ve svislé rovině. Musí být umístěny jedna na přední a druhá na zadní straně dopravní jednotky, obě kolmo k podélné ose dopravní jednotky. Musí být zřetelně viditelné.

Je-li přípojně vozidlo obsahující nebezpečné věci během přepravy odpojeno od svého motorového vozidla, musí oranžová tabulka zůstat umístěna na zadní straně přípojněho vozidla. Pokud jsou cisterny označeny v souladu s 5.3.2.1.3, musí oranžová tabulka odpovídat nejvíc nebezpečné látce obsažené v cisterně.

5.3.2.1.2 Pokud je ve sloupci (20) tabulky A kapitoly 3.2 uvedeno identifikační číslo nebezpečnosti, cisternová vozidla, bateriová vozidla nebo dopravní jednotky s jednou nebo více cisternami přepravující nebezpečné věci musí být kromě toho opatřeny na obou bočních stranách každé cisterny nebo každé komory cisterny nebo každého článku bateriových vozidel zřetelně viditelnými a rovnoběžně s podélnou osou vozidla umístěnými oranžovými tabulkami předepsanými v 5.3.2.1.1. Na těchto oranžových tabulkách musí být uvedeno identifikační číslo nebezpečnosti a UN číslo předepsané ve sloupci (20), popřípadě (1) tabulky A kapitoly 3.2 pro každou z látek přepravovaných v cisterně, v komoře cisterny nebo v článku bateriového vozidla. Pro MEMU se tyto požadavky vztahují jen na cisterny o vnitřním objemu 1 000 litrů nebo větším a na kontejnery pro volně ložené látky.

5.3.2.1.3 Na cisternových vozidlech nebo dopravních jednotkách s jednou nebo více cisternami přepravujících látku UN čísel 1202, 1203 nebo 1223 nebo letecké palivo zařazené pod UN 1268 nebo 1863, ale ne jinou nebezpečnou látku, oranžové tabulky předepsané v 5.3.2.1.2 nemusí být umístěny, jestliže je na tabulkách umístěných vpředu a vzadu podle 5.3.2.1.1 uvedeno identifikační čísla nebezpečnosti a UN číslo předepsané pro nejnebezpečnější přepravovanou látku, tj. látku s nejnižším bodem vzplanutí.

5.3.2.1.4 Pokud je ve sloupci (20) tabulky A kapitoly 3.2 uvedeno identifikační číslo nebezpečnosti, dopravní jednotky a kontejnery přepravující nebalené tuhé látky nebo předměty nebo balenou radioaktivní látku s jediným UN číslem vyžadujícím přepravu za výlučného použití a žádné jiné nebezpečné věci, musí být kromě toho opatřeny na obou bočních stranách každé dopravní jednotky nebo kontejneru zřetelně viditelnými a rovnoběžně s podélnou osou vozidla umístěnými oranžovými tabulkami předepsanými v 5.3.2.1.1. Na těchto oranžových tabulkách musí být uvedeno identifikační číslo nebezpečnosti a UN číslo předepsané ve sloupcích (20), popřípadě (1) tabulky A kapitoly 3.2 pro každou z látek ve volně loženém stavu nebo pro balenou radioaktivní látku, vyžaduje-li přepravu za výlučného použití, přepravovaných v dopravní jednotce nebo v kontejneru.

5.3.2.1.5 Pokud oranžové tabulky předepsané v 5.3.2.1.2 a 5.3.2.1.4, umístěné na kontejnerech, cisternových kontejnerech, MEGC nebo na přemístitelných cisternách nejsou dobře viditelné zvnějšku přepravujícího vozidla, musí být tytéž tabulky umístěny na obou bočních stranách vozidla.

POZNÁMKA: Tento odstavec se nemusí použít pro označování oranžovými tabulkami, jde-li o uzavřená vozidla nebo vozidla s plachtou přepravující cisterny o nejvyšším vnitřním objemu 3000 litrů.

5.3.2.1.6 Pro dopravní jednotky přepravující pouze jednu nebezpečnou látku a žádnou látku, která není nebezpečná, nejsou oranžové tabulky podle 5.3.2.1.2, 5.3.2.1.4 a 5.3.2.1.5 nezbytné, pokud je na oranžových tabulkách umístěných vpředu a vzadu podle 5.3.2.1.1 uvedeno identifikační číslo nebezpečnosti a UN číslo pro tuto látku předepsané ve sloupcích (20), popřípadě (1) tabulky A kapitoly 3.2.

5.3.2.1.7 Požadavky uvedené v 5.3.2.1.1 až 5.3.2.1.5 se vztahují také na nesnímatelné nebo snímatelné cisterny, bateriová vozidla, cisternové kontejnery, přemístitelné cisterny a MEGC, vesměs prázdné, nevyčištěné, neodplyněné nebo nedekontaminované, MEMU, nevyčištěné jakož i na vozidla a kontejnery pro přepravu volně ložených látek, vesměs prázdné, nevyčištěné nebo nedekontaminované.

- 5.3.2.1.8** Oranžové označení, které se nevztahuje na přepravované nebezpečné věci nebo jejich zbytky, musí být odstraněno nebo zakryto. Pokud jsou oranžové tabulky zakryty, jejich kryty musí být celistvé a musí zůstat účinné po 15 minutách přímého působení ohně.

5.3.2.2 Specifikace oranžových tabulek

- 5.3.2.2.1** Oranžové tabulky musí být reflexivní a musí být 40 cm široké a 30 cm vysoké. Tyto tabulky musí mít černý okraj 15 mm široký. Použitý materiál musí být odolný proti povětrnosti a musí zaručovat trvalivé označení. Tabulka se nesmí uvolnit ze svého držáku po 15 minutách přímého působení ohně. Musí zůstat upevněna bez ohledu na orientaci vozidla. Tyto oranžové tabulky mohou být ve středu rozděleny vodorovnou černou čarou o tloušťce 15 mm.

Jestliže rozměry a konstrukce vozidla jsou takové, že disponibilní povrch je nedostačující pro umístění těchto tabulek, jejich rozměry mohou být zmenšeny na minimální šířku 300 mm, výšku 120 mm a šířku černého okraje 10 mm. V takovém případě smí být použity pro dvě oranžové tabulky různé sady rozměrů v určeném rozsahu dle 5.3.2.1.1.

V případě použití zmenšených oranžových tabulek pro balené radioaktivní látky přepravované za výlučného použití se vyžaduje jen UN číslo a velikost číslic předepsaných v 5.3.2.2.2 smí být zmenšena na 65 mm výšky a 10 mm tloušťky čáry.

Na kontejnerech přepravujících nebezpečné tuhé látky ve volně loženém stavu a na cisternových kontejnerech, MEGC a přemístitelných cisternách mohou být oranžové tabulky předepsané v 5.3.2.1.2, 5.3.2.1.4 a 5.3.2.1.5 nahrazeny samolepicí fólií, barevným nátěrem nebo jakýmkoli jiným rovnocenným způsobem. Toto alternativní označení musí odpovídat specifikacím uvedeným v tomto pododdílu, s výjimkou ustanovení týkajících se odolnosti proti ohni uvedených v 5.3.2.2.1 a 5.3.2.2.2.

POZNÁMKA: Barva oranžových tabulek v podmínkách normálního užívání musí mít souřadnice barevnosti ležící uvnitř plochy diagramu barevnosti vytvořeného spojením následujících souřadnic:

Souřadnice barevnosti bodů v rozích plochy diagramu barevnosti				
X	0,52	0,52	0,578	0,618
Y	0,38	0,40	0,422	0,38

Koeficient jasu odrážející barvy: $\beta > 0,12$.

Vztažný střed E, standardní světelný zdroj C, normální dopad 45° pod zorným úhlem 0°.

Koeficient odrazové svítivosti při úhlu osvětlení 5° pod zorným úhlem 0,2°: nejméně 20 candel na lux a m².

- 5.3.2.2.2** Identifikační číslo nebezpečnosti a UN číslo sestává z černých číslic o výšce 100 mm a tloušťce čáry 15 mm. Identifikační číslo nebezpečnosti musí být uvedeno v horní části tabulky a UN číslo v dolní části; obě čísla musí být od sebe oddělena vodorovnou černou čarou o tloušťce 15 mm, vedenou v polovině výšky tabulky od jednoho jejího okraje k druhému (viz 5.3.2.2.3). Identifikační číslo nebezpečnosti a UN číslo musí být nesmazatelná a musí zůstat čitelná po 15 minutách přímého působení ohně. Vyměnitelná čísla a písmena na tabulkách představující identifikační číslo nebezpečnosti a UN číslo musí zůstat na svém místě během přepravy a bez ohledu na orientaci vozidla.

5.3.2.2.3*Příklad oranžové tabulky s identifikačním číslem nebezpečnosti a UN číslem*

Podklad oranžový.

Okraj, vodorovná čára a číslice černé, tloušťka 15 mm.

5.3.2.2.4Dovolené tolerance pro rozměry stanovené v tomto pododdílu jsou $\pm 10\%$.**5.3.2.2.5**

Jsou-li oranžové tabulky připevněny na sklopných panelech, musí být konstruovány a zajištěny tak, aby se nemohly rozevřít nebo se uvolnit z držáku během přepravy (zejména jako výsledek rázů nebo neúmyslných činností).

5.3.2.3**Význam identifikačních čísel nebezpečnosti****5.3.2.3.1**

Identifikační číslo nebezpečnosti sestává ze dvou nebo třech číslic. Obecně označují číslice tato nebezpečí:

- 2 Únik plynu tlakem nebo chemickou reakcí
- 3 Hořlavost kapalin (par) a plynů nebo kapalin schopných samoohřevu
- 4 Hořlavost tuhých látek nebo tuhých látek schopných samoohřevu
- 5 Podpora hoření
- 6 Toxicita nebo nebezpečí infekce
- 7 Radioaktivita
- 8 Žiravost
- 9 Nebezpečí prudké samovolné reakce

POZNÁMKA: Nebezpečí prudké samovolné reakce ve významu číslice 9 zahrnuje z povahy látky vyplývající možnost nebezpečí výbuchu, rozpadu nebo polymerační reakce za uvolňování značného tepla nebo hořlavých a/nebo toxických plynů.

Zdvojení číslice označuje zvýšení příslušného nebezpečí.

Postačuje-li k označení nebezpečnosti látky jediná číslice, doplní se tato číslice na druhém místě nulou.

Následující kombinace číslic však mají zvláštní význam: 22, 323, 333, 362, 382, 423, 44, 446, 462, 482, 539, 606, 623, 642, 823, 842, 90 a 99 (viz 5.3.2.3.2).

Pokud je před identifikačním číslem nebezpečnosti uvedeno písmeno „X“, znamená to, že látka reaguje nebezpečně s vodou. Pro takové látky smí být použita voda pouze po schválení znalci.

Pro látky třídy 1 se jako identifikační číslo nebezpečnosti použije klasifikační kód podle sloupce (3b) tabulky A kapitoly 3.2. Klasifikační kód sestává z:

- čísla podtřídy podle 2.2.1.1.5; a
- písmene skupiny snášenlivosti podle 2.2.1.1.6.

5.3.2.3.2 Identifikační čísla nebezpečnosti uvedená ve sloupci (20) tabulky A kapitoly 3.2 mají tento význam:

20	dusivý plyn nebo plyn bez vedlejšího nebezpečí
22	hluboce zchlazený zkapalněný plyn; dusivý
223	hluboce zchlazený zkapalněný plyn, hořlavý
225	hluboce zchlazený zkapalněný plyn, podporující hoření
23	hořlavý plyn
238	hořlavý plyn, žíravý
239	hořlavý plyn, který může vyvolat samovolně prudkou reakci
25	plyn podporující hoření
26	toxický plyn
263	toxický plyn, hořlavý
265	toxický plyn, podporující hoření
28	žíravý plyn
268	toxický plyn, žíravý
30	hořlavá kapalina (bod vzplanutí od 23 °C do 60 °C včetně) nebo hořlavá kapalina nebo tuhá látka v roztaveném stavu s bodem vzplanutí vyšším než 60 °C ohřátá na teplotu rovnou nebo vyšší než její bod vzplanutí, nebo kapalina schopná samoohřevu
323	hořlavá kapalina reagující s vodou a vyvíjející hořlavé plyny
X323	hořlavá kapalina reagující nebezpečně s vodou a vyvíjející hořlavé plyny ¹
33	velmi hořlavá kapalina (bod vzplanutí pod 23 °C)
333	pyroforní kapalina
X333	pyroforní kapalina reagující nebezpečně s vodou ¹
336	velmi hořlavá kapalina, toxická

- 68 toxická látka, žíravá
- 69 toxická nebo slabě toxická látka, která může vyvolat samovolně prudkou reakci
- 70 radioaktivní látka
- 78 radioaktivní látka, žíravá
- 80 žíravá nebo slabě žíravá látka
- X80 žíravá nebo slabě žíravá látka, která nebezpečně reaguje s vodou¹
- 823 žíravá kapalina, reagující s vodou, vyvíjející hořlavé plyny
- 83 žíravá nebo slabě žíravá látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně)
- X83 žíravá nebo slabě žíravá látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně), nebezpečně reagující s vodou¹
- 839 žíravá nebo slabě žíravá látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně), která může vyvolat samovolně prudkou reakci
- X839 žíravá nebo slabě žíravá látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně), která může vyvolat samovolně prudkou reakci a nebezpečně reagující s vodou¹
- 84 žíravá tuhá látka, hořlavá nebo schopná samoohřevu
- 842 žíravá tuhá látka, která reaguje s vodou, vyvíjející hořlavé plyny
- 85 žíravá nebo slabě žíravá látka, podporující hoření
- 856 žíravá nebo slabě žíravá látka, podporující hoření a toxická
- 86 žíravá nebo slabě žíravá látka, toxická
- 88 silně žíravá látka
- X88 silně žíravá látka, která nebezpečně reaguje s vodou¹
- 883 silně žíravá látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně)

¹ Voda nesmí být použita bez schválení znalci.

- 884 silně žíravá tuhá látka, hořlavá nebo schopná samoohřevu
- 885 silně žíravá látka, podporující hoření
- 886 silně žíravá látka, toxická
- X886 silně žíravá látka, toxická, nebezpečně reagující s vodou²
- 89 žíravá nebo slabě žíravá látka, která může vyvolat samovolně prudkou reakci
- 90 látka ohrožující životní prostředí; jiné nebezpečné látky
- 99 jiné nebezpečné látky přepravované v zahřátém stavu.

5.3.3 Značka pro zahřáté látky

Cisternová vozidla, cisternové kontejnery, přemístitelné cisterny, speciální vozidla nebo kontejnery nebo speciálně vybavená vozidla nebo kontejnery obsahující látku, která je přepravována nebo podávána k přepravě v kapalném stavu při teplotě 100°C a vyšší nebo v pevném stavu při teplotě 240°C a vyšší, musí být opatřeny na obou bočních stranách a na zadní straně vozidla a na obou bočních stranách a na obou koncích kontejnerů, cisternových kontejnerů a přemístitelných cisteren značkou uvedenou na Obrázku 5.3.3.

Obrázek 5.3.3

Značka pro přepravu zahřátých látek

Značka musí mít tvar rovnostranného trojúhelníka. Barva značky musí být červená. Minimální rozměry stran musí být 250 mm. Tam, kde nejsou udány rozměry, musí všechny prvky proporčně odpovídat uvedenému obrázku.

5.3.4 (Vyhrazeno)

5.3.5 (Vyhrazeno)

² Voda nesmí být použita bez schválení znalci.

5.3.6 *Značka pro látky ohrožující životní prostředí*

- 5.3.6.1 Je-li podle ustanovení oddílu 5.3.1 vyžadováno umístění velké bezpečnostní značky, musí být kontejnery, MEGC, cisternové kontejnery, přemístitelné cisterny a vozidla obsahující látky ohrožující životní prostředí splňující kritéria uvedená v 2.2.9.1.10 označeny značkou pro látky ohrožující životní prostředí vyobrazenou v 5.2.1.8.3.
- 5.3.6.2 Značka pro látky ohrožující životní prostředí pro kontejnery, MEGC, cisternové kontejnery, přemístitelné cisterny a vozidla musí odpovídat popisu v 5.2.1.8.3 a Obrázku 5.2.1.8.3, kromě požadavků na rozměry, které musí být minimálně 250 x 250 mm. Ostatní ustanovení oddílu 5.3.1 týkající se velkých bezpečnostních značek se vztahují s patřičnými změnami na tuto značku.

KAPITOLA 5.4

PRŮVODNÍ DOKLADY

5.4.0 Všeobecně

- 5.4.0.1** Pokud není stanoveno jinak, musí být každá přeprava věcí podléhajících ADR doprovázena doklady předepsanými v této kapitole, jak je to náležité.

POZNÁMKA: Seznam dokladů, které musí být při přepravě v dopravních jednotkách, viz 8.1.2.

- 5.4.0.2** Použití technik elektronického zpracování dat (EDP) nebo elektronické výměny dat (EDI) jako pomůcky nebo místo papírových dokladů je dovoleno, pokud tyto postupy používané pro sběr, uchovávání a zpracovávání elektronických dat splňují legislativní požadavky z hlediska průkaznosti a přístupnosti dat během přepravy způsobem nejméně rovnocenným s papírovými doklady.

- 5.4.0.3** Jsou-li informace o nebezpečných věcech poskytovány dopravci technikami EDP nebo EDI, musí být odesílatel schopen dodat tyto informace dopravci v papírové formě s údaji uvedenými v pořadí vyžadovaném touto kapitolou.

5.4.1 Přepravní doklad pro nebezpečné věci a předepsané údaje

5.4.1.1 Všeobecné údaje předepsané pro přepravní doklad

- 5.4.1.1.1** Přepravní doklad(y) musí obsahovat dále uvedené údaje pro každou nebezpečnou látku, materiál nebo předmět podaný k přepravě:

- (a) UN číslo s předřazenými písmeny „UN“;
- (b) oficiální pojmenování pro přepravu případně doplněné (viz 3.1.2.8.1) technickým názvem v závorkách (viz 3.1.2.8.1.1), jak je uvedeno v oddílu 3.1.2;
- (c) - pro látky a předměty třídy 1: klasifikační kód uvedený ve sloupci (3 b) tabulky A v kapitole 3.2;

Pokud jsou ve sloupci (5) tabulky A v kapitole 3.2 uvedena čísla vzorů bezpečnostních značek jiná než 1, 1.4, 1.5 a 1.6, musí být tato čísla vzorů bezpečnostních značek uvedena v závorkách za klasifikačním kódem;

- pro radioaktivní látky třídy 7: číslo třídy „7“;

POZNÁMKA: K radioaktivním látkám s vedlejším nebezpečím viz též zvláštní ustanovení 172 v kapitole 3.3.

- pro látky a předměty jiných tříd: čísla vzorů bezpečnostních značek uvedená ve sloupci (5) nebo vyžadovaná podle zvláštního ustanovení uvedeného ve sloupci (6) tabulky A v kapitole 3.2. Pokud je uvedeno více čísel vzorů bezpečnostních značek, čísla následující za prvním číslem musí být uvedena v závorkách. Pro látky a předměty, pro které nejsou ve sloupci (5) tabulky A kapitoly 3.2 uvedeny žádné vzory bezpečnostních značek, musí být místo nich uvedena jejich třída podle sloupce (3a).

- (d) kde je to stanoveno, obalová skupina pro látku, které mohou předcházet písmena „OS“ (např. „OS II“) nebo počáteční písmena odpovídající slovům „Obalová skupina“ v jazycích používaných podle 5.4.1.4.1;

POZNÁMKA: Pro radioaktivní látky třídy 7 s vedlejším nebezpečím, viz zvláštní ustanovení 172 (d) v kapitole 3.3.

- (e) počet a popis kusů pokud je to aplikovatelné. UN kódy obalů smějí být použity pouze k doplnění popisu druhu kusu (např. jedna bedna (4G));

POZNÁMKA: Počet, druh a vnitřní objem každého vnitřního obalu ve vnějším obalu skupinového obalu není nutno uvádět.

- (f) celkové množství každé položky nebezpečných věcí označené různým UN číslem, oficiálním pojmenováním pro přepravu nebo případně obalovou skupinou [jako objem nebo celková (brutto) hmotnost, nebo případně jako čistá (netto) hmotnost];

POZNÁMKA1: V případě předpokládaného vynětí z platnosti podle pododdílu 1.1.3.6 musí být celkové množství nebezpečných věcí pro každou přepravní kategorii uvedeno v přepravním dokladu podle 1.1.3.6.3.

POZNÁMKA 2: Pro nebezpečné věci ve strojích nebo zařízeních specifikovaných v této příloze musí být uvedené množství celkové množství nebezpečných věcí, které jsou v nich obsaženy, v kilogramech nebo litrech, jak je to náležité.

- (g) jméno a adresa odesílatele;
- (h) jméno a adresa příjemce(ů). Jsou-li nebezpečné věci přepravovány k dodání více příjemcům, kteří nemohou být identifikováni na počátku přepravy, mohou být se souhlasem příslušných orgánů zemí dotčených přepravou alternativně uvedena slova „Rozvoz – prodej“;
- (i) prohlášení vyžadované podmínkami případné zvláštní dohody.
- (j) (Vyhrazeno)
- (k) kde je to stanoveno, kód omezení pro tunely udaný ve sloupci (15) tabulky A kapitoly 3.2 velkými písmeny v závorkách. Kód omezení pro tunely nemusí být v přepravním dokladu uveden, pokud je předem známo, že přeprava nebude spojena s průjezdem tunelem, v němž platí omezení pro přepravu nebezpečných věcí.

Umístění a pořadí předepsaných údajů v přepravním dokladu je libovolné, kromě údajů uvedených výše pod písmeny (a), (b), (c) a (d) a (k), které musí být uvedeny v pořadí uvedeném výše (tj. (a), (b), (c), (d), (k)) s žádnými vloženými údaji, kromě dovolených podle ADR. Příklady takových dovolených zápisů nebezpečných věcí jsou:

„UN 1098 ALLYLALKOHOL, 6.1 (3), I, (C/D)“ nebo
„UN 1098, ALLYLALKOHOL, 6.1 (3), OS I, (C/D)“

5.4.1.1.2

Údaje uvedené v přepravním dokladu musí být čitelné. Ačkoli jsou velká písmena používána v kapitole 3.1 a v tabulce A kapitoly 3.2 pro uvedení údajů, které musí být součástí oficiálního pojmenování pro přepravu, a ačkoli jsou velká a malá písmena používána v této kapitole pro uvedení údajů požadovaných v přepravním dokladu s výjimkou ustanovení v 5.4.1.1.1 (k), je použití velkých a malých písmen pro uvedení údajů v přepravním dokladu libovolné.

5.4.1.1.3

Zvláštní ustanovení pro odpady

Jsou-li přepravovány odpady obsahující nebezpečné látky (kromě radioaktivních odpadů), musí být před oficiálním pojmenováním pro přepravu uvedeno slovo „ODPAD“, pokud toto slovo není již částí oficiálního pojmenování pro přepravu, např.

„UN 1230 ODPAD METHANOL, 3 (6.1), II, (D/E)“, nebo

„UN 1230 ODPAD METHANOL, 3 (6.1), OS II, (D/E)“ nebo

„UN 1993 ODPAD LÁTKA HOŘLAVÁ, KAPALNÁ, J.N. (toluen a ethylalkohol), 3, II, (D/E)“, nebo

„UN 1993 ODPAD LÁTKA HOŘLAVÁ, KAPALNÁ, J.N. (toluen a ethylalkohol), 3, OS II, (D/E)“.

Je-li použito ustanovení pro odpady uvedené v 2.1.3.5.5, musí se k popisu nebezpečného zboží vyžadovanému v 5.4.1.1.1 (a) až (d) a (k) doplnit:

„ODPAD PODLE 2.1.3.5.5“ (např. „UN 3264 LÁTKA ŽÍRAVÁ, KAPALNÁ, KYSELÁ, ANORGANICKÁ, J.N., 8, II, (E) ODPAD PODLE 2.1.3.5.5“).

Technický název, jak je předepsán v kapitole 3.3 zvláštním ustanovením 274, nemusí být doplněn.

5.4.1.1.4 (Vypuštěno)**5.4.1.1.5** *Zvláštní ustanovení pro záchranné obaly a záchranné tlakové nádoby*

Jsou-li nebezpečné věci přepravovány v záchranném obalu nebo v záchranné tlakové nádobě, musí být v přepravním dokladu za popisem věcí uvedena slova „**ZÁCHRANNÝ OBAL**“ nebo „**ZÁCHRANNÁ TLAKOVÁ NÁDOBA**“.

5.4.1.1.6 *Zvláštní ustanovení pro prázdné nevyčištěné obalové, přepravní a dopravní prostředky*

5.4.1.1.6.1 Pro prázdné nevyčištěné obalové, přepravní a dopravní prostředky, které obsahují zbytky nebezpečných věcí jiných tříd než třídy 7, musí mít před nebo za popisem nebezpečných věcí stanoveným v 5.4.1.1.1 (a) až (d) a (k), uvedena slova „PRÁZDNÝ, NEVYČIŠTĚNÝ“ nebo „ZBYTEK, POSLEDNÍ OBSAH“. Kromě toho 5.4.1.1.1 (f) neplatí.

5.4.1.1.6.2 Zvláštní ustanovení 5.4.1.1.6.1 může být nahrazeno ustanoveními v 5.4.1.1.6.2.1, 5.4.1.1.6.2.2 nebo popřípadě 5.4.1.1.6.2.3.

5.4.1.1.6.2.1 Pro prázdné nevyčištěné obaly, které obsahují zbytky nebezpečných věcí jiných tříd než třídy 7, včetně prázdných nevyčištěných nádob na plyny s vnitřním objemem nejvýše 1000 litrů, jsou údaje podle odstavce 5.4.1.1.1 (a), (b), (c), (d), (e) a (f) nahrazeny zápisem „PRÁZDNÝ OBAL“, „PRÁZDNÁ NÁDOBA“, „PRÁZDNÁ IBC“ nebo popřípadě „PRÁZDNÝ VELKÝ OBAL“, následovaným údajem o posledně naložených nebezpečných věcech, jak je předepsáno v 5.4.1.1.1 (c).

Viz například: „PRÁZDNÝ OBAL, 6.1 (3)“.

Kromě toho mohou být, v případě, že jsou posledními naloženými věcmi věci třídy 2, informace předepsané v odstavci 5.4.1.1.1 (c) nahrazeny číslem třídy „2“.

5.4.1.1.6.2.2 Pro prázdné nevyčištěné přepravní a dopravní prostředky jiné než obaly, které obsahují zbytky nebezpečných věcí jiných tříd než třídy 7, a pro prázdné nevyčištěné nádoby na plyny s vnitřním objemem větším než 1000 litrů je před údaje podle 5.4.1.1.1 (a) až (d) a (k) předfazen zápis „PRÁZDNÉ CISTERNOVÉ VOZIDLO“, „PRÁZDNÁ SNÍMATELNÁ CISTERNA“, „PRÁZDNÝ CISTERNOVÝ KONTEJNER“, „PRÁZDNÁ PŘEMÍSTITELNÁ CISTERNA“, „PRÁZDNÉ BATERIOVÉ VOZIDLO“, „PRÁZDNÝ MEGC“, „PRÁZDNÁ MEMU“, „PRÁZDNÉ VOZIDLO“, „PRÁZDNÝ KONTEJNER“ nebo popřípadě „PRÁZDNÁ NÁDOBA“, následovaný slovy „POSLEDNÍ NÁKLAD“. Kromě toho 5.4.1.1.1 (f) neplatí.

Viz například:

„PRÁZDNÉ CISTERNOVÉ VOZIDLO, POSLEDNÍ NÁKLAD: UN 1098 ALLYLALKOHOL, 6.1 (3), I, (C/D)“ nebo

„PRÁZDNÉ CISTERNOVÉ VOZIDLO, POSLEDNÍ NÁKLAD: UN 1098 ALLYLALKOHOL, 6.1 (3), OS I, (C/D)“.

5.4.1.1.6.2.3 Jestliže se prázdné nevyčištěné obaly, přepravní nebo dopravní prostředky, které obsahují zbytky nebezpečných věcí jiných tříd než třídy 7, vracejí odeslateli, mohou se použít také přepravní doklady vystavené pro přepravu s nákladem těchto nebezpečných věcí. V takových případech je třeba údaj o množství odstranit (jeho vymazáním, škrtnutím nebo jiným způsobem) a nahradit jej slovy „PRÁZDNÝ, NEVYČIŠTĚNÝ ZPĚT“.

5.4.1.1.6.3 (a) Jsou-li prázdné nevyčištěné cisterny, bateriová vozidla a MEGC přepravovány do nejbližšího místa, kde může být provedeno vyčištění nebo oprava podle ustanovení uvedených v 4.3.2.4.3, musí být v přepravním dokladu uveden tento dodatečný zápis: „**Přeprava podle 4.3.2.4.3**“.

(b) Jsou-li prázdná nevyčištěná vozidla a kontejnery přepravovány do nejbližšího místa, kde může být provedeno vyčištění nebo oprava podle ustanovení uvedených v 7.5.8.1, musí být v přepravním dokladu uveden tento dodatečný zápis: „**Přeprava podle 7.5.8.1**“.

5.4.1.1.6.4 Pro přepravu nesnímatelných cisteren (cisternových vozidel), snímatelných cisteren, bateriových vozidel, cisternových kontejnerů a MEGC za podmínek uvedených v 4.3.2.4.4, musí být v přepravním dokladu uveden tento zápis: „Přeprava podle 4.3.2.4.4“.

- 5.4.1.1.7** *Zvláštní ustanovení pro přepravu v přepravním řetězci s námořní nebo leteckou dopravou*
- Při přepravě podle 1.1.4.2.1 musí být v přepravním dokladu uveden tento zápis: „**Přeprava podle 1.1.4.2.1**“.
- 5.4.1.1.8** *(Vyhrazeno)*
- 5.4.1.1.9** *(Vyhrazeno)*
- 5.4.1.1.10** *(Vypuštěno)*
- 5.4.1.1.11** *Zvláštní ustanovení pro přepravu IBC nebo přemístitelných cisteren po uplynutí data platnosti poslední periodické zkoušky nebo inspekce*
- Pro přepravu podle 4.1.2.2 (b), 6.7.2.19.6 (b), 6.7.3.15.6 (b) nebo 6.7.4.14.6 (b) musí být v tomto smyslu uveden v přepravním dokladu tento zápis: „**Přeprava podle 4.1.2.2 (b)**“, „**Přeprava podle 6.7.2.19.6 (b)**“, „**Přeprava podle 6.7.3.15.6 (b)**“ nebo „**Přeprava podle 6.7.4.14.6 (b)**“, jak je to náležité.
- 5.4.1.1.12** *(Vyhrazeno)*
- 5.4.1.1.13** *Zvláštní ustanovení pro přepravu ve vícekomorových cisternových vozidlech nebo dopravních jednotkách s více než jednou cisternou*
- Pokud jsou odchylkou od 5.3.2.1.2 vícekomorová cisternová vozidla nebo dopravní jednotky s více než jednou cisternou označeny podle 5.3.2.1.3, musí být látky obsažené v každé cisterně nebo v každé komoře cisterny uvedeny v přepravním dokladu.
- 5.4.1.1.14** *Zvláštní ustanovení pro přepravu zahřátých látek*
- Pokud oficiální pojmenování pro přepravu látky, která je přepravována nebo předávána k přepravě v kapalném stavu při teplotě rovné nebo vyšší než 100°C, nebo v tuhém stavu při teplotě rovné nebo vyšší než 240°C, neobsahuje podmínku zvýšené teploty (např. použitím termínu „ROZTAVENÁ“ nebo „V ZAHŘÁTÉM STAVU“ jako součásti oficiálního pojmenování pro přepravu), musí být slovo „**ZAHŘÁTÁ**“ uvedeno před oficiálním pojmenováním pro přepravu.
- 5.4.1.1.15** *Zvláštní ustanovení pro přepravu látek stabilizovaných řízením teploty*
- Pokud slovo „**STABILIZOVANÁ**“ je součástí oficiálního pojmenování pro přepravu (viz 3.1.2.6), je-li stabilizace dosažena řízením teploty, řízená teplota a kritická teplota (viz 2.2.41.1.17) musí být uvedeny v přepravním dokladu takto:
- „**Řízená teplota: °C Kritická teplota: °C**“
- 5.4.1.1.16** *Informace vyžadované podle zvláštního ustanovení 640 v kapitole 3.3*
- Pokud je to vyžadováno zvláštním ustanovením 640 kapitoly 3.3, musí být v přepravním dokladu uveden zápis „**Zvláštní ustanovení 640X**“, kde „X“ je velké písmeno uvedené za příslušným odkazem na zvláštní ustanovení 640 ve sloupci (6) tabulky A kapitoly 3.2.
- 5.4.1.1.17** *Zvláštní ustanovení pro přepravu tuhých látek v kontejnerech pro volně ložené látky odpovídajících oddílu 6.11.4*
- Jestliže jsou tuhé látky přepravovány v kontejnerech pro volně ložené látky odpovídajících oddílu 6.11.4, musí být v přepravním dokladu uveden tento zápis (viz POZNÁMKA na začátku oddílu 6.11.4):
- „**Kontejner pro volně ložené látky BK(x)¹ schválený příslušným orgánem**“
- 5.4.1.1.18** *Zvláštní ustanovení pro přepravu látek ohrožujících životní prostředí (vodní prostředí)*
- Jestliže látka spadající do jedné ze tříd 1 až 9 splňuje kritéria uvedená v 2.2.9.1.10, musí být v přepravním dokladu uveden doplňkový zápis „**OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ**“ nebo

¹ (x) musí být nahrazeno číslem „1“ nebo „2“, jak je to vhodné

„LÁTKA ZNEČIŠŤUJÍCÍ MOŘE/OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ“. Tento dodatečný požadavek se nevztahuje na UN čísla 3077 a 3082 a na výjimky uvedené v 5.2.1.8.1.

Zápis „MARINE POLLUTANT“ („LÁTKA ZNEČIŠŤUJÍCÍ MOŘE“) (podle 5.4.1.4.3 IMDG Codu) je dovolen pro přepravu v přepravním řetězci zahrnujícím námořní dopravu.

5.4.1.1.19 *Zvláštní ustanovení pro přepravu vyřazených, prázdných, nevyčištěných obalů (UN 3059)*

Pro obaly, vyřazené, prázdné, nevyčištěné musí být oficiální pojmenování pro přepravu uvedené v 5.4.1.1.1 (b) doplněno slovy „(SE ZBYTKY [...])“ následováno uvedením tříd(y) a vedlejšího(ch) nebezpečí odpovídající zbytkům tříd v pořadí. Kromě toho se nepoužije 5.4.1.1.1 (f).

Příklad: Obaly, vyřazené, prázdné, nevyčištěné, které obsahovaly látky třídy 4.1 zabalené společně s obaly, vyřazenými, prázdnými, nevyčištěnými, které obsahovaly látky třídy 3 s vedlejším nebezpečím třídy 6.1, bude v přepravním dokladu uvedeno:

„UN 3509 OBALY VYŘAZENÉ, PRAZDNÉ, NEVYČIŠTĚNÉ (SE ZBYTKY 3, 4.1, 6.1), 9“.

5.4.1.2 ***Dodatečné nebo zvláštní údaje pro určité třídy***

5.4.1.2.1 *Zvláštní ustanovení pro třídu 1*

- (a) V přepravním dokladu musí být, dodatečně k požadavkům uvedeným v 5.4.1.1.1 (f), uvedeno:
- celková čistá hmotnost výbušného obsahu² pro každou látku nebo předmět označené různým UN číslem, v kg;
 - celková čistá hmotnost výbušného obsahu² všech látek a předmětů uvedených v přepravním dokladu v kg.
- (b) Pro společné balení dvou různých věcí musí popis věcí v přepravním dokladu obsahovat UN čísla a oficiální pojmenování vytištěná velkými písmeny ve sloupcích (1) a (2) tabulky A kapitoly 3.2 obou látek nebo předmětů. Jestliže jsou obsaženy v jednom kusu více než dvě různé věci v souladu se zvláštními ustanoveními MP1, MP2 a MP20 až MP24 uvedenými v ustanoveních o společném balení v oddílu 4.1.10 musí být v přepravním dokladu uvedena v popise věcí UN čísla všech látek a předmětů obsažených v kusu touto formou „**Věci UN čísel ...**“;
- (c) Při přepravě látek a předmětů přiřazených k j.n. položce. nebo k položce „0190 VZORKY, VÝBUŠNÉ“ nebo balených podle pokynu pro balení P101 uvedeného v pododdílu 4.1.4.1 musí být připojena k přepravnímu dokladu kopie schválení příslušného orgánu s podmínkami pro přepravu. Musí to být v úředním jazyce odesílající země a též, jestliže tento jazyk není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud případné dohody uzavřené mezi státy zainteresovanými na přepravě nestanoví jinak;
- (d) Pokud kusy obsahující látky a předměty skupin snášenlivosti B a D jsou naloženy společně do jednoho vozidla podle požadavků uvedených v pododdílu 7.5.2.2, kopie osvědčení příslušného orgánu o schválení ochranné komory nebo kontejmentového systému podle pododdílu 7.5.2.2 poznámky ^a pod tabulkou musí být připojeno k přepravnímu dokladu. Musí být vystaveno v úředním jazyce odesílající země a též, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud případné dohody uzavřené mezi zeměmi dotčenými přepravou nestanoví jinak.;
- (e) Pokud jsou výbušné látky nebo předměty přepravovány v obalech podle pokynu pro balení P101, v přepravním dokladu musí být uveden zápis „**Obal schválen příslušným orgánem...**“ (viz 4.1.4.1, pokyn pro balení P101).
- (f) *(Vyhrazeno)*

² Pro předměty se pojmem „výbušný obsah“ rozumí výbušná látka obsažená v předmětu.

- (g) Pokud jsou přepravovány výrobky zábavné pyrotechniky UN čísel 0333, 0334, 0335, 0336 a 0337, v přepravním dokladu musí být uveden zápis:

„Klasifikace zábavné pyrotechniky příslušným orgánem XX s osvědčením zábavné pyrotechniky XX/YYZZZ“.

Osvědčení o schválení klasifikace nemusí doprovázet zásilku, ale odesílatel musí být schopen je poskytnout dopravci nebo příslušnému orgánu ke kontrolním účelům. Osvědčení o schválení klasifikace nebo jeho kopie musí být v oficiálním jazyce země odeslání, a pokud tímto jazykem není němčina, angličtina nebo francouzština, též v němčině, angličtině nebo francouzštině.

POZNÁMKA 1: V přepravním dokladu může být uveden obchodní nebo technický název věci dodatečně k oficiálnímu pojmenování pro přepravu.

POZNÁMKA 2: Číslo osvědčení o klasifikaci musí sestávat ze smluvní strany ADR, v níž byl schválen klasifikační kód podle zvláštního ustanovení 645 oddílu 3.3.1, uvedené rozlišovací značkou pro motorová vozidla v mezinárodním provozu (XX)³, z identifikace příslušného orgánu (YY) a z jediného sériového čísla jednacím (ZZZZ). Příklady takových čísel osvědčení o klasifikaci jsou:

GB/HSE123456
D/BAM1234“.

5.4.1.2.2 *Dodatečná ustanovení pro třídu 2*

- (a) Při přepravě směsí (viz 2.2.2.1.1) v cisternách (snímatelných cisternách, nesnímatelných cisternách, přemístitelných cisternách, cisternových kontejnerech nebo člancích bateriových vozidel nebo MEGC), musí být uvedeno složení směsi v % objemu nebo % hmotnosti. Složky o obsahu nižším než 1 % nemusí být uváděny (viz též 3.1.2.8.1.2). Složení směsi nemusí být uvedeno, jsou-li použity jako doplněk k oficiálnímu pojmenování pro přepravu technické názvy dovolené podle zvláštních ustanovení 581, 582 nebo 583;
- (b) Při přepravě lahví, trubkových nádob, tlakových sudů, kryogenních nádob a svazků lahví podle podmínek uvedených v pododdílu 4.1.6.10, musí být v přepravním dokladu uveden tento zápis: „**Přeprava podle 4.1.6.10**“.

5.4.1.2.3 *Dodatečná ustanovení pro samovolně se rozkládající látky třídy 4.1 a organické peroxidy třídy 5.2*

- 5.4.1.2.3.1 Při přepravě samovolně se rozkládajících látek třídy 4.1 a organických peroxidů třídy 5.2, které vyžadují řízení teploty během přepravy (pro samovolně se rozkládající látky viz 2.2.41.1.17; pro organické peroxidy viz 2.2.52.1.15 až 2.2.52.1.17), v přepravním dokladu musí být uvedeny řízená teplota a kritická teplota takto:

„Řízená teplota: °C“ „Kritická teplota: °C“.

- 5.4.1.2.3.2 Pokud pro určité samovolně se rozkládající látky třídy 4.1 a určité organické peroxidy třídy 5.2, příslušný orgán povolil, aby nebyla použita bezpečnostní značka podle vzoru č. 1 pro zvláštní obal (viz 5.2.2.1.9) v přepravním dokladu musí být o tom uvedena poznámka takto: „**Bezpečnostní značka podle vzoru č. 1 není vyžadována**“.

- 5.4.1.2.3.3 Pokud jsou organické peroxidy a samovolně se rozkládající látky přepravovány za podmínek kdy se vyžaduje schválení (pro organické peroxidy viz 2.2.52.1.8, 4.1.7.2.2 a zvláštní ustanovení TA2 uvedené v oddílu 6.8.4; pro samovolně se rozkládající látky viz 2.2.41.1.13 a 4.1.7.2.2) v přepravním dokladu musí být o tom uvedena poznámka, např. „**Přeprava podle 2.2.52.1.8**“.

K přepravnímu dokladu musí být připojena jedna kopie schválení příslušného orgánu s podmínkami pro přepravu. Schválení musí být vystaveno v úředním jazyce odesílající země

³ Rozlišovací značka pro motorová vozidla v mezinárodním provozu předepsaná Úmluvou o silničním provozu (Víděň, 1968).

a též, pokud tímto jazykem není angličtina, francouzština, italština nebo němčina, v angličtině, francouzštině, italštině nebo němčině, pokud případné dohody uzavřené mezi státy dotčenými přepravou nestanoví něco jiného.

5.4.1.2.3.4 Pokud je přepravován vzorek organického peroxidu (viz 2.2.52.1.9) nebo samovolně se rozkládající látky (viz 2.2.41.1.15), v přepravním dokladu o tom musí být uvedena poznámka, např. „**Přeprava podle 2.2.52.1.9**“.

5.4.1.2.3.5 Pokud jsou přepravovány samovolně se rozkládající látky typu G (viz Příručka zkoušek a kritérií, část II, odst. 20.4.2 (g)), v přepravním dokladu musí být o tom uvedena poznámka: „**Není látkou samovolně se rozkládající třídy 4.1**“.

Pokud jsou přepravovány organické peroxidy typu G (viz Příručka zkoušek a kritérií, část II, odst. 20.4.2 (g)), v přepravním dokladu musí být o tom uvedena poznámka: „**Není látkou třídy 5.2**“.

5.4.1.2.4 *Dodatečná ustanovení pro třídu 6.2*

Kromě údajů o příjemci (viz 5.4.1.1.1 (h)) musí být uvedeno jméno a číslo telefonu odpovědné osoby.

5.4.1.2.5 *Dodatečná ustanovení pro třídu 7*

5.4.1.2.5.1 V přepravním dokladu musí být pro každou zásilku látek třídy 7 uvedeny, pokud je to vhodné, v uvedeném pořadí a bezprostředně po údajích předepsaných v 5. 4. 1.1.1 (a) až (c) a (k) tyto údaje:

- (a) název nebo symbol každého radionuklidu nebo, pro směsi radionuklidů, vhodný všeobecný popis nebo seznam nejvíce omezujících nuklidů;
- (b) popis fyzikálního a chemického stavu látky, nebo údaj o tom, že látka je zvláštní formou radioaktivní látky nebo málo rozpustitelnou radioaktivní látkou. Druhový chemický popis se připouští pro chemický stav. Pro radioaktivní látky s vedlejším nebezpečím viz pododstavec (c) zvláštního ustanovení 172 kapitoly 3.3.
- (c) nejvyšší aktivita radioaktivního obsahu během přepravy vyjádřená v becquerelech (Bq) s příslušným symbolem předpony SI (viz 1.2.2.1). U štěpných látek smí být místo aktivity udána hmotnost štěpných látek (nebo hmotnost každého štěpného nuklidu pro směsi, pokud je to náležité) v gramech (g) nebo jejich vhodném násobku;
- (d) kategorie kusu, tj. I-BÍLÁ, II-ŽLUTÁ, III-ŽLUTÁ;
- (e) přepravní index (pouze kategorie II-ŽLUTÁ a III-ŽLUTÁ);
- (f) pro štěpné látky:
 - (i) odesílané podle jednoho z vyjmutí dle 2.2.7.2.3.5 (a) až (f), odkaz na tento odstavec;
 - (ii) odesílané podle 2.2.7.2.3.5 (c) až (e), celková hmotnost štěpných nuklidů;
 - (iii) obsažené v obalu, pro který platí jeden z bodů 6.4.11.2 (a) až (c) nebo 6.4.11.3, odkaz na tento odstavec;
 - (iv) kde je to vhodné, index kritické bezpečnosti;
- (g) identifikační značka každého schvalovacího osvědčení příslušného orgánu (zvláštní forma radioaktivní látky, málo rozpustitelná radioaktivní látka, štěpná látka vyjmutá podle 2.2.7.2.3.5 (f), zvláštní ujednání, konstrukce kusu nebo odeslání) vztahující se na zásilku;
- (h) pro zásilky více než jednoho kusu údaje požadované v 5.4.1.1.1 a ve výše uvedených bodech (a) až (g) musí být uvedeny pro každý kus. Pro kusy v přepravním obalovém souboru, v kontejneru nebo ve vozidle musí zahrnovat podrobný popis obsahu každého kusu uvnitř přepravního obalového souboru, kontejneru nebo vozidla, a pokud je to vhodné, každého přepravního obalového souboru, kontejneru nebo vozidla. Jestliže kusy mají být vyjmuty z přepravního obalového souboru, z kontejneru nebo z vozidla v místě jejich překládky, musí být k dispozici příslušný přepravní doklad;
- (i) pokud se vyžaduje, aby zásilka byla odeslána za výlučného použití, poznámka „**ODESLÁNÍ ZA VÝLUČNÉHO POUŽITÍ**“; a
- (j) pro látky LSA-II a LSA-III, SCO-I a SCO-II celková aktivita zásilky jako násobek A_2 . Pro radioaktivní látky, pro něž je hodnota A_2 neomezena, musí být násobek A_2 nula.

- 5.4.1.2.5.2 Odesílatel musí uvést v přepravních dokladech prohlášení týkající se případných činností, které jsou požadovány od dopravce. Prohlášení musí být v jazycích považovaných dopravcem nebo zainteresovanými orgány za nezbytné, a musí obsahovat nejméně následující údaje:
- (a) dodatečné požadavky na nakládku, uložení, přepravu, manipulaci a vykládku kusu, přepravního obalového souboru nebo kontejneru včetně ustanovení o zvláštním uložení pro bezpečný odvod tepla (viz zvláštní ustanovení CV33 (3.2) uvedené v 7.5.11) nebo prohlášení, že takové požadavky nejsou nezbytné;
 - (b) omezení s hlediska způsobu přepravy nebo vozidla a všechny nezbytné údaje o dopravní cestě;
 - (c) nouzová opatření vhodná pro zásilku.
- 5.4.1.2.5.3 Ve všech případech mezinárodní přepravy kusů vyžadujících schválení konstrukčního vzoru kusu nebo odeslání příslušným orgánem, pro něž se používají v různých zemích, jichž se přeprava týká, různé druhy schválení, musí být UN číslo a oficiální pojmenování pro přepravu, vyžadované v 5.4.1.1.1, v souladu s osvědčením země původu konstrukčního vzoru kusu.
- 5.4.1.2.5.4 Příslušná osvědčení příslušného orgánu nemusí doprovázet zásilku. Odesílatel je musí dát k dispozici dopravci(ům) před nakládkou a vykládkou.
- 5.4.1.3** (Vyhrazeno)
- 5.4.1.4** **Formát a jazyk**
- 5.4.1.4.1** Doklad obsahující údaje uvedené v pododdílech 5.4.1.1 a 5.4.1.2 může být takový, jaký je již vyžadován jinými platnými předpisy pro přepravu jiným druhem dopravy. V případě více příjemců jméno a adresa příjemců a dodávaná množství umožňující kdykoli vyhodnotit povahu a přepravované množství, mohou být uvedeny v jiných dokladech, které jsou používány nebo v jiných povinných dokladech předepsaných jinými zvláštními předpisy a které musí být během přepravy ve vozidle.
- Údaje uvedené v dokladu musí být v úředním jazyce odesílající země a též, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině pokud případné tarify pro mezinárodní silniční dopravu nebo dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.
- 5.4.1.4.2** Jestliže z důvodu rozměru nákladu celá zásilka nemůže být naložena do jedné dopravní jednotky, musí být vyhotoveno nejméně tolik oddělených přepravních dokladů nebo kopií jednoho přepravního dokladu, kolik je naložených dopravních jednotek. Kromě toho ve všech případech musí být vyhotoveny přepravní doklady pro zásilky nebo části zásilek, které nemohou být naloženy společně do jednoho vozidla z důvodů zákazů uvedených v oddílu 7.5.2.
- Údaje týkající se rizik přepravovaných věcí (jak je uvedeno v pododdílu 5.4.1.1) mohou být zapsány nebo kombinovány s údaji v existujícím přepravním nebo nákladním dokladu. Uvedení údajů v dokladu (nebo pokyn pro přenos odpovídajících dat systémem elektronického zpracování dat (EDP) nebo systémem elektronické výměny dat) musí být provedeno podle 5.4.1.1.1.
- Pokud existující přepravní doklad nebo nákladní doklad nemůže být použit jako doklad o nebezpečných věcech pro multimodální dopravu, je považováno za vhodné použití dokladů odpovídajících příkladu uvedenému v oddílu 5.4.5⁴.

4 Pokud je tento způsob použit, je možno získat informace z příslušných doporučení Střediska OSN pro zjednodušení formalit v mezinárodním obchodu (UN/CEFACT), zejména Doporučení č.1 (United Nations Layout Key for Trade Documents - Dispoziční klíč pro obchodní dokumenty Spojených národů) (ECE/TRADE/137, vydání 81.3), UN Layout Key for Trade Documents – Guidelines for Applications (Dispoziční klíč pro obchodní dokumenty Spojených národů – Směrnice pro aplikaci) (ECE/TRADE 270, vydání 2002), Doporučení č. 11 (Documentary Aspects of the International Transport of Dangerous Goods - Aspekty dokumentace mezinárodní přepravy nebezpečných věcí) (ECE/TRADE/204, vydání 96.1- nyní v revizi) a Doporučení č. 22 (Layout Key for Standard Consignment Instructions - Dispoziční klíč pro standardní pokyny pro zásilky) (ECE/TRADE/168, vydání 1989). Viz též UN/CEFACT Summary of Trade Facilitation Recommendations (Přehled doporučení pro usnadnění obchodu) (ECE/TRADE/346, vydání 2006) a United Nations Trade Data Elements Directory (UNTDDED) (Seznam prvků obchodních údajů) (ECE/TRADE/362, vydání 2005).

5.4.1.5 Věci nepovažované za nebezpečné

Pokud věci uvedené jmenovitě v tabulce A kapitoly 3.2 nepodléhají ADR, protože nejsou považovány za nebezpečné podle části 2, odesílatel může uvést v přepravním dokladu zápis v tomto smyslu např. „**Věci nespádající do třídy ...**“.

POZNÁMKA: Toto ustanovení může být použito zejména tehdy, jestliže odesílatel usoudí, že vzhledem k chemické povaze přepravovaných věcí (např. roztoky nebo směsi) nebo vzhledem ke skutečnosti, že takové věci jsou považovány za nebezpečné podle jiných předpisů, by zásilka mohla být podrobena kontrole během přepravy.

5.4.2 Osvědčení o naložení velkého kontejneru nebo vozidla

Jestliže přeprava nebezpečných věcí ve velkém kontejneru předchází přepravě po moři, musí být přepravní doklad⁵ doprovázen osvědčením o naložení kontejneru odpovídajícím oddílu 5.4.2 IMDG Code⁶.

Formuláře přepravního dokladu požadovaného v oddílu 5.4.1 a osvědčení o naložení kontejneru mohou být spojeny do jednoho dokladu; pokud tomu tak není, musí být tyto doklady připojeny jeden k druhému. Jestliže jsou tyto formuláře spojeny do jednoho dokladu, vložení poznámky, že naložení kontejneru bylo provedeno podle příslušných modálních předpisů s uvedením osoby odpovědné za osvědčení o naložení kontejneru, musí být dostatečné.

POZNÁMKA: Osvědčení o naložení kontejneru se nepožaduje pro přemístitelné cisterny, cisternové kontejnery a MEGC.

⁵ Pokyny pro použití v praxi a při školení o nakládání věcí do dopravních jednotek byly zpracovány též Mezinárodní námořní organizací (IMO), Mezinárodní organizací práce (ILO) a Evropskou hospodářskou komisí Organizace spojených národů (UN/ECE) a byly uveřejněny IMO („IMO/ILO/UN-ECE Pokyny pro nakládání nákladních dopravních jednotek (CTU)“).

⁶ Oddíl 5.4.2 IMDG Code vyžaduje následující

„5.4.2 Osvědčení o naložení kontejneru/vozidla

5.4.2.1 Jestliže jsou nebezpečné věci baleny nebo naloženy do kontejneru nebo vozidla, osoby odpovědné za naložení kontejneru nebo vozidla musí vystavit „osvědčení o naložení kontejneru/vozidla“ uvádějící identifikační číslo(a) kontejneru/vozidla a osvědčující, že operace byly provedeny podle následujících podmínek:

- .1 Kontejner/vozidlo bylo čisté, suché a prokazatelně připraveno pro uložení věcí;
- .2 Kusy, které je třeba oddělit podle příslušných požadavků na oddělené uložení, nesmějí být společně naloženy na nebo do jednoho kontejneru/vozidla [pokud to není schváleno příslušným orgánem podle 7.2.2.3 (IMDG Code)];
- .3 Všechny kusy byly zevnějšku prohlédnuty na poškození a byly naloženy pouze nepoškozené kusy;
- .4 Sudy byly uloženy nastojato, ledaže by jinak bylo schváleno příslušným orgánem, a všechny věci byly správně naloženy a, pokud je to nezbytné, přiměřeně fixovány zajišťujícím materiálem vyhovujícím druhu(ům) dopravy po přepravní trase; Faksimile podpisů jsou přípustné, pokud příslušné právní předpisy uznávají legální platnost faksimilí podpisů
- .5 Věci naložené jako volně ložené látky musí být rovnoměrně rozloženy v kontejneru/vozidle;
- .6 Pro zásilky obsahující věci třídy 1, kromě podtřídy 1.4 je kontejner/vozidlo konstrukčně provozuschopné v souladu s 7.4.6 (IMDG Code);
- .7 Kontejner/vozidlo a kusy byly správně popsány, označeny bezpečnostními značkami a popřípadě velkými bezpečnostními značkami;
- .8 Pokud jsou pro účely chlazení a kondicionování použity látky představující riziko udušení (jako např. suchý led (UN 1845) nebo dusík, hluboce zchlazený, kapalný (UN 1977) nebo argon, hluboce zchlazený, kapalný (UN 1951)), kontejner/vozidlo je zevnějšku označeno v souladu s 5.5.3.6 (IMDG Code); a
- .9 Přepravní doklad pro nebezpečné věci, požadovaný v 5.4.1 (IMDG Code), byl obdržen pro každou zásilku nebezpečných věcí naložených v kontejneru/vozidle.

POZNÁMKA: Osvědčení o naložení kontejneru/vozidla se nepožaduje pro cisterny.

5.4.2.2 Údaje požadované v přepravním dokladu pro nebezpečné věci a v osvědčení o naložení kontejneru/vozidla mohou být spojeny do jednoho dokladu; pokud tomu tak není, musí být tyto doklady připojeny jeden k druhému. Jestliže tyto údaje jsou spojeny do jednoho dokladu, doklad musí obsahovat podepsané prohlášení takové jako „Prohlašuji se, že naložení věcí do kontejneru/vozidla bylo provedeno podle příslušných ustanovení“. V dokladu musí být uvedeno datum a identifikace osoby, která prohlášení podepsala“.

5.4.2.3 Je-li osvědčení o naložení kontejneru/vozidla předáváno dopravci pomocí techniky přenosu dat v systému EDP nebo EDI, smí (smějí) být podpis(y) nahrazen(y) jménem (jmény) (velkými písmeny) osob(y) oprávněné (oprávněných) k podpisu.

5.4.2.4 Je-li osvědčení o naložení kontejneru/vozidla předáváno dopravci pomocí techniky přenosu dat v systému EDP nebo EDI a následně jsou nebezpečné věci předány dopravci, který požaduje přepravní doklad k nebezpečným věcem v papírové formě, musí tento dopravce zajistit, aby papírový doklad obsahoval zápis „Originál obdržen elektronicky“ a jméno podpisu bylo uvedeno velkými písmeny.

5.4.3 Písemné pokyny

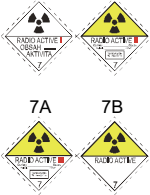

- 5.4.3.1** Jako pomoc během nehodové nouzové situace, k níž může dojít nebo která může vzniknout během přepravy, musí být písemné pokyny ve formě stanovené v 5.4.3.4 při přepravě v kabině řidiče vozidla a musí být snadno přístupné:
- 5.4.3.2** Tyto pokyny musí poskytnout dopravce osádce vozidla před započítím jízdy v jazyce (jazycích), ve kterém (kterých) je každý člen osádky schopen je přečíst a porozumět jim. Dopravce musí zajistit, aby každý dotčený člen osádky vozidla pokynům porozuměl a byl schopen podle nich správně postupovat.
- 5.4.3.3** Před započítím jízdy se musí členové osádky vozidla sami informovat o naložených nebezpečných věcech a nahlédnout do písemných pokynů ke zjištění podrobností k činnostem, které je nutno provést v případě nehody nebo nouzové situace.
- 5.4.3.4** Písemné pokyny musí odpovídat následujícímu čtyřstránkovému vzoru, jak pokud jde o jejich formu, tak i obsah.

PÍSEMNÉ POKYNY PODLE ADRČinnosti v případě nehody nebo nouzové situace

V případě nehody nebo nouzové situace, k níž může dojít nebo která může vzniknout během přepravy, musí členové osádky vozidla učinit následující opatření, kde je to bezpečné a proveditelné:

- Použít brzdový systém, zastavit chod motoru a odpojit akumulátor použitím odpojovače akumulátoru, pokud je jím vozidlo vybaveno;
- Vyloučit zápalné zdroje, zejména nekouřit, nepoužívat elektronické cigarety nebo podobné prostředky a nezapínat žádné elektrické zařízení;
- Informovat příslušné zásahové jednotky a poskytnout jim co možno nejvíce informací o události nebo nehodě a o dotčených látkách;
- Obléci si fluoreskující výstražnou vestu a umístit stojací výstražné prostředky, jak je to vhodné;
- Uchovávat průvodní doklady snadno přístupné pro zásahové jednotky při jejich příjezdu;
- Nevstupovat do vyteklych nebo vysypaných látek, ani se jich nedotýkat, a vyhnout se vdechnutí výparů, kouře, prachu a par zdržováním se na návětrné straně;
- Kde je to vhodné a bezpečné, použít hasicí přístroje k uhašení malých/začínajících požárů pneumatik, brzd a motorových prostorů;
- Požáry v ložných prostorech nesmějí členové osádky vozidla hasit;
- Kde je to vhodné a bezpečné, použít výbavu vozidla k zamezení úniků do vodního prostředí nebo do kanalizačního systému a k sebrání vyteklych nebo vysypaných látek;
- Vzdálit se z blízkosti místa nehody nebo nouzové situace, upozornit jiné osoby, aby se vzdálily, a řídit se pokyny zásahových jednotek;
- Odložit všechno kontaminované oblečení a použitou kontaminovanou ochrannou výbavu a bezpečně je zlikvidovat.

Dodatečná opatření pro členy osádky vozidla o nebezpečných vlastnostech nebezpečných věcí podle tříd a o činnostech za obvyklých okolností

<p>Látky podporující hoření</p>  <p>5.1</p>	Nebezpečí prudké reakce, vznícení a výbuchu ve styku se zápalnými nebo hořlavými látkami	Vyvarovat se smíchání s hořlavými nebo zápalnými látkami (např. pilinami).
<p>Organické peroxidy</p>  <p>5.2</p>	Nebezpečí exotermického rozkladu při zvýšených teplotách, styku s jinými látkami (jako jsou kyseliny, sloučeniny těžkých kovů nebo aminy), tření nebo otřesu. Toto může vést k vyvíjení škodlivých a hořlavých plynů nebo par nebo samovznícení.	Vyvarovat se smíchání s hořlavými nebo zápalnými látkami (např. pilinami).
<p>Toxické látky</p>  <p>6.1</p>	Nebezpečí otravy vdechnutím, dotykem s pokožkou nebo požitím. Nebezpečí pro vodní prostředí nebo kanalizační systém.	Použít nouzovou únikovou masku.
<p>Infekční látky</p>  <p>6.2</p>	Nebezpečí infekce. Mohou způsobit vážnou nemoc u lidí nebo zvířat. Nebezpečí pro vodní prostředí a kanalizační systém.	
<p>Radioaktivní látky</p>  <p>7A 7B 7C 7D</p>	Nebezpečí absorpce a vnějšího ozáření.	Omezit dobu expozice.
<p>Štěpné látky</p>  <p>7E</p>	Nebezpečí jaderné řetězové reakce.	
<p>Žiravé látky</p>  <p>8</p>	Nebezpečí popálenin poleptáním. Mohou prudce reagovat spolu vzájemně, s vodou a s jinými látkami. Rozlitá nebo rozsypaná látka může vyvíjet žiravé páry. Nebezpečí pro vodní prostředí nebo kanalizační systém.	
<p>Jiné nebezpečné látky a předměty</p>  <p>9</p>	Nebezpečí popálenin. Nebezpečí ohně. Nebezpečí výbuchu. Nebezpečí pro vodní prostředí nebo kanalizační systém.	

POZNÁMKA 1: Pro nebezpečné věci s více nebezpečnými vlastnostmi a pro smíšené náklady se musí dodržet všechna odpovídající opatření.

POZNÁMKA 2: Dodatečná opatření uvedená výše smějí být přizpůsobena tak, aby odrážela třídy nebezpečných věcí, které se mají přepravovat a jejich dopravní prostředky.

Dodatečné poučení pro členy osádky vozidla o nebezpečných vlastnostech nebezpečných věcí, naznačených značkami, a o činnostech za obvyklých okolností		
Značka	Charakteristiky nebezpečí	Dodatečná opatření
(1)	(2)	(3)
Látky ohrožující životní prostředí 	Nebezpečí pro vodní prostředí nebo kanalizační systém.	
Zahřáté látky 	Nebezpečí popálenin horkem.	Vyvarovat se kontaktu s horkými částmi dopravní jednotky a s rozlitou nebo rozsypanou látkou.

Výbava pro osobní a obecnou ochranu k provádění všeobecných činností a specifických nouzových činností s ohledem na nebezpečí, která musí být při přepravě ve vozidle podle oddílu 8.1.5 ADR

Následující výbava musí být při přepravě v dopravní jednotce:

- pro každé vozidlo zakládací klín, jehož velikost odpovídá maximální hmotnosti vozidla a průměru kola;
- dva stojací výstražné prostředky;
- kapalina pro výplach očí^a; a

pro každého člena osádky vozidla

- fluoreskující výstražná vesta;
- přenosná svítidla;
- pár ochranných rukavic; a
- ochrana očí.

Dodatečná výbava vyžadovaná pro určité třídy:

- nouzová úniková maska pro každého člena osádky vozidla musí být při přepravě ve vozidle pro čísla bezpečnostních značek 2.3 nebo 6.1;
- lopata^b;
- ucpávka kanalizační vpusti^b;
- sběrná nádoba^b.

^a Nevyžaduje se pro čísla bezpečnostních značek 1, 1.4, 1.5, 1.6, 2.1, 2.2 a 2.3.

^b Vyžaduje se jen pro tuhé látky a kapaliny s čísly bezpečnostních značek 3, 4.1, 4.3, 8 nebo 9.

5.4.4 Uchovávání informací o přepravě nebezpečných věcí

5.4.4.1 Odesílatel a dopravce musí uchovávat kopii přepravního dokladu k nebezpečným věcem a dodatečné informace a dokumentaci, jak je uvedena v ADR, po dobu nejméně tří měsíců.

5.4.4.2 Jsou-li dokumenty uchovávány v elektronické formě nebo v počítačovém systému, odesílatel a dopravce musí být schopni je reprodukovat v tištěné formě.

5.4.5. Příklad formuláře pro multimodální přepravu nebezpečných věcí

Příklad vzorového formuláře, který může být použit zároveň jako deklarace nebezpečných věcí a zároveň jako osvědčení o naložení kontejneru pro multimodální přepravu nebezpečných věcí.

KAPITOLA 5.5

ZVLÁŠTNÍ USTANOVENÍ

5.5.1 (Vypuštěno)

5.5.2 Zvláštní ustanovení pro zaplynované nákladní dopravní (přepravní) jednotky (UN 3359)

5.5.2.1 Všeobecně

5.5.2.1.1 Zaplynované nákladní dopravní (přepravní) jednotky (UN 3359), které neobsahují žádné jiné nebezpečné věci, nepodléhají žádným jiným ustanovením ADR, než jsou ustanovení tohoto oddílu.

„POZNÁMKA: Pro účely této kapitoly se pod pojmem nákladní dopravní (přepravní) jednotka rozumí vozidlo, kontejner, cisternový kontejner, přemístitelná cisterna nebo MEGC.

5.5.2.1.2 Jsou-li zaplynované nákladní dopravní (přepravní) jednotky naloženy nebezpečnými věcmi, navíc k zaplynovacímu prostředku, použijí se všechna ustanovení ADR týkající se těchto věcí (včetně označování velkými bezpečnostními značkami, značení a dokumentace) navíc k ustanovením tohoto oddílu.

5.5.2.1.3 Pro přepravu nákladu pod zaplynováním se musí použít pouze nákladní dopravní (přepravní) jednotky, které mohou být uzavřeny takovým způsobem, že je únik plynu omezen na minimum.

5.5.2.2 Školení

Osoby zabývající se manipulací se zaplynovanými nákladními dopravními (přepravními) jednotkami musí být vyškoleny přiměřeně ke svým odpovědnostem.

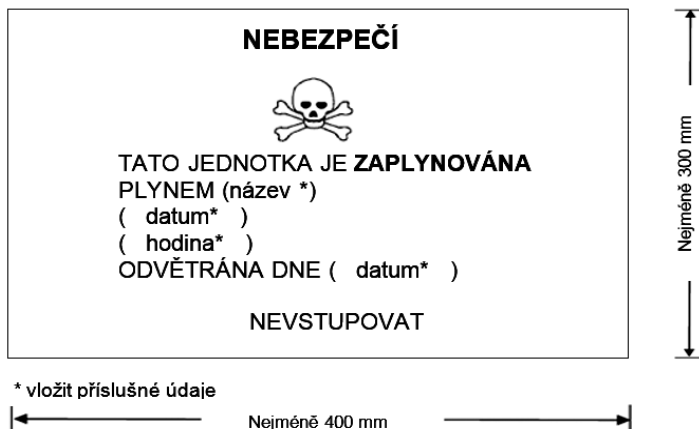

5.5.2.3 Označování

5.5.2.3.1 Zaplynovaná nákladní dopravní (přepravní) jednotka musí být označena výstražnou značkou, uvedenou v 5.5.2.3.2, na každém přístupovém místě tam, kde bude snadno viditelná osobami otevírajícími nákladní dopravní (přepravní) jednotku nebo do ní vstupujícími. Tato značka musí zůstat na nákladní dopravní (přepravní) jednotce, dokud nebyla provedena následující opatření:

- (a) zaplynovaná nákladní dopravní (přepravní) jednotka byla odvětrána, aby se odstranily škodlivé koncentrace zaplynovacího plynu; a
- (b) zaplynované věci nebo materiály byly vyloženy.

5.5.2.3.2 Výstražná značka pro zaplynovanou jednotku musí odpovídat obrázku 5.5.2.3.2

Obrázek 5.5.2.3.2

Výstražná značka pro zaplynovanou jednotku

Značka musí být pravoúhlá. Musí být minimálně 400 mm široká a 300 mm vysoká a šířka vnější čáry musí být 2 mm. Nápis musí být černé barvy na bílém podkladu s písmeny nejméně 25 mm vysokými. Tam, kde nejsou udány rozměry, musí všechny prvky proporcčně odpovídat uvedenému obrázku.

- 5.5.2.3.3** Jestliže byla zaplynovaná nákladní dopravní (přepravní) jednotka úplně vyvětrána buď otevřením dveří jednotky, nebo mechanickou ventilací po zaplynování, musí být datum odvětrání vyznačeno na výstražné značce pro zaplynovanou jednotku.
- 5.5.2.3.4** Jestliže byla zaplynovaná nákladní dopravní (přepravní) jednotka vyvětrána a vyložena, musí být výstražná značka pro zaplynovanou jednotku odstraněna.
- 5.5.2.3.5** Na zaplynovanou nákladní dopravní (přepravní) jednotku se nemusí umístit velké bezpečnostní značky podle vzoru č. 9 (viz 5.2.2.2.2), pokud nejsou vyžadovány pro jiné látky nebo předměty třídy 9, které jsou v této jednotce naloženy.

5.5.2.4 Dokumentace

- 5.5.2.4.1** Doklady spojené s přepravou nákladních dopravních (přepravních) jednotek, které byly zaplynovány a nebyly úplně vyvětrány před přepravou, musí obsahovat následující informace:

- „UN 3359, zaplynovaná nákladní dopravní (přepravní) jednotka, 9“, nebo „UN 3359, zaplynovaná nákladní dopravní (přepravní) jednotka, třída 9“;

- datum a čas zaplynování; a

- druh a množství použitého zaplynovacího prostředku.

Tyto údaje musí být napsány v oficiálním jazyce země odeslání, a pokud tímto jazykem není angličtina, francouzština nebo němčina, též v angličtině, francouzštině nebo němčině, pokud případné dohody uzavřené mezi zeměmi, jichž se přeprava týká, nestanoví jinak.

- 5.5.2.4.2** Doklady směřjí být v jakékoli formě za podmínky, že obsahují informace vyžadované v 5.5.2.4.1. Tyto informace musí být snadno identifikovatelné, čitelné a trvalé.
- 5.5.2.4.3** Musí být vypracovány pokyny pro likvidaci jakéhokoli zbytkového zaplynovacího prostředku včetně zaplynovacích zařízení (pokud jsou používána).
- 5.5.2.4.4** Doklad se nevyžaduje, jestliže byla zaplynovaná nákladní dopravní (přepravní) jednotka úplně vyvětrána a datum odvětrání bylo vyznačeno na výstražné značce (viz 5.5.2.3.3 a 5.5.2.3.4).

5.5.3 Zvláštní ustanovení platná pro kusy a vozidla a kontejnery obsahující látky představující riziko udušení, jsou-li používány pro účely chlazení nebo kondicionování (jako jsou suchý led (UN 1845), nebo dusík, hluboce zchlazený, kapalný (UN 1977) nebo argon, hluboce zchlazený, kapalný (UN 1951))

5.5.3.1 Rozsah platnosti

5.5.3.1.1 Tento oddíl se nevztahuje na látky, které mohou být používány pro účely chlazení nebo kondicionování, jsou-li přepravovány jako zásilka nebezpečných věcí. Jsou-li přepravovány jako zásilka, musí být tyto látky přepravovány pod příslušnou položkou tabulky A kapitoly 3.2 podle se ní spojených podmínek přepravy.

5.5.3.1.2 Tento oddíl se nevztahuje na plyny v chladicích okruzích.

5.5.3.1.3 Nebezpečné věci používané pro chlazení nebo kondicionování cisteren nebo MEGC během přepravy nepodléhají ustanovením tohoto oddílu.

5.5.3.1.4 Vozidla a kontejnery obsahující látky pro účely chlazení nebo kondicionování zahrnují vozidla a kontejnery obsahující látky pro účely chlazení a kondicionování uvnitř kusů a také vozidla a kontejnery s nebalenými látkami používanými pro účely chlazení nebo kondicionování.

5.5.3.1.5 Pododdíly 5.5.3.6 a 5.5.3.7 platí pouze tehdy, pokud existuje skutečné riziko udušení ve vozidle nebo kontejneru. Dotčení účastníci musí vyhodnotit toto riziko s ohledem na nebezpečí, které představuje látka používaná pro chlazení nebo kondicionování, množství přepravované látky, dobu trvání přepravy a použitého způsobu balení.

5.5.3.2 Všeobecně

5.5.3.2.1 Vozidla a kontejnery obsahující látky používané pro účely chlazení nebo kondicionování (jiné než zaplňování) během přepravy nepodléhají žádným jiným ustanovením ADR, než jsou ustanovení tohoto oddílu.

5.5.3.2.2 Jsou-li nebezpečné věci naloženy ve vozidlech nebo kontejnerech obsahující látku používanou pro účely chlazení nebo kondicionování, použijí se všechna ostatní ustanovení ADR vztahující se na tyto nebezpečné věci, navíc k ustanovením tohoto oddílu.

5.5.3.2.3 *(Vyhrazeno)*

5.5.3.2.4 Osoby zabývající se manipulací nebo přepravou vozidel a kontejnerů obsahující látky používané pro účely chlazení nebo kondicionování, musí být vyškoleny přiměřeně ke svým odpovědnostem.

5.5.3.3 Kusy obsahující chladivo nebo kondicionér

5.5.3.3.1 Balené nebezpečné věci vyžadující chlazení nebo kondicionování, přiřazené k pokynům pro balení P203, P620, P650, P800, P901 nebo P904 pododdílu 4.1.4.1, musí splňovat příslušné požadavky tohoto pokynu pro balení.

5.5.3.3.2 Pro balené nebezpečné věci vyžadující chlazení nebo kondicionování, přiřazené k jiným pokynům pro balení, musí být kusy schopny snášet velmi nízké teploty a nesmějí být poškozovány ani významně zeslabovány chladivem nebo kondicionérem. Kusy musí být konstruovány a vyrobeny tak, aby dovolovaly uvolnění plynu k zamezení nárůstu tlaku, který by mohl protrhnout obal. Nebezpečné věci musí být zabaleny takovým způsobem, aby se zamezilo pohybu po rozptýlení chladiva nebo kondicionéru.

5.5.3.3.3 Kusy obsahující chladivo nebo kondicionér musí být přepravovány v dobře větraných vozidlech a kontejnerech. Toto ustanovení se nepoužije, pokud jsou kusy přepravovány v izotermickém, chlazeném nebo chladicím a mrazicím zařízení, jak je stanoveno v Dohodě o mezinárodní přepravě zkazitelných potravin a o specializovaných prostředcích určených pro tyto přepravy (ATP).

5.5.3.4 Označování kusů obsahujících chladivo nebo kondicionér

5.5.3.4.1 Kusy obsahující nebezpečné věci používané pro chlazení nebo kondicionování musí být označeny pojmenováním těchto věcí uvedeným ve sloupci (2) tabulky A kapitoly 3.2, následovaným slovy „JAKO CHLADIVO“ nebo „JAKO KONDICIONÉR“, jak je to náležité, v úředním jazyce země původu a též, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

5.5.3.4.2 Označení musí být trvanlivé, čitelné a umístěné na takovém místě a takové velikosti v poměru ke kusu, aby bylo snadno viditelné.

5.5.3.5 Vozidla a kontejnery obsahující nebalený suchý led

5.5.3.5.1 Je-li suchý led použit v nebalené formě, nesmí přijít do přímého styku s kovovou konstrukcí vozidla nebo kontejneru, aby se zamezilo zkrěhnutí kovu. Musí být učiněna opatření k zajištění přiměřené izolace mezi suchým ledem a vozidlem nebo kontejnerem jejich oddělením mezerou o šířce nejméně 30 mm (např. použitím vhodných materiálů s nízkou tepelnou vodivostí, jako jsou dřevěná prkna, palety atd.).

5.5.3.5.2 Pokud je suchý uložen okolo kusů, musí být učiněna opatření k zajištění toho, že kusy zůstanou během přepravy v původní poloze poté, co se suchý led roztýlil.

5.5.3.6 Označování vozidel a kontejnerů

5.5.3.6.1 Vozidla a kontejnery obsahující nebezpečné věci používané pro účely chlazení nebo kondicionování musí být označeny výstražnou značkou, uvedenou v 5.5.3.6.2, umístěnou na každém přístupovém místě tam, kde bude snadno viditelná osobami otevírajícími vozidlo nebo kontejner nebo do nich vstupujícími. Tato značka musí zůstat na vozidle nebo kontejneru, dokud nebyla provedena následující opatření:

(a) Vozidlo nebo kontejner byl(o) odvětrán(o), aby se odstranily škodlivé koncentrace chladiva nebo kondicionéru; a

(b) Chlazené nebo kondicionované věci byly vyloženy.

5.5.3.6.2 Výstražná značka musí odpovídat obrázku 5.5.3.6.2

Obrázek 5.5.3.6.2

Výstražná značka chlazení/kondicionování pro vozidla a kontejnery

* Vložit pojmenování chladiva/kondicionéru uvedeného ve sloupci (2) tabulky A, kapitoly 3.2. Nápis musí být velkými písmeny o výšce nejméně 25 mm, vše musí být na jednom řádku. V případě, že je oficiální pojmenování pro přepravu příliš dlouhé, aby se vešlo do vymezeného prostoru, může být písmo zmenšeno na vhodnou maximální možnou velikost. Příklad: „OXID UHLÍČITÝ, TUHÝ“.

** Vložit „JAKO CHLADIVO“ nebo „JAKO KONDICIONÉR“, jak je to náležité. Nápis musí být velkými písmeny o výšce nejméně 25 mm, vše musí být na jednom řádku.

Výstražná značka musí být pravoúhlá. Musí být nejméně 150 mm široká a nejméně 250 mm vysoká. Slovo "POZOR" musí být v červené nebo bílé barvě s písmeny o výšce nejméně 25 mm. Tam, kde nejsou udány rozměry, musí všechny prvky proporcčně odpovídat uvedenému obrázku.

Slovo „POZOR“ a slova „JAKO CHLADIVO“ nebo „JAKO KONDICIONÉR“, jak je to náležité, musí být uvedeny v úředním jazyce země původu a pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

5.5.3.7 Dokumentace

5.5.3.7.1 Doklady (jako konosament, nákladový list nebo nákladní list CMR/CIM) spojené s přepravou vozidel nebo kontejnerů, obsahující nebo které obsahovaly látky pro účely chlazení nebo kondicionování a nebyly úplně vyvětrány před přepravou, musí obsahovat následující informace:

- (a) UN číslo s předřazenými písmeny „UN“; a
- (b) Pojmenování uvedené ve sloupci (2) tabulky A kapitoly 3.2, následované slovy „JAKO CHLADIVO“ nebo „JAKO KONDICIONÉR“, jak je to náležité, v úředním jazyce země původu a též, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

Například: UN 1845 OXID UHLIČITÝ, TUHÝ, JAKO CHLADIVO.

5.5.3.7.2 Přepravní doklad smí být v jakékoli formě za podmínky, že obsahuje informace vyžadované v 5.5.3.7.1. Tyto informace musí být snadno identifikovatelné, čitelné a trvalé.

ČÁST 6

POŽADAVKY NA KONSTRUKCI A ZKOUŠENÍ OBALŮ, VELKÝCH NÁDOB PRO VOLNĚ LOŽENÉ LÁTKY (IBC), VELKÝCH OBALŮ A CISTEREN

KAPITOLA 6.1

POŽADAVKY NA KONSTRUKCI A ZKOUŠENÍ OBALŮ

6.1.1 Všeobecně

6.1.1.1 Požadavky této kapitoly se nevztahují na:

- (a) Obaly obsahující radioaktivní materiál třídy 7, pokud není stanoveno jinak (viz 4.1.9.);
- (b) Obaly obsahující infekční látky třídy 6.2, pokud není stanoveno jinak (viz kapitola 6.3, Poznámka a pokyn pro balení P621 uvedené v 4.1.4.1);
- (c) Nádoby obsahující plyny třídy 2;
- (d) Obaly, u nichž hmotnost náplně (netto) přesahuje 400 kg;
- (e) Obaly na kapaliny, kromě skupinových obalů, s vnitřním objemem přesahujícím 450 litrů.

6.1.1.2 Požadavky na obaly uvedené v 6.1.4 jsou založeny na obalech běžně používaných. S ohledem na vědecký a technický pokrok, nejsou námitky proti používání obalů s odlišnou specifikací od uvedených v 6.1.4, pokud jsou stejně účinné, přijatelné pro příslušný orgán a schopné úspěšně vyhovět zkouškám popsaným v 6.1.1.3 a v 6.1.5. Jiné metody zkoušení než popsané v této kapitole jsou přípustné, pokud jsou rovnocenné a jsou uznány příslušným orgánem.

6.1.1.3 Každý obal určený pro kapaliny musí být podroben úspěšně zkoušce těsnosti a musí být schopen splnit přiměřenou úroveň zkoušek uvedenou v 6.1.5.4.3:

- (a) před prvním použitím pro přepravu;
- (b) po rekonstrukci nebo obnovení, před jeho opětovným použitím pro přepravu;

Pro tuto zkoušku nemusí být obaly vybaveny vlastními uzávěry.

Vnitřní nádoba kompozitních obalů může být zkoušena bez vnějšího obalu, pokud tím nejsou ovlivněny výsledky zkoušky.

Tato zkouška se nevyžaduje pro:

- vnitřní obaly skupinových obalů;
- vnitřní nádoby kompozitních obalů (sklo, porcelán nebo kamenina) označené znakem „RID/ADR“ podle pododdílu 6.1.3.1 (a) (ii);
- obaly z jemného plechu označené znakem „RID/ADR“ podle pododdílu 6.1.3.1 (a) (ii);

6.1.1.4 Obaly musí být vyrobeny, obnoveny a odzkoušeny podle programu zajištění kvality, přijatelný pro příslušný orgán, aby bylo zajištěno, že každý vyrobený obal splňuje požadavky této kapitoly.

POZNÁMKA: Norma ISO 16106:2006 „Obaly - Převážné obaly pro nebezpečné věci - Obaly pro nebezpečné věci, velké nádoby pro volně ložené látky (IBC) a velké obaly - Návody pro aplikaci normy ISO 9001“ - poskytuje přijatelný návod pro předepsané postupy.

6.1.1.5 Výrobci a následní distributoři obalů musí uživatelům poskytnout informace týkající se postupů, které je nutno dodržovat a popis typů a rozměrů uzávěrů (zahrnujíc v to i požadovaná těsnění) a jakékoliv další komponenty potřebné pro zabezpečení toho, aby obaly připravené k přepravě byly schopny projít jakýmkoliv aplikovatelnými zkouškami odolnosti uvedenými v této kapitole.

6.1.2 Kódování konstrukčních typů obalů**6.1.2.1 Kód sestává z:**

- (a) arabské číslice označující druh obalu, např. sud, kanystr atd., následované;
- (b) jedním nebo několika velkými latinskými písmeny označujícími druh materiálu, např. ocel, dřevo atd., následované v případě nutnosti;
- (c) arabskou číslicí označující kategorii obalu v rámci konstrukčního typu obalu.

6.1.2.2 Pro kompozitní obaly se použijí dvě velká latinská písmena na druhém místě kódu. První písmeno označuje materiál vnitřní nádoby a druhé písmeno označuje materiál vnějšího obalu.

6.1.2.3 U skupinových obalů včetně obalů pro látky třídy 6.2 se musí použít pouze kódové číslo pro vnější obal.

6.1.2.4 Písmena „T“, „V“ nebo „W“ mohou být uvedena za kódem obalu. Písmeno „T“ označuje záchranný obal odpovídající požadavkům uvedeným v 6.1.5.1.11. Písmeno „V“ označuje zvláštní obal odpovídající požadavkům uvedeným v 6.1.5.1.7. Písmeno „W“ označuje, že obal, ačkoli je téhož typu uvedeného v kódu, je vyroben podle specifikací odlišných od specifikací uvedených v 6.1.4 a je považován za ekvivalentní požadavkům uvedeným v 6.1.1.2.

6.1.2.5 Následující číslice se musí použít pro druhy obalů:

- 1. Sud
- 2. (Vyhrazeno)
- 3. Kanystr
- 4. Bedna
- 5. Pytel
- 6. Kompozitní obal
- 7. (Vyhrazeno)
- 8. Obaly z jemného plechu

6.1.2.6 Následující velká písmena se použijí pro druhy materiálu:

- A. Ocel (všechny druhy a povrchové úpravy);
- B. Hliník
- C. Dřevo přírodní
- D. Překližka
- F. Rekonstituované dřevo (jako dřevovláknité či dřevotřískové materiály)
- G. Lepenka
- H. Plast
- L. Textilní tkanina
- M. Papír vícevrstvý
- N. Kov (jiný než ocel nebo hliník)
- P. Sklo, porcelán nebo kamenina

POZNÁMKA: *Plastové materiály zahrnují také jiné polymerní materiály, jako je guma.*

6.1.2.7 následující tabulce jsou uvedeny kódy používané pro značení typu obalů v závislosti na druhu obalů, materiálu použitém pro jejich výrobu a jejich kategorii; současně se v ní odkazuje na pododdíly, kde jsou uvedeny příslušné požadavky:

Druh obalu	Materiál	Kategorie obalu	Kód	Pod-oddíl
1. Sudy	A Ocel	neodnímatelné víko	1A1	6.1.4.1
		odnímatelné víko	1A2	
	B. Hliník	neodnímatelné víko	1B1	6.1.4.2
		odnímatelné víko	1B2	
	D. Překližka		1D	6.1.4.5
	G. Lepenka		1G	6.1.4.7
	H. Plast	neodnímatelné víko	1H1	6.1.4.8
		odnímatelné víko	1H2	
	N. Kov, jiný než ocel nebo hliník	neodnímatelné víko	1N1	6.1.4.3
odnímatelné víko		1N2		
2.	(Vyhrazeno)			
3. Kanystry	A. Ocel	neodnímatelné víko	3A1	6.1.4.4
		odnímatelné víko	3A2	
	B. Hliník	neodnímatelné víko	3B1	6.1.4.4
		odnímatelné víko	3B2	
	H. Plast	neodnímatelné víko	3H1	6.1.4.8
		odnímatelné víko	3H2	
4. Bedny	A. Ocel		4A	6.1.4.14
	B. Hliník		4B	6.1.4.14
	C. Dřevo přírodní	běžné	4C1	6.1.4.9
		s prachotěsnými stěnami	4C2	
	D. Překližka		4D	6.1.4.10
	F. Rekonstituované dřevo		4F	6.1.4.11
	G. Lepenka		4G	6.1.4.12
	H. Plast	pěnový (lehčený)	4H1	6.1.4.13
		tuhý plast	4H2	
	N. Kov, kromě oceli a hliníku		4N	6.1.4.14
5. Pytle	H. Plastová tkanina	bez vnitřní vložky nebo povlaku	5H1	6.1.4.16
		prachotěsné	5H2	
		vodovzdorné	5H3	
	H. Plastová folie		5H4	6.1.4.17
	L. Textilní tkanina	bez vnitřní vložky nebo povlaku	5L1	6.1.4.15
		Prachotěsné	5L2	
		vodovzdorné	5L3	
	M. Papír	vícevrstvé	5M1	6.1.4.18
vícevrstvé, vodovzdorné		5M2		

Druh obalu	Materiál	Kategorie obalu	Kód	Pod-oddíl
6. Kompozitní	H. Plastová nádoba	s vnějším ocelovým sudem	6HA1	6.1.4.19
		s vnějším ocel. košem nebo bednou	6HA2	6.1.4.19
		s vnějším hliníkovým sudem	6HB1	6.1.4.19
		s vnějším hliníkovým košem nebo bednou	6HB2	6.1.4.19
		s vnější dřevěnou bednou	6HC	6.1.4.19
		s vnějším překližkovým sudem	6HD1	6.1.4.19
		s vnější překližkovou bednou	6HD2	6.1.4.19
		s vnějším lepenkovým sudem	6HG1	6.1.4.19
		s vnější lepenkovou bednou	6HG2	6.1.4.19
		s vnějším plastovým sudem	6HH1	6.1.4.19
		s vnější bednou z tuhého plastu tvaru bedny	6HH2	6.1.4.19
	P. Porcelánová, skleněná, nebo kameninová nádoba	s vnějším ocelovým sudem	6PA1	6.1.4.20
		s vnějším ocelovým košem nebo bednou	6PA2	6.1.4.20
		s vnějším hliníkovým sudem	6PB1	6.1.4.20
		s vnějším hliníkovým košem nebo bednou	6PB2	6.1.4.20
		s vnější dřevěnou bednou	6PC	6.1.4.20
		s vnějším překližkovým sudem	6PD1	6.1.4.20
		s vnějším proutěným košem	6PD2	6.1.4.20
		s vnějším lepenkovým sudem	6PG1	6.1.4.20
		s vnější lepenkovou bednou	6PG2	6.1.4.20
		s vnějším obalem z pěnového plastu	6PH1	6.1.4.20
		s vnějším obalem z tuhého plastu	6PH2	6.1.4.20
7. (Vyhrazeno)				
0. Obaly	A. Ocel	neodnímatelné víko	0A1	6.1.4.22
		odnímatelné víko	0A2	

6.1.3

Značení

POZNÁMKA 1: Označení UN kódem uvádí, že obal, který je jím opatřen, odpovídá plně odzkoušenému konstrukčnímu typu a že splňuje ustanovení této kapitoly, která se vztahují na jeho výrobu, nikoli však na jeho používání. Proto značka nezbytně nepotvrzuje, že obal smí být použit pro jakoukoli látku. Obecně druh obalu (např. ocelový sud), jeho nejvyšší vnitřní objem a /nebo nejvyšší hmotnost a další zvláštní požadavky jsou stanoveny pro každou látku v tabulce A kapitoly 3.2.

POZNÁMKA 2: Značení UN kódem je určeno jako pomůcka pro výrobce, obnovitele, uživatele obalů, dopravce a příslušné orgány. Originální značení je prostředkem výrobce k identifikaci typu a ukazatelem splnění zkušebních předpisů.

POZNÁMKA 3: UN kód neuvádí vždy úplné podrobnosti o úrovni zkoušek atd., které se mohou zohlednit např. odkazem na zkušební protokol, certifikát, atest nebo na registr úspěšně odzkoušených obalů. Například obal mající značení X nebo Y může být použit pro látku, kterým byla

přiřazena obalová skupina pro nižší stupeň nebezpečnosti s nejvyšší dovolenou hodnotou relativní hustoty¹ určenou s přihlédnutím ke koeficientu 1,5, popřípadě 2,25 (jak je to vhodné), uvedenému v požadavcích pro zkoušky obalů v 6.1.5. Například obal odzkoušený pro látku obalové skupiny I s relativní hustotou 1,2 může být použit pro látku obalové skupiny II s relativní hustotou 1,8 nebo pro látku obalové skupiny III s relativní hustotou 2,7, samozřejmě za podmínky, že mohou být ještě splněna všechna závazná kritéria kladená na obaly pro látky s vyšší relativní hustotou.

6.1.3.1

Každý obal určený pro používání podle ADR musí být označen UN kódem, který je trvanlivý, dobře čitelný a v rozměru přiměřeném velikosti obalu, umístěn tak aby byl dobře viditelný. Kusy o celkové (brutto) hmotnosti větší než 30 kg musí být opatřeny UN kódem nebo jeho duplikátem na vrchní nebo boční straně obalu. Písmena, číslice a znaky musejí být nejméně 12 mm vysoké, kromě obalů s obsahem 30 litrů nebo 30 kg nebo méně, kdy musí být nejméně 6 mm vysoké, a kromě obalů s obsahem 5 litrů nebo 5 kg nebo méně, kdy musí být přiměřeného rozměru.

UN kód musí uvádět:

(a)

- (i) Znak Spojených národů pro obaly

Tento znak nesmí být použit pro jiné účely než pro osvědčení, že obal, přemístitelná cisterna nebo MEGC splňuje příslušné požadavky kapitoly 6.1, 6.2, 6.3, 6.5, 6.6 nebo 6.72. Tento znak nesmí být použit pro obaly, které odpovídají jen zjednodušeným podmínkám v 6.1.1.3, 6.1.5.3.1 (e), 6.1.5.3.5 (c), 6.1.5.4, 6.1.5.5.1 a 6.1.5.6 (viz rovněž (ii) níže). Pro kovové obaly značené plastickým (reliéfním) způsobem, mohou být namísto znaku použita velká písmena „UN“; nebo

- (ii) Znak „RID/ADR“ pro kompozitní obaly (sklo, porcelán nebo kamenina) a obaly z jemného plechu splňující zjednodušené podmínky (viz 6.1.1.3, 6.1.5.3.1 (e), 6.1.5.3.5 (c), 6.1.5.4, 6.1.5.5.1 a 6.1.5.6)

POZNÁMKA: Obaly označené tímto znakem jsou schváleny pro železniční přepravy, silniční přepravy a přepravy po vnitrozemských vodních cestách, které jsou předmětem předpisů RID, ADR a ADN. Nejsou nutně přijímány pro přepravu jinými druhy dopravy, nebo pro přepravy silniční, železniční nebo vnitrozemskou vodní dopravou, které podléhají jiným předpisům.

- (b) Kód konstrukčního typu obalu podle 6.1.2;

(c) Dvoudílný kód

- (i) Písmeno označující obalovou(é) skupinu(y), pro kterou(é) byl konstrukční typ s úspěchem odzkoušen;

X pro obalové skupiny I, II a III;

Y pro obalové skupiny II a III;

Z pouze pro obalovou skupinu III;

- (ii) U obalů určených na kapaliny se uvede relativní hustota zaokrouhlená na jedno desetinné místo, pro kterou byl konstrukční typ odzkoušen; od tohoto údaje může být

¹ Relativní hustota (d) je považována za synonymum specifické hmotnosti a je v tomto textu používána.

² Tento symbol se také používá k potvrzení, že flexibilní objemové vaky schválené pro ostatní druhy dopravy jsou v souladu s požadavky uvedenými v kapitole 6.8 UN Modelového regulativu.

upuštěno, pokud relativní hustota nepřesahuje 1,2. Pro obaly na tuhé látky nebo vnitřní obaly nejvyšší celková (brutto) hmotnost v kilogramech.

- (iii) U obalů z jemného plechu označených znakem „RID/ADR“ podle pododdílu 6.1.3.1 a), (ii), určených pro kapaliny mající viskozitu při 23°C převyšující 200 mm²/s, se uvádí nejvyšší celková (brutto) hmotnost v kg;
- (d) U obalů pro tuhé látky nebo vnitřních obalů se uvádí písmeno „S“. U obalů na kapaliny (jiných než skupinové obaly) se uvádí hodnota hydraulického zkušebního tlaku v kPa, kterému obal odolal, zaokrouhlená dolů na nejbližších 10 kPa.

U obalů z jemného plechu označených písmeny „RID/ADR“ podle pododdílu 6.1.3.1 (a), (ii), určených pro kapaliny mající viskozitu při 23°C převyšující 200 mm²/s, se uvede písmeno „S“.
- (e) Poslední dvě číslice roku, během něhož byl obal vyroben. Obaly typu 1H a 3H musí být též vhodně označeny měsícem jejich výroby; tato část značení může být umístěna také na jiném místě než ostatní značení. Vhodný způsob je:

* Na tomto místě je možné zobrazit poslední dvě číslice roku výroby. V takovém případě musí být dvě číslice roku v označení typového schválení a ve vnitřním kruhu hodin identické.

POZNÁMKA: Jsou přijatelné i další metody, které poskytují minimální požadované informace trvanlivým, viditelným a čitelným způsobem.

- (f) Stát schvalující udělení UN kódu, uvedený rozlišovací značkou pro motorová vozidla v mezinárodním provozu³;
 - (g) Jméno výrobce nebo jiná identifikace obalu stanovená příslušným orgánem.
- 6.1.3.2 K doplnění trvalého označení UN kódem předepsaného v 6.1.3.1, musí být každý nový kovový sud o vnitřním objemu větším než 100 litrů, na dně opatřen značením popsáním v 6.1.3.1 a) až e) s trvanlivým údajem alespoň jmenovitá tloušťka použitého plechu v mm, (na 0,1 mm) provedeným např. vyražením. Jestliže jmenovitá tloušťka alespoň jedné ze dvou základen sudu je tenčí než jmenovitá tloušťka jeho pláště, jmenovitá tloušťka vrchní části, pláště a spodní základny musí být vyznačena na dnu v trvalé formě (např. vyražením), např. „1,0 - 1,2 -1,0“ nebo „0,9 - 1,0 - 1,0“. Jmenovitá tloušťka plechu musí být určena podle příslušné ISO normy, např. ISO 3574:1999 pro ocel. Značení uvedená v pododdílu 6.1.3.1 (f) a (g) se nesmějí použít v trvalé formě kromě případů uvedených v pododdílu 6.1.3.5.
- 6.1.3.3 Každý obal, kromě obalů uvedených v 6.1.3.2, který může být podroben obnově, při které by mohl být značení na obalu zničeno, musí mít značení uvedené v 6.1.3.1 (a) až (e) v trvalé formě. Značení je trvalé, jestliže je schopné odolat obnovovacímu procesu (provedeném např. vyražením). U obalů jiných než kovové sudy o vnitřním objemu větším než 100 litrů může toto trvalé značení nahradit trvanlivé značení předepsané v 6.1.3.1.

³ Rozlišovací značka pro motorová vozidla v mezinárodním provozu předepsaná Úmluvou o silničním provozu (Videň, 1968).

- 6.1.3.4 U rekonstruovaných kovových sudů, jestliže se nejedná o změnu typu obalu nebo náhradu nebo odnětí konstrukčních součástí, požadovaná značení nemusí být trvalá. Každý jiný rekonstruovaný kovový sud musí být opatřen značením uvedeným v 6.1.3.1 (a) až (e) v trvalé formě (např. vyražením) na vrchu nebo na boku.
- 6.1.3.5 Kovové sudy vyrobené z materiálů (např. nerezové oceli) umožňujících jejich opakované opětovné použití mohou být opatřeny značením uvedeným v 6.1.3.1 (f) a (g) v trvalé formě (např. vyražením).
- 6.1.3.6 UN kód obalu v souladu s 6.1.3.1 platí jen pro konstrukční typ nebo konstrukční řadu. Různé povrchové úpravy mohou být zahrnuty ve stejném konstrukčním typu.
- „Řadou konstrukčních typů“ se rozumějí obaly stejné konstrukce, stejné tloušťky stěny, stejného materiálu a stejného průřezu, které se liší od schváleného konstrukčního typu pouze menšími konstrukčními výškami.
- Uzávěry nádob musí být identifikovatelné s uzávěry uvedenými v protokole o zkoušce.
- 6.1.3.7 Prvky UN kódu musí být uvedeny v pořadí odstavců v 6.1.3.1; každý prvek značení požadovaného v těchto odstavcích a tam kde je to vhodné v 6.1.3.8 (h) až (j) musí být jasně oddělen např. lomítkem nebo mezerou tak, aby údaje byly snadno identifikovatelné, viz např. 6.1.3.11.
- Každé dodatečné značení schválené příslušným orgánem musí umožnit, aby části UN kódu byly správně identifikovány s odkazem na 6.1.3.1.
- 6.1.3.8 Po obnovení obalu musí obnovitel umístit na obal trvanlivé značení v tomto pořadí:
- (h) Stát, ve kterém byla obnova provedena, uvedený rozlišovací značkou pro motorová vozidla v mezinárodním provozu3;
 - (i) Jméno obnovitele nebo jiná identifikace obalu stanovená příslušným orgánem;
 - (j) Rok obnovy; písmeno „R“ a u každého obalu, který byl podroben a vyhověl zkoušce těsnosti podle pododdílu 6.1.3.1, dodatečně ještě písmeno „L“.
- 6.1.3.9 Jestliže po obnovení obalu již není značení požadované v 6.1.3.1 (a) až (d) ani na vrchu ani na boku kovového sudu, obnovitel musí toto značení doplnit trvanlivou formou uvedenou v 6.1.3.8 (h), (i) a (j). Tato značení nesmí udávat větší funkční schopnost, než pro kterou byl původní konstrukční typ obalu odzkoušen a označen.
- 6.1.3.10 Obaly vyrobené s recyklovaných plastů, jak je uvedeno v oddílu 1.2.1, musí být označeny „REC“. Toto značení musí být umístěno v blízkosti značení předepsaného v pododdílu 6.1.3.1.

6.1.3.11 **Příklady značení NOVÝCH obalů**

4G/Y145/S/02
NL/VL823

v 6.1.3.1 (a) (i), (b), (c), (d) a (e)

USA/RB/00 R v 6.1.3.8 (h), (i) a (j)

6.1.3.13 Příklad značení ZÁCHRANNÝCH obalů

1A2T/Y/300/S/01 v 6.1.3.1 (a) (i), (b), (c), (d) a (e)
USA/abc v 6.1.3.1 (f) a (g)

POZNÁMKA: Značení, jejichž příklady jsou uvedeny v pododdílech 6.1.3.11, 6.1.3.12 a 6.1.3.13, mohou být uvedena v jedné řádce nebo ve více řádcích, pokud je zachováno správné pořadí.

6.1.3.14 Certifikace

Umístěním UN kódu na obalu podle 6.1.3.1 se potvrzuje, že sériově vyráběné obaly odpovídají schválenému konstrukčnímu typu a že jsou splněny požadavky uvedené v dokladu o schválení (atestu).

6.1.4 Požadavky na obaly

6.1.1.0 Všeobecné požadavky

Jakékoliv propouštění látky obsažené v obale nesmí za normálních podmínek přepravy znamenat nebezpečí.

6.1.4.1 Ocelové sudy

1A1 s neodnímatelným víkem;

1A2 s odnímatelným víkem.

6.1.4.1.1 Plášť a základny musí být vyrobeny z ocelového plechu vhodného typu a přiměřené tloušťky ve vztahu k vnitřnímu objemu sudu a jeho očekávanému použití.

POZNÁMKA: v případě sudů z uhlíkaté oceli jsou vhodné oceli uvedené v ISO 3573:1999 „Tabule za tepla válcované uhlíkaté oceli v komerční a tažné kvalitě“ a ISO 3574:1999 „Tabule za studena válcované uhlíkaté oceli v komerční a tažné kvalitě“. Pro sudy z uhlíkaté oceli pod 100 litrů jsou také, kromě výše uvedených použitelné oceli uvedené v ISO 11949:1995 „Za studena válcované elektrolyticky pocínované plechy“, ISO 11950:1995 „Za studena válcovaná ocel elektrolyticky pochromovaná (potahovaná kyslíčnickem chromu - chromium/chromium oxide) a ISO 11951:1995 „Černý plech za studena válcovaný ve svitcích, pro výrobu pocínovaného, nebo elektrolyticky pochromovaného plechu“.

6.1.4.1.2 Spoje pláště sudů určených k naplnění více než 40 litrů kapalných látek musí být svařované. Spoje pláště sudů určených pro tuhé látky nebo k naplnění nejvýše 40 litrů kapalných látek musí být mechanicky lemované nebo svařované.

- 6.1.4.1.3 Spoje mezi základnami a pláštěm musí být mechanicky lemované (zdrápkované) nebo svařované. Mohou být použity samostatné zesilovací obruče.
- 6.1.4.1.4 Těleso sudu s vnitřním objemem větším než 60 litrů musí mít minimálně vytlačené valivé obruče pro válení nebo alternativně nejméně dvě oddělené valivé obruče. Má-li sud separátní valivé obruče, musí tyto přiléhat těsně k plášti a být upevněny tak, aby se nemohly posunout. Valivé obruče nesmějí být upevněny bodovými svary.
- 6.1.4.1.5 Průměr otvorů pro plnění, vyprazdňování a odvodu vzduchu v plášti nebo základnách sudů s neodnímatelným víkem (1A1) nesmí být větší než 7 cm. Sudy s většími otvory se považují za sudy s odnímatelným víkem (1A2). Uzávěry pro otevírání v plášti a základnách sudů musí být konstruovány a provedeny tak, aby se za normálních přepravních podmínek neuvolnily a sud zůstal těsný. Příruby uzávěrů mohou být mechanicky lemované (zdrápkované) nebo svařované. Pokud uzávěr není přirozeně těsný, musí být opatřen těsněním nebo jinými těsnícími prostředky.
- 6.1.4.1.6 Uzavírací zařízení sudů s odnímatelným víkem (1A2) musí být konstruována a provedena tak, aby se za normálních přepravních podmínek neuvolnila a sud zůstal těsný. Odnímatelná víka musí být opatřena těsněním nebo jinými těsnícími prostředky.
- 6.1.4.1.7 Pokud materiály použité pro plášť, základny, uzávěry a příslušenství nejsou snášlivé s přepravovaným obsahem, musí být použit vhodný vnitřní ochranný povlak nebo úprava. Tyto povlaky nebo úpravy si musí zachovat své ochranné vlastnosti za normálních podmínek přepravy.
- 6.1.4.1.8 Nejvyšší vnitřní objem sudů: 450 litrů.
- 6.1.4.1.9 Nejvyšší čistá (netto) hmotnost: 400 kg.
- 6.1.4.2 Hliníkové sudy**
- 1B1 s neodnímatelným víkem;
- 1B2 s odnímatelným víkem.
- 6.1.4.2.1 Plášť a dna musí být z hliníku se stupněm čistoty nejméně 99 % nebo z vhodné hliníkové slitiny. Použitý materiál musí být vhodného typu a přiměřené tloušťky přizpůsobenými vnitřnímu objemu a účelu použití sudu.
- 6.1.4.2.2 Všechny spoje musejí být svařované. Pokud existují spoje po obvodu základen, musí být opatřeny samostatnými zesilovacími obručemi.
- 6.1.4.2.3 Plášť sudu s vnitřním objemem větším než 60 litrů musí mít obecně vytlačené valivé obruče nebo alternativně nejméně dvě separátní valivé obruče. Má-li sud separátní obruče, musí tyto přiléhat těsně k plášti a být upevněny tak, aby se nemohly posunout. Separátní valivé obruče nesmějí být upevněny bodovými svary.
- 6.1.4.2.4 Průměr otvorů pro plnění, vyprazdňování a odvodu vzduchu v plášti nebo základnách sudů s neodnímatelným víkem (1B1) nesmí být větší než 7 cm. Sudy s většími otvory se považují za sudy s odnímatelným víkem (1B2). Uzávěry otvorů v plášti a základnách sudů musí být konstruovány a provedeny tak, aby zůstaly bezpečné a těsné za normálních přepravních podmínek. Příruby uzávěrů mohou být mechanicky lemované (zdrápkované) nebo svařované. Odnímatelná víka musí být opatřena těsněním nebo jinými těsnícími prostředky, pokud uzávěry nejsou přirozeně těsné.
- 6.1.4.2.5 Uzavírací zařízení sudů s odnímatelným víkem (1B2) musí být konstruována a provedena tak, aby zůstala bezpečná a aby sudy zůstaly za normálních přepravních podmínek těsné. Odnímatelná víka musí být opatřena těsněním nebo jinými těsnícími prostředky.
- 6.1.4.2.6 Nejvyšší vnitřní objem sudů: 450 litrů.
- 6.1.4.2.7 Nejvyšší čistá (netto) hmotnost: 400 kg.

6.1.4.3 Sudy z kovu jiného než hliník nebo ocel

1N1 s neodnímatelným víkem;

1N2 s odnímatelným víkem.

6.1.4.3.1 Plášť a základny musí být vyrobeny z kovu nebo slitiny kovů jiných než ocel nebo hliník. Použitý materiál musí být vhodného typu a přiměřené tloušťky přizpůsobenými vnitřnímu objemu a účelu použití sudu.

6.1.4.3.2 Pokud existují spoje po obvodu základen, musí být opatřeny samostatnými zesilovacími obručemi. Všechny švy, pokud jsou, musejí být spojeny (svařeny, spájeny atd.) technickou metodou pro použití kov nebo slitinu kovů.

6.1.4.3.3 Plášť sudu s vnitřním objemem větším než 60 litrů musí mít obecně vytlačené valivé obruče nebo alternativně nejméně dvě separátní valivé obruče. Má-li sud separátní obruče, musí tyto přiléhat těsně k plášti a být upevněny tak, aby se nemohly posunout. Separátní valivé obruče nesmějí být upevněny bodovými svary.

6.1.4.3.4 Průměr otvorů pro plnění, vyprazdňování a odvzdušnění v plášti nebo základnách sudů s neodnímatelným víkem (1N1) nesmí být větší než 7 cm. Sudy s většími otvory se považují za sudy s odnímatelným víkem (1N2). Uzávěry otvorů v plášti a základnách sudů musí být konstruovány a provedeny tak, aby se za normálních přepravních podmínek zůstaly bezpečné a těsné. Příruby uzávěrů mohou být mechanicky lemované (zdrápkované) nebo svařované. Švové spoje musí být provedeny v souladu s technickým stavem a úrovní znalostí o daném kovu tak aby byly bezpečné a těsné. Víka musí být opatřena těsněním nebo jinými těsnícími prostředky, pokud uzávěry nejsou přirozeně těsné.

6.1.4.3.5 Uzávěry sudů s odnímatelným víkem (1N2) musí být konstruovány a provedeny tak, aby se za normálních přepravních podmínek zůstaly bezpečné a těsné. Odnímatelná víka musí být opatřena těsněním nebo jinými těsnícími prostředky.

6.1.4.3.6 Nejvyšší vnitřní objem sudů: 450 litrů.

6.1.4.3.7 Nejvyšší čistá (netto) hmotnost: 400 kg.

6.1.4.4 Ocelové nebo hliníkové kanystry

3A1 z oceli s neodnímatelným víkem

3A2 z oceli s odnímatelným víkem

3B1 z hliníku s neodnímatelným víkem

3B2 z hliníku s odnímatelným víkem

6.1.4.4.1 Plášť a dna musí být vyrobeny z ocelového plechu, z hliníku nejméně 99 % čistoty základní hliníkové slitiny. Materiál musí být vhodného typu a přiměřené tloušťky vzhledem k vnitřnímu objemu a účelu použití kanystru.

6.1.4.4.2 Švy všech kanystrů musí být mechanicky lemovány nebo svařeny. Spoje pláště kanystrů určených k naplnění více než 40 litrů kapalných látek musí být svařované. Švy pláště kanystrů určených k naplnění až do 40 litrů kapalných látek musí být mechanicky zalemovány nebo svařeny. U hliníkových kanystrů musí být všechny švy svařované. Pokud na kanystru jsou spojovací švy (plášť se dnem), musí být zesíleny použitím samostatného prstence.

6.1.4.4.3 Průměr otvorů kanystrů (3A1 a 3B1) nesmí být větší než 7 cm. Kanystry s většími otvory se považují za kanystry s odnímatelným víkem (3A2 a 3B2). Uzávěry musí být konstruovány tak, aby zůstaly bezpečné a těsné za normálních podmínek přepravy. Těsnění nebo jiné těsnící prvky musí být použity, pokud samotné uzávěry nejsou přirozeně těsné.

6.1.4.4.4 Pokud materiály použité pro pláště, základny, uzávěry a příslušenství nejsou snášenlivé s přepravovaným obsahem, musí být použit vhodný vnitřní ochranný povlak nebo úprava. Tyto povlaky nebo úpravy si musí zachovat své ochranné vlastnosti za normálních podmínek přepravy

6.1.4.4.5 Nejvyšší vnitřní objem kanystru: 60 litrů.

6.1.4.4.6 Nejvyšší čistá (netto) hmotnost: 120 kg.

6.1.4.5 Překližkové sudy

1 D

6.1.4.5.1 Použité dřevo musí být přirozeně stárnuté, obchodně obvykle suché a bez vad, které by mohly ovlivnit použitelnost sudu k danému účelu. Pokud se ke zhotovení základen použije jiný materiál než překližka, musí být tento materiál z hlediska kvality překližce rovnocenný.

6.1.4.5.2 Plášť sudu musí být vyroben minimálně z dvouvrstvé překližky a základny z překližky třívrstvé. Vrstvy ložené křížem musí být pevně slepeny vodovzdorným lepidlem.

6.1.4.5.3 Plášť a základny sudu a jeho spoje musí být navrženy s ohledem na jeho vnitřní objem a použití.

6.1.4.5.4 K zamezení prosypu obsahu se víka potáhnou sulfátovým papírem (kraftovým papírem) nebo jiným rovnocenným materiálem, který se musí k víku bezpečně připevnit a po celém obvodu víka musí přesahovat přes jeho okraj.

6.1.4.5.5 Nejvyšší vnitřní objem sudů: 250 litrů;

6.1.4.5.6 Nejvyšší čistá (netto) hmotnost: 400 kg.

6.1.4.6 (Vypuštěno)

6.1.4.7 Lepenkové sudy

1 G

6.1.4.7.1 Plášť sudu se musí sestávat z více vrstev sulfátového papíru (kraftový papír) nebo hladké lepenky (nikoliv vlnité), které jsou spolu pevně slepeny nebo laminovány, a může obsahovat jednu nebo více ochranných vrstev bitumenu, voskovaného sulfátového papíru, kovové fólie, plastu atd.

6.1.4.7.2 Základny musí být z přírodního dřeva, lepenky, kovu, překližky, plastu nebo jiného vhodného materiálu a mohou být opatřeny jednou nebo více ochrannými vrstvami živice, voskovaného sulfátového papíru (kraftový), kovové fólie, plastu atd.

6.1.4.7.3 Konstrukce pláště sudu, dna a jejich spojení musí být přizpůsobeny vnitřnímu objemu sudu a účelu jeho použití.

6.1.4.7.4 Kompletní obal musí být dostatečně odolný proti vodě, aby za normálních přepravních podmínek nedošlo k odlepení (odštěpení) vrstev.

6.1.4.7.5 Nejvyšší vnitřní objem sudů: 450 litrů.

6.1.4.7.6 Nejvyšší čistá (netto) hmotnost: 400 kg.

6.1.4.8 Plastové sudy a kanystry

1H1 sudy s neodnímatelným víkem

1H2 sudy s odnímatelným víkem

3H1 kanystry s neodnímatelným víkem

3H2 kanystry s odnímatelným víkem

- 6.1.4.8.1 Obal musí být vyroben z vhodného plastu a být přiměřené pevnosti s ohledem na vnitřní objem a účel použití. Kromě recyklovaných plastů, jak je uvedeno v 1.2.1, nesmějí být pro nové obaly použity žádné jiné odpadní materiály než zbytky nebo rozdrčené odpady ze stejného výrobního postupu. Obal musí být přiměřeně odolný proti stárnutí a degradaci způsobenou buď přepravovanou látkou nebo ultrafialovým zářením. Za normálních podmínek přepravy nesmí jakékoli proniknutí látky obsažené v obalu nebo recyklované plasty použité pro výrobu nového obalu být příčinou ohrožení bezpečnosti přepravy.
- 6.1.4.8.2 Je-li nutná ochrana před ultrafialovým zářením, pak musí být tato provedena přimísením sazí nebo jiných vhodných pigmentů nebo inhibitorů. Tyto přísady musí být snášitelné s obsahem a musí zachovat svoji účinnost po přípustnou dobu životnosti obalu. Při použití sazí, pigmentů nebo inhibitorů odlišných od těch, které byly použity při zhotovení schváleného konstrukčního typu, může být od opakování zkoušek upuštěno, nepřekračuje-li jejich podíl u sazí 2 % hmotnostně nebo u pigmentů 3 % hmotnostně; podíl inhibitorů proti ultrafialovému záření není omezen.
- 6.1.4.8.3 Přísady k jiným účelům než k ochraně před ultrafialovým zářením smějí být do plastu přimíseny za předpokladu, že nebudou mít nepříznivý vliv na chemické a fyzikální vlastnosti materiálu obalu. V tomto případě je možno upustit od opakování zkoušky.
- 6.1.4.8.4 Tloušťka stěny na každém místě obalu musí být přizpůsobena vnitřnímu objemu a účelu jeho použití, přičemž musí být vzato v úvahu namáhání jednotlivých míst.
- 6.1.4.8.5 Průměr otvorů pro plnění, vyprazdňování a odvzdušňování v plášti nebo základnách sudů s neodnímatelným víkem (1H1) a kanystrů s neodnímatelným víkem (3H1) nesmí být větší než 7 cm. Sudy a kanystry s většími otvory se považují za sudy a kanystry s odnímatelným víkem (1H2,3H2). Uzávěry otvorů v plášti a základnách sudů a kanystrů musí být konstruovány a provedeny tak, aby zůstaly bezpečné a těsné za normálních podmínek přepravy. Uzávěry musí být opatřeny těsněním nebo jinými těsnicími prostředky, pokud uzávěry nejsou přirozeně těsné.
- 6.1.4.8.6 Uzávěry sudů a kanystrů s odnímatelným víkem (1H2 a 3H2) musí být konstruovány tak, aby zůstaly bezpečné a nepropustné za normálních podmínek přepravy. Těsnění musí být použita u všech odnímatelných vík, ledaže by konstrukce sudu nebo kanystru byla taková, že odnímatelná víka jsou skutečně bezpečná a sud nebo kanystr je přirozeně nepropustný.
- 6.1.4.8.7 Nejvyšší dovolená propustnost pro hořlavé kapaliny činí 0,008 g/l.h při 23 °C (viz 6.1.5.7).
- 6.1.4.8.8 Pokud je použit recyklovaný materiál pro výrobu nového obalu, specifické vlastnosti recyklovaného materiálu musí být zajištěny a dokumentovány pravidelně jako část programu zajištění kvality uznaného příslušným orgánem. Program zajištění kvality musí zahrnovat zprávu o vlastním předběžném roztřídění a ověření, že každá vsádka recyklovaného plastového materiálu má stejnou rychlost toku taveniny, hustotu a pevnost v tahu stejně jako konstrukční typ vyrobený z takového recyklovaného materiálu. Tato nutnost zahrnuje znalost materiálu obalu, ze kterého byly recyklované plasty odvozeny, jakož i znalost původních obsahů těchto obalů, pokud by tento původní obsah mohl snížit schopnost nového obalu vyrobeného s použitím tohoto materiálu. Kromě toho program zajištění kvality výrobce obalu podle 6.1.1.4 musí zahrnovat provedení mechanického zkoušení konstrukčního typu uvedeného v 6.1.5 na obalech vyrobených z každé dávky recyklovaného plastového materiálu. Při tomto zkoušení může být odolnost vůči stohování ověřena vhodnou dynamickou zkouškou stlačením namísto statické zkoušky zatížením.
- POZNÁMKA:** ISO 16103:2005 – „Obaly – Přeprava obalů pro nebezpečné látky recyklované plasty“, poskytuje dodatečný návod na postupy, které je nutno dodržovat při schvalování použití recyklovaných plastů.
- 6.1.4.8.9 Nejvyšší vnitřní objem sudů a kanystrů: 1H1 a 1H2: 450 litrů; 3H1 a 3H2: 60 litrů.
- 6.1.4.8.10 Nejvyšší čistá (netto) hmotnost- 1H1 a 1H2: 400 kg; 3H1 a 3H2: 120 kg.

6.1.4.9 *Bedny z přírodního dřeva*

4C1 jednoduché;

4C2 s prachotěsnými stěnami.

6.1.4.9.1 Použité dřevo musí být přírodně vyzrálé, vysušené a bez vad, které by mohly podstatně zmenšit odolnost kterékoli části bedny. Pevnost použitého materiálu a konstrukce bedny musí být přizpůsobeny vnitřnímu objemu bedny a jejímu použití. Vrch a spodek mohou být z vodovzdorných velkoplošných materiálů z rekonstituovaného dřeva, jako jsou dřevotřískové desky nebo dřevovláknité desky nebo jiný vhodný druh.

6.1.4.9.2 Spoje musí být odolné proti vibracím vznikajícím během normálních přepravních podmínek. Je třeba se vyhnout hřebikování ve směru vláken dřeva na konci přířezů. Pro spoje, které jsou pravděpodobně nejvíce namáhány, musí být použito zahnutí hřebíků, hřeby nýtovací nebo vrutové (s kruhovým pohybem při zatlačování) nebo jiné rovnocenné spojení.

6.1.4.9.3 Bedny 4C2: Každý díl bedny musí být z jednoho kusu nebo být tomuto rovnocenný. Díly se považují za rovnocenné dílům z jednoho kusu, jsou-li přířezy spojeny jednou z následujících metod: Lindermanovo spojení (spoj typu na rybinu), spojení na pero a drážku, spojení na polodrážku nebo na tupý spoj s nejméně dvěma vlnovitými kovovými upevňovacími prvky pro každý spoj.

6.1.4.9.4 Nejvyšší čistá (netto) hmotnost: 400 kg.

6.1.4.10 *Překližkové bedny*

4 D

6.1.4.10.1 Použitá překližka musí sestávat nejméně ze tří vrstev. Musí být vyrobena z dýhy z přírodně stárnutého dřeva loupané nebo řezané, vyschlé a bez vad, které by mohly snížit pevnost bedny. Pevnost použitého materiálu a konstrukční metoda musejí být přiměřené vnitřnímu objemu a očekávanému účelu použití bedny. Všechny vrstvy překližky musí být navzájem slepeny vodovzdorným lepidlem. Při konstrukci beden mohou být společně s překližkou použity i ostatní jiné vhodné materiály. Bedny musí být pevně sbity hřebíky, nebo zabezpečeny v rohových a hranových spoích, nebo kompletovány stejně vhodnými prostředky

6.1.4.10.2 Nejvyšší čistá (netto) hmotnost: 400 kg.

6.1.4.11 *Bedny z rekonstituovaného dřeva*

4 F

6.1.4.11.1 Stěny beden musí být z vodovzdorných materiálů jako dřevotřískové nebo dřevovláknité desky, nebo z jiných vhodných materiálů. Pevnost materiálů a konstrukce beden musí být přizpůsobeny vnitřnímu objemu a účelu jejich použití.

6.1.4.11.2 Ostatní části beden mohou být zhotoveny z jiného vhodného materiálu.

6.1.4.11.3 Bedny musí být bezpečně spojeny vhodnými prostředky.

6.1.4.11.4 Nejvyšší čistá (netto) hmotnost: 400 kg.

6.1.4.12 *Lepenkové bedny*

4 G

6.1.4.12.1 Bedny musí být zhotoveny z pevné hladké lepenky nebo tří a vícevrstvé vlnité lepenky dobré kvality, přizpůsobené vnitřnímu objemu a účelu použití beden. Odolnost vnějšího povrchu proti vodě musí být taková, aby zvýšení hmotnosti během zkoušky absorpce vody po dobu 30 minut metodou Cobb nečinilo více než 155 g/m² (podle normy ISO 535:1991). Lepenka musí mít odpovídající kvalitu

pevnosti v ohybu. Lepenka musí být formátována bez pořezání - trhlin a rylována tak, že se při kompletaci obalu nesmí v rylování lámat či na povrchu popraskat, nebo nepatříčně ohýbat. Vlny vlnité lepenky musí být pevně slepeny s vnější vrstvou.

- 6.1.4.12.2 Hrany beden mohou být opatřeny dřevěným rámem nebo mohou být celé ze dřeva nebo z jiného vhodného materiálu. Mohou být použity zesilovací lišty ze dřeva nebo z jiného vhodného materiálu.
- 6.1.4.12.3 Výrobní spoje pláště bedny musí být lepeny lepicí páskou, přesazeny a slepeny nebo přesazeny a sešity kovovými sponami. Přepletované spoje musí mít odpovídající přesah.
- 6.1.4.12.4 Když je uzavření provedeno slepením, nebo přelepením lepicí páskou musí být použito vodovzdorné lepidlo.
- 6.1.4.12.5 Bedny musí být konstruovány tak, aby dobře vyhovovaly obsahu.
- 6.1.4.12.6 Nejvyšší čistá (netto) hmotnost: 400 kg.

6.1.4.13 Plastové bedny

4H1 Bedny z pěnového plastu

4H2 Bedny z tuhého plastu

- 6.1.4.13.1 Bedny musí být zhotoveny z vhodných plastů a jejich pevnost musí být v souladu s vnitřním objemem a účelem jejich použití. Bedny musí být přiměřeně odolné vůči stárnutí a proti degradaci způsobené přepravovanou látkou nebo ultrafialovým zářením.
- 6.1.4.13.2 Bedny z pěnového plastu se musí sestávat ze dvou vytvarovaných dílů, spodního dílu s dutinami pro vnitřní obaly a horního dílu, který dolní díl překrývá a do něho zapadá. Horní a spodní díly musí být konstruovány tak, aby do nich vnitřní obaly těsně zapadaly. Uzávěry vnitřních obalů nesmějí přijít do styku s vnitřním povrchem horního dílu bedny.
- 6.1.4.13.3 Pro přepravu musí být bedny z pěnového plastu uzavřeny samolepicí páskou, která musí mít dostatečnou pevnost v tahu, aby se zabránilo otevření bedny. Lepicí páska musí být odolná proti povětrnostním vlivům a lepidlo se musí snášet s lehčeným plastem bedny. Jiné systémy uzavření se mohou použít za předpokladu, že mají nejméně stejnou účinnost.
- 6.1.4.13.4 U beden z tuhého plastu musí být ochrana proti ultrafialovému záření, je-li požadována, provedena přímísením sazí nebo jiných vhodných pigmentů nebo inhibitorů do materiálu. Tyto přísady se musí snášet s obsahem bedny a musí si zachovat svou účinnost po celou dobu životnosti bedny. Při užití sazí, pigmentů nebo inhibitorů odlišných od těch, které byly použity při zhotovení zkoušeného konstrukčního typu, může být upuštěno od opakování zkoušek, pokud podíl sazí nepřekračuje 2 % hm., nebo jestliže podíl pigmentů nepřekračuje 3 % hm., podíl inhibitorů proti ultrafialovému záření není omezen.
- 6.1.4.13.5 Přísady k jiným účelům než k ochraně proti ultrafialovému záření smějí být k plastu pro výrobu beden (4H1 a 4H2) přimíseny za předpokladu, že nepříznivě neovlivní chemické a fyzikální vlastnosti materiálu bedny. V tomto případě je možno upustit od opakování zkoušek.
- 6.1.4.13.6 Bedny z tuhého plastu musí mít uzavírací zařízení z vhodného materiálu dostatečné pevnosti, konstruované tak, aby bylo zabráněno nechtěnému otevření.
- 6.1.4.13.7 Pokud je použit recyklovaný materiál pro výrobu nového obalu, specifické vlastnosti recyklovaného materiálu musí být zajištěny a dokumentovány pravidelně jako část programu zajištění kvality uznávaného příslušným orgánem. Program zajištění kvality musí zahrnovat zprávu o vlastním předběžném roztřídění a ověření, že každá vsádka recyklovaného plastového materiálu má hodnotu rychlosti toku taveniny, hustoty a pevnosti v tahu stejnou jako konstrukční typ vyrobený z téhož recyklovaného materiálu. Tato nutnost zahrnuje znalost materiálu obalu, ze kterého byly recyklované plasty odvozeny, jakož i znalost původních obsahů těchto obalů, pokud by tento původní obsah mohl snížit schopnost nového obalu vyrobeného s použitím tohoto materiálu. Následně, výrobcův program

zajištění kvality obalů dle 6.1.1.4 musí zahrnovat provedení mechanického zkoušení konstrukčního typu v 6.1.5 na obalech vyrobených z každé vsádky recyklovaného plastového materiálu. Při této zkoušce může být odolnost vůči stohování ověřena vhodnou dynamickou tlakovou zkouškou namísto statické zkoušky zatížením.

- 6.1.4.13.8 Nejvyšší čistá (netto) hmotnost: 4H1: 60 kg;
4H2: 400 kg.

6.1.4.14 Ocelové, hliníkové nebo jiné kovové bedny

- 4A bedny z oceli
4B bedny z hliníku
4N kovové bedny, jiné než z oceli nebo hliníku

- 6.1.4.14.1 Pevnost kovu a konstrukce bedny musí být přizpůsobeny vnitřnímu objemu a účelu jejího použití.

- 6.1.4.14.2 Bedny musí být, pokud je to požadováno, vyloženy lepenkou nebo plstěnými přířezy, nebo musí být opatřeny vnitřní vložkou nebo povlakem z vhodného materiálu. Použijí-li se dvojité lemovaná (zdrápkovaná) kovová vložka, musí se učinit opatření k zamezení pronikání látek zvláště výbušných do stykových spár lemů.

- 6.1.4.14.3 Uzávěry mohou být jakéhokoli vhodného typu; musí však za normálních přepravních podmínek zůstat bezpečné.

- 6.1.4.14.4 Nejvyšší čistá (netto) hmotnost: 400 kg.

6.1.4.15 Textilní pytle

- 5L1 bez vnitřní vložky nebo povlaku
5L2 prachotěsné
5L3 vodovzdorné

- 6.1.4.15.1 Použitá tkanina musí být dobré jakosti. Pevnost tkaniny a provedení pytle musí být v souladu s vnitřním objemem pytle a účelu jeho použití.

- 6.1.4.15.2 Pytle prachotěsné 5L2: Pytel musí být vyroben jako prachotěsný, např. pomocí:

- (a) papíru přilepeného na vnitřní stranu pytle vodovzdorným lepidlem, jako je bitumen (dehtový papír); nebo
(b) fólie z plastu zakotvené na vnitřní stranu pytle; nebo
(c) jedné nebo více vnitřních papírových nebo plastových vložek

- 6.1.4.15.3 Pytle vodovzdorné 5L3: k zabránění vstupu vlhkosti musí být pytel vodotěsný, např. použitím:

- (a) samostatných vnitřních vložek z vodovzdorného papíru (např. voskovaného sulfátového „kraft“ papíru, dehtového papíru nebo plastem potahovaného sulfátového papíru); nebo
(b) plastového filmu na vnitřní straně pytle; nebo
(c) jedné nebo více plastových vnitřních vložek.

- 6.1.4.15.4 Nejvyšší čistá (netto) hmotnost: 50 kg.

6.1.4.16 Tkané plastové pytle

- 5H1 bez vnitřní vložky nebo bez vnitřního povlaku

5H2 prachotěsné

5H3 vodovzdorné.

6.1.4.16.1 Pytle musí být vyrobeny z tažených pásů nebo tažených jednotlivých vláken z vhodného plastu. Pevnost použitého materiálu a provedení pytle musí být přizpůsobeny vnitřnímu objemu pytle a účelu jeho použití.

6.1.4.16.2 Je-li tkanina tkaná naplocho, musí být pytle zhotoveny sešitím nebo jiným způsobem zajišťujícím uzavření dna a jedné strany. Je-li tkanina vyrobena jako hadice, musí se pytel vytvořit sešitím, tkaním (dna), nebo jiným způsobem s rovnocennou odolností.

6.1.4.16.3 Pytle prachotěsné, 5H2: Pytel musí být vyroben jako prachotěsný, např. pomocí:

- (a) papíru nebo plastového filmu zakotveného na vnitřní straně pytle; nebo
- (b) jedné nebo více samostatných vnitřních vložek z papíru nebo z plastu.

6.1.4.16.4 Pytle vodovzdorné 5H3: k zábraně vniknutí vlhkosti, pytel musí být k vodotěsný upravený např. pomocí:

- (a) samostatných vnitřních vložek z vodovzdorného papíru (např. sulfátový papír „kraft“, voskovaný, oboustranně dehtovaný nebo potažený vrstvou plastu); nebo
- (b) plastového filmu zakotveného na vnitřním nebo vnějším povrchu pytle; nebo
- (c) jedné nebo více vnitřních plastových vložek.

6.1.4.16.5 Nejvyšší čistá (netto) hmotnost: 50 kg.

6.1.4.17 *Pytle z plastové fólie*

5H4

6.1.4.17.1 Pytle musí být vyrobeny z vhodného plastu. Pevnost použitého materiálu a provedení pytle musí být přizpůsobeny vnitřnímu objemu pytle a účelu jeho použití. Spoje a uzávěry musí odolávat tlakům a nárazům, které se vyskytují za normálních přepravních podmínek.

6.1.4.17.2 Nejvyšší čistá (netto) hmotnost: 50 kg.

6.1.4.18 *Papírové pytle*

5M1 vícevrstvé

5M2 vícevrstvé, vodovzdorné

6.1.4.18.1 Pytle musí být vyrobeny z vhodného sulfátového papíru „kraft“ nebo z rovnocenného papíru, nejméně ve třech vrstvách, střední vrstva může být spojena s vnější vrstvou přilepením síťové tkaniny. Pevnost papíru a provedení pytlů musí být přizpůsobeny vnitřnímu objemu pytle a účelu jeho použití. Spoje a uzávěry musí být prachotěsné.

6.1.4.18.2 Pro ochranu proti vniknutí vlhkosti musí být pytel ze čtyř nebo více vrstev vodotěsný užitím buď vodovzdorné vrstvy jako jedné ze dvou vnějších vrstev nebo vodovzdornou bariérou z vhodného bariérového materiálu mezi dvěma vnějšími vrstvami; třívrstvý pytel je nutno učinit vodotěsným použitím vodovzdorné vrstvy jako vnější vrstvy. Existuje-li nebezpečí reakce obsahu pytle s vlhkostí nebo je-li obsah pytle balen ve vlhkém stavu, vodovzdorná vrstva nebo vložka, např. z dvojité dehtovaného papíru „kraft“, nebo „kraft“ papíru s plastovým povlakem na vnitřní straně vnitřní vrstvy - musí být umístěn přímo k látce, stejně tak jeden nebo více vložkových plastových pytlů. Spoje a uzávěry musí být vodotěsné.

6.1.4.18.3 Nejvyšší čistá (netto) hmotnost: 50 kg.

6.1.4.19 Kompozitní obaly (plast)

- 6HA1 Plastová nádoba s vnějším ocelovým sudem
- 6HA2 Plastová nádoba s vnějším ocelovým košem nebo bednou
- 6HB1 Plastová nádoba s vnějším hliníkovým sudem
- 6HB2 Plastová nádoba s vnějším hliníkovým košem nebo bednou
- 6HC Plastová nádoba s vnější dřevěnou bednou
- 6HD1 Plastová nádoba s vnějším překližkovým sudem
- 6HD2 Plastová nádoba s vnější překližkovou bednou
- 6HG1 Plastová nádoba s vnějším lepenkovým sudem
- 6HG2 Plastová nádoba s vnější lepenkovou bednou
- 6HH1 Plastová nádoba s vnějším plastovým sudem
- 6HH2 Plastová nádoba s vnější bednou z tuhého plastu

6.1.4.19.1 Vnitřní nádoba

6.1.4.19.1.1 Požadavky uvedené v 6.1.4.8.1 a 6.1.4.8.4 až 6.1.4.8.7 se vztahují i na vnitřní plastové nádoby.

6.1.4.19.1.2 Plastová vnitřní nádoba musí zapadnout těsně do vnější části obalu, který nesmí mít žádné výstupky, které by mohly způsobit odírání plastu.

6.1.4.19.1.3 Nejvyšší objem vnitřní nádoby:

6HA1, 6HB1, 6HD1, 6HG1, 6HH1: 250 litrů;

6HA2, 6HB2, 6HC, 6HD2, 6HG2, 6HH2 : 60 litrů.

6.1.4.19.1.4 Nejvyšší čistá (netto) hmotnost :

6HA1, 6HB1, 6HD1, 6HG1, 6HH1: 400 kg;

6HA2, 6HB2, 6HC, 6HD2, 6HG2, 6HH2 : 75 kg.

6.1.4.19.2 Vnější plášť

6.1.4.19.2.1 Plastová nádoba s vnějším ocelovým nebo hliníkovým sudem 6HA1 nebo 6HB1; příslušné požadavky uvedené v 6.1.4.1 nebo 6.1.4.2, pokud je to vhodné, se vztahují na konstrukci vnějšího obalu

6.1.4.19.2.2 Plastová nádoba s vnějším ocelovým nebo z hliníkovým košem nebo bednou 6HA2 nebo 6HB2; příslušné požadavky uvedené v 6.1.4.14 se vztahují na konstrukci vnějšího obalu.

6.1.4.19.2.3 Plastová nádoba s vnější dřevěnou bednou 6HC; příslušné požadavky uvedené v 6.1.4.9 se vztahují na konstrukci vnějšího obalu.

6.1.4.19.2.4 Plastová nádoba s vnějším překližkovým sudem 6HD1; příslušné požadavky uvedené v 6.1.4.5 se vztahují na konstrukci vnějšího obalu.

6.1.4.19.2.5 Plastová nádoba s vnější překližkovou bednou 6HD2; příslušné požadavky uvedené v 6.1.4.10 se vztahují na konstrukci vnějšího obalu.

6.1.4.19.2.6 Plastová nádoba s vnějším lepenkovým sudem 6HG1; požadavky uvedené v 6.1.4.7.1 až 6.1.4.7.4 se vztahují na konstrukci vnějšího obalu.

- 6.1.4.19.2.7 Plastová nádoba s vnější lepenkovou bednou 6HG2; příslušné požadavky uvedené v 6.1.4.12 se vztahují na konstrukci vnějšího obalu.
- 6.1.4.19.2.8 Plastová nádoba s vnějším plastovým sudem 6HH1; požadavky uvedené v 6.1.4.8.1 až 6.1.4.8.6 se vztahují na konstrukci vnějšího obalu.
- 6.1.4.19.2.9 Plastová nádoba s vnější bednou z tuhého plastu 6HH2; požadavky uvedené v 6.1.4.13.1 a 6.1.4.13.4 až 6.1.4.13.6 se vztahují na konstrukci vnějšího obalu.

6.1.4.20 Kompozitní obaly (sklo, porcelán nebo kamenina)

- 6PA1 Nádoba s vnějším ocelovým sudem
- 6PA2 Nádoba s vnějším ocelovým košem nebo bednou
- 6PB1 Nádoba s vnějším hliníkovým sudem
- 6PB2 Nádoba s vnějším hliníkovým košem nebo bednou
- 6PC Nádoba s vnější dřevěnou bednou
- 6PD1 Nádoba s vnějším překližkovým sudem
- 6PD2 Nádoba s vnějším proutěným košem
- 6PG1 Nádoba s vnějším lepenkovým sudem
- 6PG2 Nádoba s vnější lepenkovou bednou
- 6PH1 Nádoba s vnějším obalem z pěnového plastu
- 6PH2 Nádoba s vnějším obalem z tuhého plastu

6.1.4.20.1 Vnitřní nádoba

- 6.1.4.20.1.1 Nádoby musí mít vhodný tvar (válcovitý nebo hruškovitý), musí být vyrobeny z materiálu dobré jakosti bez vad, které by mohly snížit jejich odolnost. Stěny musí být na všech místech dostatečně tlusté a bez vnitřních prutů.
- 6.1.4.20.1.2 Jako uzávěrů nádob musí být použito šroubových uzávěrů z plastu, zabroušených skleněných zátek nebo uzávěrů nejméně stejně účinných. Každá část uzávěru, která může přijít do styku s obsahem nádoby, musí být proti němu odolná. Je třeba věnovat pozornost zajištění uzávěrů, aby lícovaly (s hrdlem) a byly těsné a byly vhodně zabezpečeny před uvolněním při přepravě. Jsou-li třeba uzávěry s odvětrávacím zařízením, musí vyhovět 4.1.1.8.
- 6.1.4.20.1.3 Nádoba musí být pevně zabezpečena ve vnějším obalu pomocí fixačních a / nebo absorpčních materiálů.
- 6.1.4.20.1.4 Nejvyšší vnitřní objem nádoby: 60 litrů.
- 6.1.4.20.1.5 Nejvyšší čistá (netto) hmotnost: 75 kg.

6.1.4.20.2 Vnější plášť

- 6.1.4.20.2.1 Nádoba s vnějším ocelovým sudem, 6PA1: příslušné požadavky uvedené v 6.1.4.1 se vztahují na konstrukci vnějšího obalu. Odnímatelné víko nutné u tohoto druhu obalu však může mít tvar poklopu.
- 6.1.4.20.2.2 Nádoba s vnějším ocelovým košem nebo bednou 6PA2: příslušné požadavky uvedené v 6.1.4.14 se vztahují na konstrukci vnějšího obalu. Jde-li o válcovité nádoby, vnější obal musí ve svislé poloze, převyšovat nádoby a jejich uzávěry. Obklopuje-li vnější koš nádobu hruškovitého tvaru a k této tvarově těsně přiléhá, musí se vnější obal opatřit ochranným krytem (poklopem).

- 6.1.4.20.2.3 Nádoba s vnějším hliníkovým sudem 6PB1: na konstrukci vnějšího obalu se vztahují příslušné požadavky uvedené v pododdílu 6.1.4.2.
- 6.1.4.20.2.4 Nádoba s vnějším hliníkovým košem nebo bednou 6PB2: na konstrukci vnějšího obalu se vztahují příslušné požadavky uvedené v 6.1.4.14.
- 6.1.4.20.2.5 Nádoba s vnější dřevěnou bednou 6PC: na konstrukci vnějšího obalu se vztahují příslušné požadavky uvedené v 6.1.4.9.
- 6.1.4.20.2.6 Nádoba s vnějším s překližkovým sudem 6PD1: na konstrukci vnějšího obalu se vztahují příslušné požadavky uvedené v 6.1.4.5.
- 6.1.4.20.2.7 Nádoba s vnějším proutěným košem 6PD2: proutěný koš musí být zhotoven z dobrého materiálu a musí být dobré kvality. Musí být opatřen ochranným krytem (poklopem), aby se zamezilo poškození nádob.
- 6.1.4.20.2.8 Nádoba s vnějším lepenkovým sudem 6PG1: na konstrukci vnějšího obalu se vztahují příslušné požadavky uvedené v 6.1.4.7.1 až 6.1.4.7.4
- 6.1.4.20.2.9 Nádoba s vnější lepenkovou bednou 6PG2: na konstrukci vnějšího obalu se vztahují příslušné požadavky uvedené v 6.1.4.12.
- 6.1.4.20.2.10 Nádoba s vnějším obalem z pěnového nebo tuhého plastu (6PH1 nebo 6PH2): materiály obou těchto vnějších obalů musí splňovat příslušné požadavky uvedené v 6.1.4.13. Vnější obaly z tuhého plastu musí být zhotoveny z vysoko-hustotního polyetylenu, nebo z jiného srovnatelného plastu. Odnímatelné víko pro tento typ obalu však může mít tvar poklopu.

6.1.4.21 Skupinové obaly

Platí odpovídající požadavky pro vnější obaly podle 6.1.4.

POZNÁMKA: Pro vnitřní a vnější obaly se použijí příslušné pokyny pro balení uvedené v kapitole 4.1.

6.1.4.22 Obaly z jemného plechu

0A1 s neodnímatelným víkem

0A2 s odnímatelným víkem

- 6.1.4.22.1 Plech pro plášť a dna musí být z vhodné oceli; jeho tloušťka musí být přizpůsobena vnitřnímu objemu obalů a účelu jejich použití.
- 6.1.4.22.2 Spoje musí být svařované, nejméně dvojité zalemované při lemování (zadrápkování) nebo provedeny jiným způsobem zaručujícím stejný stupeň pevnosti a těsnosti.
- 6.1.4.22.3 Vnitřní povlaky ze zinku, cinu, laku apod. musí být odolné a musí být na celé ploše, včetně uzávěrů, pevně spojeny s ocelí.
- 6.1.4.22.4 Průměr otvorů pro plnění, vyprazdňování a odvětrání v pláštích nebo základnách obalů s neodnímatelným víkem (0A1) nesmí být větší než 7 cm. Obaly s většími otvory se považují za obaly s odnímatelným víkem (0A2).
- 6.1.4.22.5 Uzávěry obalů s neodnímatelným víkem (0A1) musí být buď šroubové nebo být zabezpečené šroubovacím zařízením nebo jiným, stejně účinným zařízením. Uzávěry obalů s odnímatelným víkem (0A2) musí být tak konstruovány a zajištěny, aby za normálních přepravních podmínek zůstaly pevně uzavřeny a obaly zůstaly těsné.
- 6.1.4.22.6 Nejvyšší vnitřní objem obalů: 40 litrů.
- 6.1.4.22.7 Nejvyšší čistá (netto) hmotnost: 50 kg.

6.1.5 Požadavky na zkoušky obalů**6.1.5.1 Provedení a opakování zkoušek**

6.1.5.1.1 Konstrukční typ každého obalu musí být zkoušen, jak je uvedeno v 6.1.5, v souladu se stanovenými postupy odsouhlasenými příslušným orgánem povolujícím umístění značky a musí být tímto příslušným orgánem schválen.

6.1.5.1.2 Každý konstrukční typ obalu musí před použitím úspěšně projít zkouškami předepsanými v této kapitole. Konstrukční typ obalu je definován konstrukcí, rozměrem, materiálem a tloušťkou, způsobem výroby a systémem balení, ale mohou být zahrnuty různé úpravy povrchu. Zahrnuje též obaly, které se liší od konstrukčního typu pouze svou menší konstrukční výškou.

6.1.5.1.3 Zkoušky musí být opakovány na výrobních vzorcích sériově vyráběných obalů ve lhůtách stanovených příslušným orgánem. Pro takové zkoušky papírových a lepenkových obalů se příprava při okolních podmínkách považuje za rovnocennou požadavkům uvedeným v 6.1.5.2.3.

6.1.5.1.4 Zkoušky musí být též opakovány po každé úpravě, která mění konstrukci, materiál nebo způsob výroby obalu.

6.1.5.1.5 Příslušný orgán může povolit selektivní zkoušení obalů odlišujících se pouze nepatrně od již odzkoušeného konstrukčního typu, např. obaly obsahující vnitřní obaly menších rozměrů nebo nižší čisté (netto) hmotnosti, nebo obaly jako sudy, pytle a bedny, které jsou vyrobeny s malými zmenšeními vnějších rozměrů.

6.1.5.1.6 (Vyhrazeno)

POZNÁMKA: Pro podmínky sestavení různých vnitřních obalů ve vnějším obalu a přípustné změny pro vnitřní obaly, viz 4.1.1.5.1

6.1.5.1.7 Předměty nebo vnitřní obaly jakéhokoli typu na tuhé látky nebo na kapaliny mohou být společně uloženy a přepravovány bez zkoušení ve vnějším obalu za následujících podmínek:

- (a) Vnější obal musel být úspěšně odzkoušen podle 6.1.5.3 s křehkými (např. skleněnými) vnitřními obaly obsahujícími kapaliny v parametrech pádové výšky pro obalovou skupinu I;
- (b) celková (brutto) hmotnost vnitřních obalů ve skupinovém balení nesmí přesáhnout polovinu celkové (brutto) hmotnosti vnitřních obalů použitých pro zkoušku pádem uvedenou výše v odstavci (a);
- (c) Tloušťka fixačního materiálu mezi vnitřními obaly a mezi vnitřními obaly a stěnou obalu nesmí být zmenšena pod odpovídající tloušťku v původně zkoušeném obalu; a jestliže byl použit samotný vnitřní obal při původní zkoušce, tloušťka fixace mezi vnitřními obaly nesmí být menší než tloušťka fixace mezi stěnou obalu a vnitřním obalem při původní zkoušce. Jestliže se použije buď menší počet, nebo menší vnitřní obaly (ve srovnání s vnitřními obaly použitými při zkoušce pádem), musí být použit dodatečný fixační materiál v dostatečném množství pro vyplnění volného prostoru;
- (d) Prázdný vnější obal musí být podroben s úspěchem zkoušce stohováním podle 6.1.5.6, vždy prázdný. Celková hmotnost identických obalů musí být založena na celkové hmotnosti vnitřních obalů skupinového balení, použitých pro zkoušku pádem uvedenou výše v odstavci a);
- (e) Vnitřní obaly obsahující kapaliny musejí být úplně obklopeny dostatečným množstvím absorpčního materiálu k absorbování celkového obsahu kapalin ve vnitřních obalech;
- (f) Pokud vnější obal (skupinového balení) je určen pro vnitřní obaly obsahující kapaliny a není těsný nebo je určen pro vnitřní obaly obsahující tuhé látky a není prachotěsný, zajištění zábrany úniku jakékoli kapalné nebo tuhé látky musí být provedeno ve formě nepropustné vložky, vložkového plastového pytle, nebo jiných stejně účinných prostředků. V obalech obsahujících kapaliny musí být absorpční materiál požadovaný výše v odstavci e) umístěn mezi vnitřní obalové prostředky obsahující kapalnou náplň;

- (g) Obaly musí být označeny UN kódem podle 6.1.3 jako odzkoušené pro obalovou skupinu I. v provedení pro skupinové obaly. Označená celková(brutto) hmotnost v kilogramech musí být součtem hmotnosti vnějšího obalu a jedné poloviny hmotnosti vnitřního(ch) obalu(ů), jak byly použity pro zkoušku pádem uvedenou výše v odstavci a). Takové značení obalu musí též obsahovat písmeno „V“, jak je popsáno v 6.1.2.4.

6.1.5.1.8 Příslušný orgán může kdykoli požadovat důkaz, aby se zkouškami podle tohoto odstavce prokázalo, že sériově vyráběné obaly splňují požadavky zkoušek konstrukčního typu. Pro účely ověření musí být protokoly o takových zkouškách uchovávány.

6.1.5.1.9 Je-li z bezpečnostních důvodů požadována vnitřní úprava nebo povlak, musí si zachovat své ochranné vlastnosti i po zkouškách.

6.1.5.1.10 Na jednom vzorku smí být provedeno několik zkoušek, pokud to neovlivní platnost výsledků zkoušek a pokud to schválí příslušný orgán.

6.1.5.1.11 **Záchranné obaly**

Záchranné obaly (viz. 1.2.1) musí být zkoušeny a označeny UN kódem podle ustanovení vztahujících se na obaly obalové skupiny II určené pro přepravu tuhých látek nebo vnitřní obaly, s výjimkou těchto:

- (a) Látkou použitou při provádění zkoušek musí být voda a obaly musí být naplněny nejméně na 98 % jejich nejvyššího vnitřního objemu. Je dovoleno použít přídavného zatížení, jako jsou pytle s olověnými broky, aby bylo dosaženo požadované celkové hmotnosti kusu, pokud je umístěno tak, že nebudou ovlivněny výsledky zkoušek. Při provádění zkoušky pádem může být pádová výška měněna podle 6.1.5.3.5 b);
- (b) Obaly musí být kromě toho s úspěchem podrobeny zkoušce těsnosti při 30 kPa a výsledek této zkoušky musí být uveden ve zprávě o zkoušce (protokolu) požadované v 6.1.5.8; a
- (c) Obaly musí být označeny písmenem „T“, jak je předepsáno v 6.1.2.4.

6.1.5.2 **Příprava obalů a jednotek balení pro zkoušky**

6.1.5.2.1 Zkoušky musí být provedeny s obaly připravenými jako k přepravě, včetně vnitřních obalů skupinových obalů. Vnitřní nebo samostatné nádoby nebo obaly jiné nežli pytle musí být naplněny nejméně do 98 % svého nejvyššího vnitřního objemu, jde-li o kapaliny, a nejméně do 95 %, jde-li o tuhé látky. Pytle budou plněny na maximální hmotnost, pro kterou mohou být používány. Pro skupinové obaly, kde vnitřní obal je určen k přepravě kapalin nebo tuhých látek, se vyžaduje samostatné provedení zkoušky pro obojí obsahy, tj. kapaliny a tuhé látky. Látky nebo předměty, které mají být přepravovány v obalech, smějí být nahrazeny jinými látkami nebo předměty, pokud by tím nedošlo ke zkreslení výsledků zkoušek. Jsou-li tuhé látky nahrazeny jinými látkami, musí mít tyto látky stejné fyzikální vlastnosti (hmotnost, velikost zrna atd.) jako látky, které mají být přepravovány. Je dovoleno použít přívazky, jako sáčky s olověným šrotem, aby se dosáhlo potřebné celkové hmotnosti kusu, pokud jsou umístěny tak, že neovlivní výsledky zkoušky.

6.1.5.2.2 Použije-li se při zkoušce pádem u kapalných látek jiná kapalná látka, musí mít tato látka podobnou relativní hustotu a viskozitu jako látka, která se má přepravovat. Za podmínek stanovených v 6.1.5.3.5 smí být pro tyto zkoušky pádem použito i vody.

6.1.5.2.3 Obaly z papíru nebo z lepenky musí být nejméně po dobu 24 hodin kondicionovány v prostředí, jehož teplota a relativní vlhkost jsou kontrolovány. Je možno volit jednu ze tří možností. Přednostně se doporučuje 23 ± 2 °C a 50 ± 2 % relativní vlhkosti vzduchu. Další dvě možnosti jsou 20 ± 2 °C a 65 ± 2 % nebo 27 ± 2 °C a 65 ± 2 % relativní vlhkosti vzduchu.

POZNÁMKA: Průměrné hodnoty se musí pohybovat uvnitř těchto mezí. Krátkodobé výkyvy a limity měření mohou být příčinou, že jednotlivá měření se pohybují v rozmezí ± 5 % relativní vlhkosti bez znatelného zhoršení reprodukovatelnosti zkoušky.

6.1.5.2.4 (Vyhrazeno)

- 6.1.5.2.5 Sudy a kanystry z plastu podle 6.1.4.8 a, pokud je to nutné, kompozitní obaly (plast) podle 6.1.4.19 musí být po dobu 6 měsíců skladovány při teplotě okolí, aby se prokázala jejich dostatečná chemická snášenlivost s kapalnými látkami. Po tuto dobu musí zůstat zkušební vzorky naplněny látkami, které se v těchto obalech mají přepravovat.

Během prvních a posledních 24 hodin skladování musí být zkušební vzorky postaveny uzavěrem dolů. U obalů opatřených odvětrávacím zařízením se to však provede vždy jen na dobu 5 minut. Po tomto skladování musí být zkušební vzorky podrobeny zkouškám předepsaným v 6.1.5.3 až 6.1.5.6.

Je-li známo, že se pevnostní vlastnosti plastu vnitřních nádob kompozitních obalů (plast) působením plnicí látky podstatně nezmění, není nezbytná kontrola, zda je chemická snášenlivost dostačující.

Za podstatné změny pevnostních vlastností se považují:

- (a) zřetelné zkrěhnutí;
- (b) značné snížení elasticity, pokud není spojeno alespoň s úměrným zvýšením prodloužení při zatížení.

Pokud chování plastu bylo stanoveno jinými prostředky, výše uvedená zkouška snášenlivosti může být vypuštěna. Takové postupy musí být nejméně rovnocenné výše uvedené zkoušce snášenlivosti a musí být uznány příslušným orgánem.

POZNÁMKA: Pro plastové sudy a kanystry a kompozitní obaly (plast) vyrobené z polyetylénu, viz též níže 6.1.5.2.6 .

- 6.1.5.2.6 Pro polyethylenové sudy a kanystry podle pododdílu 6.1.4.8, a pokud je to nutné, polyethylenové kompozitní obaly podle pododdílu 6.1.4.19, může být chemická snášenlivost s plnicími kapalinami přizpůsobená podle pododdílu 4.1.1.21 ověřena následovně se standardními kapalinami (viz oddíl 6.1.6).

Standardní kapaliny jsou zástupci pro procesy zhoršování vlastností polyetylénu, jako je měknutí v důsledku nabobtnání, praskání pod napětím, molekulární degradace a jejich kombinace. Dostatečná chemická snášenlivost těchto obalů může být prokázána skladováním s vhodnou standardní kapalinou po dobu tří týdnů při teplotě 40 °C; je-li jako standardní kapalina použita voda, není důkaz dostatečné chemické snášenlivosti nutný. Skladování se nevyžaduje pro zkušební vzorky, které byly použity pro zkoušku stohováním v případě standardních kapalin“ buďto „smáčecí roztok“ anebo „kyselina octová“.

Během prvních a posledních 24 hodin skladování musí být zkušební vzorky postaveny uzavěrem dolů. U obalů opatřených odvětrávacím zařízením se to však provede vždy jen na dobu 5 minut. Po tomto skladování musí být zkušební vzorky podrobeny zkouškám předepsaným v 6.1.5.3 až 6.1.5.6.

Zkouška snášenlivosti pro terc-buthydroperoxid s obsahem více než 40 % peroxidu a kyselin peroxyoctových třídy 5.2 nesmí být prováděna použitím standardních kapalin. Pro tyto látky musí být důkaz dostatečné chemické snášenlivosti zkušebních vzorků prováděn s látkami, které jsou určeny k přepravě, v průběhu skladovacího období šesti měsíců při okolní teplotě.

Výsledky postupu dle tohoto odstavce pro obaly z polyetylénu mohou být uznány také pro stejný konstrukční typ, jehož vnitřní povrch je fluorován.

- 6.1.5.2.7 Pro obaly vyrobené z polyetylénu, jak je specifikováno v 6.1.5.2.6, které prošly zkouškou v 6.1.5.2.6, mohou být rovněž schváleny plnicí látky jiné nežli látky přiřazené podle 4.1.1.21. Toto schválení musí být založeno na laboratorních zkouškách ověřujících, že vliv těchto plnicích látek na zkušební vzorky je menší než vliv příslušné zkušební kapaliny s přihlédnutím k příslušným procesům zhoršování vlastností. Vzhledem k relativní hustotě a tenzi par je nutno použít stejné podmínky, jak jsou uvedeny ve 4.1.1.21.2.

- 6.1.5.2.8 Pokud se pevnostní vlastnosti plastů vnitřních obalů skupinového obalu působením plnicí látky podstatně nezmění, není nezbytný důkaz chemické snášenlivosti. Za podstatné změny pevnostních vlastností se považují:

- (a) zřetelné zkřehnutí;
- (b) značné poklesy elasticity, pokud není spojeno alespoň s úměrným zvýšením prodloužení.

6.1.5.3 **Zkouška volným pádem⁴**

6.1.5.3.1 **Počet zkušebních vzorků (na konstrukční typ a výrobce) a orientace zkušebního vzorku pro zkoušku pádem:**

Pro jiné zkoušky než pádem naplocho se musí těžiště nacházet na svislici procházející bodem nárazu.

Pokud je možných více než jedna orientace vzorku pro danou zkoušku pádem, musí být použita orientace, při níž nejpravděpodobněji vznikne poškození obalu.

Obal	Počet zkušebních vzorků	Orientace zkušebního vzorku při zkoušce pádem
(a) Sudy ocelové, hliníkové, z jiného kovu než ocel a hliník Kanystry ocelové, hliníkové Sudy lepenkové Sudy a kanystry plastové Kompozitní obaly ve tvaru sudu Obaly z jemného plechu	Šest (tři pro každý typ pádu)	První typ pádu (se třemi zkušebními vzorky): obal musí dopadnout na dopadovou plochu diagonálně na hranu dna nebo, nemá-li jej, na obvodový šev nebo na obvod dna. Druhý typ pádu (se třemi dalšími zkušebními vzorky): obal musí narazit na dopadovou plochu nejslabším místem, které nebylo při první zkoušce pádem zkoušeno, např. uzávěr, nebo u některých válcových sudů, na podélný svar pláště sudu.
(b) Bedny z přírodního dřeva Bedny překližkové Bedny z rekonstituovaného dřeva Bedny lepenkové Bedny plastové Bedny ocelové nebo hliníkové Kompozitní obaly ve tvaru bedny	Pět (jeden pro každý pád)	1. vzorek pád: na plochu dna 2. vzorek pád na plochu víka (na horní část) 3. vzorek pád na bok (na nejdelší stranu) 4. vzorek pád: na čelo (na krátkou stranu) 5. vzorek pád na roh
(c) Pytle – jednovrstvé s postranním švem	Tři (tři pády u každého pytle)	První pád: naplocho na širokou stranu Druhý pád naplocho na úzkou stranu Třetí pád na dno pytle
(d) Pytle – jednovrstvé bez postranního švu nebo vícevrstvé	Tři (dva pády u každého pytle)	První pád naplocho na širokou stranu Druhý pád na dno pytle
(e) Kompozitní obaly (sklo, kamenina nebo porcelán), označené znakem „RID/ADR“ podle pododdílu 6.1.3.1 a) ii) a které jsou ve tvaru sudu nebo bedny	Tři (jeden pro jeden pád)	Diagonálně na hranu dna nebo, na obvodový šev dna nebo na obvod dna

6.1.5.3.2 **Zvláštní příprava zkušebních vzorků pro zkoušku pádem**

Teplota zkušebního vzorku a jeho obsahu musí být redukována na -18 °C nebo níže pro:

- (a) plastové sudy (viz 6.1.4.8);

⁴ Viz norma ISO 2248.

- (b) plastové kanystry (viz 6.1.4.8);
- (c) plastové bedny kromě beden z pěnového plastu (viz 6.1.4.13);
- (d) kompozitní obaly (plast) (viz 6.1.4.19); a
- (e) skupinové obaly s vnitřními obaly z plastu, jinými než plastové sáčky, určené pro tuhé látky a předměty.

Pokud jsou zkušební vzorky připraveny tímto způsobem, kondicionování podle 6.1.5.2.3 může být vypuštěno. Zkušební kapaliny musejí být udržovány v tekutém stavu, pokud je to nezbytné přidáním mrazuvzdorných látek.

6.1.5.3.3 Obaly s odnímatelným víkem, určené pro kapaliny, nesmějí být podrobeny pádům dříve než 24 hodin po plnění a uzavření, aby se vzala v úvahu jakákoliv možná změna vlastností těsnění.

6.1.5.3.4 **Dopadová plocha**

Dopadová plocha musí mít nepružný a horizontální povrch a musí být:

- dostatečně celistvá (integrální), aby se s ní nedalo pohybovat,
- hladká a bez místních poškození, které by mohly ovlivnit výsledky zkoušek,
- dostatečně pevná, nedeformovatelná za podmínek zkoušky a aby nebyla během zkoušek náchylná k poškození; a
- dostatečně velká, aby bylo zajištěno, že zkoušený obal dopadne na její povrch.

6.1.5.3.5 **Výška pádu**

Pro tuhé látky a kapaliny, jestliže se zkouška provádí s tuhou látkou nebo kapalinou, která bude přepravována nebo s jinou látkou mající v podstatě tytéž fyzikální charakteristiky.

Obalová skupina I	Obalová skupina II	Obalová skupina III
1,8 m	1,2 m	0,8 m

Pro kapalné látky v samostatných obalech a pro vnitřní obaly skupinových obalů, jestliže se zkouška provádí s vodou:

POZNÁMKA: Pojem voda znamená vodu/nemrznoucí směs s minimální hustotou 0,95 při požadavku na teplotu zkoušky -18 °C.

- (a) pro látky, které mají být přepravovány, jejichž relativní hustota nepřesahuje 1,2:

Obalová skupina I	Obalová skupina II	Obalová skupina III
1,8 m	1,2 m	0,8 m

- (b) pro látky, které mají být přepravovány, jejichž relativní hustota přesahuje 1,2 se výška pádu vypočte na základě relativní hustoty látky d) určené k přepravě, zaokrouhlené na první desetinné místo takto:

Obalová skupina I	Obalová skupina II	Obalová skupina III
d x 1,5 (m)	d x 1,0 (m)	d x 0,67 (m)

- (c) pro obaly z jemného plechu označené znakem „RID/ADR“ podle 6.1.3.1 (a) (ii) určené pro přepravu látek s viskozitou při 23°C vyšší než 200 mm²/s (což odpovídá výtokové době 30 sekund z normalizovaného kelímku ISO s výtokovou tryskou o vnitřním průměru 6 mm podle normy ISO 2431:1993);

- (i) jejichž relativní hustota nepřesahuje 1,2:

Obalová skupina II	Obalová skupina III
0,6 m	0,4 m

- (ii) pro látky, které mají být přepravovány, jejichž relativní hustota (
- d
-) přesahuje 1,2, se výška pádu vypočte na základě relativní (
- d
-) hustoty látky, která se má přepravovat, zaokrouhlené na první desetinné místo takto:

Obalová skupina II	Obalová skupina III
$d \times 0,5$ m	$d \times 0,33$ m

6.1.5.3.6 Kritéria pro vyhovění zkoušce

6.1.5.3.6.1 Každý obal obsahující kapalinu musí zůstat po vyrovnání vnitřního a vnějšího tlaku těsný, kromě vnitřních obalů skupinových obalů a kromě vnitřních nádob kompozitních obalů (sklo, porcelán nebo kamenina) označených znakem „RID/ADR“ podle 6.1.3.1 (a) (ii), kde není nutné vyrovnání tlaků.

6.1.5.3.6.2 Pokud je obal na tuhé látky podroben zkoušce pádem a jeho horní část dopadne na dopadovou plochu, vyhověl zkušební vzorek zkoušce, jestliže celý obsah vnitřního(ch) obalu (ů) (např. plastový sáček) nebo vnitřní nádoby obsah úplně zadržel, i když uzávěr vnějšího obalu zatímco je funkční, není již prachotěsný.

6.1.5.3.6.3 Obal nebo vnější obal kompozitního nebo skupinového obalu nesmí vykazovat žádná poškození, která by mohla ovlivnit bezpečnost během přepravy. Vnitřní nádoby, vnitřní obaly nebo předměty musí zůstat zcela uvnitř vnějšího obalu a nesmí tam dojít k žádnému úniku látky z vnitřní(ch) nádob(y) nebo vnitřního(ch) obalu(ů).

6.1.5.3.6.4 Ani vnější vrstva pytle ani vnější obal nesmí vykazovat žádná poškození, která by mohla ovlivnit bezpečnost během přepravy.

6.1.5.3.6.5 Nepatrný únik obsahu z uzávěru(ů) při nárazu se nepovažuje za selhání obalu za předpokladu, že následně už nedochází k žádnému úniku.

6.1.5.3.6.6 Nesmí dojít k protržení obalů obsahujících věci třídy 1, které by mohlo zapříčinit únik uvolněných výbušných látek nebo předmětů z vnějšího obalu.

6.1.5.4 Zkouška těsnosti

Zkouška těsnosti musí být provedena u všech konstrukčních typů obalů určených pro kapalné látky; není však nutná u:

- vnitřních obalů skupinových obalů;
- vnitřních nádob kompozitních obalů (sklo, porcelán nebo kamenina) označených znakem „RID/ADR“ podle 6.1.3.1 (a) (ii);
- obalů z jemného plechu označených znakem „RID/ADR“ podle 6.1.3.1 (a) (ii) určených pro látky, jejichž viskozita při 23°C je větší než 200 mm²/s;

6.1.5.4.1 Počet zkušebních vzorků: tři zkušební vzorky od každého konstrukčního typu a výrobce.

6.1.5.4.2 *Zvláštní příprava zkušebních vzorků pro zkoušku:* Uzávěry opatřené odvodušňovacím ventilem musí být buď nahrazeny podobnými uzávěry bez odvodušňovacího ventilu nebo uzávěry musejí být neprodyšně uzavřeny.

6.1.5.4.3 *Zkušební postup a použitý tlak vzduchu:* obaly včetně jejich uzávěrů se musí ponořit pod vodu a udržovat tam po dobu 5 minut při současném udržování vnitřního přetlaku; způsob, jakým se drží pod vodou, nesmí ovlivnit výsledky zkoušky.

Použitý tlak vzduchu (přetlak) musí být:

Obalová skupina I	Obalová skupina II	Obalová skupina III
Nejméně 30 kPa (0.3 baru)	Nejméně 20 kPa (0.2 baru)	Nejméně 20 kPa (0.2 baru)

Mohou se také použít jiné nejméně stejně účinné postupy.

6.1.5.4.4 *Kritérium pro vyhovění zkoušce:* Nesmí být zpozorován žádný únik vzduchu.

6.1.5.5 **Zkouška vnitřním (hydraulickým) tlakem**

6.1.5.5.1 **Obaly pro zkoušku**

Zkouška vnitřním hydraulickým tlakem (musí být provedena u všech konstrukčních typů obalů z oceli, plastů a kompozitních obalů určených pro kapaliny. Avšak tato zkouška se nevyžaduje se u:

- vnitřních obalů skupinových obalů;
- vnitřních nádob kompozitních obalů (sklo, porcelán nebo kamenina) označených znakem „RID/ADR“ podle 6.1.3.1 (a) (ii);
- obalů z jemných plechů označených znakem „RID/ADR“ podle 6.1.3.1 (a) (ii) určených pro látky, jejichž viskozita při 23 °C je větší než 200 mm²/s;

6.1.5.5.2 *Počet zkušebních vzorků:* tři zkušební vzorky od každého konstrukčního typu a výrobce.

6.1.5.5.3 *Zvláštní příprava zkušebních vzorků pro zkoušku:* Každý odvodušňovací ventil musí být buď nahrazeny obdobnými nepropustnými uzávěry nebo ventily musí být neprodyšně uzavřeny.

6.1.5.5.4 *Zkušební metoda a použitý tlak:* obaly z kovu a kompozitní obaly (sklo, porcelán nebo kamenina) včetně jejich uzávěrů musí být podrobeny zkušebnímu tlaku po dobu 5 minut. Plastové obaly a kompozitní obaly (plast) musí být podrobeny zkušebnímu tlaku po dobu 30 minut. Tento tlak je tlakem uvedeným ve značení požadovaném v 6.1.3.1 (d). Způsob podepření obalů nesmí zkreslit výsledky zkoušky. Tlak se musí zvyšovat postupně a bez rázů; zkušební tlak musí být po celou dobu trvání zkoušky konstantní. Hydraulický tlak (přetlak) stanovený jednou z dále uvedených metod musí být:

- (a) nejméně celkový změřený přetlak v obalu (tj. tenze par naplněné látky a parciální tlak vzduchu nebo jiných inertních plynů, minus 100 kPa) při 55 °C, vynásobený koeficientem bezpečnosti 1,5; tento celkový přetlak se musí určit pro nejvyšší stupeň plnění podle 4.1.1.4 a plnicí teplotu 15 °C; nebo
- (b) nejméně 1,75 násobek tenze par naplněné látky při 50 °C, minus 100 kPa, avšak nejmenší zkušební tlak 100 kPa; nebo
- (c) nejméně 1,5 násobek tenze par naplněné látky při 55 °C, minus 100 kPa, avšak nejmenší zkušební tlak 100 kPa.

6.1.5.5.5 Navíc obaly určené pro látky obalové skupiny I musí být zkoušeny nejmenším zkušebním tlakem 250 kPa (přetlak) po dobu 5 nebo 30 minut v závislosti na materiálu konstrukce obalu.

6.1.5.5.6 *Kritérium pro vyhovění zkoušce:* nesmí dojít k žádnému úniku.

6.1.5.6 **Zkouška stohováním**

Všechny konstrukční typy obalů, s výjimkou pytlů a nestohovatelných kompozitních obalů (sklo, porcelán nebo kamenina), označených znakem „RID/ADR“ podle pododdílu 6.1.3.1 (a) (ii) musejí být podrobeny zkoušce stohováním.

6.1.5.6.1 *Počet zkušebních vzorků:* tři zkušební vzorky od každého konstrukčního typu a výrobce.

6.1.5.6.2 *Zkušební postup:* zkušební vzorek musí být vystaven zatížení vrchní plochy zkušebního vzorku o stejné celkové hmotnosti totožných kusů, které by na něj mohly být v průběhu přepravy nastohovány; pokud zkušební vzorky obsahují jinou než nebezpečnou kapalinu s relativní hustotou odlišnou od kapaliny určené k přepravě, zatížení musí být vypočteno vzhledem k poslednímu. Minimální výška stohování, včetně zkušební vzorku, musí být 3 m. Zkouška musí trvat 24 hodiny, s výjimkou plastových sudů a kanystrů a kompozitních obalů - (plast) 6HH1 a 6HH2 určených pro kapaliny, které musí být podrobeny zkoušce stohováním po dobu 28 dnů při teplotě nejméně 40 °C.

Pro zkoušku dle 6.1.5.2.5 se použije originální plnicí látka. Pro zkoušku dle 6.1.5.2.6 se zkouška stohováním provede se standardní kapalinou.

6.1.5.6.3 *Kritéria pro vyhovění zkoušce:* Žádný ze zkušebních vzorků se nesmí stát netěsným. U kompozitních obalů nebo skupinových obalů nesmí dojít k úniku naplněné látky z vnitřní nádoby nebo vnitřního obalu. Žádný zkušební vzorek nesmí vykazovat poškození, která by mohla zhoršit bezpečnost během přepravy, ani deformace, které by mohly snížit jeho odolnost nebo způsobit nestabilitu, jsou-li obaly stohovány. Plastové obaly musí být před ohodnocením ochlazeny na okolní teplotu.

6.1.5.7 *Dodatková zkouška propustnosti pro plastové sudy a kanystry podle 6.1.4.8 a pro kompozitní obaly (plast) podle 6.1.4.19 určené pro přepravu kapalin s bodem vzplanutí ≤ 60 °C, s výjimkou obalů 6HA1.*

U obalů z polyetylénu se tato zkouška provede jen tehdy, mají-li být schváleny pro přepravu benzenu, toluenu, xylenu nebo směsi a přípravků obsahujících tyto látky.

6.1.5.7.1 *Počet zkušebních vzorků:* tři obaly od každého konstrukčního typu a výrobce.

6.1.5.7.2 *Zvláštní příprava zkušební vzorku pro zkoušku:* Zkušební vzorky se předem uskladní s originální náplní podle 6.1.5.2.5 nebo u obalů z polyetylénu se standardní kapalinou - směs uhlovodíků (White spirit) podle 6.1.5.2.6.

6.1.5.7.3 *Zkušební postup:* Zkušební vzorky naplněné látkou, pro kterou má být obal schválen, se před a po 28 denním skladování při teplotě 23 °C a 50 % relativní vlhkosti vzduchu zváží. U obalů z polyetylénu smí být zkouška provedena se standardní kapalinou směsi uhlovodíků (White spirit) namísto benzenu, toluenu nebo xylenu.

6.1.5.7.4 *Kritérium pro vyhovění zkoušce:* propustnost nesmí být větší než 0,008 g/l.h.

6.1.5.8 *Zkušební protokol*

6.1.5.8.1 O provedených zkouškách musí být sepsán zkušební protokol, obsahující minimálně následující údaje a musí být k dispozici uživatelům obalů

1. Název a adresa zkušebny;
2. Jméno a adresa žadatele, pokud je to vhodné;
3. Jednoznačná identifikace protokolu o zkoušce (např. číslo);
4. Datum protokolu o zkoušce;
5. Výrobce obalu;
6. Popis konstrukčního typu obalu (např. rozměry, materiály, uzávěry, tloušťka atd.) včetně způsobu výroby (např. vyfukování lisování, atd.), který může zahrnovat výkres(y) a/nebo fotografii(e);
7. Nejvyšší vnitřní objem;
8. Charakteristiky zkušebních náplní, např. viskozita a relativní hustota pro kapaliny a rozměry částic pro tuhé látky;

9. Popis zkoušky a výsledky;

10. Protokol o zkoušce musí být podepsán s uvedením jména a funkce podepsaného.

6.1.5.8.2 Protokol o zkoušce musí obsahovat prohlášení, že obal určený pro přepravu byl odzkoušen podle příslušných požadavků tohoto oddílu a že použití jiných metod balení nebo komponent, může mít za následek jeho neplatnost. Kopie protokolu o zkoušce musí být dána k dispozici příslušnému orgánu.

6.1.6 Standardní kapaliny pro důkaz chemické snášenlivosti obalů a IBC z polyetylenu podle 6.1.5.2.6, popřípadě 6.5.6.3.5

6.1.6.1 Pro tyto plasty se používají následující standardní kapaliny:

(a) **Smáčecí roztok** pro látky, které u polyetylenu pod napětím silně působí na vznik trhlin, zejména pro všechny roztoky a přípravky obsahující smáčecí prostředky.

Musí se použít vodný roztok 1 % alkylbenzensulfonátu, nebo vodný roztok 5 % nonylfenoethoxylátu, který byl předtím skladován nejméně 14 dní při teplotě 40 °C, předtím než byl poprvé použit pro zkoušky. Povrchové napětí tohoto roztoku musí být 31 až 35 mN/m při 23 °C.

Pro zkoušku stohováním se bere za základ relativní hustota nejméně 1,20.

Je-li prokázána dostatečná chemická snášenlivost se smáčecím roztokem, nevyžaduje se zkouška snášenlivosti s kyselinou octovou.

Pro originální náplně způsobující v polyetylenu trhliny pod napětím, který je odolný působení smáčecího prostředku, může být důkazem odpovídající chemické snášenlivosti provedení předběžného třítydenního skladování, avšak s originální náplní při 40 °C podle 6.1.5.2.6.

(b) **Kyselina octová** pro látky a přípravky, které u polyetylenu způsobují za napětí vznik trhlin, zejména pro monokarboxylové kyseliny a jednomocné alkoholy.

Musí se použít kyselina octová o koncentraci 98 až 100 %. Relativní hustota = 1,05.

Pro zkoušku stohováním se bere za základ relativní hustota nejméně 1,1.

Pro originální náplně způsobující že polyetylén nabobtnává více než působením kyseliny octové tak, že hmotnost polyetylenu se zvýší až o 4 %, může být důkazem odpovídající chemické snášenlivosti provedení předběžného třítydenního skladování, avšak s originální náplní při 40 °C podle 6.1.5.2.6.

(c) **n-butylacetát/smáčecí roztok nasycený n-butylacetátem** pro látky a přípravky, které nabobtnávají polyetylén tak, že se hmotnost polyetylenu zvýší nejvýše asi o 4 %, a které současně způsobují vznik trhlin za napětí, zejména pro prostředky k ochraně rostlin, tekuté barvy a estery. Pro předběžné skladování podle 6.1.5.2.6 se musí použít n-butylacetát o koncentraci 98 až 100 %.

Pro zkoušku stohováním v souladu s 6.1.5.6 se musí použít zkušební kapalina sestávající z 1 až 10 % vodného roztoku smáčecího prostředku smíšeného s 2 % n-butylacetátu podle předcházejícího odstavce a).

Pro zkoušku stohováním se bere za základ relativní hustota nejméně 1,0.

U plnicích látek, jejichž působením polyetylén nabobtnává více než působením n-butylacetátu a tak, že se hmotnost polyetylenu zvýší nejvýše o 7,5 %, smí být odpovídající chemická snášenlivost prokázána po předběžném třítydenním skladování při 40 °C podle 6.1.5.2.6, avšak s originální náplní.

(d) **Směs uhlovodíků (White spirit)** pro látky a přípravky, které působí nabobtnáváním polyetylenu, zejména pro uhlovodíky, estery a ketony.

Musí se použít směs uhlovodíků s rozmezím bodu varu od 160 do 200 °C, relativní hustotou 0,78 až 0,80, bodem vzplanutí vyšším než 50 °C a obsahem aromatických uhlovodíků od 16 do 21 %.

Pro zkoušku stohováním se bere za základ relativní hustota nejméně 1,0.

U plnicích látek, které nabobtnávají polyetylén tak, že se hmotnost polyetylénu zvýší o více než 7,5 %, smí být přiměřená chemická snášenlivost prokázána po třítydenním předběžném skladování při 40 °C podle 6.1.5.2.6, avšak s originální plnicí látkou.

- (e) **Kyselina dusičná** pro všechny látky a přípravky, které působí na polyetylén oxidačně a způsobují molekulární degradaci (a následně snižují molekulární hmotnost) stejnou nebo menší než 55 % kyselina dusičná.

Musí se použít kyselina dusičná o koncentraci nejméně 55 %.

Pro zkoušku stohováním se bere za základ relativní hustota nejméně 1,4.

U originálních náplní, které oxidují silněji než 55 % kyselina dusičná, nebo které snižují molekulární hmotnost, se musí postupovat podle 6.1.5.2.5.

Doba životnosti obalu musí být v takových případech stanovena pozorováním stupně poškození (např. dva roky pro kyselinu dusičnou o koncentraci nejméně 55 %).

- (f) **Voda** pro látky, které nenapadají polyetylén způsoby uvedenými v předchozích odstavcích a) až e), zejména pro anorganické kyseliny a louhy, vodné roztoky solí, vícemocné alkoholy a organické látky ve vodném roztoku.

Pro zkoušku stohováním se bere za základ relativní hustota nejméně 1,2.

Zkouška konstrukčního typu s vodou se nevyžaduje, pokud je prokázána přiměřená chemická snášenlivost se smáčecím roztokem nebo s kyselinou dusičnou.

KAPITOLA 6.2

POŽADAVKY NA KONSTRUKCI A ZKOUŠENÍ TLAKOVÝCH NÁDOB, AEROSOLOVÝCH ROZPRAŠOVAČŮ, MALÝCH NÁDOBEK OBSAHUJÍCÍCH PLYN (PLYNOVÝCH KARTUŠÍ) A ZÁSObNÍKŮ DO PALIVOVÝCH ČLÁNKŮ OBSAHUJÍCÍCH ZKAPALNĚNÝ HOŘLAVÝ PLYN

POZNÁMKA: Aerosolové rozprašovače, malé nádoby obsahující plyn (plynové kartuše) a zásobníky do palivových článků obsahující zkapalněný hořlavý plyn nejsou předmětem požadavků oddílů 6.2.1 až 6.2.5.

6.2.1 Všeobecné požadavky

6.2.1.1 Konstrukce a výroba

6.2.1.1.1 Tlakové nádoby a jejich uzávěry musí být zkonstruovány, vyrobeny, odzkoušeny a vybaveny takovým způsobem, aby vydržely všechny podmínky, včetně únavy, kterým budou vystaveny během normálních podmínek přepravy a používání.

6.2.1.1.2 (Vyhrazeno)

6.2.1.1.3 V žádném případě nesmí být minimální tloušťka stěny menší nežli ta, která je specifikovaná v technických normách pro konstrukci a výrobu.

6.2.1.1.4 Pro svařované tlakové nádoby se smějí použít pouze kovy dobře svařitelné.

6.2.1.1.5 Zkušební tlak láhví, trubkových nádob, tlakových sudů a svazků láhví musí splňovat pokyn pro balení P200 pododdílu 4.1.4.1 nebo pro chemikálie pod tlakem pokyn pro balení P206 pododdílu 4.1.4.1. Zkušební tlak pro uzavřené kryogenní nádoby musí splňovat podmínky pokynu pro balení P203 pododdílu 4.1.4.1. Zkušební tlak zásobníkového systému s hydridem kovu musí splňovat podmínky pokynu pro balení P 205 pododdílu 4.1.4.1. Zkušební tlak láhve na adsorbovaný plyn musí být v souladu s pokyny pro balení P208 podle 4.1.4.1.

6.2.1.1.6 Tlakové nádoby uspořádané do svazků musí být strukturálně podepřeny a musí držet pohromadě jako jednotka. Tlakové nádoby musí být zabezpečeny způsobem, který zabraňuje v pohybu ve vztahu ke strukturálnímu uspořádání a k pohybu, který by měl za následek vznik lokálních koncentrací nebezpečných napětí. Různá příslušenství (např. sběrné potrubí, ventily a měřiče tlaku) musí být zkonstruována a vyrobena tak, aby byla chráněna před poškozením nárazem a před silami, kterým jsou při přepravě normálně vystavena. Sběrná a rozdělovací potrubí musejí mít nejméně stejný zkušební tlak jako láhve. Pro toxické zkapalněné plyny, musí mít každá tlaková nádoba izolační ventil, který zajistí, že každá tlaková nádoba může být plněna samostatně a dále zaručí, že během přepravy nedojde ke vzájemné výměně obsahu tlakových nádob.

POZNÁMKA: Toxické zkapalněné plyny mají klasifikační kódy 2T, 2TF, 2TC, 2TO, 2TFC nebo 2TOC.

6.2.1.1.7 Je třeba se vyvarovat styku rozdílných kovů, který může mít za následek poškození vlivem galvanického působení.

6.2.1.1.8 **Dodatečné požadavky na konstrukci uzavřených kryogenních nádob pro hluboce zchlazené zkapalněné plyny.**

6.2.1.1.8.1 Mechanické vlastnosti použitého kovu musí být stanoveny pro každou tlakovou nádobu; rovněž musí být stanovena vrubová houževnatost a koeficient ohybu.

POZNÁMKA: Pro vrubovou houževnatost jsou detaily zkušebních požadavků, které je možno použít, uvedeny v 6.8.5.3.

6.2.1.1.8.2 Tlakové nádoby musí být tepelně izolovány. Tepelná izolace musí být chráněna proti nárazu pomocí izolačního pláště. Jestliže prostor mezi tlakovou nádobou a izolačním pláštěm je zbaven vzduchu (vakuová izolace) musí být plášť zkonstruován tak, aby bez trvalé deformace vydržel vnější tlak nejméně 100 kPa (1 bar), vypočtený podle uznaného technického kódu, nebo vypočtený kritický tlak, při kterém dojde ke zhroutení, ne menší než 200 kPa (2 bary) přetlaku. Jestliže je plášť uzavřený tak, že je plynotěsný (např. v případě vakuové izolace), musí být vybaven zařízením, které má zabránit, v případě neodpovídající plynotěsnosti tlakové nádoby nebo jejího příslušenství, vzniku jakéhokoli nebezpečného tlaku v izolační vrstvě. Zařízení musí zabránit pronikání vlhkosti do izolace.

6.2.1.1.8.3 Uzavřené kryogenní nádoby určené pro přepravu hluboce zchlazených zkapalněných plynů s bodem varu pod -182°C při atmosférickém tlaku nesmějí obsahovat materiály, které by mohly nebezpečným způsobem reagovat s kyslíkem nebo s atmosférou obohacenou kyslíkem, pokud jsou umístěny v částech tepelné izolace, kde existuje riziko styku s kyslíkem nebo s kapalinou obohacenou kyslíkem.

6.2.1.1.8.4 Uzavřené kryogenní nádoby musí být zkonstruovány a vyrobeny s vhodným zdvihacím a zabezpečovacím zařízením.

6.2.1.1.9 ***Dodatečné požadavky na konstrukci tlakových nádob pro acetylen***

Tlakové nádoby pro UN 1001 acetylen, rozpuštěný a UN 3374 acetylen, bez rozpouštědla musí být naplněny porézním materiálem, rovnoměrně rozloženým a typu, který vyhovuje předpisům a zkouškám specifikovaným příslušným orgánem a který:

(a) je snášlivý s tlakovou nádobou a nevytváří škodlivé nebo nebezpečné sloučeniny buďto s acetylenem, nebo s rozpouštědlem v případě UN 1001; a

(b) je schopen zabránit šíření rozkladu acetyleny v porézním materiálu.

V případě UN 1001 se musí rozpouštědlo snášet s tlakovou nádobou.

6.2.1.2 ***Materiály***

6.2.1.2.1 Konstrukční materiály tlakových nádob a jejich uzávěrů, které jsou v přímém styku s nebezpečnými látkami, které se mají přepravovat, nesmějí být těmito látkami napadány nebo zeslabeny a nesmějí být příčinou nebezpečného efektu, jako je například katalytická reakce nebo reakce s nebezpečnými látkami.

6.2.1.2.2 Tlakové nádoby a jejich uzávěry musí být vyrobeny z materiálů specifikovaných v konstrukčních a výrobních technických normách a v odpovídajícím pokynu pro balení pro látky určené k přepravě v tlakové nádobě. Materiály musí být odolné proti křehkému lomu a vůči trhlínkové korozi, jak je stanoveno v konstrukčních a výrobních normách.

6.2.1.3 ***Provozní výstroj***

6.2.1.3.1 Ventily, potrubí a jiná příslušenství vystavená tlaku, s výjimkou zařízení pro vyrovnávání tlaku, musí být zkonstruovány a vyrobeny tak, aby tlak při roztržení byl nejméně 1,5 násobkem zkušebního tlaku tlakové nádoby.

6.2.1.3.2 Provozní výstroj musí být uspořádána nebo zkonstruována tak, aby se zabránilo poškození, které by mohlo vést k uvolnění obsahu tlakové nádoby během normálních podmínek manipulace a přepravy. Sběrná potrubí vedoucí k uzavíracím ventilům musí být dostatečně flexibilní, aby chránila ventily a potrubí před smykovým lomem nebo uvolněním obsahu tlakových nádob. Plnicí a vyprazdňovací ventily a všechna ochranná víka musí být schopna zajištění proti neúmyslnému otevření. Ventily musí být chráněny, jak je specifikováno v 4.1.6.8.

- 6.2.1.3.3 Tlakové nádoby, které nejsou schopné ruční manipulace nebo valení, musí být vybaveny příslušenstvím (skluznicemi, úchyty, řemeny), které zajistí, že mohou být bezpečně manipulovány mechanickými prostředky a které je uzpůsobeno tak, aby nebyla narušena jejich pevnost, ani aby nezpůsobilo nepřiměřená napětí v tlakové nádobě.
- 6.2.1.3.4 Jednotlivé tlakové nádoby musí být vybaveny zařízením pro vyrovnávání tlaku, jak je to specifikováno v pokynu pro balení P200 (2) nebo P205 pododdílu 4.1.4.1 nebo v 6.2.1.3.6.4 a 6.2.1.3.6.5. Zařízení pro vyrovnávání tlaku musí být zkonstruována tak, aby zabránila vniknutí cizí látky, úniku plynu a vzniku jakéhokoliv nebezpečného nadměrného tlaku. Pokud jsou zařízení pro vyrovnávání tlaku na horizontálních tlakových nádobách spojených sběrným potrubím a naplněných hořlavým plynem, musí být uspořádána tak, aby plyn volně unikl do volného prostoru takovým způsobem, aby se unikajícímu plynu zabránilo dostat se do styku s vlastní tlakovou nádobu za normálních podmínek přepravy.
- 6.2.1.3.5 Tlakové nádoby, jejichž plnění se měří objemově, musí být vybaveny ukazatelem hladiny.
- 6.2.1.3.6 ***Dodatečné požadavky na uzavřené kryogenní nádoby***
- 6.2.1.3.6.1 Každý plnicí a vyprazdňovací otvor uzavřené kryogenní nádoby použité pro přepravu hořlavých hluboce zchazených zkapalněných plynů, musí být vybaven nejméně dvěma navzájem nezávislými uzavíracími zařízeními v sérii, z nichž první je uzavírací ventil a druhé zátka nebo ekvivalentní zařízení.
- 6.2.1.3.6.2 Pro sekce potrubí, které mohou být na obou koncích uzavřeny a kde kapalný produkt může být zachycen, musí být použit způsob automatického uvolnění tlaku, aby se zabránilo nadměrnému nárůstu tlaku v potrubí.
- 6.2.1.3.6.3 Každé připojení k uzavřené kryogenní nádobě musí být jasně označeno, aby byla určena jeho funkce (např. plynná nebo kapalná fáze).
- 6.2.1.3.6.4 Zařízení pro vyrovnávání tlaku
- 6.2.1.3.6.4.1 Každá uzavřená kryogenní nádoba musí být vybavena nejméně jedním zařízením pro vyrovnávání tlaku. Toto zařízení musí být takového typu, aby odolávalo dynamickým silám včetně rázové vlny.
- 6.2.1.3.6.4.2 Uzavřené kryogenní nádoby mohou mít navíc průtržný kotouč paralelně s pružinovým(i) zařízením(ími), aby byly splněny požadavky 6.2.1.3.6.5.
- 6.2.1.3.6.4.3 Připojení k zařízením pro vyrovnávání tlaku musí mít dostatečný rozměr, aby umožnily neomezený průchod požadovaného množství plynu k zařízení pro vyrovnávání tlaku.
- 6.2.1.3.6.4.4 Veškeré příводы zařízení pro vyrovnávání tlaku musí být za podmínek maximálního plnění umístěny v plynném prostoru uzavřené kryogenní nádoby a zařízení musí být uspořádána tak, aby se zajistilo, že unikající plyn může být vypouštěn bez omezení.
- 6.2.1.3.6.5 Kapacita a nastavení zařízení pro vyrovnávání tlaku
- POZNÁMKA:*** Ve vztahu k zařízením pro vyrovnávání tlaku uzavřených kryogenních nádob znamená nejvyšší dovolený provozní tlak (MAWP) maximální účinný přetlak přípustný na horní části naplněné uzavřené kryogenní nádoby v její provozní poloze včetně nejvyššího účinného tlaku během plnění a vyprazdňování.
- 6.2.1.3.6.5.1 Zařízení pro vyrovnávání tlaku se musí otevírat automaticky při tlaku ne nižším nežli MAWP a musí být plně otevřena při tlaku rovném 110% MAWP. Po odpouštění se musí uzavřít při tlaku ne nižším než 10 % pod hodnotou tlaku, při kterém začíná odpouštění, a musí zůstat uzavřená při všech nižších tlacích.
- 6.2.1.3.6.5.2 Průtržné kotouče musí být nastaveny tak, aby praskly při nominálním tlaku, který je nižší než zkušební tlak nebo 150 % MAWP.

6.2.1.3.6.5.3 V případě ztráty vakua ve vakuově izolované uzavřené kryogenní nádobě musí být kombinovaná kapacita všech instalovaných zařízení pro vyrovnávání tlaku natolik dostatečná, aby tlak (včetně akumulace) uvnitř uzavřené kryogenní nádoby nepřekročil 120 % MAWP.

6.2.1.3.6.5.4 Požadovaná kapacita zařízení pro vyrovnávání tlaku musí být vypočtena podle stanoveného technického předpisu uznaného příslušným orgánem¹.

6.2.1.4 Schvalování tlakových nádob

6.2.1.4.1 Shoda tlakových nádob musí být hodnocena (sledována) v době výroby, jak požaduje příslušný orgán. Tlakové nádoby musí být podrobeny inspekci, zkouškám a musí být schváleny inspekční organizací. Technická dokumentace musí zahrnovat všechny specifikace týkající se konstrukce a výroby a úplnou dokumentaci pro výrobu a zkoušky.

6.2.1.4.2 Systémy zajištění kvality musí být v souladu s požadavky příslušného orgánu.

6.2.1.5 První inspekce a zkouška

6.2.1.5.1 Nové tlakové nádoby, jiné než uzavřené kryogenní nádoby a zásobníkové systémy s hydridem kovu, musí být podrobeny zkouškám a inspekcím během a po výrobě podle příslušných konstrukčních norem, včetně následujících ustanovení:

Na adekvátním vzorku tlakových nádob:

- (a) zkoušení mechanických vlastností konstrukčních materiálů;
- (b) ověření minimální tloušťky stěny;
- (c) ověření homogenity materiálu pro každou výrobní šarži;
- (d) inspekce vnějšího a vnitřního stavu tlakových nádob;
- (e) inspekce závitů hrdla;
- (f) ověření souladu s konstrukční normou;

Pro všechny tlakové nádoby:

- (g) hydraulická tlaková zkouška. Tlakové nádoby musí odolat zkušebnímu tlaku bez expanze větší než je dovolena v konstrukční specifikaci;

POZNÁMKA: Se souhlasem příslušného orgánu může být hydraulická tlaková zkouška nahrazena zkouškou za použití plynu, kde taková operace neznamená žádné nebezpečí.

- (a) inspekce a vyhodnocení výrobních závad a buďto jejich oprava nebo označení tlakových nádob za nepoužitelné. V případě svařovaných tlakových nádob musí být věnována zvláštní pozornost kvalitě svárů;
- (b) inspekce značení na tlakových nádobách;
- (c) tlakové nádoby určené k přepravě UN 1001 acetylenu, rozpuštěného a UN 3374 acetylenu, bez rozpouštědla musí být navíc podrobeny inspekci, aby byla zajištěna odpovídající instalace a stav porézního materiálu a, pokud je to patřičné, množství rozpouštědla.

6.2.1.5.2 Na přiměřeném vzorku uzavřených kryogenních nádob musí být provedeny inspekce a zkoušky specifikované v 6.2.1.5.1 (a), (b), (d) a (f). Svary musí být navíc podrobeny inspekci pomocí radiografické, ultrazvukové nebo jiné vhodné nedestruktivní zkušební metodě na vzorku uzavřených

¹ viz např. CGA Publikace S-1.2-2003 „Pressure Relief Device Standards Part 2– Cargo and Portable Tanks for Compressed Gases“ and S-1.1-2003 „Pressure Relief Device Standards – Part 1 – Cylinders for Compressed Gases“.

kryogenních nádob podle příslušné konstrukční a výrobní normy. Tato inspekce sváru se nepoužívá pro plášť.

Všechny uzavřené kryogenní nádoby musí navíc podstoupit první inspekce a zkoušky specifikované v 6.2.1.5.1 (g), (h) a (i), a po kompletaci zkoušku těsnosti a zkoušku funkční způsobilosti provozní výstroje.

- 6.2.1.5.3 Pro zásobníkový systém s hydridem kovu, musí být ověřeno, že inspekce a zkoušky specifikované v 6.2.1.5.1 (a), (b), (c), (d), (e) pokud je to vhodné, (f), (g), (h) a (i) byly provedeny na přiměřeném vzorku nádob použitých v zásobníkovém systému s hydridem kovu. Kromě toho na přiměřeném vzorku zásobníkového systému s hydridem kovu musí být provedeny inspekce a zkoušky specifikované v 6.2.1.5.1 (c) a (f) stejně jako 6.2.1.5.1 (e), pokud je to vhodné a zkoušky vnějšího stavu zásobníkového systému s hydridem kovu.

Všechny zásobníkové systémy s hydridem kovu musí navíc podstoupit první inspekce a zkoušky specifikované v 6.2.1.5.1 (h) a (i), stejně jako zkoušku těsnosti a zkoušku funkční způsobilosti provozní výstroje.

6.2.1.6 Periodická inspekce a zkouška

- 6.2.1.6.1 Opakovatelně plnitelné tlakové nádoby, jiné než kryogenní nádoby, musí být podrobeny periodickým inspekcím a zkouškám organizací pověřenou příslušným orgánem podle dále uvedených požadavků:

- (a) kontrola vnějšího stavu tlakové nádoby a ověření výstroje a vnějšího značení;
- (b) kontrola vnitřního stavu tlakové nádoby (např. kontrolou vnitřku, ověření minimální tloušťky stěny);
- (c) ověření závitů, jsou-li stopy koroze nebo je-li demontováno příslušenství;
- (d) hydraulická tlaková zkouška, a pokud je to nutné, ověření charakteristik materiálu vhodnými zkouškami;
- (e) ověření provozní výstroje, jiných příslušenství a zařízení pro vyrovnávání tlaku, pokud mají být znovu uvedeny do provozu.

POZNÁMKA 1: Se souhlasem příslušného orgánu může být hydraulická tlaková zkouška nahrazena zkouškou za použití plynu, pokud není tento postup nebezpečný.

POZNÁMKA 2: Se souhlasem příslušného orgánu může být hydraulická tlaková zkouška láhvi nebo trubkových nádob nahrazena ekvivalentní metodou na základě zkoušky akustické emise nebo kombinace zkoušky akustické emise a zkoušky ultrazvukem. ISO 16148:2006 může být použita jako návod pro postup zkoušky akustické emise.

POZNÁMKA 3: Hydraulická tlaková zkouška může být nahrazena ultrazvukovou zkouškou uskutečněnou v souladu s ISO 10461:2005+A1:2006 pro bezešvé plynové láhve ze slitiny hliníku a v souladu s ISO 6406:2005 pro bezešvé ocelové plynové láhve.

POZNÁMKA 4: Periodické kontroly a četnosti zkoušek – viz pokyn pro balení P200 pododdílu 4.1.4.1 nebo pro chemikálie pod tlakem pokyn pro balení P206 pododdílu 4.1.4.1.

- 6.2.1.6.2 U tlakových nádob určených pro přepravu UN 1001 acetyleny, rozpuštěného a UN 3374 acetyleny, bez rozpouštědla musí být provedena pouze kontrola podle 6.2.1.6.1 (a), (c) a (e). Navíc musí být zkontrolován stav porézního materiálu (např. praskliny, volný prostor v horní části, uvolnění, usazení).
- 6.2.1.6.3 U tlakových pojistných ventilů pro uzavřené kryogenní nádoby se musí provádět periodické kontroly a zkoušky.

6.2.1.7 Požadavky na výrobce

6.2.1.7.1 Výrobce musí být technicky schopný a musí vlastnit veškeré prostředky požadované pro úspěšnou výrobu tlakových nádob, zvláště kvalifikovaný personál pro:

- (a) dohled nad celým výrobním procesem;
- (b) provedení spojů materiálů; a
- (c) provedení příslušných zkoušek.

6.2.1.7.2 Zkouška odbornosti výrobce musí být ve všech případech vykonána inspekční organizací pověřenou příslušným orgánem země schválení.

6.2.1.8 Požadavky na inspekční organizaci

6.2.1.8.1 Inspekční organizace musí být nezávislá na výrobních podnicích a kompetentní pro provádění zkoušek, inspekci a požadovaných schválení.

6.2.2 Požadavky na UN tlakové nádoby

Navíc k všeobecným požadavkům oddílu 6.2.1, musí UN tlakové nádoby splňovat požadavky tohoto oddílu, včetně příslušných norem. Po datu uvedeném v pravém sloupci tabulek není povolena výroba nových tlakových lahví nebo servisního zařízení podle jakékoliv konkrétní normy v 6.2.2.1 a 6.2.2.3.

POZNÁMKA: UN tlakové nádoby a servisní zařízení konstruované podle norem platných v době výroby je možné nadále používat pod podmínkou ustanovení o pravidelných kontrolách ADR.

6.2.2.1 Konstrukce, výroba a první inspekce a zkouška

6.2.2.1.1 Následující normy se vztahují na konstrukci, výrobu a první inspekci a zkoušku UN láhví, s výjimkou toho, že požadavky na inspekci vztahující se k systému posuzování shody a schvalování musí být v souladu s 6.2.2.5:

Reference	Název	Použitelnost pro výrobu
ISO 9809-1:1999	Plynové lahve – Opakovaně plnitelné bezešvé ocelové plynové lahve – Konstrukce, výroba a zkoušení - Část 1: Kalené a temperované ocelové lahve s pevností v tahu menší než 1100 MPa POZNÁMKA: Poznámka týkající se <i>F</i> faktoru v oddílu 7.3 této normy nesmí být použita pro UN lahve.	Do 31.12.2018
ISO 9809-1:2010	Lahve na plyny - Znovuplnitelné bezešvé ocelové lahve na plyny - Návrh, konstrukce a zkoušení - Část 1: Lahve ze zušlechtěné oceli s mezí pevnosti v tahu menší než 1 100 MPa	Až do odvolání
ISO 9809-2:2000	Lahve na plyny - Znovuplnitelné bezešvé ocelové lahve na plyny - Návrh, konstrukce a zkoušení - Část 2: Lahve ze zušlechtěné oceli s mezí pevnosti v tahu 1 100 MPa nebo větší	Do 31.12.2018
ISO 9809-2:2010	Lahve na plyny - Znovuplnitelné bezešvé ocelové lahve na plyny - Návrh, konstrukce a zkoušení - Část 2: Lahve ze zušlechtěné oceli s mezí pevnosti v tahu 1 100 MPa nebo větší	Až do odvolání
ISO 9809-3:2000	Plynové lahve – Opakovaně plnitelné bezešvé ocelové plynové lahve -Konstrukce, výroba a zkoušení - Část 3: Normalizované ocelové lahve	Do 31.12.2018
ISO 9809-3:2010	Lahve na plyny - Znovuplnitelné bezešvé ocelové lahve na plyny - Návrh, konstrukce a zkoušení - Část 3: Lahve z normalizačně žíhané oceli	Až do odvolání
ISO 7866:1999	Plynové lahve - Opakovaně plnitelné bezešvé plynové lahve ze slitiny hliníku-Konstrukce, výroba a zkoušení	Do 31.12.2020

	POZNÁMKA: Poznámka týkající se <i>F</i> faktoru v oddílu 7.2 této normy nesmí být použita pro UN láhve. Slitina hliníku 6351A – T6 nebo ekvivalentní není dovolena.	
ISO 7866:2012	Plynové láhve – Opakovaně plnitelné bezešvé plynové láhve ze slitiny hliníku – Konstrukce, výroba a zkoušení POZNÁMKA: Slitina hliníku 6351A nebo ekvivalentní nesmí být použita	Až do odvolání
ISO 4706:2008	Plynové láhve – Opakovaně plnitelné svařované ocelové láhve – zkušební tlak 60 barů a nižší	Až do odvolání
ISO 18172-1:2007	Plynové láhve – Opakovaně plnitelné svařované nerezové ocelové láhve – Část 1: Zkušební tlak 6 MPa a nižší	Až do odvolání
ISO 20703:2006	Plynové láhve - Opakovaně plnitelné plynové láhve ze slitiny hliníku – Konstrukce, výroba a zkoušení	Až do odvolání
ISO 11118:1999	Plynové láhve – Kovové plynové láhve pro jedno použití – Specifikace a zkušební metody	Až do odvolání
ISO 11119-1:2002	Plynové láhve kompozitní konstrukce- Specifikace a zkušební metody – Část 1: Kompozitní plynové láhve ovinuté obručí	Až do odvolání
ISO 11119-2:2002	Plynové láhve kompozitní konstrukce - Specifikace a zkušební metody - Část 2: Plně ovinuté, vláknem vyztužené kompozitní plynové láhve s kovovými vložkami podílejícími se na zátěži	Až do odvolání
ISO 11119-3:2002	Plynové láhve kompozitní konstrukce – Specifikace a zkušební metody - Část 3: Plně ovinuté, vláknem vyztužené kompozitní plynové láhve s kovovými nebo nekovovými vložkami nepodílejícími se na zátěži	Až do odvolání

POZNÁMKA 1: Ve výše uvedených referenčních normách musí být kompozitní láhve zkonstruovány pro neomezenou provozní životnost.

POZNÁMKA 2: Po prvních 15 letech provozu mohou být kompozitní láhve vyrobené dle těchto norem schváleny pro další provoz příslušným orgánem, který je zodpovědný za původní schválení láhve a který založí svoje rozhodnutí na informacích ze zkoušky, které mu poskytne výrobce nebo vlastník nebo uživatel.

6.2.2.1.2

Následující norma se vztahuje na konstrukci, výrobu a první inspekci a zkoušku UN trubkových nádob, s výjimkou toho, že požadavky na inspekci vztahující se k systému posuzování shody a schvalování musí být podle 6.2.2.5:

Reference	Název	Použitelnost pro výrobu
ISO 11120:1999	Plynové láhve – Opakovaně plnitelné bezešvé ocelové trubkové nádoby pro přepravu stlačeného plynu s hydraulickým vnitřním objemem mezi 150 l a 3000 l – Konstrukce, výroba a zkoušení POZNÁMKA: Poznámka týkající se <i>F</i> faktoru v oddílu 7.3. této normy nesmí být použita pro UN trubkové nádoby použita.	Až do odvolání

6.2.2.1.3

Následující normy se vztahují na konstrukci, výrobu a první inspekci a zkoušku UN láhví na acetylen, s výjimkou toho, že požadavky na inspekci vztahující se k systému posuzování shody a schvalování musí být podle 6.2.2.5:

Pro vlastní láhev:

Reference	Název	Použitelnost pro výrobu
ISO 9809-1:1999	Lahve na plyny - Znovuplnitelné bezešvé ocelové lahve na plyny - Návrh, konstrukce a zkoušení - Část 1: Lahve ze zušlechtěné oceli s mezí pevnosti v tahu menší než 1 100 MPa POZNÁMKA: Poznámka týkající se <i>F</i> faktoru v oddílu 7.3 této normy nesmí být použita pro UN láhve.	Do 31. 12. 2018

ISO 9809-1:2010	Lahve na plyny - Znovuplnitelné bezešvé ocelové lahve na plyny - Návrh, konstrukce a zkoušení - Část 1: Lahve ze zušlechtěné oceli s mezí pevnosti v tahu menší než 1 100 MPa	Až do odvolání
ISO 9809-3:2000	Lahve na plyny - Znovuplnitelné bezešvé ocelové lahve na plyny - Návrh, konstrukce a zkoušení - Část 3: Lahve z normalizačně žíhané oceli	Do 31. 12. 2018
ISO 9809-3:2010	Lahve na plyny - Znovuplnitelné bezešvé ocelové lahve na plyny - Návrh, konstrukce a zkoušení - Část 3: Lahve z normalizačně žíhané oceli	Až do odvolání

Pro porézní materiály v láhvi:

Reference	Název	Použitelnost pro výrobu
ISO 3807-1:2000	Láhve na acetylen - Základní požadavky – Část 1: Láhve bez tavných zátek	Až do odvolání
ISO 3807-2:2000	Láhve na acetylen - Základní požadavky – Část 2: Láhve s tavnými zátkami	Až do odvolání

- 6.2.2.1.4 Následující norma se vztahuje na konstrukci, výrobu a první inspekci a zkoušku UN kryogenních nádob, s výjimkou toho, že požadavky na inspekci vztahující se k systému posuzování shody a schvalování musí být podle 6.2.2.5:

Reference	Název	Použitelnost pro výrobu
ISO 21029-1:2004	Kryogenní nádoby - Převratitelné vakuové izolované nádoby s objemem nejvýše 1000 l - Část 1: Konstrukce, výroba, inspekce a zkoušky	Až do odvolání

- 6.2.2.1.5 Následující norma se vztahuje na konstrukci, výrobu a první inspekci a zkoušku UN zásobníkového systému s hydridem kovu, s výjimkou toho, že požadavky na inspekci vztahující se k systému posuzování shody a schvalování musí být podle 6.2.2.5:

Reference	Název	Použitelnost pro výrobu
ISO 16111:2008	Převratitelný plynový zásobníkový systém – vodík absorbovaný v reversibilním hydridu kovu	Až do odvolání

- 6.2.2.1.6 Níže uvedená norma platí pro návrh, konstrukci a počáteční kontrolu a zkoušky svazků lahví UN. Každá láhev ve svazku lahví UN musí být láhev UN splňující požadavky 6.2.2. Požadavky na kontrolu související se systémem hodnocení shody a schvalováním svazků UN lahví musí být v souladu s 6.2.2.5.

Reference	Název	Použitelnost pro výrobu
ISO 10961:2010	Lahve na plyny - Svazky lahví - Návrh, výroba, zkoušení a kontrola	Až do odvolání

POZNÁMKA: Výměna jednoho nebo více válců stejného konstrukčního typu, včetně stejného zkušebního tlaku, ve stávajícím svazku válců UN nevyžaduje recertifikaci stávajícího svazku.

- 6.2.2.1.7 Následující normy se vztahují na konstrukci, výrobu a první inspekci a zkoušku lahví UN pro adsorbované plyny, kromě toho, že požadavky na kontrolu vztahující se k systému posuzování shody a schvalování musí být podle 6.2.2.5.

Reference	Název	Použitelnost pro výrobu
ISO 11513:2011	Lahve na plyny - Znovuplnitelné svařované ocelové lahve obsahující materiály pro subatmosférické balení plynů (kromě acetylénu) - Návrh, konstrukce, zkoušení, používání a periodické kontroly	Až do odvolání

ISO 9809-1:2010	Lahve na plyny - Znovuplnitelné bezešvé ocelové lahve na plyny - Návrh, konstrukce a zkoušení - Část 1: Lahve ze zušlechtěné oceli s mezí pevnosti v tahu menší než 1 100 MPa	Až do odvolání
-----------------	---	----------------

6.2.2.2***Materiály***

Navíc k materiálovým požadavkům specifikovaným v normách pro konstrukci a výrobu tlakových nádob a k veškerým omezením specifikovaným v příslušném pokynu pro balení pro přepravovaný plyn(y) (např. pokyn pro balení P200 nebo P 205 v 4.1.4.1), se ke snášenlivosti materiálu použijí následující normy:

ISO 11114-1:2012	Plynové láhve - Snášenlivost materiálů lahví a ventilů s plynným obsahem – Část 1 : Kovové materiály
ISO 11114- 2:2000	Převratitelné plynové láhve- Snášenlivost materiálů lahví a ventilů s plynným obsahem – Část 2 : Nekovové materiály

6.2.2.3***Provozní výstroj***

Na uzávěry a jejich ochranu se vztahují následující normy:

Reference	Název	Použitelnost pro výrobu
ISO 11117:1998	Lahve na plyny - Ochranné kloboučky ventilů a kryty ventilů pro průmyslové a zdravotnické lahve na plyny - Návrh, konstrukce a zkoušky	Do 31. 12. 2014
ISO 11117:2008 + Cor 1:2009	Lahve na plyny - Ochranné kloboučky ventilů a kryty ventilů - Návrh, konstrukce a zkoušky	Až do odvolání
ISO 10297:1999	Lahve na plyny - Ventily znovuplnitelných lahví na plyny - Technické podmínky a typové zkoušky	Do 31. 12. 2008
ISO 10297:2006	Lahve na plyny - Ventily znovuplnitelných lahví na plyny - Technické podmínky a typové zkoušky POZNÁMKA: EN verze této normy ISO splňuje požadavky a je též možné ji použít.	Až do odvolání
ISO 13340:2001	Lahve na přepravu plynů - Ventily lahví na jedno použití (kartaše) - Technické podmínky a prototypové zkoušky	Až do odvolání

Pro UN zásobníkový systém s hydridem kovu, se požadavky specifikované v následující normě vztahují na uzávěry a jejich ochranu:

Reference	Název	Použitelnost pro výrobu
ISO 16111:2008	Převratitelný plynový zásobníkový systém – vodík absorbovaný v reversibilním hydridu kovu	Až do odvolání

6.2.2.4***Periodická inspekce a zkouška***

Na periodické inspekce a zkoušky UN lahví a UN zásobníkový systém s hydridem kovu se vztahují následující normy:

Reference	Název	Použitelnost pro výrobu
ISO 6406:2005	Periodická inspekce a zkouška bezešvých ocelových plynových lahví	Až do odvolání
ISO 10460:2005	Lahve na plyny – Lahve na plyny ze svařované uhlíkové oceli – Periodické kontroly a zkoušení POZNÁMKA: Oprava svarů popsáná v pododdílu 12.1 této normy není přípustná. Opravy popsáné v pododdílu 12.2 vyžadují schválení příslušného orgánu, který schválil organizace pro periodické inspekce a zkoušky v souladu s 6.2.2.6.	Až do odvolání

ISO 10461:2005 + A1: 2006	Bezešvé plynové láhve ze slitiny hliníku - Periodická inspekce a zkouška	Až do odvolání
ISO 10462 : 2005	Plynové láhve – Převratitelné láhve na rozpuštěný acetylen – Periodická inspekce a údržba	Až do odvolání
ISO 11513:2011	Lahve na plyny - Znovuplnitelné svařované ocelové lahve obsahující materiály pro subatmosférické balení plynů (kromě acetylenu) - Návrh, konstrukce, zkoušení, používání a periodické kontroly	Až do odvolání
ISO 11623 : 2002	Převratitelné plynové láhve – Periodická inspekce a zkouška kompozitních plynových lahví	Až do odvolání
ISO 16111:2008	Převratitelný plynový zásobníkový systém – vodík absorbovaný v reversibilním hydridu kovu	Až do odvolání

6.2.2.5 **Systém posuzování shody a schvalování pro výrobu tlakových nádob**

6.2.2.5.1 **Definice**

Pro účely tohoto pododdílu:

Systém posuzování shody znamená systém schválení výrobce příslušným orgánem, schválením konstrukčního typu tlakových nádob, schválením systému kvality výrobce a schválením inspekční organizací,

Konstrukční typ znamená konstrukci tlakové nádoby, jak je specifikována v příslušné normě pro tlakové nádoby,

Ověřit znamená potvrdit zkouškou nebo poskytnutím objektivního důkazu, že předepsané požadavky byly splněny.

6.2.2.5.2 **Všeobecné požadavky**

Příslušný orgán

6.2.2.5.2.1 Příslušný orgán schvalující tlakovou nádobu musí schválit systém posuzování shody, aby zaručil, že tlakové nádoby splňují požadavky ADR. V případech, kdy příslušný orgán, který schvaluje tlakovou nádobu, není příslušným orgánem v zemi výroby, musí být ve značení na tlakové nádobě uvedeny značky země schválení a země výroby (viz 6.2.2.7 a 6.2.2.8).

Příslušný orgán země schválení musí na žádost předložit svému protějšku v zemi používání důkaz o tom, že účinně aplikuje systém posuzování shody.

6.2.2.5.2.2 Příslušný orgán může delegovat své funkce v tomto systému posuzování shody úplně nebo částečně.

6.2.2.5.2.3 Příslušný orgán musí zajistit, že je k dispozici platný seznam schválených inspekčních organizací a jejich identifikačních značek a schválených výrobců a jejich identifikačních značek.

Inspekční organizace

6.2.2.5.2.4 Inspekční organizace musí být schválena příslušným orgánem pro inspekci tlakových nádob a musí:

- mít personál s organizační strukturou, způsobilý, vyškolený, kompetentní a zručný k uspokojivému výkonu jeho technických funkcí;
- mít přístup k vhodnému a odpovídajícímu vybavení a zařízením;
- pracovat nestranně a být oproštěna od jakéhokoliv vlivu, který by jí v tom mohl bránit;
- zajistit důvěrnost obchodních a vlastnických aktivit výrobce a jiných organizací;
- udržovat jasnou hranici mezi aktuálními funkcemi inspekční organizace a funkcemi nesouvisejícími;

- (f) používat zdokumentovaný systém kvality;
- (g) zajistit, aby byly provedeny zkoušky a inspekce specifikované v příslušné normě pro tlakové nádoby a v ADR; a
- (h) udržovat účinný a vhodný systém zpráv a záznamů dle 6.2.2.5.6.

6.2.2.5.2.5 Inspekční organizace musí provádět schválení konstrukčního typu, výrobní inspekce a zkoušky tlakových nádob a certifikaci k ověření shody s odpovídající normou pro tlakové nádoby (viz 6.2.2.5.4 a 6.2.2.5.5).

Výrobce

6.2.2.5.2.6 Výrobce musí:

- (a) používat dokumentovaný systém kvality podle 6.2.2.5.3;
- (b) požádat o schválení konstrukčního typu podle 6.2.2.5.4;
- (c) vybrat inspekční organizaci ze seznamu schválených inspekčních organizací vedeného příslušným orgánem v zemi schválení; a
- (d) uchovávat záznamy podle 6.2.2.5.6.

Zkušební laboratoř

6.2.2.5.2.7 Zkušební laboratoř musí mít:

- (a) personál v organizační struktuře, v dostatečném počtu, kompetentní a zkušený; a
- (b) vhodná a odpovídající zařízení a vybavení k provádění zkoušek vyžadovaných výrobní normou ke spokojenosti inspekční organizace.

6.2.2.5.3 **Systém kvality výrobce**

6.2.2.5.3.1 Systém kvality musí obsahovat všechny prvky, požadavky a předpisy převzaté výrobcem. Musí být systematicky a přehledně zdokumentován formou písemných rozhodnutí, postupů a instrukcí.

Musí zejména obsahovat odpovídající popisy:

- (a) organizační struktury a zodpovědnosti personálu vzhledem ke konstrukci a kvalitě výrobků;
- (b) postupů kontroly a ověřování konstrukce a postupů použitých při konstrukci tlakových nádob;
- (c) instrukcí, které budou používány pro výrobu tlakových nádob, kontrolu kvality, zajištění kvality a instrukcí k průběhu operací;
- (d) záznamů o kvalitě, jako jsou inspekční zprávy a zkušební a kalibrační data;
- (e) rozborů managementu k zajištění účinné činnosti systému kvality vycházejících z auditů podle 6.2.2.5.3.2;
- (f) postupu popisujícího, jak jsou plněny požadavky zákazníka;
- (g) postupu kontroly dokumentů a jejich revize;
- (h) prostředků pro kontrolu tlakových nádob neodpovídajících předpisům, nakoupených komponentů a výrobních a finálních materiálů; a
- (i) školicích programů a kvalifikačních postupů pro příslušné zaměstnance.

6.2.2.5.3.2 Audit systému kvality

Systém kvality musí být nejprve posouzen, aby se zjistilo, zda splňuje požadavky uvedené v 6.2.2.5.3.1 ke spokojenosti příslušného orgánu.

Výrobce musí být seznámen s výsledky auditu. Sdělení musí obsahovat závěry auditu a veškerá požadovaná nápravná opatření.

Periodické audity musí být prováděny ke spokojenosti příslušného orgánu, aby se zajistilo, že výrobce dodržuje a používá systém kvality. Zprávy o periodických auditech musí být poskytnuty výrobcí.

6.2.2.5.3.3 Dodržování systému kvality

Výrobce musí dodržovat systém kvality tak, jak je schválen, aby zůstal přiměřený a účinný.

Výrobce musí oznámit příslušnému orgánu, který schválil systém kvality, všechny zamýšlené změny systému. Navržené změny musí být vyhodnoceny, aby se stanovilo, zda pozměněný systém kvality bude splňovat požadavky uvedené v 6.2.2.5.3.1.

6.2.2.5.4 **Schvalovací proces**

První schválení konstrukčního typu

6.2.2.5.4.1 První schválení konstrukčního typu se musí skládat ze schválení systému kvality výrobce a schválení konstrukce vyráběné tlakové nádoby, která se má vyrábět. Žádost o první schválení konstrukčního typu musí splňovat požadavky uvedené v 6.2.2.5.4.2 až 6.2.2.5.4.6 a 6.2.2.5.4.9.

6.2.2.5.4.2 Výrobce, který chce vyrábět tlakové nádoby podle normy pro tlakové nádoby a ADR, musí požádat, obdržet a uchovávat osvědčení o schválení konstrukčního typu vydané příslušným orgánem v zemi schválení pro nejméně jeden konstrukční typ tlakové nádoby podle postupu uvedeného v 6.2.2.5.4.9. Toto osvědčení musí být na žádost předloženo příslušnému orgánu země použití.

6.2.2.5.4.3 Žádost musí být podána pro každou výrobní jednotku a musí obsahovat:

- (a) jméno a registrovanou adresu výrobce, a pokud je žádost podávána pověřeným zástupcem, také jeho jméno a adresu;
- (b) adresu výrobní jednotky (je-li rozdílná od výše uvedené);
- (c) jméno a titul osoby (osob) zodpovědné za systém kvality;
- (d) identifikaci tlakové nádoby a příslušné normy pro tlakovou nádobu;
- (e) podrobnosti jakéhokoliv odmítnutí schválení podobné žádosti jiným příslušným orgánem;
- (f) identitu inspekční organizace pro schválení konstrukčního typu;
- (g) dokumentaci o výrobní jednotce, jak je specifikována pod 6.2.2.5.3.1; a
- (h) technickou dokumentaci vyžadovanou pro schválení konstrukčního typu, která umožní ověření shody tlakových nádob s požadavky odpovídající normy pro tlakovou nádobu. Technická dokumentace musí pokrýt konstrukci a způsob výroby a musí obsahovat, pokud je to důležité pro posouzení, nejméně následující:
 - (i) normu pro konstrukci tlakové nádoby, konstrukční a výrobní výkresy ukazující komponenty a montážní podskupiny, pokud existují;
 - (ii) popisy a vysvětlivky nezbytné pro porozumění výkresům a k předpokládanému použití tlakových nádob;
 - (iii) seznam norem nutných pro úplnou definici výrobního procesu;
 - (iv) konstrukční výpočty a specifikace materiálů; a
 - (v) zkušební protokoly ze zkoušek provedených ke schválení konstrukčního typu, popisující výsledky prohlídek a zkoušek provedených podle 6.2.2.5.4.9.

6.2.2.5.4.4 První audit podle 6.2.2.5.3.2 musí být proveden ke spokojenosti příslušného orgánu.

6.2.2.5.4.5 Pokud je výrobci schválení odepřeno, musí příslušný orgán poskytnout písemné podrobné zdůvodnění takového zamítnutí.

6.2.2.5.4.6 Po obdržení schválení musí být příslušný orgán informován o změnách v informacích poskytnutých podle 6.2.2.5.4.3, vztahujících se k prvnímu schválení.

Následná schválení konstrukčního typu

6.2.2.5.4.7 Žádost o následné schválení konstrukčního typu musí splňovat požadavky uvedené v 6.2.2.5.4.8 a 6.2.2.5.4.9, pokud je výrobce vlastníkem prvního schválení konstrukčního typu. V tomto případě systém kvality výrobce podle 6.2.2.5.3 musel být schválen během prvního schválení konstrukčního typu a musí být použitelný pro novou konstrukci.

6.2.2.5.4.8 Žádost musí obsahovat:

- (a) jméno a adresu výrobce, a pokud je žádost podávána pověřeným zástupcem, také jeho jméno a adresu;
- (b) podrobnosti jakéhokoliv odmítnutí podobné žádosti jiným příslušným orgánem;
- (c) důkaz, že bylo uděleno první schválení konstrukčního typu; a
- (d) technickou dokumentaci, jak je popsána v 6.2.2.5.4.3 (h).

Postup pro schválení konstrukčního typu

6.2.2.5.4.9 Inspekční organizace musí:

- (a) přezkoumat technickou dokumentaci, aby ověřila že:
 - (i) konstrukce je v souladu s odpovídajícími ustanoveními normy; a
 - (ii) prototyp byl vyroben podle technické dokumentace a je reprezentantem konstrukčního typu;
- (b) ověřit, že výrobní inspekce byly provedeny tak, jak je vyžadováno podle 6.2.2.5.5;
- (c) vybrat tlakové nádoby z prototypové výrobní série a dohlížet nad zkouškami těchto tlakových nádob, jak se to vyžaduje pro schválení konstrukčního typu;
- (d) provést nebo nechat provést prohlídky a zkoušky specifikované v normě pro tlakové nádoby, aby se zjistilo, že:
 - (i) norma byla použita a splněna; a
 - (ii) postupy použité výrobcem splňují požadavky normy; a
- (e) zajistit, aby různé druhy schvalovacích prohlídek a zkoušek byly provedeny správně a úplně.

Po úspěšném provedení zkoušek prototypu a po splnění všech příslušných požadavků v 6.2.2.5.4 musí být vydáno osvědčení o schválení konstrukčního typu, které musí obsahovat jméno a adresu výrobce, výsledky a závěry šetření a data nutná pro identifikaci konstrukčního typu.

Pokud je výrobci schválení odepřeno, musí příslušný orgán poskytnout podrobné písemné zdůvodnění tohoto zamítnutí.

6.2.2.5.4.10 Změny schválených konstrukčních typů

Výrobce musí buď:

- (a) informovat vydávající příslušný orgán o změnách schváleného konstrukčního typu v případech, že takové změny nevytvářejí novou konstrukci, jak je to specifikováno v normě pro tlakové nádoby; nebo

- (b) požádat o dodatečné schválení konstrukčního typu v případě, že tyto změny vytvářejí novou konstrukci podle příslušné normy pro tlakové nádoby. Toto dodatečné schválení musí být uděleno ve formě změny původního osvědčení o schválení konstrukčního typu.

6.2.2.5.4.11 Na žádost musí příslušný orgán sdělit všem dalším příslušným orgánům informace týkající se schválení konstrukčního typu, změn schválení a odejmutých schválení.

6.2.2.5.5 **Výrobní inspekce a certifikace**

Všeobecné požadavky

Inspekční organizace, nebo její zástupce, musí provést inspekci a certifikaci každé tlakové nádoby. Inspekční organizace vybraná výrobcem pro inspekci a zkoušení během výroby, může být odlišná od inspekční organizace, která provedla zkoušky pro schválení konstrukčního typu.

Tam, kde může být ke spokojenosti inspekční organizace prokázáno, že výrobce vyškoli kompetentní inspektory, nezávislé na výrobě, může být inspekce prováděna těmito inspektory. V tomto případě musí výrobce uchovat zprávy o školení inspektorů.

Inspekční organizace musí ověřit, že inspekce provedené výrobcem a zkoušky provedené na těchto tlakových nádobách jsou plně v souladu s normou a požadavky ADR. Pokud by byl zjištěn nesoulad v souvislosti s touto inspekci a zkouškami, může být povolení k provádění inspekce vlastními inspektory výrobcem odebráno.

Výrobce musí, po schválení inspekční organizací, učinit prohlášení o shodě s konstrukčním typem. Umístění certifikační značky na tlakovou nádobu musí být považováno prohlášení, že tlaková nádoba splňuje příslušné normy pro tlakové nádoby a požadavky systému posuzování shody a ADR. Inspekční organizace umístí nebo nechá umístit výrobce certifikační značku tlakové nádoby a registrovanou značku inspekční organizace na každou schválenou tlakovou nádobu.

Certifikát o shodě, podepsaný inspekční organizací a výrobcem, musí být vydán předtím, než budou tlakové nádoby naplněny.

6.2.2.5.6 **Záznamy**

Záznamy o schválení konstrukčního typu a certifikát o shodě musí být uchovány výrobcem a inspekční organizací po dobu nejméně 20 let.

6.2.2.6 **Schvalovací systém pro periodické inspekce a zkoušky tlakových nádob**

6.2.2.6.1 **Definice**

Pro účely tohoto oddílu:

Schvalovací systém znamená systém příslušného orgánu ke schválení organizace k výkonu periodických inspekci a zkoušek tlakových nádob (dále uváděna jako „organizace pro periodické inspekce a zkoušky“), včetně schválení systému kvality této organizace.

6.2.2.6.2 **Všeobecné požadavky**

Příslušný orgán

6.2.2.6.2.1 Příslušný orgán musí vytvořit schvalovací systém, aby zajistil, že periodické inspekce a zkoušky tlakových nádob splňují požadavky ADR. V případech, kdy příslušný orgán, který schvaluje organizaci provádějící periodickou inspekci a zkoušku tlakové nádoby, není příslušným orgánem v zemi schvalující výrobu tlakové nádoby, musí být značky země schvalující periodické inspekce a zkoušky uvedeny ve značení tlakové nádoby (viz 6.2.2.6.7).

Příslušný orgán země schválení pro periodickou inspekci a zkoušku musí na žádost svému protějšku v zemi použití poskytnout přesvědčivý důkaz o souladu s tímto schvalovacím systémem včetně zpráv o periodických inspekcích a zkouškách.

Příslušný orgán země schválení může ukončit platnost schvalovacího certifikátu zmíněného v 6.2.2.6.4.1, pokud přesvědčivý důkaz prokáže nesoulad se schvalovacím systémem.

6.2.2.6.2.2 Příslušný orgán může delegovat svoje funkce v tomto schvalovacím systému vcelku nebo částečně.

6.2.2.6.2.3 Příslušný orgán musí zajistit dostupnost aktuálního seznamu schválených organizací pro periodické inspekce a zkoušky i s jejich identifikačními značkami.

Organizace pro periodické inspekce a zkoušky

6.2.2.6.2.4 Organizace pro periodické inspekce a zkoušky musí být schválena příslušným orgánem a musí:

- (a) mít personál s organizační strukturou, způsobilý, vyškolený, kompetentní a kvalifikovaný k uspokojivému výkonu jeho technických funkcí;
- (b) mít přístup k vhodnému a odpovídajícímu vybavení a zařízením;
- (c) pracovat nestranně a být oproštěna od jakéhokoliv vlivu, který by jí v tom mohl bránit;
- (d) zajistit důvěrnost obchodních aktivit;
- (e) zachovávat jasnou hranici mezi aktuálními funkcemi organizace pro periodické inspekce a zkoušky a funkcemi nesouvisejícími;
- (f) používat zdokumentovaný systém kvality podle 6.2.2.6.3;
- (g) požádat o schválení podle 6.2.2.6.4;
- (h) zajistit provádění periodických inspekci a zkoušek dle 6.2.2.6.5; a
- (i) udržovat účinný a vhodný systém zpráv a záznamů dle 6.2.2.6.6.

6.2.2.6.3 ***Systém kvality a audit organizace pro periodické inspekce a zkoušky***

6.2.2.6.3.1 Systém kvality

Systém kvality musí obsahovat všechny prvky, požadavky a předpisy přijaté organizací pro periodické inspekce a zkoušky. Musí být systematicky a přehledně zdokumentován formou písemných rozhodnutí, postupů a instrukcí.

Systém kvality musí obsahovat:

- (a) popis organizační struktury a odpovědností;
- (b) pravidla a postup, které budou používány pro inspekce a zkoušky, kontrolu kvality a zajištění kvality;
- (c) záznamy o kvalitě, jako jsou zprávy o inspekci, zkušební a kalibrační data a certifikáty;
- (d) rozbor managementu k zajištění účinné činnosti systému kvality vycházející z auditů provedených podle 6.2.2.6.3.2;
- (e) postup kontroly dokumentů a jejich revize;
- (f) prostředky pro kontrolu tlakových nádob neodpovídajícím předpisům; a
- (g) školicí programy a kvalifikační postupy pro příslušný personál.

6.2.2.6.3.2 Audit

Organizace pro periodické inspekce a zkoušky a jeho systém kvality musí být podroben auditu, aby se zjistilo, zda splňuje požadavky ADR ke spokojenosti příslušného orgánu.

Audit musí být proveden jako součást prvního schvalovacího procesu (viz 6.2.2.6.4.3). Audit může být vyžádán jako součást postupu pro změnu schválení (viz 6.2.2.6.4.6).

Periodické audity musí být provedeny ke spokojenosti příslušného orgánu, aby se zajistilo, že organizace pro periodické inspekce a zkoušky stále splňuje požadavky ADR.

Organizace pro periodické inspekce a zkoušky musí být seznámen s výsledky auditu. Oznámení musí obsahovat všechny závěry auditu a veškerá požadovaná nápravná opatření.

6.2.2.6.3.3 Udržování systému kvality

Organizace pro periodické inspekce a zkoušky musí udržovat systém kvality tak, jak byl schválen, aby zůstal odpovídající a účinný.

Organizace pro periodické inspekce a zkoušky musí oznámit příslušnému orgánu, který, schválil systém kvality, jakékoli zamýšlené změny, podle postupu pro změnu schválení uvedeného v 6.2.2.6.4.6.

6.2.2.6.4 **Schvalovací proces organizace pro periodické inspekce a zkoušky**

První schválení

6.2.2.6.4.1 Organizace, která si přeje provádět periodické inspekce a zkoušky tlakových nádob podle norem pro tlakové nádoby a ADR, musí požádat, získat a uchovat schvalovací certifikát vydaný příslušným orgánem.

Toto písemné schválení musí být, na požádání, předloženo příslušnému orgánu země použití.

6.2.2.6.4.2 Žádost musí být podána pro každou organizaci pro periodické inspekce a zkoušky a musí obsahovat:

- (a) jméno a adresu organizace pro periodické inspekce a zkoušky, a pokud je žádost podána pověřeným zástupcem, také jeho jméno a adresu;
- (b) adresu každého střediska provádějícího periodickou inspekci a zkoušku;
- (c) jméno a titul osoby (osob) zodpovědné za systém kvality;
- (d) identifikaci tlakových nádob, metod periodických inspekci a zkoušek a příslušných norem pro tlakové nádoby zohledněných v systému kvality;
- (e) dokumentaci každého střediska, vybavení a systému kvality, jak je to specifikováno v 6.2.2.6.3.1;
- (f) záznamy o kvalifikaci a o školení zkušebního personálu pro periodické inspekce a zkoušky; a,
- (g) podrobnosti o jakémkoli zamítnutí nebo schválení podobné žádosti jiným příslušným orgánem.

6.2.2.6.4.3 Příslušný orgán musí:

- (a) přezkoumat dokumentaci, aby ověřil, že postupy jsou v souladu s požadavky odpovídajících norem pro tlakové nádoby a ADR; a
- (b) provést audit podle 6.2.2.6.3.2, aby ověřil, zda jsou inspekce a zkoušky prováděny podle požadavků příslušných norem pro tlakové nádoby a ADR, ke spokojenosti příslušného orgánu.

6.2.2.6.4.4 Po provedení auditu s uspokojivými výsledky a splnění všech příslušných požadavků uvedených v 6.2.2.6.4 musí být vydán schvalovací certifikát. Ten musí obsahovat jméno organizace pro periodické inspekce a zkoušky, registrovanou značku, adresu každého střediska a data nezbytná pro identifikaci jeho schválených činností (např. identifikace tlakových nádob, metody periodických inspekci a zkoušek a příslušné normy pro tlakové nádoby).

6.2.2.6.4.5 Pokud je organizací pro periodické inspekce a zkoušky schválení odepřeno, musí příslušný orgán poskytnout písemně podrobné zdůvodnění tohoto zamítnutí.

Modifikace schválení organizace pro periodické inspekce a zkoušky

- 6.2.2.6.4.6 Po schválení musí organizace pro periodické inspekce a zkoušky oznámit vydávajícímu příslušnému orgánu veškeré změny týkající se informací poskytnutých podle 6.2.2.6.4.2 ve vztahu k prvnímu schválení.

Změny musí být vyhodnoceny, aby se určilo, zdali požadavky příslušných norem pro tlakové nádoby a ADR budou splněny. Může být požadován audit podle 6.2.2.6.3.2. Příslušný orgán musí tyto změny přijmout, nebo je písemnou formou zamítnout, a pokud je to nutné, vydat pozměněný schvalovací certifikát.

- 6.2.2.6.4.7 Na žádost musí příslušný orgán sdělit všem dalším příslušným orgánům informace týkající se prvních schválení, změn ve schváleních a odejmutých schválení.

6.2.2.6.5 **Periodické inspekce a zkoušky a certifikace tlakových nádob**

Umístění značky organizace pro periodické inspekce a zkoušky na tlakovou nádobu je považováno za prohlášení, že tlaková nádoba splňuje příslušné normy pro tlakové nádoby a požadavky ADR. Organizace pro periodické inspekce a zkoušky musí umístit označení periodické inspekce a zkoušky, včetně své registrované značky na každou schválenou tlakovou nádobu (viz 6.2.2.7.6).

Zpráva potvrzující, že tlaková nádoba úspěšně prošla periodickou inspekcí a zkouškou musí být vydána organizací pro periodické inspekce a zkoušky před naplněním tlakové nádoby.

6.2.2.6.6 **Záznamy**

Organizace pro periodické inspekce a zkoušky musí uchovávat záznamy o všech periodických inspekcích a zkouškách tlakových nádobách (jak úspěšných, tak i neúspěšných) včetně adresy zkušebního střediska po dobu nejméně 15 let.

Vlastník tlakové nádoby musí uchovávat identickou zprávu až do příští periodické inspekce a zkoušky, pokud tlaková nádoba není trvale vyřazena z provozu.

6.2.2.7 **Značení opakovaně plnitelných UN tlakových nádob**

POZNÁMKA: Požadavky na značení UN systémů pro ukládání hydridů kovů jsou uvedeny v 6.2.2.9 a požadavky na značení pro svazky UN lahví jsou uvedeny v 6.2.2.10.

- 6.2.2.7.1 Opakovaně plnitelné UN tlakové nádoby musí být označeny jasně a čitelně certifikačními, provozními a výrobními značkami. Tyto značky musí být na tlakové nádobě trvale připevněny (např. vyraženy, vyryty nebo vyleptány). Označení musí být na rameni, na horním konci nebo na hrdle tlakové nádoby nebo na trvale připojené součásti tlakové nádoby (např. přivařený límec nebo korozi odolná destička přivařená na vnějším plášti kryogenní nádoby). S výjimkou UN znaku pro obaly musí být minimální rozměr těchto značek 5 mm pro tlakové nádoby s průměrem větším nebo rovným 140 mm a 2,5 mm pro tlakové nádoby s průměrem menším nežli 140 mm. Minimální rozměr UN znaku pro obaly musí být 10 mm pro tlakové nádoby s průměrem větším nebo rovným 140 mm a 5 mm pro tlakové nádoby s průměrem menším než 140 mm.

- 6.2.2.7.2 Musí se použít následující certifikační značky:

(a) Znak Spojených národů pro obaly

Tento znak nesmí být použit pro účely jiné nežli k osvědčení, že obal, přemístitelná cisterna nebo MEGC splňuje příslušné požadavky kapitoly 6.1, 6.2, 6.3, 6.5, 6.6 nebo 6.7². Tento znak nesmí být použit pro tlakové nádoby, které splňují pouze požadavky uvedené v 6.2.3 až 6.2.5 (viz 6.2.3.9).

- (b) Technická norma (např. ISO 9809-1) použitá pro konstrukci, výrobu a zkoušení;
- (c) Písmeno (a) identifikující zemi schválení, jak je udáno pomocí rozlišovacích značek motorových vozidel v mezinárodním provozu³,

POZNÁMKA: *Zemí schválení se rozumí země, která schválila organizaci, která provedla inspekci jednotlivé nádoby při výrobě.*

- (d) Identifikační značka nebo značka inspekční organizace, která je zaregistrována u příslušného orgánu země schvalující značení;
- (e) Datum první inspekce, rok (čtyři číslice) následovaný měsícem (2 číslice) oddělené lomítkem (např. „/“).

6.2.2.7.3 Musí se použít následující provozní značení:

- (f) Zkušební tlak v barech, kterému předchází písmena „PH“, a následují písmena „BAR“;
- (g) Hmotnost prázdné tlakové nádoby včetně všech trvale připojených integrálních částí (např. hrdlový kroužek, patní kroužek atd.) v kilogramech, následovaná písmeny „KG“. Tato hmotnost nesmí zahrnovat hmotnost ventilu, čepičky ventilu nebo ochrany ventilu, žádný povlak, nebo v případě acetylenu porézní materiál. Hmotnost musí být vyjádřena číslem s třemi platnými číslicemi, poslední číslice se zaokrouhuje nahoru. Pro láhve s hmotností menší než 1 kg musí být hmotnost vyjádřena číslem se dvěma platnými číslicemi, poslední číslice se zaokrouhuje nahoru. V případě tlakových nádob pro UN 1001 acetylen, rozpuštěný a UN 3374 acetylen, bez rozpouštědla bude za desetinnou čárkou nejméně jedno desetinné místo a dvě desetinná místa pro tlakové nádoby menší než 1 kg.
- (h) Minimální zaručená tloušťka stěny tlakové nádoby v mm, následovaná písmeny „MM“. Toto značení se nevyžaduje pro tlakové nádoby s hydraulickým vnitřním objemem menším nebo rovným 1 litr nebo pro kompozitní láhve nebo pro uzavřené kryogenní nádoby.
- (i) V případě tlakových nádob pro stlačené plyny, UN 1001 acetylen, rozpuštěný a UN 3374 acetylen, bez rozpouštědla provozní tlak v barech, kterému předchází písmena „PW“. V případě uzavřených kryogenních nádob nejvyšší dovolený provozní tlak, jemuž předchází písmena „MAWP“.
- (j) V případě tlakových nádob na zkapalněné plyny a hluboce zchladené zkapalněné plyny, hydraulický vnitřní objem v litrech, vyjádřený na tři platné číslice, poslední číslice se zaokrouhuje dolů, po kterém následuje písmeno „L“. Pokud hodnota minimálního nebo jmenovitého hydraulického vnitřního objemu je celé číslo, nemusí být číslice za desetinnou čárkou uvedeny.
- (k) V případě tlakových nádob pro UN 1001 acetylen, rozpuštěný součet hmotností prázdné tlakové nádoby, připojení a příslušenství, které se během plnění neodnímají, jakéhokoli povlaku, porézního materiálu, rozpouštědla a saturačního plynu, vyjádřený číslem se třemi platnými číslicemi (poslední číslice se zaokrouhuje dolů), následovaný písmeny „KG“. Nejméně jedno desetinné místo musí být za desetinnou čárkou. Pro tlakové nádoby menší než 1 kg, musí být hmotnost vyjádřena číslem se dvěma platnými číslicemi, poslední číslice se zaokrouhuje dolů.
- (l) V případě tlakových nádob pro UN 3374 acetylen, bez rozpouštědla, součet hmotností prázdné tlakové nádoby, připojení a příslušenství, které se během plnění neodnímají, jakéhokoli povlaku a porézního materiálu, vyjádřený číslem se třemi platnými číslicemi,

² Tento symbol se také používá k potvrzení, že flexibilní objemové vaky schválené pro ostatní druhy dopravy jsou v souladu s požadavky uvedenými v kapitole 6.8 Modelového regulativu OSN.

³ Rozlišovací značky pro motorová vozidla v mezinárodním provozu předepsané Vídeňskou úmluvou o silničním provozu (1968).

poslední číslice zaokrouhlená směrem dolů, následovaný písmeny „KG“. Hmotnost musí být vyjádřena nejméně na jedno desetinné místo. Pro tlakové nádoby menší než 1 kg musí být hmotnost vyjádřena číslem se dvěma platnými číslicemi, poslední číslice se zaokrouhluje směrem dolů.

6.2.2.7.4 Musí být použita následující výrobní značení:

- (m) Označení závitů láhve (např. 25E). Tato značka se nevyžaduje pro uzavřené kryogenní nádoby.
- (n) Značka výrobce registrovaná příslušným orgánem. Pokud země výroby není stejná jako země schválení, musí značka výrobce předcházet značka identifikující zemi výroby, jak je udána pomocí rozlišovacích značek pro motorová vozidla v mezinárodním provozu³. Značka země a značka výrobce musí být odděleny mezerou nebo lomítkem.
- (o) Sériové číslo přidělené výrobcem;
- (p) V případě ocelových tlakových nádob a kompozitních tlakových nádob s ocelovou vložkou, určených pro přepravu plynů s rizikem vodíkového zkrěhnutí, písmeno „H“ udávající snášenlivost oceli (viz ISO 11114-1:2012).

6.2.2.7.5 Výše uvedená značení musí být umístěna ve třech skupinách:

- Výrobní značení musí být v horní skupině a musí se objevit postupně v pořadí uvedeném v 6.2.2.7.4.
- Provozní značení podle 6.2.2.7.3 musí být ve skupině uprostřed a zkušební tlak (f) musí být bezprostředně za provozním tlakem (i), pokud je vyžadován.
- Certifikační značení musí být ve spodní skupině a musí být uvedeno v pořadí uvedeném v 6.2.2.7.2.

Následující příklad značení je použitelný pro plynové láhve:

(m)	(n)	(o)	(p)	
25E	D MF	765432	H	
(i)	(f)	(g)	(j)	(h)
PW200	PH300BAR	62,1KG	50L	5.8MM
(a)	(b)	(c)	(d)	(e)
	ISO 9809-1	F	IB	2000/12

6.2.2.7.6 Jiná značení jsou dovolena na jiných plochách mimo boční stěny za předpokladu, že jsou umístěna na málo namáhaných plochách a ne v rozměrech a do hloubky, které by mohly způsobit škodlivé koncentrace napětí. V případě uzavřených kryogenních nádob může být toto značení na oddělené destičce připevněné k vnějšímu plášti. Taková značení nesmějí být v rozporu s předepsaným značením.

³ Rozlišovací značky pro motorová vozidla v mezinárodním provozu předepsané Vídeňskou úmluvou o silničním provozu (1968).

6.2.2.7.7 Navíc k předchozímu značení musí být každá opakovaně plnitelná tlaková nádoba, která splňuje požadavky na periodické inspekce a zkoušky podle 6.2.2.4, opatřena značením uvádějícím:

- (a) písmeno (a) rozlišovací značky země, která schválila organizaci pro periodické inspekce a zkoušky, jak je indikováno charakteristickými znaky motorových vozidel v mezinárodní dopravě³. Toto označení se nevyžaduje, pokud je tato organizace schválena příslušným orgánem země schvalující výrobu.
- (b) registrovanou značku organizace pověřené příslušným orgánem pro provádění periodických inspekci a zkoušek;
- (c) datum periodické inspekce a zkoušky, rok (dvě číslice), následovaný měsícem (dvě číslice), oddělené lomítkem (např. „/“). Pro označení roku je možno použít čtyři číslice.

Výše uvedené značení se objeví postupně v uvedeném pořadí.

6.2.2.7.8 Se souhlasem příslušného orgánu může být pro acetylenové láhve datum poslední periodické inspekce a značka organizace provádějící periodickou inspekci a zkoušku, vyraženy na prstenci upevněném na lahvi pomocí ventilu. Prstenec musí být umístěn tak, aby mohl být odstraněn pouze odpojením ventilu od láhve.

6.2.2.7.9 (Vypuštěno)

6.2.2.8 **Značení UN tlakových lahví pro jedno použití**

6.2.2.8.1 UN tlakové láhve pro jedno použití musí být zřetelně a viditelně označeny certifikační značkou a specifickým označením pro plyny nebo pro tlakové nádoby. Tyto značky musí být trvale připevněny (např. nastříkány pomocí šablony, vyraženy, vyryty nebo vyleptány) na každé tlakové nádobě. S výjimkou použití šablony musí být značky na rameni, horním konci nebo na hrdle tlakové nádoby nebo na trvale připevněné součásti tlakové nádoby (např. na přivařeném límci). S výjimkou UN znaku pro obaly a nápisu „ZNOVU NEPLNIT“, musí být minimální rozměr značek 5 mm pro tlakové nádoby o průměru větším nebo rovném 140 mm a 2,5 mm pro tlakové nádoby o průměru menším než 140 mm. Minimální rozměr UN znaku pro obaly musí být 10 mm pro tlakové nádoby o průměru větším nebo rovném 140 mm a 5 mm pro tlakové nádoby o průměru menším než 140 mm. Nejmenší rozměr nápisu „ZNOVU NEPLNIT“ musí být 5 mm.

6.2.2.8.2 Značky uvedené v 6.2.2.7.2 až 6.2.2.7.4 musí být použity, s výjimkou (g), (h) a (m). Sériové číslo (o) může být nahrazeno číslem šarže. Navíc, slova „ZNOVU NEPLNIT“ se vyžadují s výškou písmen nejméně 5 mm.

6.2.2.8.3 Požadavky uvedené v 6.2.2.7.5 se použijí.

POZNÁMKA: U tlakových lahví pro jedno použití je možno, kvůli jejich rozměrům, nahradit toto značení nálepkou.

6.2.2.8.4 Jiná značení jsou dovolena za předpokladu, že jsou provedena na plochách s nízkým napětím mimo boční stěny a nemají takové rozměry a hloubku, aby mohly způsobit škodlivé koncentrace napětí. Takové značky nesmějí být v rozporu s předepsaným označením.

6.2.2.9 **Značení UN zásobníkového systému s hydridem kovu**

6.2.2.9.1 UN zásobníkový systém s hydridem kovu musí být označen jasně a čitelně značkami uvedenými níže. Tyto značky musí být trvale připevněny (např. vyraženy, vyryty nebo vyleptány) na UN zásobníkovém systému s hydridem kovu. Označení musí být na rameni, na horním konci nebo na hrdle UN zásobníkového systému s hydridem kovu nebo na trvale připojené součásti UN zásobníkového systému s hydridem kovu. S výjimkou UN znaku pro obaly musí být minimální rozměr těchto značek 5 mm pro UN zásobníkový systém s hydridem kovu s nejmenším celkovým

³ Charakteristické znaky motorových vozidel v mezinárodní dopravě předepsané Vídeňskou úmluvou o silničním provozu (1968).

rozměrem větším nebo rovným 140 mm a 2,5 mm pro UN zásobníkový systém s hydridem kovu s nejmenším celkovým rozměrem menším nežli 140 mm. Minimální rozměr UN znaku pro obaly musí být 10 mm pro UN zásobníkový systém s hydridem kovu s nejmenším celkovým rozměrem větším nebo rovným 140 mm a 5 mm pro UN zásobníkový systém s hydridem kovu s nejmenším celkovým rozměrem menším než 140 mm.

6.2.2.9.2 Musí se použít následující značky:

- (a) Znak Spojených národů pro obaly;

Tento znak nesmí být použit pro jiné účely než pro osvědčení, že obal, přemístitelná cisterna nebo MEGC splňuje příslušné požadavky kapitoly 6.1, 6.2, 6.3, 6.5, 6.6 nebo 6.7².

- (b) „ISO 16111“ (technická norma použitá pro konstrukci, výrobu a zkoušení) ;

- (c) Písmeno(a) identifikující zemi schválení, jak je udáno pomocí rozlišovacích značek motorových vozidel v mezinárodním provozu³,

POZNÁMKA: Zemí schválení se rozumí země, která schválila organizaci, která provedla inspekci jednotlivé nádoby při výrobě.

- (d) Identifikační značka nebo značka inspekční organizace, která je zaregistrována u příslušného orgánu země schvalující značení;

- (e) Datum první inspekce, rok (čtyři číslice) následovaný měsícem (2 číslice) oddělené lomítkem (např. „/“).

- (f) Zkušební tlak nádoby v barech, kterému předchází písmena „PH“ a následují písmena „BAR“;

- (g) Jmenovitý plnicí tlak zásobníkového systému s hydridem kovu v barech, kterému předchází písmena „RCP“ a následují písmena „BAR“;

- (h) Značka výrobce registrovaná příslušným orgánem. Pokud země výroby není stejná jako země schválení, musí značka výrobce předcházet značka identifikující zemi výroby, jak je udána pomocí rozlišovacích značek pro motorová vozidla v mezinárodním provozu³. Značka země a značka výrobce musí být odděleny mezerou nebo lomítkem.

- (i) Sériové číslo přidělené výrobcem;

- (j) V případě ocelových nádob a kompozitních nádob s ocelovou vložkou, písmeno „H“ udávající snášenlivost oceli (viz ISO 11114-1:2012); a

- (k) V případě zásobníkového systému s hydridem kovu mající omezenou dobu životnosti, datum spotřeby, označené písmeny „FINAL“ následují rok (čtyři číslice) následovaný měsícem (2 číslice) oddělené lomítkem (např. „/“).

Certifikační značky specifikované v (a) až (e) se musí objevovat postupně v pořadí uvedeném výše. Zkušební tlak (f) musí bezprostředně předcházet jmenovitému plnicímu tlaku (g). Výrobní značení specifikované od (h) do (k) se musí objevovat postupně v pořadí uvedeném výše.

² Tento symbol se také používá k potvrzení, že flexibilní objemové vaky schválené pro ostatní druhy dopravy jsou v souladu s požadavky uvedenými v kapitole 6.8 Modelového regulativu OSN.

³ Rozlišovací značky pro motorová vozidla v mezinárodním provozu předepsané Vídeňskou úmluvou o silničním provozu (1968).

³ Rozlišovací značky pro motorová vozidla v mezinárodním provozu předepsané Vídeňskou úmluvou o silničním provozu (1968).

- 6.2.2.9.3 Jiná značení jsou povolena na plochách mimo boční stěny, za předpokladu, že jsou provedena na plochách s nízkým napětím a nemají takové rozměry a hloubku, aby mohly způsobit škodlivé koncentrace napětí. Takové značky nesmějí být v rozporu s předepsaným označením.
- 6.2.2.9.4 Navíc k předchozímu značení musí být každý zásobníkový systém s hydridem kovu, který splňuje požadavky na periodické inspekce a zkoušky podle 6.2.2.4, opatřena značením uvádějícím:
- (a) písmeno(a) rozlišovací značky země, která schválila organizaci pro periodické inspekce a zkoušky, jak je udáno pomocí rozlišovacích značek motorových vozidel v mezinárodním provozu³ Toto označení se nevyžaduje, pokud je tato organizace schválena příslušným orgánem země schvalující výrobu.
 - (b) registrovanou značku organizace pověřené příslušným orgánem pro provádění periodických inspekcí a zkoušek;
 - (c) datum periodické inspekce a zkoušky, rok (dvě číslice), následovaný měsícem (dvě číslice), oddělené lomítkem (např. „/“). Pro označení roku je možno použít čtyři číslice.

Výše uvedené značení se objeví postupně v uvedeném pořadí.

6.2.2.10 **Značení svazků lahví UN**

- 6.2.2.10.1 Jednotlivé lahve ve svazku lahví musí být označeny v souladu s 6.2.2.7.
- 6.2.2.10.2 Opakovaně plnitelné svazky lahví UN musí být zřetelně a čitelně označeny certifikačními, provozními a výrobními značkami. Tyto značky musí být trvale vyznačeny (například razítko, vyrytí nebo vyleptání) na desce trvale připevněné k rámu svazku lahví. S výjimkou znaku Spojených národů pro obaly musí být minimální rozměr těchto značek 5 mm. Minimální velikost znaku Spojených národů pro obaly musí být 10 mm.
- 6.2.2.10.3 Použijí se následující značky:
- (a) Certifikační značky specifikované v 6.2.2.7.2 (a), (b), (c), (d) a (e);
 - (b) Provozní značky specifikované v 6.2.2.7.3 (f), (i), (j) a celková hmotnost rámu svazku a všech trvale připojených částí (lahve, potrubí, armatury a ventily). Svazky určené pro přepravu acetylenu UN 1001, rozpuštěného a UN 3374 acetyleny, bez rozpouštědla musí mít uvedenou hmotnost obalu, jak je specifikováno v bodu B.4.2 normy ISO 10961:2010; a
 - (c) Výrobní značky specifikované v 6.2.2.7.4 (n), (o) a případně (p).
- 6.2.2.10.4 Značky musí být umístěny ve třech skupinách:
- (a) Výrobní značky musí být v horním seskupení a musí být uvedeny za sebou v pořadí uvedeném v 6.2.2.10.3 (c);
 - (b) Provozní značky v 6.2.2.10.3 (b) musí být ve středním seskupení a provozní značka uvedená v 6.2.2.7.3 (f) musí bezprostředně předcházet provozní značka uvedená v 6.2.2.7.3 (i), přičemž poslední uvedená je povinná;
 - (c) Certifikační značky musí být ve spodní skupině a musí být uvedeny za sebou v pořadí uvedeném v 6.2.2.10.3 (a);

6.2.2.11 **Ekvivalentní postupy pro posuzování shody a periodické inspekce a zkoušky**

Pro UN tlakové nádoby se považují požadavky uvedené v 6.2.2.5 a 6.2.2.6 za splněné, pokud se použijí následující postupy:

Postup	Příslušná organizace
Typové schválení (1.8.7.2)	Xa
Dohled nad výrobou (1.8.7.3)	Xa nebo IS
První inspekce a zkoušky (1.8.7.4)	Xa nebo IS
Periodická inspekce (1.8.7.5)	Xa nebo Xb nebo IS

Xa znamená příslušný orgán, jeho zástupce nebo inspekční organizaci podle 1.8.6.2, 1.8.6.4, 1.8.6.5 a 1.8.6.8 a akreditovanou podle EN ISO/IEC 17020:2012 (kromě ustanovení 8.1.3) typ A.

Xb znamená inspekční organizaci podle 1.8.6.2, 1.8.6.4, 1.8.6.5 a 1.8.6.8 a akreditovanou podle EN ISO/IEC 17020:2012 (kromě ustanovení 8.1.3) typ B.

IS znamená vlastní inspekční službu žadatele pod dohledem inspekční organizace podle 1.8.6.2, 1.8.6.4, 1.8.6.5 a 1.8.6.8 a akreditované podle EN ISO/IEC 17020:2012 (kromě ustanovení 8.1.3) typ A. Vlastní inspekční služba musí být nezávislá na procesu konstrukce, výroby, oprav a údržby.

6.2.3 Všeobecné požadavky na tlakové nádoby neodpovídající UN

6.2.3.1 Konstrukce a výroba

6.2.3.1.1 Tlakové nádoby a jejich uzávěry, které nejsou zkonstruovány, vyrobeny, kontrolovány, zkoušeny a schváleny podle požadavků 6.2.2 musí být zkonstruovány, vyrobeny, kontrolovány, zkoušeny a schváleny podle všeobecných požadavků v 6.2.1, doplněných nebo upravených podle požadavků tohoto oddílu a požadavků uvedených v 6.2.4 nebo 6.2.5.

6.2.3.1.2 Kdykoliv je to možné, musí být tloušťka stěny stanovena výpočtem doprovázeným, pokud je to zapotřebí, experimentální analýzou napětí. Jinak může být tloušťka stěny stanovena experimentálně.

K zajištění bezpečnosti tlakových nádob musí být použity při konstrukci tlakového pláště a podpěrných částí nádoby vhodné výpočty.

Minimální tloušťka stěny k odolání tlaku musí být vypočtena se zvláštním zřetelem na:

- výpočtové tlaky, které nesmějí být menší než zkušební tlak;
- výpočtové teploty dovolující dostatečné míry bezpečnosti;
- maximální napětí a koncentrace špičkového napětí tam, kde je to nutné;
- faktory spojené s vlastnostmi materiálu.

6.2.3.1.3 Pro svařované tlakové nádoby musí být použity pouze kovy s dobrou svařitelností, jejichž vrubová houževnatost při teplotě okolí -20 °C může být zaručena.

6.2.3.1.4 Pro uzavřené kryogenní nádoby musí být zkouška vrubové houževnatosti, která musí být určena podle 6.2.1.1.8.1, provedena tak, jak je to stanoveno v 6.8.5.3.

6.2.3.1.5 Láhve na acetylen nesmějí být opatřeny tavnými zátkami.

6.2.3.2 (Vyhrazeno)

6.2.3.3 Provozní výstroj

6.2.3.3.1 Provozní výstroj musí splňovat požadavky uvedené v 6.2.1.3.

6.2.3.3.2 Otvory

Tlakové sudy mohou být opatřeny otvory pro plnění a vyprazdňování a dalšími otvory určenými pro měřiče hladiny, měřiče tlaku nebo odpouštěcí zařízení. Počet otvorů musí být udržován na minimu v souladu s bezpečností práce. Tlakové sudy mohou být opatřeny rovněž otvorem pro inspekci, který musí být uzavřen účinným uzávěrem.

6.2.3.3.3 Příslušenství

- (a) Pokud jsou láhve vybaveny zařízením pro válení, nesmí být toto zařízení součástí ochranného krytu ventilu.
- (b) Tlakové sudy, které jsou schopné válení, musí být vybaveny obručemi pro válení, nebo být jinak chráněny proti poškození v důsledku válení (např. korozi odolným kovem nastříkaným na povrch tlakové nádoby).
- (c) Svazky lahví musí být vybaveny vhodným příslušenstvím umožňujícím bezpečnou manipulaci a přepravu.
- (d) Pokud jsou instalovány měřiče hladiny, měřiče tlaku nebo odpouštěcí zařízení, musí být chráněny stejným způsobem, jak se to vyžaduje pro ventily v 4.1.6.8.

6.2.3.4 První inspekce a zkouška

6.2.3.4.1 Nové tlakové nádoby musí být podrobeny zkoušení a inspekci v průběhu výroby a po výrobě podle požadavků 6.2.1.5.

6.2.3.4.2 Specifické předpisy platné pro tlakové nádoby z hliníkových slitin

- (a) Navíc k první inspekci vyžadované podle 6.2.1.5.1 je nutná zkouška kvůli možné mezikrystalické korozi vnitřní stěny tlakových nádob vyrobených z hliníkové slitiny obsahující měď, nebo vyrobených z hliníkové slitiny obsahující hořčík a mangan, pokud je obsah hořčíku větší než 3,5 % nebo obsah manganu nižší než 0,5 %;
- (b) V případě slitiny hliník/měď musí být zkouška provedena výrobcem v době schvalování nové slitiny příslušným orgánem; poté musí být zkouška opakována během výroby pro každé lití slitiny;
- (c) V případě slitiny hliník/hořčík musí být zkouška provedena výrobcem v době schvalování nové slitiny a výrobního procesu příslušným orgánem. Zkouška musí být opakována při každé změně ve složení slitiny nebo ve výrobním procesu.

6.2.3.5 Periodická inspekce a zkouška

6.2.3.5.1 Periodická inspekce a zkouška musí být v souladu s 6.2.1.6.

POZNÁMKA: Se souhlasem příslušného orgánu země, která vydala typové schválení, může být hydraulická tlaková zkouška každé svařované ocelové láhve určené pro přepravu plynů UN 1965, uhlovodíky, plynné, směs, zkapalněná, j.n. s vnitřním objemem pod 6,5 l nahrazena jinou zkouškou zajišťující stejnou úroveň bezpečnosti.

6.2.3.5.2 Uzavřené kryogenní nádoby musí být předmětem pravidelných kontrol a zkoušek v souladu s periodicitou definovanou v pokynu pro balení P203 (8) (b) odstavce 4.1.4.1, v souladu s následujícími ustanoveními:

- (a) Kontrola vnějšího stavu nádoby a ověřování zařízení a vnějšího značení;
- (b) Zkouška těsnosti.

6.2.3.6 Schvalování tlakových nádob

6.2.3.6.1 Postupy pro posuzování shody a periodické inspekce oddílu 1.8.7 musí být provedeny příslušným orgánem podle následující tabulky:

Postup	Příslušná organizace
Typové schválení (1.8.7.2)	Xa
Dohled nad výrobou (1.8.7.3)	Xa nebo IS
První inspekce a zkoušky (1.8.7.4)	Xa nebo IS
Periodická inspekce (1.8.7.5)	Xa nebo Xb nebo IS

Pro tlakové nádoby s možností plnění, posouzení shody ventilů a jiných demontovatelných příslušenství majících přímou bezpečnostní funkci může být provedeno odděleně od nádob a postup pro posouzení shody musí být nejméně tak přísný, jako ten, který podstoupila tlaková nádoba, ke které jsou připojeny.

Xa znamená příslušný orgán, jeho zástupce nebo inspekční organizaci dle 1.8.6.2, 1.8.6.4, 1.8.6.5 a 1.8.6.8 a akreditovanou podle EN ISO/IEC 17020:2012 (kromě ustanovení 8.1.3) typ A.

Xb znamená inspekční organizaci podle 1.8.6.2, 1.8.6.4, 1.8.6.5 a 1.8.6.8 a akreditovanou podle EN ISO/IEC 17020:2012 (kromě ustanovení 8.1.3) typ B.

IS znamená vlastní inspekční službu žadatele pod dohledem inspekční organizace podle 1.8.6.2, 1.8.6.4, 1.8.6.5 a 1.8.6.8 a akreditované podle EN ISO/IEC 17020:2012 (kromě ustanovení 8.1.3) typ A. Vlastní inspekční služba musí být nezávislá na procesu konstrukce, výroby, oprav a údržby.

6.2.3.6.2 Jestliže země schválení není smluvní stranou ADR, musí být příslušný orgán zmíněný v 6.2.1.7.2 příslušným orgánem smluvní strany ADR.

6.2.3.7 Požadavky na výrobce

6.2.3.7.1 Musí být splněny odpovídající požadavky oddílu 1.8.7.

6.2.3.8 Požadavky na inspekční organizaci

6.2.3.8.1 Musí být splněny požadavky oddílu 1.8.6.

6.2.3.9 Značení opakovaně plnitelných tlakových nádob

6.2.3.9.1 Značení musí být v souladu s pododdílem 6.2.2.7 s následujícími změnami.

6.2.3.9.2 UN znak pro obaly, specifikovaný v 6.2.2.7.1 (a), se nesmí používat.

6.2.3.9.3 Požadavky uvedené v 6.2.2.7.2(j) musí být nahrazeny následovně:

(j) Hydraulický vnitřní objem tlakové nádoby v litrech následovaný písmenem „L“. V případě tlakových nádob pro zkapalněné plyny musí být hydraulický vnitřní objem v litrech vyjádřen číslem se třemi platnými číslicemi, poslední se zaokrouhluje dolů. Pokud je hodnota minimálního nebo jmenovitého hydraulického vnitřního objemu celé číslo, je možno číslice za desetinnou čárkou vynechat.

6.2.3.9.4 Značky specifikované v 6.2.2.7.2 (g) a (h) a v 6.2.2.7.3 (m) nejsou vyžadovány pro tlakové nádoby na UN 1965 uhlovodíky, plynné, směs, zkapalněná, j.n.

6.2.3.9.5 Pokud se vyžaduje vyznačení dat podle 6.2.2.7.6 (c), nemusí být udán měsíc pro plyny mající interval mezi periodickými inspekcemi 10 let nebo více (viz pokyny pro balení P200 a P203 pododdílu 4.1.4.1).

6.2.3.9.6 Značení podle 6.2.2.7.6 mohou být vyryta na prstenec z vhodného materiálu připevněný k láhvi, když je nainstalován ventil, a který je odnímatelný pouze odpojením ventilu od láhve.

6.2.3.9.7 Značení svazků lahví

6.2.3.9.7.1 Jednotlivé láhve ve svazku lahví musí být značeny podle 6.2.3.9.1 až 6.2.3.9.6.

6.2.3.9.7.2 Značení svazků lahví musí odpovídat ustanovením uvedeným v 6.2.2.10.2 a 6.2.2.10.3, s výjimkou toho, že se nepoužije UN symbol balení, uvedený v 6.2.2.7.2 (a).

6.2.3.9.7.3 Navíc k předchozímu značení musí být každý svazek lahví, který splňuje požadavky na periodické inspekce a zkoušky uvedené v 6.2.4.2, opatřen značením, které sestává z těchto údajů:

- (a) Písmeno(a) identifikující zemi, která pověřila organizaci k provádění periodických inspekcí a zkoušek, ve shodě s rozlišovací značkou pro motorová vozidla v mezinárodním provozu³. Toto značení se nevyžaduje, je-li organizace schválena příslušným orgánem země schvalující výrobu;
- (b) Registrační značka organizace pověřené příslušným orgánem k provádění periodických inspekcí a zkoušek;
- (c) Datum periodické inspekce a zkoušky, rok (dvě číslice) následovaný měsícem (dvě číslice) a oddělený lomítkem (např. „/“). K uvedení roku směji být použity čtyři číslice.

Výše uvedené údaje musí být vyznačeny ve stanoveném pořadí, buď na štítku specifikovaném v 6.2.2.10.2, nebo na odděleném štítku trvale připevněném k rámu svazku lahví.

6.2.3.10 Značení tlakových nádob pro jedno použití

- 6.2.3.10.1 Značení musí být v souladu s 6.2.2.8 s výjimkou toho, že UN znak pro obaly, specifikovaný v 6.2.2.7.2 (a), nesmí být použit.

6.2.3.11 Záchranné tlakové nádoby

- 6.2.3.11.1 Pro umožnění bezpečné manipulace a likvidace tlakových nádob nesených uvnitř záchranné tlakové nádoby, může návrh obsahovat zařízení, které se jinak nepoužívá pro válce nebo tlakové nádoby, jako jsou ploché hlavy, zařízení pro rychlé otevření a otvory ve válcové části.
- 6.2.3.11.2 Pokyny pro bezpečnou manipulaci a používání záchranné tlakové nádoby musí být jasně uvedeny v dokumentaci pro předložení příslušnému orgánu země schválení, a musí tvořit součást osvědčení o schválení. V osvědčení o schválení musí být uvedeny tlakové nádoby schválené pro přepravu v záchranné tlakové nádobě. Musí být rovněž uveden seznam konstrukčních materiálů všech částí, které mohou být v kontaktu s nebezpečnými věcmi.
- 6.2.3.11.3 Kopie osvědčení o schválení musí být dodaná výrobcem vlastníkovi záchranné tlakové nádoby.
- 6.2.3.11.4 Označování záchranných nádob podle 6.2.3 musí být stanoveno příslušným orgánem země a schválení musí brát v úvahu ustanovení odstavce 6.2.3.9 o vhodném označení podle potřeby. Označení musí obsahovat objem vody a zkušební tlak záchranné tlakové nádoby.

6.2.4 Požadavky na tlakové nádoby neodpovídající UN, které jsou zkonstruovány, vyrobeny a odzkoušeny podle norem

POZNÁMKA: Osoby nebo organizace uvedené v normách jako odpovědné podle ADR musí splňovat požadavky ADR.

6.2.4.1 Konstrukce, výroba a první inspekce a zkouška

Normy v níže uvedené tabulce musí být použity pro vydání typových schválení, jak je uvedeno ve sloupci (4), aby byly splněny požadavky kapitoly 6.2 dle sloupce (3). Požadavky kapitoly 6.2 dle sloupce (3) musí být ve všech případech nadřazeny. Sloupec (5) uvádí poslední datum, kdy existující typové schválení musí být odebráno s ohledem na 1.8.7.2.4; pokud není datum uvedeno, typové schválení zůstává v platnosti do doby jeho platnosti.

Od 1. ledna 2009 je použití norem závazné. Výjimky jsou řešeny v 6.2.5.

Jestliže je více nežli jedna norma uvedena jako povinná pro použití stejných požadavků, může být použita pouze jedna z nich, ale v úplném znění, pokud není v tabulce níže specifikováno jinak.

³ Rozlišovací značky pro motorová vozidla v mezinárodním provozu předepsané Vídeňskou úmluvou o silničním provozu (1968).

Rozsah platnosti každé normy je specifikován v ustanovení o rozsahu platnosti, pokud není v níže uvedené tabulce uvedeno jinak.

6.2.4.2 Periodické inspekce a zkoušky

Normy v níže uvedené tabulce musí být použity pro periodické inspekce a zkoušky tlakových nádob jak je uvedeno ve sloupci (3), aby byly splněny požadavky uvedené v 6.2.3.5, které mají ve všech případech přednost.

Použití uvedených norem je závazné.

Pokud je tlaková nádoba konstruovaná v souladu s ustanovením 6.2.5, postup pro periodickou inspekci, pokud je specifikován v typovém schválení, musí být dodržen.

Jestliže je více než jedna norma uvedena pro použití stejných požadavků, musí být použita pouze jedna z nich, avšak v úplném znění, pokud není v tabulce níže specifikováno jinak.

Rozsah platnosti každé normy je specifikována v ustanovení o rozsahu platnosti, pokud není v níže uvedené tabulce uvedeno jinak.

6.2.5 Požadavky na tlakové nádoby neodpovídající UN, které nejsou zkonstruovány, vyrobeny a odkoušeny podle norem

S ohledem na vědecký a technický pokrok nebo tam, kde není uvedena žádná norma v seznamu v 6.2.2 nebo 6.2.4, nebo jde-li o specifické aspekty neuvedené v seznamu norem v 6.2.2 nebo 6.2.4, může příslušný orgán připustit používání technického předpisu zaručujícího stejnou úroveň bezpečnosti.

V typovém schválení musí vydávající organizace specifikovat postup pro periodickou inspekci, pokud normy odkazované v 6.2.2 nebo 6.2.4 nejsou nebo nesmí být použity.

Příslušný orgán musí předat sekretariátu EHK OSN seznam technických předpisů, které připouští. Seznam by měl zahrnovat následující podrobnosti: název a datum předpisu, účel předpisu a informace, jak je možno je získat. Sekretariát musí tuto informaci zpřístupnit na svých webových stránkách.

Norma, která byla přijata pro odkaz do příštího vydání ADR, může být schválena příslušným orgánem pro použití bez oznámení sekretariátu EHK OSN.

Požadavky 6.2.1, 6.2.3 a následující požadavky musí být splněny.

POZNÁMKA: Pro tento oddíl musí odkazy na technické normy v 6.2.1 být považovány jako odkazy na technické předpisy.

6.2.5.1 Materiály

Následující ustanovení obsahují příklady materiálů, které mohou být použity pro splnění požadavků na materiály podle 6.2.1.2.

- (a) Uhlíková ocel pro stlačené, zkapalněné, hluboce zchlazené zkapalněné plyny a rozpuštěné plyny, jakož i pro látky nepatřící do třídy 2, které jsou uvedeny v tabulce 3 pokynu pro balení P200 v 4.1.4.1;
- (b) Slitiny oceli (speciální oceli), nikl, slitiny niklu (např. Monelův kov) pro stlačené, zkapalněné, hluboce zchlazené zkapalněné plyny a rozpuštěné plyny, jakož i pro látky nepatřící do třídy 2, které jsou uvedeny v tabulce 3 pokynu pro balení P200 v 4.1.4.1;
- (c) Měď pro:
 - (i) plyny s klasifikačními kódy 1A, 1O, 1F a 1TF, jejichž plnicí tlak vztažený na teplotu 15 °C nepřekročí 2 MPa (20 bar);
 - (ii) plyny s klasifikačním kódem 2A a také UN 1033 dimethylether, UN 1037 chlorethan (ethylchlorid), UN 1063 chlormethan (methylchlorid), UN 1079 oxid siřičitý, UN 1085 vinylbromid, UN 1086 vinylchlorid a UN 3300 ethylenoxid a oxid uhličitý, směs s více nežli 87 % ethylenoxidu;
 - (iii) plyny s klasifikačním kódem 3A, 3O a 3F;
- (d) Hliníkové slitiny, viz zvláštní požadavek „a” v pokynu pro balení P200 (10) v 4.1.4.1;
- (e) Kompozitní materiály pro stlačené, zkapalněné, hluboce zchlazené zkapalněné plyny a rozpuštěné plyny;
- (f) Syntetické materiály pro hluboce zchlazené zkapalněné plyny; a
- (g) Sklo pro hluboce zchlazené zkapalněné plyny s klasifikačním kódem 3A, jiné než UN 2187 oxid uhličitý, hluboce zchlazený, kapalný nebo jeho směsí, a pro plyny s klasifikačním kódem 3O.

6.2.5.2 Provozní výstroj

(Vyhrazeno)

6.2.5.3 Kovové láhve, trubkové nádoby, tlakové sudy a svazky lahví

Při zkušebním tlaku nesmí napětí v kovu v nejvíce namáhaném bodě tlakové nádoby překročit 77 % zaručené minimální meze pružnosti (Re).

„Mez pružnosti” znamená napětí, při kterém došlo k trvalému prodloužení 2 na tisíc (tj. 0,2 %) nebo, pro austenitické ocele, 1 % kontrolní délky na zkušebním vzorku.

POZNÁMKA: V případě plechu osa tahu zkušebního vzorku musí být v pravém úhlu ve směru válcování. Trvalé prodloužení při prasknutí musí být měřeno na zkušebním vzorku, na kterém kontrolní délka „l” je rovna pětinasobku průměru „d” ($l = 5d$); pokud jsou použity zkušební vzorky obdélníkového průřezu, musí být kontrolní délka vypočtena podle vzorce:

$$l = 5,65\sqrt{F_0}$$

kde F_0 označuje počáteční plochu průřezu zkušebního vzorku.

Tlakové nádoby a jejich uzávěry musí být vyrobeny z vhodných materiálů, které budou odolné proti křehkému lomu a proti trhlínkové korozi za napětí při teplotách mezi -20 °C a + 50 °C.

Sváry musí být provedeny odborně a musí zaručovat plnou bezpečnost.

6.2.5.4 *Dodatečné předpisy vztahující se na tlakové nádoby z hliníkových slitin pro stlačené plyny, zkapalněné plyny, rozpuštěné plyny a pro plyny, které nejsou pod tlakem a jsou předmětem zvláštních požadavků (vzorky plynů), jakož i na předměty obsahující plyn pod tlakem, jiné nežli aerosolové rozprašovače a malé nádoby obsahující plyn (plynové kartuše)*

6.2.5.4.1 Materiály tlakových nádob ze slitin hliníku, které mají být akceptovány, musí splňovat následující požadavky:

	A	B	C	D
Pevnost v tahu, R_m , v MPa (= N/mm ²)	49 až 186	196 až 372	196 až 372	343 až 490
Mez průtažnosti, R_e , v MPa (= N/mm ²) (trvalé prodloužení $\lambda = 0,2 \%$)	10 až 167	59 až 314	137 až 334	206 až 412
Trvalé prodloužení při zlomu ($l = 5d$) v procentech	12 až 40	12 až 30	12 až 30	11 až 16
Zkouška na ohyb (původní průměr $d = n \times e$, kde e je tloušťka zkušební vzorku)	$n = 5$ ($R_m \leq 98$) $n = 6$ ($R_m > 98$)	$n = 6$ ($R_m \leq 325$) $n = 7$ ($R_m > 325$)	$n = 6$ ($R_m \leq 325$) $n = 7$ ($R_m > 325$)	$n = 7$ ($R_m \leq 392$) $n = 8$ ($R_m > 392$)
Sériové číslo Hliníkové Asociace ^a	1000	5000	6000	2000

^a viz „Aluminium Standards and Data“, páté vydání, leden 1976, vydáno Aluminium Association, 750 Third Avenue, New York.

Skutečné vlastnosti budou záviset na složení dané slitiny a na konečném provedení tlakové nádoby, avšak pro jakoukoliv slitinu musí být tloušťka tlakové nádoby vypočtena podle jednoho ze dvou následujících vzorců:

$$e = \frac{R_{MPa} D}{\frac{2R_e}{1.3} + R_{MPa}} \quad \text{nebo} \quad e = \frac{R_{bar} D}{\frac{20R_e}{1.3} + R_{MPa}}$$

kde

e = minimální tloušťka stěny tlakové nádoby, v mm

P_{MPa} = zkušební tlak, v MPa

P_{bar} = zkušební tlak, v barech

D = jmenovitý vnější průměr tlakové nádoby, v mm; a

R_e = zaručená minimální mez průtažnosti při trvalém prodloužení 0,2 %, v MPa (= N/mm²)

Navíc, hodnota minimální zaručené meze průtažnosti (R_e) dosazená do vzorce nesmí být v žádném případě větší nežli 0,85 násobek zaručené minimální pevnosti v tahu (R_m), při jakémkoli typu použité slitiny.

POZNÁMKA 1: Výše uvedené charakteristiky jsou založeny na dřívější zkušlosti s následujícími materiály použitými pro tlakové nádoby:

Sloupec A: Hliník, nelegovaný, čistota 99 %;

Sloupec B: Slitiny hliníku a hořčíku;

Sloupec C: Slitiny hliníku, křemíku a hořčíku, jako ISO/R209-Al-Si-Mg (Aluminium Association 6351);

Sloupec D: Slitiny hliníku, mědi a hořčíku.

POZNÁMKA 2: Trvalé prodloužení při přetržení se měří pomocí zkušebních vzorků kruhového průměru, ve kterých standardní délka „I“ je rovna pětinasobku průměru „d“ ($I=5d$); pokud se použije zkušební vzorek obdélníkového průřezu standardní délka se vypočte ze vzorce:

$$I = 5,65 \sqrt{F_0}$$

kde F_0 je počáteční plocha zkušebního vzorku.

POZNÁMKA 3:

- Zkouška na ohyb (viz schéma) musí být provedena na vzorku získaném vyseknutím dvou stejných částí tloušťky $3e$, ale v žádném případě ne menší než 25 mm, kruhové sekce válce. Vzorky musí být strojně obrobena všude kromě hran;
- Zkouška ohybem musí být provedena mezi ohýbacím trnem o průměru (d) a dvěma kruhovými podpěrami oddělenými mezerou o velikosti $(d+3e)$. Během zkoušky musí být vnitřní čela oddělena mezerou ne větší než je průměr ohýbacího trnu;
- Vzorek nesmí vykazovat trhliny, pokud byl ohnut směrem do dovnitř okolo ohýbacího trnu, dokud jsou vnitřní čela oddělena mezerou ne větší, než je průměr jádra;
- Poměr (n) mezi průměrem ohýbacího trnu a tloušťkou vzorku musí být v souladu s hodnotami uvedenými v tabulce.

6.2.5.4.2

Nižší hodnota minimálního prodloužení je přijatelná za předpokladu, že dodatečná zkouška schválená příslušným orgánem země, ve které je tlaková nádoba vyrobena, prokáže, že bezpečnost přepravy je zajištěna na stejné úrovni, jako v případě tlakových nádob zkonstruovaných tak, aby splnily vlastnosti uvedené v tabulce 6.2.5.4.1 (viz rovněž EN 1975:1999 + A1:2003).

6.2.5.4.3

Tloušťka stěny tlakové nádoby v nejslabším bodě musí být následující:

- kde je průměr tlakové nádoby menší než 50 mm, ne menší než 1.5 mm,

- kde je průměr tlakové nádoby od 50 do 150 mm, ne menší než 2 mm a
- kde je průměr tlakové nádoby větší než 150 mm, ne menší než 3 mm.

6.2.5.4.4 Dna tlakových nádob musí mít polokruhový, eliptický nebo nepravidelně eliptický profil; musí poskytovat stejný stupeň bezpečnosti jako těleso tlakové nádoby.

6.2.5.5 Tlakové nádoby z kompozitních materiálů

Pro láhve, trubkové nádoby, tlakové sudy a svazky lahví, které využívají kompozitní materiály, musí být konstrukce taková, aby minimální poměr mezi tlakem při prasknutí a zkušebním tlakem) je:

- 1,67 pro tlakové nádoby vyztužené obručemi;
- 2,00 pro tlakové nádoby plně vyztužené.

6.2.5.6 Uzavřené kryogenní nádoby

Na konstrukci uzavřených kryogenních nádob pro hluboce zchlazené zkapalněné plyny se vztahují následující požadavky:

6.2.5.6.1 Pokud se použijí nekovové materiály, musí odolat křehkému lomu při nejnižší provozní teplotě tlakové nádoby včetně její výstroje.

6.2.5.6.2 Zařízení pro vyrovnávání tlaku musí být zkonstruována takovým způsobem, aby pracovala bezvadně i při svých nejnižších provozních teplotách. Jejich funkční spolehlivost při této teplotě musí být stanovena a ověřena vyzkoušením každého zařízení nebo vzorku zařízení stejného konstrukčního typu.

6.2.5.6.3 Ventily a zařízení pro vyrovnávání tlaku tlakových nádob musí být zkonstruovány takovým způsobem, aby bylo zabráněno vystřikování kapaliny.

6.2.6 Všeobecné požadavky na aerosolové rozprašovače, malé nádoby obsahující plyn (plynové kartuše) a zásobníky do palivových článků obsahující zkapalněný hořlavý plyn

6.2.6.1 Návrh a konstrukce

6.2.6.1.1 Aerosolové rozprašovače (UN 1950 aerosoly) obsahující pouze plyn nebo směs plynů a nádoby, malé, obsahující plyn (kartuše) UN 2037, musí být vyrobeny z kovu. Tento požadavek se nevztahuje na aerosoly a nádoby, malé, obsahující plyn (kartuše), s vnitřním objemem nejvýše 100 ml pro UN 1011 butan. Jiné aerosolové nádoby (UN 1950) musí být vyrobeny z kovu, syntetického materiálu nebo skla. Nádoby vyrobené z kovu s vnějším poloměrem nejméně 40 mm musí mít vyduté dno.

6.2.6.1.2 Vnitřní objem nádobek vyrobených z kovu nesmí být větší než 1000 ml; vnitřní objem nádobek vyrobených ze syntetického materiálu nebo ze skla nesmí být větší než 500 ml.

6.2.6.1.3 Každý typ nádobek (aerosolů nebo kartuší) musí být před uvedením do provozu s úspěchem podroben hydraulické tlakové zkoušce podle 6.2.6.2.

6.2.6.1.4 Odpouštěcí ventily a rozprašovací zařízení aerosolových nádobek s plyny pod tlakem (UN 1950 aerosoly) a ventily UN 2037 nádobek, malých obsahujících plyny (kartuší) musí zajišťovat, že nádoby jsou neprodyšně uzavřeny a že jsou chráněny proti nežádoucímu otevření. Ventily a rozprašovací zařízení, které jsou uzavřeny pouze účinkem vnitřního tlaku, jsou nepřípustné.

6.2.6.1.5 Vnitřní tlak aerosolových rozprašovačů při 50 °C nesmí překročit ani dvě třetiny zkušebního tlaku ani 1,32 MPa (13,2 bar). Musí být plněny tak, aby při teplotě 50 °C kapalné fáze nepřesahovala 95 % jejich objemu. Malé nádoby obsahující plyn (plynové kartuše) musí splňovat požadavky na zkušební tlak a plnění podle P200 odstavce 4.1.4.1.

6.2.6.2 Zkouška hydraulickým přetlakem

6.2.6.2.1 Použitý vnitřní tlak (zkušební tlak) musí být 1,5 násobek vnitřního tlaku při 50 °C, s minimálním tlakem 1 MPa (10 barů);

6.2.6.2.2 Hydraulické tlakové zkoušky musí být provedeny s nejméně pěti prázdnými nádobkami každého typu.

- (a) po dobu do dosažení předepsaného zkušební tlaku se nesmí objevit žádný únik ani viditelná trvalá deformace; a
- (b) než dojde k úniku nebo roztržení, musí povolit jako první vydutý konec, pokud existuje, a nádobka nesmí ztratit těsnost nebo se roztrhnout před dosažením 1,2 násobku zkušební tlaku.

6.2.6.3 Zkouška těsnosti (nepropustnosti)

Každý naplněný aerosolový rozprašovač nebo plynová kartuš nebo kartuš do palivových článků musí být podroben zkoušce v lázni s horkou vodou v souladu s 6.2.6.3.1 nebo ve schválené alternativní vodní lázni v souladu s 6.2.6.3.2.

6.2.6.3.1 Zkouška v lázni s horkou vodou

6.2.6.3.1.1 Teplota vodní lázně a doba trvání zkoušky musí být takové, aby vnitřní tlak dosáhl takového tlaku, kterého by bylo dosaženo při teplotě 55 °C (50 °C, pokud kapalná fáze nepřesahuje 95 % kapacity aerosolového rozprašovače, plynové kartuše nebo kartuše do palivových článků při 50 °C). Pokud je obsah citlivý na teplo nebo pokud aerosolové rozprašovače, plynové kartuše nebo kartuše do palivových článků jsou vyrobeny z plastového materiálu, který při této zkušební teplotě měkne, teplota lázně se musí nastavit na teplotu mezi 20 °C a 30 °C, ale kromě toho jeden aerosolový rozprašovač, plynová kartuš nebo kartuš do palivových článků ze 2000 se musí zkoušet při vyšší teplotě.

6.2.6.3.1.2 Nesmí dojít k žádnému úniku ani trvalé deformaci aerosolového rozprašovače, plynové kartuše nebo kartuše palivových článků, s výjimkou toho, že plastový aerosolový rozprašovač, plynová kartuš nebo kartuš palivových článků se může zdeformovat změkčením, pokud nedojde k úniku.

6.2.6.3.2 Alternativní metody

Se souhlasem kompetentního orgánu je možné použít alternativní metody, které poskytují ekvivalentní bezpečnosti, za předpokladu, že jsou splněny požadavky 6.2.6.3.2.1 a podle vhodnosti 6.2.6.3.2.2 a 6.2.6.3.2.3.

6.2.6.3.2.1 Systém jakosti

Plniči aerosolových rozprašovačů, plynových kartuší a palivových článků a výrobci komponent musí mít systém jakosti. Systém jakosti musí zavést postupy s cílem zajistit, aby všechny aerosolové rozprašovače, plynové kartuše nebo kartuše palivových článků, které unikají nebo jsou deformované, byly vyřazeny a nebyly nabízeny k přepravě.

Systém jakosti musí obsahovat:

- (a) Popis organizační struktury a odpovědností;
- (b) Příslušné provozní instrukce pro kontrolu a zkoušení, řízení jakosti, zajišťování jakosti a provozní procesy, které se budou používat;
- (c) Záznamy o jakosti, jako jsou zprávy k kontrole, zkušební data, kalibrační údaje a certifikáty;
- (d) Přezkoumání vedením pro zajištění účinného fungování systému jakosti;

- (e) Proces řízení dokumentů a jejich revizí;
- (f) Prostředky pro řízení neshodných aerosolových rozprašovačů, plynových kartuší nebo kartuší palivových článků;
- (g) Školící programy a kvalifikační postupy pro příslušný personál; a
- (h) Postupy zajišťující prevenci poškození konečného výrobku.

Musí být proveden prvotní audit a musí se provádět periodické audity ke spokojenosti příslušného orgánu. Tyto audity musí zajistit, aby schválený systém byl a zůstal přiměřený a účinný. Všechny navrhované změny schváleného systému musí být oznámeny příslušnému orgánu v předstihu.

6.2.6.3.2.2 *Aerosolové rozprašovače*

- 6.2.6.3.2.2.1 Zkoušky tlaku a těsnosti aerosolových rozprašovačů před plněním Každý prázdný aerosolový rozprašovač musí být podroben tlaku rovnajícímu se nebo vyššímu než je maximum očekávané v naplněných aerosolových rozprašovačích při 55 °C (50 °C, pokud kapalná fáze nepřesahuje 95 % objemu nádoby při 50 °C). Toto musí být nejméně dvě třetiny konstrukčního tlaku aerosolového rozprašovače. Pokud kterýkoliv aerosolový rozprašovač vykazuje známky úniku (netěsnosti) o rychlosti rovnající se nebo větší než $3,3 \times 10^{-2}$ mbar.l.s⁻¹ při zkušebním tlaku, deformace nebo jiné vady, musí být vyřazen.

6.2.6.3.2.2.2 Zkoušení aerosolových rozprašovačů po naplnění

Před plněním musí plnič zajistit, aby lemovací zařízení bylo správně nastaveno a aby byl použit správný hnací plyn.

Každý naplněný aerosolový rozprašovač se musí zvážít a musí se provést zkouška jeho těsnosti. Zařízení pro detekci úniku musí být dostatečně citlivé, aby zjistilo alespoň rychlost úniku $2,0 \times 10^{-3}$ mbar.l.s⁻¹ těsnosti při 20 °C.

Každý naplněný aerosolový rozprašovač, který vykazuje známky úniku, deformace nebo nadměrné hmotnosti, musí být vyřazen.

6.2.6.3.2.3 *Plynové kartuše a kartuše palivových článků*

6.2.6.3.2.3.1 Tlakové zkoušky plynových kartuší a kartuší palivových článků

Každá plynová kartuš nebo kartuš palivových článků musí být podrobena zkušebnímu tlaku rovnajícímu se nebo vyššímu než je maximum očekávané v naplněné nádobě 55 °C (50 °C, pokud kapalná fáze nepřesahuje 95 % objemu nádoby při 50 °C). Tento zkušební tlak musí být tlak specifikovaný pro plynové kartuše nebo kartuše palivových článků a nesmí být menší než dvě třetiny konstrukčního tlaku plynové kartuše nebo kartuše palivových článků. Pokud kterákoliv plynová kartuš nebo kartuš palivových článků vykazuje známky úniku (netěsnosti) o rychlosti rovnající se nebo větší než $3,3 \times 10^{-2}$ mbar.l.s⁻¹ při zkušebním tlaku, nebo deformace nebo jakékoliv jiné vady, musí být vyřazena.

6.2.6.3.2.3.2 Zkoušky těsnosti plynových kartuší a kartuší palivových článků

Před plněním a utěsněním musí plnič zajistit, aby uzávěry (pokud jsou) a související těsnící zařízení byly vhodně uzavřeny a aby byl použit specifikovaný plyn.

U každé naplněné plynové kartuše nebo kartuše palivových článků se musí zkontrolovat správná hmotnost plynu a musí se provést zkouška těsnosti. Zařízení pro detekci úniku musí být dostatečně citlivé, aby zjistilo alespoň rychlost úniku $2,0 \times 10^{-3}$ mbar.l.s⁻¹ těsnosti při 20 °C.

Jakákoliv plynová kartuš nebo kartuš palivových článků, u které hmotnosti plynu nejsou v souladu s deklarovanými hmotnostními limity nebo která vykazuje známky úniku nebo deformace, musí být vyřazena.

6.2.6.3.3 Se souhlasem příslušného orgánu nepodléhají aerosoly a malé nádoby ustanovením v 6.2.6.3.1 a 6.2.6.3.2, pokud musí být sterilní a mohly by být negativně ovlivněny zkouškou ve vodní lázni, pokud:

- (a) obsahují nehořlavý plyn a buď
 - (i) obsahují jiné látky, které jsou součástí farmaceutických výrobků pro zdravotnické, veterinární nebo podobné účely;
 - (ii) obsahují jiné látky použité ve výrobních procesech pro farmaceutické výrobky; nebo
 - (iii) jsou používány ve zdravotnictví, veterinářství nebo k podobným účelům;
- (b) ekvivalentní úroveň bezpečnosti je dosažena tím, že výrobce použije alternativní způsoby pro zjišťování úniku a odolnosti proti tlaku, jako jsou detekce pomocí helia a pomocí zkoušky ve vodní lázni na statistickém vzorku nejméně 1 z 2000 každé výrobní šarže.
- (c) farmaceutické výrobky podle výše uvedených (a) (i) a (iii), jsou vyrobeny pod dohledem národního zdravotního úřadu. Pokud to vyžaduje příslušný orgán, zásady Good Manufacturing Practice (GMP) vytvořené World Health Organization (WHO)⁴ musí být dodrženy.

6.2.6.4 Odkazy na normy

Požadavky tohoto oddílu se považují za splněné, pokud jsou splněny dále uvedené normy:

- pro aerosolové rozprašovače (UN 1950 aerosoly): Příloha ke Směrnici Rady 75/324/EEC⁵ ve znění pozdějších předpisů platných v den výroby;
- pro UN 2037 nádoby, malé, obsahující plyn (kartuše) obsahující UN 1965 uhlovodíky, plyné, směs, zkapalněná, j.n.: EN 417:2012 Kovové kartuše na zkapalněné ropné plyny pro jedno použití, s ventilem nebo bez ventilu, pro používání v přenosných zařízeních - Konstrukce, inspekce, zkoušení a značení.

⁴ Publikace WHO: „Quality assurance of pharmaceuticals. A compendium of guidelines and related materials. Volume 2: Good manufacturing practices and inspection“.

⁵ Směrnice Rady EU 75/324/EEC z 20 května o přibližování zákonů členských států vztahující se na aerosolové rozprašovače (aerosoly) publikovaný v Official Journal of the European Commission č. L 147 z 9/06/1975.

KAPITOLA 6.3

POŽADAVKY NA KONSTRUKCI A ZKOUŠENÍ OBALŮ PRO INFEKČNÍ LÁTKY KATEGORIE A TŘÍDY 6.2

POZNÁMKA: Požadavky této kapitoly neplatí pro obaly, které budou používány dle 4.1.4.1, pokynu pro balení P 621 pro přepravu látek třídy 6.2

6.3.1 Obecné

6.3.1.1 Požadavky této kapitoly se použijí pro obaly určené k přepravě infekčních látek kategorie A.

6.3.2 Požadavky na balení

6.3.2.1 Požadavky na obaly v tomto oddílu jsou založeny na obalech, jak jsou specifikovány v 6.1.4, běžně používaných. S ohledem na vědecký a technický pokrok, není žádná námitka proti používání obalů se specifikací odlišnou od té, která je uvedena v této kapitole, za předpokladu, že jsou stejně účinné, přijatelné pro příslušný orgán a schopné úspěšně projít zkouškami popsány v 6.3.5. Způsoby zkoušení, jiné nežli ty uvedené v ADR, jsou přijatelné za předpokladu, že jsou rovnocenné a jsou uznány příslušným orgánem.

6.3.2.2 Obaly musí být vyrobeny a odzkoušeny podle programu zajištění kvality, který uspokojí příslušný orgán, aby se zajistilo, že každý obal splňuje požadavky této kapitoly.

POZNÁMKA: ISO 16106:2006 „Obaly - Přepravní balení pro nebezpečné věci - Obaly na nebezpečné věci, IBC a velké obaly - Směrnice pro použití ISO 9001“ poskytuje vhodné nároky na postupy, které mohou být využity.

6.3.2.3 Výrobci a následní distributoři obalů musí uživatelům poskytnout informace týkající se postupů, které je nutno dodržet, a popis typů a rozměrů uzávěrů (zahrnujíc v to požadovaná těsnění) a jakékoliv další komponenty potřebné k tomu, aby obaly jak jsou podávány k přepravě, byly schopny projít schvalovacími zkouškami konstrukčního typu dle této kapitoly.

6.3.3 Kód pro určení typu obalů

6.3.3.1 Kódy k označení typů obalů jsou stanoveny v 6.1.2.7.

6.3.3.2 Písmena „U“ nebo „W“ mohou následovat po obalovém kódu. Písmeno „U“ označuje speciální obal splňující požadavky uvedené v 6.3.5.1.6. Písmeno „W“ označuje, že obal, ačkoli je stejného typu určeného tímto kódem, je vyroben odlišně od specifikace uvedené v 6.1.4 a je považován za ekvivalentní podle požadavků v 6.3.2.1.

6.3.4 Značení

POZNÁMKA 1: Značení udává, že obal, který ho nese, odpovídá úspěšně odzkoušenému konstrukčnímu typu a je v souladu s požadavky této kapitoly vztahujícími se na výrobu, ale ne na používání obalu.

POZNÁMKA 2: Značení je určeno jako podpora výrobcům obalů, rekondicionovatelům, uživatelům obalů, dopravcům a legislativním orgánům.

POZNÁMKA 3: Značení ne vždy poskytuje všechny podrobnosti o úrovních zkoušek atd. a tyto je třeba vzít dále v úvahu, např. odkazem na zkušební certifikát, záznamy o zkoušce nebo na registr úspěšně odzkoušených obalů.

6.3.4.1 Každý obal určený pro použití podle ADR musí nést značení, která jsou trvalá, čitelná a umístěná na místě a v takové velikosti v poměru k obalu, aby byla snadno viditelná. Pro kusy s celkovou (brutto)

hmotností vyšší nežli 30 kg, značení nebo jeho duplikát se musí objevit na horní části nebo na straně obalu. Písmena, číslice a znaky musí být nejméně 12 mm vysoké, s výjimkou obalů s kapacitou 30 litrů nebo 30 kg nebo méně, kde mohou být nejméně 6 mm vysoké, a pro obaly s kapacitou 5 litrů nebo 5 kg nebo méně, kdy budou mít odpovídající rozměr.

6.3.4.2 Obal splňující požadavky tohoto oddílu a oddílu 6.3.5 musí být označen UN kódem takto:

(a) Znak Spojených národů pro obaly;

Tento znak nesmí být použit pro jiné účely než pro osvědčení, že obal, přemístitelná cisterna nebo MEGC splňuje příslušné požadavky kapitoly 6.1, 6.2, 6.3, 6.5, 6.6 nebo 6.7¹.

(b) Kódem označujícím typ obalu podle požadavků uvedených v oddílu 6.1.2;

(c) Textem „TRÍDA 6.2“;

(d) Posledními dvěma číslicemi roku výroby obalu;

(e) Označením státu schvalujícího přidělení značky (UN kódu) uvedením rozlišovací značky pro motorová vozidla v mezinárodním provozu²;

(f) Jménem výrobce nebo jinou identifikací obalu stanovenou příslušným orgánem;

(g) Pro obaly splňující požadavky pododdílu 6.3.5.1.6 písmenem „U“ umístěným bezprostředně za označením požadovaným ve výše uvedeném odstavci (b).

6.3.4.3 Značení musí být používáno v pořadí uvedeném v 6.3.4.2 (a) až (g); každý prvek značení požadovaný v tomto pododdílu musí být jasně oddělen, např. pomocí lomítka nebo mezery tak, aby byl jasně identifikovatelný. Příklady viz 6.3.4.4.

Každé dodatečné značení schválené příslušným orgánem musí ještě umožnit, aby části značky byly správně identifikovatelné podle 6.3.4.1.

6.3.4.4 **Příklad značení**

4G/ TRÍDA 6.2/06

jako v 6.3.4.2 (a), (b), (c), a (d)

S/SP-9989-ERIKSSON

jako v 6.3.4.2 (e) a (f)

6.3.5 **Požadavky na zkoušení obalů**

6.3.5.1 **Provedení a frekvence zkoušek**

6.3.5.1.1 Konstrukční typ každého obalu musí být odzkoušen, jak je uvedeno v tomto pododdílu podle postupů stanovených příslušným orgánem povolujícím umístění značek a musí být tímto příslušným orgánem schválen.

6.3.5.1.2 Každý konstrukční typ obalu musí před použitím úspěšně projít zkouškami předepsanými v této kapitole. Konstrukční typ obalu je definován svou konstrukcí, rozměrem, druhem materiálu a tloušťkou, způsobem výroby a balení, ale může zahrnovat různé povrchové úpravy. Zahrnuje rovněž obaly, které se od konstrukčního typu liší pouze svou menší konstrukční výškou.

¹ Tento symbol se také používá k potvrzení, že flexibilní objemové vaky schválené pro ostatní druhy dopravy jsou v souladu s požadavky uvedenými v kapitole 6.8 Modelového regulativu OSN.

² Rozlišovací značka pro motorová vozidla v mezinárodní dopravě předepsaná Úmluvou o silničním provozu (Videň, 1968).

- 6.3.5.1.3 Zkoušky musí být opakovány také na výrobních vzorcích v intervalech stanovených příslušným orgánem.
- 6.3.5.1.4 Zkoušky musí být také opakovány po každé změně, která mění konstrukci, materiál nebo způsob výroby obalu.
- 6.3.5.1.5 Příslušný orgán může povolit výběrové zkoušení obalů odlišných pouze v malé míře od zkušebního typu, např. menších rozměrů nebo nižší čisté (netto) hmotnosti primárních nádob a obaly takové jako sudy, bedny, které jsou vyráběny s malým zmenšením vnějšího(ch) rozměru(ů).
- 6.3.5.1.6 Primární obaly jakéhokoli typu mohou být vloženy do sekundárního obalu a přepravovány bez zkoušení v tuhém vnějším obalu za dále uvedených podmínek:
- (a) Kombinace tuhý vnější obal musí být uspokojivě odzkoušena podle 6.3.5.2.2 (a) s křehkými (např. skleněnými) primárními nádobami;
 - (b) Součtová celková (btto) hmotnost primárních nádob nesmí přesáhnout polovinu celkové (btto) hmotnosti primárních nádob použitých pro zkoušku pádem ve výše uvedeném odstavci (a);
 - (c) Tloušťka fixace mezi primárními nádobami a mezi primárními nádobami a vnitřní stěnou sekundárního obalu nesmí být zmenšena pod odpovídající tloušťky v původně testovaném obalu; a jestliže jednoduchá primární nádoba byla použita pro původní zkoušku, tloušťka fixace mezi primárními nádobami nesmí být menší než tloušťka fixace mezi vnitřní stěnou sekundárního obalu a primární nádobou při původní zkoušce. Pokud se použijí buď menší počet, nebo menší primární nádoby (ve srovnání s primárními nádobami použitými pro zkoušku pádem), musí být použit pro vyplnění prázdného prostoru dodatečný fixační materiál;
 - (d) Prázdný tuhý vnější obal musí projít úspěšně stohovací zkouškou uvedenou v 6.1.5.6. Celková hmotnost totožných kusů musí být založena na součtové hmotnosti obalů použitých pro zkoušku pádem uvedenou výše v odstavci (a);
 - (e) Pro primární nádoby obsahující kapaliny musí být do vnějšího obalu vloženo přiměřené množství absorpčního materiálu k absorpci kapalného obsahu primárních nádob;
 - (f) Pokud tuhý vnější obal je určen, aby obsahoval kapaliny a není vodotěsný, nebo je určen, aby obsahoval primární nádoby pro tuhé látky a není prachotěsný, pak musí být opatřen prostředky zachycujícími jakékoli kapalně nebo tuhé obsahy provedenými ve formě těsné vložky, plastového pytle nebo jiných rovnocenně účinných prostředků;
 - (g) Kromě značení předepsaných v 6.3.4.2 (a) až (f) musí být obaly značeny podle 6.3.4.2 (g).
- 6.3.5.1.7 Příslušný orgán může kdykoli vyžadovat důkaz pomocí zkoušek podle tohoto pododdílu, že sériově vyráběné obaly splňují požadavky zkoušek konstrukčního typu.
- 6.3.5.1.8 Za předpokladu, že platnost výsledků zkoušek není ovlivněna, a se schválením příslušného orgánu, může být na jednom vzorku provedeno několik zkoušek.

6.3.5.2 **Příprava obalů pro zkoušky**

- 6.3.5.2.1 Vzorky každého obalu musí být připraveny jako pro přepravu, kromě toho, že kapalná, nebo pevná infekční látka určená k přepravě musí být nahrazena vodou nebo, kde se vyžaduje teplota -18 °C, nemrznoucí kapalinou. Každá primární nádoba musí být naplněna na ne méně nežli 98 % její kapacity.

POZNÁMKA: Výraz *voda* zahrnuje voda /mrazuvzdorný roztok s minimální specifickou hmotností 0,95 při teplotě -18 °C.

6.3.5.2.2 **Zkoušky a počet vyžadovaných vzorků**

Zkoušky požadované pro typy obalů

Typ obalu ^a			Požadované zkoušky					
Pevný vnější obal	Primární obal		Zkrápění vodou 6.3.5.3.6.1	Redukce teploty 6.3.5.3.6.2	Volný pád 6.3.5.3	Další pády 6.3.5.3.6.3	Průraz 6.3.5.4	Stohování 6.1.5.6
	Plast	Ost.	Počet vz.	Počet vz.	Poč.vz	Počet vz.	Poč. vz.	Počet vz.
Lepen. bedna	x		5	5	10	Požaduje se jeden vzorek, když obsahuje suchý led	2	požadují se 3 vz. když se zkouší na "U" značku, jak je uvedeno v 6.3.5.1.6 pro special. požadavky
		x	5	0	5		2	
Lepenkový sud	x		3	3	6		2	
		x	3	0	3		2	
Plastová bedna	x		0	5	5		2	
		x	0	5	5		2	
Plast. sud/ kanystř	x		0	3	3		2	
		x	0	3	3		2	
Bedny z ostat. materiálů	x		0	5	5		2	
		x	0	3	5		2	
Sudy a kanystř z ostat. materiálů	x		0	3	3		2	
		x	0	0	3		2	

^a „Typ obalu“ kategorizuje obaly pro účely zkoušek podle druhu obalů a jejich materiálových vlastností.

POZNÁMKA 1: V případech, kdy je primární nádoba vyrobena ze dvou nebo více materiálů, musí být odpovídající zkoušce podroben materiál, který je nejvíce náchylný k poškození.

POZNÁMKA 2: Materiál sekundárních obalů se nebere v úvahu při výběru zkoušky nebo kondicionování pro zkoušku.

Vysvětlení pro používání tabulky:

Jestliže se obal, který má být zkoušen, skládá z vnější lepenkové bedny s primární nádobou z plastu, musí zkoušku zkrápěním vodou (viz 6.3.5.3.6.1) podstoupit pět vzorků ještě před zkouškou volným pádem a dalších pět vzorků musí být kondicionováno při -18 °C (viz 6.3.5.3.6.2) před zkouškou volným pádem. Jestliže je obal určen pro suchý led, potom další jeden vzorek musí být podroben pětkrát zkoušce volným pádem po kondicionování podle 6.3.5.3.6.3.

Obaly připravené jako pro přepravu musí být podrobeny zkouškám podle 6.3.5.3 a 6.3.5.4. Pro vnější obaly se záhlaví tabulky vztahuje na lepenku nebo podobné materiály, jejichž odolnost může být rychle ovlivněna vlhkostí, plasty, které mohou při nízkých teplotách křehnout a jiné materiály, jako kovy, jejichž odolnost není vlhkostí nebo teplotou ovlivněna.

6.3.5.3 Zkouška volným pádem

6.3.5.3.1 Vzorky musí být podrobeny zkoušce volným pádem z výšky 9 m na nepružnou, vodorovnou, hladkou a tuhou plochu podle 6.1.5.3.4.

6.3.5.3.2 Když jsou vzorky tvaru bedny, musí být zkoušeno pět vzorků podle následujících orientací:

- (a) naplocho na základnu
- (b) naplocho na vrchní část
- (c) naplocho na nejdelší stranu
- (d) naplocho na nejkratší stranu
- (e) na roh

- 6.3.5.3.3 Tam, kde mají vzorky tvar sudu, budou zkoušeny tři vzorky podle jedné z následujících orientací
- (a) diagonálně na horní hranu sudu, s centrem gravitace přímo nad bodem nárazu:
 - (b) diagonálně na spodní hranu.
 - (c) na plochu pláště
- 6.3.5.3.4 Když byly vzorky uvolněny v požadované orientaci, přijímá se, že z aerodynamických důvodů nemusí být náraz v této orientaci.
- 6.3.5.3.5 Po příslušné sekvenci pádů nesmí dojít k úniku z primární nádoby (nádob), která musí zůstat chráněna fixačním/absorpčním materiálem v sekundárním obalu.
- 6.3.5.3.6 ***Speciální příprava zkušební vzorku na zkoušku volným pádem.***
- 6.3.5.3.6.1 Lepenka – zkouška zkrápěním vodou
- Vnější obaly z lepenky: Vzorek musí být podroben kropení vodou, které simuluje vystavení dešti o intenzitě přibližně 5 cm za hodinu po dobu nejméně jedné hodiny. Potom bude podroben zkoušce popsané v 6.3.5.3.1.
- 6.3.5.3.6.2 Plastové materiály – kondicionování za studena
- Primární nádoby z plastu nebo vnější obaly: Teplota zkušební vzorku a jeho obsah musí být redukována na teplotu – 18 °C nebo nižší po dobu nejméně 24 hodin a v rozmezí 15 minut po vyjmutí z tohoto prostředí musí být zkušební vzorek podroben zkoušce popsané v 6.3.5.3.1. Pokud vzorek obsahuje suchý led, doba kondicionování se sníží na 4 hodiny.
- 6.3.5.3.6.3 Obaly určené pro suchý led – Dodatečná zkouška volným pádem
- Pokud je obal určen pro suchý led, musí být provedena dodatečná pádová zkouška ke zkoušce volným pádem uvedené v 6.3.5.3.1, a pokud je to nutné dle 6.3.5.3.6.1 nebo 6.3.5.3.6.2. Jeden vzorek musí být uložen tak, aby veškerý suchý led vysublimoval, a potom je tento vzorek podroben zkoušce pádem v jedné z orientací popsaných v 6.3.5.3.2. Zvolí se ta, kde je nejvyšší pravděpodobnost poškození obalu.
- 6.3.5.4 Zkouška průrazem**
- 6.3.5.4.1 ***Obaly s celkovou (brutto) hmotností 7 kg nebo méně***
- Vzorky musí být umístěny na rovný tvrdý povrch. Kulatá ocelová tyč o hmotnosti nejméně 7 kg, průměru z 38 mm a jejíž rádius nepřekračuje 6 mm viz obrázek 6.3.5.4.2, musí být spouštěna volným pádem svisle z výšky 1 m, měřeno od jejího nárazového konce k místu nárazu na povrchu vzorku. Jeden vzorek musí být umístěn na svou základnu. Druhý vzorek musí být umístěn v kolmém směru ke směru použitému při předchozí zkoušce. V každém případě ocelová tyč musí být zaměřena tak, aby udeřila do primární nádoby. Proražení sekundárního obalu je po každém následujícím úderu přijatelné, pokud nedojde k úniku z primární(ch) nádob(y).
- 6.3.5.4.2 ***Obaly s celkovou (brutto) hmotností převyšující 7 kg***
- Vzorky musí být spouštěny na konec válcové ocelové tyče. Tyč musí být nastavena svisle na rovný tvrdý povrch. Musí mít průměr 38 mm a hrany vrchního konce musí mít poloměr nepřekračující 6 mm viz obrázek 6.3.5.4.2. Tyč musí vyčnívat z povrchu na vzdálenost nejméně rovnou vzdálenosti mezi středem primární nádoby (nádob) a vnějším povrchem vnějšího obalu o nejméně 200 mm. Jeden vzorek musí být spouštěn se svou nejnižší horní plochou svislým volným pádem z výšky 1 m měřené od vrcholu ocelové tyče. Druhý vzorek musí být spouštěn ze stejné výšky ve směru kolmém na směr, který byl použit poprvé. V každém případě obal musí být nasměrován tak, že by ocelová trubka měla proniknout do primární(ch) nádob(y). Při každém dalším nárazu, proniknutí sekundárního obalu je přijatelné za předpokladu, že nedojde k úniku.

Obrázek 6.3.5.4.2

6.3.5.5 *Protokol o zkoušce*

6.3.5.5.1 O provedených zkouškách musí být sepsán protokol o zkoušce, obsahující minimálně následující podrobnosti a musí být k dispozici uživatelům obalů

1. Název a adresa zkušebny;
2. Jméno a adresa žadatele, pokud je to vhodné;
3. Jednoznačná identifikace protokolu o zkoušce (např. číslo);
4. Datum zkoušky a protokolu o zkoušce;
5. Výrobce obalu;
6. Popis konstrukčního typu obalu (např. rozměry, materiály, uzávěry, tloušťka atd.) včetně způsobu výroby (např. vyfukování lisování, atd.), který může zahrnovat výkres(y) a/nebo fotografii(e);
7. Nejvyšší vnitřní objem;
8. Obsah zkoušek;
9. Popis zkoušky a výsledky;
10. Protokol o zkoušce musí být podepsán s uvedením jména a funkce podepsaného.

6.3.5.5.2 Protokol o zkoušce musí obsahovat prohlášení, že obal určený pro přepravu byl odzkoušen podle příslušných požadavků tohoto odstavce a že použití jiných metod balení nebo komponent, může mít za následek jeho neplatnost. Kopie protokolu o zkoušce musí být dána k dispozici příslušnému orgánu.

KAPITOLA 6.4

POŽADAVKY NA KONSTRUKCI, ZKOUŠENÍ A SCHVALOVÁNÍ KUSŮ PRO RADIOAKTIVNÍ LÁTKY A NA SCHVALOVÁNÍ TAKOVÝCH LÁTEK

6.4.1 (Vyhrazeno)

6.4.2 Všeobecné požadavky

6.4.2.1 Kus musí být tak konstruován vzhledem ke své hmotnosti, objemu a tvaru, aby mohl být snadno a bezpečně přepravován. Kromě toho kus musí být tak konstruován, aby mohl být vhodně zajištěn ve nebo na vozidle během přepravy.

6.4.2.2 Konstrukční vzor musí být takový, aby jakékoli úchyty pro zvedání na kusu neselhaly, pokud jsou používány zamýšleným způsobem, a takový, pokud by k poruše těchto úchytů došlo, aby schopnost kusu splnit jiné požadavky této přílohy nebyla snížena. Konstrukční vzor musí brát v úvahu odpovídající bezpečnostní koeficienty pro případ zvedání třem.

6.4.2.3 Úchyty a jakékoli přídavné příslušenství na vnějším povrchu kusu, které může být používáno pro zvedání, musí být konstruováno buď jako odpovídající jeho hmotnosti podle požadavků uvedených v 6.4.2.2 nebo musí být snímatelné nebo musí být jinak vyřaditelné z použití během přepravy.

6.4.2.4 Pokud je to prakticky možné, musí být obal konstruován a povrchově opracován tak, aby jeho vnější povrchy byly bez výčnělků a mohly být snadno dekontaminovány.

6.4.2.5 Pokud je to prakticky možné, musí být kus konstruován tak, aby zabránil sběru a zadržování vody.

6.4.2.6 Jakákoli zařízení připojená ke kusu v době jeho přepravy, která nejsou částí kusu, nesmějí snižovat jeho bezpečnost.

6.4.2.7 Kus musí být schopen odolat účinku jakéhokoli zrychlení, vibrace a vibrační rezonance, které mohou nastat v průběhu běžných podmínek přepravy bez snížení účinnosti uzavíracích zařízení na jeho různých nádobách nebo celistvosti kusu. Zejména šrouby, matice a jiná upevňovací zařízení musí být konstruovány tak, aby se zabránilo jejich ztrátě nebo neočekávanému uvolnění dokonce i po opakovaném použití.

6.4.2.8 Materiály obalu a jakýchkoli částí a celků musí být fyzikálně a chemicky snášenlivé, a to navzájem i vůči radioaktivnímu obsahu. Musí se vzít v úvahu jejich chování po ozáření.

6.4.2.9 Všechny ventily, jimiž by mohl radioaktivní obsah uniknout, musí být chráněny proti neoprávněné manipulaci.

6.4.2.10 Konstrukční vzor kusu musí brát v úvahu okolní teploty a tlaky, se kterými se pravděpodobně setkává v běžných podmínkách přepravy.

6.4.2.11 Kus musí být zkonstruován tak, aby při maximálním projektovaném radioaktivním obsahu, k jehož přepravě je obalový soubor navržen bylo zajištěno dostatečné stínění za běžných podmínek přepravy, tedy, aby příkon dávkového ekvivalentu na libovolném místě vnějšího povrchu kusu nepřekročil hodnoty specifikované v příslušných z 2.2.7.2.4.1.2, 4.1.9.1.10 a 4.1.9.1.11, s ohledem na 7.5.11 CV33 (3.3) (b) a 7.5.11 CV33 (3.5).

6.4.2.12 Pro radioaktivní látku mající jiné nebezpečné vlastnosti musí být kus konstruován s přihlédnutím k těmto vlastnostem, viz 2.1.3.5.3 a 4.1.9.1.5.

6.4.2.13 Výrobci a následní distributoři obalů musí poskytnout informaci o postupu při jejich uzavírání a popis typů a rozměrů uzávěrů (včetně požadovaných gaskets) a všech dalších částí nezbytných k zajištění, že kusy tak, jak jsou připraveny k přepravě, jsou schopné absolvovat příslušné testy této kapitoly.

6.4.3 (Vyhrazeno)

6.4.4 Požadavky na kusy vyňaté z platnosti

Kus vyňatý z platnosti musí být konstruován tak, aby splnil požadavky uvedené v oddílu 6.4.2.

6.4.5 Požadavky na průmyslové kusy

6.4.5.1 Kusy typů IP-1, IP-2 a IP-3 musí splňovat požadavky uvedené v oddílu 6.4.2 a pododdílu 6.4.7.2.

6.4.5.2 Kus typu IP-2, pokud podléhá zkouškám uvedeným v 6.4.15.4 a 6.4.15.5, musí zabránit:

- (a) ztrátě nebo rozptýlení radioaktivních obsahů; a
- (b) více než 20% nárůstu maximální dávkové intenzity na jakémkoli místě vnějšího povrchu kusu.

6.4.5.3 Kus typu IP-3 musí splňovat všechny požadavky uvedené v oddílech 6.4.7.2 až 6.4.7.15.

6.4.5.4 Alternativní požadavky na kusy typů IP-2 a IP-3

6.4.5.4.1 Kusy mohou být používány jako kusy typu IP-2, pokud:

- (a) splňují požadavky uvedené v 6.4.5.1;
- (b) jsou navrženy tak, aby splňovaly požadavky předepsané pro obalovou skupinu I nebo II v kapitole 6.1, a
- (c) po provedení zkoušek požadovaných pro obalovou skupinu I nebo II v kapitole 6.1 zabrání:
 - (i) ztrátě nebo rozptýlení radioaktivních obsahů; a
 - (ii) více než 20% nárůstu maximální dávkové intenzity na jakémkoli místě vnějšího povrchu kusu.

6.4.5.4.2 Přemístitelné cisterny mohou být používány jako kus typů IP-2 nebo IP-3 pokud:

- (a) splňují požadavky uvedené v 6.4.5.1;
- (b) jsou zkonstruovány tak, aby splňovaly požadavky předepsané v kapitole 6.7 a aby byly způsobilé odolávat zkušebnímu tlaku 265 kPa; a
- (c) jsou konstruovány tak, aby jakékoli dodatečné stínění, pokud je provedeno, bylo schopno odolat statickým a dynamickým namáháním způsobeným manipulacemi a běžnými podmínkami přepravy a zabránilo zvýšení maximální dávkové intenzity o více než 20 % na jakémkoli místě vnějšího povrchu přemístitelných cisteren.

6.4.5.4.3 Cisterny, kromě přemístitelných cisteren, mohou být též používány jako kus typů IP-2 nebo IP-3 pro přepravu kapalin a plynů LSA-I a LSA-II, jak je předepsáno v tabulce 4.1.9.2.5, pokud:

- (a) odpovídají požadavkům 6.4.5.1;
- (b) jsou zkonstruovány tak, aby splňovaly požadavky předepsané v kapitole 6.8; a
- (c) jsou navrženy tak, aby jakékoliv dodatečné stínění, které je použito, bylo schopné odolávat statickému a dynamickému zatížení vyplývajícím z manipulačních a běžných přepravních podmínek přepravy a zamezovalo více než 20 % zvýšení maximálního příkonu dávkového ekvivalentu na jakémkoliv vnějším povrchu cisterny.

6.4.5.4.4 Kontejnery s povahou trvalého uzavření mohou být používány jako kus typů IP-2 nebo IP-3 pokud:

- (a) radioaktivní obsahy jsou omezeny na tuhé materiály;
- (b) splňují požadavky uvedené v 6.4.5.1; a
- (c) jsou konstruovány podle mezinárodní normy ISO 1496-1:1990: Série 1 Kontejnery – Specifikace a zkoušení – Část 1: Všeobecné nákladní kontejnery a pozdějších změn 1:1993,

2:1998, 3:2005, 4:2006 a 5:2006 kromě rozměrů a charakteristik. Musí být konstruovány tak, aby po provedení zkoušek předepsaných v tomto dokumentu a zrychlením vyskytujícím se v běžných podmínkách přepravy zabránily:

- (i) ztrátě nebo rozptýlení radioaktivních obsahů; a
- (ii) více než 20% nárůstu maximální dávkové intenzity na jakémkoli místě vnějšího povrchu kontejneru.

6.4.5.4.5 Kovové velké nádoby pro volně ložené látky mohou být používány jako kus typů IP-2 nebo IP-3 pokud:

- (a) splňují požadavky uvedené v 6.4.5.1; a
- (b) jsou konstruovány podle norem a zkoušek předepsaných v kapitole 6.5 pro obalové skupiny I nebo II, ale se zkouškou pádem provedenou v nejvíce poškozujícím směru, a zabrání:
 - (i) ztrátě nebo rozptýlení radioaktivních obsahů; a
 - (ii) více než 20% nárůstu maximální dávkové intenzity na jakémkoli místě vnějšího povrchu IBC.

6.4.6 Požadavky na kusy obsahující hexafluorid uranu

6.4.6.1 Kusy projektované na obsah hexafluorid uranu musí splňovat požadavky, vztahující se na radioaktivní a štěpné vlastnosti této látky, předepsané jinde v ADR. S výjimkou povolenou v 6.4.6.4 musí hexafluorid uranu o hmotnosti 0,1 kg a více být také plněn do obalů a přepravován podle ustanovení mezinárodní normy ISO 7195:2005 „Atomová energie - Balení hexafluoridu uranu (UF6) pro přepravu a požadavků uvedených v 6.4.6.2 a 6.4.6.3.

6.4.6.2 Každý kus konstruovaný na obsah 0,1 kg nebo více hexafluoridu uranu musí být konstruován tak, aby splňoval následující požadavky:

- (a) odolat bez úniku a bez nepřijatelného napětí, jak je uvedeno ISO 7195:2005, zkoušce pevnosti uvedené v 6.4.21.5 s výjimkou povolenou v 6.4.6.4;
- (b) odolat beze ztráty nebo rozptylu hexafluoridu uranu zkoušce volným pádem uvedené v 6.4.15.4; a
- (c) odolat bez porušení kontejmentového systému tepelné zkoušce uvedené v 6.4.17.3 s výjimkou povolenou v 6.4.6.4.

6.4.6.3 Kusy konstruované na obsah 0,1 kg nebo více hexafluoridu uranu nesmějí být vybaveny zařízením pro snižování tlaku.

6.4.6.4 Pouze na základě vícestranného schválení mohou být přepravovány kusy konstruované na obsah 0,1 kg nebo více hexafluoridu uranu, jestliže jsou konstruovány:

- (a) podle mezinárodních nebo národních norem jiných než ISO 7195:2005, za předpokladu, že je dodržena stejná úroveň bezpečnosti a/nebo;
- (b) tak, aby odolaly bez úniku a bez nepřijatelného napětí zkušebnímu tlaku 2,76 MPa, jak je uvedeno v 6.4.21.5; a/nebo
- (c) na obsah 9000 kg nebo více hexafluoridu uranu a kusy nesplňují požadavky uvedené v 6.4.6.2 (c)

Požadavky popsané v 6.4.6.1 až 6.4.6.3 musí být ve všech ostatních ohledech splněny.

6.4.7 Požadavky na kusy typu A

- 6.4.7.1 Kusy typu A musí být konstruovány tak, aby splňovaly všeobecné požadavky uvedené v oddílu 6.4.2 a v 6.4.7.2 až 6.4.7.17.
- 6.4.7.2 Nejmenší vnější celkový rozměr kusu nesmí být menší než 10 cm.
- 6.4.7.3 Na vnější straně kusu musí být zařízení, jako např. pečeť (plomba), které se nemůže snadno poškodit a jehož neporušený stav dokazuje, že kus nebyl otevřen.
- 6.4.7.4 Jakákoli připojená úchytná zařízení na kusu musí být konstruována tak, aby síly vznikající při normálních a nehodových podmínkách přepravy v těchto zařízeních nenarušily schopnost kusu plnit požadavky ADR.
- 6.4.7.5 Konstrukční vzor kusu musí brát v úvahu rozsah teplot $-40\text{ }^{\circ}\text{C}$ až $+70\text{ }^{\circ}\text{C}$ pro části obalu. Pozornost musí být věnována teplotám tuhnutí kapalin a možnému zhoršování materiálů obalu v mezích uvedeného rozsahu teplot.
- 6.4.7.6 Konstrukce a výrobní technologie musí odpovídat národním a mezinárodním normám nebo jiným požadavkům uznaným příslušným orgánem.
- 6.4.7.7 Konstrukční vzor musí zahrnovat kontejmentový systém bezpečně uzavíratelný spolehlivým uzavíracím zařízením, které nemůže být otevřeno neúmyslně, nebo tlakem, který může vzniknout uvnitř kusu.
- 6.4.7.8 Radioaktivní látka zvláštní formy může být považována za součást kontejmentového systému.
- 6.4.7.9 Jestliže je kontejmentový systém oddělenou jednotkou kusu, musí být uzavíratelný spolehlivým uzavíracím zařízením, které je nezávislé na jakékoli jiné části obalu.
- 6.4.7.10 Konstrukce jakékoli části kontejmentového systému musí brát v úvahu, pokud je to vhodné, radiolytický rozklad kapalin a jiných nestálých materiálů a vývoj plynů při chemické reakci a radiolýze.
- 6.4.7.11 Kontejmentový systém musí svůj radioaktivní obsah udržet při snížení vnějšího okolního tlaku do 60 kPa.
- 6.4.7.12 Všechny ventily, kromě zařízení pro vyrovnávání tlaku, musí být provedeny s uzávěrem zamezujícím jakémukoliv úniku z ventilu.
- 6.4.7.13 Radiační stínění, které uzavírá součást kusu specifikovanou jako část kontejmentového systému, musí být konstruováno tak, aby zabránilo neúmyslnému oddělení této součásti od stínění. Kde radiační stínění a taková součást tvoří oddělenou jednotku, musí být tato jednotka uzavíratelná spolehlivým uzavíracím zařízením, které je nezávislé na jakékoli jiné části obalu.
- 6.4.7.14 Kus musí být konstruován tak, aby, je-li je podroben zkouškám stanoveným v oddílu 6.4.15, zabránil:
- (a) ztrátě nebo rozptýlení radioaktivních obsahů; a
 - (b) více než 20% nárůstu maximální dávkové intenzity na jakémkoli místě vnějšího povrchu kusu.
- 6.4.7.15 Konstrukční vzor kusu určeného pro kapalnou radioaktivní látku musí odpovídat ustanovení o úbytku obsahu a volného prostoru vlivem změn teploty obsahu, dynamických účinků a dynamik plnění.
- Kus typu A určený pro kapaliny*
- 6.4.7.16 Kus typu A konstruovaný pro kapalnou radioaktivní látku musí kromě uvedených požadavků navíc:
- (a) dostatečně splňovat podmínky uvedené v 6.4.7.14 (a) výše, pokud kus byl podroben zkouškám uvedeným v oddílu 6.4.16; a
 - (b) buď

- (i) obsahovat dostatečně absorpčního materiálu schopného absorbovat dvojnásobek objemu kapalného obsahu. Takový absorpční materiál musí být vhodně umístěn co nejblíže ke kapalině pro případ jejího úniku; nebo
- (ii) být opatřen kontejmentovým systémem tvořeným primárními vnitřními a sekundárními vnějšími kontejmentovými částmi konstruovanými ke kompletnímu uzavření kapalných obsahů a zajištění jejich zadržení uvnitř sekundárních vnějších kontejmentových částí, i když primární vnitřní části jsou netěsné.

Kus typu A určený pro plyny

- 6.4.7.17 Kus konstruovaný pro plyny musí zabránit ztrátě nebo rozptýlení radioaktivních obsahů, pokud kus byl podroben zkouškám uvedeným v oddílu 6.4.16. Kus typu A konstruovaný pro plyn tritium nebo pro vzácné plyny musí být vyňat z tohoto požadavku.

6.4.8 Požadavky na kusy typu B(U)

- 6.4.8.1 Kusy typu B(U) musí být konstruovány tak, aby splnily požadavky uvedené v oddílu 6.4.2 a v 6.4.7.2 až 6.4.7.15, kromě uvedených v 6.4.7.14 (a), a kromě toho požadavky uvedené v 6.4.8.2 až 6.4.8.15.

- 6.4.8.2 Kus musí být konstruován tak, aby při okolních podmínkách uvedených v 6.4.8.5 a 6.4.8.6 teplo vyvíjené uvnitř kusu jeho radioaktivním obsahem za normálních podmínek přepravy, jak jsou představovány zkouškami uvedenými v oddílu 6.4.15, nepříznivě neovlivnilo kus takovým způsobem, že by mohlo být negativně ovlivněno plnění relevantních požadavků na kontejment a stínění, jestliže byl ponechán bez dozoru po dobu jednoho týdne. Zvláštní pozornost musí být věnována účinkům tepla, které mohou způsobit jedno nebo více z následujících:

- (a) změnit uspořádání, geometrický tvar nebo fyzikální stav radioaktivního obsahu nebo, pokud radioaktivní látka je uzavřena v plechovce nebo nádobě (např. zapouzdřené palivové články), způsobit, že se plechovka, nádoba nebo látka zdeformují nebo roztaví;
- (b) zmenšit účinnost obalu vlivem různé tepelné roztažnosti nebo prasknutí nebo roztavení materiálu radiačního stínění;
- (c) v kombinaci s vlhkostí zrychlit korozi.

- 6.4.8.3 Kus musí být konstruován tak, že při okolních podmínkách uvedených v 6.4.8.5 a bez vlivu slunečního záření, teplota přístupných povrchů kusu nesmí překročit 50 °C, ledaže je kus přepravován za výlučného použití.

- 6.4.8.4 Nejvyšší teplota jakéhokoli snadno přístupného povrchu kusu během přepravy za výlučného použití nesmí překročit 85 °C bez izolace za okolních podmínek uvedených v 6.4.8.5. Přitom je možno přihlídnout k přepážkám nebo dělicím stěnám umístěným k ochraně osob, aniž by bylo nutné podrobit tyto přepážky nebo dělicí stěny zkoušce.

- 6.4.8.5 Musí být uvažována okolní teplota 38 °C.

- 6.4.8.6 Musí se předpokládat, že podmínky slunečního ozáření jsou takové, jaké jsou uvedeny v tabulce 6.4.8.6.

Tabulka 6.4.8.6: Údaje o ozáření

Stav	Tvar a umístění povrchu	Ozáření sluncem po 12 hodin za den (W/m ²)
1	Ploché povrchy přepravované vodorovně – obrácené dolů	0
2	Ploché povrchy přepravované vodorovně – obrácené vzhůru	800
3	Povrchy přepravované svisle	200 ^a
4	Ostatní povrchy obrácené dolů (nepřepravované vodorovně)	200 ^a
5	Všechny ostatní povrchy	400 ^a

^a Alternativně může být použita sinusová funkce s přijatým absorpčním koeficientem a účinky možného odrazu od sousedních předmětů.

6.4.8.7 Kus, který je vybaven tepelnou ochranou za účelem splnění požadavků uvedených v 6.4.17.3, musí být tak konstruován, že taková ochrana zůstane účinnou, jestliže kus je podroben zkouškám uvedeným v oddílu 6.4.15 a v 6.4.17.2 (a) a (b) nebo 6.4.17.2 (b) a (c), jak je to vhodné. Jakákoli taková ochrana vnějšku kusu nesmí mít sníženou účinnost porušením povrchu protřením, proříznutím, smyknutím, otěrem nebo hrubou manipulací.

6.4.8.8 Kus musí být tak konstruován, že, pokud byl podroben:

- (a) zkouškám uvedeným v oddílu 6.4.15, omezil by ztrátu radioaktivních obsahů tak, aby nepřevýšila $10^{-6} A_2$ za hodinu; a
- (b) zkouškám uvedeným v 6.4.17.1, 6.4.17.2 (b), 6.4.17.3 6.4.17.4 a jedné ze zkoušek uvedených v:
 - (i) 6.4.17.2 (c), když kus má hmotnost nejvýše 500 kg a celkovou hustotu vypočtenou z vnějších rozměrů nejvýše 1000 kg/m^3 a radioaktivní obsah větší než $1000 A_2$, ne však jako radioaktivní látka zvláštní formy; nebo
 - (ii) 6.4.17.2 (a) pro všechny jiné kusy

splnil by následující požadavky:

- zachovat si dostatečné stínění zajišťující, že dávková intenzita ve vzdálenosti 1 m od povrchu kusu nepřekročí 10 mSv/h při maximálním radioaktivním obsahu, pro který byl kus konstruován; a
- omezit celkovou ztrátu radioaktivního obsahu po dobu jednoho týdne nejvýše na $10 A_2$ pro krypton-85 a nejvýše na A_2 pro všechny ostatní radionuklidy.

Jedná-li se o směsi různých radionuklidů, vztahují se na ně ustanovení uvedená v 2.2.7.7.2.2.4 až 2.2.7.7.2.2.6 kromě toho, že pro krypton-85 může být použita efektivní hodnota A_2 (i) rovná $10 A_2$. V případě uvedeném v odstavci (a) výše hodnocení musí brát v úvahu meze vnější kontaminace uvedené v 4.1.9.1.2.

6.4.8.9 Kus pro radioaktivní obsah s aktivitou větší než $10^5 A_2$ musí být tak konstruován, aby, pokud byl podroben rozšířené zkoušce ponořením do vody uvedené v oddílu 6.4.18, nedošlo k porušení kontejmentového systému.

6.4.8.10 Splnění dovolených limitů uvolňování aktivity nesmí být závislé ani na filtrech, ani na strojním chladicím systému.

6.4.8.11 Kus nesmí být vybaven systémem pro vyrovnávání tlaku, který by dovolil únik radioaktivní látky do okolního prostředí za podmínek zkoušek uvedených v oddílech 6.4.15 a 6.4.17.

- 6.4.8.12 Kus musí být konstruován tak, aby při nejvyšším normálním provozním tlaku a při podrobení se zkouškám uvedeným v oddílech 6.4.15 a 6.4.17 úroveň napětí v kontejmentovém systému nepřekročila hodnoty, které by nepříznivě ovlivnily kus takovým způsobem, že by neplnil příslušné požadavky.
- 6.4.8.13 Kus nesmí mít nejvyšší normální provozní tlak převyšující přetlak 700 kPa.
- 6.4.8.14 Kusy obsahující radioaktivní látku s nízkou rozptýlitelností musí být zkonstruovány tak, aby jakákoliv vlastnost přidaná k radioaktivní látce s nízkou rozptýlitelností, která není její součástí, nebo jakékoliv vnitřní součásti obalu nemohly nepříznivě ovlivnit technické parametry radioaktivní látky s nízkou rozptýlitelností.
- 6.4.8.15 Kus musí být konstruován pro teplotu okolního prostředí v rozsahu $-40\text{ }^{\circ}\text{C}$ až $+38\text{ }^{\circ}\text{C}$.

6.4.9 Požadavky na kusy typu B(M)

- 6.4.9.1 Kusy typu B(M) musí splňovat požadavky na kusy typu B(M) uvedené v 6.4.8.1, kromě těch požadavků na kusy, které jsou přepravovány výhradně uvnitř dané země nebo výhradně mezi určitými zeměmi. Jiné podmínky, než které jsou uvedeny výše v 6.4.7.5, 6.4.8.4 až 6.4.8.6 a 6.4.8.9. až 6.4.8.15 mohou být použity se schválením příslušných orgánů těchto zemí. Nicméně požadavky na kusy typu B(M) uvedené v 6.4.8.4 a 6.4.8.8 až 6.4.8.15 musí být splněny, jak je to jen prakticky možné.
- 6.4.9.2 Periodická ventilace kusů typu B(M) během přepravy může být dovolena za podmínky, že provozní kontroly ventilace jsou přijatelné pro všechny zainteresované příslušné orgány.

6.4.10 Požadavky na kusy typu C

- 6.4.10.1 Kusy typu C musí být konstruovány tak, aby splnily požadavky uvedené v 6.4.2 a v 6.4.7.2 až 6.4.7.15, kromě uvedených v 6.4.7.14 (a), a požadavky uvedené v 6.4.8.2 až 6.4.8.6, 6.4.8.10 až 6.4.8.15 a navíc v 6.4.10.2 až 6.4.10.4.
- 6.4.10.2 Kus musí být schopen splnit hodnotící kritéria, předepsaná pro zkoušky v 6.4.8.8(b) a 6.4.8.12 po tepelné zkoušce v prostředí, definovaném tepelnou vodivostí $0,33\text{ W}\cdot\text{m}^{-1}\cdot\text{K}^{-1}$ a teplotou $38\text{ }^{\circ}\text{C}$ v ustáleném stavu. Výchozí podmínky hodnocení musí vzít v úvahu, že jakákoli tepelná izolace kusu zůstává nedotčena, kus je používán při nejvyšším normálním provozním tlaku a okolní teplota je $38\text{ }^{\circ}\text{C}$.
- 6.4.10.3 Kus musí být konstruován tak, že pokud by při maximálním normálním provozním tlaku byl vystaven:
- (a) zkouškám specifikovaným v 6.4.15 omezil by ztrátu radioaktivního obsahu tak, že by nepřekročila 10^{-6} A_2 za hodinu ; a
 - (b) posloupnosti zkoušek v 6.4.20.1,
 - (i) zachoval by si dostatečné stínění zajišťující, že příkon dávkového ekvivalentu ve vzdálenosti 1 m od povrchu kusu nepřekročí 10 mSv/h při maximálním radioaktivním obsahu, pro který je kus konstruován; a
 - (ii) omezil by celkovou ztrátu radioaktivního obsahu za období 1 týden tak, aby nepřekročila 10 A_2 pro krypton-85 a A_2 pro všechny ostatní radionuklidy.

Jedná-li se o směsi různých radionuklidů, vztahují se na ně ustanovení uvedená v 2.2.7.7.2.2.4 až 2.2.7.7.2.2.6 kromě toho, že pro krypton-85 může být použita efektivní hodnota A_2 (i) rovná 10 A_2 . V případě uvedeném v odstavci (a) výše hodnocení musí brát v úvahu meze vnější kontaminace uvedené v 4.1.9.1.2.

- 6.4.10.4 Kus musí být tak konstruován tak, aby nedošlo k porušení kontejmentového systému, pokud byl podroben rozšířené zkoušce ponořením do vody popsané v 6.4.18.

6.4.11 Požadavky na kusy obsahující štěpné látky

6.4.11.1 Štěpné látky musí být přepravovány tak, aby:

- (a) byl udržen podkritický stav za běžných normálních a nehodových podmínek přepravy; zejména musí být uvažováno s následujícími nahodilostmi:
 - (i) vniknutí vody do kusu nebo únik vody z kusu;
 - (ii) ztráta účinnosti vložených neutronových absorbátorů nebo moderátorů;
 - (iii) změna geometrického uspořádání obsahu buď uvnitř kusu, nebo jako důsledek úniku z kusu;
 - (iv) zmenšení prostoru uvnitř nebo mezi kusy;
 - (v) ponoření kusů do vody nebo zasypání sněhem; a
 - (vi) změny teploty; a
- (b) byly splněny požadavky uvedené:
 - (i) v 6.4.7.2 s výjimkou nebaleného materiálu, pokud je to výslovně dovoleno 2.2.7.2.3.5 (e);
 - (ii) předepsané kdekoli v ADR, které se týkají radioaktivních vlastností štěpných látek;
 - (iii) v 6.4.7.3, ledaže by látky byly vyjmuty 2.2.7.2.3.5;
 - (iv) v 6.4.11.4 až 6.4.11.14, ledaže by látky byly vyjmuty 2.2.7.2.3.5, 6.4.11.2 nebo 6.4.11.3.

6.4.11.2 Kusy obsahující štěpné látky, které splňují požadavky pododstavce (d) a jeden z požadavků (a) až (c) níže jsou vyjmuty z požadavků ustanovení 6.4.11.4 až 6.4.11.14.

- (a) Kusy obsahující štěpné látky v libovolné formě za předpokladu, že:
 - (i) Nejmenší celkový vnější rozměr kusu není menší než 10 cm;
 - (ii) Index bezpečné podkritičnosti (CSI) se vypočte podle následujícího vzorce:

$$CSI = 50 \times 5 \times \left(\frac{\text{Hmotnost uranu-235 v kusu (g)}}{Z} + \frac{\text{Hmotnost ostatních štěpných nuklidů* v kusu (g)}}{280} \right)$$

* Plutonium může být libovolného izotopového složení za předpokladu, že v kusu je množství Pu-241 menší než množství Pu-240.

kde hodnoty Z jsou vzaty z tabulky 6.4.11.2;

- (iii) index bezpečné podkritičnosti každého kusu nepřekročí hodnotu 10;
- (b) Kusy obsahující štěpné látky v libovolné formě za předpokladu, že:
 - (i) Nejmenší celkový vnější rozměr kusu není menší než 30 cm;
 - (ii) Kus po vystavení zkouškám specifikovaným v (ustanoveních) 6.4.15.1 až 6.4.15.6:
 - si zachová svůj obsah štěpných látek;
 - si zachová nejmenší celkový vnější rozměr nejméně 30 cm;
 - zabrání vložení krychle o hraně 10 cm;

(iii) Index bezpečné podkritičnosti (CSI) se vypočte podle následujícího vzorce:

$$CSI = 50 \times 2 \times \left(\frac{\text{Hmotnost uranu-235 v kusu (g)}}{Z} + \frac{\text{Hmotnost ostatních štěpných nuklidů * v kusu (g)}}{280} \right)$$

* Plutonium může být libovolného izotopového složení za předpokladu, že v kusu je množství Pu-241 menší než množství Pu-240.

kde hodnoty Z jsou vzaty z tabulky 6.4.11.2;

(iv) Index bezpečné podkritičnosti každého kusu nepřekročí hodnotu 10;

(c) Kusy obsahující štěpné látky v libovolné formě za předpokladu, že:

(i) Nejmenší celkový vnější rozměr kusu není menší než 10 cm;

(ii) Kus po vystavení zkouškám specifikovaným v (ustanoveních) 6.4.15.1 to 6.4.15.6:

- si zachová svůj obsah štěpných látek;
- si zachová nejmenší celkový vnější rozměr nejméně 10 cm;
- zabrání vložení krychle o hraně 10 cm;

(iii) Index bezpečné podkritičnosti (CSI) se vypočte podle následujícího vzorce:

$$CSI = 50 \times 2 \times \left(\frac{\text{Hmotnost uranu-235 v kusu (g)}}{450} + \frac{\text{Hmotnost ostatních štěpných nuklidů * v kusu (g)}}{280} \right)$$

* Plutonium může být libovolného izotopového složení za předpokladu, že v kusu je množství Pu-241 menší než množství Pu-240.

(iv) Maximální hmotnost štěpných nuklidů v každém kusu nepřekročí 15 g;

(d) Celková hmotnost beryllia, látek obsahujících vodík obohacený deuteriem a grafitu a ostatních alotropických forem uhlíku nesmí být větší než hmotnost štěpných nuklidů v jednotlivém kusu s výjimkou případu, kdy jejich celkový podíl nepřekročí 1 g v libovolných 1000 g látky. K beryliu jako součásti měděných slitin do obsahu 4% váhových slitiny se nemusí přihlížet.

Tabulka 6.4.11.2 Hodnoty Z pro výpočet indexu bezpečné podkritičnosti (CSI) podle (ustanovení) 6.4.11.2

Obohacení ^a	Z
Uran obohacený do 1,5%	2200
Uran obohacený do 5%	850
Uran obohacený do 10%	660
Uran obohacený do 20%	580
Uran obohacený do 100%	450

^a Je-li obsahem kusu uranu s různým obohacením izotopem uranu-235, použije se pro Z hodnota odpovídající nejvyššímu obohacení uranu v kusu.

6.4.11.3

Kusy neobsahující více než 1000 g plutonia jsou vyjmuty z požadavků 6.4.11.4 až 6.4.11.14 za předpokladu, že:

(a) Štěpné nuklidy netvoří více než 20% hmotnosti plutonia;

- (b) Index bezpečné podkritičnosti (CSI) se vypočte podle následujícího vzorce:

$$CSI = 50 \times 2 \frac{\text{hmotnost plutonia (g)}}{1000}$$

- (c) Je-li v radioaktivní zásilce obsažen kromě plutonia i uran, nesmí jeho množství překročit 1 % hmotnosti plutonia.

- 6.4.11.4 Kde chemická nebo fyzikální forma, izotopové složení, hmotnost nebo koncentrace, moderační poměr či hustota nebo geometrické uspořádání nejsou známy, hodnocení uvedená v 6.4.11.8 až 6.4.11.13 musí být provedena stejným způsobem jako se známými podmínkami a parametry těchto hodnocení s předpokladem, že každý parametr, který není znám, má hodnotu, která vede k maximální multiplikaci neutronů.
- 6.4.11.5 Pro ozářené jaderné palivo hodnocení uvedené v 6.4.11.8 až 6.4.11.13 musí být založeno na izotopovém složení, které průkazně poskytnou buď:
- (a) hodnoty maximální multiplikace neutronů během doby ozáření; nebo
 - (b) konzervativní odhad multiplikace neutronů pro hodnocení kusu. Po ozáření, ale před odesláním, musí být provedena měření pro potvrzení konzervativnosti odhadu izotopového složení.
- 6.4.11.6 Kus po provedených zkouškách specifikovaných v 6.4.15, musí:
- (a) zachovat minimální vnější celkový rozměr obalu nejméně 10 cm; a
 - (b) zabránit průniku krychle o hraně 10 cm
- 6.4.11.7 Kus musí být konstruován pro okolní teplotu v rozsahu -40 °C až +38 °C, pokud příslušný orgán nestanoví jinak v rozhodnutí o typovém schválení.
- 6.4.11.8 Pro samostatný kus musí být vzato v úvahu, že voda může proniknout dovnitř nebo ven ze všech prázdných prostorů kusu včetně těch uvnitř kontejmentového systému. Avšak jestliže konstrukce zahrnuje zvláštní prostředky, zabraňující takovému vnikání vody dovnitř nebo její unikání ven z určitých prázdných prostorů, dokonce i v případě chyby obsluhy, nemusí se pro tyto prázdné prostory takové vnikání nebo únik uvažovat. Zvláštní prostředky musí splňovat jeden z následujících požadavků:
- (a) Vícenásobné vysoce účinné zábrany proti vodě, nejméně dvě z nich zůstávají vodotěsné, pokud kus byl podroben zkouškám předepsaným v 6.4.11.12 (b), vysoký stupeň kontroly jakosti ve výrobě, údržbě a opravách obalů a zkoušky prokazující uzavření každého kusu před jeho odesláním; nebo
 - (b) Pro kusy obsahující pouze hexafluorid uranu s maximálním obohacením na 5% hmotnostních uranu-235
 - (i) kusy, kde po zkouškách předepsaných v 6.4.11.13 (b) není žádný fyzický styk mezi ventilem a jakoukoli částí obalu jinou než jeho původní bod připojení a kde kromě toho po provedení zkoušky předepsané v 6.4.17.3 ventily zůstávají nepropustné; a
 - (ii) vysoký stupeň kontroly jakosti ve výrobě, údržbě a opravách obalů spojený se zkouškami prokazujícími uzavření každého kusu před každým odesláním.
- 6.4.11.9 Musí být vzato v úvahu a zhodnoceno, že dochází k odrazu způsobenému nejméně 20 cm vrstvou vody nebo většímu, jež může být dodatečně způsoben obklopujícím materiálem obalu. Avšak pokud může být prokázáno, že omezující systém zůstává uvnitř obalu po zkouškách předepsaných v 6.4.11.13 (b), může být v 6.4.11.10 (c) uvažován odraz blízkou vrstvou vody nejméně 20 cm silnou.

- 6.4.11.10 Kus musí být podkritický za předpokladů uvedených v 6.4.11.7 a 6.4.11.8, které vyústí v maximální multiplikaci neutronů při podmínkách odpovídajících:
- (a) běžným podmínkám přepravy (bez nehod);
 - (b) zkouškám uvedeným v 6.4.11.12 (b);
 - (c) zkouškám uvedeným v 6.4.11.13 (b).
- 6.4.11.11 (Vyhrazeno)
- 6.4.11.12 Pro normální podmínky přepravy musí být odvozen počet „N“ tak, že soubor pětikrát „N“ kusů zůstane v podkritickém stavu pro podmínky způsobující maximální multiplikaci neutronů shodně s následujícími:
- (a) nic nesmí být mezi kusy a soubor kusů musí být vystaven odrazu ze všech stran nejméně 20 cm vrstvou vody; a
 - (b) stav kusů musí být odpovídat výpočtem stanovené nebo skutečné podmínce, že byly podrobeny zkouškám uvedeným v oddílu 6.4.15.
- 6.4.11.13 Pro nehodové podmínky musí být odvozen počet „N“ tak, že soubor dvakrát „N“ kusů zůstane v podkritickém stavu pro podmínky způsobující maximální multiplikaci neutronů shodně s následujícími:
- (a) vodíková moderace mezi kusy a soubor kusů je vystaven na všech stranách odrazu nejméně 20 cm vrstvy vody; a
 - (b) zkoušky uvedené v oddílu 6.4.15 následované jakýmkoli z dále uvedených, které jsou více omezující:
 - (i) zkoušky uvedené v 6.4.17.2 (b) a uvedené buď v 6.4.17.2 (c) pro kusy s hmotností nejvýše 500 kg a celkovou hustotou nejvýše 1000 kg/m³ stanovené z vnějších rozměrů, nebo uvedené v 6.4.17.2 (a) pro všechny jiné kusy; následované zkouškou uvedenou v 6.4.17.3 a zakončenou zkouškami uvedenými v 6.4.19.1 až 6.4.19.3; nebo
 - (ii) zkoušky uvedené v 6.4.17.4; a
 - (c) kde jakákoli část štěpné látky uniká z kontejmentového systému po zkoušce uvedené v 6.4.11.13 (b), musí se předpokládat, že štěpná látka uniká z každého kusu v souboru a že všechny štěpné látky budou v takovém uspořádání a za takové moderace, které mají za následek maximální multiplikaci neutronů při odrazu blízkou vrstvou vody nejméně 20 cm silnou.
- 6.4.11.14 Index bezpečné podkritičnosti (CSI) pro radioaktivní zásilky obsahující štěpné materiály se získá dělením čísla 50 menší ze dvou hodnot „N“, získaných postupem uvedeným v 6.4.11.12 a 6.4.11.13 (tj. $CSI = 50/N$). Hodnota přepravního indexu z hlediska zachování podkritického stavu může být nula za předpokladu, že neomezený počet radioaktivních zásilek je podkritický (tj., že „N“ se prakticky rovná nekonečnu v obou případech).
- 6.4.12 Zkušební postupy a důkaz shodnosti**
- 6.4.12.1 Důkaz shodnosti provedení s normami požadovanými v 2.2.7.2.3.1.3, 2.2.7.2.3.1.4, 2.2.7.2.3.3.1, 2.2.7.2.3.3.2, 2.2.7.2.3.4.1, 2.2.7.2.3.4.2 a 6.4.2 až 6.4.11 musí být proveden jakoukoli metodou níže uvedenou nebo jejich kombinací:
- (a) Provedení zkoušek se vzorky představující látku LSA-III nebo radioaktivní látku zvláštní formy nebo radioaktivní látky s nízkou rozpítlivostí nebo s prototypy nebo vzorky obalu, kde obsah vzorku nebo obalu pro zkoušky musí simulovat co nejpřesněji, jak je to jen prakticky možné, očekávaný rozsah radioaktivních obsahů a vzorky nebo obaly, které mají být zkoušeny, musí být připraveny tak, jak budou předány k přepravě;
 - (b) Odkaz na předchozí uspokojivé důkazy dostatečně podobné povahy;

- (c) Provedení zkoušek s modely vhodného měřítka s vlastnostmi, které jsou významné z hlediska tohoto zkoumání, pokud inženýrská praxe prokázala, že výsledky takových zkoušek jsou přijatelné pro konstrukční účely. Pokud je použit model v měřítku, musí být vzata v úvahu potřeba úpravy určitých zkušebních parametrů, jako je průměr průrazové tyčky nebo tlakové zatížení.
- (d) Výpočet nebo zdůvodněný důkaz, pokud výpočetní metody a parametry jsou všeobecně považovány za spolehlivé nebo konzervativní.

6.4.12.2 Po provedení zkoušek vzorku nebo prototypu musí být použity vhodné metody hodnocení pro potvrzení toho, že požadavky na zkušební postupy byly splněny v souladu s normami na provedení a přijatelnost předepsanými v 2.2.7.2.3.1.3, 2.2.7.2.3.1.4, 2.2.7.2.3.3.1, 2.2.7.2.3.3.2, 2.2.7.2.3.4.1, 2.2.7.2.3.4.2 a 6.4.2 až 6.4.11.

6.4.12.3 Všechny vzorky musí být zkontrolovány před zkoušením, aby byly zjištěny a zaznamenány vady a poškození včetně těchto:

- (a) odchylky od konstrukčního vzoru;
- (b) výrobní vady;
- (c) koroze nebo jiné zhoršení; a
- (d) deformace.

Kontejmentový systém musí být zřetelně specifikován. Vnější charakteristiky vzorku musí být zřetelně identifikovány tak, aby bylo možno jednoduše a zřetelně provést odkaz na jakékoli části vzorku.

6.4.13 Zkoušení celistvosti kontejmentového systému a stínění a zhodnocení podkritičnosti

Po každé z relevantních zkoušek uvedených v oddílech 6.4.15 až 6.4.21:

- (a) musí být zjištěny a zaznamenány vady a poškození;
- (b) musí být stanoveno, zda celistvost kontejmentového systému a stínění zůstaly zachovány v rozsahu požadovaném v oddílech 6.4.2 až 6.4.11 pro zkoušený kus; a
- (c) pro kusy obsahující štěpnou látku musí být zjištěno, zda jsou splněny předpoklady a podmínky použité v hodnoceních požadovaných v 6.4.11.1 až 6.4.11.14 pro jeden nebo více kusů.

6.4.14 Terč pro zkoušky pádem

Terč pro zkoušky pádem specifikovaný v 2.2.7.2.3.3.5 (a), 6.4.15.4, 6.4.16 (a), 6.4.17.2 a 6.4.20.2 musí mít plochý vodorovný povrch takového charakteru, aby jakékoli zvýšení jeho odolnosti proti změně polohy nebo deformaci úderem vzorku nezvýšilo významně poškození vzorku.

6.4.15 Zkoušky pro prokázání schopnosti odolat normálním podmínkám přepravy

6.4.15.1 Zkoušky jsou: zkouška postřikem vodou, zkouška volným pádem, zkouška tlakovým zatížením a zkouška průrazem. Vzorky kusu musí být podrobeny zkoušce volným pádem, zkoušce tlakovým zatížením a zkoušce průrazem, kterým v každém případě předchází zkouška postřikem vodou. Jeden vzorek může být použit pro všechny zkoušky, pokud požadavky uvedené v 6.4.15.2 jsou splněny.

6.4.15.2 Časový interval mezi ukončením zkoušky postřikem vodou a následující zkouškou musí být takový, aby voda prosákla v maximální míře bez patrného sušení vnějšku vzorku. Nejeví-li se zřejmý opak, tento interval musí trvat dvě hodiny, pokud postřik vodou je směřován současně ze čtyř směrů. Avšak žádný časový interval nesmí uplynout, jestliže postřik vodou je směřován z každého ze čtyř směrů následně.

6.4.15.3 Zkouška postřikem vodou: Vzorek musí být podroben zkoušce postřikem vodou, která simuluje jeho vystavení dešti o srážkové intenzitě přibližně odpovídající hodnotě 5 cm za hodinu po dobu nejméně jedné hodiny.

6.4.15.4 Zkouška volným pádem: Vzorek musí padat na plochu terče tak, aby došlo k jeho maximálnímu poškození z hlediska jeho zkoušených bezpečnostních vlastností.

- (a) Výška pádu měřená od nejnižšího bodu vzorku k hornímu povrchu terče nesmí být menší než vzdálenost uvedená v tabulce 6.4.15.4 pro příslušnou hmotnost. Terč musí být takový, jaký je uveden v oddílu 6.4.14;
- (b) Pro pravoúhlé lepenkové nebo dřevěné kusy s hmotností nejvýše 50 kg jednotlivý vzorek musí být podroben volnému pádu na každý roh z výšky 0,3 m;
- (c) Pro lepenkové kusy válcovitého tvaru s hmotností nepřevyšující 100 kg jednotlivý vzorek musí být podroben volnému pádu na každou čtvrtinu každé hrany z výšky 0,3 m.

Tabulka 6.4.15.4: Výška volného pádu při zkoušení kusů pro normální podmínky přepravy

Hmotnost kusu (kg)		Výška volného pádu (m)
Hmotnost kusu < 5000		1.2
5000 ≤	Hmotnost kusu < 10000	0.9
10000 ≤	Hmotnost kusu < 15000	0.6
15000 ≤	Hmotnost kusu	0.3

6.4.15.5 Zkouška tlakovým zatížením: Pokud tvar obalu nezabraňuje účinně stohování, vzorek musí být podroben po dobu 24 hodin tlakovému zatížení rovnající se většímu z následujících:

- (a) ekvivalentu pětinasobku maximální hmotnosti kusu; a
- (b) ekvivalent 13 kPa násobený půdorysnou plochou kusu.

Zatížení musí být rovnoměrně vystaveny dvě protilehlé strany vzorku, z nichž jedna musí být základna, na které kus zůstává normálně uložen.

6.4.15.6 Zkouška průrazem: Vzorek musí být uložen na tvrdý, plochý, vodorovný povrch, který se nebude znatelně pohybovat po dobu provádění zkoušky.

- (a) Tyčka o průměru 3,2 cm s půlkulovým koncem a hmotností 6 kg musí být spuštěna a přímo dopadnout svou podélnou osou svisle na střed nejslabší části vzorku tak, že, pokud pronikne dostatečně daleko, narazí na kontejmentový systém. Tyčka se nesmí znatelně deformovat při provádění zkoušky;
- (b) Výška pádu tyčky měřená od jejího nejnižšího konce k předpokládanému bodu nárazu na horní povrch vzorku musí být 1m.

6.4.16 Dodatečné zkoušky kusů typu A konstruované pro kapaliny a plyny

Jeden vzorek nebo další vzorky musí být podrobeny každé z následujících zkoušek, pokud nemůže být prokázáno, že jedna zkouška je pro dotyčný vzorek náročnější, než druhá, ve kterémžto případě jeden vzorek musí být podroben té náročnější zkoušce.

- (a) Zkouška volným pádem: Vzorek musí být spuštěn na plochu terče tak, aby došlo k jeho maximálnímu poškození z hlediska kontejmentového systému. Výška pádu měřená od nejnižší části vzorku k hornímu povrchu plochy terče musí být 9 m. Terč musí být takový, jak je definován v oddílu 6.4.14;
- (b) Zkouška průrazem: Vzorek musí být podroben zkoušce uvedené v 6.4.15.6, s tím, že výška pádu musí být zvýšena na 1,7 m z 1 m uvedené v 6.4.15.6 (b).7

6.4.17 Zkoušky pro prokázání schopnosti odolat nehodovým podmínkám při přepravě

6.4.17.1 Jeden vzorek musí být podroben společným účinkům zkoušek uvedeným v 6.4.17.2 a 6.4.17.3 v tomto pořadí. Po provedení těchto zkoušek musí být buď tento vzorek nebo další vzorek podroben účinku(ům) zkoušky(ek) ponoření do vody, jak je uvedeno v 6.4.17.4 a pokud je to vhodné, v 6.4.18.

6.4.17.2 Mechanická zkouška: Mechanickou zkoušku tvoří tři různé zkoušky pádem. Každý vzorek musí být podroben vhodným pádům uvedeným v 6.4.8.8 nebo 6.4.11.13. Pořadí, ve kterém je vzorek podrobován pádům, musí být takové, že po dokončení mechanické zkoušky vzorek musí utrpět poškození vedoucí k maximálnímu poškození při tepelné zkoušce, která následuje.

- (a) Pro pád I, vzorek musí padat na plochu terče tak, aby utrpěl maximální poškození a výška pádu měřená od nejnižšího bodu vzorku k hornímu povrchu plochy terče musí být 9 m. Terč musí být takový, jak je definován v oddílu 6.4.14;
- (b) Pro pád II, vzorek musí být spuštěn tak, aby utrpěl maximální poškození tyčí pevně připevněnou kolmo na plochu terče. Výška pádu měřená od předpokládaného bodu nárazu vzorku na horní povrch tyčky musí být 1 m. Tyč musí být z pevné měkké oceli kruhového průřezu, průměru $15,0 \pm 0,5$ cm a délky 20 cm, ledaže by delší tyč způsobila větší poškození. V tomto případě může být použita tyč dostatečné délky způsobující maximální poškození. Horní konec tyče musí být plochý a vodorovný s hranou zaoblenou o poloměru nejvýše 6 mm. Terč, ke kterému je tyč připevněna, musí být takový, jak je popsán v oddílu 6.4.14;
- (c) Pro pád III, musí být vzorek podroben dynamické zkoušce drcením umístěním vzorku na plochu terče tak, aby utrpěl maximální poškození pádem hmotnosti 500 kg na vzorek z výšky 9 m. Padající sondu musí tvořit pevná deska z měkké oceli 1 m x 1 m a musí dopadnout ve vodorovné poloze. Spodní plocha ocelové desky musí mít hrany a rohy zaoblené s poloměrem zaoblení nepřesahujícím 6 mm. Výška pádu musí být měřena od spodní strany desky k nejvyššímu bodu vzorku. Terč, na kterém vzorek zůstává, musí být takový, jak je definován v oddílu 6.4.14.

6.4.17.3 Tepelná zkouška: Vzorek musí být v tepelné rovnováze v podmínkách okolní teploty 38 °C odpovídající podmínkám slunečního ozáření uvedeným v tabulce 6.4.8.6 a maximálnímu projektovanému vývinu vnitřního tepla uvnitř kusu z radioaktivních obsahů. Alternativně je dovoleno, aby jakýkoli z těchto parametrů měl různé hodnoty před a během zkoušky, pokud na ně je vzat zřetel v následných hodnoceních odezvy kusu.

Tepelnou zkoušku musí tvořit:

- (a) Vystavení vzorku pod dobu 30 minut tepelnému prostředí, které zajišťuje tepelný tok nejméně rovnocenný tepelnému toku hořícího uhlovodíkového paliva se vzduchem v dostatečně stabilních okolních podmínkách dosahujícího průměrný koeficient emise 0,9 a průměrnou teplotu nejméně 800 °C, plně obklopující vzorek s povrchem majícím absorpční koeficient 0,8 nebo hodnotu, kterou kus prokazatelně může mít, jestliže je vystaven uvedenému ohni, následovanému,
- (b) Vystavení vzorku okolní teplotě 38 °C odpovídající podmínkám slunečního ozáření uvedeným v tabulce 6.4.8.6 a maximálnímu projektovanému vývinu vnitřního tepla uvnitř kusu z radioaktivních obsahů po dostatečnou dobu pro zajištění, že teploty ve vzorku jsou všude klesající a/nebo blíží se podmínkám prvotního stálého stavu. Alternativně je dovoleno, aby jakýkoli z těchto parametrů měl různé hodnoty po přerušení zahřívání, pokud na ně je vzat zřetel v následných hodnoceních odezvy kusu.

V průběhu zkoušky a po zkoušce vzorek nesmí být uměle ochlazován a jakékoli hoření materiálů vzorku musí být ponecháno přirozenému průběhu.

6.4.17.4 Zkouška ponořením do vody: Vzorek musí být ponořen pod hladinu vody nejméně 15 m po dobu nejméně osm hodin v poloze, která povede k maximálnímu poškození. Pro účely důkazu musí se za splnění těchto podmínek považovat vnější tlak 150 kPa.

6.4.18 Rozšířená zkouška ponořením do vody pro kusy typu B(U) a typu B(M) obsahující výše než 10^5 A₂ a typu C

Rozšířená zkouška ponořením do vody: Vzorek musí být ponořen pod hladinu vody nejméně 200 m po dobu nejméně jedné hodiny. Pro účely důkazu musí se za splnění těchto podmínek považovat vnější přetlak 2 MPa.

6.4.19 Zkouška úniku vody pro kus obsahující štěpnou látku

6.4.19.1 Kusy, pro které bylo oceněno pro účely hodnocení podle 6.4.11.8 až 6.4.11.13 vniknutí nebo úniku vody v rozsahu, který má za následek nejvyšší reaktivitu, jsou vyjmuty z této zkoušky.

6.4.19.2 Vzorek, před podrobením se zkoušce vniknutí anebo úniku vody uvedené níže, musí být podroben zkouškám uvedeným v 6.4.17.2 (b) a buď 6.4.17.2 (a) nebo (c), jak je požadováno v 6.4.11.13, a zkoušce uvedené v 6.4.17.3.

6.4.19.3 Vzorek musí být ponořen pod hladinu vody nejméně 0,9 m po dobu nejméně 8 hodin v poloze, ve které se předpokládá největší vniknutí anebo únik.

6.4.20 Zkoušky pro kusy typu C

6.4.20.1 Vzorky musí být v uvedeném pořadí podrobeny účinkům každé z následujících zkoušek:

(a) Zkoušky popsané v 6.4.17.2(a), 6.4.17.2(c), 6.4.20.2 a 6.4.20.3; a

(b) Zkouška popsaná v 6.4.20.4.

Pro posloupnost zkoušek dle (a) a (b) je povoleno používat zvláštní vzorky.

6.4.20.2 Zkouška průrazem/roztržením: Vzorek musí být podroben ničivému účinku svislé pevné sondy ze střední oceli. Orientace vzorku kusu a místa dopadu na povrchu kusu musí být takové, aby na konci pořadí zkoušek popsaných v 6.4.20.1(a) způsobily maximální poškození vzorku.

(a) Vzorek reprezentující kus o hmotnosti menší než 250 kg, musí být umístěn na terč a vystaven pádu sondy o hmotnosti 250 kg, padající z výše 3 m nad zamýšleným bodem dopadu. Sonda pro tuto zkoušku musí být válcová tyč o průměru 20 cm s koncem (který bude narážet na vzorek) ve tvaru komolého kužele s následujícími rozměry: 30 cm výška a 2,5 cm průměr koncové části, na konci s hranou zaoblenou na poloměr ne větší než 6 mm. Terč, ke kterému je vzorek připevněn musí odpovídat popisu v 6.4.14.

(b) Pro kusy o hmotnosti větší než 250 kg musí být upevněna na terč sonda a vzorek padá na sondu. Výška pádu, měřená od bodu dopadu k vnějšímu povrchu sondy musí činit 3 m. Pro tuto zkoušku musí mít sonda stejný tvar a rozměry jako je popsáno v (a) výše, s výjimkou toho, když by větší délka a hmotnost sondy mohla přivodit větší poškození vzorku. Terč, ke kterému je tyč připevněna musí odpovídat popisu v 6.4.14.

6.4.20.3 Rozšířená tepelná zkouška: Podmínky pro tuto zkoušku musí být stejné jako podmínky popsané v 6.4.17.3, s výjimkou toho, že vystavení teple musí trvat 60 minut.

6.4.20.4 Nárazová zkouška: Vzorek musí být podroben nárazu na terč rychlostí ne menší než 90 m/s, a to tak orientován, aby utrpěl maximální poškození. Terč musí odpovídat popisu v 6.4.14, s výjimkou, že jeho povrch může být v libovolné orientaci, pokud je kolmý ke dráze vzorku.

6.4.21 Prohlídky obalů konstruovaných pro obsah 0,1 kg nebo více hexafluoridu uranu

6.4.21.1 Každý vyrobený obal a jeho provozní a konstrukční výstroj musí být podroben buď společně nebo každá tato část zvlášť první prohlídce před uvedením do provozu a následně periodicky. Tyto prohlídky musí být prováděny a osvědčovány po dohodě s příslušným orgánem.

6.4.21.2 První prohlídku musí tvořit kontrola konstrukčních charakteristik, zkouška pevnosti, zkouška těsnosti, zkouška vnitřního objemu vodou a kontrola správného provozu provozní výstroje.

- 6.4.21.3 Periodické prohlídky musí tvořit vizuální prohlídka, zkouška pevnosti, zkouška těsnosti a kontrola správného provozu provozní výstroje. Nejdelší lhůty pro periodické prohlídky musí být pět let. Obaly, které nebyly podrobeny prohlídce v průběhu pětileté lhůty, musí být zkoušeny před přepravou podle programu schváleného příslušným orgánem. Tyto obaly nesmějí být znovu plněny před dokončením plného programu periodických prohlídek.
- 6.4.21.4 Kontrola konstrukčních charakteristik musí prokázat shodu se specifikacemi konstrukčního vzoru a výrobním programem.
- 6.4.21.5 Pro první zkoušku pevnosti obaly konstruované pro obsah 0,1 kg nebo více hexafluoridu uranu musí být zkoušeny hydraulicky vnitřním tlakem nejméně 1,38 MPa (13,8 bar), ale pokud je zkušební tlak menší 2,76 MPa (27,6 bar), typové schválení musí být vícestranné. Pro opětovné zkoušení obalů smí být podkladem jakékoli jiné rovnocenné nedestruktivní zkoušení, za podmínky vícestranného schválení.
- 6.4.21.6 Zkouška těsnosti musí být provedena v souladu s postupem, který je schopen měřit úniky z kontejmentového systému s citlivostí 0,1 Pa./s (10–6 bar/s).
- 6.4.21.7 Zkouška vnitřního objemu vodou se provádí s přesností $\pm 0,25$ % při referenční teplotě 15 °C. Obsah musí být uveden na štítku popsaném v 6.4.21.8.
- 6.4.21.8 Štítek vyrobený z nekorodujícího kovu musí být trvale upevněn na každý obal na snadno přístupném místě. Způsob upevnění štítku nesmí snižovat pevnost obalu. Na štítku musí být vyznačeny vyražením nebo jakýmkoli jiným rovnocenným způsobem nejméně tyto údaje:
- Identifikační označení rozhodnutí o typovém schválení;
 - Sériové číslo výrobce;
 - Nejvyšší provozní tlak (přetlak);
 - Zkušební tlak (přetlak);
 - Obsah: hexafluorid uranu;
 - Vnitřní objem v litrech;
 - Nejvyšší dovolená hmotnost náplně hexafluoridu uranu;
 - Hmotnost obalu;
 - Datum (měsíc, rok) první zkoušky a poslední periodické zkoušky;
 - Razítko znalce, který provedl zkoušky.

6.4.22 Typové schválení kusu a materiálů

- 6.4.22.1 Typové schválení kusů obsahujících 0,1 kg nebo více hexafluoridu uranu vyžaduje, aby:
- (a) Každý konstrukční vzor, který splňuje požadavky uvedené v 6.4.6.4, byl vícestranně schválen;
 - (b) Po 31. prosinci 2003 každý konstrukční vzor, který splňuje požadavky uvedené v pododílech 6.4.6.1 až 6.4.6.3, musí být jednostranně schválen příslušným orgánem země původu konstrukčního typu, není-li z jiných důvodů vyžadováno vícestranné schválení dle (dohody) ADR.
- 6.4.22.2 Každý konstrukční vzor kusu typu B(U) a kusu typu C vyžaduje jednostranné schválení, kromě:
- (a) konstrukčního vzoru kusu pro štěpnou látku, který je též uveden v 6.4.22.4, 6.4.23.7 a 5.1.5.2.1, vyžadující vícestranné schválení; a

- (b) konstrukční vzoru kusu typu B(U) pro radioaktivní látku s malou rozptýlitelností vyžadující vícestranné schválení.
- 6.4.22.3 Každý konstrukční vzor kusu typu B(U), včetně těch pro štěpnou látku, které jsou též předmětem požadavků uvedených v 6.4.22.4, 6.4.23.7 a 5.1.5.2.1, a těch pro radioaktivní látku s malou rozptýlitelností vyžaduje vícestranné schválení.
- 6.4.22.4 Každý konstrukční vzor kusu pro štěpnou látku, které není vyjmuto podle jednoho z odstavců 2.2.7.2.3.5 (a) až (f), 6.4.11.2 a 6.4.11.3 vyžaduje vícestranné schválení.
- 6.4.22.5 Konstrukční vzor radioaktivní látky zvláštní formy vyžaduje jednostranné schválení. Konstrukční typ pro radioaktivní látku s malou rozptýlitelností vyžaduje vícestranné schválení (viz též 6.4.23.8).
- 6.4.22.6 Vzor pro štěpnou látku vyjmutou z klasifikace „ŠTĚPNÁ“ na základě ustanovení 2.2.7.2.3.5 (f) vyžaduje vícestranné schválení
- 6.4.22.7 Alternativní meze aktivity pro vyjmutí zásilky přístrojů nebo výrobků na základě ustanovení 2.2.7.2.2.2 (b) vyžadují vícestranné schválení.
- 6.4.22.8 Jakýkoli konstrukční vzor, který vyžaduje jednostranné schválení země původu, která je smluvní stranou dohody ADR, musí být typově schválen příslušným orgánem této země; jestliže země, kde byl kus zkonstruován není smluvní stranou dohody ADR, přeprava je možná pouze za těchto podmínek:
- (a) rozhodnutí nebo osvědčení o typovém schválení bylo dodáno touto zemí, dokazující, že typ kusu splňuje technické požadavky ADR a že toto rozhodnutí nebo osvědčení je společně podepsáno příslušným orgánem první smluvní strany ADR, do které zásilka vstoupí;
- (b) jestliže nebylo žádné osvědčení a žádné typové schválení konstrukčního typu kusu smluvní straně ADR dodáno, konstrukční typ kusu je typově schválen příslušným orgánem první smluvní strany ADR, do které zásilka vstoupí.
- 6.4.22.9 Pro konstrukční vzor typově schválené podle přechodných ustanovení viz oddíl 1.6.6.
- 6.4.23 Žadosti a povolování přepravy radioaktivní látky**
- 6.4.23.1 (Vyhrazeno)
- 6.4.23.2 Žádost o povolení přepravy musí obsahovat:
- (a) Dobu týkající se přepravy, na kterou se povolení požaduje;
- (b) Skutečný radioaktivní obsah, očekávané způsoby přepravy, typ vozidla a pravděpodobná nebo navrhovaná trasa; a
- (c) Podrobnosti jak budou provedena preventivní a administrativní nebo provozní opatření, uvedená v rozhodnutích o typovém schválení kusu, pokud je to relevantní, vydaných podle ustanovení 5.1.5.2.1 (a) (v), (vi) nebo (vii).
- 6.4.23.3 Žádost o povolení přepravy za zvláštních podmínek musí obsahovat všechny údaje nezbytné pro uspokojení požadavku příslušného orgánu, že celková úroveň bezpečnosti při přepravě je nejméně rovnocenná úrovni, které by bylo dosaženo, kdyby všechny příslušné požadavky ADR byly splněny.
- Žádost musí též obsahovat:
- (a) Prohlášení o důvodech, proč odeslání nemůže být v plném souladu s příslušnými požadavky ADR; a
- (b) Výčet zvláštních opatření nebo zvláštních administrativních nebo provozních opatření, která mají být použita během přepravy, aby se tak kompenzovaly nedostatky při plnění příslušných požadavků ADR.

- 6.4.23.4 Žádost o typové schválení kusu typu B(U) nebo typu C musí obsahovat:
- (a) Podrobný popis navrhovaného radioaktivního obsahu s odkazem na jeho fyzikální a chemický stav a povahu vyzařovaného záření;
 - (b) Podrobný popis konstrukčního vzoru, včetně kompletních technických výkresů a přehledů materiálů a výrobních metod;
 - (c) Zpráva o zkouškách, které byly provedeny a jejich výsledky nebo důkaz založený na výpočtových metodách nebo jiný důkaz, že konstrukční vzor splňuje příslušné požadavky;
 - (d) Navrhované pokyny pro provoz a údržbu při používání obalu;
 - (e) Jestliže kus je konstruován pro nejvyšší normální provozní tlak překračující 100 kPa, specifikace materiálů pro výrobu kontejmentového systému, vzorky, které se mají použít, a zkoušky, které se mají provést;
 - (f) Pokud navrhovaný radioaktivní obsah je ozářené jaderné palivo, popis a zdůvodnění předpokladů v bezpečnostní analýze vztahující se k charakteristikám paliva a popis opatření před odesláním vyžadovaných v 6.4.11.5 (b);
 - (g) Zvláštní ustanovení o umístování pro přepravu, nezbytná pro zajištění bezpečného odvodu tepla z kusu beroucí v úvahu použité různé druhy přepravy a typ vozidla nebo kontejneru;
 - (h) Reprodukovatelné vyobrazení ne větší než 21 cm x 30 cm ilustrující provedení kusu; a
 - (i) Specifikaci vhodného systému řízení požadovaného v 1.7.3.
- 6.4.23.5 Žádost o typové schválení kusu typu B(M) musí obsahovat kromě informací, požadovaných pro typové schválení kusu v 6.4.23.4 pro kusy typu B(U):
- (a) Seznam požadavků uvedených v 6.4.7.5, 6.4.8.4, 6.4.8.5, 6.4.8.6 a 6.4.8.9 až 6.4.8.15, kterým kus nevyhovuje;
 - (b) Navrhovaná dodatečná provozní opatření, která mají být provedena během přepravy pravidelně neprováděná podle této přílohy, ale která jsou nezbytná pro zajištění bezpečnosti kusu nebo která kompenzují nesplněné požadavky uvedené v odstavci (a) výše;
 - (c) Výčet jakýchkoli omezení způsobu přepravy a jakýchkoli zvláštních postupů nakládky, přepravy, vykládky nebo manipulace; a
 - (d) Rozsah okolních podmínek (teplota, sluneční záření), které jsou očekávány během přepravy a které byly vzaty v úvahu při projektování konstrukčního vzoru.
- 6.4.23.6 Žádost o typové schválení kusů obsahujících 0,1 kg nebo více hexafluoridu uranu musí obsahovat všechny údaje potřebné k dokázání příslušnému orgánu, že konstrukční typ splňuje příslušné požadavky uvedené v 6.4.6.1, a popis vhodného programu zajištění jakosti, jak se požaduje v oddílu 1.7.3.
- 6.4.23.7 Žádost o typové schválení kusu pro štěpné látky musí obsahovat všechny údaje k dokázání příslušnému orgánu, že konstrukční typ splňuje příslušné požadavky uvedené v 6.4.11.1 a popis vhodného programu zajištění jakosti, jak se požaduje v oddílu 1.7.3.
- 6.4.23.8 Žádost o typové schválení radioaktivní látky zvláštní formy a radioaktivní látky s malou rozptýlitelností musí obsahovat:
- (a) Podrobný popis radioaktivní látky nebo, pokud je v pouzdru, obsahu; musí být uveden zejména odkaz jak na fyzikální tak i chemický stav;
 - (b) Podrobný popis konstrukčního typu použitého pouzdra;
 - (c) Zpráva o provedených zkouškách a jejich výsledcích nebo důkaz na základě výpočtových metod ukazující, že radioaktivní látka je schopna vyhovět předepsaným zkouškám nebo jiný důkaz, že radioaktivní látka zvláštní formy nebo radioaktivní látka s malou rozptýlitelností splňuje příslušné požadavky ADR;

- (d) Popis programu zajištění jakosti, jak se požaduje v oddílu 1.7.3.
 - (e) Navrhovaná opatření, která se mají provést před odesláním zásilky s radioaktivní látkou zvláštní formy nebo radioaktivní látky s malou rozptýlitelností.
- 6.4.23.9 Žádost o schválení štěpné látky vyjmuté z klasifikace „ŠTĚPNÁ“ podle tabulky 2.2.7.2.1.1 na základě ustanovení 2.2.7.2.3.5 (f) musí obsahovat:
- (a) Podrobný popis látky se zvláštním zřetelem na fyzikální i chemický stav;
 - (b) Uvedení zkoušek, které byly provedeny a jejich výsledků, nebo důkazy založené na výpočetních metodách prokazujících, že látka je způsobila vyhovět požadavkům specifikovaným v ustanovení 2.2.7.2.3.6;
 - (c) Popis použitého systému řízení, jak požaduje ustanovení 1.7.3;
 - (d) Uvedení zvláštních opatření, která mají být provedena před přepravou.“
- 6.4.23.10 Žádost o alternativní meze aktivity pro vyjmutí zásilky přístrojů nebo výrobků musí obsahovat:
- (a) Identifikaci a podrobný popis přístroje nebo výrobku, jeho předpokládané použití a obsažené v něm radionuklidy;
 - (b) Maximální aktivita radionuklidů v nástroji nebo výrobku;
 - (c) Maximální příkony dávkového ekvivalentu na povrchu a ve vzdálenosti 1 m od nástroje nebo výrobku;
 - (d) Chemická a fyzikální forma radionuklidů obsažených v nástroji nebo výrobku;
 - (e) Podrobnosti projektu a konstrukce přístroje nebo výrobku, zejména zádržného systému a stínění záření obsažených radionuklidů za běžných podmínek a normálních podmínek přepravy a za podmínek nehody při přepravě;
 - (f) Použitý integrovaný systém řízení včetně zkoušek jakosti a verifikačních postupů, které se provádí s radioaktivními zdroji, součástmi a hotovými výrobky k zajištění toho, že specifikované meze aktivity radioaktivních látek nebo příkonů dávkového ekvivalentu specifikovaných pro přístroj nebo výrobek nejsou překročeny a že přístroje nebo výrobky jsou konstruovány podle projektových specifikací;
 - (g) Nejvyšší počet přístrojů nebo výrobků, který se předpokládá přepravovat v jedné zásilce a ročně;
 - (h) Výpočet dávek podle principů a metodik stanovených v dokumentu International Basic Safety Standards for Protection against Ionizing Radiation and for the Safety of Radiation Sources, Safety Series No. 115, IAEA, Vienna (1996), včetně individuálních dávek pracovníků přepravy a jednotlivců z kritické skupiny obyvatel a, případně-li to v úvahu, kolektivních dávek za běžných podmínek a normálních podmínek přepravy a za podmínek nehody při přepravě, a to na základě reprezentativních scénářů dopravy zásilek.
- 6.4.23.11 Každé rozhodnutí o typovém schválení nebo o povolení vydané příslušným orgánem musí být označeno identifikační značkou. Identifikační značka musí být následujícího všeobecného typu:
- VRI/Číslo/Kód typu
- (a) Kromě uvedeného v 6.4.23.12 (b), VRI představuje mezinárodní rozlišovací značku vozidla země vydávající rozhodnutí nebo osvědčení⁴;
 - (b) Číslo musí být přiděleno příslušným orgánem a musí být jednoznačné a specifické se zřetelem ke konstrukčnímu vzoru nebo přepravě nebo alternativně mezím aktivity pro vyjmutou zásilku. Identifikační značka povolení přepravy musí být jednoznačné ve vztahu k identifikační značce o typovém schválení;

⁴ Viz mezinárodní rozlišovací značka státu předepsaná v Úmluvě o silničním provozu, Vídeň (1968).

- (c) Následující kódy typu musí být použity v uvedeném pořadí pro označení typů vydaných rozhodnutí o typovém schválení nebo povolení přepravy:

AF	Konstrukční vzor kusu Typ A pro štěpnou látku
B(U)	Konstrukční vzor kusu Typ B(U) [B(U) F pro štěpnou látku]
B(M)	Konstrukční vzor kusu Typ B(M) [B(M) F pro štěpnou látku]
C	Konstrukční vzor kusu Typ C [CF pro štěpnou látku]
IF	Konstrukční vzor průmyslového kusu pro štěpnou látku
S	Radioaktivní látka zvláštní formy
LD	Radioaktivní látka s malou rozptýlitelností
FE	Štěpná látka splňující požadavky 2.2.7.2.3.6
T	Přeprava
X	Zvláštní podmínky
AL	Alternativní meze aktivity pro vyjmutí zásilky přístrojů nebo výrobků

V případě konstrukčních vzorů kusu obsahujících hexafluorid uranu, který není štěpnou látkou nebo je vyjmutou štěpnou látkou, a na který se žádný z výše uvedených kódů nevztahuje, pak se musí použít následující typy kódů:

H(U)	Jednostranné schválení
H(M)	Mnohostranné schválení

- (d) Rozhodnutí o typovém schválení kusu a radioaktivní látky zvláštní formy, kromě vydaných podle přechodných ustanovení pododdílu 1.6.6.2 až 1.6.6.4, a rozhodnutí o typovém schválení radioaktivní látky s malou rozptýlitelností, musí být ke kódu připojeny znaky „-96“.

6.4.23.12 Tyto identifikační značky musí být uvedeny takto:

- (a) Každé rozhodnutí a každý kus musí být označeny příslušnou identifikační značkou obsahující znaky předepsané v 6.4.23.11 a), b), c) a d) výše, kromě toho, že za druhou závorkou musí být kusy opatřeny pouze příslušným kódem typu, případně včetně znaku „-96“, tj. že „T“ nebo „X“ se nesmějí uvádět v identifikačním nápisu na kusu. Kde rozhodnutí o typovém schválení a povolení přepravy jsou kombinována, příslušné kódy typu není třeba opakovat. Například:

A/132/B(M)F-96:A	Konstrukční vzor kusu typu B(M) schválený pro štěpnou látku, vyžadující mnohostranné schválení, pro který příslušný orgán Rakouska přidělil číslo konstrukčního typu 132 (pro označení kusu i pro rozhodnutí o typovém schválení);
A/132B(M)F-96T	Povolení přepravy vydané pro kus označený identifikační značkou uvedenou výše (pro označení pouze na rozhodnutí);
A/137/X:	Povolení přepravy za zvláštních podmínek, vydané příslušným orgánem Rakouska, kterému bylo přiděleno číslo 137 (pro označení pouze na rozhodnutí);
A/139/IF-96:	Typové schválení průmyslového kusu pro štěpnou látku vydané příslušným orgánem Rakouska, kterému bylo přiděleno číslo 139 (pro označení kusu i rozhodnutí o typovém schválení kusu); a

A/145/H(U)-96: Typové schválení kusu obsahujícího hexafluorid uranu, který je vyjmutou štěpnou látkou, vydané příslušným orgánem Rakouska, kterému bylo přiděleno číslo 145 (pro označení kusu i rozhodnutí o typovém schválení kusu);

- (b) Pokud je mnohostranné schválení provedeno validací podle 6.4.23.16, musí být použita pouze identifikační značka vydaná zemí původu konstrukčního typu nebo odeslání. Pokud je mnohostranné schválení provedeno vydáním rozhodnutí nebo osvědčení následnými zeměmi, musí být označeno příslušnou identifikační značkou a kus, jehož konstrukční typ byl takto schválen, musí být označen všemi příslušnými identifikačními značkami.

Například:

A/132/B(M)F-96

CH/28/B(M)F-96

byly by identifikační značky kusů, které byly původně schváleny Rakouskem a následně byly schváleny odděleným osvědčením Švýcarskem. Dodatečné identifikační značky byly by uvedeny na kusu podobným způsobem;

- (c) Revize rozhodnutí nebo osvědčení musí být vyznačena zápisem uvedeným v závorkách za identifikační značkou. Například A/132/B(M)F-96 (Rev. 2) by značilo druhou revizi rakouského osvědčení o typovém schválení kusu; nebo A/132/B(M)F-96 (Rev. 0) by označovalo původní vydání rakouského osvědčení o typovém schválení kusu. Pro původní vydání zápis v závorkách je nepovinný a jiná slova, jako „Původní vydání“ mohou být též použita místo „Rev 0“. Číslo revizí rozhodnutí nebo osvědčení smějí být vydávána pouze zemí, která vydala původní rozhodnutí nebo osvědčení o schválení.
- (d) Dodatečné znaky (které mohou být nezbytné podle národních předpisů) mohou být doplněny v závorkách na konec identifikační značky; například A/132/B(M)F-96(SP503);
- (e) Není nutno měnit identifikační značku na obalu pokaždé, kdy je provedena revize rozhodnutí o typovém schválení. Takové opětné označení musí být provedeno pouze v těch případech, kdy revize rozhodnutí o typovém schválení kusu má za následek změnu písmena kódu typu, uvedeného za druhou závorkou.

6.4.23.13 Každé rozhodnutí o typovém schválení vydané příslušným orgánem pro radioaktivní látku zvláštní formy nebo radioaktivní látku s malou rozptýlitelností musí obsahovat tyto údaje:

- (a) Typ rozhodnutí nebo osvědčení;
- (b) Identifikační značka vydaná příslušným orgánem;
- (c) Datum vydání a datum skončení platnosti;
- (d) Seznam příslušných národních a mezinárodních předpisů včetně vydání IAEA Regulations for the Safe Transport of Radioactive Material (MAAE Pravidla pro bezpečnou dopravu radioaktivních látek), podle kterých byla radioaktivní látka zvláštní formy nebo radioaktivní látka schválena;
- (e) Identifikace radioaktivní látky zvláštní formy nebo radioaktivní látky s malou rozptýlitelností;
- (f) Popis radioaktivní látky zvláštní formy nebo radioaktivní látky s malou rozptýlitelností;
- (g) Specifikace konstrukčního typu pro radioaktivní látky zvláštní formy nebo radioaktivní látky s malou rozptýlitelností, která může zahrnovat odkazy na výkresy;
- (h) Specifikace radioaktivního obsahu, která zahrnuje obsažené aktivity a která může zahrnovat fyzikální a chemickou formu;
- (i) Specifikace příslušného systému řízení, jak je požadováno v oddílu 1.7.3;
- (j) Odkaz na pokyny zpracované žadatelem týkající se zvláštních činností, které mají být provedeny před odesláním;

- (k) Odkaz na totožnost žadatele, pokud to bude považovat příslušný orgán za vhodné;
- (l) Podpis a identifikace organizace vydávajícího rozhodnutí nebo osvědčení.
- 6.4.23.14 Každé rozhodnutí nebo osvědčení o látce vyjmuté z klasifikace „ŠTĚPNÁ“ vydané příslušným orgánem musí obsahovat tyto údaje:
- (a) Typ rozhodnutí nebo osvědčení;
- (b) Identifikační značka vydaná příslušným orgánem;
- (c) Datum vydání a datum skončení platnosti;
- (d) Seznam příslušných národních a mezinárodních předpisů včetně vydání IAEA Regulations for the Safe Transport of Radioactive Material (MAAE Pravidla pro bezpečnou dopravu radioaktivních látek), podle kterých bylo vyjmutí schváleno;
- (e) Popis vyjmuté (štěpné) látky;
- (f) Popis veškerých omezení pro vyjmutou (štěpnou) látku;
- (g) Popis použitého vhodného systému řízení jak požaduje ustanovení 1.7.3;
- (h) Odkaz na pokyny zpracované žadatelem týkající se zvláštních činností, které mají být provedeny před odesláním;
- (i) Odkaz na totožnost žadatele, pokud to bude považovat příslušný orgán za vhodné;
- (j) Podpis a identifikace orgánu vydávajícího rozhodnutí nebo osvědčení;
- (k) Odkaz na dokumentaci prokazující soulad s ustanovením 2.2.7.2.3.6.
- 6.4.23.15 Každé rozhodnutí o povolení přepravy za zvláštních podmínek, vydané příslušným orgánem musí obsahovat tyto údaje:
- (a) Typ rozhodnutí nebo osvědčení;
- (b) Identifikační značka vydaná příslušným orgánem;
- (c) Datum vydání a datum skončení platnosti;
- (d) Způsob(y) přepravy;
- (e) Jakékoli omezení způsobu přepravy, typ vozidla, kontejneru a jakékoli pokyny pro dopravní trasu,
- (f) Seznam příslušných národních a mezinárodních předpisů včetně vydání IAEA Regulations for the Safe Transport of Radioactive Material (MAAE Pravidla pro bezpečnou dopravu radioaktivních látek), podle kterých byla zvláštní dohoda schválena;
- (g) Následující prohlášení:
- „Toto rozhodnutí nezbavuje odesílatele odpovědnosti za plnění jakýchkoli požadavků vlády jakékoli země, kterou bude kus procházet nebo do které bude přepraven.“
- (h) Odkazy na rozhodnutí pro alternativní radioaktivní obsahy, na schválení provedené validací jinými příslušnými orgány, nebo jiné doplňkové technické údaje, které příslušný orgán považuje za vhodné;
- (i) Popis obalu s odkazem na výkresy nebo specifikaci konstrukčního vzoru. Pokud to příslušný orgán považuje za vhodné, musí být též uvedeno reprodukovatelné vyobrazení ne větší než 21 cm x 30 cm ilustrující provedení kusu doprovázené stručným popisem obalu, včetně materiálů, z něhož byl vyroben, celková hmotnost, vnější rozměry a vzhled;
- (j) Specifikace schválených radioaktivních obsahů, včetně jakýchkoli omezení radioaktivních obsahů, které by nemohly být zřejmé z povahy obalu. Musí být též uvedeny fyzikální a chemické formy, obsažené aktivity (pokud je to vhodné, včetně aktivit jednotlivých izotopů), hmotnosti v gramech (pro štěpnou látku nebo v případě potřeby pro každý štěpných nuklid) a,

pokud je to vhodné, údaj, že se jedná o radioaktivní látku zvláštní formy nebo radioaktivní látku s malou rozptýlitelností nebo štěpnou látku vyjmutou na základě ustanovení 2.2.7.2.3.5 (f);

- (k) Dodatečně pro kusy obsahující štěpnou látku:
 - (i) podrobný popis schváleného radioaktivního obsahu;
 - (ii) hodnota indexu bezpečné podkritičnosti;
 - (iii) odkaz na doklad prokazující zachování podkritického stavu obsahu;
 - (iv) jakékoli zvláštní prostředky, na jejichž základě se uvažovala nepřítomnost vody v určitých prázdných prostorech při hodnocení podkritičnosti;
 - (v) jakákoli dovolená odchylka (na základě 6.4.11.5 (b)) pro změnu multiplikace neutronů předpokládané v hodnocení podkritičnosti jako důsledek; skutečných hodnot ozáření a
 - (vi) rozsah okolní teploty, pro kterou byla přeprava za zvláštních podmínek povolena;
- (l) Podrobný seznam jakýchkoli dodatečných provozních opatření požadovaných pro přípravu, nakládku, přepravu, vykládku a manipulaci se zásilkou a jakákoli ustanovení o umístování na dopravním prostředku k bezpečnému odvodu tepla;
- (m) Důvody pro přepravu za zvláštních podmínek, pokud to vyžaduje příslušný orgán;
- (n) Popis kompenzačních opatření, která mají být provedena jako důsledek přepravy za zvláštních podmínek;
- (o) Odkaz na pokyny vypracované žadatelem vztahující se na použití obalu nebo zvláštní činnosti, které musí být provedeny před odesláním;
- (p) Popis okolních podmínek uvažovaných při projekci konstrukčního typu, pokud neodpovídají podmínkám uvedeným v 6.4.8.5, 6.4.8.6 a 6.4.8.15, pokud je to vhodné;
- (q) Jakákoli nouzová opatření považovaná příslušným orgánem za nezbytná;
- (r) Specifikace vhodného systému řízení, jak je požadováno v oddílu 1.7.3;
- (s) Odkaz na totožnost žadatele a na totožnost dopravce, pokud to bude považovat příslušný orgán za vhodné;
- (t) Podpis a identifikace orgánu vydávajícího rozhodnutí nebo osvědčení.

6.4.23.16 Každé rozhodnutí nebo osvědčení o povolení přepravy vydané příslušným orgánem musí obsahovat tyto údaje:

- (a) Typ rozhodnutí nebo osvědčení;
- (b) Identifikační značka(y) vydaná(é) příslušným orgánem;
- (c) Datum vydání a datum skončení platnosti;
- (d) Seznam příslušných národních a mezinárodních předpisů včetně vydání IAEA Regulations for the Safe Transport of Radioactive Material (MAAE Pravidla pro bezpečnou dopravu radioaktivních látek), podle kterých bylo odeslání schváleno;
- (e) Jakékoli omezení způsobu přepravy, typu vozidla, kontejneru a jakékoli pokyny pro trasu přepravy;
- (f) Následující prohlášení:

„Toto rozhodnutí nebo osvědčení nezbavuje odesílatele odpovědnosti za plnění jakýchkoli požadavků vlády jakékoli země, kterou bude kus procházet nebo do které bude přepraven.“
- (g) Podrobný seznam jakýchkoli dodatečných provozních opatření požadovaných pro přípravu, nakládku, přepravu, vykládku a manipulaci se zásilkou a jakákoli ustanovení o umístování na dopravním prostředku k bezpečnému odvodu tepla nebo udržení podkritického stavu;

- (h) Odkaz na pokyny zpracované žadatelem týkající se zvláštních činností, které mají být provedeny před odesláním;
- (i) Odkaz na příslušné (á) rozhodnutí nebo osvědčení o typovém schválení;
- (j) Specifikace schválených radioaktivních obsahů, včetně jakýchkoli omezení radioaktivních obsahů, které by nemohly být zřejmé z povahy obalu. Musí být též uvedeny fyzikální a chemické formy, obsažené aktivity (pokud je to vhodné, včetně aktivit různých izotopů), hmotnosti v gramech (pro štěpnou látku nebo v případě potřeby pro každý štěpných nuklid) a, pokud je to vhodné, údaj, že se jedná o radioaktivní látku zvláštní formy nebo radioaktivní látku s malou rozptýlitelností nebo štěpnou látku vyjmutou na základě ustanovení 2.2.7.2.3.5 (f);
- (k) Jakákoli nouzová opatření považovaná příslušným orgánem za nezbytná;
- (l) Specifikace vhodného systému řízení, jak je požadováno v oddílu 1.7.3;
- (m) Odkaz na totožnost žadatele, pokud to bude považovat příslušný orgán za vhodné;
- (n) Podpis a identifikace orgánu vydávajícího rozhodnutí nebo osvědčení.

6.4.23.17

Každé rozhodnutí nebo osvědčení o typovém schválení kusu vydané příslušným orgánem musí obsahovat tyto údaje:

- (a) Typ rozhodnutí nebo osvědčení;
- (b) Identifikační značka vydaná příslušným orgánem;
- (c) Datum vydání a datum skončení platnosti;
- (d) Jakékoli omezení způsobu přepravy, pokud je to vhodné;
- (e) Seznam příslušných národních a mezinárodních předpisů včetně vydání IAEA Regulations for the Safe Transport of Radioactive Material (MAAE Pravidla pro bezpečnou dopravu radioaktivních látek), podle kterých byl kus typově schválen;
- (f) Následující prohlášení:
„Toto rozhodnutí nebo osvědčení nezbavuje odesílatele odpovědnost za plnění jakýchkoli požadavků vlády jakékoli země, kterou bude kus procházet nebo do které bude přepraven.“;
- (g) Odkazy na rozhodnutí nebo osvědčení pro alternativní radioaktivní obsahy, na schválení provedené validací jinými příslušnými orgány, nebo jiné doplňkové technické údaje, které příslušný orgán považuje za vhodné;
- (h) Prohlášení o rozhodnutí nebo osvědčení o povolení přepravy, pokud je povolení přepravy podle 5.1.5.1.2 vyžadováno;
- (i) Identifikace obalu;
- (j) Popis obalu s odkazem na výkresy nebo specifikaci konstrukčního typu. Pokud to příslušný orgán považuje za vhodné, musí být též uvedeno reprodukovatelné vyobrazení ne větší než 21 cm x 30 cm ilustrující provedení kusu doprovázené stručným popisem obalu, včetně materiálů, z něhož byl vyroben, celková hmotnost, vnější rozměry a vzhled;
- (k) Specifikace konstrukčního typu odkazem na výkresy;
- (l) Specifikace schválených radioaktivních obsahů, včetně jakýchkoli omezení radioaktivních obsahů, které by nemohly být zřejmé z povahy obalu. Musí být též uvedeny fyzikální a chemické formy, obsažené aktivity (pokud je to vhodné, včetně aktivit různých izotopů), hmotnosti v gramech (pro štěpnou látku celkovou hmotnost štěpných nuklidů nebo v případě potřeby pro každý štěpný nuklid) a, pokud je to relevantní, údaj, že se jedná o radioaktivní látku zvláštní formy nebo radioaktivní látku s malou rozptýlitelností nebo štěpnou látku vyjmutou na základě ustanovení 2.2.7.2.3.5 (f);
- (m) Popis kontejmentového (zádržného) systému;

- (n) Dodatečně pro konstrukční vzor kusů pro obsah štěpné látky, které vyžadují vícestranné schválení podle 6.4.22.4:
 - (i) podrobný popis schváleného radioaktivního obsahu;
 - (ii) Popis kontejmentového (omezujícího) systému;
 - (iii) hodnota indexu bezpečné podkritičnosti;
 - (iv) odkaz na doklad prokazující zachování podkritického stavu obsahu;
 - (v) jakékoli zvláštní prostředky, na jejichž základě se uvažovala nepřítomnost vody v určitých prázdných prostorech při hodnocení podkritičnosti;
 - (vi) jakákoli dovolená odchylka (na základě 6.4.11.5 (b)) pro změnu multiplikace neutronů předpokládané v hodnocení podkritičnosti jako důsledek skutečných hodnot ozáření; a
 - (vii) rozsah okolní teploty, pro kterou byl kus typově schválen;
- (o) Pro kusy typu B(M) výčet uvádějící ty požadavky uvedené v 6.4.7.5, 6.4.8.4, 6.4.8.5, 6.4.8.6 a 6.4.8.9 až 6.4.8.15, které kus nesplňuje, a jakékoli rozšiřující informace, které mohou být užitečné pro jiné příslušné orgány;
- (p) Pro kusy obsahující více než 0,1 kg hexafluoridu uranu výčet uvádějící ta ustanovení, pododdílu 6.4.6.4, kterých bylo využito, pokud tomu tak bylo, a jakékoli doplňující informace, které mohou být užitečné pro jiné příslušné orgány;
- (q) Podrobný seznam jakýchkoli dodatečných provozních opatření požadovaných pro přípravu, nakládku, přepravu, vykládku a manipulaci se zásilkou a jakákoli ustanovení o umístění na dopravním prostředku k bezpečnému odvodu tepla;
- (r) Odkaz na pokyny zpracované žadatelem týkající se použití obalu nebo zvláštních činností, které mají být provedeny před odesláním;
- (s) Výčet okolních podmínek předpokládaných při projektování konstrukčního typu, pokud neodpovídají podmínkám uvedeným v 6.4.8.5, 6.4.8.6 a 6.4.8.15, pokud je to vhodné;
- (t) Specifikace vhodného systému řízení, jak je požadováno v oddílu 1.7.3;
- (u) Jakákoli nouzová opatření považovaná příslušným orgánem za nezbytná;
- (v) Odkaz na totožnost žadatele, pokud to bude považovat příslušný orgán za vhodné;
- (w) Podpis a identifikace orgánu vydávajícího rozhodnutí nebo osvědčení.

6.4.23.18 Každé rozhodnutí nebo osvědčení o povolení alternativních mezí aktivity pro vyjmutí zásilky přístrojů nebo výrobků vydané příslušným orgánem na základě ustanovení 5.1.5.2.1 (d) musí obsahovat tyto údaje:

- (a) Typ rozhodnutí nebo osvědčení;
- (b) Identifikační značka vydaná příslušným orgánem;
- (c) Datum vydání a datum skončení platnosti;
- (d) Seznam příslušných národních a mezinárodních předpisů včetně vydání IAEA Regulations for the Safe Transport of Radioactive Material (MAAE Pravidla pro bezpečnou dopravu radioaktivních látek), podle kterých byly alternativní meze aktivity pro vyjmutí zásilky schváleny;
- (e) Identifikace přístroje nebo výrobku;
- (f) Popis přístroje nebo výrobku;
- (g) Podrobný popis konstrukčního typu přístroje nebo výrobku;
- (h) Specifikace radionuklidu (radionuklidů) a povolený alternativní limit (povolené alternativní limity) aktivity pro vyjmutí zásilky (zásilek) přístroje (přístrojů) nebo výrobku (výrobků);

- (i) Odkaz na dokumentaci prokazující soulad s ustanovením 2.2.7.2.2.2 (b);
- (j) Odkaz na totožnost žadatele, pokud to bude považovat příslušný orgán za vhodné;
- (k) Podpis a identifikace orgánu vydávajícího rozhodnutí nebo osvědčení.

6.4.23.19 Příslušný orgán musí být informován o sériovém čísle každého obalu vyrobeného podle jím typově schváleného konstrukčního vzoru podle 1.6.6.2.1, 1.6.6.2.2, 6.4.22.2, 6.4.22.3 a 6.4.22.4.

6.4.23.20 Mnohostranné schválení může být provedeno validací původního rozhodnutí nebo osvědčení vydaného příslušným orgánem země původu konstrukčního typu nebo odeslání. Taková validace může mít formu rubopisu na původním rozhodnutí nebo osvědčení nebo může být provedena vydáním odděleného rubopisu, přílohy, dodatku atd. příslušným orgánem země, kterou zásilka prochází nebo do které zásilka přichází.

KAPITOLA 6.5

POŽADAVKY NA KONSTRUKCI A ZKOUŠENÍ VELKÝCH NÁDOB PRO VOLNĚ LOŽENÉ LÁTKY (IBC)

6.5.1 Obecné požadavky

6.5.1.1 Rozsah

6.5.1.1.1 Požadavky této kapitoly se vztahují na IBC - velké nádoby pro volně ložené látky (jejichž používání je výslovně dovoleno pro přepravu určitých nebezpečných látek podle pokynů pro balení uvedených ve sloupci (8) kapitoly 3.2. Přemístitelné cisterny, cisternové kontejnery, které odpovídají požadavkům kapitoly 6.7, nebo 6.8, se nepovažují za IBC. IBC, které splňují požadavky této kapitoly, se pro účely ADR nepovažují za kontejnery.

6.5.1.1.2 IBC a jejich provozní výstroj neodpovídající přesně těmto požadavkům, ale mající přijatelné alternativy, mohou být příslušným orgánem považovány za přijatelné pro schválení. Kromě toho s ohledem na vědecký a technický pokrok může být používání alternativních uspořádání, která nabízejí nejméně stejnou bezpečnost používání z hlediska snášenlivosti s vlastnostmi přepravovaných látek a stejnou nebo vyšší odolnost proti nárazu, zatížení a ohni, povoleno příslušným orgánem.

6.5.1.1.3 Konstrukce, výstroj, zkoušení, značení a provoz IBC musí být uznány příslušným orgánem země, ve které byla IBC schválena.

POZNÁMKA: Strany provádějící kontroly a zkoušky v jiných zemích po uvedení IBC do provozu, nemusí být schváleny příslušným orgánem země, ve které byla IBC schválena, ale prohlídky a zkoušky se musí provádět v souladu s pravidly uvedenými ve schválení IBC.

6.5.1.1.4 Výrobci a následní distributoři IBC musí poskytnout informace týkající se postupů, které je nutno dodržovat a popis typů a rozměrů uzávěrů (zahrnujíc v to požadovaná těsnění) a jakékoliv další komponenty potřebné k tomu, aby se zajistilo, že IBC, jak jsou podávány k přepravě jsou schopné projít konstrukčními zkouškami předepsanými v této kapitole.

6.5.1.2 (Vyhrazeno)

6.5.1.3 (Vyhrazeno)

6.5.1.4 Kódovací systém pro značení IBC

6.5.1.4.1 Kód konstrukčního typu tvoří dvě arabské číslice, jak je uvedeno v odstavci (a), následované velkým(i) písmenem(ny), jak je uvedeno v odstavci (b), následované, pokud je to stanoveno v jednotlivých oddílech, arabskou číslicí označující kategorii IBC.

(a)

Typ	Pro tuhé látky, plněné nebo vyprazdňované		Pro kapaliny
	Samospádem	pod tlakem vyšším než 10 kPa (0,1 baru)	
Tuhý	11	21	31
Flexibilní	13	–	–

(b) Materiály: A. Ocel (všechny typy a povrchové úpravy)

B. Hliník

C. Přírodní dřevo

D. Překlička

F. Rekonstituované dřevo (dřevo vláknité a třískové materiály)

G. Lepenka

H. Plast

L. Textilní tkaniny

M. Papír, vícevrstvý

N. Kov (mimo ocel a hliník)

6.5.1.4.2 Pro kompozitní IBC musí být použity v druhém pořadí kódu dvě velká písmena latinské abecedy. První udává materiál vnitřní nádoby IBC a druhé vnějšího pláště IBC.

6.5.1.4.3 Dále jsou uvedeny typy a kódy IBC:

Materiál	Kategorie	Kód	Pododdíl
Kov			
A. Ocel	pro tuhé látky, plněné a vyprazdňované samospádem pro tuhé látky, plněné a vyprazdňované pod tlakem pro kapaliny	11A 21A 31A	6.5.5.1
B. Hliník	pro tuhé látky, plněné a vyprazdňované samospádem pro tuhé látky, plněné a vyprazdňované pod tlakem pro kapaliny	11B 21B 31B	
N. Ostatní kovy	pro tuhé látky, plněné a vyprazdňované samospádem pro tuhé látky, plněné a vyprazdňované pod tlakem pro kapaliny	11N 21N 31N	
Flexibilní			
H. Plasty	tkané plasty bez povlaku nebo vložky tkané plasty s povlakem tkané plasty s vložkou tkané plasty s povlakem a s vložkou plastová fólie	13H1 13H2 13H3 13H4 13H5	6.5.5.2
Flexibilní			
L. Textilní tkanina	bez povlaku nebo vložky s povlakem s vložkou s povlakem a s vložkou	13L1 13L2 13L3 13L4	6.5.5.2
M. Papír	Vícevrstvý vícevrstvý, vodovzdorný	13M1 13M2	
H. Tuhé plasty	pro tuhé látky, plněné a vyprazdňované samospádem, vybavené provozní výstrojí pro tuhé látky, plněné a vyprazdňované samospádem, samonosné pro tuhé látky, plněné a vyprazdňované pod tlakem, vybavené provozní výstrojí pro tuhé látky, plněné a vyprazdňované pod tlakem, samonosné pro kapaliny, vybavené provozní výstrojí pro kapaliny, samonosné	11H1 11H2 21H1 21H2 31H1 31H2	6.5.5.3

Materiál	Kategorie	Kód	Pododdíl
HZ. Kompozitní s plastovou vnitřní nádobou ^a	pro tuhé látky, plněné a vyprazdňované samospádem, s nádobou z tuhého plastu	11HZ1	6.5.5.4
	pro tuhé látky, plněné a vyprazdňované samospádem, s nádobou z flexibilního plastu	11HZ2	
	pro tuhé látky, plněné a vyprazdňované pod tlakem, s nádobou z tuhého plastu	21HZ1	
	pro tuhé látky, plněné a vyprazdňované pod tlakem, s nádobou z flexibilního plastu	21HZ2	
	pro kapaliny, s nádobou z tuhého plastu	31HZ1	
	pro kapaliny, s nádobou z flexibilního plastu	31HZ2	
G. Lepenka	pro tuhé látky, plněné a vyprazdňované samospádem	11G	6.5.5.5
Dřevo			
C. Přírodní dřevo	pro tuhé látky, plněné a vyprazdňované samospádem, s vnitřní vložkou	11C	6.5.5.6
D. Překližka	pro tuhé látky, plněné a vyprazdňované samospádem, s vnitřní vložkou	11D	
F. Rekonstituované dřevo	pro tuhé látky, plněné a vyprazdňované samospádem, s vnitřní vložkou	11F	

^a Tento kód musí být doplněn nahrazením písmena Z velkým písmenem podle 6.5.1.4.1 b) označujícím použitý materiál pro vnější obal.

6.5.1.4.4 Písmeno „W“ může být uvedeno za kódem IBC. Písmeno „W“ označuje, že IBC, ačkoli je stejného typu uvedeného kódem, je vyrobena podle specifikace odlišné od specifikace uvedené v 6.5.5 a je považována za rovnocennou podle požadavků uvedených v 6.5.1.1.2.

6.5.2 Značení UN kódem

6.5.2.1 Základní značení

6.5.2.1.1 Každá IBC vyrobená a určená pro používání podle ADR musí mít značení, které je trvalé, čitelné a umístěné tak, aby bylo zřetelně viditelné. Písmena, číslice a znaky musí být nejméně 12 mm vysoké a musí uvádět:

(a) Znak Spojených národů pro obaly:

Tento znak nesmí být použit pro jiné účely než pro osvědčení, že obal, přemístitelná cisterna nebo MEGC splňuje příslušné požadavky kapitoly 6.1, 6.2, 6.3, 6.5, 6.6 nebo 6.7¹.

U kovových IBC, na kterých se značení provádí vyražením nebo vytlačením, smí být použita místo znaku písmena UN;

(b) Kód udávající typ IBC podle 6.5.1.4;

(c) Velká písmena, která udávají obalovou skupinu(y), pro kterou(é) je konstrukční typ schválen:

(i) X pro obalové skupiny I, II a III (IBC pouze pro tuhé látky)

(ii) Y pro obalové skupiny II a III;

(iii) Z pouze pro obalovou skupinu III;

¹ Tento symbol se také používá k potvrzení, že flexibilní objemové vaky schválené pro ostatní druhy dopravy jsou v souladu s požadavky uvedenými v kapitole 6.8 Modelového regulativu OSN.

- (d) Měsíc a rok (vždy poslední dvě číslice) výroby.
- (e) Stát povolující přidělení značení UN kódem; uvedený rozlišovací značkou pro motorová vozidla v mezinárodním provozu²;
- (f) Jméno nebo značka výrobce nebo jiné označení IBC stanovené příslušným orgánem;
- (g) Zkušební zatížení při zkoušce stohováním v kg. Číslicí „0“ musí být označena IBC, která nejsou konstruována pro stohování;
- (h) Nejvyšší dovolená celková (btto) hmotnost v kg.

Shora předepsané základní značení musí být vyznačeno v pořadí pododstavců uvedených níže. Značení podle 6.5.2.2, jakož i všechna další značení schválená příslušným orgánem, je nutno umístit tak, aby jednotlivé části značení byly správně identifikovatelné.

Každý prvek UN kódu podle (a) až (h) a 6.5.2.2 musí být jasně oddělen, např. lomítkem, nebo mezerou, tak aby byl snadno identifikovatelný

6.5.2.1.2

Příklady značení pro různé typy IBC v souladu s 6.5.2.1.1, písmeny (a) až (h) uvedenými výše:

	11A/Y/02 99 NL/Mulder 007/5500/1500	Kovové IBC z oceli pro přepravu tuhých látek, které se vyprazdňují např. samospádem pro obalové skupiny II a III, vyrobená v únoru 1999, schválená v Nizozemsku, vyrobená firmou Mulder podle konstrukčního typu, pro který příslušný orgán přidělil kód 007, použité zatížení při zkoušce stohováním v kg, nejvyšší celková (btto) hmotnost v kg
	13H3/Z/03 01 F/Meunier 1713/0/1500	Flexibilní IBC pro přepravu tuhých látek, vyprazdňované samospádem, vyrobená z plastové tkaniny s vložkou, určené pro stohování.
	31H1/Y/04 99 GB/9099/10800/1200	IBC z tuhého plastu pro přepravu kapalných látek s konstrukčním vybavením, uzpůsobeným ke stohování.
	31HA1/Y/05 01 D/Müller/1683/10800 1200	Kompozitní-IBC pro přepravu kapalin s vnitřní nádobou z tuhého plastu s vnějším pláštěm z oceli.
	11C/X/01 02 S/Aurigny/9876/3000 910	IBC z přírodního dřeva pro přepravu tuhých látek s vnitřní vložkou, schválené pro tuhé látky obalové skupiny I.

² Rozlišovací značky pro motorová vozidla v mezinárodní dopravě podle Vídeňské konvence o silničním provozu (1968).

6.5.2.2 Doplnkové značení

6.5.2.2.1 Každá IBC musí mít značení požadované v 6.5.2.1 a kromě toho následující informace, které mohou být uvedeny na korozi odolném štítku trvale připevněném na místě snadno dostupném pro kontrolu.

Doplnkové značení	Kategorie IBC				
	Kovové	Z tuhého plastu	Kompozitní	Lepenkové	Dřevěné
Vnitřní objem v litrech ^a při 20 °C	X	X	X		
Vlastní hmotnost v kg ^a	X	X	X	X	X
Zkušební (pře)tlak v kPa nebo barech ^a , pokud se na něj vztahuje		X	X		
Nejvyšší přípustný plnicí/vyprazdňovací tlak v kPa nebo barech ^a , pokud se na něj vztahuje	X	X	X		
Materiál tělesa a jeho minimální tloušťka v mm	X				
Datum poslední zkoušky těsnosti, pokud se na něj vztahuje (měsíc a rok)	X	X	X		
Datum poslední inspekce (měsíc a rok)	X	X	X		
Číslo výrobní série	X				
Maximální povolená stohovací zátěž ^b	X	X	X	X	X

^a Používaná jednotka musí být uvedena.

^b Viz 6.5.2.2.2. Toto dodatečné značení se musí použít pro všechny IBC vyrobené, opravené nebo zrekonstruované od 1. ledna 2011 (viz rovněž 1.6.1.15)

6.5.2.2.2 Maximální povolené stohovací zatížení platné při používání IBC musí být uvedeno na značce podle vyobrazení na obrázku 6.5.2.2.1 nebo na obrázku 6.5.2.2.2. Značka musí být trvanlivá a dobře viditelná.

obrázek 6.5.2.2.1

IBC, které je možné stohovat

obrázek 6.5.2.2.2

IBC, které není možné stohovat

Minimální rozměry musí být 100 mm x 100 mm. Výška písmen a číslic udávajících hmotnost musí být nejméně 12 mm. Plocha uvnitř tiskových značek označených rozměrovými šipkami musí být čtvercová. Tam, kde rozměry nejsou uvedeny, musí být všechny vlastnosti v přibližném poměru k vlastnostem na obrázku. Hmotnost vyznačená nad značkou nesmí překročit zatížení působící při

konstrukční typové zkoušky (viz 6.5.6.6.4) děleno 1,8. Kromě označení uvedených v 6.5.2.1 mohou mít flexibilní IBC piktogram označující doporučené zdvihací metody.

6.5.2.2.3 Vnitřní nádoba kompozitních IBC vyrobená po 1. lednu 2011 musí nést označení uvedené v 6.5.2.1.1 (b), (c), (d) kde toto datum udává výrobu vnitřní plastové nádoby, (e) a (f). UN kód obalu nemusí být použit. Značení musí být použito v pořadí uvedeném v 6.5.2.1.1. Musí být trvanlivé, čitelné a umístěno tak, aby bylo dobře viditelné, pokud je vnitřní nádoba umístěna uvnitř vnějšího obalu.

6.5.2.2.4 Datum výroby vnitřní plastové nádoby může být alternativně označeno na vnitřní nádobě přilehlé k ostatnímu značení. V takovém případě musí být dvě číslice roku v označení a ve vnitřním kruhu hodin identické. Příklad vhodného způsobu označení je:

POZNÁMKA: Jsou přijatelné i další metody, které poskytují minimální požadované informace trvanlivým, viditelným a čitelným způsobem.

6.5.2.2.5 Pokud jsou kompozitní IBC konstruovány takovým způsobem, že vnější plášť je určen k sejmutí při přepravě prázdných IBC (takové jako zpětná přeprava IBC pro opětovné použití původním odesílatelem), každá z odnímatelných částí musí být označena měsícem a rokem výroby a jménem nebo znakem výrobce a dalšími identifikačními údaji IBC stanovenými příslušným orgánem (6.5.2.1.1(f)).

6.5.2.3 Shodnost s konstrukčním typem

Označení IBC UN kódem potvrzuje, že IBC odpovídá s úspěchem ozkoušenému konstrukčnímu typu a že požadavky uvedené v osvědčení byly splněny.

6.5.2.4 Značení rekonstruovaných kompozitních IBC (31HZ1)

Značení specifikované v 6.5.2.1.1 a 6.5.2.2 musí být odstraněno z původního IBC nebo trvale znečitelněno a nové značení musí být použito na IBC rekonstruované v souladu s ADR.

6.5.3 Požadavky na konstrukci

6.5.3.1 Obecné požadavky

6.5.3.1.1 IBC musí být odolné, nebo vhodným způsobem chráněny proti degradaci, způsobované okolním prostředím.

6.5.3.1.2 IBC musí být vyrobeny a uzavřeny tak, aby nemohlo dojít k úniku obsahu při normálních podmínkách přepravy, včetně účinku vibrací nebo změn teploty, vlhkosti nebo tlaku.

- 6.5.3.1.3 IBC a jejich uzávěry musí být zhotoveny z materiálů, snášenlivých s obsahem nebo být zevnitř chráněny, aby nenastalo nebezpečí:
- (a) že budou napadeny obsahem takovým způsobem, který by jejich použití učinil rizikovým;
 - (b) že dojde k reakci nebo rozkladu obsahu, popř. k vytvoření zdraví škodlivých nebo nebezpečných sloučenin, působením obsahu na materiály IBC.
- 6.5.3.1.4 Byla-li použita těsnění, musí být z materiálu, který nemůže být obsahem IBC napaden.
- 6.5.3.1.5 Veškerá provozní výstroj musí být umístěna nebo chráněna tak, aby riziko úniku obsahu z důvodu jejího poškození při manipulaci a přepravě bylo minimalizováno.
- 6.5.3.1.6 IBC, jejich příslušenství a jejich provozní a konstrukční výstroj musí být uzpůsobeny tak, aby odolávaly vnitřnímu přetlaku obsahu bez jeho ztráty a namáhání normální manipulace a přepravy. IBC určené ke stohování musí být pro tento účel konstrukčně přizpůsobeny. Zvedací a bezpečnostní prvky IBC musí být dostatečně pevné, aby odolaly normálním podmínkám manipulace a přepravy bez podstatné deformace nebo poškození; musí být umístěny tak, aby v žádné části IBC nevznikalo nadměrné namáhání.
- 6.5.3.1.7 Je-li IBC tvořena tělesem nádoby uvnitř rámu, musí být konstruována tak, aby:
- (a) se těleso nádoby netřelo či nedřelo o rám, které by způsobovalo poškození tělesa nádoby,
 - (b) těleso nádoby zůstávalo stále zajištěno v rámu,
 - (c) části výstroje byly fixovány tak, aby nemohly být poškozeny, jestliže spojení mezi tělesem nádoby a rámem umožňuje rozpínání nebo vzájemný pohyb.
- 6.5.3.1.8 Je-li použit spodní vypouštěcí ventil, musí být zabezpečen v uzavřené poloze a celý vyprazdňovací systém musí být vhodným způsobem chráněn proti poškození. Ventily s pákovými uzávěry musí být chráněny proti náhodnému otevření, přičemž musí být poloha otevřeno – zavřeno lehce zjištělná. U IBC obsahujících kapalně látky musí být též dodatkové zařízení k utěsnění výpustního otvoru, např. slepá příruba nebo stejně účinné zařízení.
- 6.5.4 Zkoušení, certifikace a inspekce**
- 6.5.4.1 Zajištění kvality: IBC musí být vyrobeny, rekonstruovány, opraveny a odzkoušeny podle systému zajištění kvality uznaného příslušným orgánem, aby bylo zajištěno, že každá vyrobená, rekonstruovaná nebo opravená IBC splňuje požadavky této kapitoly.
- POZNÁMKA:** Norma ISO 16106:2006 „Obaly - Převážné obaly pro nebezpečné věci - Obaly pro nebezpečné věci, velké nádoby pro volně ložené látky (IBC) a velké obaly - Návod pro aplikaci normy ISO 9001“ - poskytuje přijatelný návod pro předepsané postupy.
- 6.5.4.2 Zkušební požadavky: IBC musí být podrobeny zkouškám konstrukčního typu a prvními a periodickými inspekcemi a zkouškami podle 6.5.4.4, pokud se na ně vztahují.
- 6.5.4.3 Certifikace: ke každému konstrukčnímu typu IBC musí být vydán atest s povolením označování sériových výrobků UN kódem (jak je uvedeno v 6.5.2.) prokazujícím, že konstrukční typ, včetně své výstroje, splňuje zkušební požadavky.
- 6.5.4.4 Inspekce a zkouška:
- POZNÁMKA:** Viz též pododdíl 6.5.4.5. pro prohlídky a zkoušky na opravených IBC
- 6.5.4.4.1 Aby bylo vyhověno požadavkům příslušného orgánu, musí být každá kovová IBC, IBC z tuhého plastu kompozitní IBC podrobena inspekci.
- (a) před uvedením do provozu (jakož i po rekonstrukci) a potom v intervalech nepřekračujících pět let z hlediska:

- (i) shodnosti s konstrukčním typem, včetně značení
- (ii) vnitřního a vnějšího stavu
- (iii) provozuschopnosti provozního výstroje

Pokud je IBC opatřena tepelnou izolací, je třeba ji sejmut pouze v míře nezbytné. Pro řádné přezkoumání tělesa IBC.

- (b) V intervalech nejvýše dvou a půl let z hlediska:
 - (i) vnějšího stavu
 - (ii) provozuschopnosti provozního výstroje.

Každá IBC musí odpovídat ve všech ohledech svému konstrukčnímu typu.

6.5.4.4.2 Každá kovová IBC, IBC z tuhého plastu a kompozitní IBC určená pro kapaliny nebo určená pro pevné látky plněné nebo vyprazdňované pod tlakem, se musí podrobit vhodné zkoušce těsnosti nejméně stejně účinné jako zkoušce předepsané v 6.5.6.7.3 a musí být schopna splnit úroveň zkoušek Uvedených v 6.5.6.7.3

- (a) předtím nežli je poprvé použit k přepravě
- (b) v intervalech ne více nežli dva a půl roku

Pro tuto zkoušku musí být IBC vybaven primárním uzávěrem dna. Vnitřní nádoba kompozitní IBC může být zkoušena bez vnějšího obalu za předpokladu, že výsledky zkoušek tím nejsou ovlivněny.

6.5.4.4.3 Zpráva o každé inspekci a zkoušce musí být uložena držitelem IBC nejméně do příští inspekce nebo zkoušky. Zpráva musí obsahovat výsledky inspekce a zkoušky a identifikaci subjektu provádějícího inspekci a zkoušku (viz také požadavky na označení v 6.5.2.2.1).

6.5.4.4.4 Příslušný orgán na důkaz, že IBC splňuje požadavky zkoušek konstrukčního typu, může kdykoli požádat přezkoušení IBC zkouškami dle této kapitoly.

6.5.4.5 Opravené IBC

6.5.4.5.1 Pokud je IBC poškozena následkem nárazu (např. při nehodě) nebo z jiné příčiny, musí být opravena nebo jinak ošetřena (viz definice „Běžné opravy a údržba IBC“ v 1.2.1), v souladu s konstrukčním typem. Tělesa tuhých plastových IBC a vnitřní nádoby kompozitních IBC, pokud jsou poškozena, musí být nahrazena.

6.5.4.5.2 Navíc k jiným zkouškám a inspekcím, které předepisuje ADR, musí být IBC podrobeny všem zkouškám a inspekcím dle požadavků uvedených v 6.5.4.4 a kdykoli je IBC opravena, musí být vypracován požadovaný protokol.

6.5.4.5.3 Subjekt provádějící zkoušky a inspekce musí IBC po opravě označit trvanlivým způsobem poblíž výrobcem umístěného UN kódu konstrukčního typu, aby byly zřejmé informace:

- (a) stát, ve kterém byly provedeny a inspekce
- (b) název nebo autorizovaný znak subjektu provádějícího zkoušky a inspekce
- (c) datum (měsíc, rok) provedení zkoušek a inspekcí

6.5.4.5.4 Zkoušky a inspekce provedené v souladu s 6.5.4.5.2 mohou být považovány za vyhovující požadavkům pro 2,5 leté a 5-leté periodické zkoušky a inspekce.

6.5.5 Zvláštní požadavky na IBC**6.5.5.1 Zvláštní požadavky na kovové IBC**

6.5.5.1.1 Tyto požadavky se vztahují na kovové IBC určené pro přepravu tuhých látek a kapalin. Existují tři kategorie kovových IBC:

- (a) IBC pro tuhé látky, které jsou plněny a vyprazdňovány samospádem (11A, 11B, 11N);
- (b) IBC pro tuhé látky, které jsou plněny a vyprazdňovány přetlakem větším než 10 kPa (0,1 baru) (21A, 21B, 21N); a
- (c) IBC pro kapaliny (31A, 31B, 31N).

6.5.5.1.2 Tělesa IBC musí být zhotovena z vhodných tvárných kovových materiálů s prokázanou svařitelností. Svary musí být provedeny odborně a musí poskytovat dokonalou bezpečnost. Musí se brát v úvahu provedení pro nízkou teplotu, pokud je to vhodné.

6.5.5.1.3 Musí se dbát na to, aby se zabránilo poškození galvanickým účinkem, vyvolaným těsným stykem různých kovů.

6.5.5.1.4 IBC z hliníku pro přepravu hořlavých kapalných látek nesmějí mít žádné pohyblivé části, jako víka, uzávěry atd., z nechráněné - rezavějící oceli, které by mohly vyvolat nebezpečnou reakci při styku s hliníkem třením nebo nárazem.

6.5.5.1.5 Kovové IBC musí být zhotoveny z kovů vyhovujících těmto požadavkům:

- (a) u oceli nesmí prodloužení po přetržení v procentech činit méně než

$$\frac{1000}{R_m} \text{ s absolutním minimem } 20 \%$$

kde R_m = zaručená minimální pevnost v tahu použité oceli v N/mm^2 .

- (b) u hliníku a jeho slitin nesmí prodloužení po přetržení v procentech činit méně než

$$\frac{1000}{R_m} \text{ s absolutním minimem } 8 \%$$

Zkušební vzorky použité pro stanovení prodloužení po přetržení musí být odebrány kolmo ke směru válcování a být upevněny tak, aby

$$L_0 = 5d \quad \text{nebo}$$

$$L_0 = 5,65\sqrt{A},$$

kde: L_0 = měřená délka zkušební vzorku před zkouškou

d = průměr

A = plocha průřezu zkušební vzorku

6.5.5.1.6 Nejmenší tloušťka stěny

- (a) u referenční oceli se součinem
- $R_m \times A_o = 10\,000$
- nesmí tloušťka stěn činit méně než:

Vnitřní objem (C) v litrech	Tloušťka stěny (T) v mm			
	Typy 11A, 11B, 11N		Typy 21A, 21B, 21N, 31A, 31B, 31N	
	Nechráněná	Chráněná	Nechráněná	Chráněná
$C \leq 1000$	2,0	1,5	2,5	2,0
$1000 < C \leq 2000$	$T = C/2000 + 1,5$	$T = C/2000 + 1,0$	$T = C/2000 + 2,0$	$T = C/2000 + 1,5$
$2000 < C \leq 3000$	$T = C/2000 + 1,5$	$T = C/2000 + 1,0$	$T = C/1000 + 1,0$	$T = C/2000 + 1,5$

kde: A_o = minimální prodloužení (v procentech) použité referenční oceli při přetržení při namáhání v tahu (viz 6.5.5.1.5);

- (b) u jiných kovů než u referenční oceli uvedené pod bodem (a) se nejmenší tloušťka stěny vypočítá podle tohoto vzorce:

$$e_1 = \frac{21,4 \times e_0}{\sqrt[3]{R_{m1} \times A_1}}$$

kde: e_1 = požadovaná ekvivalentní tloušťka stěny použitého kovu (v mm);

e_0 = požadovaná nejmenší tloušťka stěny pro referenční ocel (v mm);

R_{m1} = zaručená minimální pevnost v tahu použitého kovu (v N/mm²) (viz (c))

A_1 = minimální prodloužení (v procentech) použitého kovu při přetržení při namáhání v tahu (viz 6.5.5.1.5).

Tloušťka stěny však v žádném případě nesmí činit méně než 1,5 mm.

- (c) Pro účely výpočtu uvedeného v odstavci b) zaručená minimální pevnost v tahu použitého kovu (R_{m1}) musí mít minimální hodnotu podle národních a mezinárodních materiálových norem. Avšak pro austenitické oceli může být stanovená hodnota pro R_m zvýšena až o 15 %, jestliže je v materiálovém kontrolním osvědčení ověřena vyšší hodnota. Pokud neexistuje žádná materiálová norma pro dotyčný materiál, hodnota R_m musí být minimální hodnotou ověřenou v materiálovém kontrolním osvědčení.

6.5.5.1.7

Zařízení pro vyrovnávání tlaku: IBC určené k přepravě kapalných látek musí umožňovat odvádění dostatečného množství par, aby tím bylo zajištěno, že při působení ohně nedojde k prasknutí tělesa nádoby. Toho může být dosaženo běžnými zařízeními pro vyrovnání tlaku nebo jinými konstrukčními prostředky. Spouštěcí tlak nesmí být vyšší než 65 kPa (0,65 baru) a ne nižší než zjištěný celkový přetlak v IBC (tzn. součet tenze par plněné látky a parciálního tlaku vzduchu nebo jiných inertních plynů zmenšený o 100 kPa (1 bar) zjištěný na základě nejvyššího stupně plnění při 55 °C uvedeného v 4.1.1.4. Potřebná zařízení pro zajištění vyrovnání tlaku musí být umístěna v části nádoby, kde zůstává plynná fáze.

6.5.5.2 **Zvláštní ustanovení pro flexibilní IBC**

6.5.5.2.1

Tyto požadavky se vztahují na flexibilní IBC těchto typů:

- 13H1 plastová tkanina bez vnitřního povlaku nebo vnitřní vložky
- 13H2 plastová tkanina s vnitřním povlakem
- 13H3 plastová tkanina s vnitřní vložkou
- 13H4 plastová tkanina s vnitřním povlakem a vnitřní vložkou
- 13H5 plastová fólie

13L1 textilní tkanina bez vnitřního povlaku nebo vnitřní vložky

13L2 textilní tkanina s vnitřním povlakem

13L3 textilní tkanina s vnitřní vložkou

13L4 textilní tkanina s vnitřním povlakem a vnitřní vložkou

13M1 papír, vícevrstvý

13M2 papír, vícevrstvý, vodovzdorný

Flexibilní IBC jsou určeny pouze pro přepravu tuhých látek.

6.5.5.2.2 Tělesa musí být zhotovena z vhodných materiálů. Pevnost materiálu a konstrukce flexibilní IBC musí být přizpůsobena vnitřnímu objemu flexibilní IBC a jejímu předpokládanému použití.

6.5.5.2.3 Všechny materiály použité při výrobě flexibilních IBC typu 13M1 a 13M2 si musí po úplném ponoření do vody po dobu nejméně 24 hodin zachovat ještě nejméně 85 % pevnosti v tahu, měřené původně po kondicionování materiálu do rovnovážného stavu při relativní vlhkosti rovnající se nebo menší než 67 %.

6.5.5.2.4 Spoje musí být šité, tepelně svařené, lepené nebo provedeny jiným rovnocenným postupem. Všechny konce šitých spojů musí být zabezpečeny (před uvolněním švu).

6.5.5.2.5 Flexibilní IBC musí mít dostatečnou odolnost proti stárnutí a poklesu pevnosti, způsobené ultrafialovými paprsky, klimatickými podmínkami nebo plněnými látkami, aby byly vhodné pro předpokládané použití.

6.5.5.2.6 U flexibilních plastových IBC z plastu, který musí být chráněn proti ultrafialovému záření, musí být tato ochrana provedena přidáním sazí nebo jiných vhodných pigmentů nebo inhibitorů do materiálu. Tyto přísady musí být snášitelné s obsahem a musí si zachovat svoji účinnost po celou dobu životnosti nádoby. Při použití sazí, pigmentů nebo inhibitorů, které se liší od těch, které byly použity pro výrobu zkoušeného konstrukčního typu, může být od opakování zkoušek upuštěno, nebude-li mít změněný obsah sazí, pigmentů nebo inhibitorů nepříznivý vliv na fyzikální vlastnosti konstrukčního materiálu.

6.5.5.2.7 Ke zlepšení odolnosti proti stárnutí nebo pro jiné účely, mohou být do materiálu tělesa přimíseny přísady za předpokladu, že tyto přísady nebudou mít nepříznivý vliv na fyzikálně- chemické vlastnosti materiálu.

6.5.5.2.8 Při výrobě těles nádob IBC nesmí být použit materiál z již použitých nádob. Zbytky při výrobě nebo odpady ze stejného výrobního procesu však smějí být použity. Toto však nemá vyloučit opětné použití jednotlivých částí, jako např. upevňovacích částí a podstavců palet za předpokladu, že tyto části nebyly při svém předchozím použití žádným způsobem poškozeny.

6.5.5.2.9 V naplněném stavu nesmí poměr výšky k šířce činit více než 2:1.

6.5.5.2.10 Vnitřní vložka musí být zhotovena z vhodného materiálu. Pevnost použitého materiálu a konstrukce vnitřní vložky musí být přiměřená vnitřnímu objemu IBC a předpokládanému použití. Spoje a uzávěry musejí být prachotěsné a schopné odolat tlaku a nárazům, které vznikají za normálních podmínek manipulace a přepravy.

6.5.5.3 ***Zvláštní ustanovení pro IBC z tuhého plastu***

6.5.5.3.1 Tyto požadavky se vztahují na IBC z tuhého plastu pro přepravu tuhých látek nebo kapalin. IBC jsou těchto typů:

11H1 opatřené konstrukční výstrojí (rámem) odolávající plnému zatížení při stohování, pro tuhé látky, plněné a vyprazdňované samospádem

- 11H2 samonosné, pro tuhé látky, plněné a vyprazdňované samospádem
- 21H1 opatřené konstrukční výstrojí (rámem) odolávající plnému zatížení při stohování, pro tuhé látky, plněné a vyprazdňované pod tlakem
- 21H2 samonosné, pro tuhé látky, plněné a vyprazdňované pod tlakem
- 31H1 opatřené konstrukční výstrojí (rámem) odolávající plnému zatížení při stohování, pro kapaliny.
- 31H2 samonosné, pro kapaliny.
- 6.5.5.3.2 Těleso nádoby musí být zhotoveno z vhodného plastu známé specifikace. Pevnost materiálu a konstrukce musí být přizpůsobeny vnitřnímu objemu IBC a jejímu předpokládanému použití. Materiál musí být přiměřeným způsobem odolný proti stárnutí a ovlivnění plněními látkami a popřípadě také odolávat ultrafialovému záření. Odolnost vůči nízké teplotě je nutno vzít v úvahu pokud je to účelné. Za normálních přepravních podmínek nesmí docházet k propouštění obsahu.
- 6.5.5.3.3 Je-li nutná ochrana proti ultrafialovým paprskům, musí se provést přidáním sazí nebo jiných vhodných pigmentů nebo inhibitorů. Tyto přísady musí být snášitelné s obsahem a musí si zachovat svoji účinnost po celou dobu životnosti tělesa nádoby. Při použití sazí, pigmentů nebo inhibitorů, které se liší od těch, které byly použity pro výrobu zkoušeného konstrukčního typu, může být od opakování zkoušek upuštěno, nebude-li mít změněný obsah sazí, pigmentů nebo inhibitorů nepříznivý vliv na fyzikálně - chemické vlastnosti materiálu.
- 6.5.5.3.4 Ke zlepšení odolnosti proti stárnutí nebo pro jiné účely mohou být do materiálu tělesa nádoby přimísены přísady za předpokladu, že tyto přísady nebudou mít nepříznivý vliv na fyzikálně-chemické vlastnosti materiálu.
- 6.5.5.3.5 Pro výrobu IBC z tuhého plastu nesmí být použit odpadní materiál jiný než rozemleté zbytky z téhož výrobního procesu.
- 6.5.5.4 Zvláštní ustanovení pro kompozitní IBC s vnitřní plastovou nádobou**
- 6.5.5.4.1 Tyto požadavky se vztahují na kompozitní IBC pro přepravu tuhých látek nebo kapalin těchto typů:
- 11HZ1 kompozitní IBC s touhou plastovou vnitřní nádobou pro tuhé látky plněné a vyprazdňované samospádem
- 11HZ2 kompozitní IBC s flexibilní plastovou vnitřní nádobou, pro tuhé látky plněné a vyprazdňované samospádem
- 21HZ1 kompozitní IBC s touhou plastovou vnitřní nádobou, pro tuhé látky plněné a vyprazdňované pod tlakem
- 21HZ2 kompozitní IBC s flexibilní plastovou vnitřní nádobou, pro tuhé látky plněné a vyprazdňované pod tlakem
- 31HZ1 kompozitní IBC s touhou plastovou vnitřní nádobou pro kapaliny
- 31HZ2 kompozitní IBC s flexibilní plastovou vnitřní nádobou pro kapaliny.
- Tento kód musí být upraven nahrazením písmene Z velkým písmenem podle 6.5.1.4.1 b) k vyznačení druhu materiálu vnějšího pláště.
- 6.5.5.4.2 Vnitřní nádoba bez svého vnějšího pláště není určena k tomu, aby vykonávala obalovou funkci. „Tuhá“ vnitřní nádoba je nádoba, které zůstává její tvar, pokud je prázdná s umístěnými uzávěry a bez podpory vnějšího zajištění. Jakákoli vnitřní nádoba, pokud není „tuhá“, je považována za „flexibilní“.

- 6.5.5.4.3 Vnější plášť sestává zpravidla z tuhého materiálu formovaného tak, aby chránil vnitřní nádobu před fyzickým poškozením při manipulaci a přepravě, avšak není určen k tomu, aby zastával funkci obalu. Pokud je to vhodné, zahrnuje vnější plášť základní paletu.
- 6.5.5.4.4 Kompozitní IBC s plně uzavřeným vnějším pláštěm je nutno konstruovat tak, aby bylo možno snadno posoudit stav vnitřní nádoby ve spojení se zkouškami těsnosti a hydraulickými tlakovými zkouškami.
- 6.5.5.4.5 Nejvyšší vnitřní objem IBC typu 31HZ2 smí být nejvýše 1250 litrů.
- 6.5.5.4.6 Vnitřní nádoba musí být vyrobena z vhodného plastu známé specifikace. Pevnost materiálu a konstrukce musí být přizpůsobeny vnitřnímu objemu IBC a jejímu předpokládanému použití. Materiál musí být přiměřeně odolný proti stárnutí a ovlivnění plněnými látkami a popřípadě také odolávat ultrafialovým paprskům. Musí se brát v úvahu provedení pro nízkou teplotu, pokud je to vhodné. Za normálních přepravních podmínek nesmí docházet k propouštění obsahu.
- 6.5.5.4.7 Je-li nutná ochrana proti ultrafialovým paprskům, musí se provést přidáním sazí nebo jiných vhodných pigmentů nebo inhibitorů. Tyto přísady musí být snášetlivé s obsahem a musí si zachovat svoji účinnost po celou dobu životnosti tělesa nádoby. Při použití sazí, pigmentů nebo inhibitorů, které se liší od těch, které byly použity pro výrobu odzkoušeného konstrukčního typu, může být od opakování zkoušek upuštěno, nebude-li mít změněný obsah sazí, pigmentů nebo inhibitorů nepříznivý vliv na fyzikální vlastnosti materiálu.
- 6.5.5.4.8 Ke zlepšení odolnosti proti stárnutí nebo pro jiné účely mohou být do materiálu tělesa nádoby přimíseny přísady za předpokladu, že tyto přísady nebudou mít nepříznivý vliv na fyzikálně - chemické vlastnosti materiálu.
- 6.5.5.4.9 Pro výrobu vnitřních nádob nesmí být použit odpadní materiál jiný než rozemleté zbytky z téhož výrobního procesu.
- 6.5.5.4.10 Vnitřní nádoba IBC typu 31HZ2 musí být tvořena nejméně třemi vrstvami.
- 6.5.5.4.11 Pevnost materiálu a konstrukce vnějšího zajištění (obalu) musí být přizpůsobeny vnitřnímu objemu kompozitní IBC a jejímu použití.
- 6.5.5.4.12 Vnější plášť nesmí mít žádné vyčnívající části, které by mohly poškodit vnitřní nádobu.
- 6.5.5.4.13 Kovový vnější plášť musí být vyroben z vhodného materiálu odpovídající tloušťky.
- 6.5.5.4.14 Vnější plášť z přírodního dřeva musí být z vyzrálého, suchého a bezvadného dřeva, aby se zabránilo tomu, že bude ovlivněna pevnost jeho částí. Horní a spodní části mohou být z vodovzdorných materiálů rekonstituovaného dřeva, jako dřevotřískových desek, dřevotřískových desek nebo z jiných vhodných materiálů.
- 6.5.5.4.15 Vnější plášť z překližky musí být vyroben z dobře vyzrálé loupané nebo řezané dýhy, suché a bez vad, které by mohly podstatně ovlivnit pevnost pláště. Jednotlivé vrstvy musí být dobře slepeny vodovzdorným lepidlem. Při výrobě vnějšího pláště mohou být spolu s překližkou použity také jiné vhodné materiály. Vnější plášť musí být pevně spojen hřebíky nebo díly, musí být upevněny na rohových sloupcích nebo zakončeních nebo kompletován jinými rovnocennými prostředky.
- 6.5.5.4.16 Stěny vnějšího pláště z rekonstituovaného dřeva musí být z vodovzdorných materiálů, jako dřevotřískových nebo dřevotřískových desek nebo jiných vhodných materiálů stejného druhu. Ostatní části pláště smějí být vyrobeny z jiných vhodných materiálů.
- 6.5.5.4.17 Lepenkový vnější plášť musí být vyroben z hladké lepenky nebo ze tří a vícevrstvé vlnité lepenky dobré kvality, odpovídající vnitřnímu objemu a účelu použití. Odolnost vnějšího povrchu proti vodě musí být taková, aby zvýšení hmotnosti po dobu 30 minut trvající zkoušky na absorpci vody dle metody Cobb nečinila více než 155 g/m² (viz ISO 535:1991). Lepenka musí mít vhodnou pevnost v ohybu. Lepenka musí být formátována bez narušení a rolována tak, aby se při sestavení nelámala, její povrch se nenarušil a aby se příliš neprohýbal. Vlny vlnité lepenky musejí být pevně slepeny s vnější vrstvou.

- 6.5.5.4.18 Vnější hrany lepenkového pláště mohou mít dřevěný rám nebo být úplně ze dřeva. Pro zesílení mohou být použity dřevěné lišty.
- 6.5.5.4.19 Tovární hrany lepenkového vnějšího pláště musí být spojeny lepicí páskou, přeplátovány a slepeny nebo sešity kovovými sponami. U přeplátovaných spojů musí být přesah přiměřeně široký. Jestliže uzávěr je proveden slepením nebo lepicí páskou, musí být lepidlo vodovzdorné.
- 6.5.5.4.20 Jestliže je vnější plášť z plastu, vztahují se na něj odpovídající požadavky uvedené v 6.5.5.4.6 až 6.5.5.4.9, přičemž v tomto případě se požadavky na vnitřní nádoby vztahují i na vnější plášť kompozitních IBC.
- 6.5.5.4.21 Vnější plášť IBC typu 31HZ2 musí plně obklopovat vnitřní nádobu ze všech stran.
- 6.5.5.4.22 Každé integrální paletové dno, které patří k IBC, nebo odnímatelná paleta musí umožňovat mechanickou manipulaci IBC s náplní na nejvyšší dovolenou celkovou (bto) hmotnost).
- 6.5.5.4.23 Paletu nebo integrální dno je nutno konstruovat tak, aby byly bez výčnělků, které by mohly při manipulaci způsobit porušení spodku nádoby IBC.
- 6.5.5.4.24 Vnější plášť s odnímatelnou paletou musí být bezpečně spojeny, aby byla zajištěna stabilita při manipulaci a přepravě. Použije-li se odnímatelná paleta, musí být její povrch zbaven ostrých, vyčnívajících částí, které by mohly IBC poškodit.
- 6.5.5.4.25 Zesilovací prvky pro zvýšení stohovací pevnosti, jako dřevěné podpěry, musí být umístěny vně vnitřní nádoby.
- 6.5.5.4.26 Pokud jsou IBC určeny ke stohování, musí být nosná plocha vytvořena tak, aby zatížení bylo bezpečně rozloženo. Tyto IBC musí být konstruovány tak, aby zátěž nebyla nesena vnitřní nádobou.
- 6.5.5.5 Zvláštní ustanovení pro lepenkové IBC**
- 6.5.5.5.1 Tyto požadavky se vztahují na IBC z lepenky pro přepravu tuhých látek, které se plní a vyprazdňují samospádem. IBC z lepenky jsou typu 11G.
- 6.5.5.5.2 IBC z lepenky nesmějí být opatřeny úchyty pro zvedání shora.
- 6.5.5.5.3 Těleso nádoby musí být vyrobeno ze silné hladké lepenky nebo tří a vícevrstvé vlnité lepenky (s jednou nebo více zvlněnými vrstvami) dobré jakosti, přizpůsobených vnitřnímu objemu IBC a předpokládanému použití. Odolnost vnější plochy proti vodě musí být taková, aby zvětšení hmotnosti během 30 minut trvající zkoušky absorpce vody podle metody Cobb nečinilo více než 155 g/m² (viz ISO 535:1991). Lepenka musí mít vhodnou pevnost v ohybu. Lepenka musí být formátována bez porušení a rolována tak, aby se při sestavení nelámala, její povrch nepraskal a aby se nepatříčně neprohýbala. Vlny vlnité lepenky musí být pevně slepeny s vnější vrstvou.
- 6.5.5.5.4 Stěny včetně víka a dna musí mít minimální pevnost proti proražení 15 J, měřenou podle ISO 3036:1975.
- 6.5.5.5.5 Výrobní hrany tělesa nádoby je nutno opatřit vhodným přeplátováním a spojit použitím lepicí pásky, zalepením, sešitím kovovými sponami nebo jinými spojovacími systémy s minimálně stejnou účinností. Jestliže se spojení provádí zalepením nebo použitím lepicí pásky, musí se použít vodovzdorné lepidlo. Kovové spony musí prošívat všechny spojované díly a musí se použít ochrana tak, aby vnitřní vložka jimi nemohla být podřena či propíchnuta.
- 6.5.5.5.6 Vnitřní vložka musí být vyrobena z vhodného materiálu. Odolnost použitého materiálu a konstrukce vložky musí být přizpůsobena vnitřnímu objemu IBC a předpokládanému použití. Spoje a uzávěry musí být prachotěsné a schopné odolávat tlakům a nárazům, které mohou nastat za normálních manipulačních a přepravních podmínek.

- 6.5.5.5.7 Jakýkoliv integrální paletový podstavec, který patří k IBC, nebo odnímatelná paleta musí být uzpůsobené pro mechanickou manipulaci IBC po naplnění na nejvyšší dovolenou celkovou hmotnost.
- 6.5.5.5.8 Paletu nebo integrální podstavec je nutno konstruovat tak, aby styčná plocha s nádobou IBC byla bez výčnělků, které by při manipulaci mohly způsobit škody.
- 6.5.5.5.9 Těleso nádoby je nutno spojit s jakoukoliv odnímatelnou paletou tak, aby byla zajištěna stabilita při manipulaci a přepravě. Horní povrch odnímatelné palety, musí být zbaven ostrých vyčnívajících částí, které by mohly IBC poškodit.
- 6.5.5.5.10 Zesilovací prvky ke zvýšení stohovací odolnosti, jako dřevěné podpěry, smějí být použity, ale musí být umístěny vně vnitřní vložky.
- 6.5.5.5.11 Pokud jsou IBC určeny pro stohování, musí být nosná plocha utvořena tak, aby zatížení bylo bezpečně rozděleno.

6.5.5.6 Zvláštní ustanovení pro dřevěné IBC

- 6.5.5.6.1 Tyto požadavky se vztahují na IBC ze dřeva pro přepravu tuhých látek, plněných a vyprazdňovaných samospádem. IBC ze dřeva jsou těchto typů:
- 11C Přírodní dřevo s vnitřní vložkou
- 11D Překližka s vnitřní vložkou
- 11F Rekonstituované dřevo s vnitřní vložkou
- 6.5.5.6.2 IBC ze dřeva nesmějí být opatřeny úchyty pro zvedání shora.
- 6.5.5.6.3 Odolnost použitých materiálů a druh konstrukce musí být přizpůsobeny vnitřnímu objemu a účelu použití IBC.
- 6.5.5.6.4 Přírodní dřevo musí být dobře vyztřelé, suché a bez vad, aby se zabránilo snížení odolnosti každého jednotlivého dílu IBC. Každý díl IBC musí sestávat z jednoho kusu (plnostěnný) nebo mu být rovnocenný. Díly (z přířezů) se považují za rovnocenné jednomu kusu, použije-li se vhodná metoda lepených spojů (jako např. Lindermanovo spojení - rybinový spoj, na pero a drážku, spojení na polodrážku nebo na tupý spoj s nejméně dvěma zvlněnými kovovými upevňovacími prvky pro každý spoj nebo jiné nejméně stejně účinné metody).
- 6.5.5.6.5 Překližková tělesa nádoby musí být minimálně z třívrstvé překližky. Musí být vyrobena z dobře vyztřelé rotačně loupané, nebo řezané dýhy, suché a bez vad, které by mohly podstatně ovlivnit pevnost tělesa nádoby. Jednotlivé vrstvy musí být slepeny vodovzdorným lepidlem. Při výrobě těles nádoby mohou být spolu s překližkou použity také jiné vhodné materiály.
- 6.5.5.6.6 Tělesa nádoby z rekonstituovaného dřeva musí být z vodovzdorných materiálů jako např. dřevotřískových nebo dřevovláknitých desek nebo jiných vhodných materiálů stejného typu.
- 6.5.5.6.7 Díly IBC musí být v hranových a rohových spojech pevně sбиты hřebíky nebo kompletovány jiným vhodným způsobem.
- 6.5.5.6.8 Vnitřní vložka musí být zhotovena z vhodného materiálu. Pevnost použitého materiálu a konstrukce vnitřní vložky musí být přiměřená vnitřnímu objemu IBC a předpokládanému použití. Spoje a uzávěry musejí být prachotěsné a schopné odolat tlaku a nárazům, které vznikají za normálních podmínek manipulace a přepravy.
- 6.5.5.6.9 Integrální paletový podstavec, který patří k IBC, nebo odnímatelná paleta musí být uzpůsobeny k mechanické manipulaci IBC po naplnění na nejvyšší dovolenou celkovou hmotnost.
- 6.5.5.6.10 Paletu nebo integrální podstavec je nutno konstruovat tak, aby spodek IBC byl bez výčnělků, které by mohly při manipulaci způsobit poškození.

- 6.5.5.6.11 Těloso musí být spojeno s odnímatelnou paletou, aby byla zajištěna stabilita při manipulaci a přepravě. Použije-li se odnímatelná paleta, musí být její povrch zbaven ostrých, vyčnívajících částí, které by mohly IBC poškodit.
- 6.5.5.6.12 Zesilovací přípravky pro zvýšení stohovací pevnosti, jako dřevěné podpěry, mohou být použity, musí být ale umístěny vně vnitřní vložky.
- 6.5.5.6.13 Pokud je IBC určena pro stohování, musí být nosná plocha utvořena tak, aby zatížení bylo bezpečně rozloženo.

6.5.6 Požadavky na zkoušky IBC

6.5.6.1 Provedení a četnost zkoušek

- 6.5.6.1.1 Každý konstrukční typ IBC musí úspěšně vyhovět zkouškám předepsaným v této Kapitole před jeho použitím a před schválením příslušným orgánem povolujícím umístění značky. Konstrukční typ IBC je určen konstrukcí, velikostí, materiálem a tloušťkou stěn, způsobem výroby a plnicím a vyprazdňovacím zařízením; může mít ale různé povrchové úpravy. Zahrnuty jsou rovněž IBC, které se od konstrukčního typu liší pouze menšími vnějšími rozměry.
- 6.5.6.1.2 Zkoušky musí být prováděny na IBC připravených k přepravě. IBC musí být plněny podle údajů pro různé zkoušky. Látky, určené k přepravě mohou být nahrazeny náhradní náplní, pokud se tím nezkrusí výsledek zkoušek. Jestliže tuhé látky budou nahrazeny jinými látkami, musí mít tyto stejné fyzikální vlastnosti (hmotnost, velikost zrna apod.) jako látky určené k přepravě. Je přípustné použít dodatečná závaží, jako sáčky s olověným šrotem, aby bylo dosaženo potřebné celkové hmotnosti kusů, pokud jsou vloženy tak, aby neovlivnily výsledek zkoušek.

6.5.6.2 Zkoušky konstrukčního typu

- 6.5.6.2.1 Jedno IBC každého konstrukčního typu, rozměru, tloušťky stěny a způsobu konstrukce musí být podrobeno zkouškám v pořadí uvedeném v 6.5.6.3.7 a jak je uvedeno v 6.5.6.4 až 6.5.6.13. Tyto zkoušky konstrukčního typu musí být provedeny podle požadavku příslušného orgánu.
- 6.5.6.2.2 Aby se prokázala dostatečná chemická snášenlivost s obsaženými věcmi nebo se standardními kapalinami podle 6.5.6.3.3, nebo 6.5.6.3.5 pro IBC z tuhého plastu typu 31H2 a pro kompozitní IBC typů 31HH1 a 31HH2, pokud jsou IBC navrženy pro stohování, může se použít druhá IBC. V tomto případě musí být obě IBC podrobeny předchozímu skladování.
- 6.5.6.2.3 Příslušný orgán může povolit selektivní zkoušení IBC, které se pouze nepatrně liší od již schváleného typu, např. malými zmenšeními vnějších rozměrů.
- 6.5.6.2.4 Pokud jsou používány odnímatelné palety při těchto zkouškách, zkušební protokol vydaný podle 6.5.6.14 musí zahrnovat technický popis použitých palet.

6.5.6.3 Příprava IBC ke zkouškám

- 6.5.6.3.1 Papírové a lepenkové IBC a kompozitní IBC s vnějším lepenkovým pláštěm se musí kondicionovat nejméně 24 hodin v atmosféře s řízenou teplotou a relativní vlhkostí. Jsou tři možnosti, z nichž je nutné zvolit jednu. Přednostní atmosféra je $23 \pm 2^\circ\text{C}$ a $50 \pm 2\%$ relativní vlhkosti. Dvě další možnosti jsou $20 \pm 2^\circ\text{C}$ a $65 \pm 2\%$ relativní vlhkosti, nebo $27 \pm 2^\circ\text{C}$ a $65 \pm 2\%$ relativní vlhkosti.

POZNÁMKA: Průměrné hodnoty musí být uvnitř tohoto tolerančního rozmezí. Krátkodobé výkyvy a omezení měření mohou způsobit, že jednotlivá měření se mohou pohybovat v rozmezí $\pm 5\%$ relativní vlhkosti bez významného vlivu na zhoršení reprodukovatelnosti zkoušky.

- 6.5.6.3.2 Dále musí být zjištěno, zda plasty použité při výrobě IBC z tuhého plastu (typů 31H1 a 31H2) a kompozitních IBC (typů 31HZ1 a 31HZ2) odpovídají požadavkům v 6.5.5.3.2 až 6.5.5.3.4 a 6.5.5.4.6 až 6.5.5.4.9.

6.5.6.3.3 Na důkaz dostatečné chemické snášenlivosti s plněnými látkami musí být vzorky IBC po dobu šesti měsíců podrobeny předběžnému skladování. Po tuto dobu zůstanou vzorky IBC naplněné látkami, které mají být přepravovány, nebo látkami, které mají nejméně stejné vlivy, a to vlivy způsobující trhliny prnutím, zmenšování odolnosti a degradační vlivy na molekuly plastu, potom se vzorky podrobí vhodným zkouškám uvedeným v tabulce v 6.5.6.3.7.

6.5.6.3.4 V případě, že chování plastů bylo prokázáno nějakým jiným postupem, může být od výše uvedených zkoušky snášenlivosti upuštěno. Takové postupy musí být výše uvedené zkoušky snášenlivosti nejméně rovnocenné a musí být uznány příslušným orgánem.

6.5.6.3.5 Pro polyethylenové IBC z pevného plastu (typy 31H1 a 31H2) v souladu s pododdílem 6.5.5.3 a kompozitní IBC s polyethylenovou vnitřní nádobou (typy 31HZ1 a 31HZ2) v souladu s pododdílem 6.5.5.4 může být chemická snášenlivost s plnicími materiály podle pododdílu 4.1.1.21 prokázána následujícím způsobem se standardními kapalinami (viz oddíl 6.1.6)

Standardní kapaliny jsou představiteli pro procesy zhoršování vlastností polyetylenu, protože vlivem bobtnání dochází k měknutí, k popraskání vlivem napětí, k molekulární degradaci a ke kombinaci těchto vlivů.

Dostatečná chemická snášenlivost IBC může být prokázána skladováním požadovaných zkušebních vzorků po dobu tří týdnů při teplotě 40°C s příslušnou standardní kapalinou (kapalinami). Tam kde je standardní kapalinou voda, se skladování podle tohoto postupu nevyžaduje.

Skladováním se vyžaduje buďto pro zkušební vzorky, které se používají pro zkoušku stohováním v případě standardních kapalin smáčecího roztoku a kyseliny octové. Po tomto skladování musí zkušební vzorky podstoupit zkoušky předepsané v 6.5.6.4 až 6.5.6.9.

Zkouška snášenlivosti pro terc.-butylhydroperoxid s obsahem více nežli 40 % peroxidu a kyseliny peroxyoctové třídy 5.2 nesmí být prováděna (s) použitím standardních kapalin. Pro tyto látky musí být poskytnut důkaz o dostatečné chemické snášenlivosti zkušebních vzorků s látkami, které jsou určeny k přepravě během skladování po dobu šesti měsíců při pokojové teplotě.

Výsledky postupu podle tohoto odstavce s IBC z polyetylenu mohou být uznány pro stejný konstrukční typ, jehož vnitřní povrch je fluorován.

6.5.6.3.6 Pro konstrukční typy IBC vyrobené z polyetylenu jak je specifikován v 6.5.6.3.5 může být chemická snášenlivost s plnicími látkami prokázána rovněž laboratorními zkouškami za předpokladu, že vliv těchto plnicích látek na zkušební vzorky je menší, než vliv příslušné standardní kapaliny (kapalin) s přihlédnutím k významným zhoršujícím procesům. Pokud se týká relativní hustoty a tenze par musí se používat stejné podmínky, jak je uvedeno v 4.1.1.21.2.

6.5.6.3.7 **Požadované zkoušky konstrukčního typu a jejich pořadí**

Typ IBC	Vibrace ^f	Zdvih zdola	Zdvih shora ^a	Stohování ^b	Těsnost	Hydraulický tlak	Volný pád	Roztržení	Pád z překlopení	Vztyčování ^c
Kovové:

Dřevěné	—	1.	—	2.	—	—	3.	—	—	—

^a Pokud jsou IBC konstruovány pro tento způsob manipulace.

^b Pokud jsou IBC konstruovány pro stohování.

^c Pokud jsou IBC konstruovány pro zdvih shora nebo ze strany.

^d Požadovaná zkouška označená x; IBC, která prošla jednou zkouškou, může být použita pro další zkoušku v jakémkoli pořadí.

^e Jiná IBC stejné konstrukce může být použita pro zkoušku volným pádem.

^f Pro zkoušku vibrací může být použit jiný IBC stejného konstrukčního typu

^g Druhá IBC podle 6.5.6.2.2 může být použita mimo uvedené pořadí bezprostředně po předběžném skladování.

6.5.6.4 **Zkouška zdvihem zdola**6.5.6.4.1 **Rozsah použití**

Pro všechny lepenkové a dřevěné IBC a pro všechny typy IBC, které jsou opatřeny zařízením pro zdvih zdola (k vidlicové manipulaci), jako zkouška konstrukčního typu.

6.5.6.4.2 Příprava IBC pro zkoušku

IBC musí být naplněna při stejnoměrném rozdělení nákladu do 1,25 násobku své nejvyšší dovolené celkové (bto) hmotnosti.

6.5.6.4.3 **Postup zkoušky**

IBC musí být dvakrát zdvižena vysokozdvizným vozíkem a opět spuštěna. Přitom musí být vidlice vozíku nasazeny centrálně a vzdáleny od sebe tak, aby tato vzdálenost odpovídala 3/4 rozměrů strany, na kterou se vidlice zasouvají (leđaže by body pro nasunutí vidlic byly předem dány). Vidlice vysokozdvizného vozíku musí být zasunuty nejméně do 3/4 ve směru zasunutí. Zkouška musí být opakována v každém možném směru zasunutí.

6.5.6.4.4 *Kritéria pro vyhovění zkoušce*

6.5.6.4.5 Žádná trvalá deformace IBC, včetně palety, pokud k ní dojde, nesmí učinit IBC nezpůsobilou k přepravě a nesmí dojít k žádnému úniku naplněné látky.

6.5.6.5 *Zkouška zdvihem shora***6.5.6.5.1 *Rozsah použití***

Pro všechny typy IBC, které jsou konstruovány pro zdvih shora (k závěsné manipulaci) nebo pro flexibilní IBC konstruované pro zdvih shora nebo ze strany jako zkouška konstrukčního typu.

6.5.6.5.2 *Příprava IBC pro zkoušku*

Kovové IBC, IBC z tuhého plastu, kompozitní IBC s vnitřní nádobou z plastu musí být naplněny dvojnásobkem své nejvyšší dovolené celkové (btto) hmotnosti. Flexibilní IBC musí být naplněny reprezentativním materiálem a potom musí být zatíženy na šestnásobek své maximální povolené hrubé hmotnosti, zátěž musí být rozložena rovnoměrně.

6.5.6.5.3 *Postup zkoušky*

Kovové a flexibilní IBC musí být stanoveným způsobem zvedány, až se nedotýkají země a v této poloze drženy po dobu 5 minut.

IBC z tuhého plastu a kompozitní IBC musí být zvedány:

- (a) za každou dvojici diagonálně protilehlých zvedacích zařízení tak, aby zdvihací síly působily svisle po dobu 5 minut; a
- (b) za každou dvojici diagonálně protilehlých zvedacích zařízení tak, aby zdvihací síly působily směrem do středu pod úhlem 45° ke svislici po dobu 5 minut.

6.5.6.5.4 Pro flexibilní IBC mohou být pro zkoušku zdvihem shora a pro přípravu ke zkoušce použity jiné postupy, které jsou nejméně stejně účinné.

6.5.6.5.5 *Kritéria pro vyhovění zkoušce*

- (a) IBC kovové, z tuhého plastu a kompozitní: IBC zůstává bezpečný za normálních podmínek přepravy, nevykazuje žádnou zřetelnou deformaci, včetně základní palety, pokud tato existuje, a žádnou ztrátu obsahu;
- (b) Flexibilní IBC: žádné poškození IBC nebo jejích zvedacích zařízení, které by ji učinilo nezpůsobilou pro přepravu nebo manipulaci. A žádná ztráta obsahu.

6.5.6.6 *Zkouška stohováním***6.5.6.6.1 *Rozsah použití***

Pro všechny typy IBC, které jsou konstruovány pro stohování na sobě, jako zkouška konstrukčního typu.

6.5.6.6.2 *Příprava IBC pro zkoušku*

IBC musí být naplněna na svou nejvyšší dovolenou celkovou (btto) hmotnost. Jestliže je pro svou specifickou hmotnost výrobek pro zkoušky nevhodný musí být IBC dodatečně naplněna tak, aby byl odzkoušena na svou nejvyšší dovolenou celkovou (btto) hmotnost, přičemž zátěž musí být rovnoměrně rozložena.

6.5.6.6.3 *Postup zkoušky*

- (a) IBC musí být umístěna na své základně na rovném tvrdém podkladu a musí být podrobena působení přídavného zkušebního zatížení (nákladu) rovnoměrně rozloženého (viz 6.5.6.6.4). Pro IBC z tuhého plastu typu 31H2 a kompozitní IBC typů 31HH1 a 31HH2, musí být zkouška

stohováním provedena s původními plnicími látkami nebo po ukončení předběžného skladování se standardní kapalinou (viz 6.1.6) podle 6.5.6.3.3 nebo 6.5.6.3.5 použitím druhé IBC podle 6.5.6.2.2. IBC musí být podrobeny zkoušce na zatížení po dobu nejméně:

- (i) 5 minut pro kovové IBC;
 - (ii) 28 dní při 40°C pro IBC z tuhého plastu typů 11H2, 21H2 a 31H2 a pro kompozitní s vnějším plastovým pláštěm, které snesou stohovací zatížení (tj. typů 11HH1, 11HH2, 21HH1, 21HH2, 31HH1 a 31HH2);
 - (iii) 24 hodin pro všechny ostatní typy IBC;
- (b) Zatížení musí být aplikováno jednou z následujících metod:
- (i) jedna nebo více IBC stejného typu se naplní na nejvyšší dovolenou celkovou (bto) hmotnost a uloží se na zkoušenou IBC;
 - (ii) vhodná závaží se uloží na plochu desku nebo na napodobeninu dna IBC, která se pak umístí na zkoušenou IBC.

6.5.6.6.4 **Výpočet zkušebního stohovacího zatížení**

Zatížení, které se uloží na IBC, musí činit nejméně 1,8 násobek součtové nejvyšší dovolené celkové (bto) hmotnosti všech stejných IBC, které mohou být během přepravy nastohovány na IBC.

6.5.6.6.5 **Kritéria pro vyhovění zkoušce**

- (a) Všechny typy IBC, kromě flexibilních IBC: žádná trvalá deformace, která by učinila IBC, včetně základní palety, nezpůsobilou pro přepravu, a žádná ztráta naplněné látky.
- (b) Flexibilní IBC: žádné poškození tělesa nádoby, které by učinilo IBC nezpůsobilou pro přepravu, a žádná ztráta obsahu.

6.5.6.7 **Zkouška těsnosti**

6.5.6.7.1 **Rozsah použití**

Pro typy IBC používané k přepravě kapalin a tuhých látek plněných nebo vyprazdňovaných pod tlakem jako zkouška konstrukčního typu a periodická zkouška.

6.5.6.7.2 **Příprava IBC pro zkoušku**

Zkouška musí být prováděna před upevněním jakéhokoli tepelně izolačního vybavení. Odvětrávací ventily se buď musí nahradit uzavřenými, nebo se otvor pro odvětrávání musí utěsnit.

6.5.6.7.3 **Postup zkoušky a zkušební tlak**

Zkouška musí být prováděna po dobu nejméně 10 minut vzduchem o konstantním přetlaku nejméně 20 kPa (0,2 baru). Vzduchotěsnost IBC musí být určena přiměřenou metodou, jako např. měřením rozdílu tlaku nebo ponořením IBC do vody nebo, pro kovové IBC pokrytím švů a spojů mýdlovou pěnou. V případě ponoření do vody musí být použit pro hydrostatický tlak korekční činitel.

6.5.6.7.4 **Kritéria pro vyhovění zkoušce**

Žádný únik vzduchu.

6.5.6.8 **Zkouška vnitřním hydraulickým tlakem**

6.5.6.8.1 **Rozsah použití**

Pro typy IBC používané pro přepravu kapalin a tuhých látek plněných nebo vyprazdňovaných pod tlakem jako zkouška konstrukčního typu.

6.5.6.8.2 Příprava IBC pro zkoušku

Zkouška musí být prováděna před upevněním jakéhokoli tepelně izolačního vybavení. Zařízení pro vyrovnání tlaku musí být vyřazena z provozu nebo odstraněna a vzniklé otvory uzavřeny.

6.5.6.8.3 Postup zkoušky

Zkouška musí být prováděna po dobu nejméně 10 minut hydraulickým tlakem, který nesmí být menší než tlak uvedený v 6.5.6.8.4. IBC nesmějí být během zkoušky mechanicky podpírány.

6.5.6.8.4 Zkušební tlak**6.5.6.8.4.1 Kovové IBC:**

- (a) Pro IBC typů 21A, 21B a 21N na tuhé látky obalové skupiny I: 250 kPa (2,5 baru) (přetlak);
- (b) Pro IBC typů 21A, 21B, 21N, 31A, 31B a 31N na látky obalové skupiny II nebo III: 200 kPa (2 bary) (přetlak);
- (c) Kromě toho pro IBC typů 31A, 31B a 31N: zkušební přetlak 65 kPa (0,65 bar). Tato zkouška se musí provést před zkouškou 200 kPa (2 bary).

6.5.6.8.4.2 IBC z tuhého plastu a kompozitní IBC:

- (a) Pro IBC typů 21H1, 21H2, 21HZ1 a 21HZ2: 75 kPa (0,75 baru) (přetlak);
 - (b) Pro IBC typů 31H1, 31H2, 31HZ1 a 31HZ2: vždy vyšší ze dvou hodnot, první je stanovena podle jedné z následujících metod:
 - (i) celkový přetlak změřený v IBC (tj. tenze par plněné látky a parciální tlak vzduchu nebo jiných inertních plynů, minus 100 kPa) při 55 °C, vynásobený koeficientem bezpečnosti 1,5; tento celkový přetlak musí být stanoven na základě nejvyššího stupně plnění podle 4.1.1.4 a teploty plnění 15 °C;
 - (ii) 1,75 násobek tenze par přepravované látky při 50 °C minus 100 kPa, nejméně však se zkušebním tlakem 100 kPa;
 - (iii) 1,5 násobek tenze par přepravované látky při 55 °C minus 100 kPa, nejméně však se zkušebním tlakem 100 kPa;
- a druhá se stanoví následující metodou:
- (iv) dvojnásobek statického tlaku přepravované látky, nejméně však dvojnásobná hodnota hydrostatického tlaku vody.

6.5.6.8.5 Kritéria pro vyhovění zkoušce(kám)

- (a) Pro IBC typů 21A, 21B, 21N, 31A, 31B a 31N, které byly podrobeny zkušebnímu tlaku stanovenému v 6.5.6.8.4.1 a) nebo b): žádná netěsnost;
- (b) Pro IBC typů 31A, 31B a 31N, které byly podrobeny zkušebnímu tlaku stanovenému v 6.5.6.8.4.1 c): žádná trvalá deformace, která by učinila IBC nezpůsobilou pro přepravu ani žádná netěsnost;
- (c) Pro IBC z tuhého plastu a kompozitní IBC: žádná trvalá deformace, která by učinila IBC nezpůsobilou pro přepravu, ani žádná netěsnost.

6.5.6.9 Zkouška volným pádem**6.5.6.9.1 Rozsah použití**

Pro všechny typy IBC jako zkouška konstrukčního typu.

6.5.6.9.2 Příprava IBC pro zkoušku

- (a) Kovové IBC: IBC musí být naplněny nejméně na 95 % své maximální kapacity pro pevné látky nebo na 98 % své maximální kapacity pro kapaliny podle konstrukčního typu. Zařízení pro vyrovnávání tlaku musí být vyřazena z provozu nebo odstraněna a vzniklé otvory uzavřeny;
- (b) Flexibilní IBC: IBC musí být naplněny na maximální povolenou hrubou hmotnost, obsah musí být rovnoměrně rozložen.
- (c) Pevné plastové a kompozitní IBC: IBC musí být naplněny nejméně na 95 % své maximální kapacity pro pevné látky nebo na 98 % maximální kapacity pro kapaliny podle konstrukčního typu. Zařízení pro vyrovnávání tlaku musí být vyřazena z provozu nebo odstraněna a vzniklé otvory uzavřeny. Zkouška musí být provedena, se vzorkem o teplotě včetně obsahu redukován na minus 18 °C nebo na nižší teplotu. Pokud zkušební vzorky kompozitních IBC jsou připraveny tímto způsobem, může být upuštěno od kondicionování stanoveného v 6.5.6.3.1. Zkušební kapalina musí být udržována v kapalném stavu, v nezbytném případě s příměsí proti zmrznutí. Toto kondicionování se nemusí provádět, pokud dotyčné materiály jsou dostatečně tvárné a pevné v tahu při nízkých teplotách;
- (d) Lepenkové a dřevěné IBC: IBC musí být naplněny na nejméně 95 % svého maximálního vnitřního objemu.

6.5.6.9.3

Postup zkoušky

IBC bude podroben zkoušce volným pádem svou základnou na nepružný, vodorovný, plochý, masivní a tuhý povrch podle požadavků 6.1.5.3.4 takovým způsobem, aby se zajistilo, že bod nárazu je taková část základny IBC, která je považována za nejzranitelnější. IBC o vnitřním objemu 0,45 m³ nebo menším, musí být dále podrobeny pádům:

- (a) Kovové IBC: na nejzranitelnější část jinou, než je základna IBC zkoušená prvním pádem;
- (b) Flexibilní IBC: na nejzranitelnější boční stranu;
- (c) IBC z tuhého plastu, kompozitní, lepenkové a dřevěné IBC: na plochu boční strany, na plochu vrchní části a na roh.

Pády mohou být provedeny s jedním vzorkem nebo různými vzorky od jednoho typu IBC.

6.5.6.9.4

Výška pádu

Pro pevné látky a pro kapaliny, pokud je zkouška provedena s pevnou látkou nebo s kapalinou, které mají být přepravovány nebo s jinou látkou mající zásadně stejné fyzikální charakteristiky

Obalová skupina I	Obalová skupina II	Obalová skupina III
1,8 m	1,2 m	0,8 m

Pro kapaliny se zkouškou provede s vodou

- (a) tam, kde přepravované látky mají relativní hustotu nepřevyšující 1,2:

Obalová skupina II	Obalová skupina III
1,2 m	0,8 m

- (b) tam, kde přepravované látky mají relativní hustotu převyšující hodnotu 1,2, bude výška pádu vypočtena na základě relativní hustoty (d) přepravované látky zaokrouhlené nahoru na první desetinné místo jak vyplývá z:

Obalová skupina II	Obalová skupina III
-d x 1,0 m	d x 0,67 m

6.5.6.9.5

Kritéria pro vyhovění zkoušce

- (a) Kovové IBC: žádná ztráta obsahu;

- (b) Flexibilní IBC: žádná ztráta obsahu. Malé unikání např. z uzávěrů nebo místy na švech při nárazu není považováno za vadu IBC, pokud nedochází po jejím postavení na zem k dalšímu úniku;
- (c) IBC z tuhého plastu, kompozitní, lepenkové a dřevěné IBC: žádná ztráta obsahu. Malý unik z uzávěrů při nárazu není považován za vadu IBC, pokud nedochází k následné netěsnosti;
- (d) Všechny IBC : žádné poškození, které sníží bezpečnost a způsobilost IBC ke sběru, nebo nakládání, a nedojde k žádné ztrátě obsahu. Navíc musí být IBC schopen zdvihnutí s pomocí vhodných přípravků, pokud zůstane po dobu pěti minut mezi podlahou a IBC volný prostor.

POZNÁMKA: Kriteria v (d) platí pro konstrukční typy IBC vyrobené od 1. ledna 2011.

6.5.6.10 Zkouška roztržením

6.5.6.10.1 Rozsah použití

Pro všechny typy flexibilních IBC jako zkouška konstrukčního typu.

6.5.6.10.2 Příprava IBC pro zkoušku

IBC musí být naplněna nejméně do 95 % svého vnitřního objemu rovnoměrně rozloženým nákladem do své nejvyšší dovolené celkové hmotnosti.

6.5.6.10.3 Postup zkoušky

Když je IBC na zemi, provede se řez nožem v délce 100 mm, který úplně pronikne nejširší z bočních stěn v úhlu 45° k hlavní ose IBC, a to v polovině výšky mezi dnem IBC a horní hladinou naplněné látky. IBC musí být potom vystavena rovnoměrně rozdělenému stohovacímu zatížení odpovídajícímu dvojnásobku nejvyšší dovolené celkové hmotnosti. Zatížení musí působit nejméně po dobu 5 minut. IBC konstruované pro zdvihání shora nebo ze strany, musí být po odstranění stohovacího zatížení zvednuty, až se nedotýkají země, a v této poloze musí být drženy po dobu 5 minut.

6.5.6.10.4 Kritéria pro vyhovění zkoušce

Řez se nesmí prodloužit o více než 25 % své původní délky.

6.5.6.11 Zkouška překlopením (pádem z překlopení)

6.5.6.11.1 Rozsah použití

Pro všechny typy flexibilních IBC jako zkouška konstrukčního typu.

6.5.6.11.2 Příprava IBC pro zkoušku

IBC musí být naplněna nejméně na 95 % svého vnitřního objemu rovnoměrně rozloženým nákladem na nejvyšší dovolenou celkovou hmotnost.

6.5.6.11.3 Postup zkoušky

IBC se musí převrátit tak, aby padla na jakoukoliv část své výšky na pevnou, nepružnou, hladkou, plochou a vodorovnou plochu.

6.5.6.11.4 Výška pádu z překlopení

Obalová skupina I	Obalová skupina II	Obalová skupina III
1,8 m	1,2 m	0,8 m

6.5.6.11.5 Kritéria pro vyhovění zkoušce

Žádná ztráta obsahu. Malé unikání např. z uzávěrů nebo místy na švech při nárazu není považováno za vadu IBC, pokud nedochází k dalšímu úniku;

6.5.6.12 Zkouška vztyčováním**6.5.6.12.1 Rozsah použití**

Pro všechny flexibilní IBC konstruované pro zvedání shora nebo ze strany jako zkouška konstrukčního typu.

6.5.6.12.2 Příprava IBC pro zkoušku

IBC musí být naplněna nejméně na 95 % svého vnitřního objemu rovnoměrně rozloženým nákladem na nejvyšší dovolenou celkovou hmotnost.

6.5.6.12.3 Postup zkoušky

Na straně ležící IBC musí být zvednuta jedním ze zvedacích zařízení nebo dvěma zvedacími zařízeními, jsou-li k dispozici čtyři, zvednuta rychlostí nejméně 0,1 m/s do svislé polohy tak, aby se už nedotýkala země.

6.5.6.12.4 Kritéria pro vyhovění zkoušce

Žádné poškození IBC nebo jeho zvedacích zařízení, které by IBC učinilo nezpůsobilou pro přepravu nebo manipulaci.

6.5.6.13 Zkouška vibrací**6.5.6.13.1 Použitelnost**

Pro všechny IBC používané pro kapaliny, jako zkouška konstrukčního typu.

POZNÁMKA: Tato zkouška se použije pro konstrukční typy IBC vyrobené po 31. prosinci 2010 (viz rovněž 1.6.1.14).

6.5.6.13.2 Příprava IBC pro zkoušku

Vzorek IBC bude vybrán náhodně a musí být vybaven a uzavřen jako pro přepravu. IBC musí být naplněn vodou na nejméně 98 % své maximální kapacity.

6.5.6.13.3 Zkušební metoda a doba trvání

6.5.6.13.3.1 IBC musí být umístěn ve středu plošiny zkušebního přístroje s vertikální, sinusoidální, dvojitou amplitudou (posunutí vrchol – vrchol) 25 mm \pm 5 %. Je-li to nutné, musí být omezující zařízení k plošině připevněna, aby se zabránilo vodorovnému pohybu vzorku z plošiny bez omezení vertikálního pohybu.

6.5.6.13.3.2 Zkouška musí být provedena po dobu jedné hodiny s frekvencí, která způsobí, že část základny IBC se přechodně zvedne od vibrující plošiny po část každého cyklu o takový stupeň, že může být kovová vložka na ni přerušovaně zcela vložena, mezi nejméně jeden bod základny IBC a zkušební plošinu. Frekvence mohou být upraveny po nastavení počátečního stupně tak, aby se obal nedostal do rezonance. Zkušební frekvence ale musí pokračovat, aby dovolila vložení kovové vložky pod IBC, jak je to shora popsáno. Schopnost vkládat kovovou vložku mezi IBC a vibrační plošinu je pro úspěšné projití testu podstatná. Aby bylo možno zkoušku provést, musí být kovová vložka použita pro tuto zkoušku nejméně 1.6 mm tlustá, 50 mm široká a musí mít dostatečnou délku, aby mohla být vložena minimálně 100 mm mezi IBC a vibrační plošinu.

6.5.6.13.4 Kritéria pro vyhovění zkoušce

Nesmí být pozorován žádný únik ani popraskání a, navíc žádný zlom nebo poškození strukturálních komponent, jako jsou prasklé sváry nebo poškozená upevnění.

6.5.6.14 *Protokol o zkoušce*

6.5.6.14.1 O zkoušce musí být sepsán protokol obsahující alespoň následující podrobnosti, který musí být přístupný uživatelům IBC:

1. Název a adresa zkušebny;
2. Jméno (název) a adresa žadatele (kde to je vhodné);
3. Jednoznačné identifikační číslo protokolu o zkoušce;
4. Datum protokolu o zkoušce;
5. Výrobce IBC;
6. Popis konstrukčního typu IBC (např. rozměry, materiály, uzávěry, tloušťky atd.), dále způsob výroby (např. tvarování foukáním), který může zahrnovat výkres(y) nebo/a fotografii(e);
7. Nejvyšší vnitřní objem;
8. Charakteristiky zkoušených náplní (látek), např. viskozita a relativní hustota u kapalin a rozměr zrn u tuhých látek;
9. Popisy zkoušky a výsledky;
10. Zkušební protokol musí být podepsán s uvedením jména a funkce signatáře.

6.5.6.14.2 Protokol o zkoušce musí obsahovat prohlášení, že IBC určená pro přepravu byla odzkoušena podle příslušných ustanovení této kapitoly a že použití jiných obalových postupů nebo komponentů může učinit protokol neplatným. Jedno vyhotovení protokolu o zkoušce se uloží u příslušného orgánu.

KAPITOLA 6.6

POŽADAVKY NA KONSTRUKCI A ZKOUŠENÍ VELKÝCH OBALŮ

6.6.1 Všeobecné

6.6.1.1 Požadavky této kapitoly neplatí pro:

- obaly pro třídu 2, vyjma velkých obalů pro předměty třídy 2, včetně obalů na aerosoly;
- obaly pro třídu 6.2, vyjma velkých obalů pro UN 3291 odpad klinický;
- obaly pro třídu 7 obsahující radioaktivní látky.

6.6.1.2 Velké obaly musí být vyráběny, zkoušeny a rekonstruovány podle programu zajištění kvality uznaného příslušným orgánem, aby bylo zabezpečeno, že každý vyrobený nebo rekonstruovaný velký obal odpovídá požadavkům této kapitoly.

POZNÁMKA: ISO 16106:2006 „Obaly - Přepavní obaly pro nebezpečné věci - Obaly pro nebezpečné věci, velké nádoby pro volně ložené látky (IBC) a velké obaly – Návod pro používání ISO 9001“ poskytuje přijatelný návod pro postupy, které je nutno sledovat

6.6.1.3 Zvláštní požadavky na velké obaly v 6.6.4 jsou založeny na běžně používaných velkých obalech. S ohledem na vědecký a technický pokrok neexistuje námitka proti použití velkých obalů majících rozdílné specifikace od těch, které jsou uvedeny v 6.6.4, za předpokladu, že jsou stejně účinné, přijatelné pro příslušný orgán a schopné úspěšně absolvovat zkoušky popsané v 6.6.5. Jiné postupy zkoušení nežli jsou ty popsané v ADR, jsou přijatelné za předpokladu, že jsou rovnocenné a jsou uznány příslušným orgánem.

6.6.1.4 Výrobci a následní distributoři obalů musí poskytnout informace ohledně následných postupů a popisu typů a rozměrů uzávěrů (zahrnující v to požadovaná těsnění) a jakýchkoliv dalších komponent potřebných k zajištění, aby obaly jak jsou předávány k přepravě byly schopné projít příslušnými zkouškami odolnosti dle této kapitoly.

6.6.2 Kód pro označení typu velkých obalů

6.6.2.1 Kódy používané pro velké obaly se skládají z:

- (a) dvou arabských číslic, a sice:
 - 50 pro tuhé velké obaly; nebo
 - 51 pro flexibilní velké obaly; a
- (b) latinské velké písmeno označující povahu materiálu, např. dřevo, ocel atd., podle seznamu v pododdíle 6.1.2.6.

6.6.2.2 Kód velkého obalu může být doplněn písmeny „W“ nebo „T“. Písmeno „T“ označuje velké záchranné obaly odpovídající požadavkům 6.6.5.1.9. Písmeno „W“ znamená, že velký obal sice náleží typu označenému kódem, avšak byl vyroben podle rozdílné specifikace, než je uvedena v 6.6.4 a podle ustanovení v 6.6.1.3 byl uznán jako ekvivalentní.

6.6.3 Značení

6.6.3.1 Primární značení: Každý velký obal, který je vyroben a určen pro použití podle požadavků ADR, musí být opatřen značením, které je trvanlivé, čitelné a je umístěno na takovém místě, aby bylo ihned viditelné. Písmena, číslice a značky musí být alespoň 12 mm vysoké a musí zobrazovat:

- (a) Znak Spojených národů pro obaly:

Tento znak nesmí být použit pro jiné účely než pro osvědčení, že obal, přemístitelná cisterna nebo MEGC splňuje příslušné požadavky kapitoly 6.1, 6.2, 6.3, 6.5, 6.6 nebo 6.7¹.

Pro velké kovové obaly, na kterých je označení provedeno vytlačněním nebo vyražením, smí být namísto znaku použito písmen „UN“;

- (b) Číslo „50“ označuje tuhé velké obaly nebo „51“ označuje flexibilní velké obaly, následované označením materiálového typu podle seznamu v 6.5.1.4.1(b);
- (c) Velké písmeno, které udává obalové skupiny, pro které je konstrukční typ schválen:
- X pro obalové skupiny I, II, a III;
- Y pro obalové skupiny II a III
- Z jen pro obalovou skupinu III
- (d) Měsíc a rok (vždy poslední dvě číslice) výroby
- (e) Stát schvalující udělení UN kódu; uvedený rozlišovací značkou pro motorová vozidla v mezinárodním provozu²;
- (f) Jméno nebo znak výrobce a jiné označení pro velký obal podle ustanovení příslušného orgánu;
- (g) Zkušební zátěž při zkoušce stohováním v kg. Pro velké obaly, které nejsou určeny pro stohování, se uvede „0“;
- (h) Nejvyšší dovolená celková (btto) hmotnost v kg.

Výše požadované primární označení, musí být uvedeno v pořadí pododstavců.

Každý prvek značení aplikovaný v souladu s písmeny (a) až (h) musí být jasně oddělen, např. lomítkem nebo mezerou, tak aby byl snadno identifikovatelný.

6.6.3.2

Příklady značení

50A/X/05 01/N/PQRS
2500/1000

Velký obal z ocele, který smí být stohován
stohovací zátěž: 2500 kg,
nejvyšše přípustná hmotnost (btto): 1000 kg.

50H/Y/04 02/D/ABCD 987
/0/800

Velký obal z plastu, který nesmí být stohován,
nejvyšší celková (btto) hmotnost: 800 kg.

51H/Z/06 01/S/1999
0/500

Flexibilní velký obal, který nesmí být stohován,
nejvyšší celková (btto) hmotnost: 500 kg.

50AT/Y/05/01/B/PQRS
2500/1000

Pro velké ocelové záchranné obaly vhodné pro stohování;
Zatížení ve stohu: 2500 kg; maximální hrubá hmotnost:
1000 kg.

¹ Tento symbol se také používá k potvrzení, že flexibilní objemové vaky schválené pro ostatní druhy dopravy jsou v souladu s požadavky uvedenými v kapitole 6.8 Modelového regulativu OSN.

² Rozlišovací značky pro motorová vozidla v mezinárodním provozu podle Vídeňské konvence o silničním provozu (1968).

- 6.6.3.3 Maximální povolené stohovací zatížení platné při používání velkých obalů musí být uvedeno na značce podle vyobrazení na obrázku 6.6.3.3.1 nebo na obrázku 6.6.3.3.2. Značka musí být trvanlivá a dobře viditelná.

obrázek 6.6.3.3.1

Velké obaly, které je možné stohovat

obrázek 6.6.3.3.2

Velké obaly, které NENÍ možné stohovat

Minimální rozměry musí být 100 mm x 100 mm. Výška písmen a číslic udávajících hmotnost musí být nejméně 12 mm. Plocha uvnitř tiskových značek označených rozměrovými šipkami musí být čtvercová. Tam, kde rozměry nejsou uvedeny, musí být všechny vlastnosti v přibližném poměru k vlastnostem na obrázku. Hmotnost vyznačená nad značkou nesmí překročit zatížení působící při konstrukční typové zkoušce (viz 6.6.5.3.3.4) děleno 1,8.

6.6.4 Zvláštní požadavky na velké obaly

6.6.4.1 Zvláštní požadavky na velké kovové obaly

- 50 A z oceli
- 50 B z hliníku
- 50 N z kovu (jiného než ocel nebo hliník)

- 6.6.4.1.1 Velké obaly musí být vyrobeny z přiměřeně tvarovatelného kovu, jehož svařitelnost byla plně prokázána. Svary musí být odborně provedeny a poskytovat plnou bezpečnost. Odolnost vůči nízké teplotě musí být brána v úvahu, když je to vhodné.

- 6.6.4.1.2 Musí se dbát na to, aby bylo zabráněno škodlivému galvanickému působení na základě doteku různých kovů.

6.6.4.2 Zvláštní požadavky na velké obaly z flexibilních materiálů

- 51 H z flexibilního plastu
- 51 M z papíru

- 6.6.4.2.1 Velké obaly musí být vyrobeny z vhodných materiálů. Pevnost materiálu a provedení flexibilních velkých obalů musí být uzpůsobeny vnitřnímu objemu a předpokládanému použití.

- 6.6.4.2.2 U všech flexibilních velkých obalů typu 51 M musí použitý materiál po minimálně 24 hodinovém úplném ponoření do vody vykazovat ještě minimálně 85% hodnoty pevnosti v tahu, která byla původně naměřena u materiálu při kondicionování do rovnovážného stavu při relativní vlhkosti do 67 %.

- 6.6.4.2.3 Spoje musí být provedeny šitím, tepelným svařováním, lepením nebo jiným stejně vhodným postupem. Všechny konce švů musí být zabezpečeny.

- 6.6.4.2.4 Flexibilní velké obaly musí vykazovat přiměřenou odolnost vůči stárnutí a ztrátě pevnosti způsobené ultrafialovým zářením, klimatickými podmínkami nebo obsaženou látkou a tím prokázat vhodnost k jejich předpokládanému použití.
- 6.6.4.2.5 U flexibilních velkých obalů z plastu, u kterých se vyžaduje ochrana proti ultrafialovému záření, se tato ochrana zajišťuje přidáním sazí nebo jiných vhodných pigmentů nebo inhibitorů (do konstrukčního materiálu). Tyto příměsi se musí snášet s plněným nákladem a musí zůstat funkční během celé doby použití velkého obalu. Při použití sazí, pigmentů nebo inhibitorů, které se odlišují od těch, které byly použity pro výrobu odzkoušeného konstrukčního typu, může být upuštěno od opakování zkoušek, pokud změněný obsah sazí, pigmentů nebo inhibitorů nemá negativní vliv na fyzikální vlastnosti konstrukčních materiálů.
- 6.6.4.2.6 Do materiálů velkých obalů smějí být přimíchány příměsi, které zlepší odolnost vůči stárnutí nebo pro jiné účely, za předpokladu, že nepříznivě neovlivní jeho fyzikální nebo chemické vlastnosti.

6.6.4.2.7 Je-li velký obal naplněn, nesmí poměr výšky vůči šířce činit více než 2:1.

6.6.4.3 Zvláštní požadavky na plastové velké obaly

50 H z tuhých plastů

- 6.6.4.3.1 Velký obal musí být zhotoven z vhodného plastu známé specifikace a jeho pevnost musí odpovídat objemu a předpokládanému používání. Materiál musí být odpovídajícím způsobem odolný vůči stárnutí a ztrátě pevnosti, způsobené obsahem nebo případně působením ultrafialového záření. Chování za nízké teploty musí být bráno v úvahu, pokud je to vhodné. Za normálních přepravních podmínek nesmí dojít k unikání obsahu.
- 6.6.4.3.2 Je-li potřebná ochrana proti ultrafialovému záření, musí být toto provedeno přidáním sazí nebo jiných vhodných pigmentů nebo inhibitorů. Tyto příměsi se musí snášet s obsahem a musí plnit svoji funkci během životnosti velkého obalu. Při použití sazí, pigmentů nebo inhibitorů, které se odlišují od těch, které byly použity pro výrobu odzkoušeného konstrukčního typu, může být upuštěno od opakování zkoušek, pokud změněný obsah sazí, pigmentů nebo inhibitorů nemá negativní vliv na fyzikální vlastnosti konstrukčního materiálu.
- 6.6.4.3.3 Aditiva mohou být přidána do materiálu velkého obalu ke zvýšení odolnosti vůči stárnutí, nebo pro jiné účely, pokud nepříznivě neovlivní fyzikální nebo chemické vlastnosti materiálu.

6.6.4.4 Zvláštní požadavky na lepenkové velké obaly

50 G z tuhé lepenky

- 6.6.4.4.1 Velký obal musí být zhotoven z pevné hladké lepenky nebo tří- a vícevrstvé vlnité lepenky dobré kvality, odpovídající vnitřnímu objemu a předpokládanému použití. Odolnost vnějšího povrchu k absorpci vody podle Cobba 30 min (v režimu Cobb1800) nesmí být vyšší než 155 g/m² (viz norma ISO –535:1991). Lepenka musí mít odpovídající pevnost v ohybu. Lepenka musí být formátována bez trhlin. Lepenka při kompletaci obalu se nesmí v rylování lámat či na povrchu popraskat, nebo se silně vyboulet. Vlny lepenky musí být pevně slepeny s vnější vrstvou.
- 6.6.4.4.2 Stěny, včetně víka a dna, musí vykazovat odolnost vůči průrazu minimálně 15 J, měřeno podle normy ISO 3036:1975.
- 6.6.4.4.3 Výrobní spoje lepenkových vnějších obalů musí vykazovat dostatečné překrytí a musí být provedeny lepicí páskou, slepením, sešitím kovovými sponami nebo jiným minimálně stejně vhodnými spojovacími prostředky. Je-li spojení provedeno slepením nebo za použití lepicí pásky, lepidlo musí být vodovzdorné. Kovové spony musí prošívat všechny spojované části obalu a být tvarovány nebo chráněny tak, aby nemohly ohrozit vnitřní vložku prodřením nebo propíchnutím.

- 6.6.4.4.4 Paletová dna, která tvoří součást velkého obalu, nebo jakékoliv odnímatelné palety musí být uzpůsobeny k mechanické (vidlicové) manipulaci s velkým obalem naplněným na nejvyšší dovolenou celkovou (bto) hmotnost.
- 6.6.4.4.5 Odnímatelná paleta nebo paletové dno musí být bez výstupků, aby se zabránilo narušení spodku velkého obalu, což by při manipulaci mohlo být příčinou škody.
- 6.6.4.4.6 U odnímatelné palety musí být těleso obalu pevně spojeno s odnímatelnou paletou, aby se zajistila stabilita při manipulaci a přepravě. Mimo to musí být vrchní povrch odnímatelných palet prost ostrých výstupků, které by mohly poškodit velký obal.
- 6.6.4.4.7 Ke zvýšení odolnosti při stohování, smějí být používány podpůrné prvky jako dřevěné vzpěry, které se však musí umístit vně vnitřní vložky.
- 6.6.4.4.8 Je-li předpokládáno stohování velkých obalů, musí být nosná plocha zhotovena tak, aby zátěž byla bezpečně rozložena.

6.6.4.5 Zvláštní požadavky na dřevěné velké obaly

- 50 C z přírodního dřeva
- 50 D z překližky
- 50 F z rekonstituovaného dřeva
- 6.6.4.5.1 Pevnost používaných materiálů a jejich konstrukční aplikace musí odpovídat objemu a předpokládanému použití velkých obalů.
- 6.6.4.5.2 Je-li velký obal z přírodního dřeva, musí být z dřeva dobře vyvrátého, vyschlého a dřeva bez vad, aby nedošlo k závažnému snížení pevnosti kterékoliv části velkých obalů. Každý díl velkých obalů musí být plnostěnný (z jednoho kusu), nebo tomuto rovnocenný. Díly lze považovat za plnostěnné, pokud přířezy dílu jsou spojeny odpovídající metodou např. Lindermanovo spojení (spoj typu vlašťovčího ocasu), spojení na pero a drážku, přeplátováním, na tupý spoj s nejméně 2 vlnovitými kovovými upevňovacími prvky pro každý spoj nebo jiným stejně účinným způsobem.
- 6.6.4.5.3 Je-li velký obal z překližky, musí se tato skládat nejméně ze tří vrstev. Tyto musí být vyrobeny z dobře vyvráté loupané nebo po létech řezané dýhy, obchodně obvykle suché a bez vad, které by snížily pevnost velkého obalu. Jednotlivé vrstvy musí být spolu slepeny vodovzdorným lepidlem. Pro výrobu velkých obalů mohou být použity také jiné vhodné materiály společně s překližkou.
- 6.6.4.5.4 Je-li velký obal z rekonstituovaného dřeva, pak musí být materiály jako tvrdé dřevovláknité či dřevotřískové desky nebo jiné vhodné materiály vodovzdorné.
- 6.6.4.5.5 Velké obaly musí být pevně spojeny hřebíky nebo zabezpečeny s rohovými svlaky nebo konci, nebo musí být kompletovány jinými stejně vhodnými prostředky.
- 6.6.4.5.6 Paletové dno, které vytváří nedílnou část velkého obalu, nebo odnímatelná paleta musí být vhodné pro mechanickou manipulaci velkého obalu naplněného na nejvyšší přípustnou celkovou (bto) hmotnost.
- 6.6.4.5.7 Odnímatelná paleta nebo paletové dno musí být navrženy tak, aby se zabránilo možnosti jakýchkoliv výčnělků základny velkého obalu, které by mohly být náchylné k vzniku poškození při manipulaci.
- 6.6.4.5.8 U odnímatelné palety musí být těleso obalu spojeno pevně s paletou, aby byla zajištěna stabilita při manipulaci a přepravě. Povrch odnímatelné palety musí být prost nerovností, které by mohly velký obal poškodit.
- 6.6.4.5.9 Zesilovací systémy, jako jsou dřevěné podpěry k zvýšení stohovatelnosti, smí být použity, ale musí být situovány vně vnitřní vložky.

- 6.6.4.5.10 Je-li předpokládáno, že velké obaly budou stohovány, musí být nosné plochy uzpůsobeny tak, že dojde k bezpečnému rozložení nákladu.

6.6.5 Zkušební požadavky na velké obaly

6.6.5.1 Provádění a četnost zkoušek

- 6.6.5.1.1 Konstrukční typ každého velkého obalu musí být podroben podle 6.6.5.3 předpokládaným zkouškám a to podle pevně stanovených postupů příslušným orgánem povolujícím umístění značky a musí být tímto příslušným orgánem schválen.

- 6.6.5.1.2 Každý konstrukční typ velkého obalu musí před použitím úspěšně projít zkouškami předepsanými v této kapitole. Konstrukční typ velkého obalu je určen konstrukcí, rozměrem, použitým materiálem a jeho tloušťkou, způsobem výroby a balení, může však také zahrnovat různé opracování povrchu, včetně velkých obalů, které se od svého konstrukčního typu odlišují pouze nižší konstrukční výškou.

- 6.6.5.1.3 Zkoušky musejí být provedeny se vzorky z výroby v intervalech, které jsou příslušným orgánem pevně stanoveny. Budou-li takovéto zkoušky provedeny na velkých obalech z lepenky, příprava při okolních podmínkách (prostředí) se považuje za rovnocennou podmínkám uvedeným v 6.6.5.2.4.

- 6.6.5.1.4 Zkoušky se musejí opakovat také po každé modifikaci měnící konstrukci, materiál nebo technologii výroby velkých obalů.

- 6.6.5.1.5 Příslušný orgán může povolit selektivní zkoušku velkých obalů, které se jen velmi málo liší od již zkoušeného konstrukčního typu: např. menšími rozměry vnitřních obalů nebo vnitřními obaly s nižší čistou (netto) hmotností, nebo také velké obaly s malými redukcemi vnějšího(-ch) rozměru(-ů).

- 6.6.5.1.6 (Vyhrazeno)

POZNÁMKA: Pro podmínky sestavování různých vnitřních obalů do velkého obalu a povolených variací vnitřních obalů, viz 4.1.1.5.1.

- 6.6.5.1.7 Příslušný orgán může kdykoliv požadovat důkaz, aby zkouškami podle tohoto oddílu bylo prokázáno, že velké obaly ze sériové výroby splňují požadavky pro zkoušky konstrukčního typu.

- 6.6.5.1.8 Pod podmínkou, že platnost výsledků zkoušky nebude ovlivněna a se souhlasem příslušného orgánu smí být provedeno více zkoušek s jedním vzorkem.

- 6.6.5.1.9 Velké záchranné obaly

Velké Záchranné obaly musí být zkoušeny a označeny v souladu s ustanoveními platnými pro obalovou skupinu II velké obaly určené pro přepravu tuhých látek nebo vnitřní obaly, s těmito výjimkami:

- (a) Zkušební látka používá při provádění těchto zkoušek, musí být voda a velké záchranné obaly musí být naplněny na nejméně 98 % jejich maximálního objemu. Pro dosažení požadované celkové hmotnosti obalu je přípustné používat přídavky, jako jsou sáčky se sekaným olovem, pokud jsou umístěny tak, aby nebyly ovlivněny výsledky zkoušek. Případně při provádění pádové zkoušky je možné měnit pádovou výšku v souladu s 6.6.5.3.4.4.2 (b);
- (b) Velké záchranné obaly musí být navíc úspěšně podrobeny zkoušce těsnosti při 30 kPa, přičemž výsledky tohoto testu musí být uvedeny v protokolu o zkoušce podle požadavku 6.6.5.4; a
- (c) Velké záchranné obaly musí být označeny písmenem "T", jak je popsáno v 6.6.2.2.

6.6.5.2 Příprava pro zkoušky

- 6.6.5.2.1 Zkoušky se provedou na velkých obalech připravených k přepravě, včetně vnitřních obalů nebo přepravovaných předmětů. Vnitřní obaly pro kapalné látky musí být plněny nejméně na 98 % svého nejvyššího vnitřního objemu, pro tuhé látky na nejméně 95% svého nejvyššího vnitřního objemu.

U velkých obalů, jejichž vnitřní obaly jsou určeny pro přepravu kapalných nebo pevných látek, je potřeba provést oddělené zkoušky s kapalným a tuhým obsahem. Látky obsažené ve vnitřních obalech nebo předměty obsažené ve velkých obalech určené k přepravě se smí nahradit jinými látkami nebo předměty, pokud tímto nebudou výsledky zkoušky negativně zkresleny. Jsou-li použity jiné vnitřní obaly nebo předměty, musí mít stejné fyzikální vlastnosti (hmotnost atd.) jako k přepravě určené vnitřní obaly nebo předměty. Je přípustné použít přídavnou zátěž, jako pytle s olověným šrotem, aby se dosáhlo požadované celkové hmotnosti kusu, pokud jsou použity tak, aby tímto neovlivnily výsledky zkoušky.

6.6.5.2.2 Použije-li se při zkoušce pádem místo kapaliny jiná látka, musí mít podobnou relativní hustotu a viskozitu jako látka, která se má přepravovat. Voda může být také použita pro zkoušku pádem dle ustanovení 6.6.5.3.4.4.

6.6.5.2.3 Velké plastové obaly a velké obaly obsahující vnitřní plastové obaly, vyjma pytlů, které jsou určeny pro pevné látky nebo předměty, je třeba podrobit zkoušce volným pádem, když teplota zkušební vzorku a jeho obsahu byla redukována na $-18\text{ }^{\circ}\text{C}$ nebo nižší. Od kondicionování může být upuštěno, jestliže materiály obalu vykazují při nízkých teplotách dostatečnou poddajnost a pevnost v tahu. Budou-li zkušební vzorky připraveny tímto způsobem, lze ustoupit od kondicionování podle 6.6.5.2.4. Pro zkoušky použité kapalně látky se musí udržet v kapalném stavu přidáním příměsí proti zmrznutí, pokud je to nutné.

6.6.5.2.4 Velké lepenkové obaly musí být minimálně 24 hodin kondicionovány v prostředí, kde je teplota a relativní vlhkost vzduchu řízena. Jsou tři možnosti, z nichž musí být jedna vybrána.

Upřednostněné prostředí je $23\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$ a $50\% \pm 2\%$ relativní vlhkost vzduchu. Obě ostatní možnosti jsou $20\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$ a $65\% \pm 2\%$ relativní vlhkosti vzduchu nebo $27\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$ a $65\% \pm 2\%$ relativní vlhkosti vzduchu.

POZNÁMKA: Střední hodnoty musí ležet uvnitř těchto mezních hodnot. Krátkodobé odchylky a mezní hodnoty mohou vyvolat odchylky jednotlivých měření až o $\pm 5\%$ pro relativní vlhkost vzduchu, bez významného zhoršení reprodukovatelnosti zkoušky.

6.6.5.3 Zkušební požadavky

6.6.5.3.1 Zkouška zdvihem zdola

6.6.5.3.1.1 Rozsah použití

Pro všechny druhy velkých obalů, které jsou uzpůsobeny ke zdvihu zdola (vidlicové manipulaci), jako zkouška konstrukčního typu.

6.6.5.3.1.2 Příprava velkých obalů pro zkoušku

Velký obal je plněn až k 1,25 násobku své nejvyšší dovolené celkové (btto) hmotnosti, přičemž je zátěž rovnoměrně rozložena.

6.6.5.3.1.3 Postup zkoušení

Velký obal musí být 2x zvednut vidlicovým vysokozdvížným vozíkem a nechá se potom klesnout, přičemž je třeba vidlice umístit centrálně s odstupem 3/4 od zaváděcího bočního rozměru (pokud nejsou zaváděcí body udány). Vidlice musí být zavedena až do 3/4 zaváděcího směru. Zkouška musí být opakována v každém možném zaváděcím směru.

6.6.5.3.1.4 Kritéria pro vyhovění zkoušce

Žádné trvalé deformace velkého obalu, které ovlivní bezpečnost přepravy a žádná ztráta obsahu.

6.6.5.3.2 Zkouška zdvihem shora**6.6.5.3.2.1 Rozsah použití**

Pro všechny druhy velkých obalů, které jsou uzpůsobeny pro zdvih shora (závěsnou manipulaci), jako zkouška konstrukčního typu.

6.6.5.3.2.2 Příprava velkých obalů pro zkoušku

Velké obaly musí být naplněny na dvojnásobek jejich nejvyšší dovolené celkové (btto) hmotností. Flexibilní velké obaly musí být naplněny na šestinásobek jejich nejvyšší dovolené celkové (btto) hmotností, přičemž zátěž musí být rovnoměrně rozložena.

6.6.5.3.2.3 Postup zkoušení

Velké obaly musí být zvednuty způsobem, pro který jsou vybaveny, až se nacházejí volně nad podlahou a po dobu 5 minut jsou v této poloze drženy.

6.6.5.3.2.4 Kritéria pro vyhovění zkoušce

- (a) Kovové velké obaly a velké obaly z plastu nesmějí vykazovat žádné trvalé deformace včetně základny palety, které by velké obaly učinily nezpůsobilé k přepravě, a žádnou ztrátu obsahu.
- (b) Velké flexibilní obaly: žádné poškození velkých obalů nebo jejich zvedacích zařízení, které by ji učinilo nezpůsobilou pro přepravu nebo manipulaci, a žádná ztráta obsahu.

6.6.5.3.3 Zkouška stohováním**6.6.5.3.3.1 Rozsah použití**

Pro všechny druhy velkých obalů, které jsou uzpůsobeny ke stohování na sobě, jako zkouška konstrukčního typu.

6.6.5.3.3.2 Příprava velkých obalů pro zkoušku

Velký obal musí být naplněn na svou nejvyšší dovolenou celkovou (btto) hmotnost.

6.6.5.3.3.3 Způsob provedení zkoušky

Velký obal musí svým dnem stát na vodorovném tvrdém podkladě a být vystaven působení rovnoměrně rozdělené zkušební zátěži (viz odstavec 6.6.5.3.3.4) po dobu nejméně 5 minut; Velké obaly ze dřeva, lepenky nebo plastu musí být této zátěži vystaveny nejméně 24 hodin.

6.6.5.3.3.4 Výpočet zkušební zátěže

Zátěž, kterou se velký obal zatíží, musí být minimálně 1,8 násobkem součtové nejvyšší dovolené celkové (btto) hmotnosti počtu stejných velkých obalů, které mohou být během přepravy na velký obal nastohovány.

6.6.5.3.3.5 Kritéria pro vyhovění zkoušce

- (a) Všechny typy velkých obalů, kromě flexibilních velkých obalů: řádná trvalá deformace, která by učinila velké obaly, včetně základní palety, nezpůsobilou pro přepravu, a žádná ztráta naplněné látky.
- (b) Flexibilní velké obaly: žádné poškození tělesa nádoby, které by učinilo velké obaly nezpůsobilé pro přepravu, a žádná ztráta obsahu.

6.6.5.3.4 Zkouška volným pádem**6.6.5.3.4.1 Rozsah použití**

Pro všechny druhy velkých obalů, jako zkoušky konstrukčního typu.

6.6.5.3.4.2 Příprava velkých obalů na zkoušku

Velké obaly musí být naplněny podle 6.6.5.2.1.

6.6.5.3.4.3 Způsob provedení zkoušky

Velký obal musí být spuštěn na nepružný, horizontální, rovný, masivní a tuhý povrch podle požadavků 6.1.5.3.4 takovým způsobem, aby se zajistilo, že bod nárazu je v té části základny velkého obalu, kterou je možno považovat za nejvíce zranitelnou.

6.6.5.3.4.4 Výška pádu

POZNÁMKA: Velké obaly pro látky a předměty třídy 1 musí být zkoušeny podle zkušebních požadavků pro obalovou skupinu II.

6.6.5.3.4.4.1 Pro vnitřní obaly obsahující tuhé látky, kapaliny nebo předměty, pokud je zkouška prováděna s tuhou látkou, kapalinou nebo předměty, které se mají přepravovat, nebo s jinou látkou nebo předměty mající v podstatě stejné fyzikální vlastnosti:

Obalová skupina I	Obalová skupina II	Obalová skupina III
1,8 m	1,2 m	0,8 m

6.6.5.3.4.4.2 Pro vnitřní obaly obsahující kapaliny, pokud je zkouška prováděna s vodou:

(a) Jestliže látka, která se má přepravovat, má relativní hustotu nepřesahující 1.2:

Obalová skupina I	Obalová skupina II	Obalová skupina III
1,8 m	1,2 m	0,8 m

(b) Jestliže látka, která se má přepravovat má relativní hustotu přesahující 1.2, výška pádu musí být vypočítána na základě relativní hustoty (d) přepravované látky, zaokrouhlена na desetiny, následovně:

Obalová skupina I	Obalová skupina II	Obalová skupina III
d x 1,5 (m)	d x 1,0 (m)	d x 0,67 (m)

6.6.5.3.4.5 Kritéria pro vyhovění zkoušce

6.6.5.3.4.5.1 Velké obaly nesmějí vykazat žádné poškození, které by ohrožovalo bezpečnost přepravy. Žádný únik přepravované látky z vnitřního(ch) obalu(ů) nebo předmětu(ů).

6.6.5.3.4.5.2 U velkých obalů pro předměty třídy 1 není dovolena žádná trhлина, která by umožnila únik výbušných látek nebo předmětů z velkého obalu.

6.6.5.3.4.5.3 Byl-li velký obal podroben zkoušce volným pádem, zkušební vzorek obstál, jestliže celý obsah zůstal v obalu, i když uzávěr už není prachotěsný.

6.6.5.4 Zkušební protokol

6.6.5.4.1 Na každý konstrukční typ velkého obalu musí být vydán atest s povolením značení (UN kódem dle 6.6.3) osvědčující, že konstrukční typ včetně jeho vybavení splnil požadavky zkoušek.

6.6.5.4.2 O zkoušce musí být sepsán zkušební protokol obsahující minimálně následující údaje a musí být dostupný uživatelům velkého obalu:

1. Jméno a adresa zkušebny;
2. Jméno a adresa objednavatele (pokud je to vhodné);
3. Jednoznačná identifikace protokolu;

4. Datum protokolu;
5. Výrobce velkého obalu;
6. Popis konstrukčního typu velkého obalu (např. rozměry, materiály, uzávěry, tloušťky stěn atd.) a / nebo fotografie;
7. Nejvyšší vnitřní objem / nejvyšší dovolená celková (bto) hmotnost;
8. Charakteristické znaky zkoušeného obsahu, např. druhy a popisy použitých vnitřních obalů nebo předmětů;
9. Popisy a výsledky zkoušek;
10. Zkušební protokol musí být podepsán s uvedením jména a funkce podepisujícího.

6.6.5.4.3 Zkušební protokol musí obsahovat prohlášení, že pro přepravu připravený velký obal byl odzkoušen v souladu s příslušnými požadavky této kapitoly, a že tento zkušební protokol při použití jiných způsobů balení nebo komponent, může být neplatný. Jedno vyhotovení zkušebního protokolu je třeba.

KAPITOLA 6.7

POŽADAVKY NA KONSTRUKCI, VÝROBU, INSPEKCE A ZKOUŠENÍ PŘEMÍSTITELNÝCH CISTEREN A UN VÍCEČLÁNKOVÝCH KONTEJNERŮ NA PLYN (MEGC)

POZNÁMKA: Pro nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby s nádržemi z kovových materiálů, pro bateriová vozidla a více článkové kontejnery na plyn (MEGC) jiné než UN MEGC viz kapitola 6.8; pro cisterny z vyztužených plastů viz kapitola 6.9; pro cisterny pro podtlakové vyčerpávání odpadů viz kapitola 6.10.

6.7.1 Platnost a všeobecné požadavky

6.7.1.1 Požadavky této kapitoly se vztahují na přemístitelné cisterny určené pro přepravu nebezpečných věcí a na MEGC určené pro přepravu nezchlazených plynů třídy 2 všemi druhy dopravy. Kromě požadavků této kapitoly, pokud není stanoveno jinak, musí každá multimodální přemístitelná cisterna nebo MEGC odpovídající definici "kontejner" splňovat příslušné požadavky Mezinárodní úmluvy o bezpečných kontejnerech (KBK) 1972, se změnami a doplňky. Dodatečné požadavky mohou být uplatněny na přemístitelné cisterny nebo MEGC přicházející na moře, které jsou manipulovány na otevřeném moři.

6.7.1.2 S ohledem na vědecký a technický pokrok mohou být technické požadavky této kapitoly upraveny alternativními ujednáními. Tato alternativní ujednání musí nabízet nejméně takovou úroveň bezpečnosti, která je dána požadavky této kapitoly s ohledem na snášlivost s přepravovanými látkami, a schopnost přemístitelné cisterny nebo MEGC odolat nárazu, zatížení a požáru. Pro mezinárodní dopravu alternativní ujednání přemístitelných cisteren nebo MEGC musí být schváleny vhodnými příslušnými orgány.

6.7.1.3 Pokud látka není uvedena v pokynech pro přemístitelné cisterny (T1 až T23, T50 nebo T75) ve sloupci (10) tabulky A kapitoly 3.2, může být příslušným orgánem země původu vydáno prozatímní schválení. Schválení musí být uvedeno v dokumentaci k zásilce a musí obsahovat nejméně informace normálně uvedené v pokynech pro přemístitelné cisterny a podmínky, za nichž musí být látka přepravována.

6.7.2 Požadavky na konstrukci, výrobu, inspekce a zkoušení přemístitelných cisteren určených pro přepravu látek třídy 1 a tříd 3 až 9

6.7.2.1 Definice

Pro účely tohoto oddílu se následujícími pojmy rozumí:

Alternativní ujednání znamená schválení zaručené příslušným orgánem pro přemístitelnou cisternu nebo MEGC, které byly konstruovány, vyrobeny nebo zkoušeny podle technických požadavků nebo zkušebních metod jiných, než uvedených v této kapitole;

Přemístitelná cisterna znamená multimodální cisternu pro přepravu látek třídy 1 a tříd 3 až 9. Přemístitelná cisterna zahrnuje nádrž s provozní výstrojí a konstrukční výstrojí nezbytnou pro přepravu nebezpečných látek. Přemístitelnou cisternu musí být možno plnit a vyprazdňovat bez sejmutí konstrukční výstroje. Musí mít stabilizační členy vně nádrže a musí ji být možno zvedat v naplněném stavu. Musí být především konstruována pro zdvih na vozidlo, železniční vůz nebo námořní plavidlo nebo plavidlo pro vnitrozemské vodní cesty a musí být vybavena zarážkami, úchyty nebo příslušenstvím umožňujícím mechanickou manipulaci. Silniční cisternová vozidla, železniční cisternové vozy, nekovové cisterny a velké nádoby pro volně ložené látky (IBC) nespádají pod definici přemístitelných cisteren;

Nádrž znamená část přemístitelné cisterny, která obsahuje látky určené pro přepravu (vlastní cisterna), včetně otvorů a jejich uzávěrů, ale nezahrnuje provozní výstroj a konstrukční výstroj;

Provozní výstroj znamená měřicí přístroje a plnicí, vyprazdňovací, větrací, pojistná, zahřívací, chladicí a tepelně izolační zařízení;

Konstrukční výstroj znamená výztužné, upevňovací, ochranné a stabilizační prvky vně nádrže;

Nejvyšší dovolený provozní tlak (MAWP) znamená tlak, který nesmí být menší než nejvyšší z dále uvedených tlaků měřených na vrcholu nádrže v provozní poloze:

- (a) Nejvyšší dovolený efektivní přetlak v nádrži během plnění nebo vyprazdňování; nebo
- (b) Nejvyšší dovolený efektivní přetlak, pro který je nádrž konstruována, jež nesmí být menší než součet:
 - (i) absolutního tlaku par (v barech) látky při 65 °C, zmenšeného o 1 bar; a
 - (ii) dílčího tlaku (v barech) vzduchu nebo jiných plynů v prostoru nad látkou vlivem nejvyšší teploty 65 °C v tomto prostoru a roztažnost kapaliny vlivem zvýšení střední teploty látky $t_r - t_f$ (t_f = teplota plnění, obvykle 15 °C, t_r = 50 °C, nejvyšší střední teplota látky);

Výpočtový tlak znamená tlak používaný pro výpočty a požadovaný schváleným předpisem pro tlakové nádoby. Výpočtový tlak musí být vyšší než nejvyšší z dále uvedených tlaků:

- (a) nejvyšší dovolený efektivní přetlak v nádrži během plnění nebo vyprazdňování; nebo
- (b) součet:
 - (i) absolutní tenze par (v barech) látky při 65 °C, zmenšená o 1 bar;
 - (ii) dílčího tlaku (v barech) vzduchu nebo jiných plynů v prostoru nad látkou vlivem nejvyšší teploty 65 °C v tomto prostor a roztažnost kapaliny vlivem zvýšení střední teploty látky $t_r - t_f$ (t_r = teplota plnění, obvykle 15 °C, t_f = 50 °C, nejvyšší střední teplota látky); a
 - (iii) tlaku stanoveného na základě statických sil uvedených v 6.7.2.2.12, ale nejméně 0,35 baru;
- (c) dvě třetiny nejmenšího zkušebního tlaku uvedeného v příslušných pokynech pro přemístitelné cisterny ve 4.2.5.2.6;

Zkušební tlak znamená nejvyšší přetlak ve vrcholu nádrže během hydraulické tlakové zkoušky rovný nebo nejméně 1,5 násobku výpočtového tlaku. Nejnižší zkušební tlak pro přemístitelné cisterny určené pro zvláštní látky je uveden v příslušných pokynech pro přemístitelné cisterny ve 4.2.5.2.6.

Zkouška těsnosti znamená zkoušku nádrže a její provozní výstroje používající plyn do vnitřního tlaku nejméně 25 % MAWP;

Nejvyšší dovolená celková hmotnost (MPGM) znamená součet vlastní hmotnosti přemístitelné cisterny a nejvyšší dovolené užitečné hmotnosti;

Referenční ocel znamená ocel s mezí pevností v tahu 370 N/mm² a prodloužením při přetržení 27 %;

Měkká ocel znamená ocel se zaručenou mezí pevností v tahu 360 N/mm² až 440 N/mm² a zaručeným nejmenším prodloužením při přetržení podle 6.7.2.3.3.3;

Projektovaný teplotní rozsah pro nádrž musí být od -40 °C do 50 °C pro látky přepravované za normálních podmínek. Pro látky manipulované za podmínek zvýšené teploty nesmí být projektovaná teplota nižší než nejvyšší teplota látky během plnění, vyprazdňování nebo přepravy. Přísnější konstrukční teploty musí být uvažovány pro přemístitelné cisterny provozované v tvrdých klimatických podmínkách;

Jemnozrná ocel znamená ocel, která má rozměr feritických zrn 6 nebo menší, pokud je určen podle ASTM E 112-96 nebo definován v normě EN 10028-3, část 3;

Tavný prvek znamená opětovně neuzavíratelné zařízení pro vyrovnávání tlaku, které je teplotně ovládáno.

Přemístitelná cisterna pro přepravu v systému offshore znamená přemístitelnou cisternu speciálně konstruovanou pro opětné použití pro přepravu do, z a mezi přibližnými zařízeními. Přemístitelná cisterna pro přepravu v systému offshore je zkonstruována a vyrobena podle pokynů pro schvalování kontejnerů přepravovaných po otevřených mořích stanovených Mezinárodní námořní organizací (International Maritime Organization) v dokumentu MSC/Circ. 860.

6.7.2.2 Všeobecné konstrukční a výrobní požadavky

- 6.7.2.2.1 Nádrže musí být konstruovány a vyrobeny v souladu s požadavky na tlakové nádoby uznávanými příslušným orgánem. Nádrže musí být vyrobeny z kovových materiálů vhodných pro tváření. Materiály musí v zásadě odpovídat národním a mezinárodním materiálovým normám. Pro svařované nádrže musí být použit pouze materiál, jehož svařitelnost byla plně prokázána. Svary musí být odborně provedeny a zaručovat úplnou bezpečnost. Pokud je to pro výrobní proces a materiály nezbytné, musí být nádrže vhodně tepelně zpracovány, aby byla zaručena přiměřená pevnost ve svaru a tepelně ovlivněných zónách. Při volbě materiálu musí být zohledněno riziko křehkého lomu, napětí korozivních trhlin a odolnost proti nárazu. Pokud je použita jemnozrná ocel, zaručená hodnota meze pružnosti nesmí být vyšší než 460 N/mm² a zaručená hodnota horní meze pevnosti v tahu nesmí být vyšší než 725 N/mm² podle specifikace materiálu. Hliník může být použit jako konstrukční materiál, jen pokud je uveden ve zvláštním ustanovení pro přemístitelnou cisternu pro zvláštní látku v sloupci (11) tabulky A kapitoly 3.2 nebo pokud je to schváleno příslušným orgánem. Pokud je hliník schválen, musí být izolován, aby se zabránilo ztrátě fyzikálních vlastností, pokud je podroben tepelnému zatížení 110 kW/m² po dobu nejvýše 30 minut. Izolace musí zůstat účinná při všech teplotách do 649 °C a musí být potažena materiálem s bodem tavení nejméně 700 °C. Materiály přemístitelných cisteren musí být vhodné pro okolní prostředí, ve kterém mohou být přepravovány.
- 6.7.2.2.2 Nádrže přemístitelných cisteren, spojovací prvky a potrubí musí být vyrobeny z materiálů, které jsou:
- (a) Podstatně odolné proti působení látky(ek) určené(ých) k přepravě; nebo
 - (b) Netečné nebo neutralizované chemickou reakcí; nebo
 - (c) Potaženy antikoročním materiálem přímo nataženým na nádrž nebo spojeným rovnocennými prostředky.
- 6.7.2.2.3 Těsnění musí být vyrobena z materiálů odolných proti látkám určeným k přepravě.
- 6.7.2.2.4 Pokud jsou nádrže potaženy, potažení musí být dostatečně odolné proti působení látky(ek) určené(ých) k přepravě, homogenní, neporézní, bez trhlin, dostatečně pružné a shodné charakteristiky tepelné roztažnosti nádrže. Potažení každé nádrže, upevnění nádrže a potrubí musí být souvislé a musí pokrývat celou plochu jakékoli příruby. Pokud jsou vnější upevnění přivařena na cisternu, potažení musí být souvislé a upevnění a kolem celé plochy vnějších přírub.
- 6.7.2.2.5 Spoje a švy potažení musí být provedeny zatavením materiálů nebo jinými rovnocennými prostředky.
- 6.7.2.2.6 Dotyk různých kovů, které by mohly způsobit poškození galvanickými účinky, není přípustěn.
- 6.7.2.2.7 Materiály přemístitelné cisterny, včetně jakýchkoli přístrojů, těsnění, potažení a příslušenství nesmějí nepříznivě ovlivňovat látku určené k přepravě v přemístitelné cisterně.
- 6.7.2.2.8 Přemístitelné cisterny musí být konstruovány a vyrobeny s podporami pro bezpečnou základnu během přepravy a vhodnými zvedacími a spouštěcími upevňovacími prvky.

- 6.7.2.2.9 Přemístitelné cisterny musí být konstruovány tak, aby odolaly beze ztráty obsahu nejméně vnitřnímu tlaku způsobenému obsahem a statickým, dynamickým a tepelným zatížením během normálních podmínek manipulace a dopravy. Konstrukce musí prokázat, že únavové účinky způsobené těmito opakovanými namáháními v průběhu očekávané životnosti přemístitelné cisterny byly zohledněny.
- 6.7.2.2.9.1 Pro přemístitelné cisterny určené pro provoz v systému offshore, musí být zohledněna dynamická namáhání vzniklá během manipulace na otevřeném moři.
- 6.7.2.2.10 Nádrž, která má být vybavena zařízením pro vyrovnávání podtlaku, musí být konstruována tak, aby odolala bez trvalé deformace vnějšímu tlaku nejméně 0,21 baru nad vnitřní tlak. Zařízení pro vyrovnávání podtlaku musí být nastaveno tak, aby vypouštělo při podtlaku do minus (-)0,21 baru, pokud nádrž není konstruována pro vyšší vnější přetlak; v takovém případě nesmí být odpouštěcí tlak zařízení vyšší než výpočtový podtlak cisterny. Nádrž používaná pro přepravu tuhých látek (práškových nebo zrnitých) pouze obalových skupin II nebo III, které během přepravy nezkapalňují, může být zkonstruována pro nižší vnější tlak, podléhající schválení příslušného orgánu. V tomto případě musí být podtlakový ventil nastaven tak, aby otevíral při tomto nižším tlaku. Nádrž, která nemá být vybavena zařízením pro vyrovnávání podtlaku, musí být konstruována tak, aby odolala bez trvalé deformace vnějšímu tlaku nejméně 0,4 baru nad vnitřní tlak.
- 6.7.2.2.11 Podtlak vyrovnávající zařízení používané na přemístitelných cisternách, určených pro přepravu látek splňujících kritéria bodu vzplanutí třídy 3, včetně zahřátých látek přepravovaných při nebo nad jejich bodem vzplanutí, musí být chráněno proti okamžitému prolehnutí plamene do nádrže, nebo musí mít přemístitelná cisterna nádrž schopnou odolat bez úniku obsahu výbuchu z prolehnutí plamene do nádrže.
- 6.7.2.2.12 Přemístitelné cisterny a jejich upevnění musí při nejvyšším dovoleném zatížení být schopny absorbovat následující jednotlivé statické síly:
- (a) Ve směru jízdy: dvojnásobek MPGM násobená zemským zrychlením (g)¹;
 - (b) Vodorovně kolmo na směr jízdy: MPGM (pokud směr jízdy není jasně určen, síly musí být rovnocenné dvojnásobku MPGM) násobená zemským zrychlením (g)¹;
 - (c) Svisle vzhůru: MPGM násobená zrychlením (g)¹; a
 - (d) Svisle dolů: dvojnásobek MPGM (celkové zatížení včetně účinku gravitace) násobené zemským zrychlením (g)¹.
- 6.7.2.2.13 U každé ze sil v 6.7.2.2.12 musí být zachován koeficient bezpečnosti takto:
- (a) Pro kovy mající výrazně definovanou mez pružnosti koeficient 1,5 ve vztahu k mezi tažnosti; nebo
 - (b) Pro kovy nemající výrazně definovanou mez pružnosti koeficient 1,5 ve vztahu k zaručeným 0,2 % prokázané pružnosti a pro austenitické oceli 1 % prokázané pružnosti.
- 6.7.2.2.14 Hodnoty meze pevnosti nebo prokázané pevnosti musí být hodnoty podle národních a mezinárodních materiálových norem. Pokud jsou používány austenitické oceli, stanovené nejnižší hodnoty meze pevnosti nebo prokázané pevnosti podle materiálových norem mohou být zvýšeny o 15 %, pokud jsou tyto vyšší hodnoty ověřeny v kontrolních osvědčeních materiálu. Pokud neexistuje žádná materiálová norma pro daný materiál, hodnota meze pevnosti nebo prokázané pevnosti musí být schválena příslušným orgánem.
- 6.7.2.2.15 Přemístitelné cisterny musí být možno elektricky uzemnit, pokud jsou určeny pro přepravu látek s bodem vzplanutí podle kritérií pro třídu 3 včetně zahřátých látek přepravovaných při teplotě rovné nebo převyšující jejich bod vzplanutí. Musí být provedena taková opatření, aby se zamezilo nebezpečnému elektrostatickému výboji.

¹ Pro účely výpočtu $g = 9,81 \text{ m/s}^2$

6.7.2.2.16 Pokud je to požadováno pro určité látky vhodným pokynem pro přemístitelné cisterny uvedeným ve sloupci (10) tabulky A kapitoly 3.2 a popsáném v 4.2.5.2.6 nebo zvláštním ustanovením pro přemístitelné cisterny uvedeným ve sloupci (11) tabulky A kapitoly 3.2 a popsáným v 4.2.5.3, přemístitelné cisterny musí být provedeny s dodatečnou ochranou, která může mít formu dodatečné tloušťky nádrže nebo vyššího zkušebního tlaku, dodatečné tloušťky stěny nebo vyššího zkušebního tlaku stanoveného podle přirozeného nebezpečí spojeného s přepravou daných látek.

6.7.2.2.17 Tepelná izolace v přímém kontaktu s nádrží určenou pro látky přepravované v zahřátém stavu musí mít zápalnou teplotu nejméně o 50 °C vyšší než je nejvyšší výpočtová teplota cisterny.

6.7.2.3 **Konstrukční kritéria**

6.7.2.3.1 Nádrže musí být konstruovány na základě matematické analýzy namáhání nebo experimentální míry odolnosti napětí nebo jinými metodami schválenými příslušným orgánem.

6.7.2.3.2 Nádrže musí být konstruovány a vyrobeny tak, aby odolaly hydraulickému zkušebnímu tlaku rovnému nejméně 1,5 násobku výpočtového tlaku. Zvláštní požadavky pro určité látky v příslušném pokynu pro přemístitelné cisterny jsou uvedeny v sloupci (10) tabulky A kapitoly 3.2 a popsány ve 4.2.5.2.6 nebo ve zvláštním ustanovení pro přemístitelné cisterny uvedeném ve sloupci (11) tabulky A kapitoly 3.2 a popsáném ve 4.2.5.3. Pozornost je věnována požadavkům na nejmenší tloušťku stěn nádrže těchto cisteren uvedeným v 6.7.2.4.1 až 6.7.2.4.10.

6.7.2.3.3 Pro kovy vykazující zřetelnou mez pevnosti nebo charakterizované zaručenou prokázanou pevností (0,2 % prokázané pevnosti obecně nebo 0,1 % prokázané pevnosti pro austenitické oceli) primární povrchové napětí σ (sigma) v nádrží nesmí překročit 0,75 Re nebo 0,50 Rm, podle toho, která z nich je nižší, při zkušebním tlaku, kde:

Re = výrazná mez průtažnosti v N/mm² nebo 0,2 % prokázané průtažnosti nebo pro austenitické ocele 1 % prokázané průtažnosti;

Rm = zaručená minimální pevnost v tahu v N/mm².

6.7.2.3.3.1 Použité hodnoty Re a Rm musí být stanoveny jako nejmenší hodnoty podle národních a mezinárodních materiálových norem. Pokud je použita austenitická ocel, stanovené nejnižší hodnoty pro Re a Rm podle materiálových norem mohou být zvýšeny až o 15 %, jestliže vyšší hodnoty jsou ověřeny v materiálovém kontrolním osvědčení. Neexistují-li žádné materiálové normy pro daný kov, použité hodnoty Re a Rm musí být schváleny příslušným orgánem nebo jím pověřenou organizací.

6.7.2.3.3.2 Oceli, které mají poměr Re/Rm větší než 0,85, nejsou dovoleny pro výrobu svařovaných nádrží. Hodnoty Re a Rm použité pro stanovení tohoto poměru musí být hodnoty uvedené v materiálovém kontrolním osvědčení.

6.7.2.3.3.3 Oceli použité pro konstrukci nádrží musí mít prodloužení při přetržení v % nejméně 10 000/Rm s absolutním minimem 16 % pro jemnozrnné oceli a 20 % pro ostatní oceli. Hliník a hliníkové slitiny používané v konstrukci nádrží musí mít prodloužení při přetržení v % nejméně 10 000/Rm s absolutním minimem 12 %.

6.7.2.3.3.4 Pro účely stanovení skutečných hodnot materiálů je třeba dodat, že pro pláštový materiál musí být osa vzorku kovu pro zkoušku pevnosti v pravém úhlu (kolmá) ke směru stáčení. Stálé prodloužení při přetržení musí být měřeno na zkušebních vzorcích v pravoúhlých příčných řezech v souladu s ISO 6892:1998 používající 50 mm měrné délky.

6.7.2.4 **Minimální tloušťka stěny**

6.7.2.4.1 Minimální tloušťka stěny musí být větší než tloušťka stanovená takto:

(a) Minimální tloušťka stěny stanovená podle požadavků 6.7.2.4.2 až 6.7.2.4.10;

(b) Minimální tloušťka stěny stanovená podle uznávaných předpisů pro tlakové nádoby včetně požadavků v 6.7.2.3; a

- (c) Minimální tloušťka stěny stanovená v příslušném pokynu pro přemístitelné cisterny uvedeném ve sloupci (10) tabulky A kapitoly 3.2 a popsaném v 4.2.5.2.6 nebo stanovená podle zvláštního ustanovení pro přemístitelné cisterny uvedeného ve sloupci (11) tabulky A kapitoly 3.2 a popsaného v 4.2.5.3.

- 6.7.2.4.2 Cylindrické části, konce (dna) a kryty uzávěrů nádrží o průměru do 1,8 m musí mít tloušťku nejméně 5 mm v referenční oceli nebo rovnocennou tloušťku použitého kovu. Nádrže o průměru větším než 1,8 m musí mít tloušťku nejméně 6 mm v referenční oceli nebo rovnocennou tloušťku použitého kovu kromě toho, že pro práškové a zrnité tuhé látky obalové skupiny II nebo III může být požadavek na minimální tloušťku snížen na nejméně 5 mm tloušťky v referenční oceli nebo rovnocennou tloušťku použitého kovu.
- 6.7.2.4.3 Pokud je provedena dodatečná ochrana nádrže proti poškození, přemístitelné cisterny se zkušebními tlaky menšími než 2,65 baru mohou mít minimální tloušťku stěny zmenšenou úměrně k provedené ochraně schválené příslušným orgánem. Avšak nádrže o průměru nejvýše 1,8 m nesmějí mít tloušťku menší než 3 mm v referenční oceli nebo rovnocennou tloušťku použitého kovu. Nádrže o průměru větším než 1,8 m nesmějí mít tloušťku menší než 4 mm v referenční oceli nebo rovnocennou tloušťku použitého kovu.
- 6.7.2.4.4 Cylindrické části, konce (dna) a kryty uzávěrů nádrží nesmějí mít tloušťku menší než 3 mm bez ohledu na materiál konstrukce.
- 6.7.2.4.5 Dodatečná ochrana uvedená v 6.7.2.4.3 může být provedena celkovou vnější konstrukční ochranou, jako vhodnou "sendvičovou" konstrukcí s vnější ochranou (pláštěm) upevněnou k nádrži, konstrukcí dvojité stěny nebo uzavřením nádrže v kompletním rámu s podélnými a příčnými konstrukčními prvky.
- 6.7.2.4.6 Rovnocenná tloušťka kovu jiná než předepsaná pro referenční ocel v 6.7.2.4.2 musí být stanovena podle tohoto vzorce:

$$e_1 = \frac{21,4 e_0}{\sqrt[3]{Rm_1 A_1}}$$

kde:

- e_1 = požadovaná rovnocenná tloušťka (v mm) použitého kovu;
- e_0 = minimální tloušťka (v mm) referenční oceli stanovená v příslušném pokynu pro přemístitelné cisterny uvedeném ve sloupci (10) tabulky A kapitoly 3.2 a popsaném v 4.2.5.2.6 nebo ve zvláštním ustanovení pro přemístitelné cisterny uvedeném ve sloupci (11) tabulky A kapitoly 3.2 a popsaném v 4.2.5.3;
- Rm_1 = minimální zaručená pevnost v tahu (v N/mm²) použitého kovu (viz 6.7.2.3.3);
- A_1 = zaručené minimální prodloužení při přetržení (v %) použitého kovu podle národních nebo mezinárodních norem.

- 6.7.2.4.7 Pokud je v příslušném pokynu pro přemístitelné cisterny v 4.2.5.2.6 uvedena minimální tloušťka 8 mm nebo 10 mm, je třeba poznamenat, že tyto tloušťky jsou založeny na vlastnostech referenční oceli a průměru nádrže 1,80 m. Pokud je použit kov jiný než měkká ocel (viz 6.7.2.1) nebo nádrž má průměr větší než 1,80 m, tloušťka musí být stanovena podle tohoto vzorce:

$$e_1 = \frac{21,4 e_0 d_1}{1,8 \sqrt[3]{Rm_1 A_1}}$$

kde:

- e_1 = požadovaná rovnocenná tloušťka (v mm) použitého kovu;

e_0 = minimální tloušťka (v mm) referenční oceli stanovené v příslušném pokynu pro přemístitelné cisterny uvedeném ve sloupci (10) tabulky A kapitoly 3.2 a popsaném v 4.2.5.2.6 nebo ve zvláštním ustanovení pro přemístitelné cisterny uvedeném ve sloupci (11) tabulky A kapitoly 3.2 a popsaném v 4.2.5.3;

d_1 = průměr nádrže (v m), avšak nejméně 1,80 m;

R_{m1} = minimální zaručená pevnost v tahu (v N/mm²) použitého kovu (viz 6.7.2.3.3);

A_1 = zaručené minimální prodloužení při přetržení (v %) použitého kovu podle národních nebo mezinárodních norem.

6.7.2.4.8 V žádném případě nesmí být tloušťka stěny nádrže menší, než je předepsána v 6.7.2.4.2, 6.7.2.4.3 a 6.7.2.4.4. Všechny části nádrže musí mít minimální tloušťku stanovenou v 6.7.2.4.2 až 6.7.2.4.4. Tato tloušťka musí být výlučně bez jakéhokoli přídavku na korozi.

6.7.2.4.9 Pokud je použita měkká ocel (viz 6.7.2.1), pro výpočet se nevyžaduje použití vzorce v 6.7.2.4.6.

6.7.2.4.10 V místech připojení konců (den) k cylindrické části nádrže nesmějí být žádné změny tloušťky.

6.7.2.5 *Provozní výstroj*

6.7.2.5.1 Provozní výstroj musí být tak uspořádána, aby byla chráněna proti nebezpečí utržení nebo poškození během přepravy a manipulace. Pokud spoj mezi rámem a nádrží dovoluje relativní pohyb mezi jednotlivými konstrukčními částmi, musí být výstroj upevněna tak, aby dovozovala takový pohyb bez nebezpečí poškození provozních částí. Vnější spojovací vyprazdňovací prvky (potrubí, uzavírací ventily), vnitřní uzavírací ventil a jeho sedlo musí být chráněny proti nebezpečí utržení působením vnějších sil (např. použitím pružných částí). Plnicí a vyprazdňovací zařízení (včetně přírub nebo šroubových uzávěrů) a jakékoliv ochranné kryty musí umožňovat zajištění proti nežádoucímu otevření.

6.7.2.5.2 Všechny otvory nádrže určené pro plnění a vyprazdňování přemístitelné cisterny musí být vybaveny ručně ovládaným uzavíracím ventilem umístěným co nejbližší k nádrží, jak je to jen prakticky možné. Jiné otvory kromě otvorů pro odvětrání nebo odpouštění tlaku musí být vybaveny buď uzavíracím ventilem nebo jinými vhodnými uzavíracími prostředky upevněnými co nejbližší k nádrží jak je to možné.

6.7.2.5.3 Všechny přemístitelné cisterny musí být vybaveny otvorem s kryty nebo jinými kontrolními otvory vhodných rozměrů dovolujícími vnitřní kontrolu a přiměřený vstup pro údržbu a opravy vnitřku. Komorové přemístitelné cisterny musí mít otvor s krytem nebo jiné kontrolní otvory pro každou komoru.

6.7.2.5.4 Vnější spojovací prvky musí být, pokud je to možné, seskupeny. Pro izolaci přemístitelných cisteren musí být vrchní spojovací prvky obkrouženy zásobníkem pro únik s vhodným odtokem.

6.7.2.5.5 Každý spoj na přemístitelné cisterně musí být zřetelně označen s uvedením své funkce.

6.7.2.5.6 Každý uzavírací ventil nebo jiné uzavírací prostředky musí být konstruovány a vyrobeny na jmenovitý tlak nádrže MAWP a vyšší s ohledem na teploty očekávané během přepravy. Všechny uzavírací ventily se šroubovými uzávěry musí být uzavírány pravotočivým pohybem ručního kola. Pro ostatní ventily musí být poloha (otevřeno - zavřeno) a směr uzavírání zřetelně vyznačeny. Všechny uzavírací ventily musí být konstruovány tak, aby se zabránilo nežádoucímu otevření.

6.7.2.5.7 Pohyblivé části, jako jsou kryty, části uzávěrů atd., nesmějí být vyrobeny z nechráněné korozivní oceli, pokud mohou přijít do styku třením nebo dotykem s hliníkovými přemístitelnými cisternami určenými pro přepravu látek splňujících kritérium bodu vzplanutí třídy 3, včetně zahřátých látek přepravovaných při teplotě rovné nebo vyšší, než je jejich bod vzplanutí.

6.7.2.5.8 Potrubí musí být konstruováno, vyrobeno a instalováno tak, aby se zabránilo nebezpečí poškození působením tepelné roztaživosti a smršťování mechanických rázů a vibrací. Všechna potrubí musí být

z vhodného kovového materiálu. Svařované spoje potrubí musí být používány všude, kde je to jen možné.

- 6.7.2.5.9 Spoje v měděném potrubí musí být spájeny nebo mít rovnocenně pevné kovové spojení. Bod tavení pájecích materiálů nesmí být vyšší než 525 °C. Spoje nesmějí snižovat pevnost potrubí, což se může stát u šroubových spojů.
- 6.7.2.5.10 Průřzný tlak všech potrubí a spojovacích prvků potrubí nesmí být menší než nejvyšší čtyřnásobek MAWP nádrže nebo čtyřnásobek tlaku, kterému může být vystavena v provozu při činnosti čerpadla nebo jiného zařízení (kromě zařízení na vyrovnávání tlaku).
- 6.7.2.5.11 Tažné kovy smějí být používány při konstrukci ventilů a příslušenství.
- 6.7.2.5.12 Vytápěcí systém musí být zkonstruován nebo kontrolován tak, že látka nesmí dosáhnout teploty, při které tlak v cisterně překročí její MAWP nebo způsobí jiná rizika (např. nebezpečný tepelný rozklad).
- 6.7.2.5.13 Vytápěcí systém musí být zkonstruován nebo kontrolován tak, že energie pro vnitřní topné články nesmí být k dispozici, dokud nejsou topné články kompletně ponořeny. Teplota na povrchu topných článků pro vnitřní vytápěcí zařízení, nebo teplota na nádrži v případě vnějšího vytápěcího zařízení nesmí v žádném případě překročit 80 % teploty samovznícení (ve °C) přepravované látky.
- 6.7.2.5.14 Pokud je elektrický vytápěcí systém umístěn uvnitř cisterny, musí být vybaven přerušovačem zemního okruhu s odpojením při méně než 100 mA.
- 6.7.2.5.15 Elektrická spínací skříň připojená k cisterně nesmí mít přímé spojení s vnitřkem cisterny a musí poskytovat ochranu alespoň rovnocennou s typem IP 56 v souladu s IEC 144 nebo IEC 529.

6.7.2.6 Spodní otvory

- 6.7.2.6.1 Určité látky nesmějí být přepravovány v přemístitelných cisternách se spodními otvory. Pokud vhodný pokyn pro přemístitelné cisterny uvedený ve sloupci (I0) tabulky A kapitoly 3.2, popsany v 4.2.5.2.6 stanoví, že spodní otvory jsou zakázány, nesmějí být žádné otvory pod hladinou kapaliny v nádrži, pokud je plněna na svoje nejvyšší dovolené plnění. Pokud je existující otvor uzavřen, musí být opatřen deskou vnitřním a vnějším přivařením k nádrži.
- 6.7.2.6.2 Otvory spodního vyprazdňování přemístitelných cisteren přepravujících určité tuhé krystalizující nebo viskózní látky musí být vybaveny nejméně dvěma v sérii uspořádanými a vzájemně nezávislými uzavíracími zařízeními. Konstrukce zařízení musí být schválena příslušným orgánem nebo jím pověřenou organizací a musí zahrnovat:
- (a) Vnější uzavírací ventil upevněný co nejbližší k nádrži a konstruovaný tak, aby se zabránilo nežádoucímu otevření při nárazu nebo jiném neúmyslném jednání; a
 - (b) Vodotěsný uzávěr na konci vyprazdňovacího potrubí, který může být uzavřen slepou přírubou nebo šroubovou čepičkou.
- 6.7.2.6.3 Každý vývod spodního vyprazdňování, kromě uvedených v 6.7.2.6.2, musí být vybaven třemi v sérii uspořádanými a vzájemně nezávislými uzavíracími zařízeními. Konstrukce zařízení musí být schválena příslušným orgánem nebo jím pověřenou organizací musí zahrnovat:
- (a) Samouzavírací vnitřní uzavírací ventil, jímž je uzavírací ventil v nádrži nebo v přivařené přírubě nebo jeho společné přírubě s tím, že:
 - (i) Ovládací zařízení pro provoz ventilu je konstruováno tak, aby se zabránilo nežádoucímu otevření při nárazu nebo jiném neúmyslném jednání;
 - (ii) Ventil může být ovládán svrchu nebo zdola;
 - (iii) Pokud je to možné, nastavení ventilu (otevřeno - zavřeno) musí být možno ověřit ze země;

- (iv) Kromě přemístitelných cisteren s vnitřním objemem nejvýše 1000 litrů, musí být možné uzavřít ventil s přístupné polohy přemístitelné cisterny, která je vzdálena od ventilu samého; a
 - (v) Ventil musí zůstat provozuschopný v případě poškození vnějšího zařízení pro ovládání činnosti ventilu;
 - (b) Vnější uzavírací ventil upevněný co nejbliže k nádrži, jak je to prakticky účelné;
 - (c) Vodotěsný uzávěr na konci vyprazdňovacího potrubí, který může být uzavřen slepou přírubou nebo šroubovou čepičkou.
- 6.7.2.6.4 Pro podélnou nádrž může být vnitřní uzavírací ventil požadovaný v 6.7.2.6.3(a) nahrazen dodatečným vnějším zavíracím ventilem. Výrobce musí splnit požadavky příslušného orgánu nebo jím pověřené organizace.
- 6.7.2.7 Bezpečnostní zařízení**
- 6.7.2.7.1 Všechny přemístitelné cisterny musí být vybaveny nejméně jedním zařízením pro vyrovnávání tlaku. Všechna tato zařízení musí být konstruována, vyrobena a označena podle požadavků příslušného orgánu nebo jím pověřené organizace.
- 6.7.2.8 Zařízení pro vyrovnávání tlaku**
- 6.7.2.8.1 Každá přemístitelná cisterna s vnitřním objemem nejméně 1900 litrů a každá nezávislá komora přemístitelné cisterny se stejným vnitřním objemem, musí být vybavena jedním nebo více zařízeními pro vyrovnávání tlaku pružinového typu s případným průtržným kotoučem nebo tavným prvkem a paralelně s pružinovým zařízením, pokud to není zakázáno v odvolávce na 6.7.2.8.3 v příslušném pokynu pro přemístitelné cisterny v 4.2.5.2.6. Zařízení pro vyrovnávání tlaku musí mít dostatečnou kapacitu, aby zabránilo roztržení nádrže vlivem přetlaku nebo podtlaku způsobeného plněním, vyprazdňováním nebo zahříváním obsahu.
- 6.7.2.8.2 Zařízení pro vyrovnávání tlaku musí být konstruováno tak, aby se zabránilo vniknutí cizích předmětů, úniku kapaliny a vývoji nebezpečného nadměrného tlaku.
- 6.7.2.8.3 Pokud je to požadováno pro určité látky příslušným pokynem pro přemístitelné cisterny uvedeným v sloupci (10) tabulky A kapitoly 3.2 a popsáním v 4.2.5.2.6, musí mít přemístitelné cisterny zařízení pro vyrovnávání tlaku schválené příslušným orgánem. Pokud není přemístitelná cisterna vyhrazena pro přepravu jedné látky a vybavena schváleným zařízením pro vyrovnávání tlaku vyrobeným z materiálů snášenlivých s přepravovanou látkou, musí zařízení pro vyrovnávání tlaku obsahovat průtržný kotouč předcházející pružinovému zařízením pro vyrovnávání tlaku. Pokud je průtržný kotouč vložen do série s požadovaným zařízením pro vyrovnávání tlaku, prostor mezi průtržným kotoučem musí být vybaven měřidlem tlaku nebo indikátorem protřetí kotouče proděravění nebo úniku, který mohla způsobit špatná funkce systému pro vyrovnávání tlaku. Průtržný kotouč se musí protrhnout při tlaku o 10 % vyšším, než je počáteční vypouštěcí tlak zařízení pro vyrovnávání tlaku.
- 6.7.2.8.4 Každá přemístitelná cisterna s vnitřním objemem menším než 1900 litrů musí být vybavena zařízením pro vyrovnávání tlaku, kterým může být průtržný kotouč, pokud tento kotouč odpovídá požadavkům v 6.7.2.11.1. Pokud není použito pružinové zařízení pro vyrovnávání tlaku, musí být průtržný kotouč nastaven na protřetí při jmenovitém tlaku rovném zkušebnímu tlaku. Kromě toho, tavné prvky odpovídající 6.7.2.10.1 mohou být také použity.
- 6.7.2.8.5 Pokud je nádrž vybavena pro tlakové vyprázdnění, musí být vstupní potrubí osazeno vhodným zařízením pro vyrovnávání tlaku nastaveným tak, aby pracovalo při tlaku nejvýše MAWP nádrže a uzavírací ventil byl upevněn co nejbliže k nádrži jak je to možné.

6.7.2.9 Nastavení zařízení pro vyrovnávání tlaku

6.7.2.9.1 Je třeba připomenout, že zařízení pro vyrovnávání tlaku musí pracovat pouze v podmínkách nadměrného zvýšení teploty, jelikož cisterna nepodléhá nadměrným změnám tlaku během normálních podmínek přepravy (viz 6.7.2.12.2).

6.7.2.9.2 Požadované zařízení pro vyrovnávání tlaku musí být nastaveno tak, aby začalo vypouštět při jmenovitém tlaku pěti šestin zkušební tlaku pro nádrže mající zkušební tlak nejvýše 4,5 baru a 110 % dvou třetin zkušební tlaku pro nádrže mající zkušební tlak větší než 4,5 baru. Po vypuštění se zařízení musí uzavřít tlakem nejvýše o 10 % nižším, než je otevírací tlak. Zařízení musí zůstat uzavřeno při všech nižších tlacích. Tento požadavek nezabráňuje použití tlaku zařízení pro vyrovnávání tlaku nebo kombinace tlakových a podtlakových vyrovnávacích zařízení.

6.7.2.10 Tavné prvky

6.7.2.10.1 Tavné prvky musí fungovat při teplotě mezi 100 °C a 149 °C za podmínky, že tlak v nádrži při tavné teplotě nebude vyšší než zkušební tlak. Musí být umístěny na vrcholu nádrže s jejich vstupy ve výparném prostoru a při použití, pro účely bezpečnosti dopravy, nesmějí být chráněny před vnějším teplem. Tavné prvky nesmějí být používány na přemístitelných cisternách se zkušebním tlakem, který překračuje 2,65 baru nestanoví-li zvláštní ustanovení TP36 ve sloupci (11) tabulky A kapitoly 3.2 jinak. Tavné prvky používané na přemístitelných cisternách určených pro přepravu zahřátých látek musí být konstruovány pro provoz při teplotě vyšší, než bude nejvyšší teplota očekávaná během přepravy, a musí splňovat požadavky příslušného orgánu nebo jím pověřené organizace.

6.7.2.11 Průtržné kotouče

6.7.2.11.1 Průtržné kotouče, kromě uvedených v 6.7.2.8.3, musí být nastaveny na protržení při jmenovitém tlaku rovném zkušebnímu tlaku v celém rozsahu projektované teploty. Pokud jsou používány průtržné kotouče, musí být věnována zvláštní pozornost požadavkům v 6.7.2.5.1 a 6.7.2.8.3.

6.7.2.11.2 Průtržné kotouče musí být vhodné pro podtlaky, které mohou vzniknout v přemístitelné cisterně.

6.7.2.12 Kapacita zařízení pro vyrovnávání tlaku

6.7.2.12.1 Pružinové zařízení pro vyrovnávání tlaku požadované v 6.7.2.8.1 musí mít příčný průtokový průřez rovnocenný otvoru o průměru 31,75 mm. Pokud je používáno podtlakové zařízení pro vyrovnávání tlaku, musí mít plochu průtokového průřezu nejméně 284 mm².

6.7.2.12.2 Kombinovaná dodávková kapacita systému pro vyrovnávání tlaku (s přihlédnutím ke sníženému průtoku, pokud je přemístitelná cisterna vybavena průtržným kotoučem předřazeným pružinovému zařízení pro vyrovnávání tlaku nebo pokud je pružinové zařízení pro vyrovnávání tlaku provedeno se zařízením pro ochranu před prošlehnutím plamene) za podmínky kompletního zvládnutí ohně přemístitelné cisterny musí být dostatečná omezit tlak v nádrži o 20 % nad tlak uvádějící v činnost zařízení pro vyrovnávání tlaku. Nouzové zařízení pro vyrovnávání tlaku může být použito pro dosažení předepsané vypouštěcí kapacity. Tato zařízení mohou být tavná, pružinová nebo průtržné kotouče nebo kombinace zařízení pružinových a průtržných kotoučů. Celková kapacita zařízení pro vyrovnávání tlaku musí být stanovena použitím vzorce v 6.7.2.12.2.1 nebo tabulky v 6.7.2.12.2.3.

6.7.2.12.2.1 Pro stanovení celkové požadované kapacity zařízení pro vyrovnávání tlaku, která musí být součtem individuálních kapacit všech spolupůsobících zařízení, musí být použit následující vzorec:

$$Q = 12,4 \frac{FA^{0,82}}{LC} \sqrt{\frac{ZT}{M}}$$

kde:

Q = minimální požadovaný stupeň v krychlových metrech vzduchu za sekundu (m^3/s) za normálních podmínek: 1 bar a 0°C (273 K);

F = koeficient této hodnoty:

pro neizolované nádrže $F = 1$;

pro izolované nádrže $F = U(649 - t)/13,6$ avšak v žádném případě není menší než 0,25;

kde:

U = koeficient prostupu tepla v $\text{kW}\cdot\text{m}^2\cdot\text{K}^{-1}$ při 38°C

t = skutečná teplota látky během plnění (ve $^\circ\text{C}$); pokud tato teplota není známa, použije se $t = 15^\circ\text{C}$;

Hodnota koeficientu F výše uvedená pro izolované nádrže může být použita, pokud izolace splňuje požadavky uvedené v 6.7.2.12.2.4;

A = celková plocha vnějšího povrchu nádrže ve čtverečných metrech

Z = koeficient stlačitelnosti plynu za akumulací podmínky (pokud tento koeficient není znám, budiž Z rovno 1);

T = absolutní teplota v Kelvinech ($^\circ\text{C} + 273$) nad zařízením pro vyrovnávání tlaku za akumulací podmínky;

L = utajené teplo výparnosti kapaliny, v kJ/kg , za akumulací podmínky;

M = molekulární hmotnost vypouštěného plynu;

C = konstanta odvozená z jednoho z následujících vzorců jako funkce poměru k specifických tepel:

$$k = \frac{c_p}{c_v}$$

kde:

C_p = specifické teplo při konstantním tlaku; a

C_v = specifické teplo při konstantním objemu.

Pokud $k > 1$:

$$C = \sqrt{k \left(\frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

Pokud $k = 1$ nebo k není znám:

$$C = \frac{1}{\sqrt{e}} = 0,607$$

kde e je matematická konstanta 2,7183

C může být též převzata z následující tabulky:

k	C	k	C	K	C
1,00	0,607	1,26	0,660	1,52	0,704
1,02	0,611	1,28	0,664	1,54	0,707
1,04	0,615	1,30	0,667	1,56	0,710
1,06	0,620	1,32	0,671	1,58	0,713
1,08	0,624	1,34	0,674	1,60	0,716
1,10	0,628	1,36	0,678	1,62	0,719
1,12	0,633	1,38	0,681	1,64	0,722
1,14	0,637	1,40	0,685	1,66	0,725
1,16	0,641	1,42	0,688	1,68	0,728
1,18	0,645	1,44	0,691	1,70	0,731
1,20	0,649	1,46	0,695	2,00	0,770
1,22	0,652	1,48	0,698	2,20	0,793
1,24	0,656	1,50	0,701		

6.7.2.12.2.2 Jako alternativa k výše uvedeným vzorcům, mohou mít nádrže konstruované pro přepravu kapalin rozměry svých zařízení pro vyrovnávání tlaků podle tabulky v 6.7.2.12.2.3. Tato tabulka počítá s hodnotou koeficientu izolace $F = 1$ a musí být upravena podobně, jako když je nádrž izolována.

$$M = 86,7$$

$$T = 394 \text{ K}$$

$$L = 334,94 \text{ kJ/kg}$$

$$C = 0,607$$

$$Z = 1$$

6.7.2.12.2.3 Minimální nouzová ventilační kapacita, Q , v krychlových metrech vzduchu za sekundu při 1 baru a 0 °C (273 K).

A Exponovaná plocha (čtvereční metry)	Q (Krychlové metry vzduchu za sekundu)	A Exponovaná plocha (čtvereční metry)	Q (Krychlové metry vzduchu za sekundu)
2	0,230	37,5	2,539
3	0,320	40	2,677
4	0,405	42,5	2,814
5	0,487	45	2,949
6	0,565	47,5	3,082
7	0,641	50	3,215
8	0,715	52,5	3,346
9	0,788	55	3,476
10	0,859	57,5	3,605
12	0,998	60	3,733
14	1,132	62,5	3,860
16	1,263	65	3,987

22,5	1,670	75	4,483
25	1,821	80	4,726
27,5	1,969	85	4,967
30	2,115	90	5,206
32,5	2,258	95	5,442
35	2,400	100	5,676

6.7.2.12.2.4 Izolační systémy používané za účelem snižování ventilační kapacity musí být schváleny příslušným orgánem nebo jím pověřené organizace. Ve všech případech musí izolační systém schválený pro tento účel:

- (a) zůstat účinný při všech teplotách až do 649 °C; a
- (b) být chráněn pláštěm s bodem tavení 700 °C nebo vyšším.

6.7.2.13 Značení zařízení pro vyrovnávání tlaku

6.7.2.13.1 Každé zařízení pro vyrovnávání tlaku musí být zřetelně a trvale označeno těmito údaji:

- (a) Tlak (v barech nebo kPa) nebo teplota (ve °C), na které je nastaveno vypouštění;
- (b) Dovolená tolerance vypouštěcího tlaku pro pružinová zařízení pro vyrovnávání tlaku;
- (c) Referenční teplota odpovídající nastavenému tlaku pro průtržné kotouče;
- (d) Dovolená tolerance teploty pro tavné prvky;
- (e) Nastavená průtoková kapacita pružinových zařízení pro vyrovnávání tlaku, průtržných kotoučů nebo tavných prvků v normálních krychlových metrech vzduchu za sekundu (m³/s);
- (f) Příčný průtokový průřez pružinových zařízení pro vyrovnávání tlaku, průtržných kotoučů nebo tavných prvků v mm².

Pokud je to proveditelné, musí být uvedeny následující údaje:

- (g) Jméno výrobce a příslušné katalogové číslo zařízení pro vyrovnávání tlaku.

6.7.2.13.2 Nastavená průtoková kapacita označená na pružinových zařízeních pro vyrovnávání tlaku musí být stanovena podle ISO 4126-1:2004 a ISO 4126-7:2004.

6.7.2.14 Spoje k zařízení pro vyrovnávání tlaku

6.7.2.14.1 Spoje k zařízení pro vyrovnávání tlaku musí být dostatečných rozměrů, aby umožnily neomezeně propustit požadované vypouštění do zařízení pro vyrovnávání tlaku. Žádný uzavírací ventil nesmí být vestavěn mezi nádrž a zařízení pro vyrovnávání tlaku, kromě zdvojeného zařízení pro údržbu nebo jiných důvodů a uzavíracích ventilů sloužících pro uzamčení otevřeného zařízení v provozu nebo uzavíracích ventilů vzájemně uzamčených tak, že alespoň jeden ze zdvojených je vždy v provozu. Nesmí být žádná překážka pro otevírání vedení k zařízení ventilačnímu nebo pro vyrovnávání tlaku, která by mohla omezit nebo uzavřít průtok z nádrže do tohoto zařízení. Otvory nebo potrubí od vyústění zařízení pro vyrovnávání tlaku, pokud jsou používány, musí vypouštět přebytečné páry nebo kapaliny do atmosféry za podmínek minimálního zpětného tlaku do zařízení pro vyrovnávání tlaku.

6.7.2.15 Umístění zařízení pro vyrovnávání tlaku

6.7.2.15.1 Každé vyústění zařízení pro vyrovnávání tlaku musí být umístěno na vrchol nádrže co nejbližší podélnému a příčnému středu nádrže, jak je to proveditelné. Všechna vyústění zařízení pro vyrovnávání tlaku musí být umístěna tak, aby za podmínek maximálního plnění byla ve výparném prostoru nádrže, a zařízení musí být tak uspořádáno, aby zajistilo neomezené vypouštění unikajících par. U hořlavých látek musí být unikající páry vyvedeny přímo ven z nádrže takovým způsobem, aby se nemohly dostat pod nádrž. Ochranná zařízení, která odklánějí proud par, jsou dovolena pouze tehdy, nezměňují-li kapacitu zařízení pro vyrovnávání tlaku.

6.7.2.15.2 Uspořádání musí být provedena tak, aby zabránila přístupu nepovolaných osob k zařízení pro vyrovnávání tlaku a chránila tato zařízení před poškozením způsobeným převrácením přemístitelné cisterny.

6.7.2.16 Stavoznaky (měřicí zařízení)

6.7.2.16.1 Skleněné stavoznaky a měřidla vyrobená z křehkého materiálu, která jsou v přímém styku s obsahem nádrže, nesmějí být použity.

6.7.2.17 Podpěry, rámy, zvedací a spouštěcí vybavení přemístitelných cisteren

- 6.7.2.17.1 Přemístitelné cisterny musí být konstruovány a vyráběny s podpěrnou konstrukcí zajišťující jejich bezpečnou základnu během přepravy. Síly uvedené v 6.7.2.2.12 a koeficient bezpečnosti uvedený v 6.7.2.2.13 musí být zohledněny při konstrukci. Zarážky, rámy, podstavce nebo jiné podobné konstrukce jsou přípustné.
- 6.7.2.17.2 Kombinovaná namáhání způsobená konstrukční výstrojí přemístitelné cisterny (např. podstavce, rámy atd.) a zvedací a spouštěcí zařízení nesmějí způsobit nadměrné namáhání v jakékoli části nádrže. Stabilní zvedací a spouštěcí zařízení musí být namontováno na všech přemístitelných cisternách. Přednostně musí být upevněno na podpěry přemístitelné cisterny, avšak může být připevněno k výztužným deskám umístěným na nádrži v bodech jejich podpěr.
- 6.7.2.17.3 Při konstrukci podpěr a rámu se musí brát v úvahu účinky klimatické koroze.
- 6.7.2.17.4 Kapsy pro zvedací vidlice musí být uzavíratelné. Prostředky pro uzavření těchto kapes musí tvořit trvalou část rámu nebo být trvale připojeny k rámu. Jednokomorové přemístitelné cisterny o délce menší než 3,65 m nemusí mít tyto kapsy uzavíratelné, pokud:
- (a) jsou nádrž včetně všech spojovacích prvků dobře chráněny proti úderům zvedacích vidlic; a
 - (b) vzdálenost mezi středy kapes pro zvedací vidlice je nejméně polovina maximální délky přemístitelné cisterny.
- 6.7.2.17.5 Pokud nejsou přemístitelné cisterny během přepravy chráněny podle 4.2.1.2, nádrže a provozní výstroj musí být chráněny proti poškození nádrže a provozní výstroje podélným nebo příčným nárazem nebo převrácením. Vnější spojovací prvky musí být chráněny tak, aby byl vyloučen únik obsahu nádrže při nárazu nebo převrácení přemístitelné cisterny na tyto spojovací prvky. Příklady takové ochrany:
- (a) Ochrana proti bočnímu nárazu, kterou mohou tvořit podélné výztuže chránící nádrž z obou stran na výškové úrovni jejího středu;
 - (b) Ochrana přemístitelné cisterny proti převrácení, kterou mohou tvořit výztužné prstence nebo výztuže upevněné napříč rámu;
 - (c) Ochrana proti nárazu zezadu, kterou může tvořit nárazník nebo rám;
 - (d) Ochrana nádrže proti poškození nárazem nebo převrácením použitím rámu ISO podle ISO 1496-3:1995.

6.7.2.18 Schválení typu

- 6.7.2.18.1 Příslušný orgán nebo jím pověřená organizace vydá osvědčení o schválení typu pro jakoukoli novou konstrukci přemístitelné cisterny. Toto osvědčení prokazuje, že přemístitelná cisterna byla prohlédnuta tímto orgánem, je vhodná pro její zamýšlený účel a odpovídá požadavkům této kapitoly a přiměřeným ustanovením pro látky uvedeným v kapitole 4.2 a v tabulce A kapitoly 3.2. Pokud série přemístitelných cisteren jsou vyráběny beze změny konstrukce, osvědčení platí pro celé tyto série. Osvědčení musí obsahovat zkušební protokol prototypu, látky nebo skupiny látek dovolené přepravovat, materiály konstrukce nádrže a vnitřního povlaku (pokud byl použit) a schvalovací číslo. Schvalovací číslo musí tvořit mezinárodní rozlišovací značka státu předepsaná v Úmluvě o silničním provozu, Vídeň 1968, a registrační číslo. V osvědčení musí být uvedena jakákoliv alternativní ujednání podle 6.7.1.2.. Schválení konstrukce typu může sloužit pro schválení menších přemístitelných cisteren vyrobených z materiálů téhož druhu a tloušťky, stejnou výrobní technologií a s identickými podpěrami, rovnocennými uzávěry a dalším příslušenstvím.
- 6.7.2.18.2 Zkušební protokol prototypu pro schválení konstrukce typu musí obsahovat nejméně toto:
- (a) Výsledky zkoušky vhodného rámu uvedené v ISO 1496-3:1995;

- (b) Výsledky první inspekce a zkoušky uvedené v 6.7.2.19.3;
- (c) Výsledek nárazové zkoušky uvedené v 6.7.2.19.1, je-li předepsána.

6.7.2.19 Inspekce a zkoušení

- 6.7.2.19.1 Přemístitelné cisterny odpovídající definici kontejneru podle Mezinárodní úmluvy o bezpečnosti kontejnerů (KBK) z roku 1972 v platném znění, nesmějí být používány. Jejich použití je možné pouze tehdy, pokud se reprezentativní vzorek každého konstrukčního typu úspěšně ověří zkouškou dynamického nárazu podle Příručky zkoušek a kritérií, díl IV, odstavec 41.
- 6.7.2.19.2 Nádrž a součásti výstroje každé přemístitelné cisterny musí být podrobeny inspekci a zkoušce před jejím prvním uvedením do provozu (první inspekce a zkouška) a potom v nejvýše pětiletých intervalech (periodická inspekce a zkouška po pěti letech) s meziperiodickou inspekci a zkouškou v polovině této doby (periodická inspekce a zkouška po dvou a půl letech). Inspekce a zkouška po dvou a půl letech může být provedena během tří měsíců před nebo po stanoveném datu. Mimořádná inspekce a zkouška musí být provedena bez ohledu na datum poslední periodické inspekce a zkoušky, pokud je to nezbytné podle 6.7.2.19.7.
- 6.7.2.19.3 První inspekce a zkouška přemístitelné cisterny musí zahrnovat kontrolu konstrukčních charakteristik, vnitřní a vnější prohlídku přemístitelné cisterny a jejich spojovacích prvků vzhledem k látkám, které v ní mají být přepravovány, a tlakovou zkoušku. Před uvedením přemístitelné cisterny do provozu musí být též provedeny zkouška těsnosti a kontrola uspokojivého provozu celé provozní výstroje. Pokud byly nádrž a její spojovací prvky tlakově zkoušeny odděleně, musí být po jejich zkompletování podrobeny zkoušce těsnosti.
- 6.7.2.19.4 Periodická inspekce a zkouška po pěti letech, musí zahrnovat vnitřní a vnější prohlídku a, jak je všeobecným pravidlem, hydraulickou tlakovou zkoušku. Pouze pro cisterny používané pro přepravu tuhých látek, jiných než toxických nebo žíravých látek, nekapalňujících během přepravy, smí být hydraulická tlaková zkouška nahrazena vhodnou tlakovou zkouškou při 1,5 násobku MAWP, po schválení příslušného orgánu. Opláštění, tepelná izolace a jiné mohou být sejmuty pouze s ohledem na požadovaný rozsah spolehlivého zhodnocení charakteristik přemístitelné cisterny. Pokud nádrž a její výstroj byly zkoušeny odděleně, musí být po jejich zkompletování podrobeny zkoušce těsnosti.
- 6.7.2.19.5 Meziperiodická inspekce a zkouška po 2,5 letech musí zahrnovat nejméně vnitřní a vnější prohlídku přemístitelné cisterny a jejich spojovacích prvků vzhledem k látkám, které v ní mají být přepravovány, zkoušku těsnosti a zkoušku uspokojivého provozu celé provozní výstroje. Opláštění, tepelná izolace a jiné mohou být sejmuty pouze s ohledem na požadovaný rozsah spolehlivého zhodnocení charakteristik přemístitelné cisterny. Pro přemístitelné cisterny určené pro přepravu jedné látky vnitřní prohlídka po 2,5 letech může být vypuštěna nebo nahrazena jinou zkušební metodou nebo inspekčními postupy stanovenými příslušným orgánem nebo jím pověřená organizace.
- 6.7.2.19.6 Přemístitelná cisterna nesmí být plněna a přistavována k přepravě po datu uplynutí platnosti poslední pětileté nebo dvou a půlleté periodické inspekce a zkoušky, jak je požadováno v 6.7.2.19.2. Avšak přemístitelná cisterna naplněná před datem uplynutí platnosti poslední periodické inspekce a zkoušky může být přepravována po dobu nepřesahující tři měsíce od uplynutí platnosti poslední periodické zkoušky nebo inspekce. Kromě toho smí být přemístitelná cisterna přepravována po datu uplynutí platnosti poslední periodické zkoušky a inspekce:
- (a) Po vyprázdnění, ale před vyčištěním, pro účely provedení příští požadované zkoušky nebo inspekce před opětovným naplněním; a
 - (b) Pokud není jinak schváleno příslušným orgánem, pro období nepřekračující šest měsíců od data uplynutí platnosti poslední periodické zkoušky nebo inspekce, aby bylo možno vrátit nebezpečné věci k jejich likvidaci nebo recyklaci. Odvolávka na tuto výjimku musí být uvedena v přepravním dokladu.
- 6.7.2.19.7 Mimořádná inspekce a zkouška je nezbytná, pokud přemístitelná cisterna vykazuje zřetelně poškozené nebo zkorodované plochy nebo únik nebo jiné okolnosti, které ukazují nedostatky, jež by

mohly ovlivnit celistvost přemístitelné cisterny. Rozsah mimořádné inspekce a zkoušky musí záviset na rozsahu poškození a zhoršení přemístitelné cisterny. Musí zahrnovat nejméně dvou a půlletou inspekci a zkoušku podle 6.7.2.19.5.

6.7.2.19.8 Vnitřní a vnější prohlídky musí zajistit, že:

- (a) nádrž je prohlédnuta se zaměřením na promáčknutí, korozi nebo odření, záhyby, zkroucení, vady ve svarech nebo jiné okolnosti, včetně úniku, které by mohly způsobit, že nádrž není bezpečná pro přepravu;
- (b) potrubí, ventily, ohřívací/chladicí systém a těsnění jsou prohlédnuty se zaměřením na zkorodované plochy, závady a jiné okolnosti, včetně úniku, které by mohly způsobit, že přemístitelná cisterna není bezpečnou pro plnění, vyprazdňování nebo přepravu;
- (c) zařízení pro těsnění uzavíratelných poklopů je provozuschopné a že zde není žádný únik uzavíratelných vík a těsnění;
- (d) chybějící nebo ztracené západky nebo šrouby na jakémkoli spojení příruby nebo slepé příruby jsou nahrazeny nebo utěsněny;
- (e) všechna pojistná zařízení a ventily jsou bez koroze, zkroucení a jakéhokoli poškození nebo vady, které by mohly zabránit jejich normální činnosti. Uzavírací zařízení a samočinné uzavírací ventily musí být uvedeny v činnost pro prokázání vlastní provozuschopnosti;
- (f) vnitřní povlaky, pokud jsou, jsou prohlédnuty podle kritérií uvedených jeho výrobcem;
- (g) požadovaná značení na přemístitelné cisterně jsou čitelná a v souladu s příslušnými požadavky; a
- (h) rám, podpěry a zařízení pro zdvih přemístitelné cisterny jsou v uspokojivém stavu.

6.7.2.19.9 Inspekce a zkoušky v 6.7.2.19.1, 6.7.2.19.3, 6.7.2.19.4, 6.7.2.19.5 a 6.7.2.19.7 musí být provedeny znalcem nebo za účasti znalce schváleného příslušným orgánem nebo jím pověřenou organizací. Pokud je součástí inspekce a zkoušky tlaková zkouška, musí být provedena zkušebním tlakem, který je vyznačen na štítku přemístitelné cisterny. Během tlakové zkoušky musí být přemístitelná cisterna kontrolována na jakýkoliv únik z cisterny, potrubí nebo výstroje.

6.7.2.19.10 Ve všech případech, kdy je prováděno řezání, opalování nebo sváření na nádrži, musí být tyto práce schváleny příslušným orgánem nebo jím pověřenou organizací s ohledem na předpisy pro tlakové nádoby používané pro konstrukci nádrže. Tlaková zkouška musí být provedena navíc k původní tlakové zkoušce po ukončení těchto prací.

6.7.2.19.11 Pokud se objeví jakákoli nebezpečná okolnost, nesmí být přemístitelná cisterna vrácena do provozu, dokud nebyla opravena a zkouška není opakována s uspokojivým výsledkem.

6.7.2.20 Značení

6.7.2.20.1 Každá přemístitelná cisterna musí být opatřena nerezavějícím kovovým štítkem trvale upevněným k přemístitelné cisterně na viditelném místě snadno přístupném pro kontrolu. Pokud z důvodů uspořádání přemístitelné cisterny nemůže být štítek trvale připevněn na nádrž, nádrž musí být označena nejméně informacemi požadovanými kódem příslušné tlakové nádoby. Jako minimum, musí být vyznačeny na štítku nejméně následující informace a to vyražením nebo jinou podobnou metodou:

- (a) Informace o vlastníkovi
 - (i) Registrační číslo vlastníka
- (b) Výrobní informace
 - (i) Země výroby
 - (ii) Rok výroby

- (iii) Jméno nebo značka výrobce
 - (iv) Výrobce přidělené sériové číslo
- (c) Informace o schválení
- (i) Znak Spojených národů pro obaly

Tento znak nesmí být použit pro jiné účely než pro osvědčení, že obal, přemístitelná cisterna nebo MEGC splňuje příslušné požadavky kapitoly 6.1, 6.2, 6.3, 6.5, 6.6 nebo 6.7².

- (ii) Země schválení;
 - (iii) Pověřená organizace pro schvalování konstrukčního typu
 - (iv) Číslo schválení konstrukčního typu
 - (v) Písmena 'AA', pokud byl konstrukční typ schválen dle ujednání (viz 6.7.1.2);
 - (vi) Předpis pro tlakové nádoby podle kterého byla nádrž zkonstruována
- (d) Tlaky
- (i) MAWP (přetlak v barech nebo kPa)³;
 - (ii) Zkušební tlak (přetlak v barech nebo kPa)³;
 - (iii) Datum první tlakové zkoušky (měsíc a rok);
 - (iv) Identifikační značka znalce účastnícího se první tlakové zkoušky
 - (v) Vnější výpočtový tlak⁴ (přetlak v barech nebo kPa)³;
 - (vi) MAWP pro ohřívací/chladicí systém (přetlak v barech nebo kPa)³; (pokud je použit);
- (e) Teploty
- (i) Rozsah výpočtových teplot (ve °C)³;
- (f) Materiály
- (i) Materiál(y) nádrže a odkaz(y) na materiálové normy;
 - (ii) Ekvivalentní tloušťka pro referenční ocel (v mm)³;
 - (iii) Materiál vnitřní izolační vložky (pokud je použita);
- (g) Vnitřní objem
- (i) Hydraulický vnitřní objem cisterny při 20 °C (v litrech)³;

Tento údaj je následován symbolem "S", pokud je nádrž rozdělena peřejníky na oddíly s objemem nejvýše 7 500 l;

² Tento symbol se používá také pro osvědčení, že velké nádoby pro volně ložené látky schválené pro jiné druhy dopravy odpovídají požadavkům v kapitole 6.8 Model Regulations.

³ Použitá jednotka musí být označena.

⁴ Viz 6.7.2.2.10.

- (ii) Hydraulický vnitřní objem z každé komory při 20 °C (v litrech)³ (pokud je použit, pro více komorovou cisternu).

Tento údaj je následován symbolem "S", pokud je nádrž rozdělena peřejníky na oddíly s objemem nejvýše 7 500 l;

(h) Periodické inspekce a zkoušky

- (i) Druh poslední periodické zkoušky (2,5-roku, 5-let nebo mimořádná);
- (ii) Datum poslední periodické zkoušky (měsíc a rok);
- (iii) Zkušební tlak (přetlak v barech nebo kPa)³ poslední periodické zkoušky (pokud je použita);
- (iv) Identifikační značka pověřené organizace, která provedla nebo dozorovala poslední zkoušku.

^a Zkušební tlak pokud se použije.

6.7.2.20.2 Následující údaje musí být trvanlivě vyznačeny buď na přemístitelné cisterně samé nebo na kovovém štítku pevně umístěném na přemístitelné cisterně:

Jméno provozovatele

Nejvyšší dovolená celková hmotnost (MPGM) _____ kg

Vlastní hmotnost _____ kg

Pokyny pro přemístitelné cisterny v souladu s 4.2.5.2.6.

POZNÁMKA: Pro identifikaci přepravovaných látek, viz též část 5.

- 6.7.2.20.3 Jestliže je přemístitelná cisterna konstruována a schválena pro manipulaci na otevřeném moři, musí být na identifikačním štítku uvedena slova "OFFSHORE PORTABLE TANK".

6.7.3 Požadavky na konstrukci, výrobu, inspekce a zkoušení přemístitelných cisteren určených pro přepravu nezmražených kapalných plynů

POZNÁMKA: Tyto požadavky se vztahují též na přemístitelné cisterny určené pro přepravu chemikálií pod tlakem (UN 3500, 3501, 3502, 3503, 3504 a 3505).

6.7.3.1 Definice

Pro účely tohoto oddílu se následujícími pojmy rozumí:

Alternativní ujednání znamená schválení zaručené příslušným orgánem pro přemístitelnou cisternu nebo MEGC, které byly konstruovány, vyrobeny nebo zkoušeny podle technických požadavků nebo zkušebních metod jiných, než uvedených v této kapitole;

Přemístitelná cisterna znamená multimodální cisternu s vnitřním objemem větším než 450 litrů používanou pro přepravu nezmražených kapalných plynů třídy 2. Přemístitelná cisterna zahrnuje nádrž s provozní výstrojí a konstrukční výstrojí nezbytnými pro přepravu plynů. Přemístitelnou cisternu musí být možno plnit a vyprazdňovat bez sejmutí konstrukční výstroje. Musí mít stabilizační členy vně nádrže a musí ji být možno zvedat v naplněném stavu. Musí být především konstruována pro zdvih na vozidlo, železniční vůz nebo námořní plavidlo nebo plavidlo pro vnitrozemské vodní cesty a musí být vybavena zádržkami, úchyty nebo příslušenstvím umožňujícím mechanickou manipulaci. Silniční cisternová vozidla, železniční cisternové vozy, nekovové cisterny a velké nádoby pro volně ložené látky (IBC), láhve na plyn a velké nádoby nejsou považovány za spadající do definice přemístitelných cisteren;

Nádrž znamená část přemístitelné cisterny, která obsahuje nezmražené kapalné plyny určené pro přepravu (vlastní cisterna), včetně otvorů a jejich uzávěrů, ale nezahrnuje provozní výstroj a konstrukční výstroj;

Provozní výstroj znamená měřicí přístroje a plnicí, vyprazdňovací, větrací, pojistná a tepelně izolační zařízení;

Konstrukční výstroj znamená výztužné, upevňovací, ochranné a stabilizační prvky vně nádrže;

Nejvyšší dovolený provozní tlak (MAWP) znamená tlak, který nesmí být menší než nejvyšší z dále uvedených tlaků měřených na vrcholu nádrže v provozní poloze, avšak v žádném případě nesmí být nižší než 7 barů:

- (a) Nejvyšší dovolený efektivní přetlak v nádrži během plnění nebo vyprazdňování; nebo
- (b) Nejvyšší dovolený efektivní přetlak, pro který je nádrž konstruována, který musí být:
 - (i) pro nezmražený kapalný plyn uvedený v pokynu pro přemístitelné cisterny T50 v 4.2.5.2.6, MAWP (v barech) uvedený v pokynu pro přemístitelné cisterny T50 pro tento plyn;
 - (ii) pro ostatní nezmražené kapalné plyny nejméně součet:
 - absolutní tlak par (v barech) nezmraženého kapalného plynu při konstrukční referenční teplotě mínus 1 bar; a
 - parciální tlak (v barech) vzduchu nebo jiných plynů ve volném prostoru stanoveném při konstrukční referenční teplotě a roztažnosti kapalné fáze a zvýšením střední teploty volně ložené látky $t_r - t_f$ (t_f = teplota plnění, obvykle 15 °C, t_r = 50 °C nejvyšší střední teplota volně ložené látky);

- (iii) pro chemikálie pod tlakem MAWP (v barech) stanovený v pokynu pro přemístitelné cisterny T50 pro zkapalněnou část plynu propellantů (hnacích plynů) uvedených v T50 v 4.2.5.2.6.

Výpočtový tlak znamená tlak používaný pro výpočty, vyžadovaný schváleným technickým předpisem pro tlakové nádoby. Výpočtový tlak musí být vyšší než nejvyšší z dále uvedených tlaků:

- (a) Nejvyšší dovolený efektivní přetlak v nádrži během plnění nebo vyprazdňování; nebo
- (b) Součet:
 - (i) nejvyššího efektivního přetlaku, na který je nádrž konstruována, jak je stanoveno v (b) v definici MAWP (viz výše); a
 - (ii) tlaku kapaliny stanoveného na základě statických sil uvedených v 6.7.3.2.9, avšak nejméně 0,35 baru;

Zkušební tlak znamená nejvyšší přetlak ve vrcholu nádrže během tlakové zkoušky;

Zkouška těsnosti znamená zkoušku nádrže a její provozní výstroje používající plyn do vnitřního tlaku nejméně 25 % nejvyššího dovoleného provozního tlaku (MAWP);

Nejvyšší dovolená celková hmotnost (MPGM) znamená součet vlastní hmotnosti přemístitelné cisterny a nejvyšší dovolené užitečné hmotnosti;

Referenční ocel znamená ocel s mezí pevností v tahu 370 N/mm² a prodloužením při přetržení 27 %;

Měkká ocel znamená ocel se zaručenou mezí pevností v tahu 360 N/mm² až 440 N/mm² a zaručeným nejmenším prodloužením při přetržení podle 6.7.3.3.3.3;

Projektovaný teplotní rozsah pro nádrž musí být od -40 °C do 50 °C pro nezchlazené zkapalněné plyny přepravované při normálních klimatických podmínkách. Přísnější projektované teploty musí být uvažovány pro přemístitelné cisterny provozované v tvrdých klimatických podmínkách;

Projektovaná referenční teplota znamená teplotu, při které je pro účely výpočtu MAWP stanovena tenze par obsahu. Projektovaná referenční teplota musí být nižší než kritická teplota nezchlazeného zkapalněného plynu nebo zkapalněného propellantu (hnacího plynu) chemikálií pod tlakem určeného pro přepravu, aby bylo zajištěno, že plyn zůstane vždy zkapalněný. Tato hodnota je pro každý typ přemístitelné cisterny následující:

- (a) Nádrž o průměru 1,5 metru nebo menším: 65 °C;
- (b) Nádrž o průměru větším než 1,5 metru:
 - (i) bez izolace nebo slunečního štítu: 60 °C;
 - (ii) se slunečním štítem (viz 6.7.3.2.12): 55 °C; a
 - (iii) s izolací (viz 6.7.3.2.12): 50 °C;

Plnicí hustota znamená průměrnou hmotnost nezchlazeného zkapalněného plynu na litr vnitřního objemu nádrže(kg/l). Plnicí hustota je uvedena v pokynu pro přemístitelné cisterny T50 v 4.2.5.2.6.

6.7.3.2

Všeobecné konstrukční a výrobní požadavky

6.7.3.2.1

Nádrže musí být zkonstruovány a vyrobeny podle požadavků předpisů pro tlakové nádoby uznávaných příslušným orgánem. Nádrže musí být vyrobeny z oceli vhodné pro tváření. Materiály musí v zásadě odpovídat národním nebo mezinárodním materiálovým normám. Pro svařované nádrže musí být použit pouze materiál, jehož svařitelnost byla plně prokázána. Svary musí být odborně provedeny a musí zaručovat úplnou bezpečnost. Pokud je to nezbytné z hlediska výrobního postupu nebo materiálů, nádrže musí být vhodně tepelně zpracovány pro zajištění přiměřené tuhosti ve svaru a v tepelně namáhaných zónách. Při volbě materiálu musí být vzato v úvahu rozmezí konstrukční teploty s přihlédnutím k nebezpečí křehkého lomu, namáhání korozivními trhlami a

odolnosti proti nárazu. Pokud je použita jemnozrnná ocel, zaručená mez průtažnosti musí být nejméně 460 N/mm² a zaručená hodnota meze pevnosti nejméně 725 N/mm² podle materiálové specifikace. Materiály přemístitelné cisterny musí být vhodné pro klimatické podmínky, v nichž mohou být přepravovány.

- 6.7.3.2.2 Nádrže přemístitelných cisteren, spojovací prvky a potrubí musí být vyrobeny z materiálů, které jsou:
- (a) Značně imunní proti působení nezchladeného(ých) zkapalněného(ých) plynu(ů); nebo
 - (b) Přirozeně pasivní nebo neutralizované chemickou reakcí.
- 6.7.3.2.3 Těsnění musí být vyrobena z materiálů snášelivých s nezchladeným(i) zkapalněným(i) plynem(y) určených k přepravě.
- 6.7.3.2.4 Musí se zabránit dotyku mezi různými kovy, který by mohl mít za následek poškození galvanickým účinkem.
- 6.7.3.2.5 Materiály přemístitelné cisterny, včetně jakýchkoli zařízení, těsnění a příslušenství nesmějí nepříznivě ovlivnit nezchladené zkapalněné plyny určené k přepravě v přemístitelné cisterně.
- 6.7.3.2.6 Přemístitelné cisterny musí být konstruovány a vyrobeny s podporami pro bezpečnou základnu během přepravy a vhodnými zvedacími a spouštěcími upevňovacími prvky.
- 6.7.3.2.7 Přemístitelné cisterny musí být konstruovány tak, aby odolaly beze ztráty obsahu nejméně vnitřnímu tlaku způsobenému obsahem a statickým, dynamickým a tepelným zatížením během normálních podmínek manipulace a přepravy. Konstrukce musí prokázat, že byly zohledněny únavové účinky způsobené těmito opakovanými namáháními v průběhu očekávané životnosti přemístitelné cisterny.
- 6.7.3.2.8 Nádrže musí být konstruovány tak, aby odolaly vnějšímu tlaku (přetlaku) nejméně 0,4 baru nad vnitřním tlakem bez trvalé deformace. Jestliže je nádrž vystavena značnému podtlaku před plněním nebo během vyprazdňování, musí být konstruována tak, aby odolala vnějšímu přetlaku nejméně 0,9 baru nad vnitřním tlakem a musí být zkoušena při tomto tlaku.
- 6.7.3.2.9 Přemístitelné cisterny a jejich upevnění musí být schopny při nejvyšším dovoleném zatížení absorbovat následující jednotlivé statické síly:
- (a) Ve směru jízdy: dvojnásobek MPGM násobená zemským zrychlením (g)²;
 - (b) Vodorovně kolmo na směr jízdy: MPGM (pokud směr jízdy není jasně určen, síly musí být rovnocenné dvojnásobku MPGM) násobená zemským zrychlením (g)²;
 - (c) Svisle vzhůru: MPGM násobená zrychlením (g)²; a
 - (d) Svisle dolů: dvojnásobek MPGM (celkové zatížení včetně účinku gravitace) násobená zemským zrychlením (g)².
- 6.7.3.2.10 U každé ze sil v 6.7.3.2.9 musí být zachován koeficient bezpečnosti takto:
- (a) Pro kovy mající výrazně definovanou mez průtažnosti koeficient bezpečnosti 1,5 ve vztahu k mezi průtažnosti; nebo
 - (b) Pro kovy nemající výrazně definovanou mez průtažnosti koeficient 1,5 ve vztahu k zaručeným 0,2 % prokázané průtažnosti a pro austenitické oceli 1 % prokázané průtažnosti.
- 6.7.3.2.11 Hodnoty meze pevnosti nebo prokázané pevnosti musí být hodnoty podle národních a mezinárodních materiálových norem. Pokud jsou používány austenitické oceli, stanovené nejnižší hodnoty meze pevnosti nebo prokázané pevnosti podle materiálových norem mohou být zvýšeny o 15 %, pokud tyto vyšší hodnoty jsou ověřeny v kontrolních osvědčeních materiálu. Pokud

² Pro účely výpočtu $g = 9,81 \text{ m/s}^2$

neexistuje žádná materiálová norma pro daný materiál, hodnota meze pevnosti nebo prokázané pevnosti musí být schválena příslušným orgánem.

6.7.3.2.12 Pokud nádrže určené pro přepravu nezchlazených zkapalněných plynů jsou vybaveny tepelnou izolací, systémy tepelné izolace musí splňovat následující požadavky:

- (a) Musí tvořit plášť pokrývající nejméně jednu třetinu avšak nejvýše jednu polovinu horního povrchu nádrže a oddělen od nádrže vzduchovou vrstvou o výšce asi 40 mm; a
- (b) Musí tvořit úplné potažení přiměřenou tloušťkou izolačních materiálů tak, aby se zabránilo prostupu vlhkosti a poškození za normálních podmínek přepravy a prostupu tepla nejvýše $0,67 \text{ W.m}^{-2}.\text{K}^{-1}$;
- (c) Pokud ochranné opláštění je tak uzavřeno, že je plynotěsné, zařízení musí být provedeno tak, aby zabránilo jakémukoli tlaku vyvíjenému v izolační vrstvě v případě nedostatečné plynotěsnosti nádrže a její výstroje;
- (d) Tepelná izolace nesmí znesnadnit přístup ke spojovacím prvkům a vypouštěcím zařízením.

6.7.3.2.13 Přemístitelné cisterny určené pro přepravu hořlavých zchlazených zkapalněných plynů musí být možno elektricky uzemnit.

6.7.3.3 **Konstrukční kritéria**

6.7.3.3.1 Nádrže musí být kruhového průřezu.

6.7.3.3.2 Nádrže musí být zkonstruovány a vyrobeny tak, aby odolaly zkušebnímu tlaku nejméně 1,3 násobku výpočtového tlaku. Konstrukce nádrže musí brát v úvahu minimální hodnoty MAWP v pokynu pro přemístitelné cisterny T50 v 4.2.5.2.6 pro každý nezchlazený zkapalněný plyn určený k přepravě. Pozornost se musí věnovat požadavkům na minimální tloušťku nádrže pro nádrže uvedené v 6.7.3.4.

6.7.3.3.3 6.7.3.3.3 Pro oceli vykazující zřetelnou mez pevnosti nebo charakterizované zaručenou prokázanou pevností (0,2 % prokázané pevnosti obecně nebo 0.1 % prokázané pevnosti pro austenitické oceli) nesmí primární povrchové napětí σ v nádrži překročit 0,75 Re nebo 0,50 Rm, podle toho, která z nich je nižší, při zkušebním tlaku, kde:

Re = výrazná mez průtažnosti v N/mm² nebo 0,2 % prokázané průtažnosti nebo pro austenitické ocele 1 % prokázané průtažnosti;

Rm = zaručená minimální pevnost v tahu v N/mm²

6.7.3.3.3.1 Použité hodnoty Re a Rm musí být stanoveny jako nejmenší hodnoty podle národních a mezinárodních materiálových norem. Pokud je použita austenitická ocel, mohou být stanovené nejnížší hodnoty pro Re a Rm podle materiálových norem zvýšeny až o 15 %, jestliže jsou vyšší hodnoty ověřeny v kontrolním osvědčení materiálu. Neexistují-li pro daný kov žádné materiálové normy, musí být použité hodnoty Re a Rm schváleny příslušným orgánem nebo jím pověřenou organizací.

6.7.3.3.3.2 Oceli, které mají poměr Re/Rm větší než 0,85, nejsou dovoleny pro výrobu svařovaných nádrží. Hodnoty Re a Rm použité pro stanovení tohoto poměru musí být hodnoty uvedené v kontrolním osvědčení materiálu.

6.7.3.3.3.3 Oceli použité pro konstrukci nádrží musí mít prodloužení při přetržení v % nejméně 10 000/Rm s absolutním minimem 16 % pro jemnozrnné oceli a 20 % pro ostatní oceli.

6.7.3.3.3.4 Pro účely stanovení skutečných hodnot materiálů je třeba dodat, že pro plášťový materiál musí být osa vzorku kovu pro zkoušku pevnosti v pravém úhlu (kolmá) ke směru stáčení. Stálé prodloužení při přetržení musí být měřeno na zkušebních vzorcích v pravoúhlých příčných řezech v souladu s ISO 6892:1998 používající 50 mm měrné délky.

6.7.3.4 Minimální tloušťka stěny

6.7.3.4.1 Minimální tloušťka stěny musí být větší než tloušťka stanovena takto:

- (a) Minimální tloušťka stěny stanovena podle požadavků 6.7.3.4; a
- (b) Minimální tloušťka stěny stanovena podle uznávaných předpisů pro tlakové nádoby včetně požadavků v 6.7.3.3.

6.7.3.4.2 Cylindrické části, konce (dna) a kryty uzávěrů nádrží o průměru nejvýše 1,80 m nesmějí mít tloušťku menší než 5 mm v referenční oceli nebo rovnocennou tloušťku v použité oceli. Nádrže o průměru větším než 1,80 m nesmějí mít tloušťku menší než 6 mm v referenční oceli nebo rovnocennou tloušťku v použité oceli.

6.7.3.4.3 Cylindrické části, konce (dna) a kryty uzávěrů nádrží nesmějí mít tloušťku menší než 4 mm bez ohledu na výrobní materiál.

6.7.3.4.4 Rovnocenná tloušťka oceli jiná než předepsaná pro referenční ocel v 6.7.3.4.2 musí být stanovena podle tohoto vzorce:

$$e_1 = \frac{21,4 e_0}{\sqrt[3]{Rm_1 A_1}}$$

kde:

e_1 = požadovaná rovnocenná tloušťka (v mm) použité oceli;

e_0 = minimální tloušťka (v mm) referenční oceli uvedená v 6.7.3.4.2;

Rm_1 = minimální zaručená pevnost v tahu (v N/mm²) použité oceli (viz 6.7.3.3.3);

A_1 = zaručené minimální prodloužení při přetržení (v %) použité oceli podle národních nebo mezinárodních norem.

6.7.3.4.5 V žádném případě nesmí být tloušťka stěny nádrže menší, než je předepsána v 6.7.3.4.1 až 6.7.3.4.3. Všechny části nádrže musí mít minimální tloušťku stanovenou v 6.7.3.4.1 až 6.7.3.4.3. Tato tloušťka musí být výlučně bez přídavku na korozi.

6.7.3.4.6 Pokud je použita měkká ocel (viz 6.7.3.1), pro výpočet se nevyžaduje použití vzorce v 6.7.3.4.4.

6.7.3.4.7 V místech připojení konců (den) k cylindrické části nádrže nesmějí být žádné změny tloušťky.

6.7.3.5 Provozní výstroj

6.7.3.5.1 Provozní výstroj musí být uspořádána tak, aby byla chráněna proti nebezpečí utržení nebo poškození během přepravy a manipulace. Pokud spoj mezi rámem a nádrží dovoluje relativní pohyb mezi jednotlivými částmi konstrukce, výstroj musí být upevněna tak, aby dovolovala takový pohyb bez nebezpečí poškození provozních částí. Vnější spojovací vyprazdňovací prvky (potrubí, uzavírací ventily), vnitřní uzavírací ventil a jeho sedlo musí být chráněny proti nebezpečí utržení působením vnějších sil (např. použitím pružných částí). Plnicí a vyprazdňovací zařízení (včetně přírub nebo šroubových uzávěrů) a jakékoliv ochranné kryty musí umožňovat zajištění proti nežádoucímu uzavření.

6.7.3.5.2 Všechny otvory přemístitelných cisteren o průměru větším než 1,5 mm, kromě otvorů pro zařízení pro vyrovnávání tlaku, kontrolních otvorů a uzavřených odvodušňovacích otvorů, musí být vybaveny nejméně třemi vzájemně nezávislými uzavíracími zařízeními v sérii, první vnitřní uzavírací ventil, ventil omezující nadměrný průtok nebo rovnocenné zařízení, druhý vnější uzavírací ventil a třetí slepá příruba nebo rovnocenné zařízení.

- 6.7.3.5.2.1 Pokud je přemístitelná cisterna vybavena ventilem omezujícím nadměrný průtok, tento ventil musí být upevněn tak, že jeho nastavení je uvnitř nádrže, nebo uvnitř svařované příruby nebo, pokud je upevněn na vnějšku, jeho instalace musí být provedena tak, aby v případě nárazu jeho účinnost zůstala zachována. Ventily omezující nadměrný průtok musí být zvoleny a upevněny tak, aby uzavíraly automaticky, jestliže je dosažen nastavený průtok stanovený výrobcem. Spoje a příslušenství vedoucí do nebo z takového ventilu musí mít kapacitu pro průtok větší, než je nastavený průtok ventilu omezujícího průtok.
- 6.7.3.5.3 Pro plnicí a vyprazdňovací otvory musí být prvním uzavíracím zařízením vnitřní uzavírací ventil a druhým musí být uzavírací ventil umístěný na přístupném místě na každém vyprazdňovacím a plnicím potrubí.
- 6.7.3.5.4 Pro spodní plnicí a vyprazdňovací otvory přemístitelných cisteren určených pro přepravu hořlavých a/nebo toxických nechlazených zkapalněných plynů nebo chemikálií pod tlakem musí být vnitřní uzavírací ventil rychle uzavíracím bezpečnostním zařízením, které uzavírá automaticky v případě neočekávaného pohybu přemístitelné cisterny během plnění nebo vyprazdňování nebo vzniku požáru. S výjimkou přemístitelných cisteren, majících vnitřní objem nejvýše 1000 litrů, musí být možné ovládat toto zařízení dálkově.
- 6.7.3.5.5 Kromě plnicích, vyprazdňovacích a tlak plynu vyrovnávajících otvorů musí mít nádrže otvory, ve kterých jsou upevněna měřidla, teploměry a tlakoměry. Spoje pro takové přístroje musí být provedeny vhodnými přivařenými nástavci nebo kapsami a nesmějí se použít šroubové spoje skrz nádrž.
- 6.7.3.5.6 Všechny přemístitelné cisterny musí být vybaveny kontrolními otvory s kryty nebo jinými kontrolními otvory vhodných rozměrů dovolujícími vnitřní kontrolu a přiměřený vstup pro údržbu a opravy vnitřku.
- 6.7.3.5.7 Vnější spojovací prvky musí být, pokud je to možné, seskupeny.
- 6.7.3.5.8 Každý spoj na přemístitelné cisterně musí být zřetelně označen s uvedením své funkce.
- 6.7.3.5.9 Každý uzavírací ventil nebo jiné uzavírací prostředky musí být konstruovány a vyrobeny na tlak nádrže MAWP a vyšší se zohledněním teplot očekávaných během přepravy. Všechny uzavírací ventily se šroubovými uzávěry musí být uzavírány pravotočivým pohybem ručního kola. Pro ostatní ventily musí být poloha (otevřeno - zavřeno) a směr uzavírání zřetelně vyznačeny. Všechny uzavírací ventily musí být konstruovány tak, aby se zabránilo nežádoucímu otevření.
- 6.7.3.5.10 Potrubí musí být konstruováno, vyrobeno a instalováno tak, aby se zabránilo nebezpečí poškození působením tepelné roztlačnosti a smršťování, mechanických rázů a vibrací. Všechna potrubí musí být z vhodného kovového materiálu. Svařované spoje potrubí musí být používány všude, kde je to jen možné.
- 6.7.3.5.11 Spoje v měděném potrubí musí být spájeny nebo mít rovnocenně silné kovové spojení. Bod tavení pájecích materiálů nesmí být vyšší než 525 °C. Spoje nesmějí snižovat pevnost potrubí, což se může stát u šroubových spojů.
- 6.7.3.5.12 Průtržný tlak všech potrubí a spojovacích prvků potrubí nesmí být menší než nejvyšší čtyřnásobek MAWP nádrže nebo čtyřnásobek tlaku, kterému může být podrobena v provozu činností čerpadla nebo jiného zařízení (kromě zařízení na vyrovnávání tlaku).
- 6.7.3.5.13 Tažné kovy smějí být používány při konstrukci ventilů a příslušenství.

6.7.3.6 Spodní otvory

- 6.7.3.6.1 Určité nechlazené zkapalněné plyny nesmějí být přepravovány v přemístitelných cisternách se spodními otvory, jestliže pokyn pro přemístitelné cisterny T50 v 4.2.5.2.6 uvádí, že spodní otvory nejsou dovoleny. Žádné otvory v nádrži nesmějí být pod úrovní hladiny kapaliny, je-li plněna na nejvyšší dovolené plnění.

6.7.3.7 Zařízení pro vyrovnávání tlaku

- 6.7.3.7.1 Přemístitelné cisterny musí být provedeny s jedním nebo více pružinovými zařízeními pro vyrovnávání tlaku. Zařízení pro vyrovnávání tlaku se musí otevírat automaticky při tlaku nejméně MAWP a musí být plně otevřeny při tlaku rovném 110 % MAWP. Tato zařízení se musí po vypuštění uzavírat při tlaku nižším nejvýše o 10 % otevíracího tlaku a musí zůstat uzavřena při všech nižších tlacích. Zařízení pro vyrovnávání tlaku musí být typu, který bude odolávat dynamickým silám včetně pohybu kapaliny. Průtržné kotouče, které nejsou uspořádány do série s pružinovým zařízením pro vyrovnávání tlaku, nejsou dovoleny.
- 6.7.3.7.2 Zařízení pro vyrovnávání tlaku musí být konstruováno tak, aby se zabránilo vniknutí cizí věci, úniku kapaliny a vývoji nebezpečného zvýšeného tlaku.
- 6.7.3.7.3 Přemístitelné cisterny určené pro přepravu určitých nezchlazených zkapačněných plynů uvedených v pokynu pro přemístitelné cisterny T50 v 4.2.5.2.6 musí mít zařízení pro vyrovnávání tlaku, schválené příslušným orgánem. Pokud není přemístitelná cisterna vyhrazena pro přepravu jedné látky a vybavena schváleným zařízením pro vyrovnávání tlaku vyrobeným z materiálů snášenlivých s přepravovanou látkou, takové zařízení musí mít průtržný kotouč předřazený pružinovému zařízením. Prostor mezi průtržným kotoučem a zařízením musí být vybaven měřidlem tlaku nebo vhodným indikačním přístrojem. Toto uspořádání dovoluje odhalení protržení kotouče, propíchnutí nebo únik, který může způsobit špatnou činnost zařízení pro vyrovnávání tlaku. Průtržný kotouč se musí protrhnout při jmenovitém tlaku o 10 % vyšším, než je počáteční vypouštěcí tlak zařízení pro vyrovnávání tlaku.
- 6.7.3.7.4 V případě víceúčelových přemístitelných cisteren se musí zařízení pro vyrovnávání tlaku otevírat při tlaku uvedeném v 6.7.3.7.1 pro plyn mající nejvyšší dovolený tlak z plynů, jejichž přeprava je v přemístitelné cisterně dovolena.

6.7.3.8 Kapacita zařízení pro vyrovnávání tlaku

- 6.7.3.8.1 Kombinovaná dodávková kapacita zařízení pro vyrovnávání tlaku musí být dostatečná, aby v případě celkového požáru tlak (včetně akumulace) uvnitř nádrže nepřekročil 120 % MAWP. Pružinová vyrovnávací zařízení musí být použita pro dosažení předepsané plné vypouštěcí kapacity. V případě víceúčelových cisteren musí být kombinovaná dodávková kapacita zařízení pro vyrovnávání tlaku vzata pro plyn, který vyžaduje nejvyšší dodávkovou kapacitu z plynů, jejichž přeprava je v přemístitelných cisternách dovolena.
- 6.7.3.8.1.1 Pro stanovení celkové požadované kapacity zařízení pro vyrovnávání tlaku, která musí být součtem individuálních kapacit všech spolupůsobících zařízení, musí být použit následující vzorec⁵:

$$Q = 12,4 \frac{FA^{0,82}}{LC} \sqrt{\frac{ZT}{M}}$$

kde:

Q = minimální požadovaný stupeň v krychlových metrech vzduchu za sekundu (m³/s) za normálních podmínek: 1 bar a 0 °C (273 K);

F = koeficient této hodnoty:

pro neizolované nádrže F = 1;

⁵ Tento vzorec se vztahuje pouze na nezchlazené zkapačněné plyny, které mají kritické teploty vyšší než teploty za akumulační podmínky. Pro plyny, které mají kritické teploty blízko nebo pod teplotou akumulační podmínky, výpočet dodávkové kapacity zařízení pro vyrovnávání tlaku musí uvažovat s dalšími termodynamickými vlastnostmi plynu (viz např. CGA S-1,2-2003 Normy zařízení pro vyrovnání tlaku, část 2, nákladní a přemístitelné cisterny na stlačené plyny).

pro izolované nádrže $F = U(649 - t)/13,6$, avšak v žádném případě není menší než 0,25,

kde:

U = koeficient prostupu tepla v kW.m - 2.K- 1 při 38 °C

t = skutečná teplota nezchlazeného zkapalněného plynu během plnění (ve °C); pokud tato teplota není známa, bude $t = 15$ °C;

Výše uvedená hodnota F pro izolované nádrže může být použita, pokud izolace splňuje požadavky uvedené v 6.7.3.8.1.2;

kde:

A = celková plocha vnějšího povrchu nádrže ve čtverečných metrech

Z = koeficient stlačitelnosti plynu za akumulační podmínky (pokud tento koeficient není znám, bude Z rovno 1);

T = absolutní teplota v Kelvinech ($^{\circ}\text{C} + 273$) nad zařízením pro vyrovnávání tlaku za akumulační podmínky;

L = utajené teplo výparnosti kapaliny, v kJ/kg, za akumulační podmínky;

M = molekulární hmotnost vypouštěného plynu;

C = konstanta odvozená z jedné z následujících vzorců jako funkce poměru k specifických tepel:

$$k = \frac{c_p}{c_p}$$

kde:

C_p = specifické teplo při konstantním tlaku; a

C_v = specifické teplo při konstantním objemu.

pokud $k > 1$:

$$k = \frac{c_p}{c_p}$$

kde:

C_p = specifické teplo při konstantním tlaku; a

C_v = specifické teplo při konstantním objemu.

Pokud $k > 1$:

$$C = \sqrt{k \left(\frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

Pokud $k = 1$ nebo k není znám:

$$C = \frac{1}{\sqrt{e}} = 0,607$$

kde e je matematická konstanta 2,7183

C může být též převzata z následující tabulky:

k	C	k	C	K	C
1,00	0,607	1,26	0,660	1,52	0,704
1,02	0,611	1,28	0,664	1,54	0,707
1,04	0,615	1,30	0,667	1,56	0,710
1,06	0,620	1,32	0,671	1,58	0,713
1,08	0,624	1,34	0,674	1,60	0,716
1,10	0,628	1,36	0,678	1,62	0,719
1,12	0,633	1,38	0,681	1,64	0,722
1,14	0,637	1,40	0,685	1,66	0,725
1,16	0,641	1,42	0,688	1,68	0,728
1,18	0,645	1,44	0,691	1,70	0,731
1,20	0,649	1,46	0,695	2,00	0,770
1,22	0,652	1,48	0,698	2,20	0,793
1,24	0,656	1,50	0,701		

6.7.3.8.1.2 Izolační systémy používané za účelem snižování ventilační kapacity musí být schváleny příslušným orgánem nebo jím pověřenou organizací. Ve všech případech musí izolační systém schválený pro tento účel:

- (a) zůstat účinný při všech teplotách až do 649 °C; a
- (b) být chráněn pláštěm s bodem tavení 700 °C nebo vyšším.

6.7.3.9 **Značení zařízení pro vyrovnávání tlaku**

6.7.3.9.1 Každé zařízení pro vyrovnávání tlaku musí být zřetelně a trvale označeno těmito údaji:

- (a) Tlak (v barech nebo kPa), na které je nastaveno vypouštění;
- (b) Dovolena tolerance vypouštěcího tlaku pro pružinová zařízení pro vyrovnávání tlaku;
- (c) Referenční teplota odpovídající nastavenému tlaku pro průtržné kotouče; a
- (d) Nastavená průtoková kapacita zařízení v normálních krychlových metrech vzduchu za sekundu (m³/s);
- (e) Příčný průtokový průřez pružinového zařízení pro vyrovnávání tlaku a průtržných kotoučů v mm².

Pokud je to proveditelné, musí být uvedeny následující údaje:

- (f) Jméno výrobce a příslušné katalogové číslo zařízení pro vyrovnávání tlaku.

6.7.3.9.2 Nastavená průtoková kapacita označená na zařízení pro vyrovnávání tlaku musí být stanovena podle ISO 4126-1:2004 a ISO 4126-7:2004.

6.7.3.10 **Spoje k zařízení pro vyrovnávání tlaku**

6.7.3.10.1 Spoje k zařízení pro vyrovnávání tlaku musí být dostatečných rozměrů, aby umožnily neomezeně propustit požadované vypouštění do zařízení pro vyrovnávání tlaku. Žádný uzavírací ventil nesmí být vestavěn mezi nádrž a zařízení pro vyrovnávání tlaku, kromě zdvojeného zařízení pro údržbu nebo jiných důvodů a uzavíracích ventilů sloužících pro uzamčení otevřeného zařízení v provozu nebo uzavíracích ventilů vzájemně uzamčených tak, že alespoň jeden ze zdvojených je vždy provozuschopný a schopný splnit požadavky v 6.7.3.8. Nesmí být žádná překážka pro otevření vedení k zařízení ventilačnímu nebo pro vyrovnávání tlaku, která by mohla omezit nebo uzavřít průtok z nádrže do tohoto zařízení. Otvory od vyústění zařízení pro vyrovnávání tlaku, pokud jsou

používány, musí vypouštět přebytečné páry nebo kapaliny do atmosféry za podmínek minimálního zpětného tlaku do zařízení pro vyrovnávání tlaku.

6.7.3.11 Umístění zařízení pro vyrovnávání tlaku

6.7.3.11.1 Každé vyústění zařízení pro vyrovnávání tlaku musí být umístěno na vrchol nádrže co nejblíže podélnému a příčnému středu nádrže, jak je to proveditelné. Všechna vyústění zařízení pro vyrovnávání tlaku musí být umístěna tak, aby za podmínek maximálního plnění byla ve výparném prostoru nádrže, a zařízení musí být tak uspořádáno, aby zajistilo neomezené vypouštění unikajících par. U hořlavých nezchlazených zkapalněných plynů musí být unikající páry vyvedeny přímo ven z nádrže takovým způsobem, aby se nemohly dostat pod nádrž. Ochranná zařízení, která odklánějí proud par, jsou povolena pouze tehdy, nezměňují-li kapacitu zařízení pro vyrovnávání tlaku.

6.7.3.11.2 Uspořádání musí být provedena tak, aby zabránila přístupu nepovolaných osob k zařízení pro vyrovnávání tlaku a chránila tato zařízení před poškozením způsobeným převrácením přemístitelné cisterny.

6.7.3.12 Stavoznaky (měřicí zařízení)

6.7.3.12.1 Pokud je přemístitelná cisterna určena pro hmotnostní plnění, musí být vybavena jedním nebo více měřicími zařízeními. Skleněné stavoznaky a měřidla vyrobená z křehkého materiálu, která jsou v přímém styku s obsahem nádrže, nesmějí být použita.

6.7.3.13 Podpěry, rámy, zvedací a spouštěcí vybavení přemístitelných cisteren

6.7.3.13.1 Přemístitelné cisterny musí být konstruovány a vyráběny s podpěrnou konstrukcí zajišťující jejich bezpečnou základnu během přepravy. Síly uvedené v 6.7.3.2.9 a koeficient bezpečnosti uvedený v 6.7.3.2.10 musí být při konstrukci zohledněny. Zarážky, rámy, podstavce nebo jiné podobné konstrukce jsou přípustné.

6.7.3.13.2 Kombinovaná namáhání způsobená konstrukční výstrojí přemístitelné cisterny (např. podstavce, rámy atd.) a zvedací a spouštěcí zařízení nesmějí způsobit nadměrné namáhání v jakékoli části nádrže. Stabilní zvedací a spouštěcí zařízení musí být namontována na všech přemístitelných cisternách. Přednostně musí být upevněna na podpěry přemístitelné cisterny, avšak mohou být připevněna i k výztužným deskám umístěným na nádrži v bodech jejich podpěr.

6.7.3.13.3 Při konstrukci podpěr a rámu se musí brát v úvahu účinky klimatické koroze.

6.7.3.13.4 Kapsy pro zvedací vidlice musí být uzavíratelné. Prostředky pro uzavření těchto kapes musí tvořit trvalou část rámu nebo musí být trvale připojeny k rámu. Jednokomorové přemístitelné cisterny o délce menší než 3,65 m nemusí mít tyto kapsy uzavíratelné, pokud:

- (a) nádrž a všechny spojovací prvky jsou dobře chráněny proti úderům zvedacích vidlí; a
- (b) vzdálenost mezi středy kapes pro zvedací vidlice je nejméně polovina maximální délky přemístitelné cisterny.

6.7.3.13.5 Pokud přemístitelné cisterny nejsou během přepravy chráněny podle 4.2.2.3, nádrže a provozní výstroj musí být chráněny proti poškození nádrže a provozní výstroje podélným nebo příčným nárazem nebo převrácením. Vnější spojovací prvky musí být chráněny tak, aby byl vyloučen únik obsahu nádrže při nárazu nebo převrácení přemístitelné cisterny na tyto spojovací prvky. Příklady takové ochrany:

- (a) Ochrana proti bočnímu nárazu, kterou mohou tvořit podélné výztuže chránící nádrž z obou stran na výškové úrovni jejího středu;
- (b) Ochrana přemístitelné cisterny proti převrácení, kterou mohou tvořit výztužné prstence nebo výztuže upevněné napříč rámu;
- (c) Ochrana proti nárazu zezadu, kterou může tvořit nárazník nebo rám;

- (d) Ochrana nádrže proti poškození nárazem nebo převrácením použitím rámu ISO podle ISO 1496-3:1995.

6.7.3.14 Schválení konstrukce

- 6.7.3.14.1 Příslušný orgán nebo jím pověřená organizace vydává osvědčení o schválení konstrukce pro jakoukoli novou konstrukci přemístitelné cisterny. Toto osvědčení ověřuje, že přemístitelná cisterna byla prohlédnuta touto organizací, je vhodná pro její zamýšlený účel a odpovídá požadavkům této kapitoly a přiměřeným ustanovením pro plyny uvedeným v pokynu pro přemístitelné cisterny T50 v 4.2.5.2.6. Pokud jsou série přemístitelných cisteren vyráběny beze změny konstrukce, osvědčení platí pro celé tyto série. Osvědčení musí obsahovat zkušební protokol prototypu, plyny dovolené přepravovat, materiály konstrukce nádrže a schvalovací číslo. Schvalovací číslo musí tvořit mezinárodní rozlišovací značka státu předepsaná v Úmluvě o silničním provozu, Vídeň 1968, a registrační číslo. Jakákoliv alternativní ujednání podle 6.7.1.2 musí být uvedena v osvědčení. Schválení konstrukce může sloužit pro schválení menších přemístitelných cisteren vyrobených z materiálů téhož druhu a tloušťky, stejnou výrobní technologií a s identickými podpěrami, rovnocennými uzávěry a dalším příslušenstvím.
- 6.7.3.14.2 Zkušební protokol prototypu pro schválení konstrukce typu musí obsahovat nejméně toto:
- (a) Výsledky zkoušky vhodného rámu uvedené v ISO 1496-3:1995;
 - (b) Výsledky první inspekce a zkoušky uvedené v 6.7.3.15.3;
 - (c) Výsledky nárazové zkoušky uvedené v 6.7.3.15.1, je-li předepsána.

6.7.3.15 Inspekce a zkoušení

- 6.7.3.15.1 Přemístitelné cisterny odpovídající definici kontejneru podle Mezinárodní úmluvy o bezpečnosti kontejnerů (KBK) z roku 1972 v platném znění, nesmějí být používány. Jejich použití je možné pouze tehdy, pokud se reprezentativní vzorek každého konstrukčního typu úspěšně ověří zkouškou dynamického nárazu podle Příručky zkoušek a kritérií, díl IV, odstavec 41.
- 6.7.3.15.2 Nádrž a součásti výstroje každé přemístitelné cisterny musí být podrobeny inspekci a zkoušce před jejím prvním uvedením do provozu (první inspekce a zkouška) a potom v nejvýše pětiletých intervalech (periodická inspekce a zkouška po pěti letech) s meziperiodickou inspekci a zkouškou v polovině této doby (periodická inspekce a zkouška po dvou a půl letech). Inspekce a zkouška po dvou a půl letech může být provedena během tří měsíců před nebo po stanoveném datu. Mimořádná inspekce a zkouška musí být provedena bez ohledu na datum poslední periodické inspekce a zkoušky, pokud je to nezbytné podle 6.7.3.15.7.
- 6.7.3.15.3 První inspekce a zkouška přemístitelné cisterny musí zahrnovat kontrolu konstrukčních charakteristik, vnitřní a vnější prohlídku přemístitelné cisterny a jejich spojovacích prvků vzhledem k nezchlazeným zkapalněným plynům, které v ní mají být přepravovány, a tlakovou zkoušku podle zkušebních postupů uvedených v 6.7.3.3.2. Tlaková zkouška může být provedena jako hydraulická zkouška nebo použitím jiné kapaliny nebo plynu po dohodě s příslušným orgánem nebo jím pověřenou organizací. Před uvedením přemístitelné cisterny do provozu musí být též provedeny zkouška těsnosti a kontrola uspokojivého provozu celé provozní výstroje. Pokud byly nádrž a její spojovací prvky tlakově zkoušeny odděleně, musí být po jejich zkompletování podrobeny zkoušce těsnosti. Všechny svary vystavené úrovni plného namáhání v nádrži musí být zkontrolovány během první zkoušky rentgenem, ultrazvukem nebo jinou metodou nedestruktivní zkoušky. To se nevztahuje na opláštění.
- 6.7.3.15.4 Periodická inspekce a zkouška po pěti letech, musí zahrnovat vnitřní a vnější prohlídku a, jak je všeobecným pravidlem, hydraulickou tlakovou zkoušku. Opláštění, tepelná izolace a jiné mohou být sejmuty pouze s ohledem na požadovaný rozsah spolehlivého zhodnocení charakteristik přemístitelné cisterny. Pokud nádrž a její výstroj byly zkoušeny odděleně, musí být po jejich zkompletování podrobeny zkoušce těsnosti.

- 6.7.3.15.5 Meziperiodická inspekce a zkouška po dvou a půl letech musí zahrnovat nejméně vnitřní a vnější prohlídku přemístitelné cisterny a jejích spojovacích prvků vzhledem k nezchlazeným zkapalněným plynům, které v ní mají být přepravovány, zkoušku těsnosti a ověření uspokojivého provozu celé provozní výstroje. Opláštění, tepelná izolace a jiné mohou být sejmuty pouze vzhledem k požadovanému rozsahu spolehlivého zhodnocení charakteristik přemístitelné cisterny. Pro přemístitelné cisterny určené pro přepravu jednoho nezchlazeného zkapalněného plynu může být vnitřní prohlídka po dvou a půl letech vypuštěna nebo nahrazena jinou zkušební metodou nebo inspekčními postupy stanovenými příslušným orgánem nebo jím pověřenou organizací.
- 6.7.3.15.6 Přemístitelná cisterna nesmí být plněna a přistavována k přepravě po datu uplynutí platnosti poslední pětileté nebo dvou a půlleté periodické inspekce a zkoušky, jak je požadováno v 6.7.3.15.2. Avšak přemístitelná cisterna naplněná před datem uplynutí platnosti poslední periodické inspekce a zkoušky může být přepravována po dobu nepřesahující tři měsíce od uplynutí platnosti poslední periodické zkoušky nebo inspekce. Kromě toho smí být přemístitelná cisterna přepravována po datu uplynutí platnosti poslední periodické zkoušky a inspekce:
- (a) Po vyprázdnění, ale před vyčištěním, pro účely provedení příští požadované zkoušky nebo inspekce před opětovným naplněním; a
 - (b) Pokud není jinak schváleno příslušným orgánem, pro období nepřekračující šest měsíců od data uplynutí platnosti poslední periodické zkoušky nebo inspekce, aby bylo možno vrátit nebezpečné věci k jejich likvidaci nebo recyklaci. Odvolávka na tuto výjimku musí být uvedena v přepravním dokladu.
- 6.7.3.15.7 Mimořádná inspekce a zkouška je nezbytná, pokud přemístitelná cisterna vykazuje zřetelně poškozené nebo zkorodované plochy nebo únik nebo jiné okolnosti, které ukazují nedostatky, jež by mohly ovlivnit celistvost přemístitelné cisterny. Rozsah mimořádné inspekce a zkoušky musí záviset na rozsahu poškození a zhoršení přemístitelné cisterny. Musí zahrnovat nejméně dvou a půlletou inspekci a zkoušku podle 6.7.3.15.5.
- 6.7.3.15.8 Vnitřní a vnější prohlídky musí zajistit, že:
- (a) Nádrž je prohlédnuta se zaměřením na promáčknutí, korozi nebo odření, záhyby, zkroucení, vady ve svarech nebo jiné okolnosti, včetně úniku, které by mohly způsobit, že přemístitelná cisterna není bezpečná pro přepravu;
 - (b) Potrubí, ventily systém a těsnění jsou prohlédnuty se zaměřením na zkorodované plochy, závady a jiné okolnosti, včetně úniku, které by mohly způsobit, že přemístitelná cisterna není bezpečnou pro plnění, vyprazdňování nebo přepravu;
 - (c) Zařízení pro těsnění uzavíratelných poklopů je provozuschopné a že zde není žádný únik z uzavíratelných vík a těsnění;
 - (d) Chybějící nebo ztracené šrouby nebo matice na jakémkoli spojení příruby nebo slepé příruby jsou nahrazeny nebo utěsněny;
 - (e) Všechna pojistná zařízení a ventily jsou bez koroze, zkroucení a jakéhokoli poškození nebo vady, které by mohly zabránit jejich normální činnosti. Uzavírací zařízení a samočinné uzavírací ventily musí být uvedeny v činnost pro prokázání vlastní provozuschopnosti;
 - (f) Požadovaná značení na přemístitelné cisterně jsou čitelná a v souladu s příslušnými požadavky; a
 - (g) Rám, podpěry a zařízení pro zdvih přemístitelné cisterny jsou v uspokojivém stavu.
- 6.7.3.15.9 Inspekce a zkoušky v 6.7.3.15.1, 6.7.3.15.3, 6.7.3.15.4, 6.7.3.15.5 a 6.7.3.15.7 musí být provedeny znalcem nebo za účasti znalce schváleného příslušným orgánem nebo jím pověřenou organizací. Pokud je součástí inspekce a zkoušky tlaková zkouška, musí být provedena zkušebním tlakem, který je vyznačen na štítku přemístitelné cisterny. Během tlakové zkoušky musí být přemístitelná cisterna kontrolována na jakýkoliv únik z cisterny, potrubí nebo výstroje.
- 6.7.3.15.10 Ve všech případech, kdy je prováděno řezání, opalování nebo sváření na nádrži, musí být tyto práce schváleny příslušným orgánem nebo jím pověřenou organizací s ohledem na předpisy pro tlakové

nádoby používané pro konstrukci nádrže. Tlaková zkouška musí být provedena navíc k původní tlakové zkoušce po ukončení těchto prací.

- 6.7.3.15.11 Pokud se objeví jakákoli nebezpečná okolnost, nesmí být přemístitelná cisterna vrácena do provozu, pokud nebyla opravena a zkouška není opakována s uspokojivým výsledkem.

6.7.3.16 Značení

- 6.7.3.16.1 Každá přemístitelná cisterna musí být opatřena nerezavějícím kovovým štítkem trvale upevněným k přemístitelné cisterně na viditelném místě snadno přístupném pro kontrolu. Pokud z důvodů uspořádání přemístitelné cisterny nemůže být štítek trvale připevněn na nádrž, nádrž musí být označena nejméně informacemi požadované kódem příslušné tlakové nádoby. Jako minimum, nejméně následující informace musí být vyznačeny na štítku vyražením nebo jinou podobnou metodou:

- (a) Informace o vlastníkovi
 - (i) Registrační číslo vlastníka
- (b) Výrobní informace
 - (i) Země výroby
 - (ii) Rok výroby
 - (iii) Jméno nebo značka výrobce
 - (iv) Výrobcem přidělené sériové číslo
- (c) Informace o schválení
 - (i) Znak Spojených národů pro obaly

Tento znak nesmí být použit pro jiné účely než pro osvědčení, že obal, přemístitelná cisterna nebo MEGC splňuje příslušné požadavky kapitoly 6.1, 6.2, 6.3, 6.5, 6.6 nebo 6.7².

- (ii) Země schválení;
 - (iii) Pověřená organizace pro schvalování konstrukčního typu.
 - (iv) Číslo schválení konstrukčního typu
 - (v) Písmena 'AA', pokud byl konstrukční typ schválen dle ujednání (viz 6.7.1.2);
 - (vi) Předpis pro tlakové nádoby podle kterého byla nádrž zkonstruována
- (d) Tlaky
 - (i) MAWP (přetlak v barech nebo kPa)³;
 - (ii) Zkušební tlak (přetlak v barech nebo kPa)³;
 - (iii) Datum první tlakové zkoušky (měsíc a rok);
 - (iv) Identifikační značka znalce účastnícího se první tlakové zkoušky

² Tento symbol se používá také pro osvědčení, že velké nádoby pro volně ložené látky schválené pro jiné druhy dopravy odpovídají požadavkům v kapitole 6.8 Model Regulations.

³ Použitá jednotka musí být označena.

- (v) Vnější výpočtový tlak⁶(přetlak v barech nebo kPa)³;
- (e) Teploty
 - (i) Rozsah výpočtových teplot (ve °C)³;
 - (ii) Referenční výpočtová teplota (ve °C)³
- (f) Materiály
 - (i) Materiál(y) nádrže a odkaz(y) na materiálové normy;
 - (ii) Ekvivalent tloušťky pro referenční ocel (v mm)³;
- (g) Vnitřní objem
 - (i) Hydraulický vnitřní objem cisterny při 20 °C (v litrech)³;
- (h) Periodické inspekce a zkoušky
 - (i) Druh poslední periodické zkoušky (2,5-roku, 5-let nebo mimořádná);
 - (ii) Datum poslední periodické zkoušky (měsíc a rok);
 - (iii) Zkušební tlak (přetlak v barech nebo kPa)³ poslední periodické zkoušky (pokud byla provedena);
 - (iv) Identifikační značka pověřené organizace, která provedla nebo dozorovala poslední zkoušku.

Tabulka 6.7.3.16.1: Příklad značení identifikačním štítkem

⁶ Viz 6.7.2.2.10.

6.7.3.16.2 Následující údaje musí být trvanlivě vyznačeny buď na přemístitelné cisterně samé nebo na kovovém štítku pevně umístěném na přemístitelné cisterně:

Jméno provozovatele

Název nezchlazeného zkapalněného plynu(ů) dovoleného(ných) k přepravě

Nejvyšší dovolená užitečná hmotnost pro každý dovolený nezchlazený zkapalněný plyn _____ kg

Nejvyšší dovolená celková hmotnost (MPGM) _____ kg

Vlastní hmotnost _____ kg

Pokyny pro přemístitelné cisterny v souladu s 4.2.5.2.6

POZNÁMKA: Pro identifikaci přepravovaných nezchlazených zkapalněných plynů, viz též část 5.

6.7.3.16.3 Jestliže je přemístitelná cisterna konstruována a schválena pro manipulaci na otevřeném moři, musí být na identifikačním štítku uvedena slova "OFFSHORE PORTABLE TANK".

6.7.4 Požadavky na konstrukci, výrobu, inspekci a zkoušení přemístitelných cisteren určených pro přepravu hluboce zchlazených zkapalněných plynů

6.7.4.1 Definice

Pro účely tohoto oddílu se následujícími pojmy rozumí:

Alternativní ujednání znamená schválení zaručené příslušným orgánem pro přemístitelnou cisternu nebo MEGC, které byly konstruovány, vyrobeny nebo zkoušeny podle technických požadavků nebo zkušebních metod jiných, než uvedených v této kapitole;

Přemístitelná cisterna znamená tepelně izolovanou multimodální cisternu s vnitřním objemem větším než 450 litrů vybavenou provozní a konstrukční výstrojí nezbytnou pro přepravu hluboce zchlazených zkapalněných plynů. Přemístitelnou cisternu musí být možno plnit a vyprazdňovat bez sejmutí konstrukční výstroje. Musí mít stabilizační členy vně nádrže a musí ji být možno zvedat v naplněném stavu. Musí být především konstruována pro zdvih na vozidlo, železniční vůz nebo námořní plavidlo nebo plavidlo pro vnitrozemské vodní cesty a musí být vybavena zarážkami, úchyty nebo příslušenstvím umožňujícím mechanickou manipulaci. Silniční cisternová vozidla, železniční cisternové vozy, nekovové cisterny, velké nádoby pro volně ložené látky (IBC), láhve na plyn a velké nádoby nespádají do definice přemístitelné cisterny;

Cisterna znamená konstrukci, kterou normálně tvoří buď:

- (a) Plášť a jedna nebo více nádrží, kde je z prostoru mezi nádrží(emi) a pláštěm vyčerpán vzduch (vakuová izolace), a může být současně doplněn tepelně izolačním systémem; nebo
- (b) Plášť a vnitřní nádrž s mezivrstvou tepelně izolačního materiálu (např. tuhé pěny);

Nádrž znamená část přemístitelné cisterny, která obsahuje hluboce zchlazené zkapalněné plyny určené pro přepravu, včetně otvorů a jejich uzávěrů, ale nezahrnuje provozní výstroj a konstrukční výstroj;

Plášť znamená vnější izolační opláštění, které může být součástí tepelně izolačního systému;

Provozní výstroj znamená měřicí přístroje a plnicí, vyprazdňovací, větrací, pojistná, komprimující, chladicí a tepelně izolační zařízení;

Konstrukční výstroj znamená výztužné, upevňovací, ochranné a stabilizační prvky vně nádrže;

Nejvyšší dovolený provozní tlak (MAWP) znamená nejvyšší dovolený efektivní přetlak ve vrcholu nádrže naplněné přemístitelné cisterny v její provozní poloze včetně nejvyššího efektivního tlaku během plnění a vyprazdňování;

Zkušební tlak znamená nejvyšší přetlak ve vrcholu nádrže během tlakové zkoušky;

Zkouška těsnosti znamená zkoušku nádrže a její provozní výstroje používající plyn do vnitřního tlaku nejméně 90 % MAWP.

Nejvyšší dovolená celková hmotnost (MPGM) znamená součet vlastní hmotnosti přemístitelné cisterny a nejvyšší dovolené užitečné hmotnosti;

Skutečná doba naplnění znamená dobu, která uplyne od začátku plnění až do zvýšení tlaku vlivem zahřívání na nejnižší nastavený tlak zařízení omezujícího(ch) tlak;

Referenční ocel znamená ocel s mezí pevnosti v tahu 370 N/mm² a prodloužením při přetržení 27 %;

Nejnižší projektovaná teplota znamená teplotu, která je používána pro návrh a výrobu nádrže nepřekračující nejnižší (studenou) teplotu (provozní teplotu) obsahu během normálních

6.7.4.2 Všeobecné konstrukční a výrobní požadavky

- 6.7.4.2.1 Nádrže musí být zkonstruovány a vyrobeny podle požadavků předpisů pro tlakové nádoby uznávaných příslušným orgánem. Nádrže a pláště musí být vyrobeny z kovových materiálů vhodných pro tváření. Pláště musí být vyrobeny z oceli. Nekomové materiály mohou být použity pro připojení a podpory mezi nádrží a pláštěm, pokud jsou vlastnosti těchto materiálů při nejmenší projektované teplotě prokázány jako dostačující. Materiály musí v zásadě odpovídat národním nebo mezinárodním materiálovým normám. Pro svařované nádrže a pláště musí být použity pouze materiály, jejichž svařitelnost byla plně prokázána. Svary musí být odborně provedeny a musí zaručovat úplnou bezpečnost. Pokud je to nezbytné z hlediska výrobního postupu nebo materiálů, musí být nádrže vhodně tepelně zpracovány pro zajištění přiměřené tuhosti ve svaru a v tepelně namáhaných zónách. Při volbě materiálu musí být vzato v úvahu rozmezí projektované teploty s přihlédnutím k nebezpečí křehkého lomu, vodíkové křehkosti namáhání korozivními trhlami a odolnosti proti nárazu. Pokud je použita jemnozrná ocel, musí být zaručena mez průtažnosti nejméně 460 N/mm² a zaručená hodnota meze pevnosti nejméně 725 N/mm² podle materiálové specifikace. Materiály přemístitelné cisterny musí být vhodné pro klimatické podmínky, v nichž mohou být přepravovány.
- 6.7.4.2.2 Jakákoli část přemístitelné cisterny, včetně spojovacích prvků, těsnění a potrubí, které mohou normálně přijít do styku s přepravovaným hluboce zchlazeným zkapalněným plynem musí být snášlivá s tímto hluboce zchlazeným zkapalněným plynem.
- 6.7.4.2.3 Musí se zabránit dotyku mezi různými kovy, který by mohl mít za následek poškození galvanickým účinkem.
- 6.7.4.2.4 Systém tepelné izolace musí tvořit úplné opláštění nádrže(i) účinnými izolačními materiály. Vnější izolace musí být chráněna pláštěm tak, aby se zabránilo pronikání vlhkosti a jinému poškození za normálních přepravních podmínek.
- 6.7.4.2.5 Pokud je plášť uzavřen tak, že je plynotěsný, zařízení musí být provedeno tak, aby zabránilo jakémukoli nebezpečnému tlaku vyvíjenému v izolačním prostoru.
- 6.7.4.2.6 Přemístitelné cisterny určené pro přepravu hluboce zchlazených zkapalněných plynů majících bod varu nižší než minus (-)182 °C při atmosférickém tlaku nesmějí obsahovat materiály, které mohou nebezpečně reagovat s kyslíkem nebo kyslíkem obsaženým ve vzduchu, pokud jsou umístěny v částech tepelné izolace, kde je nebezpečí styku s kyslíkem nebo s kyslíkem obsaženým v kapalině.
- 6.7.4.2.7 Izolační materiály se nesmějí v provozu poškozovat zvlněním.
- 6.7.4.2.8 Referenční skutečná doba naplnění musí být stanovena pro každý hluboce zchlazený zkapalněný plyn určený k přepravě v přemístitelné cisterně.
- 6.7.4.2.8.1 Referenční skutečná doba naplnění musí být stanovena metodou uznávanou příslušným orgánem na základě následujících:
- (a) Účinnosti izolačního systému stanovené podle 6.7.4.2.8.2;
 - (b) Nejnižšího nastaveného tlaku zařízení omezujícího(ch) tlak;
 - (c) Prvních plnicích podmínek;
 - (d) Očekávané teploty okolí 30 °C;
 - (e) Fyzikálních vlastností jednotlivého hluboce zchlazeného zkapalněného plynu určeného k přepravě.

- 6.7.4.2.8.2 Účinnost izolačního systému (tepelný příkon ve watttech) musí být stanoven při zkoušce typu přemístitelné cisterny podle postupu uznávaného příslušným orgánem. Tuto zkoušku tvoří buď:
- (a) Zkouška při konstantním tlaku (např. při atmosférickém tlaku), pokud ztráta hluboce zchlazeného zkapalněného plynu je měřena po celou dobu; nebo
 - (b) Zkouška uzavřeného systému, pokud vzrůst tlaku v nádrži je měřen po celou dobu.
- Pokud je prováděna zkouška při konstantním tlaku, musí se brát v úvahu změny atmosférického tlaku. Pokud se provádějí zkoušky, korekce musí být provedeny pro jakékoli změny okolní teploty od očekávané referenční teploty hodnoty 30 °C.
- POZNÁMKA:** Pro stanovení skutečné teploty naplnění před každou cestou, viz 4.2.3.7.
- 6.7.4.2.9 Plášť vakuově izolované dvojité stěny cisterny musí mít buď vnější výpočtový tlak nejméně 100 kPa (1 bar) (přetlak) vypočtený podle uznávaného technického předpisu nebo vypočtený kritický tlak nejméně 200 kPa (2 bary) (přetlak). Vnitřní a vnější vyztužení mohou být zahrnuta při výpočtu schopnosti pláště odolávat vnějšímu tlaku.
- 6.7.4.2.10 Přemístitelné cisterny musí být konstruovány a vyráběny se základnou zajišťující bezpečnost během přepravy a s vhodnými zvedacími a spouštěcími zařízeními.
- 6.7.4.2.11 Přemístitelné cisterny musí být konstruovány tak, aby odolaly beze ztráty obsahu nejméně vnitřnímu tlaku vyvolanému obsahem a statickým, dynamickým a tepelným namáháním během normálních podmínek manipulace a přepravy. Konstrukce musí prokázat, že účinky únavy způsobené opakovaným působením těchto namáhání během očekávané životnosti přemístitelné cisterny byly zohledněny.
- 6.7.4.2.12 Přemístitelné cisterny a jejich upevnění musí při nejvyšším dovoleném zatížení být schopny absorbovat následující jednotlivé statické síly:
- (a) Ve směru jízdy: dvojnásobek MPGM násobená zemským zrychlením (g)³;
 - (b) Vodorovně kolmo na směr jízdy: MPGM (pokud směr jízdy není jasně určen, síly musí být rovnocenné dvojnásobku MPGM) násobené zemským zrychlením (g)³;
 - (c) Svisle vzhůru: MPGM násobená zrychlením (g)³; a
 - (d) Svisle dolů: dvojnásobek MPGM (celkové zatížení včetně účinku gravitace) násobené zemským zrychlením (g)³.
- 6.7.4.2.13 U každé ze sil v 6.7.4.2.12 musí být zachován koeficient bezpečnosti takto:
- (a) Pro kovy mající výrazně definovanou mez průtažnosti koeficient 1,5 ve vztahu k mezi průtažnosti; nebo
 - (b) Pro kovy nemající výrazně definovanou mez průtažnosti koeficient 1,5 ve vztahu k zaručeným 0,2 % prokázané průtažnosti a pro austenitické oceli 1 % prokázané průtažnosti.
- 6.7.4.2.14 Hodnoty meze pevnosti nebo prokázané pevnosti musí být hodnoty podle národních a mezinárodních materiálových norem. Pokud jsou používány austenitické oceli, stanovené nejnižší hodnoty meze pevnosti nebo prokázané pevnosti podle materiálových norem mohou být zvýšeny o 15 %, pokud jsou tyto vyšší hodnoty ověřeny v kontrolních osvědčeních materiálu. Pokud neexistuje žádná materiálová norma pro daný materiál, hodnota meze pevnosti nebo prokázané pevnosti musí být schválena příslušným orgánem.

³ Pro účely výpočtu $g = 9,81 \text{ m/s}^2$.

- 6.7.4.2.15 Přemístitelné cisterny určené pro přepravu hořlavých hluboce zchlazených zkvapalněných plynů musí být možno elektricky uzemnit.

6.7.4.3 Konstrukční kritéria

- 6.7.4.3.1 Nádrže musí být kruhového průřezu.

- 6.7.4.3.2 Nádrže musí být zkonstruovány a vyrobeny tak, aby odolaly zkušebnímu tlaku nejméně 1,3 násobku MAWP. Pro nádrže s vakuovou izolací nesmí být zkušební tlak menší než součet MAWP a 100 kPa (1 bar). V žádném případě nesmí být zkušební tlak menší než 300 kPa (3 bary) přetlaku. Pozornost musí být věnována požadavkům na nejmenší tloušťku stěny uvedeným v 6.7.4.4.2 až 6.7.4.4.7.

- 6.7.4.3.3 Pro kovy vykazující výrazně definovanou mez průtažnosti nebo charakterizované zaručenou prokázanou průtažností (0,2 % prokázané průtažnosti obecně nebo 1 % prokázané průtažnosti pro austenitické oceli) nesmí primární povrchové napětí σ v nádrži překročit 0,75 Re nebo 0,50 Rm, podle toho, která z těchto hodnot je nižší, při zkušebním tlaku, kde:

Re = výrazná mez průtažnosti v N/mm² nebo 0,2 % prokázané průtažnosti nebo pro austenitické ocele 1 % prokázané průtažnosti;

Rm = zaručená minimální pevnost v tahu v N/mm².

- 6.7.4.3.3.1 Použité hodnoty Re a Rm musí být stanoveny jako nejmenší hodnoty podle národních a mezinárodních materiálových norem. Pokud je použita austenitická ocel, mohou být stanovené nejnižší hodnoty pro Re a Rm podle materiálových norem zvýšeny až o 15 %, jestliže vyšší hodnoty jsou ověřeny v kontrolním osvědčení materiálu. Neexistují-li žádné materiálové normy pro daný kov, použité hodnoty Re a Rm musí být schváleny příslušným orgánem nebo jím pověřenou organizací.

- 6.7.4.3.3.2 Oceli, které mají poměr Re/Rm větší než 0,85, nejsou dovoleny pro výrobu svařovaných nádrží. Hodnoty Re a Rm použité pro stanovení tohoto poměru musí být hodnoty uvedené v kontrolním osvědčení materiálu.

- 6.7.4.3.3.3 Oceli použité pro výrobu nádrží musí mít prodloužení při přetržení v % nejméně 10 000/Rm s absolutním minimem 16 % pro jemnozrnné oceli a 20 % pro ostatní oceli. Hliník a hliníkové slitiny používané v konstrukci nádrží musí mít prodloužení při přetržení v % nejméně 10 000/Rm s absolutním minimem 12 %.

- 6.7.4.3.3.4 Pro účely stanovení skutečných hodnot materiálů je třeba připomenout, že pro plášťový materiál musí být osa vzorku kovu pro zkoušku pevnosti v pravém úhlu (kolmá) ke směru stáčení. Stálé prodloužení při přetržení musí být měřeno na zkušebních vzorcích v pravoúhlých příčných řezech v souladu s ISO 6892:1998 používající 50 mm měrné délky.

6.7.4.4 Minimální tloušťka stěny nádrže

- 6.7.4.4.1 Minimální tloušťka stěny musí být větší než tloušťka stanovená následovně:

- (a) Minimální tloušťka stěny stanovená podle požadavků v 6.7.4.4.2 až 6.7.4.4.7; nebo
- (b) Minimální tloušťka stěny stanovená podle příslušných předpisů pro tlakové nádoby včetně požadavků v 6.7.4.3.

- 6.7.4.4.2 Nádrže o průměru nejvýše 1,80 m nesmějí mít tloušťku stěny menší než 5 mm v referenční oceli nebo rovnocennou tloušťku v použitém kovu. Nádrže o průměru větším než 1,80 m nesmějí mít tloušťku stěny menší než 6 mm v referenční oceli nebo rovnocennou tloušťku v použitém kovu.

- 6.7.4.4.3 Nádrže vakuově izolovaných cisteren o průměru nejvýše 1,80 m nesmějí mít tloušťku stěny menší než 3 mm v referenční oceli nebo rovnocennou tloušťku v použitém kovu. Takové nádrže o průměru větším než 1,80 m nesmějí mít tloušťku stěny menší než 4 mm v referenční oceli nebo rovnocennou tloušťku v použitém kovu.

- 6.7.4.4.4 Pro vakuově izolované cisterny musí celková tloušťka pláště a nádrže odpovídat nejmenší tloušťce předepsané v 6.7.4.4.2, tloušťka stěny nádrže samé nesmí být menší než nejmenší tloušťka předepsaná v 6.7.4.4.3.
- 6.7.4.4.5 Nádrže nesmějí mít tloušťku stěny menší než 3 mm bez ohledu na materiál konstrukce.
- 6.7.4.4.6 Rovnocenná tloušťka kovu jiná než předepsaná pro referenční ocel v 6.7.4.4.2 a 6.7.4.4.3 musí být stanovena podle tohoto vzorce:

$$e_1 = \frac{21,4 e_0}{\sqrt[3]{Rm_1 A_1}}$$

kde:

- e_1 = požadovaná rovnocenná tloušťka (v mm) použitého kovu;
- e_0 = minimální tloušťka (v mm) referenční oceli uvedená v 6.7.4.4.2 a 6.7.4.4.3;
- Rm_1 = minimální zaručená pevnost v tahu (v N/mm²) použitého kovu (viz 6.7.4.3.3);
- A_1 = zaručené minimální prodloužení při přetržení (v %) použitého kovu podle národních nebo mezinárodních norem.

- 6.7.4.4.7 V žádném případě nesmí být tloušťka stěny nádrže menší, než je předepsána v 6.7.4.4.1 až 6.7.4.4.5. Všechny části nádrže musí mít minimální tloušťku stanovenou podle 6.7.4.4.1 až 6.7.4.4.6. Tato tloušťka musí být výlučně bez přídavku na korozi.
- 6.7.4.4.8 Nesmí být žádná náhlá změna tloušťky v místě spojení konců (den) s cylindrickou částí nádrže.

6.7.4.5 Provozní výstroj

- 6.7.4.5.1 Provozní výstroj musí být uspořádána tak, aby byla chráněna proti nebezpečí utržení nebo poškození během přepravy a manipulace. Pokud spoj mezi rámem a cisternou nebo pláštěm a nádrží dovoluje relativní pohyb, výstroj musí být upevněna tak, aby dovozovala takový pohyb bez nebezpečí poškození provozních částí. Vnější spojovací vyprazdňovací prvky (potrubí, uzavírací ventily), uzavírací ventil a jeho sedlo musí být chráněny proti nebezpečí utržení působením vnějších sil (např. použitím pružných částí). Plnicí a vyprazdňovací zařízení (včetně přírub nebo šroubových uzávěrů) a jakékoliv ochranné kryty musí umožňovat zajištění proti nežádoucímu otevření.
- 6.7.4.5.2 Každý plnicí a vyprazdňovací otvor přemístitelných cisteren používaných pro přepravu hořlavých hluboce zchlazených zkapalněných plynů musí být vybaven nejméně třemi vzájemně nezávislými uzavíracími zařízeními v sérii, prvním uzavíracím ventilem umístěným co nejbližší k plášti, druhým uzavíracím ventilem a třetím slepou přírubou nebo rovnocenným zařízením. Uzavírací ventil nejbližší k plášti musí být rychle uzavíratelným zařízením, které uzavírá automaticky v případě nežádoucího pohybu přemístitelné cisterny během plnění nebo vyprazdňování nebo vzniku požáru. Toto zařízení musí být také možno dálkově ovládat.
- 6.7.4.5.3 Každý plnicí a vyprazdňovací otvor přemístitelných cisteren používaných pro přepravu nehořlavých hluboce zchlazených zkapalněných plynů musí být vybaven nejméně dvěma vzájemně nezávislými uzavíracími zařízeními v sérii, prvním uzavíracím ventilem umístěným co nejbližší k plášti, druhým slepou přírubou nebo rovnocenným zařízením.
- 6.7.4.5.4 Pro části potrubí, které zůstávají uzavřeny na obou stranách a kde může být uzavřena kapalina, musí být zajištěna metoda automatického vyrovnávání tlaku pro zabránění zvýšení tlaku vyvinutého v potrubí.
- 6.7.4.5.5 Vakuově izolované cisterny nemusí mít kontrolní otvory.
- 6.7.4.5.6 Vnější spojovací prvky musí být, pokud je to možné, seskupeny.

- 6.7.4.5.7 Každý spoj na přemístitelné cisterně musí být zřetelně označen s uvedením své funkce.
- 6.7.4.5.8 Každý uzavírací ventil nebo jiné uzavírací prostředky musí být konstruovány a vyrobeny na tlak nádrže MAWP a vyšší s ohledem na teploty očekávané během přepravy. Všechny uzavírací ventily se šroubovými uzávěry musí být uzavírány pravotočivým pohybem ručního kola. Pro ostatní ventily musí být poloha (otevřeno - zavřeno) a směr uzavírání zřetelně vyznačeny. Všechny uzavírací ventily musí být konstruovány tak, aby se zabránilo nežádoucímu otevření.
- 6.7.4.5.9 Pokud jsou použita tlaková zařízení, musí být spoje těchto zařízení pro kapaliny a páru opatřeny ventilem co možno nejbliže k plášti, aby se při poškození tlakových zařízení zabránilo uniku naplněné věci.
- 6.7.4.5.10 Potrubí musí být konstruováno, vyrobeno a instalováno tak, aby se zabránilo nebezpečí poškození působením tepelné roztažnosti a smršťování mechanických rázů a vibrací. Všechna potrubí musí být z vhodného kovového materiálu. Pro ochranu před únikem způsobeným ohněm se musí používat výhradně ocelové potrubí a svařované spoje mezi pláštěm a spojem k prvnímu uzávěru jakéhokoli vývodu. Metoda připojení uzávěru k tomuto spoji musí být odsouhlasena příslušným orgánem nebo jím pověřenou organizací. Spoje potrubí musí být svařeny všude, kde je to nezbytné.
- 6.7.4.5.11 Spoje v měděném potrubí musí být spájeny nebo mít rovnocenně silné kovové spojení. Bod tavení pájecích materiálů nesmí být vyšší než 525 °C. Spoje nesmějí snižovat pevnost potrubí, což se může stát u šroubových spojů.
- 6.7.4.5.12 Materiály konstrukce ventilů a příslušenství musí mít uspokojivé vlastnosti při nejnižší provozní teplotě přemístitelné cisterny.
- 6.7.4.5.13 Průtržný tlak všech potrubí a spojovacích prvků potrubí nesmí být menší než nejvyšší čtyřnásobek MAWP nádrže nebo čtyřnásobek tlaku, kterému může být podrobena v provozu činností čerpadla nebo jiného zařízení (kromě zařízení na vyrovnávání tlaku).

6.7.4.6 Zařízení pro vyrovnávání tlaku

- 6.7.4.6.1 Každá nádrž musí být vybavena dvěma nezávislými pružinovými zařízeními pro vyrovnávání tlaku. Zařízení pro vyrovnávání tlaku se musí otevírat automaticky při tlaku nejméně MAWP a musí být plně otevřena při tlaku rovném 110 % MAWP. Tato zařízení musí po vypuštění uzavírat při tlaku nižším nejvýše o 10 % otevíracího tlaku a musí zůstat uzavřena při všech nižších tlacích. Zařízení pro vyrovnávání tlaku musí být typu, který bude odolávat dynamickým silám včetně pohybu kapaliny.
- 6.7.4.6.2 Nádrže pro nehořlavé hluboce zchlazené zkvalněné plyny a vodík mohou mít kromě toho průtržné kotouče v sérii s pružinovými zařízeními pro vyrovnávání tlaku, jak je uvedeno v 6.7.4.7.2 a 6.7.4.7.3.
- 6.7.4.6.3 Zařízení pro vyrovnávání tlaku musí být konstruováno tak, aby se zabránilo vniknutí cizího předmětu, úniku kapaliny a vývoji nebezpečného zvýšeného tlaku.
- 6.7.4.6.4 Zařízení pro vyrovnávání tlaku musí být schválena příslušným orgánem nebo jím pověřenou organizací.

6.7.4.7 Kapacita a nastavení zařízení pro vyrovnávání tlaku

- 6.7.4.7.1 V případě ztráty podtlaku ve vakuově izolované cisterně nebo ztráty 20 % izolace cisterny izolované tuhými materiály musí být kombinovaná kapacita všech instalovaných zařízení pro vyrovnávání tlaku dostatečná, aby tlak (včetně akumulace) uvnitř nádrže nepřekročil 120 % MAWP.
- 6.7.4.7.2 Pro nehořlavé hluboce zchlazené zkvalněné plyny (kromě kyslíku) a vodík může být tato kapacita dosažena použitím průtržných kotoučů paralelně s požadovanými zařízeními pro vyrovnávání tlaku. Průtržné kotouče se musí protrhnout při jmenovitém tlaku rovném zkušebnímu tlaku nádrže.
- 6.7.4.7.3 Za okolností popsanych v 6.7.4.7.1 a 6.7.4.7.2 společně s kompletním prošlehnutím plamene musí být celková odpouštěcí kapacita všech instalovaných zařízení pro vyrovnávání tlaku dostatečná, aby omezila tlak v nádrži na zkušební tlak.

6.7.4.7.4 Požadovaná kapacita zařízení pro vyrovnávání tlaku musí být vypočtena podle technických předpisů uznávaných příslušným orgánem⁷.

6.7.4.8 Značení zařízení pro vyrovnávání tlaku

6.7.4.8.1 Každé zařízení pro vyrovnávání tlaku musí být zřetelně a trvale označeno těmito údaji:

- (a) Tlak (v barech nebo kPa), na které je nastaveno vypouštění;
- (b) Dovolena tolerance vypouštěcího tlaku pro pružinová zařízení pro vyrovnávání tlaku;
- (c) Referenční teplota odpovídající nastavenému tlaku pro průtržné kotouče; a
- (d) Nastavená průtoková kapacita zařízení v normálních krychlových metrech vzduchu za sekundu (m^3/s);
- (e) Příčný průtokový průřez pružinového zařízení pro vyrovnávání tlaku a průtržných kotoučů v mm^2 .

Pokud je to proveditelné, musí být uvedeny navíc následující údaje:

- (f) Jméno výrobce a příslušné katalogové číslo zařízení pro vyrovnávání tlaku.

6.7.4.8.2 Nastavená průtoková kapacita označená na zařízení pro vyrovnávání tlaku musí být stanovena podle ISO 4126-1:2004 a ISO 4126-7:2004.

6.7.4.9 Spoje k zařízení pro vyrovnávání tlaku

6.7.4.9.1 Spoje k zařízení pro vyrovnávání tlaku musí být dostatečných rozměrů, aby umožnily neomezeně propustit požadované vypouštění do zařízení pro vyrovnávání tlaku. Žádný uzavírací ventil nesmí být vestavěn mezi nádrž a zařízení pro vyrovnávání tlaku, kromě zdvojeného zařízení pro údržbu nebo jiných důvodů a uzavíracích ventilů sloužících pro uzamčení otevřeného zařízení v provozu nebo uzavíracích ventilů vzájemně uzamčených tak, že požadavky 6.7.4.7 jsou vždy splněny. Nesmí být žádná překážka pro otevírání vedení k odvětrávacímu zařízení nebo k zařízení pro vyrovnávání tlaku, která by mohla omezit nebo uzavřít průtok z nádrže do tohoto zařízení. Otvory od vyústění zařízení pro vyrovnávání tlaku, pokud jsou používány, musí vypouštět přebytečné páry nebo kapaliny do atmosféry za podmínek minimálního zpětného tlaku do zařízení pro vyrovnávání tlaku.

6.7.4.10 Umístění zařízení pro vyrovnávání tlaku

6.7.4.10.1 Každé vyústění zařízení pro vyrovnávání tlaku musí být umístěno na vrchol nádrže co nejbližší podélnému a příčnému středu nádrže, jak je to proveditelné. Všechna vyústění zařízení pro vyrovnávání tlaku musí být umístěna tak, aby byla za podmínek maximálního plnění ve výparném prostoru nádrže a zařízení musí být uspořádáno tak, aby zajistilo neomezené vypouštění unikajících par. U hluboce zchlazených zkapalněných plynů musí být unikající páry vyvedeny přímo ven z nádrže takovým způsobem, aby se nemohly dostat pod cisternu. Ochranná zařízení, která odklánějí proud par, jsou povolena pouze tehdy, nezměňují-li kapacitu zařízení pro vyrovnávání tlaku.

6.7.4.10.2 Uspořádání musí být provedeno tak, aby zabránilo přístupu nepovolaných osob k zařízení pro vyrovnávání tlaku a chránilo tato zařízení před poškozením způsobeným převrácením přemístitelné cisterny.

6.7.4.11 Stavoznaky (měrná zařízení)

6.7.4.11.1 Pokud je přemístitelná cisterna určena pro hmotnostní plnění, musí být vybavena jedním nebo více měřicími zařízeními. Skleněné stavoznaky a měřidla vyrobená z křehkého materiálu, která jsou v přímém styku s obsahem nádrže, nesmějí být použita.

⁷ Viz příklad CGA S-1,2-2003 normy zařízení pro vyrovnání tlaku, část 2, nákladní a přemístitelné cisterny na stlačené plyny.

6.7.4.11.2 Spoj pro měření podtlaku musí být proveden v plášti.

6.7.4.12 Podpěry, rámy, zvedací a spouštěcí vybavení přemístitelných cisteren

6.7.4.12.1 Přemístitelné cisterny musí být konstruovány a vyráběny s podpěrnou konstrukcí zajišťující jejich bezpečnou základnu během přepravy. Síly uvedené v 6.7.4.2.12 a koeficient bezpečnosti uvedený v 6.7.4.2.13 musí být zohledněny při konstrukci. Zarážky, rámy, podstavce nebo jiné podobné konstrukce jsou přípustné.

6.7.4.12.2 Kombinovaná namáhání způsobená konstrukční výstrojí přemístitelné cisterny (např. podstavce, rámy atd.) a zvedací a spouštěcí zařízení nesmějí způsobit nadměrné namáhání v jakékoli části nádrže. Stabilní zvedací a spouštěcí zařízení musí být namontována na všech přemístitelných cisternách. Přednostně musí být upevněna na podpěry přemístitelné cisterny, avšak mohou být připevněny k výztužným deskám umístěným na nádrži v bodech jejich podpěr.

6.7.4.12.3 Při konstrukci podpěr a rámu se musí brát v úvahu účinky klimatické koroze.

6.7.4.12.4 Kapsy pro zvedací vidlice musí být uzavíratelné. Prostředky pro uzavření těchto kapes musí tvořit trvalou část rámu nebo musí být trvale připojeny k rámu. Jednokomorové přemístitelné cisterny o délce menší než 3,65 m nemusí mít tyto kapsy uzavíratelné, pokud:

- (a) nádrž a všechny spojovací prvky jsou dobře chráněny proti úderům zvedacích vidlí; a
- (b) vzdálenost mezi středy kapes pro zvedací vidlice je nejméně polovina maximální délky přemístitelné cisterny.

6.7.4.12.5 Pokud přemístitelné cisterny nejsou během přepravy chráněny podle 4.2.3.3, nádrže a provozní výstroj musí být chráněny proti poškození nádrže a provozní výstroje podélným nebo příčným nárazem nebo převrácením. Vnější spojovací prvky musí být chráněny tak, aby byl vyloučen únik obsahu nádrže při nárazu nebo převrácení přemístitelné cisterny na tyto spojovací prvky. Příklady takové ochrany:

- (a) Ochrana proti bočnímu nárazu, kterou mohou tvořit podélné výztuže chránící nádrž z obou stran na výškové úrovni jejího středu;
- (b) Ochrana přemístitelné cisterny proti převrácení, kterou mohou tvořit výztužné prstence nebo výztuže upevněné napříč rámu;
- (c) Ochrana proti nárazu zezadu, kterou může tvořit nárazník nebo rám;
- (d) Ochrana nádrže proti poškození nárazem nebo převrácením použitím rámu ISO podle ISO 1496-3:1995.
- (e) Ochrana přemístitelné cisterny před nárazem a převrácením vakuově izolačním pláštěm.

6.7.4.13 Schválení konstrukce

6.7.4.13.1 Příslušný orgán nebo jím pověřená organizace vydává osvědčení o schválení konstrukce pro jakoukoli novou konstrukci přemístitelné cisterny. Toto osvědčení ověřuje, že přemístitelná cisterna byla prohlédnuta touto organizací, je vhodná pro její zamýšlený účel a odpovídá požadavkům této kapitoly. Pokud jsou série přemístitelných cisteren vyráběny beze změny konstrukce, osvědčení platí pro celé tyto série. Osvědčení musí obsahovat zkušební protokol prototypu, hluboce zchlazené zkapalněné plyny dovolené přepravovat, materiály konstrukce nádrže a schvalovací číslo. Schvalovací číslo musí tvořit mezinárodní rozlišovací značka státu předepsaná v Úmluvě o silničním provozu, Vídeň 1968, a registrační číslo. Jakákoliv alternativní ujednání k 6.7.1.2 musí být uvedena v osvědčení. Schválení konstrukce může sloužit pro schválení menších přemístitelných cisteren vyrobených z materiálů téhož druhu a tloušťky, stejnou výrobní technologií a s identickými podpěrami, rovnocennými uzávěry a dalším příslušenstvím.

6.7.4.13.2 Zkušební protokol prototypu pro schválení konstrukce musí obsahovat nejméně toto:

- (a) Výsledky zkoušky vhodného rámu uvedené v ISO 1496-3:1995;

- (b) Výsledky první inspekce a zkoušky uvedené v 6.7.4.14.3;
- (c) Výsledky nárazové zkoušky uvedené v 6.7.4.14.1, je-li předepsána.

6.7.4.14 Inspekce a zkoušení

- 6.7.4.14.1 Přemístitelné cisterny odpovídající definici kontejneru podle Mezinárodní úmluvy o bezpečnosti kontejnerů (KBK) z roku 1972 v platném znění, nesmějí být používány. Jejich použití je možné pouze tehdy, pokud se reprezentativní vzorek každého konstrukčního typu úspěšně ověří zkouškou dynamického nárazu podle Příručky zkoušek a kritérií, díl IV, odstavec 41.
- 6.7.4.14.2 Cisterna a součásti výstroje každé přemístitelné cisterny musí být podrobeny inspekci a zkoušce před jejím prvním uvedením do provozu (první inspekce a zkouška) a potom v nejvýše pětiletých intervalech (periodická inspekce a zkouška po pěti letech) s meziperiodickou inspekci a zkouškou v polovině této doby (periodická inspekce a zkouška po dvou a půl letech). Inspekce a zkouška po dvou a půl letech může být provedena během tří měsíců před nebo po stanoveném datu. Mimořádná inspekce a zkouška musí být provedena bez ohledu na datum poslední periodické inspekce a zkoušky, pokud je to nezbytné podle 6.7.4.14.7.
- 6.7.4.14.3 První inspekce a zkouška přemístitelné cisterny musí zahrnovat kontrolu konstrukčních charakteristik, vnitřní a vnější prohlídku přemístitelné cisterny a jejich spojovacích prvků vzhledem k hluboce zchlazeným zkapalněným plynům, které v ní mají být přepravovány, a tlakovou zkoušku podle zkušebních postupů uvedených v 6.7.4.3.2. Tlaková zkouška může být provedena jako hydraulická zkouška nebo použitím jiné kapaliny nebo plynu po dohodě s příslušným orgánem nebo jím pověřenou organizací. Před uvedením přemístitelné cisterny do provozu musí být též provedeny zkouška těsnosti a kontrola uspokojivého provozu celé provozní výstroje. Pokud byly nádrž a její spojovací prvky tlakově zkoušeny odděleně, musí být po jejich zkompletování podrobeny zkoušce těsnosti. Všechny svary vystavené úrovni plného namáhání musí být zkontrolovány během první zkoušky rentgenem, ultrazvukem nebo jinou metodou nedestruktivní zkoušky. To se nevztahuje na plášť.
- 6.7.4.14.4 Periodická inspekce a zkouška po 5 a 2,5 letech zahrnuje vnější prohlídku přemístitelné cisterny a jejich spojovacích prvků vzhledem k přepravovaným hluboce zchlazeným zkapalněným plynům, zkoušku těsnosti, kontrolu uspokojivého provozu celé provozní výstroje a indikátoru podtlaku, pokud je použit. V případě nevakuoově izolovaných cisteren, plášť a izolace musí být sejmuty během 2,5leté a 5leté periodické inspekce a zkoušek avšak pouze v rozsahu nezbytném pro spolehlivé hodnocení.
- 6.7.4.14.5 (Vypuštěno)
- 6.7.4.14.6 Přemístitelná cisterna nesmí být plněna a přistavována k přepravě po datu uplynutí platnosti poslední 5leté nebo 2,5leté periodické inspekce a zkoušky, jak je požadováno v 6.7.4.14.2. Avšak přemístitelná cisterna naplněná před datem uplynutí platnosti poslední periodické inspekce a zkoušky může být přepravována po dobu nepřesahující tři měsíce od uplynutí platnosti poslední periodické zkoušky nebo inspekce. Kromě toho může být přemístitelná cisterna přepravována po datu uplynutí platnosti poslední periodické zkoušky a inspekce:
- (a) Po vyprázdnění, ale před vyčištěním, pro účely provedení příští požadované zkoušky nebo inspekce před opětovným naplněním; a
 - (b) Pokud není jinak schváleno příslušným orgánem, pro období nepřekračující šest měsíců od data uplynutí platnosti poslední periodické zkoušky nebo inspekce, aby bylo možno vrátit nebezpečné věci k jejich likvidaci nebo recyklaci. Odvolávka na tuto výjimku musí být uvedena v přepravním dokladu.
- 6.7.4.14.7 Mimořádná inspekce a zkouška je nezbytná, pokud přemístitelná cisterna vykazuje zřetelně poškozené nebo zkorodované plochy nebo únik nebo jiné okolnosti, které ukazují nedostatky, jež by mohly ovlivnit celistvost přemístitelné cisterny. Rozsah mimořádné inspekce a zkoušky musí záviset na rozsahu poškození a zhoršení přemístitelné cisterny. Musí zahrnovat nejméně 2,5letou inspekci a zkoušku podle 6.7.4.14.4.

- 6.7.4.14.8 Vnitřní prohlídka během první inspekce a zkoušky musí zajistit, že nádrž je prohlédnuta se zaměřením na proděravění, korozi nebo odřeniny, promáčknutí, zvlnění, vady ve svarech a jiné okolnosti, které by mohly vést k nezpůsobilosti cisterny pro bezpečnou přepravu.
- 6.7.4.14.9 Vnější prohlídka musí zajistit, že:
- (a) Vnější potrubí, ventily, komprimující/chladicí systémy, pokud jsou použity, a těsnění jsou prohlédnuty se zaměřením na zkorodované plochy, závady nebo jiné okolnosti, včetně netěsností, které by mohly způsobit nezpůsobilost přemístitelné cisterny pro bezpečné plnění, vyprazdňování a přepravu;
 - (b) Nejsou žádné netěsnosti uzavíratelných vík a těsnění;
 - (c) Chybějící nebo ztracené šrouby nebo matice na jakémkoli spojení příruby nebo slepé příruby jsou nahrazeny nebo utěsněny;
 - (d) Všechna pojistná zařízení a ventily jsou bez koroze, zkroucení a jakéhokoli poškození nebo vady, které by mohly zabránit jejich normální činnosti. Uzavírací zařízení a samočinné uzavírací ventily musí být uvedeny v činnost pro prokázání vlastní provozuschopnosti;
 - (e) Požadovaná značení na přemístitelné cisterně jsou čitelná a v souladu s příslušnými požadavky; a
 - (f) Rám, podpěry a zařízení pro zdvih přemístitelné cisterny jsou v uspokojivém stavu.
- 6.7.4.14.10 Inspekce a zkoušky v 6.7.4.14.1, 6.7.4.14.3, 6.7.4.14.4 a 6.7.4.14.7 musí být provedeny znalcem nebo za účasti znalce schváleného příslušným orgánem nebo jím pověřenou organizací. Pokud je tlaková zkouška součástí inspekce a zkoušky, musí být provedena zkušebním tlakem vyznačeným na štítku přemístitelné cisterny. Během tlakové zkoušky musí být přemístitelná cisterna kontrolována na jakýkoliv únik z cisterny, potrubí nebo výstroje.
- 6.7.4.14.11 Ve všech případech, kdy je prováděno řezání, opalování nebo sváření na nádrži, musí být tyto práce schváleny příslušným orgánem nebo jím pověřenou organizací s ohledem na předpisy pro tlakové nádoby používané pro konstrukci nádrže. Tlaková zkouška musí být provedena navíc k původní tlakové zkoušce po ukončení těchto prací.
- 6.7.4.14.12 Pokud se objeví jakákoli nebezpečná okolnost, nesmí být přemístitelná cisterna vrácena do provozu, pokud nebyla opravena a zkouška není opakována s uspokojivým výsledkem.
- 6.7.4.15 Značení**
- 6.7.4.15.1 Každá přemístitelná cisterna musí být opatřena nerezavějícím kovovým štítkem trvale upevněným k přemístitelné cisterně na viditelném místě snadno přístupném pro kontrolu. Pokud z důvodů uspořádání přemístitelné cisterny nemůže být štítek trvale připevněn na nádrž, nádrž musí být označena nejméně informacemi požadované kódem příslušné tlakové nádoby. Jako minimum, nejméně následující informace musí být vyznačeny na štítku vyražením nebo jinou podobnou metodou:
- (a) Informace o vlastníkovi
 - (i) Registrační číslo vlastníka
 - (b) Výrobní informace
 - (i) Země výroby
 - (ii) Rok výroby
 - (iii) Jméno nebo značka výrobce
 - (iv) Výrobce přidělené sériové číslo
 - (c) Informace o schválení

- (i) Znak Spojených národů pro obaly

Tento znak nesmí být použit pro jiné účely než pro osvědčení, že obal, přemístitelná cisterna nebo MEGC splňuje příslušné požadavky kapitoly 6.1, 6.2, 6.3, 6.5, 6.6 nebo 6.7².

- (ii) Země schválení;
 - (iii) Pověřená organizace pro schvalování konstrukčního typu
 - (iv) Číslo schválení konstrukčního typu
 - (v) Písmena 'AA', pokud byl konstrukční typ schválen dle ujednání (viz 6.7.1.2);
 - (vi) Předpis pro tlakové nádoby podle kterého byla nádrž zkonstruována
- (d) Tlaky
- (i) MAWP (přetlak v barech nebo kPa)³;
 - (ii) Zkušební tlak (přetlak v barech nebo kPa)³;
 - (iii) Datum první tlakové zkoušky (měsíc a rok);
 - (iv) Identifikační značka znalce účastnícího se první tlakové zkoušky;
- (e) Teploty
- (i) Rozsah výpočtových teplot (ve °C)³;
- (f) Materiály
- (i) Materiál(y) nádrže a odkaz(y) na materiálové normy;
 - (ii) Ekvivalentní tloušťka pro referenční ocel (v mm)³;
- (g) Vnitřní objem
- (i) Hydraulický vnitřní objem cisterny při 20 °C (v litrech)³;
- (h) Izolace
- (i) Bud' „tepelně izolovaná“ nebo „vakuově izolovaná“ (pokud je použita);
 - (ii) Účinnost izolačního systému (tepelný příkon) (ve W/m²)³;
- (i) Doba uchování – pro každý hluboce zchlazený zkapalněný plyn pro který je přeprava v přemístitelných cisternách dovolena
- (i) Úplný název hluboce zchlazeného zkapalněného plynu;
 - (ii) Referenční doba uchování (ve dnech nebo hodinách)³;
 - (iii) Počáteční tlak (přetlak v barech nebo přetlak v kPa)³;
 - (iv) Stupeň plnění (v kg)³;
- (j) Periodické inspekce a zkoušky

² Tento symbol se používá také pro osvědčení, že velké nádoby pro volně ložené látky schválené pro jiné druhy dopravy odpovídají požadavkům v kapitole 6.8 Model Regulations.

³ Použitá jednotka musí být označena.

- (i) Druh poslední periodické zkoušky (2,5-roku, 5-let nebo mimořádná);
- (ii) Datum poslední periodické zkoušky (měsíc a rok);
- (iii) Identifikační značka pověřené organizace, která provedla nebo dozorovala poslední zkoušku.

6.7.4.15.2 Následující údaje musí být trvanlivě vyznačeny buď na přemístitelné cisterně samé nebo na kovovém štítku pevně umístěném na přemístitelné cisterně:

Jméno vlastníka a provozovatele

Název hluboce zchlazeného zkapalněného plynu určeného k přepravě (a nejnižší střední teplota volně ložené látky) pokud je vyšší než 50 °C

Nejvyšší dovolená celková hmotnost (MPGM) _____ kg

Vlastní hmotnost _____ kg

Skutečná doba naplnění přepravovaným plynem _____ dní (hodin)

Pokyny pro přemístitelné cisterny v souladu s 4.2.5.2.6.

POZNÁMKA: Pro zařazení přepravovaných hluboce zchlazených zkapalněných plynů, viz též část 5.

6.7.4.15.3 Jestliže je přemístitelná cisterna konstruována a schválena pro manipulaci na otevřeném moři, musí být na identifikačním štítku uvedena slova "OFFSHORE PORTABLE TANK".

6.7.5 Požadavky na konstrukci, výrobu, inspekce a zkoušení UN vícečlankových kontejnerů na plyn (MEGC) určených pro přepravu nezchlazených plynů

6.7.5.1 Definice

Pro účely tohoto oddílu se následujícími pojmy rozumí:

Alternativní ujednání znamená schválení zaručené příslušným orgánem pro přemístitelnou cisternu nebo MEGC, které byly konstruovány, vyrobeny nebo zkoušeny podle technických požadavků nebo zkušebních metod jiných, než uvedených v této kapitole;

Články jsou lahve, trubkové nádoby nebo svazky lahví;

Zkouška těsnosti znamená zkoušku používající plyn naplněný do článků a provozní výstroje MEGC na účinný vnitřní tlak nejméně 20 % zkušebního tlaku;

Sběrné potrubí znamená soustavu potrubí a ventilů spojující plnicí a/nebo vyprazdňovací otvory článků;

Největší dovolená celková hmotnost (MPGM) znamená součet vlastní hmotnosti MEGC a největší dovolené užitečné hmotnosti pro přepravu;

UN vícečlankové kontejnery na plyn (MEGC) jsou multimodální jednotky lahví, trubkových nádob a svazků lahví navzájem propojených sběrným potrubím, které jsou namontovány na rámu. MEGC zahrnují provozní výstroj a konstrukční výstroj nezbytné pro přepravu plynů;

Provozní výstroj znamená měřicí přístroje a plnicí, vyprazdňovací, ventilační a bezpečnostní zařízení;

Konstrukční výstroj znamená vyztužovací, upevňovací, ochranné a stabilizační členy článků.

6.7.5.2 Všeobecné konstrukční a výrobní požadavky

6.7.5.2.1 MEGC musí být schopný plnění a vyprazdňování bez sejmutí své konstrukční výstroje. Musí být vybaven stabilizačními členy vně článků zabezpečujícími konstrukční celistvost pro manipulace a přepravu. MEGC musí být konstruovány a vyrobeny s podporami tvořícími bezpečnou základnu během přepravy a se zvedacími a spouštěcími úchyty, které umožňují zvedání MEGC, včetně jejich naplnění na největší dovolenou celkovou hmotnost. MEGC musí být konstruovány pro naložení na vozidlo, železniční vůz nebo námořní plavidlo nebo plavidlo pro vnitrozemské vodní cesty a musí být vybaveny zárázkami, úchyty nebo příslušenstvím umožňujícím mechanickou manipulaci.

6.7.5.2.2 MEGC musí být konstruovány, vyrobeny a vybaveny tak, aby odolaly všem podmínkám, kterým mohou být vystaveny během normálních podmínek manipulace a přepravy. Konstrukce musí zohlednit účinky dynamického zatížení a únavy.

- 6.7.5.2.3 Články MEGC musí být zhotoveny z bezešvé oceli a konstruovány a zkoušeny podle 6.2.1 a 6.2.2. Všechny články MEGC musí být stejného typu.
- 6.7.5.2.4 Články MEGC, spojovací prvky a potrubí musí být:
- (a) snášetlivé s látkami určenými pro přepravu (viz ISO 11114-1:2012 a ISO 11114-2:2000); nebo
 - (b) netečné nebo neutralizované chemickou reakcí.
- 6.7.5.2.5 Dotyk různých kovů, které by mohly způsobit poškození galvanickými účinky, není dovolen.
- 6.7.5.2.6 Materiály MEGC, včetně jakýchkoli zařízení, těsnění a příslušenství nesmějí nepříznivě ovlivnit plyny určené k přepravě v MEGC.
- 6.7.5.2.7 MEGC musí být konstruovány tak, aby odolaly beze ztráty obsahu nejméně vnitřnímu tlaku způsobenému obsahem a statickým, dynamickým a tepelným zatížením během normálních podmínek manipulace a přepravy. Konstrukce musí prokázat, že únavové účinky způsobené těmito opakovanými namáháními v průběhu očekávané životnosti vícečlánkového kontejneru na plyn byly zohledněny.
- 6.7.5.2.8 MEGC a jejich upevnění musí být při nejvyšším dovoleném zatížení schopny absorbovat následující jednotlivé statické síly:
- (a) Ve směru jízdy: dvojnásobek MPGM násobená zemským zrychlením (g)¹ pod;
 - (b) Vodorovně kolmo na směr jízdy: MPGM (pokud směr jízdy není jasně určen, síly musí být rovnocenné dvojnásobku MPGM) násobené zemským zrychlením (g)¹;
 - (c) Svisle vzhůru: MPGM násobená zrychlením (g)¹; a
 - (d) Svisle dolů: dvojnásobek MPGM (celkové zatížení včetně účinku gravitace) násobené zemským zrychlením (g)¹.
- 6.7.5.2.9 Při silách uvedených v 6.7.5.2.8 nesmí napětí v nejvíce namáhaném bodě článků překročit hodnoty uvedené buď v příslušných normách pododdílu 6.2.2.1 nebo, pokud nejsou články konstruovány, vyrobeny a zkoušeny podle těchto norem, v technických předpisech nebo normách uznávaných nebo schválených příslušným orgánem země používání (viz 6.2.5).
- 6.7.5.2.10 U každé ze sil v 6.7.5.2.8 musí být zachován pro rám a upevnění koeficient bezpečnosti takto:
- (a) Pro kovy mající výrazně definovanou mez průtažnosti koeficient 1,5 ve vztahu k zaručené mezi průtažnosti; nebo
 - (b) Pro kovy nemající výrazně definovanou mez průtažnosti koeficient 1,5 ve vztahu k zaručeným 0,2 % prokázané průtažnosti a pro austenitické oceli 1 % prokázané průtažnosti.
- 6.7.5.2.11 MEGC určené pro přepravu hořlavých zchladených zkapalněných plynů musí být možno elektricky uzemnit.
- 6.7.5.2.12 Články musí být zajištěny takovým způsobem, aby se zabránilo nežádoucímu pohybu vzhledem ke konstrukci a koncentraci škodlivého místního napětí.
- 6.7.5.3 Provozní výstroj**
- 6.7.5.3.1 Provozní výstroj musí být uspořádána nebo konstruována tak, aby byla chráněna proti poškození způsobeným zvýšením tlaku obsahu nádob během normálních podmínek manipulace a přepravy. Pokud spoj mezi rámem a nádrží dovoluje relativní pohyb mezi jednotlivými částmi konstrukce, musí být výstroj upevněna tak, aby dovozovala takový pohyb bez nebezpečí poškození provozních částí.

¹ Pro účely výpočtu $g = 9,81 \text{ m/s}^2$.

Sběrné potrubí, vyprazdňovací prvky (potrubí, uzavírací ventily) a uzavírací ventil musí být chráněny proti nebezpečí utržení působením vnějších sil. Sběrné potrubí vedoucí k uzavíracím ventilům musí být dostatečně pružné, aby chránilo ventily a potrubí před stříhem nebo zvýšením tlaku obsahem nádob. Plnicí a vyprazdňovací zařízení (včetně přírub nebo šroubových uzávěrů) a jakékoliv ochranné kryty musí umožňovat zajištění proti nežádoucímu otevření.

6.7.5.3.2 Každý článek určený pro přepravu toxických plynů (plynů skupin T, TF, TC, TO, TFC a TOC) musí být opatřen ventilem. Sběrné potrubí pro zkapalněné toxické plyny (plyny klasifikačních kódů 2T, 2TF, 2TC, 2TO, 2TFC a 2TOC) musí být konstruováno tak, aby články mohly být plněny odděleně a udržovány izolovaně uzavřené zaplombovaným (uzamykatelným) ventilem. Pro přepravu hořlavých plynů (plyny skupiny F) musí být články rozděleny do skupin s vnitřním objemem nejvýše 3000 litrů každé izolované ventilem.

6.7.5.3.3 U plnicích a vyprazdňovacích otvorů MEGC musí být na každém plnicím a vyprazdňovacím potrubí na přístupném místě umístěny v sérii dva ventily. Jeden z ventilů může být nevratný. Plnicí a vyprazdňovací zařízení mohou být upevněna na sběrné potrubí. Pro části potrubí, které mohou být uzavřeny na obou koncích a z nichž kapalina může být vypuštěna, musí být pojistný ventil proveden tak, aby se zabránilo nadměrnému zvýšení tlaku. Hlavní izolující ventily na MEGC musí být zřetelně označeny s uvedením směru jejich uzavírání. Každý uzavírací ventil nebo jiné druhy uzávěrů musí být konstruovány a vyrobeny tak, aby odolaly tlaku rovnému nebo většímu než 1,5 násobku zkušebního tlaku MEGC. Všechny uzavírací ventily se šroubovými uzávěry musí být uzavírány pravotočivým pohybem ručního kola. Pro ostatní ventily musí být poloha (otevřeno - zavřeno) a směr uzavírání zřetelně vyznačeny. Všechny uzavírací ventily musí být konstruovány tak, aby se zabránilo nežádoucímu otevření. Tažný kov může být použit pro konstrukci ventilů nebo příslušenství.

6.7.5.3.4 Potrubí musí být konstruováno, vyrobeno a instalováno tak, aby se zabránilo nebezpečí poškození působením tepelné roztažnosti a smršťování, mechanických rázů a vibrací. Spoje v potrubí musí být spájeny nebo mít rovnocenně silné kovové spojení. Bod tavení pájecích materiálů nesmí být vyšší než 525 °C. Jmenovitý tlak provozní výstroje a sběrného potrubí musí být nejméně dvě třetiny zkušebního tlaku článků.

6.7.5.4 Zařízení pro vyrovnávání tlaku

6.7.5.4.1 Články MEGC používané pro přepravu UN 1013 oxid uhličitý a UN 1070 oxid dusný (rajský plyn) musí být rozděleny do skupin s vnitřním objemem nejvýše 3000 litrů každé izolované ventilem. Každá sestava musí být vybavena jedním nebo více zařízeními pro vyrovnání tlaku. Pokud je požadováno příslušným orgánem v zemi použití, MEGC pro ostatní plyny musí být vybaven zařízením pro vyrovnávání tlaku specifikovaným příslušným orgánem.

6.7.5.4.2 Každý článek nebo skupina článků MEGC, který může být izolován, musí být vybaven jedním nebo více zařízeními pro vyrovnávání tlaku. Zařízení pro vyrovnávání tlaku musí být typu, které odolá dynamickým silám, včetně rázových vln kapalin, a konstruováno tak, aby se zabránilo vniknutí cizího předmětu, úniku plynu a vývoji nebezpečného nadměrného tlaku.

6.7.5.4.3 MEGC používané pro přepravu určitých nezchladených plynů uvedených v pokynu pro přemístitelné cisterny T50 v 4.2.5.2.6 mohou mít zařízení pro vyrovnávání tlaku podle požadavků příslušného orgánu země jejich používání. Pokud není MEGC vyhrazen pro přepravu určitého plynu a vybaven schváleným zařízením pro vyrovnávání tlaku vyrobeným z materiálů snášenlivých s přepravovaným plynem, musí zařízení pro vyrovnávání tlaku obsahovat průtržný kotouč předcházející pružinovému zařízení pro vyrovnávání tlaku. Prostor mezi průtržným kotoučem a zařízením musí být vybaven měřidlem tlaku nebo vhodným indikačním přístrojem. Toto uspořádání dovoluje odhalení protržení kotouče, propíchnutí nebo úniku, který může způsobit špatnou činnost zařízení pro vyrovnávání tlaku. Průtržný kotouč se musí protrhnout při jmenovitém tlaku o 10 % vyšším než je počáteční vypouštěcí tlak pružinového zařízení pro vyrovnávání tlaku.

6.7.5.4.4 V případě víceúčelových MEGC používaných pro přepravu nízkotlakých zkapalněných plynů se musí zařízení pro vyrovnávání tlaku otevřít při tlaku uvedeném v 6.7.3.7.1 pro plyn s nejvyšším dovoleným provozním tlakem z plynů, jejichž přeprava je v MEGC dovolena.

6.7.5.5 Kapacita zařízení pro vyrovnávání tlaku

6.7.5.5.1 Kombinovaná dodávková kapacita zařízení pro vyrovnávání tlaku, pokud je instalováno, musí být dostatečná, aby v případě celkového požáru MEGC nepřekročil tlak (včetně akumulace) uvnitř článků 120 % nastaveného tlaku zařízení pro vyrovnávání tlaku. Vzorec uvedený v CGA S-1,2-2003 normy pro zařízení pro vyrovnání tlaku – Díl 2 – cisterny pro nákladní přepravy a přemístitelné cisterny pro stlačené plyny musí být použit pro stanovení nejmenší celkové průtokové kapacity pro systém zařízení pro vyrovnávání tlaku. CGA S-1,1-2003 normy pro zařízení pro vyrovnání tlaku – Díl 1 – láhve na stlačené plyny mohou být použity pro stanovení vyrovnávací kapacity jednotlivých článků. pro vyrovnávání tlaku. Pružinová zařízení pro vyrovnávání tlaku mohou být použita pro dosažení plně vypouštěcí kapacity předepsané v případě nízkotlakých zkapalněných plynů. V případě víceúčelových MEGC musí být kombinovaná dodávková kapacita zařízení pro vyrovnávání tlaku stanovena pro plyn, který vyžaduje nejvyšší dodávkovou kapacitu z plynů dovolených pro přepravu v MEGC.

6.7.5.5.2 Pro stanovení celkové požadované kapacity zařízení pro vyrovnávání tlaku instalovaného na člancích pro přepravu zkapalněných plynů musí být zohledněny termodynamické vlastnosti plynu (viz např. CGA S-1,2-2003 normy pro zařízení pro vyrovnání tlaku – Díl 2 – cisterny pro nákladní přepravy a přemístitelné cisterny pro stlačené plyny pro nízkotlaké zkapalněné plyny a CGA S-1,1-2003 normy pro zařízení pro vyrovnání tlaku - Díl 1 – láhve na stlačené plyny pro vysokotlaké zkapalněné plyny).

6.7.5.6 Značení zařízení pro vyrovnávání tlaku

6.7.5.6.1 Zařízení pro vyrovnání tlaku musí být zřetelně a trvale označeno těmito údaji:

- (a) Jméno výrobce a příslušné výrobní číslo
- (b) Tlak a teplota, na který je nastaveno vypouštění
- (c) Datum poslední zkoušky;
- (d) Příčný průtokový průřez pružinového zařízení pro vyrovnávání tlaku a průtržných kotoučů v mm².

6.7.5.6.2 Jmenovitá průtoková kapacita vyznačená na pružinovém zařízení pro vyrovnávání tlaku musí být stanovena podle ISO 4126-1:2004 nebo ISO 4126-7:2004.

6.7.5.7 Připojení zařízení pro vyrovnávání tlaku

6.7.5.7.1 Připojení zařízení pro vyrovnávání tlaku musí být dostatečných rozměrů, aby umožnilo neomezeně propustit požadované vypouštění do zařízení pro vyrovnávání tlaku. Žádný uzavírací ventil nesmí být vestavěn mezi nádrž a zařízení pro vyrovnávání tlaku, kromě zdvojeného zařízení pro údržbu nebo jiných důvodů a uzavíracích ventilů sloužících pro uzamčení otevřeného zařízení v provozu nebo uzavíracích ventilů vzájemně uzamčených tak, že alespoň jeden ze zdvojených je vždy provozuschopný a schopný splnit požadavky v 6.7.5.5. Nesmí být žádná překážka pro otevírání vedení k odvětrávacímu zařízení nebo k zařízení pro vyrovnávání tlaku, která by mohla omezit nebo uzavřít průtok z nádrže do tohoto zařízení. Otvor celým potrubím a spoji musí mít nejméně stejnou průtočnou plochu jako vstup do zařízení pro vyrovnávání tlaku, ke kterému jsou připojeny. Jmenovitý rozměr výpustního potrubí musí být nejméně tak velký, jako je výstup ze zařízení pro vyrovnávání tlaku. Otvory od vyústění zařízení pro vyrovnávání tlaku, pokud jsou používány, musí vypouštět přebytečné páry nebo kapaliny do atmosféry za podmínek minimálního zpětného tlaku do zařízení pro vyrovnávání tlaku.

6.7.5.8 Umístění zařízení pro vyrovnávání tlaku

6.7.5.8.1 Každé zařízení pro vyrovnávání tlaku při nejvyšším dovoleném plnění musí být spojeno s výparným prostorem článků pro přepravu zkapalněných plynů. Zařízení pro vyrovnávání tlaku, pokud jsou instalována, musí být tak uspořádána, aby se zajistilo vypouštění unikajících par nahoru a neomezeně pro zabránění srážení unikajícího plynu nebo kapaliny na MEGC, jeho člancích nebo osobách. Pro hořlavé plyny a plyny pyroforní a podporující hoření, musí být unikající plyn usměrněn

od článků takovým způsobem, aby nemohl narážet na jiné články. Tepelně odolná ochranná zařízení, která odklánějí proud plynu, jsou dovolena pouze tehdy, pokud nezmenšují požadovanou kapacitu zařízení pro vyrovnávání tlaku.

- 6.7.5.8.2 Uspořádání musí být provedena tak, aby zabránila přístupu nepovolaných osob k zařízení pro vyrovnávání tlaku a chránila tato zařízení před poškozením způsobeným převrácením MEGC.

6.7.5.9 Stavoznaky (měřicí zařízení)

- 6.7.5.9.1 Pokud je MEGC určen pro hmotnostní plnění, musí být vybaven jedním nebo více měřicími zařízeními. Skleněné stavoznaky a měřidla vyrobené z jiného křehkého materiálu nesmějí být použity.

6.7.5.10 Podpěry, rámy, zvedací a spouštěcí vybavení MEGC

- 6.7.5.10.1 MEGC musí být konstruovány a vyráběny s podpěrou konstrukcí zajišťující jejich bezpečnou základnu během přepravy. Síly uvedené v 6.7.5.2.8 a koeficient bezpečnosti uvedený v 6.7.5.2.10 musí zohledněny při konstrukci. Zarážky, rámy, podstavce nebo jiné podobné konstrukce jsou přípustné.

- 6.7.5.10.2 Kombinovaná namáhání způsobená konstrukční výstrojí článků (např. podstavce, rámy atd.) a zvedací a spouštěcí zařízení MEGC nesmějí způsobit nadměrné namáhání v jakémkoli článku. V žádném případě nesmí být výstroj nebo úchyty přivařeny přímo k článkům.

- 6.7.5.10.3 Při konstrukci podpěr a rámu se musí zohlednit účinky klimatické koroze.

- 6.7.5.10.4 Pokud nejsou MEGC během přepravy chráněny podle 4.2.4.3, musí být články a provozní výstroj chráněny proti poškození nádrže a provozní výstroje podélným nebo příčným nárazem nebo převrácením. Vnější spojovací prvky musí být chráněny tak, aby byl vyloučen únik obsahu článků při nárazu nebo převrácení MEGC na tyto spojovací prvky. Zvláštní pozornost musí být věnována ochraně sběrného potrubí. Příklady takové ochrany:

- (a) Ochrana proti bočnímu nárazu, kterou mohou tvořit podélné výztuže;
- (b) Ochrana proti převrácení, kterou mohou tvořit výztužné prstence nebo výztuže upevněné napříč rámu;
- (c) Ochrana proti nárazu zezadu, kterou může tvořit nárazník nebo rám;
- (d) Ochrana článků a provozní výstroje proti poškození nárazem nebo převrácením použitím rámu ISO podle příslušných ustanovení ISO 1496-3:1995.

6.7.5.11 Schválení konstrukce

- 6.7.5.11.1 Příslušný orgán nebo jím pověřená organizace vydává osvědčení o schválení konstrukce pro jakoukoli novou konstrukci MEGC. Toto osvědčení ověřuje, že MEGC byl prohlédnut touto organizací, je vhodný pro jeho zamýšlený účel a odpovídá požadavkům této kapitoly a příslušným ustanovením pro plyny kapitoly 4.1 uvedeným v pokynu pro balení P200. Pokud jsou série MEGC vyráběny beze změny konstrukce, osvědčení platí pro celé tyto série. Osvědčení musí obsahovat zkušební protokol prototypu, materiály konstrukce sběrného potrubí, normy, podle kterých byly články vyrobeny, a schvalovací číslo. Schvalovací číslo musí tvořit mezinárodní rozlišovací značka státu předepsaná v Úmluvě o silničním provozu, Vídeň 1968, a registrační číslo. Jakákoliv alternativní ujednání podle 6.7.1.2 musí být uvedena v osvědčení. Schválení konstrukce může sloužit pro schválení menších MEGC vyrobených z materiálů téhož druhu a tloušťky, stejnou výrobní technologií a s identickými podpěrami, rovnocennými uzávěry a dalším příslušenstvím.

- 6.7.5.11.2 Zkušební protokol prototypu pro schválení konstrukce musí obsahovat nejméně toto:

- (a) Výsledky zkoušky vhodného rámu uvedené v ISO 1496-3:1995;
- (b) Výsledky první inspekce a zkoušky uvedené v 6.7.5.12.3;

- (c) Výsledky nárazové zkoušky uvedené v 6.7.5.12.1; a
- (d) Schvalovací doklad ověřující, že lahve a trubkové nádoby splňují příslušné normy.

6.7.5.12 Inspekce a zkoušení

- 6.7.5.12.1 MEGC odpovídající definici kontejneru podle mezinárodní úmluvy o bezpečnosti kontejnerů (KBK) z roku 1972 v platném znění, nesmějí být používány. Jejich použití je možné pouze tehdy, pokud se reprezentativní vzorek každého konstrukčního typu úspěšně ověří zkouškou dynamického nárazu podle Příruček zkoušek a kritérií, díl IV, odstavec 41.
- 6.7.5.12.2 Články a součásti výstroje každého MEGC musí být podrobeny inspekci a zkoušce před jeho prvním uvedením do provozu (první inspekce a zkouška). Potom musí být MEGC podrobeny inspekci v nejvýše pětiletých intervalech (periodická inspekce a zkouška po pěti letech). Mimořádná inspekce a zkouška musí být provedena bez ohledu na datum poslední periodické inspekce a zkoušky, pokud je to nezbytné podle 6.7.5.12.5.
- 6.7.5.12.3 První inspekce a zkouška MEGC musí zahrnovat kontrolu konstrukčních charakteristik, vnitřní a vnější prohlídku MEGC a jeho spojovacích prvků vzhledem k plynům, které v něm mají být přepravovány, a tlakovou zkoušku provedenou zkušebními tlaky podle pokynu pro balení P200 uvedeného v 4.1.4.1. Tlaková zkouška sběrného potrubí může být provedena jako hydraulická zkouška nebo použitím jiné kapaliny nebo plynu se souhlasem příslušného orgánu nebo jím pověřené organizace. Před uvedením MEGC do provozu musí být též provedeny zkouška těsnosti a zkouška uspokojivého provozu celé provozní výstroje. Pokud byly články a jejich spojovací prvky tlakově zkoušeny odděleně, musí být po svém spojení podrobeny zkoušce těsnosti.
- 6.7.5.12.4 Periodická inspekce a zkouška po pěti letech musí zahrnovat vnější prohlídku konstrukce, článků a provozní výstroje podle 6.7.5.12.6. Články a potrubí musí být zkoušeny periodicky ve lhůtách uvedených v pokynu pro balení P200 a podle ustanovení uvedených v 6.2.1.6. Pokud byly články a jejich spojovací prvky tlakově zkoušeny odděleně, musí být po svém spojení podrobeny zkoušce těsnosti.
- 6.7.5.12.5 Mimořádná inspekce a zkouška je nezbytná, pokud MEGC vykazuje zřetelně poškozené nebo zkorodované plochy nebo únik nebo jiné okolnosti, které ukazují nedostatky, jež by mohly ovlivnit celistvost MEGC. Rozsah mimořádné inspekce a zkoušky musí záviset na rozsahu poškození a zhoršení stavu MEGC. Musí zahrnovat nejméně prohlídky požadované v 6.7.5.12.6.
- 6.7.5.12.6 Prohlídky musí zajistit, že:
- (a) články jsou zvnějšku prohlédnuty se zřetelem na promáčknutí, korozi nebo odření, záhyby, zkroucení, vady ve svarech nebo jiné okolnosti, včetně úniku, které by mohly způsobit, že MEGC není bezpečný pro přepravu;
 - (b) potrubí, ventily systém a těsnění jsou prohlédnuty se zřetelem na zkorodované plochy, závady a jiné okolnosti, včetně úniku, které by mohly způsobit, že MEGC není bezpečný pro plnění, vyprazdňování nebo přepravu;
 - (c) chybějící nebo ztracené šrouby nebo matice na jakémkoli spojení příruby nebo slepé příruby jsou nahrazeny nebo utěsněny;
 - (d) všechna pojistná zařízení a ventily jsou bez koroze, zkroucení a jakéhokoli poškození nebo vady, které by mohly zabránit jejich normální činnosti. Uzavírací zařízení a samočinné uzavírací ventily musí být uvedeny v činnost pro prokázání vlastní provozuschopnosti;
 - (e) požadovaná značení na MEGC jsou čitelná a v souladu s příslušnými požadavky; a
 - (f) rám, podpěry a zařízení pro zdvih MEGC jsou v uspokojivém stavu.
- 6.7.5.12.7 Inspekce a zkoušky v 6.7.5.12.1, 6.7.5.12.3, 6.7.5.12.4 a 6.7.5.12.5 musí být provedeny organizací nebo za účasti organizace schválené příslušným orgánem. Pokud je tlaková zkouška součástí inspekce a zkoušky, musí být provedena zkušebním tlakem vyznačeným na štítku MEGC. Během tlakové zkoušky musí být MEGC kontrolován na jakýkoliv únik z článků, potrubí nebo výstroje.

- 6.7.5.12.8 Pokud se objeví jakákoliv nebezpečná okolnost, nesmí být MEGC vrácen do provozu, pokud nebyl opraven a nebyl podroben příslušným zkouškám a ověřením.

6.7.5.13 **Značení**

- 6.7.5.13.1 Každý MEGC musí být opatřen nerezavějícím kovovým štítkem trvale upevněným k MEGC na viditelném místě snadno přístupném pro kontrolu. Kovový štítek nesmí být připevněn k článkům. Články musí být označeny v souladu s kapitolou 6.2. Jako minimum, nejméně následující informace musí být vyznačeny na štítku vyražením nebo jinou podobnou metodou:

- (a) Informace o vlastníkovi
 - (i) Registrační číslo vlastníka
- (b) Výrobní informace
 - (i) Země výroby
 - (ii) Rok výroby
 - (iii) Jméno nebo značka výrobce
 - (iv) Výrobcem přidělené sériové číslo
- (c) Informace o schválení

- (i) Znak Spojených národů pro obaly

Tento znak nesmí být použit pro jiné účely než pro osvědčení, že obal, přemístitelná cisterna nebo MEGC splňuje příslušné požadavky kapitoly 6.1, 6.2, 6.3, 6.5, 6.6 nebo 6.7².
- (ii) Země schválení;
- (iii) Pověřená organizace pro schvalování konstrukčního typu
- (iv) Číslo schválení konstrukčního typu
- (v) Písmena 'AA', pokud byl konstrukční typ schválen dle ujednání (viz 6.7.1.2);
- (d) Tlaky
 - (i) Zkušební tlak (přetlak v barech nebo kPa)³;
 - (ii) Datum první tlakové zkoušky (měsíc a rok);
 - (iii) Identifikační značka znalce účastnícího se první tlakové zkoušky
- (e) Teploty
 - (i) (i) Rozsah výpočtových teplot (ve °C)³;
- (f) Články / Vnitřní objem
 - (i) Počet článků;

² Tento symbol se používá také pro osvědčení, že velké nádoby pro volně ložené látky schválené pro jiné druhy dopravy odpovídají požadavkům v kapitole 6.8 Model Regulations.

³ Použitá jednotka musí být označena.

- (ii) Celkový hydraulický vnitřní objem (v litrech)³;
- (g) Periodické inspekce a zkoušky
 - (i) Typ poslední periodické zkoušky (2,5-roku, 5-let nebo mimořádná);
 - (ii) Datum poslední periodické zkoušky (měsíc a rok);
 - (iii) Identifikační značka pověřené organizace, která provedla nebo dozorovala poslední zkoušku.

	(měsíc/rok)	bar nebo kPa	(měsíc/rok)

6.7.5.13.2 Následující údaje musí být trvanlivě vyznačeny na kovovém štítku pevně umístěném na MEGC:

Jméno provozovatele

Nejvyšší dovolená užitečná hmotnost _____ kg

Pracovní tlak při 15 °C _____ bar

Nejvyšší dovolená celková hmotnost (MPGM) _____ kg

Vlastní hmotnost _____ kg

KAPITOLA 6.8

POŽADAVKY NA KONSTRUKCI, VÝROBU, VÝSTROJ, SCHVALOVÁNÍ TYPU, INSPEKCE A ZKOUŠENÍ A ZNAČENÍ NESNÍMATELNÝCH CISTEREN (CISTERNOVÝCH VOZIDEL), SNÍMATELNÝCH CISTEREN A CISTERNOVÝCH KONTEJNERU A CISTERNOVÝCH VÝMĚNNÝCH NÁSTAVEB S NÁDRŽEMI VYROBENÝMI Z KOVOVÝCH MATERIÁLŮ A BATERIOVÝCH VOZIDEL A VÍCEČLÁNKOVÝCH KONTEJNERŮ NA PLYNY (MEGC)

POZNÁMKA 1: Pro přemístitelné cisterny a UN MEGC viz kapitolu 6.7, pro cisterny z vyztužených plastů viz kapitola 6.9, pro cisterny pro podtlakové vyčerpávání odpadů viz kapitola 6.10.

POZNÁMKA 2: Pro nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny s aditivačními zařízeními, viz zvláštní ustanovení 664 kapitoly 3.3.

6.8.1 Rozsah použití

6.8.1.1 Požadavky uvedené přes celou šířku stránky se vztahují na nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla a současně i na cisternové kontejnery, cisternové výměnné nástavby a MEGC. Ty, které jsou uvedeny v jednotlivých sloupcích, se vztahují pouze na:

- nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla (levý sloupec);
- cisternové kontejnery, cisternové výměnné nástavby a MEGC (pravý sloupec).

6.8.1.2 Tyto požadavky se vztahují na

nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla	cisternové kontejnery, cisternové výměnné nástavby a MEGC
--	--

používané pro přepravu plyných, kapalných, práškových nebo zrnitých látek.

6.8.1.3 Oddíl 6.8.2 uvádí požadavky vztahující se na nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby určené pro přepravu látek všech tříd a na bateriová vozidla a MEGC určená pro přepravu plynů třídy 2. Oddíly 6.8.3 až 6.8.5 obsahují zvláštní požadavky doplňující nebo pozměňující požadavky uvedené v oddílu 6.8.2.

6.8.1.4 Ustanovení týkající se používání těchto cisteren viz kapitolu 4.3.

6.8.2 Požadavky vztahující se na všechny třídy

6.8.2.1 Konstrukce

Základní zásady

6.8.2.1.1 Nádrže, jejich upevnění a jejich provozní a konstrukční výstroj musejí být konstruovány tak, aby odolaly beze ztráty svého obsahu (jiné než množství plynu uniknuvšího odplyňovacími otvory):

- statickým a dynamickým namáháním za normálních podmínek přepravy uvedeným v 6.8.2.1.2 a 6.8.2.1.13;
- předepsaným nejmenším namáháním uvedeným v 6.8.2.1.15.

6.8.2.1.2	<p>Cisterny a jejich upevňovací prvky musí být při největší povolené hmotnosti náplně způsobilé odolat následujícím silám rovnajícím se silám vyvolaným působením</p> <ul style="list-style-type: none"> – ve směru jízdy: dvojnásobku celkové hmotnosti; – v příčném směru kolmo ke směru jízdy: celkové hmotnosti; – ve svislém směru zdola nahoru: celkové hmotnosti, – ve svislém směru shora dolů: dvojnásobku celkové hmotnosti. 	<p>Cisternové kontejnery a jejich upevňovací prvky musí být při největší povolené hmotnosti náplně způsobilé odolat následujícím silám rovnajícím se silám vyvolaným působením:</p> <ul style="list-style-type: none"> – ve směru jízdy: dvojnásobku celkové hmotnosti; – v příčném směru kolmo ke směru jízdy: celkové hmotnosti (není-li směr jízdy jasně určen, platí dvojnásobek celkové hmotnosti ve všech směrech); – ve svislém směru zdola nahoru: celkové hmotnosti; – ve svislém směru shora dolů: dvojnásobku celkové hmotnosti.
6.8.2.1.3	<p>Stěny nádrží musí mít nejméně tloušťku uvedenou v 6.8.2.1.17 až 6.8.2.1.21</p>	
6.8.2.1.4	<p>Nádrže musí být zkonstruovány a vyrobeny v souladu s požadavky norem uvedenými v 6.8.2.6 nebo technických předpisů uznaných příslušným orgánem v souladu s 6.8.2.7, ve kterých je určen materiál a tloušťka stěny stanovena s přihlédnutím k nejvyšším a nejnižším plnicím a provozním teplotám, avšak musí být dodrženy minimální požadavky uvedené v 6.8.2.1.6 až 6.8.2.1.26.</p>	
6.8.2.1.5	<p>Cisterny určené pro některé nebezpečné látky musí být opatřeny doplňkovou ochranou, která může mít formu přídavné tloušťky nádrže (zvýšený výpočtový tlak) stanovené vzhledem k povaze nebezpečí, která představují dotyčné látky, nebo formu ochranného zařízení (viz zvláštní ustanovení uvedená v 6.8.4).</p>	
6.8.2.1.6	<p>Svary musí být odborně provedené a musí zaručit naprostou bezpečnost. Provedení a kontrola svarů musí splňovat požadavky uvedené v 6.8.2.1.23.</p>	
6.8.2.1.7	<p>Musí být provedena opatření chránící nádrže před nebezpečím deformace způsobené vnitřním podtlakem. Nádrže, kromě nádrží podle 6.8.2.2.6, konstruované pro vybavení podtlakovými ventily musí odolat bez stálé deformace vnějšímu tlaku překračujícímu vnitřní tlak o nejméně 21 kPa (0,21 baru). Nádrže používané pouze pro přepravu tuhých látek (práškových nebo zrnitých) obalových skupin II nebo III, které během přepravy nezkapaňují, mohou být zkonstruovány pro nižší vnější tlak, avšak nejméně 5 kPa (0,05 baru). Podtlakové ventily musí být nastaveny tak, aby nastavený vyrovnávací tlak nepřevyšoval konstrukční podtlak cisterny. Nádrže, které nejsou konstruovány pro vybavení podtlakovými ventily, musí odolat bez stálé deformace vnějšímu tlaku překračujícímu vnitřní tlak o nejméně 40 kPa (0,4 baru).</p>	
	<p>Materiály pro nádrže</p>	
6.8.2.1.8	<p>Nádrže musí být vyrobeny z vhodných kovových materiálů, které jsou odolné proti křehkému lomu a proti trhlínkové korozi při napětí v rozmezí teplot -20 °C až +50 °C, pokud není u některé třídy předepsán jiný rozsah teplot.</p>	
6.8.2.1.9	<p>Materiály nádrží nebo jejich ochranných povlaků, které jsou ve styku s obsahem nádrže, nesmějí obsahovat látky náchylné k nebezpečné reakci (viz „Nebezpečné reakce“ v 1.2.1) s tímto obsahem, k vytváření nebezpečných látek nebo k podstatnému zeslabení materiálu.</p>	

Pokud styk mezi přepravovanou látkou a materiálem použitým k výrobě nádrže způsobuje progresivní úbytek tloušťky stěn nádrže, musí být tato tloušťka při výrobě patřičně zvětšena. Tato dodatečná tloušťka zohledňující korozi se nebere v úvahu při výpočtu tloušťky stěn nádrže.

- 6.8.2.1.10 Pro svařované nádrže se použije jen materiálů dokonalé svařitelnosti, u nichž může být zaručena dostatečná vrubová houževnatost při okolní teplotě $-20\text{ }^{\circ}\text{C}$, zejména ve svarech a v jejich okolí.

Při použití jemnozrnné oceli zaručená mez průtažnosti R_e musí být nejvýše 460 N/mm^2 a zaručená mez pevnosti v tahu musí být nejvýše 725 N/mm^2 podle specifikací materiálu.

- 6.8.2.1.11 Poměry R_e/R_m větší než 0,85 nejsou pro oceli používané při výrobě svařovaných cisteren dovoleny.

R_e = výrazná mez průtažnosti pro oceli s jasně definovanou mezí průtažnosti nebo zaručenou mezí průtažnosti 0,2 % prodloužení pro oceli bez jasně definované meze průtažnosti (pro austenitické oceli 1 %)

R_m = pevnost v tahu

Hodnoty uvedené v kontrolním osvědčení pro materiál musí být v každém případě vzaty za základ pro stanovení tohoto poměru.

- 6.8.2.1.12 U oceli musí být prodloužení při přetržení v % nejméně

10 000

zjištěná pevnost v tahu v N/mm^2

avšak v žádném případě nesmí být menší než 16 % u jemnozrnných ocelí a menší než 20 % u jiných ocelí.

U hliníkových slitin nesmí být prodloužení při přetržení menší než 12 %¹.

Výpočet tloušťky nádrže

- 6.8.2.1.13 Tlak, podle něhož byla stanovena tloušťka stěny, nesmí být nižší než výpočtový tlak, avšak musí být též vzata v úvahu namáhání uvedená v 6.8.2.1.1 a, pokud je to nezbytné, následující namáhání:

V případě vozidel, u nichž cisterna tvoří namáhaný samonosný prvek, musí být nádrž konstruována tak, aby odolala takto vyvolanému namáhání dodatečně k namáháním z jiných zdrojů.

Za působení těchto namáhání napětí v nejvíce namáhaném bodě nádrže a jejích upevňovacích prvků nesmí překročit hodnotu σ uvedenou v 6.8.2.1.16.

U každého z těchto namáhání stanovený koeficient bezpečnosti musí být následující:

- pro kovy s jasně stanovenou mezí průtažnosti: koeficient bezpečnosti 1,5 ve vztahu k výrazné mezí průtažnosti; nebo
- pro kovy bez jasně stanovené meze průtažnosti: koeficient bezpečnosti 1,5 ve vztahu k zaručené mezí průtažnosti 0,2 % prodloužení (1 % maximálního prodloužení pro austenitické oceli).

- 6.8.2.1.14 Výpočtový tlak je uveden v druhé části kódu (viz 4.3.4.1) podle sloupce (12) tabulky A kapitoly 3.2.

¹ U plechů musí být osa vzorku pro zkoušku tahem kolmá ke směru válcování. Prodloužení při přetržení ($l = 5\text{ d}$) se měří na zkušebních vzorcích kruhového průřezu, jejichž měrná délka (vzdálenost mezi ryskami) se rovná pětinasobku průměru d ; použije-li se zkušebních vzorků pravoúhlého průřezu, vypočítá se měrná délka podle vzorce $l = 5,65\sqrt{F_0}$, kde F_0 je původní plošný obsah průřezu zkušebního vzorku.

Pokud tam je uvedeno písmeno „G“, musí být splněny následující požadavky:

- (a) Nádrže s vyprazdňováním samospádem, určené k přepravě látek, které mají při 50 °C tenzi par nepřevyšující 110 kPa (1,1 baru) (absolutní tlak), musí být dimenzovány na tlak rovnající se dvojnásobku statického tlaku přepravované látky, nejméně však dvojnásobku statického tlaku vody.
- (b) Nádrže plněné nebo vyprazdňované pod tlakem, určené k přepravě látek, které mají při 50 °C tenzi par nepřevyšující 110 kPa (1,1 baru) (absolutní tlak), musí být dimenzovány na tlak rovnající se 1,3 násobku plnicího nebo vyprazdňovacího tlaku

Pokud je tam uveden nejmenší výpočtový tlak (přetlak), nádrž musí být konstruována na tento tlak, který nesmí být nižší než 1,3 násobek plnicího nebo vyprazdňovacího tlaku. Dále uvedené minimální požadavky se vztahují na tyto nádrže:

- (c) Nádrže s jakýmkoli systémem plnění nebo vyprazdňování, určené k přepravě látek, které mají při 50 °C tenzi par vyšší než 110 kPa (1,1 baru), a bod varu vyšší než 35°C musí být dimenzovány na výpočtový tlak nejméně 150 kPa (1,5 baru) (přetlak), nebo na tlak rovnající se 1,3 násobku plnicího nebo vyprazdňovacího tlaku, pokud je plnicí nebo vyprazdňovací tlak vyšší.
- (d) Nádrže s jakýmkoli systémem plnění nebo vyprazdňování, určené k přepravě látek, které mají bod varu nejvýše 35 °C, musí být dimenzovány na tlak rovnající se 1,3 násobku plnicího nebo vyprazdňovacího tlaku, nejméně však 400 kPa (4 bary) (přetlak).

6.8.2.1.15 Při zkušebním tlaku nesmí napětí σ (sigma) v bodě největšího namáhání nádrže překročit mezní hodnoty závislé na materiálu, které jsou předepsány dále. Je třeba pamatovat na případné zeslabení způsobené svary.

6.8.2.1.16 Pro všechny kovy a slitiny musí být napětí při zkušebním tlaku nižší než menší z hodnot daných následujícími vzorci:

$$\sigma \leq 0,75 Re \text{ nebo } \sigma \leq 0,5 Rm$$

kde

Re = výrazná mez průtažnosti pro oceli s jasně definovanou mezí průtažnosti nebo

zaručená mez průtažnosti 0,2 % prodloužení pro oceli bez jasně definované meze průtažnosti (pro austenitické oceli 1 %)

Rm = pevnost v tahu.

Hodnoty Re a Rm, které se použijí, musejí být určeny minimálními hodnotami podle materiálových norem. Pokud materiálové normy pro dotyčné kovy nebo slitiny neexistují, použité Re a Rm musí být schváleny příslušným orgánem nebo organizací jím určené.

Při použití austenitických ocelí smějí být určené minimální hodnoty podle materiálových norem překročeny nejvýše o 15 %, pokud jsou tyto vyšší hodnoty potvrzeny (doloženy) v kontrolním osvědčení.

Minimální hodnoty však nesmějí být překročeny, pokud byl použit vzorec uvedený v 6.8.2.1.18.

Minimální tloušťka nádrže

6.8.2.1.17 Tloušťka nádrže nesmí být menší, než je větší z hodnot vypočtených podle těchto vzorců:

$$e = \frac{P_T D}{2\sigma}$$

$$e = \frac{P_C D}{2\sigma}$$

kde

e = minimální tloušťka stěny v mm

P_T = zkušební tlak v MPa

P_c = výpočtový tlak v MPa definovaný v 6.8.2.1.14

D = vnitřní průměr nádrže v mm

σ = dovolené napětí, jak je definováno v 6.8.2.1.16, v N/mm²

λ = součinitel menší než 1, který zohledňuje případné zeslabení způsobené svarovými švy, v souladu s kontrolními metodami uvedenými v 6.8.2.1.23.

Tloušťka nesmí být v žádném případě menší, než je předepsáno v

	6.8.2.1.18 až 6.8.2.1.21.	6.8.2.1.18 až 6.8.2.1.20.
6.8.2.1.18	Nádrže kruhového průřezu ² o průměru nejvýše 1,80 m, kromě nádrží uvedených v 6.8.2.1.21, nesmějí mít tloušťku menší než 5 mm, pokud jsou z měkké oceli, nebo ekvivalentní tloušťku, pokud jsou z jiného kovu. Pokud je průměr větší než 1,80 m, tato tloušťka musí být zvětšena na 6 mm, kromě nádrží určených pro přepravu práškových nebo zrnitých látek, jsou-li nádrže vyrobeny z měkké oceli ³ , nebo na ekvivalentní tloušťku u nádrží vyrobených z jiného kovu.	Tloušťka nádrží z měkké oceli nesmí být menší než 5 mm (v souladu s požadavky uvedenými v 6.8.2.1.11 a 6.8.2.1.12) nebo ekvivalentní tloušťka u nádrží z jiného kovu. Pokud je průměr větší než 1,80 m, tato tloušťka musí být zvětšena na 6 mm, kromě nádrží určených pro přepravu práškových nebo zrnitých látek, jsou-li nádrže vyrobeny z měkké oceli ³ , nebo na ekvivalentní tloušťku u nádrží vyrobených z jiného kovu. Ať je použit jakýkoli kov, nejmenší tloušťka stěny nesmí být v žádném případě menší než 3 mm.

"Ekvivalentní tloušťka" znamená tloušťku vypočtenou podle tohoto vzorce⁴:

$$e_1 = \frac{464 e_0}{\sqrt[3]{(Rm_1 A_1)^2}}$$

6.8.2.1.19 Je-li nádrž vybavena ochranou proti poškození | Je-li nádrž vybavena ochranou proti. Je-li nádrž

² U nádrží nekruhového průřezu, např. pravoúhlého nebo elipsovitého, musí příslušné průměry odpovídat průměrům vypočteným z kruhového průřezu stejného plošného obsahu. Pro tyto tvary průřezů nesmí poloměry vypouklosti stěn nádrže přesáhnout 2000 mm po stranách a 3000 mm na horní a spodní části nádrže.

³ Definice „měkká ocel“ a „referenční ocel“ viz 1.2.1. „Měkká ocel“ se v tomto případě rovněž vztahuje i na ocel uvedenou v EN materiálových normách jako „měkká ocel“ s minimální pevností v tahu mezi 360 N/mm² a 490 N/mm² a minimální prodloužení při lomu v souladu s 6.8.2.1.12.

⁴ Tento vzorec je odvozen z obecného vzorce:

$$e_1 = e_0 \sqrt[3]{\frac{(R_{mo} A_0)^2}{R_{m_1} A_1}}$$

kde

e = minimální tloušťka stěny pro zvolený kov, v mm;

e_0 = minimální tloušťka stěny pro měkkou ocel, v mm, podle odstavců 6.8.2.1.18 a 6.8.2.1.19;

R_{mo} = 370 (pevnost v tahu pro referenční ocel, viz definice oddílu 1.2.1, v N/mm);

při bočním nárazu nebo převrácení podle 6.8.2.1.20, může příslušný orgán povolit zmenšení výše uvedených minimálních tloušťek v poměru k této ochraně; avšak uvedená minimální tloušťka nádrží, jejichž průměr nepřevyšuje 1,80 m, nesmí být menší než 3 mm u nádrží z měkké oceli3 nebo než ekvivalentní tloušťka u nádrží z jiných materiálů.

U nádrží o průměru větším než 1,80 m nesmí být uvedena minimální tloušťka menší než 4 mm, je-li nádrž z měkké oceli3, nebo než ekvivalentní tloušťka, je-li nádrž z jiného kovu.

Ekvivalentní tloušťka znamená tloušťku vypočtenou podle vzorce uvedeného v 6.8.2.1.18.

Kromě případů, pro které platí 6.8.2.1.21, tloušťka nádrží s ochranou proti poškození podle 6.8.2.1.20 (a) nebo (b) nesmí být menší než hodnoty uvedené v následující tabulce.

vybavena ochranou proti poškození podle 6.8.2.1.20, může příslušný orgán povolit zmenšení výše uvedených minimálních tloušťek v poměru k této ochraně; avšak uvedená minimální tloušťka nesmí být menší než 3 mm u nádrží z měkké oceli3 nebo než ekvivalentní tloušťka u nádrží z jiných materiálů, jestliže průměr nádrže nepřevyšuje 1,80 m. U nádrží o průměru větším než 1,80 m nesmí být uvedena minimální tloušťka menší než 4 mm, je-li nádrž z měkké oceli3, nebo než ekvivalentní tloušťka, je-li nádrž z jiného kovu.

Ekvivalentní tloušťka znamená tloušťku vypočtenou podle vzorce uvedeného v 6.8.2.1.18.

Tloušťka nádrží s ochranou proti poškození podle 6.8.2.1.20 nesmí být menší než uvedené v tabulce níže.

	Průměr nádrže	≤ 1.80 m	> 1.80 m
Minimální tloušťka nádrže	Austenitické nerezavějící oceli	2.5 mm	3 mm
	Austenitické feritické nerezavějící oceli	3 mm	3,5 mm
	Jiné oceli	3 mm	4 mm
	Hliníkové slitiny	4 mm	5 mm
	Hliník 99.80 %čistoty	6 mm	8 mm

6.8.2.1.20

U cisteren vyrobených po 1. lednu 1990, se za ochranu proti poškození podle 6.8.2.1.19 považují tato nebo jim rovnocenná⁵ opatření:

- (a) U cisteren určených k přepravě práškovitých nebo zrnitých látek musí ochrana proti poškození splňovat požadavky příslušného orgánu.
- (b) U cisteren určených k přepravě jiných látek se za ochranu proti poškození považuje, jestliže:

1. U nádrží kruhového nebo eliptického průřezu o maximálním poloměru zakřivení nejvýše 2 m je nádrž opatřena výztuhami tvořenými přepážkami, peřejníky, nebo vnějšími nebo vnitřními prstenci, umístěnými tak, aby byla splněna alespoň jedna z následujících podmínek:

- vzdálenost mezi dvěma sousedními výztuhami je nejvýše 1,75 m;
- vnitřní objem mezi dvěma přepážkami nebo peřejníky je nejvýše 7 500 litrů.

Vertikální průřez prstence s průřezem styčné části pláště musí mít průřezový modul nejméně 10 m³.

Vnější prstence nesmějí mít ostré hrany s poloměrem zaoblení menším než 2,5 mm.

Přepážky a peřejníky musí odpovídat ustanovením 6.8.2.1.22.

Tloušťka přepážek a peřejníků nesmí být v žádném případě menší než tloušťka stěn nádrže;

2. U cisteren s dvojitou stěnou a vakuovou izolací součet tloušťky vnější kovové stěny a tloušťky stěny nádrže odpovídá tloušťce stěny předepsané v 6.8.2.1.18 a tloušťka stěny vlastní nádrže není menší než minimální tloušťka předepsaná v 6.8.2.1.19.

3. U nádrží s dvojitou stěnou s mezivrstvou z tuhých látek o tloušťce nejméně 50 mm má vnější stěna tloušťku nejméně 0,5 mm, pokud je z měkké oceli³, nebo nejméně 2 mm, pokud je z plastu vyztuženého skelnými vlákny. Jako mezivrstvy z tuhých látek se může použít tuhé pěny (se stejnou schopností utlumit náraz jako např. polyuretanová pěna);

4. Nádrže jiných tvarů, než jsou uvedeny v bodě 1, a především cisterny skříňového tvaru jsou opatřeny ze všech stran na 30 % své výšky, v jejím středu dodatečnou ochranou konstruovanou tak, aby její specifická

Ochrana uvedená v 6.8.2.1.19 může mít formu:

- kompaktní vnější konstrukce, jako je "sendvičová" konstrukce, u níž je vnější plášť připevněn k nádrži; nebo
- konstrukce, u níž je nádrž uložena v kompletní kostře s podélnými a příčnými konstrukčními prvky; nebo
- konstrukce s dvojitou stěnou.

Jedná-li se o nádrže s dvojitou stěnou s vakuovou izolací, musí součet tloušťky vnější kovové stěny a tloušťky stěny nádrže odpovídat tloušťce stěny předepsané v 6.8.2.1.18, tloušťka stěny vlastní nádrže nesmí být menší než minimální tloušťka předepsaná v 6.8.2.1.19.

Mají-li nádrže dvojitě stěny s mezivrstvou z tuhých látek o tloušťce nejméně 50 mm, musí mít vnější stěna tloušťku nejméně 0,5 mm, jsou-li vyrobeny z měkké oceli³ nebo nejméně 2 mm, jsou-li vyrobeny z plastu vyztuženého skelným vláknem. Jako mezivrstvy z tuhých látek může být použito tuhé pěny s takovou schopností utlumit nárazy, jako např. polyuretanová pěna.

⁵ Rovnocennými opatřeními se rozumí opatření stanovená v normách uvedených v 6.8.2.6.

vrubová houževnatost byla nejméně rovna specifické vrubové houževnatosti nádrže vyrobené z měkké oceli³ o tloušťce 5 mm (pro průměr nádrže nejvýše 1,80 m) nebo 6 mm (pro průměr nádrže nad 1,80 m). Dodatečná ochrana musí být trvale připojena k nádrži.

Tento požadavek se považuje za splněný bez další zkoušky specifické vrubové houževnatosti, pokud dodatečná ochrana znamená přivaření plechu ze stejného materiálu, jako je nádrž, na její část, která se má vyztužit tak, aby minimální tloušťka stěny odpovídala 6.8.2.1.18.

Tato ochrana je funkcí možných namáhání působících v případě nehody na nádrže z měkké oceli³, jejíž dna a stěny mají při průměru nejvýše 1,80 m tloušťku nejméně 5 mm, nebo při průměru větším než 1,80 m tloušťku nejméně 6 mm. Při použití jiného kovu se určí ekvivalentní tloušťka podle vzorce uvedeného v 6.8.2.1.18.

U snímatelných cisteren se tato ochrana nevyžaduje, jsou-li chráněny ze všech stran čely a bočnicemi nosného vozidla.

6.8.2.1.21

Tloušťka stěn nádrží cisteren dimenzovaných podle 6.8.2.1.14 (a), jejichž vnitřní objem nepřevyšuje 5000 litrů nebo jež jsou rozděleny na těsné komory o jednotkovém vnitřním objemu nejvýše 5000 litrů, může být upravena na úroveň, pokud není předepsáno jinak v 6.8.3 nebo 6.8.4, která však nesmí být menší než příslušná hodnota uvedená v následující tabulce:

Maximální poloměr zakřivení nádrže (m)	Vnitřní objem nádrže nebo její komory (m ³)	Minimální tloušťka (mm)
		Měkká ocel
≤ 2	≤ 5.0	3
2 – 3	≤ 3.5	3
	> 3.5 ale ≤ 5.0	4

³ Definice „měkká ocel“ a „referenční ocel“ viz 1.2.1. „Měkká ocel“ se v tomto případě rovněž vztahuje i na ocel uvedenou v EN materiálových normách jako „měkká ocel“ s minimální pevností v tahu mezi 360 N/mm² a 490 N/mm² a minimální prodloužení při lomu v souladu s 6.8.2.1.12.

Použije-li se jiného kovu než měkké oceli³, určí se ekvivalentní tloušťka podle vzorce uvedeného v 6.8.2.1.18 a nesmí být menší než hodnoty uvedené v následující tabulce.

	Maximální poloměr zakřivení nádrže (m)	≤ 2	2 - 3	2 - 3
	Vnitřní objem nádrže nebo komory (m ³)	$\leq 5,0$	$\leq 3,5$	$> 3,5$ ale $\leq 5,0$
Minimální tloušťka nádrže	Austenitické nerezavějící oceli	2,5 mm	2,5 mm	3 mm
	Jiné oceli	3 mm	3 mm	4 mm
	Hliníkové slitiny	4 mm	4 mm	5 mm
	Hliník čistoty 99,80 %	6 mm	6 mm	8 mm

Tloušťka přepážek a peřejníků nesmí být v žádném případě menší než tloušťka nádrže.

- 6.8.2.1.22 Peřejníky a přepážky musí být vyduuté, s hloubkou vyduť nejmeně 10 cm, nebo musí být vlnité, profilované nebo jinak zesílené, aby zaručovaly rovnocennou pevnost. Plošný obsah peřejníku musí činit nejmeně 70 % plošného obsahu průřezu cisterny, v níž je peřejník zabudován.

Svařování a kontrola svarů

- 6.8.2.1.23 Způsobilost výrobce k provádění svářečských operací musí být potvrzena příslušným orgánem. Svářečské operace musí provádět kvalifikovaní svářeči používající svářecí postup, jehož kvalita (včetně potřebného tepelného zpracování) byla dokázána technologickou zkouškou. Musí se provést nedestruktivní zkoušky prozářením nebo ultrazvukem a tyto zkoušky musí potvrdit, že kvalita svarů je přiměřená namáháním.

Musí být provedeny níže uvedené kontroly podle hodnoty součinitele λ použitého pro stanovení tloušťky nádrže v 6.8.2.1.17:

$\lambda = 0,8$: svary musí být pokud možno prohlédnuty vizuálně z obou stran a podrobeny namátkové nedestruktivní zkoušce. Všechny svařované „T“ spoje s celkovou délkou zkoušeného svaru nejmeně 10 % celkové délky všech podélných, obvodových a radiálních (na koncích cisterny) svarů musí být zkoušeny;

$\lambda = 0,9$: všechny podélné svary v celé své délce, všechny křížové svary, 25 % kruhové svary a svary k připevnění částí výstroje velkého průměru musí být podrobeny nedestruktivním zkouškám. Svary musí být pokud možno prohlédnuty vizuálně z obou stran;

$\lambda = 1,0$: všechny svary musí být podrobeny nedestruktivním zkouškám a pokud možno prohlédnuty vizuálně z obou stran. Musí být odebrán zkušební vzorek svaru.

Pokud má příslušný orgán pochybnosti o kvalitě svarů, může nařídít dodatečné zkoušky.

³ Definice „měkká ocel“ a „referenční ocel“ viz 1.2.1. „Měkká ocel“ se v tomto případě rovněž vztahuje i na ocel uvedenou v EN materiálových normách jako „měkká ocel“ s minimální pevností v tahu mezi 360 N/mm² a 490 N/mm² a minimální prodloužení při lomu v souladu s 6.8.2.1.12.

Jiné konstrukční požadavky

- 6.8.2.1.24 Ochranný povlak musí být konstruován tak, aby byla zaručena jeho těsnost při jakýchkoli deformacích, k nimž může dojít v normálních podmínkách přepravy (viz 6.8.2.1.2).
- 6.8.2.1.25 Tepelná izolace musí být zkonstruována tak, aby nebránila přístupu k plnicím a vyprazdňovacím zařízením a pojistným ventilům, ani jejich funkci.
- 6.8.2.1.26 Jestliže nádrže určené pro přepravu hořlavých kapalin majících bod vzplanutí nejvýše 60 °C jsou vybaveny nekovovými ochrannými povlaky (vnitřními vyloženími), nádrže a jejich ochranné povlaky musí být tak konstruovány, aby nemohlo dojít ke vznícení (zapálení) elektrostatickými náboji.

- 6.8.2.1.27 Nádrže určené pro přepravu kapalin s bodem vzplanutí nejvýše 60 °C nebo pro přepravu hořlavých plynů nebo UN 1361 uhlí nebo UN 1361 saze, obalová skupina II, musí být připojeny k podvozku nejméně jedním dobrým elektrickým spojem. Je třeba vyloučit každý dotyk kovů, který by mohl způsobit elektrochemickou korozi. Nádrže musí být opatřeny nejméně jedním elektricky propojitelným uzemněním zřetelně označeným znakem .

Všechny části cisternového kontejneru určeného k přepravě kapalin s bodem vzplanutí nejvýše 60 °C, k přepravě hořlavých plynů nebo UN 1361 uhlí nebo UN 1361 saze, obalová skupina II, musí být možno elektricky uzemnit. Je třeba vyloučit každý dotyk kovů, který by mohl způsobit elektrochemickou korozi.

- 6.8.2.1.28 *Ochrana upevňovacích prvků na vrchní části cisterny*

Upevňovací prvky a výstroj namontované na vrchní části cisterny musí být chráněny proti poškození způsobenému převrácením. Tato ochrana musí mít formu výztužných obručí, ochranných vrchlíků nebo příčných nebo podélných členů tvarovaných tak, aby poskytovaly účinnou ochranu.

6.8.2.2 Výstroj

- 6.8.2.2.1 Pro výrobu provozní a konstrukční výstroje mohou být použity vhodné nekovové materiály. Části výstroje musí být uspořádány tak, aby byly chráněny proti nebezpečí utržení nebo poškození během přepravy a manipulace. Musí zaručovat bezpečnost odpovídající a srovnatelnou s bezpečností vlastních nádrží a musí zejména:

- být snášetlivé s přepravovanými látkami; a
- splňovat požadavky 6.8.2.1.1.

Potrubí musí být tak konstruováno, vyrobeno a namontováno, aby se zabránilo riziku poškození vlivem tepelné roztažnosti a smršťení, mechanického rázu a vibrací.

Co možno nejvíce provozních a ovládacích prvků je nutno umístit do co nejmenšího počtu otvorů v nádrži. Těsnost provozní výstroje včetně uzávěrů (vík) kontrolních otvorů musí být zajištěna i při převrácení cisterny, berouce v úvahu síly vyvolané nárazem (jako zrychlení a dynamický tlak obsahu). Je však povolen omezený únik obsahu cisterny vlivem špičky tlaku v průběhu nárazu.

Těsnost provozní výstroje musí být zajištěna i při převrácení cisternového vozidla nebo kontejneru.

Těsnění musí být vyrobena z materiálu, který se snáší s přepravovanou látkou, a musí se vyměnit, jakmile se jejich účinnost zhorší, např. v důsledku jejich stárnutí.

Těsnění zajišťující těsnost provozních a ovládacích prvků, s nimiž je nutno manipulovat během normálního použití cisterny, musí být konstruována a uspořádána tak, aby při manipulaci s provozními a ovládacími prvky, k nimž patří, nedošlo k jejich poškození.

6.8.2.2.2

Každý spodní plnicí nebo vyprazdňovací otvor v cisternách, které jsou uvedeny ve sloupci (12) tabulky A kapitoly 3.2 kódem cisterny zahrnujícím písmeno „A“ v její třetí části (viz 4.3.4.1.1) musí být vybaven nejméně dvěma na sobě nezávislými uzávěry, které jsou namontovány za sebou, tvořenými

- vnějším uzavíracím ventilem s potrubím z kovového materiálu schopného se deformovat a
- uzavíracím zařízením na konci každého potrubí, kterým může být šroubový uzávěr, slepá příruba nebo jiný stejně účinný prostředek. Toto uzavírací zařízení musí být tak těsné, že nemůže dojít k úniku látky. Je třeba přijmout opatření, která umožní umístit ve výpustném potrubí bezpečné zařízení pro vyrovnání tlaku, které účinkuje před úplným odstraněním uzavíracího zařízení.

Každý spodní plnicí nebo vyprazdňovací otvor v cisternách, které jsou uvedeny ve sloupci (12) tabulky A kapitoly 3.2 kódem cisterny zahrnujícím písmeno „B“ v její třetí části (viz 4.3.3.1.1 nebo 4.3.4.1.1), musí být vybaven nejméně třemi na sobě nezávislými uzávěry, které jsou namontovány za sebou, tvořenými

- vnitřním uzavíracím ventilem, tj. uzavíracím ventilem namontovaným uvnitř nádrže nebo v přivařené přírubě nebo v protipřírubě;
- vnějším uzavíracím ventilem nebo rovnocenným zařízením⁶
umístěným na konci každého potrubí | umístěným co možno nejblíže k nádrži
a
- uzavíracím zařízením na konci každého potrubí, kterým může být šroubový uzávěr, slepá příruba nebo jiný stejně účinný prostředek. Toto uzavírací zařízení musí být tak těsné, že nemůže dojít k úniku látky. Je třeba přijmout opatření, která umožní umístit ve výpustném potrubí bezpečné zařízení pro vyrovnání tlaku, které účinkuje před úplným odstraněním uzavíracího zařízení.

Avšak v případech cisteren určených pro přepravu určitých krystalizujících nebo vysoce viskózních látek a nádrží opatřených ebonitovým nebo termoplastovým povlakem může být vnitřní uzavírací ventil nahrazen vnějším uzavíracím ventilem s dodatečnou ochranou.

Vnitřní uzavírací ventil musí být ovladatelný buď shora nebo zdola. Poloha - otevřeno nebo zavřeno - vnitřního uzavíracího ventilu musí být v obou případech pokud možno ověřitelná se země. Ovládací zařízení vnitřního uzavíracího ventilu musí být konstruováno tak, aby se zabránilo jakémukoli nežádoucímu otevření v důsledku nárazu nebo neúmyslného jednání.

Vnitřní uzávěr musí zůstat účinný i při poškození vnějšího ovládacího zařízení.

K zamezení úniku obsahu při poškození vnějších plnicích a vyprazdňovacích zařízení (potrubí, boční uzavírací zařízení) musí být vnitřní uzavírací ventil a jeho sedlo chráněny proti nebezpečí utržení vnějším namáháním, nebo musí být konstruovány tak, aby těmto namáháním odolaly. Plnicí a vyprazdňovací zařízení (včetně přírub nebo šroubových uzávěrů) a ochranné kryty (pokud jsou) musí být zajištěny proti jakémukoli nežádoucímu otevření.

Poloha a/nebo směr uzavírání uzavíracích zařízení musí být jednoznačně patrné.

⁶ V případě cisternových kontejnerů s vnitřním objemem menším než 1 m³ vnější uzavírací ventil nebo jiné ekvivalentní zařízení může být nahrazeno slepou přírubou.

Všechny otvory cisteren, které jsou uvedeny ve sloupci (12) tabulky A kapitoly 3.2 kódem obsahujícím písmeno „C“ nebo „D“ v jeho třetí části (viz 4.3.3.1.1 a 4.3.4.1.1) musí být umístěny nad hladinou kapaliny. Tyto cisterny nesmějí mít žádné potrubí nebo spoje potrubí pod hladinou kapaliny. Čistící otvory (velikosti pěsti) jsou však povoleny ve spodní části nádrže cisteren uvedených kódem cisterny obsahujícím písmeno „C“ v jeho třetí části. Tento otvor musí být možno uzavřít těsnou přírubou, jejíž konstrukce musí být schválena příslušným orgánem nebo jím pověřenou organizací.

- 6.8.2.2.3 Cisterny, které nejsou hermeticky uzavřeny, mohou být vybaveny podtlakovými ventily pro zabránění nepříjemného vnitřního podtlaku; tyto podtlakové vyrovnávací ventily musí být nastaveny tak, aby nastavený vyrovnávací tlak nepřevyšoval konstrukční podtlak cisterny (viz 6.8.2.1.7). Hermeticky uzavřené cisterny nesmí být vybaveny podtlakovými ventily. Avšak cisterny kódů cisterny SG4H, S4AH nebo L4BH, vybavené podtlakovými ventily, které se otevírají při podtlaku ne méně než 21 kPa. (0.21 bar) jsou považována za hermeticky uzavřené. Pro cisterny určené pro přepravu tuhých látek (práškových, nebo zrnitých) obalových skupin II nebo III, které nezkapalní během přepravy, podtlak může být snížen na méně než 5 kPa (0.005 bar).

Podtlaková zařízení používaná na cisternách určených pro přepravu látek odpovídajícím kritériím bodu vzplanutí třídy 3 musí zamezit bezprostřednímu proniknutí plamene do nádrže pomocí vhodného ochranného zařízení, nebo nádrž cisterny musí být odolná proti tlaku vyvolanému výbuchem, což znamená být schopná bez úniku, ale s deformacemi, odolat výbuchu způsobenému proniknutím plamene.

V případě, že se ochranné zařízení skládá z vhodné pojistky proti prošlehnutí nebo ochrany proti prošlehnutí, musí být umístěna co nejbližší k nádrži nebo komoře nádrže. Pro vícekomorové cisterny musí být každá komora chráněna odděleně.

- 6.8.2.2.4 Nádrž nebo každá z jejích komor musí být opatřena dostatečně velkým otvorem umožňujícím prohlídku.

- 6.8.2.2.5 (Vyhrazeno)

- 6.8.2.2.6 Cisterny určené k přepravě kapalin o tenzi par nejvýše 110 kPa (1,1 baru) (absolutní tlak) při 50 °C musí být opatřeny podtlakovým zařízením a pojistným zařízením zabráňujícím úniku obsahu, dojde-li k převrácení nádrže; jinak musí splňovat podmínky uvedené v 6.8.2.2.7 nebo 6.8.2.2.8.

- 6.8.2.2.7 Cisterny určené k přepravě kapalin o tenzi par nad 110 kPa (1,1 baru), při 50 °C a bodu varu vyšší než 35 °C musí být opatřeny pojistným ventilem nastaveným na přetlak nejméně 150 kPa (1,5 baru) a takovým, aby se úplně otevřel při tlaku nepřevyšujícím zkušební tlak; jinak musí splňovat podmínky uvedené v 6.8.2.2.8.

- 6.8.2.2.8 Cisterny určené k přepravě kapalin, které mají bod varu nejvýše 35 °C, musí být opatřeny pojistným ventilem seřízeným na přetlak nejméně 300 kPa (3 bary) a takovým, aby se úplně otevřel při tlaku nepřevyšujícím zkušební tlak; jinak musí být hermeticky uzavřeny⁷.

- 6.8.2.2.9 Pohyblivé části, jako jsou kryty, uzávěry atd., které mohou přijít třením nebo nárazem do styku s hliníkovými nádržemi určenými k přepravě hořlavých kapalin o bodu vzplanutí nejvýše 60 °C nebo k přepravě hořlavých plynů, nesmějí být vyrobeny z nechráněné korodující oceli.

- 6.8.2.2.10 Jestliže cisterny, u nichž je požadováno, aby byly hermeticky uzavřeny, jsou vybaveny pojistnými ventily, tyto ventily musí být předřazeny průtržným kotoučem a musí být dodrženy tyto podmínky:

Uspořádání průtržného kotouče a pojistného ventilu musí být takové, aby uspokojilo příslušný orgán. Manometr nebo jiné vhodné měřidlo musí být instalováno do prostoru mezi průtržným kotoučem a pojistným ventilem tak, aby bylo umožněno odhalení jakékoli poruchy, protržení nebo netěsnosti kotouče, které by mohly narušit činnost pojistného systému.

⁷ Pro definici „hermeticky uzavřená cisterna“ viz 1.2.1.

6.8.2.3 Schvalování typu

6.8.2.3.1 Příslušná pověřená organizace vydá ke každému novému typu cisternového vozidla, snímatelné cisterny, cisternového kontejneru, cisternové výměnné nástavby, bateriového vozidla nebo MEGC, osvědčení potvrzující, že tento typ, včetně upevňovacích zařízení, který odborně posoudil, je vhodný k účelu, pro nějž je určen a splňuje konstrukční požadavky uvedené v 6.8.2.1, požadavky na výstroj uvedené v 6.8.2.2 a zvláštní požadavky pro třídy přepravovaných látek.

V osvědčení musí být uvedeny:

- výsledky zkoušky;
- schvalovací číslo typu;

Schvalovací číslo sestává z rozlišovací značky⁸ státu, na jehož území bylo schválení uděleno, a z registračního čísla.

- kód cisterny podle 4.3.3.1.1 nebo 4.3.4.1.1;
- alfanumerický kód zvláštních ustanovení pro konstrukci (TC), pro výstroj (TE) a pro schválení typu (TA) oddílu 6.8.4., které jsou uvedeny v kapitole 3.2 tabulce A sloupci (13) pro ty látky, pro jejichž přepravu je cisterna schválena.
- Jednu kopii tohoto osvědčení je třeba přiložit do složky dokladů k cisterně každé vyrobené cisterny, bateriového vozu nebo MEGC (viz. Odstavec 4.3.2.1.7.)
- pokud je to vyžadováno, látky a/nebo skupinu látek, pro které byla cisterna schválena. Ty musí být uvedeny svým chemickým názvem nebo odpovídajícím hromadným pojmenováním (viz 2.1.1.2) společně s jejich zařazením (třída, klasifikační kód a obalová skupina). Kromě látek třídy 2 a těch, které jsou uvedeny v 4.3.4.1.3, se schválené látky nemusí v osvědčení uvádět. V takových případech skupiny látek dovolených na základě kódu cisterny uvedeného v racionálním přiřazování v 4.3.4.1.2 musí být připsány k přepravě s ohledem na příslušné zvláštní ustanovení.

Látky uvedené v osvědčení nebo skupiny látek schválených podle racionálního přiřazování musí být všeobecně snášitelné s charakteristikami cisterny. Do osvědčení musí být vložena výhrada, pokud nebylo možné prověřit tuto snášitelnost vyčerpávajícím způsobem během schvalování typu.

Jednu kopii tohoto osvědčení je třeba přiložit do dokumentace cisterny každé vyrobené cisterny, bateriového vozu nebo MEGC (viz odstavec 4.3.2.1.7).

6.8.2.3.2 Pokud jsou cisterny, bateriová vozidla nebo MEGC vyráběny v sériích beze změn, toto osvědčení je platné pro cisterny, bateriová vozidla nebo MEGC vyrobené v těchto sériích nebo podle schváleného prototypu.

Schválení typu může též sloužit pro schválení cisteren s omezenými změnami konstrukce, které buď snižují jejich užitečnou hmotnost nebo namáhání cisteren (např. snížený tlak, zmenšená hmotnost, zmenšený vnitřní objem) nebo zvýšení bezpečnosti konstrukce (např. zvětšená tkoušťka stěny, více peřejníků, zmenšené průměry otvorů). Omezené změny musí být zřetelně popsány v osvědčení o schválení typu.

6.8.2.3.3 Následující požadavky se vztahují na cisterny, pro které neplatí zvláštní ustanovení TA4 v 6.8.4 (a tedy i 1.8.7.2.4).

Schválení typu je platné po dobu nejvýše deseti let. Pokud se v tomto období příslušné technické požadavky ADR (včetně uvedených norem) změnily tak, že schválený typ již není v souladu s nimi,

⁸ Rozlišovací značka v mezinárodním provozu předepsaná Úmluvou o silničním provozu (Videň, 1968).

příslušný orgán nebo organizace určená tímto orgánem, který vydal schválení typu, jej musí odejmout a informovat držitele tohoto schválení typu.

POZNÁMKA: Konečné termíny pro zrušení stávajících schválení typu, viz sloupec (5) tabulky v 6.8.2.6 nebo 6.8.3.6 v případě potřeby.

Pokud schválení typu skončila platnost nebo bylo odejmuto, výroba cisteren, bateriových vozidel nebo MEGC dle tohoto schválení typu již není dále dovolena.

V takovém případě příslušná ustanovení o používání, periodické inspekci a meziperiodické inspekci cisterny, bateriového vozidla nebo MEGC obsažené ve schválení typu, kterému skončila platnost nebo bylo odejmuto, platí i nadále pro tyto cisterny, bateriová vozidla nebo MEGC vyrobené před skončením platnosti nebo odejmutím, pokud mohou být dále používány.

Mohou být i nadále používány dokud jsou v souladu s požadavky ADR. Pokud již nejsou v souladu s požadavky ADR, mohou být nadále používány pouze tehdy, pokud takové užití je povoleno příslušnými přechodnými ustanoveními v kapitole 1.6.

Schválení typu může být obnoveno kompletní revizí a posouzením souladu s ustanoveními ADR platnými k datu obnovy. Obnova není povolena pokud schválení typu bylo odejmuto. Prozatímní změny stávajícího schválení typu nemají vliv (viz 6.8.2.3.2) na prodloužení nebo změnu původní doby platnosti osvědčení.

POZNÁMKA: Prohlídku a posuzování shody může provádět jiná organizace než ta, která vydala původní schválení typu.

Vydávající organizace je povinna uchovávat všechny doklady o schválení typu po celou dobu platnosti včetně jeho prodloužení, pokud je uděleno.

Je-li pověření vydávající organizace zrušeno nebo omezeno, nebo když organizace ukončila svou činnost, musí příslušný orgán přijmout vhodná opatření k zajištění toho, aby byly materiály buď zpracovány jinou organizací, nebo aby byly k dispozici.

6.8.2.3.4 V případě změny cisterny s platným, propadlým nebo odejmutým typovým schválení zkoušení, inspekce a schválení se omezují na části cisterny, které byly změněny. Změna musí splňovat ustanovení ADR použitelná v době změny. Pro všechny části cisterny neovlivněné změnou dokumentace prvního typového schválení zůstává platná.

Změna se může uplatnit na jedné nebo více cisternách pokrytých typovým schválením.

Osvědčení schvalující změnu musí být vydáno příslušným orgánem jakékoli smluvní strany ADR nebo organizací pověřenou tímto orgánem a musí být uloženo jako část dokumentace cisterny.

Každé uplatnění osvědčení o schválení změny musí být uchováno jednotlivým příslušným orgánem nebo organizací pověřenou tímto orgánem.

6.8.2.4 Inspekce a zkoušky

6.8.2.4.1 Nádrže a jejich výstroj se musí před uvedením do provozu podrobit, buď společně nebo odděleně, první inspekci. Tato inspekce zahrnuje:

- ověření shodnosti se schváleným prototypem;
- ověření konstrukčních charakteristik⁹;
- prohlídku vnějšího a vnitřního stavu;

⁹ Ověření konstrukčních charakteristik zahrnuje u nádrží se zkušební tlakem 1 MPa (10 barů) nebo vyšším rovněž odebrání zkušebních vzorků svarů (pracovní vzorky) podle 6.8.2.1.23 a zkoušky předepsané v 6.8.5.

- hydraulickou tlakovou zkoušku¹⁰ zkušební tlakem uvedeným na štítku předepsaném v 6.8.2.5.1; a
- zkouškou těsnosti a ověření dobré funkce výstroje.

Kromě třídy 2 zkušební tlak pro hydraulickou tlakovou zkoušku závisí na výpočtovém tlaku a musí být nejméně roven tlaku uvedenému dále:

Výpočtový tlak (bary)	Zkušební tlak (bary)
G ¹¹	G ¹¹
1,5	1,5
2,65	2,65
4	4
10	4
15	4
21	10(4) ¹²

Nejnižší zkušební tlaky pro třídu 2 jsou uvedeny v tabulce plynů a směsí plynů v 4.3.3.2.5.

Hydraulická tlaková zkouška se musí provést na nádrži jako celku a zvlášť na každé komoře komorových nádrží.

Zkouška se musí provést na každé komoře tlakem rovným nejméně 1,3násobku maximálního provozního tlaku.

Hydraulická tlaková zkouška se musí provést před instalací tepelné izolace, pokud je tato izolace nutná.

Jsou-li nádrže a jejich výstroj zkoušeny odděleně, musí se po montáži podrobit společně zkoušce těsnosti podle 6.8.2.4.3.

Zkouška těsnosti komorových nádrží se provádí zvlášť na každé komoře.

6.8.2.4.2 Nádrže a jejich výstroj se musí podrobit periodickým inspekcím nejpozději každých

šest let | pět let

Tyto periodické inspekce musí zahrnovat:

- vnitřní a vnější prohlídku;
- zkoušku těsnosti nádrže s její výstrojí podle 6.8.2.4.3 a kontrolu uspokojivé funkce celé výstroje;
- jako všeobecné pravidlo hydraulickou tlakovou zkoušku¹⁰ (pro zkušební tlak nádrže komor, pokud je to vhodné, viz 6.8.2.4.1).

Plášť tepelné nebo jiné izolace musí být sejmuto pouze v rozsahu nutném pro spolehlivé posouzení charakteristik nádrže.

¹⁰ Ve zvláštních případech a se souhlasem znalce schváleného příslušným orgánem může být hydraulická zkouška nahrazena tlakovou zkouškou za použití jiné kapaliny nebo plynu, pokud tento postup nevyvolá nebezpečí.

¹¹ G = nejmenší výpočtový tlak podle všeobecných požadavků 6.8.2.1.14 (viz 4.3.4.1).

¹² Nejnižší zkušební tlak pro UN 1744 brom nebo UN 1744 brom, roztok.

¹⁰ Ve zvláštních případech a se souhlasem znalce schváleného příslušným orgánem může být hydraulická zkouška nahrazena tlakovou zkouškou za použití jiné kapaliny nebo plynu, pokud tento postup nevyvolá nebezpečí.

U nádrží určených k přepravě práškovitých nebo zrnitých látek může být se souhlasem znalce schváleného příslušným orgánem od periodických hydraulických zkoušek upuštěno a mohou být nahrazeny zkouškami těsnosti podle 6.8.2.4.3 při efektivním vnitřním tlaku nejméně rovném maximálnímu provoznímu tlaku.

6.8.2.4.3 Nádrže a jejich výstroj se musí podrobit meziperiodickým inspekčním nejpozději každé

tři roky | dva a půl roku

po první inspekci a každé periodické inspekci. Tyto meziperiodické inspekce mohou být provedeny tři měsíce před nebo po stanoveném datu.

Avšak meziperiodická inspekce může být provedena kdykoli před stanoveným datem.

Jestliže meziperiodická inspekce je provedena dříve než tři měsíce před stanoveným datem, následná meziperiodická inspekce musí být provedena nejpozději

tři roky | dva a půl roku

po tomto datu.

Tyto meziperiodické zkoušky musí zahrnovat zkoušku těsnosti nádrže s její výstrojí a ověření dobré funkce veškeré výstroje. Pro tento účel musí být cisterna vystavena efektivnímu vnitřnímu tlaku rovnajícímu se nejvyššímu provoznímu tlaku. Pro cisterny určené pro přepravu kapalin nebo tuhých látek v zrnitém nebo práškovitém stavu, pokud je plyn používán pro zkoušku těsnosti, musí být efektivní vnitřní tlak roven nejméně 25 % nejvyššího provozního tlaku. Ve všech případech musí být nejméně 20 kPa (0,2 baru) (přetlak).

Pro cisterny vybavené podtlakovými zařízeními a pojistnými zařízeními, chránícími obsah před rozlitím při převrácení cisterny, zkušební tlak zkoušky těsnosti se musí rovnat statickému tlaku naplněné látky.

Zkouška těsnosti se musí provést zvlášť na každé komoře komorových nádrží.

6.8.2.4.4 Pokud mohlo v důsledku opravy, konstrukční změny nebo nehody dojít ke zhoršení bezpečnosti nádrže nebo její výstroje, musí se provést mimořádná kontrola. Pokud byla provedena mimořádná kontrola splňující požadavky 6.8.2.4.2, může být mimořádná kontrola považována za periodickou inspekci. Pokud byla provedena mimořádná kontrola splňující požadavky 6.8.2.4.3, může být mimořádná kontrola považována za meziperiodickou inspekci.

6.8.2.4.5 Zkoušky, prohlídky a kontroly podle 6.8.2.4.1 až 6.8.2.4.4 musí provést znalec schválený příslušným orgánem. Musí se vydat osvědčení, v nichž musí být uvedeny výsledky těchto zkoušek, prohlídek a kontrol dokonce i v případě negativních výsledků. Tato osvědčení se musejí odvolávat na seznam látek, které se smějí přepravovat v této cisterně nebo na kód cisterny alfanumerické kódy zvláštních ustanovení podle 6.8.2.3.

Jednu kopii tohoto osvědčení je třeba přiložit do složky dokladů k cisterně každé přezkoušené cisterny, bateriového vozu nebo MEGC (viz. 4.3.2.1.7.)

6.8.2.5 **Značení**

6.8.2.5.1 Každá nádrž musí být opatřena kovovým štítkem odolným proti korozi, který je trvale připevněn k nádrži na místě snadno přístupném při prohlídce. Na štítku musí být vyražením nebo jiným podobným způsobem vyznačeny alespoň následující údaje. Tyto údaje mohou být vyryty přímo do stěn vlastní nádrže, jsou-li stěny natolik zesílené, aby se nezmenšila pevnost nádrže¹³:

– schvalovací číslo;

¹³ Uvést měrové jednotky za číselné hodnoty.

- jméno nebo značka výrobce;
- výrobní číslo;
- rok výroby;
- zkušební tlak (přetlak);
- vnější výpočtový tlak (viz. 6.8.2.1.7)
- vnitřní objem nádrže – u vícekomorových nádrží vnitřní objem každé komory – následovaný znakem „S“, jestliže nádrže nebo komory s více než 7500 litrů jsou rozděleny peřejníky na oddíly s vnitřním objemem nejvýše 7500 litrů;
- projektovaná teplota (pouze je-li vyšší než +50 °C nebo nižší než -20 °C),
- datum a druh naposledy provedené zkoušky: (měsíc, rok) následován písmenem „P“, pokud se jedná o první zkoušku nebo periodickou zkoušku dle odstavců 6.8.2.4.1 a 6.8.2.4.2., nebo (měsíc, rok), následován písmenem „L“, pokud se jedná u této zkoušky o zkoušku těsnosti provedenou v mezidobí dle odstavce 6.8.2.4.3.
- značka znalce, který provedl zkoušky;
- materiál nádrže a popřípadě ochranného povlaku;
- zkušební tlak v nádrži jako celku a zkušební tlak komory v MPa nebo barech (přetlak) tam, kde je tlak v komoře nižší než tlak v nádrži.

Na nádržích plněných nebo vyprazdňovaných pod tlakem musí být kromě toho uveden maximální dovolený provozní tlak.

6.8.2.5.2

Následující údaje musí být napsány na cisternovém vozidle (na cisterně samé nebo na tabulkách)¹³:

- jméno vlastníka nebo provozovatele;
- vlastní hmotnost cisternového vozidla; a
- největší povolená hmotnost cisternového vozidla.

Následující údaje musí být napsány na snímatelné cisterně (na cisterně samé nebo na tabulkách)¹³:

- jméno vlastníka nebo provozovatele;
- „snímatelná cisterna“;
- vlastní hmotnost cisterny;
- největší povolená celková hmotnost cisterny;
- pro látky podle 4.3.4.1.3, oficiální

Následující údaje musí být napsány na cisternovém kontejneru (na cisterně samé nebo na tabulkách)¹³:

- jména vlastníka a provozovatele;
- vnitřní objem nádrže;
- vlastní hmotnost;
- největší povolená hmotnost;
- pro látky podle 4.3.4.1.3 oficiální pojmenování pro přepravu látky(ek);
- kód cisterny podle 4.3.4.1.1; a
- pro látky jiné než podle 4.3.4.1.3, alfanumerické kódy všech zvláštních ustanovení TC a TE, které jsou uvedeny ve sloupci (13) tabulky A kapitoly 3.2 pro látky přepravované v cisterně.

¹³ Uvést měrové jednotky za číselné hodnoty.

pojmenování pro přepravu látky(ek);

- kód cisterny podle 4.3.4.1.1; a
- pro látky jiné než podle 4.3.4.1.3, alfanumerické kódy všech zvláštních ustanovení TC a TE, které jsou uvedeny ve sloupci (13) tabulky A kapitoly 3.2 pro látky přepravované v cisterně.

6.8.2.6 **Požadavky na cisterny, které jsou zkonstruovány, vyrobeny a odzkoušeny podle norem**

POZNÁMKA: Osoby nebo organizace uvedené v normách jako odpovědné podle ADR musí splňovat požadavky ADR.

6.8.2.6.1 Konstrukce a výroba

Normy v níže uvedené tabulce musí být použity pro vydání typových schválení, jak je uvedeno ve sloupci (4), aby byly splněny požadavky kapitoly 6.8 dle sloupce (3). Požadavky kapitoly 6.8 dle sloupce (3) musí být ve všech případech nadřazeny. Sloupec (5) uvádí poslední datum, kdy existující schválení typu musí být odejmuto s ohledem na 1.8.7.2.4 nebo 6.8.2.3.3; pokud není datum uvedeno, typové schválení zůstává platné do vypršení jeho platnosti.

Od 1. ledna 2009 je použití norem závazné. Výjimky jsou řešeny v 6.8.2.7 nebo 6.8.3.7.

Jestliže je uvedena více než jedna norma pro použití stejných požadavků, může být použita pouze jedna z nich, ale v plném rozsahu, pokud není v tabulce níže specifikováno jinak.

Rozsah platnosti každé normy je uveden v klauzuli o rozsahu platnosti normy, pokud není uvedeno jinak v tabulce dole.

6.8.2.6.2 *Inspekce a zkoušky*

Normy v níže uvedené tabulce musí být použity pro inspekce a zkoušky cisteren jak je uvedeno ve sloupci (7), aby byly splněny požadavky kapitoly 6.8 uvedené ve sloupci (3), které musí být ve všech případech nadřazeny.

Použití uvedených norem je závazné.

Rozsah platnosti každé normy je uveden v klauzuli o rozsahu platnosti normy, pokud není uvedeno jinak v tabulce dole.

Odkaz	Název dokumentu	Příslušné pododdíly a odstavce	Použití dovoleno

EN 12972:2007	Cisterny pro přepravu nebezpečných věcí – Zkoušení, inspekce a značení kovových cisteren	6.8.2.4 6.8.3.4	Až do odvolání

6.8.2.7 *Požadavky na cisterny, které nejsou konstruovány, vyrobeny a odzkoušeny podle norem*

S ohledem na vědecký a technický pokrok nebo kde není uvedena žádná norma v 6.8.2.6 nebo pro řešení zvláštních aspektů neobsažených v normě uvedené v 6.8.2.6, příslušný orgán může uznat použití technického předpisu zaručujícího stejnou úroveň bezpečnosti. Cisterny však musí splňovat minimální požadavky 6.8.2.

Příslušný orgán musí sekretariátu EHK OSN předat seznam technických předpisů, které uznává. Tento seznam musí obsahovat následující údaje: název a datum technického předpisu, účel předpisu a údaje o tom, kde mohou být předpisy získány. Sekretariát musí tyto informace zveřejnit na svých webových stránkách.

Norma, která byla přijata pro odkaz do příštího vydání ADR může být schválena příslušným orgánem pro použití bez oznámení sekretariátu EHK OSN.

Pro zkoušení, inspekci a značení však může být použita norma uvedená v 6.8.2.6.

6.8.3 Zvláštní požadavky vztahující se na třídu 2**6.8.3.1 Konstrukce nádrží**

6.8.3.1.1 Nádrže určené pro přepravu stlačených nebo zkapalněných plynů nebo rozpuštěných plynů musí být vyrobeny z oceli. Odchylně od ustanovení uvedených v 6.8.2.1.12 lze připustit u bezešvých nádrží minimální prodloužení při přetržení 14 % a napětí σ nepřevyšující mezní hodnoty uvedené dále v závislosti na materiálech:

- (a) Je-li poměr R_e/R_m (minimální zaručené charakteristiky po tepelném zpracování) větší než 0,66, avšak nejvýše 0,85:

$$\sigma \leq 0,75 R_e$$

- (b) je-li poměr R_e/R_m (minimální zaručené charakteristiky po tepelném zpracování) větší než 0,85:

$$\sigma \leq 0,5 R_m$$

6.8.3.1.2 Požadavky uvedené v oddílu 6.8.5 se vztahují na materiály a konstrukci svařovaných nádrží.

6.8.3.1.3 (Vyhrazeno)

Konstrukce bateriových vozidel a MEGC

6.8.3.1.4 Láhve, trubkové nádoby, tlakové sudy a svazky lahví, jakož i články bateriových vozidel nebo MEGC musí být konstruovány podle kapitoly 6.2.

POZNÁMKA 1: Svazky lahví, které nejsou články bateriových vozidel nebo MEGC musí splňovat požadavky kapitoly 6.2.

POZNÁMKA 2: Cisterny jako články bateriových vozidel a MEGC musí být konstruovány podle 6.8.2.1 a 6.8.3.1.

POZNÁMKA 3: Snímatelné cisterny¹⁴ se nepovažují za články bateriových vozidel nebo MEGC.

6.8.3.1.5 Články a jejich upevňovací prvky musí být schopné absorbovat při maximální dovolené užitečné hmotnosti síly uvedené v 6.8.2.1.2. Při jakékoli síle nesmí namáhání v nejvíce namáhaném bodě článku nebo jeho upevňovacích prvků nesmí překročit hodnotu uvedenou v 6.2.5.3. pro lahve, trubkové nádoby, tlakové sudy a svazky lahví a pro cisterny hodnotu σ uvedenou v 6.8.2.1.16.

6.8.3.2 Výstroj

6.8.3.2.1 Výpustná potrubí nádrží musí být možno uzavřít slepou přírubou nebo jiným, stejně spolehlivým zařízením. Pro nádrže určené pro přepravu hluboce zchlazených zkapalněných plynů tyto slepé příruby nebo jiná rovnocenná zařízení mohou být vybaveny tlak propouštějícími otvory průměru nejvýše 1,5 mm.

6.8.3.2.2 Nádrže určené k přepravě zkapalněných plynů smějí být opatřeny kromě otvorů předepsaných v 6.8.2.2.2 a 6.8.2.2.4 otvory pro umístění stavoznaků, teploměrů, tlakoměrů a odvzdušňovacími otvory, jak to vyžaduje jejich provoz a bezpečnost.

6.8.3.2.3 Vnitřní uzavírací ventil všech plnicích a všech vyprazdňovacích otvorů cisteren

¹⁴ Pro definici „snímatelná cisterna“ viz 1.2.1.

| s vnitřním objemem větším než 1 m³

určených k přepravě zkapalněných hořlavých nebo toxických plynů musí být rychlezavíratelný a musí se automaticky uzavřít při nežádoucím pohybu nádrže nebo při požáru. Vnitřní uzavírací ventil musí být rovněž možné obsluhovat dálkovým ovládáním.

Nicméně pro cisterny určené pro přepravu hořlavých netoxických zkapalněných plynů, může být vnitřní uzavírací ventil s dálkovým ovládáním nahrazen zpětným ventilem pouze pro plnicí otvory v parní fázi cisterny. Zpětný ventil musí být umístěn uvnitř cisterny, musí být pružinového typu, aby se uzavřel jakmile je tlak v plnicím potrubí roven nebo nižší než tlak v cisterně a musí být vybaven vhodným těsněním¹⁵.

- 6.8.3.2.4 Cisterny určené k přepravě zkapalněných hořlavých a/nebo toxických plynů musí mít všechny otvory o jmenovitém průměru větším než 1,5 mm, s výjimkou otvorů s pojistnými ventily a s výjimkou uzavřených odvzdušňovacích otvorů, vybaveny vnitřním uzavíracím zařízením.
- 6.8.3.2.5 Odchylkou od požadavků uvedených v 6.8.2.2.2, 6.8.3.2.3 a 6.8.3.2.4 mohou být cisterny určené k přepravě hluboce zchlazených zkapalněných plynů opatřeny vnějšími zařízeními namísto zařízení vnitřních, pokud jsou tato vnější zařízení vybavena ochranou proti vnějšímu poškození, která je alespoň rovnocenná ochraně stěny nádrže.
- 6.8.3.2.6 Jsou-li cisterny vybaveny stavoznakem, nesmějí být tyto stavoznaky vyrobeny z průhledného materiálu, pokud jsou v přímém styku s přepravovanou látkou. Teploměry, jsou-li jimi nádrže vybaveny, nesmějí procházet stěnou nádrže přímo do plynu nebo kapaliny.
- 6.8.3.2.7 Plnicí a vyprazdňovací otvory umístěné v horní části cisteren musí být opatřeny navíc k tomu, co je předepsáno v 6.8.3.2.3, druhým vnějším uzavíracím zařízením. Toto zařízení musí být možno uzavřít slepou přírubou nebo jiným, stejně spolehlivým zařízením.
- 6.8.3.2.8 Pojistné ventily musí splňovat požadavky uvedené v 6.8.3.2.9 až 6.8.3.2.12 níže.
- 6.8.3.2.9 Cisterny určené pro přepravu stlačených nebo zkapalněných plynů nebo rozpuštěných plynů mohou být opatřeny pružinovými pojistnými ventily. Tyto ventily musí být schopny automaticky se otevřít při tlaku, který se rovná 0,9 až 1,0 násobku zkušební tlaku nádrže, na níž jsou namontovány. Musí být takového typu, aby odolaly dynamickým účinkům včetně pohybu kapalin v nádrži. Používání ventilů se zátěží nebo ventilů s protizávažím je zakázáno. Požadovaná kapacita bezpečnostních ventilů musí být vypočtena podle vzorce uvedeného v 6.7.3.8.1.1.
- 6.8.3.2.10 Pokud jsou cisterny určeny pro přepravu po moři, požadavky uvedené v 6.8.3.2.9 nezakazují montáž pojistných ventilů podle námořních předpisů IMDG Code.
- 6.8.3.2.11 Cisterny určené pro přepravu hluboce zchlazených zkapalněných plynů musí být opatřeny dvěma, nebo více nezávislými pojistnými ventily schopnými otevření při nejvyšším provozním tlaku uvedeném na cisterně. Dva z těchto pojistných ventilů musí být individuálně rozloženy, aby umožnil unikání plynů, které se tvoří odpařováním při normálním provozu, z cisterny takovým způsobem, aby tlak uvnitř cisterny v žádném okamžiku nepřekročil provozní tlak vyznačený na nádrži o více než 10 %.

Jeden z těchto pojistných ventilů může být nahrazen průtržným kotoučem, který se musí protrhnout při zkušebním tlaku.

¹⁵ Použití kovu na kovovém těsnění není dovoleno.

V případě ztráty vakua v cisternách s dvojitou stěnou nebo zničení 20 % izolace cisteren s jednoduchou stěnou musí kombinace zařízení pro vyrovnání tlaku dovolit únik takového množství plynu, aby tlak v nádrži nemohl překročit zkušební tlak. Ustanovení 6.8.2.1.7 se nepoužije pro cisterny s vakuovou izolací.

6.8.3.2.12 Tato zařízení pro vyrovnání tlaku cisteren určených pro přepravu hluboce zchladených zkvalněných plynů musí být zkonstruovány tak, aby fungovaly bezvadně i při své nejnižší provozní teplotě. Spolehlivost jejich funkce při této teplotě musí být zjištěna a kontrolována buď zkouškou každého zařízení, nebo zkouškou vzorku zařízení téhož konstrukčního typu.

6.8.3.2.13 Ventily snímatelných cisteren, které mohou být váleny, musí být opatřeny ochrannými čepičkami.

Tepelná izolace

6.8.3.2.14 Jsou-li cisterny určené pro přepravu zkvalněných plynů opatřeny tepelnou izolací, musí tato izolace sestávat:

- buď z krytu proti slunci pokrývajícího nejméně horní třetinu, avšak nejvýše horní polovinu povrchu cisterny a odděleného od nádrže vrstvou vzduchu o tloušťce nejméně 4 cm; nebo
- z kompletního pláště přiměřené tloušťky z izolačních materiálů.

6.8.3.2.15 Cisterny určené pro přepravu hluboce zchladených zkvalněných plynů musí být tepelně izolovány. Tepelná izolace musí být zabezpečena plným pláštěm. Je-li prostor mezi nádrží a pláštěm vzduchoprázdný (vakuová izolace), musí být ochranný plášť dimenzován tak, aby odolal bez deformace vnějšímu tlaku nejméně 100 kPa (1 bar) (přetlak). Odchytkou od definice „výpočtový tlak“ v 1.2.1 lze při výpočtech brát v úvahu vnější a vnitřní zesilovací prvky. Je-li plášť uzavřen tak, že je plynotěsný, musí být opatřen zařízením, které zabrání vzniku nebezpečného tlaku v izolační vrstvě při nedostatečné těsnosti nádrže nebo její výstroje. Toto zařízení musí zabránit vnikání vlhkosti do tepelně izolačního pláště.

6.8.3.2.16 Cisterny určené pro přepravu hluboce zchladených zkvalněných plynů, jejichž bod varu při atmosférickém tlaku je nižší než -182 °C, nesmějí obsahovat žádnou hořlavou látku ani v tepelně izolačním zařízení, ani v konstrukčních prvcích sloužících pro upevnění nádrže k podvozku.

Upevňovací prvky nádrží vakuově izolovaných cisteren smějí se souhlasem příslušného orgánu obsahovat plasty mezi nádrží a pláštěm.

6.8.3.2.17 Odchytkou od požadavků uvedených v 6.8.2.2.4 nádrže určené pro přepravu hluboce zchladených zkvalněných plynů nemusí mít kontrolní otvory.

Částí výstroje bateriových vozidel a MEGC

6.8.3.2.18 Provozní a konstrukční výstroj musí být tak uspořádána nebo konstruována, aby se předešlo poškození, které by mohlo nastat při úniku obsahu tlakové nádoby za normálních podmínek manipulace a přepravy. Pokud spojení mezi rámem a prvky bateriového vozidla nebo MEGC dovoluje relativní pohyb mezi podskupinami, výstroj musí být tak upevněna, aby dovolila takový pohyb bez poškození pracovních částí. Sběrné potrubí vedoucí k uzavíracím ventilům musí být dostatečně flexibilní (ohebné), aby ochránilo ventily a potrubí před stříhem nebo únikem obsahu tlakové nádoby. Plnicí a vyprazdňovací zařízení (včetně slepých přírub nebo šroubových uzávěrů) a všechny ochranné čepičky musí umožňovat zajištění proti nežádoucímu otevření.

6.8.3.2.19 Aby se zabránilo jakékoli ztrátě obsahu v případě poškození, sběrné potrubí, vyprazdňovací zařízení (přípojky potrubí, uzavírací zařízení) a uzavírací ventily musí být chráněny nebo uspořádány proti utržení vnějšími silami nebo konstruovány tak, aby jim odolaly.

6.8.3.2.20 Sběrné potrubí musí být konstruováno pro provoz v teplotním rozsahu -20 °C až +50 °C.

Sběrné potrubí musí být konstruováno, vyrobeno a namontováno tak, aby se zabránilo nebezpečí jeho poškození způsobenému tepelnou roztažností a smršťováním, mechanickými rázy a vibracemi. Všechna potrubí musí být z vhodného kovového materiálu. Všeude, kde to je možné, musí být použito svařovaných spojů.

Spoje měděného potrubí musí být spájeny na tvrdo nebo mít pevnostně rovnocenné kovové spojení. Bod tavení tavných materiálů musí být nižší než 525 °C. Spoje nesmějí zeslabovat potrubí, jak to může způsobit závitový spoj.

- 6.8.3.2.21 Kromě pro UN 1001 acetylen, rozpuštěný maximální dovolené napětí σ sběrného potrubí při zkušebním tlaku nádob nesmí překročit 75 % zaručené meze průtažnosti materiálu.

Nezbytná tloušťka stěny sběrného potrubí pro přepravu UN 1001 acetylen, rozpuštěný, musí být vypočtena podle uznaných technických pravidel.

POZNÁMKA: Pro mez průtažnosti viz 6.8.2.1.11.

Základní požadavky tohoto odstavce se považují za splněné, pokud se použily následující normy: (Vyhrazeno)

- 6.8.3.2.22 Odchylkou od požadavků uvedených v 6.8.3.2.3, 6.8.3.2.4 a 6.8.3.2.7 pro láhve, trubkové nádoby, tlakové sudy a svazky lahví tvořící bateriové vozidlo nebo MEGC požadovaná uzavírací zařízení mohou být umístěna uvnitř systému sběrného potrubí.
- 6.8.3.2.23 Je-li jeden z článků bateriového vozidla opatřen pojistným ventilem a jsou-li mezi jednotlivými články uzavírací zařízení, musí být pojistným ventilem opatřen každý článek.
- 6.8.3.2.24 Plnicí a vyprazdňovací zařízení smějí být upevněna na sběrném potrubí.
- 6.8.3.2.25 Každý článek bateriového vozidla, včetně každé jednotlivé láhve svazku lahví, určený pro přepravu toxických plynů musí být možno uzavřít jednotlivě uzavíracím ventilem.
- 6.8.3.2.26 Bateriová vozidla nebo MEGC určené pro přepravu toxických plynů nesmějí mít pojistné ventily, ledaže je pojistným ventilům předřazen průtržný kotouč. V posledním případě uspořádání průtržného kotouče a pojistného ventilu musí být přijatelné pro příslušný orgán.
- 6.8.3.2.27 Pokud jsou bateriová vozidla nebo MEGC určeny pro přepravu po moři, požadavky uvedené v 6.8.3.2.26 nezakazují montáž pojistných ventilů podle námořních předpisů IMDG Code.
- 6.8.3.2.28 Nádoby, které tvoří články bateriového vozidla nebo MEGC určeného pro přepravu hořlavých plynů, musí být spojeny do skupin s celkovým vnitřním objemem nejvýše 5000 litrů, které je možno navzájem oddělit uzavíracím ventilem.
- 6.8.3.2.29 Každý článek bateriového vozidla nebo MEGC určeného pro přepravu hořlavých plynů, pokud je tvořen cisternami odpovídajícími této kapitole, musí být možno uzavřít jednotlivě uzavíracím ventilem.

6.8.3.3 **Schvalování typu**

Není zvláštních předpisů.

6.8.3.4 **Inspekce a zkoušky**

- 6.8.3.4.1 Materiály každé svařované nádrže, kromě válcových lahví, trubkových nádob, tlakových sudů a lahví jako částí svazku lahví, které jsou články bateriového vozidla nebo MEGC, musí být zkoušeny metodou popsanou v oddílu 6.8.5.
- 6.8.3.4.2 Základní požadavky na zkušební tlak jsou uvedeny v 4.3.3.2.1 až 4.3.3.2.4 a nejnižší zkušební tlaky jsou uvedeny v tabulce plynů a směsí plynů v 4.3.3.2.5.

- 6.8.3.4.3 První hydraulická tlaková zkouška musí být provedena před montáží tepelné izolace. Pokud nádrž, její úchyty, potrubí a části výstroje byl zkoušeny odděleně, cisterna po její kompletní montáži musí být podrobena zkoušce těsnosti.
- 6.8.3.4.4 Vnitřní objem každé nádrže určené k přepravě stlačených plynů plněných hmotnostně, zkapalněných plynů nebo rozpuštěných plynů musí být stanoven za dohledu znalce schváleného příslušným orgánem vážením nebo volumetrickým měřením množství vody, které naplní nádrž; chyba měření vnitřního objemu nádrží musí být nižší než 1 %. Stanovení vnitřního objemu výpočtem na základě rozměrů nádrže není dovoleno. Nejvyšší dovolené hmotnosti plnění podle pokynů pro balení P200 nebo P203 v 4.1.4.1, jakož i v 4.3.3.2.2 a 4.3.3.2.3, musí být stanoveny schváleným znalcem.
- 6.8.3.4.5 Kontrola svarů musí být provedena podle podmínek stanovených pro součinitel $\lambda = 1$ uvedených v 6.8.2.1.23.
- 6.8.3.4.6 Odchylkou od požadavků uvedených v 6.8.2.4.2 se periodické inspekce musí provádět:
- | | |
|---|---|
| nejpozději po šesti letech | nejpozději po osmi letech |
| provozu a potom nejpozději každých dvanáct let v případě cisteren určených pro přepravu hluboce zchlazených zkapalněných plynů; | |
| Meziperiodické inspekce podle 6.8.2.4.3 musí být provedeny nejpozději šest let po každé periodické inspekci. | Zkouška těsnosti nebo meziperiodická inspekce podle 6.8.2.4.3 může být provedena, na žádost příslušného orgánu, mezi dvěma úspěšnými periodickými inspekcemi. |
- 6.8.3.4.7 U cisteren s vakuovou tepelnou izolací smějí být hydraulická zkouška a prohlídka vnitřního stavu nahrazeny se souhlasem schváleného znalce zkouškou těsnosti a měřením vakua.
- 6.8.3.4.8 Byly-li během periodických inspekci udělány otvory v nádržích určených k přepravě hluboce zchlazených zkapalněných plynů, musí být způsob jejich hermetického uzavření schválen před znovuvvedením do provozu schváleným znalcem a musí zaručovat celistvost nádrže.
- 6.8.3.4.9 Zkouška těsnosti cisteren určených pro přepravu plynů musí být provedena při tlaku nejméně:
- pro stlačené plyny, zkapalněné plyny a rozpuštěné plyny: 20 % zkušebního tlaku;
 - pro hluboce zchlazené zkapalněné plyny: 90 % maximálního provozního tlaku.

Inspekce a zkoušky bateriových vozidel a MEGC

- 6.8.3.4.10 Články a části výstroje každého bateriového vozidla nebo MEGC musí být kontrolovány a zkoušeny, buď společně, nebo odděleně, před prvním uvedením do provozu (první inspekce a zkouška). Potom články tvořící bateriová vozidla nebo MEGC musí být kontrolovány v nejvýše pětiletých intervalech. Články bateriových vozidel a MEGC tvořících cisterny musí být kontrolovány podle 6.8.3.4.6. Mimořádná inspekce a zkouška musí být provedeny bez ohledu na poslední periodické inspekce a zkoušky, pokud je to nezbytné, podle 6.8.3.4.14.
- 6.8.3.4.11 První prohlídka zahrnuje:
- ověření shodnosti se schváleným prototypem;
 - ověření konstrukčních charakteristik;
 - prohlídku vnějšího a vnitřního stavu;

- hydraulickou tlakovou zkoušku¹⁰ zkušebním tlakem uvedeným na štítku předepsaném v 6.8.3.5.10;
- zkoušku těsnosti nejvyšším provozním tlakem; a
- ověření dobré funkce výstroje.

Pokud byly články a jejich výstroj zkoušeny odděleně, musí být po svém sestavení podrobeny společně zkoušce těsnosti.

- 6.8.3.4.12 Láhve, trubkové nádoby a tlakové sudy, jakož i láhve jako část svazku lahví musí být zkoušeny podle pokynu pro balení P200 nebo P203 uvedených v 4.1.4.1.

Zkušební tlak sběrného potrubí bateriového vozidla nebo MEGC musí být stejný jako zkušební tlak článků bateriového vozidla nebo MEGC. Tlaková zkouška sběrného potrubí může být provedena jako hydraulická zkouška nebo s použitím jiné kapaliny nebo plynu se souhlasem příslušného orgánu nebo jím pověřené organizace. Odchylkou od tohoto požadavku zkušební tlak sběrného potrubí bateriového vozidla nebo MEGC nesmí být menší než 300 barů pro UN 1001 acetylen, rozpuštěný.

- 6.8.3.4.13 Periodická inspekce musí zahrnovat zkoušku těsnosti nejvyšším provozním tlakem a vnější prohlídku konstrukce, článků a provozní výstroje bez demontáže. Články a potrubí musí být periodicky zkoušeny ve lhůtách uvedených v pokynech pro balení P200 v 4.1.4.1 a v souladu s požadavky uvedenými v 6.2.1.6 a případně 6.2.3.5. Pokud byly články a výstroj zkoušeny odděleně, musí být po svém sestavení podrobeny společně zkoušce těsnosti.

- 6.8.3.4.14 Mimořádná inspekce a zkouška je nezbytná, pokud bateriové vozidlo nebo MEGC vykazuje evidentně poškození nebo zkorodované plochy nebo netěsnost nebo jiné podmínky svědčící o nedostacích, které by mohly ohrozit celistvost bateriového vozidla nebo MEGC. Rozsah mimořádné inspekce a zkoušky, a pokud se jeví nezbytnou, demontáž článků, závisí na rozsahu poškození nebo opotřebení bateriového vozidla nebo MEGC. To musí zahrnovat také prohlídky požadované v 6.8.3.4.15.

- 6.8.3.4.15 Prohlídky musí zajistit, že

- (a) články jsou zvnějšku prohlédnuty, zda se nevyskytují důlky, koroze nebo odřenin, stopy nárazů, deformace, vady svarů nebo jiné vady, včetně netěsností, které by mohly učinit bateriová vozidla nebo MEGC nebezpečnými pro dopravu;
- (b) potrubí, ventily a těsnění jsou prohlédnuty, zde se nevyskytují zkorodované plochy, závad a jiné podmínky, včetně netěsností, které by mohly učinit bateriová vozidla nebo MEGC nebezpečnými pro plnění, vyprazdňování nebo pro dopravu;
- (c) chybějící nebo uvolněné šrouby nebo matice na jakémkoli přírubovém spoji nebo slepé přírubě jsou nahrazeny nebo utaženy;
- (d) všechna pojistná zařízení a ventily jsou prosty koroze, deformací nebo jakéhokoli jiného poškození nebo vady, které by mohly bránit jejich normální činnosti. Dálkové uzavírací zařízení a samouzavírací ventily musí být uvedeny do provozu, aby se prokázala jejich správná činnost;
- (e) požadovaná označení bateriových vozidel nebo MEGC jsou čitelná a v souladu s příslušnými požadavky; a
- (f) nosná konstrukce (rám), podpěry a zařízení pro zvedání bateriových vozidel nebo MEGC jsou v uspokojivém stavu.

¹⁰ Ve zvláštních případech a se souhlasem znalce schváleného příslušným orgánem může být hydraulická tlaková zkouška nahrazena tlakovou zkouškou za použití jiné kapaliny nebo plynu, pokud tento postup nepředstavuje žádné nebezpečí.

6.8.3.4.16 Zkoušky, inspekce a kontroly uvedené v 6.8.3.4.10 až 6.8.3.4.15 musejí být prováděny znalcem schváleným příslušným orgánem. Ve vydaných osvědčeních musí být uvedeny výsledky těchto operací i v případě negativních výsledků.

Tato osvědčení musí obsahovat odkaz na seznam látek dovolených pro přepravu v tomto bateriovém vozidle nebo MEGC podle 6.8.2.3.1.

Kopie těchto osvědčení musí být přiloženy ke zprávě o cisterně každé odzkoušené cisterny, bateriového vozidla MEGC (viz 4.3.2.1.7.)

6.8.3.5 **Značení**

6.8.3.5.1 Na štítku předepsaném v 6.8.2.5.1 nebo přímo na stěnách nádrže samé, pokud jsou stěny tak zesíleny, že tím není dotčena pevnost nádrže, musí být vyznačeny vyražením nebo jiným podobným způsobem kromě údajů tam uvedených ještě tyto údaje:

6.8.3.5.2 U cisteren určených pro přepravu jen jedné látky:

- oficiální pojmenování pro přepravu plynu a kromě toho u plynů zařazených pod j.n. položku technický název¹⁶.

Toto označení musí být doplněno:

- v případě cisteren určených pro přepravu stlačených plynů plněných objemově (tlakem) hodnotou nejvyššího plnicího tlaku při 15 °C, který je pro cisternu dovolen; a
- v případě cisteren určených pro přepravu stlačených plynů plněných hmotnostně a zkapalněných plynů, hluboce zchlazených zkapalněných plynů a rozpuštěných plynů nejvyšším dovoleným plněním v kg a plnicí teplotou, je-li tato teplota nižší než - 20 °C.

6.8.3.5.3 U cisteren s víceúčelovým použitím:

- oficiální pojmenování pro přepravu plynů a kromě toho u plynů zařazených pod j.n. položku, technický název¹⁶ plynů, pro jejichž přepravu je cisterna schválena.

Tyto údaje musí být doplněny o údaj nejvyšší dovolené užitečné hmotnosti v kg pro každý z těchto plynů.

6.8.3.5.4 U cisteren určených pro přepravu hluboce zchlazených zkapalněných plynů:

- nejvyšší dovolený provozní tlak.

6.8.3.5.5 U cisteren s tepelnou izolací:

- nápis "tepelně izolováno" nebo "vakuově tepelně izolováno".

6.8.3.5.6 Kromě údajů předepsaných v 6.8.2.5.2 musí být uvedeny následující údaje na cisternovém vozidle (na cisterně samé nebo na tabulkách) ¹³ :	Kromě údajů předepsaných v 6.8.2.5.2 musí být uvedeny následující údaje na cisternovém kontejneru (na cisterně samé nebo na
---	---

¹⁶ Místo oficiálního pojmenování pro přepravu nebo oficiálního pojmenování pro přepravu j.n. položky následované technickým názvem je dovoleno případné používání dále uvedených názvů:

- pro UN 1078 chladicí plyn, j.n.: směs F1, směs F2, směs F3;
- pro UN 1060 methylocetylen a propadien, směsí, stabilizované: směs P1, směs P2;
- pro UN 1965 uhlovodíky, plynné, směs, zkapalněná, j.n.: směs A, směs A01, směs A02, směs A0, směs A1, směs B1, směs B2, směs B, směs C. Obchodní názvy uvedené v 2.2.2.3, klasifikační kód 2F, UN 1965, Poznámka 1 směji být používány pouze jako doplňkové;
- pro UN 1010 butadien, stabilizovaný: 1,2-butadien, stabilizovaný, 1,3-butadien, stabilizovaný.

¹³ Uvést měrové jednotky za číselné hodnoty.

na cisterně samé nebo na tabulce:

tabulkách)¹³:

na cisternovém kontejneru samém nebo na tabulce:

- (a) kód cisterny podle osvědčení (viz 6.8.2.3.1) se skutečným zkušebním tlakem cisterny;
..... nápis "nejnižší dovolená plnicí teplota:
.....";
- (b) u cisteren určených pro přepravu jen jedné látky:
- oficiální pojmenování pro přepravu plynu a kromě toho u plynů zařazených pod j.n. položku technický název¹⁶;
 - pro stlačené plyny plněné hmotnostně a pro zkapalněné plyny, hluboce zchlazené zkapalněné plyny nebo rozpuštěné plyny nejvyšší dovolené užitečné hmotnosti v kg.
- (c) u cisteren s víceúčelovým použitím:
- oficiální pojmenování pro přepravu plynů a kromě toho u plynů zařazených pod j.n. položku technický název¹⁶ všech plynů, pro jejichž přepravu je cisterna určena.
 - s uvedením nejvyšší dovolené užitečné hmotnosti v kg pro každý z nich.
- (d) u nádrží s tepelnou izolací:
- - nápis "tepelně izolováno" nebo "vakuově tepelně izolováno" v úředním jazyce státu registrace a, není-li tímto jazykem angličtina, francouzština ani němčina, rovněž v angličtině francouzštině nebo němčině, pokud případné dohody uzavřené mezi státy zúčastněnými na přepravě nestanoví jinak.

6.8.3.5.7 (Vyhrazeno)

6.8.3.5.8 Tyto údaje se nevyžadují v případě vozidel |
převážujících snímatelné cisterny.

6.8.3.5.9 (Vyhrazeno)

Značení bateriových vozidel a MEGC

6.8.3.5.10 Každé bateriové vozidlo a každý MEGC musí být opatřen(o) kovovým štítkem odolným proti korozi, který je trvale připevněn na místě snadno přístupném při prohlídce. Na štítku musí být vyražením nebo jiným podobným způsobem vyznačeny alespoň následující údaje¹³:

- schvalovací číslo;
- jméno nebo značka výrobce;
- výrobní číslo;
- rok výroby;

¹⁶ Místo oficiálního pojmenování pro přepravu nebo oficiálního pojmenování pro přepravu j.n. položky následované technickým názvem je dovoleno případně používání dále uvedených názvů:

- pro UN 1078 chladicí plyn, j.n.: směs F1, směs F2, směs F3;
- pro UN 1060 methylocetylen a propadien, směs, stabilizované: směs P1, směs P2;
- pro UN 1965 uhlovodíky, plynné, směs, zkapalněná, j.n.: směs A, směs A01, směs A02, směs A0, směs A1, směs B1, směs B2, směs B, směs C. Obchodní názvy uvedené v 2.2.2.3, klasifikační kód 2F, UN 1965, Poznámka 1 směji být používány pouze jako doplňkové;
- pro UN 1010 butadien, stabilizovaný: 1,2-butadien, stabilizovaný, 1,3-butadien, stabilizovaný.

¹³ Uvést měrové jednotky za číselné hodnoty.

- zkušební tlak (přetlak);
 - výpočtová teplota (pouze je-li vyšší než + 50 °C nebo nižší než - 20 °C);
 - datum (měsíc a rok) první zkoušky a poslední periodické zkoušky podle 6.8.3.4.10 až 6.8.3.4.13;
 - značka znalce, který provedl zkoušky.
- 6.8.3.5.11 Na bateriovém vozidle samém nebo na tabulce musí být napsány tyto údaje¹³:
- jméno vlastníka nebo provozovatele,
 - počet článků;
 - celkový vnitřní objem článků;
- a pro bateriová vozidla plněná hmotnostně:
- vlastní hmotnost;
 - největší dovolená hmotnost.
- Na MEGC samém nebo na tabulce musí být napsány tyto údaje¹³:
- jméno vlastníka nebo provozovatele,
 - počet článků;
 - celkový vnitřní objem článků;
 - největší dovolená celková hmotnost,
 - kód cisterny podle osvědčení o schválení (viz 6.8.2.3.1) se skutečným zkušebním tlakem MEGC;
 - oficiální pojmenování pro přepravu plynů a kromě toho pro plyny zařazené pod j.n. položku technický název¹⁶ plynů, pro jejichž přepravu je MEGC používán
- a pro MEGC plněné hmotnostně:
- vlastní hmotnost.
- 6.8.3.5.12 Rám bateriového vozidla nebo MEGC musí být v blízkosti místa plnění opatřen štítkem obsahujícím tyto údaje:
- nejvyšší plnicí tlak¹³ při 15 °C dovolený pro články určené pro stlačené plyny;
 - oficiální pojmenování pro přepravu plynu podle kapitoly 3.2 a kromě toho u plynů zařazených pod j.n. položku technický název¹⁶;
- a kromě toho v případě zkapačněných plynů:
- maximální dovolená užitečná plnění jednoho článku¹³.
- 6.8.3.5.13 Láhve, trubkové nádoby a tlakové sudy a láhve jako část svazku lahví musí být značeny podle 6.2.2.7. Tyto nádoby nemusí být jednotlivě označeny bezpečnostními značkami požadovanými v kapitole 5.2.
- Bateriová vozidla a MEGC musí být označeny velkými bezpečnostními značkami a oranžovými tabulkami podle kapitoly 5.3.

¹⁶ Místo oficiálního pojmenování pro přepravu nebo oficiálního pojmenování pro přepravu j.n. položky následované technickým názvem je dovoleno případně používání dále uvedených názvů:

- pro UN 1078 chladicí plyn, j.n.: směs F1, směs F2, směs F3;
- pro UN 1060 methylacetylen a propadien, směsí, stabilizované: směs P1, směs P2;
- pro UN 1965 uhlovodíky, plynné, směs, zkapačněná, j.n.: směs A, směs A01, směs A02, směs A0, směs A1, směs B1, směs B2, směs B, směs C. Obchodní názvy uvedené v 2.2.2.3, klasifikační kód 2F, UN 1965, Poznámka 1 směji být používány pouze jako doplňkové;
- pro UN 1010 butadien, stabilizovaný: 1,2-butadien, stabilizovaný, 1,3-butadien, stabilizovaný.

¹³ Uvést měrové jednotky za číselné hodnoty.

6.8.3.6 **Požadavky na bateriová vozidla a MEGC, která jsou zkonstruována, vyrobena a odzkoušena podle norem**

POZNÁMKA: Osoby nebo organizace uvedené v normách jako odpovědné podle ADR musí splňovat požadavky ADR.

Normy v níže uvedené tabulce musí být použity pro vydání typových schválení, jak je uvedeno ve sloupci (4), aby byly splněny požadavky kapitoly 6.8 dle sloupce (3). Požadavky kapitoly 6.8 dle sloupce (3) musí být ve všech případech nadřazeny. Sloupec (5) uvádí poslední datum, kdy existující schválení typu musí být odejmuto s ohledem na 1.8.7.2.4; pokud není datum uvedeno, typové schválení zůstává platné do vypršení jeho platnosti.

Od 1. ledna 2009 je použití norem závazné. Výjimky jsou řešeny v 6.8.3.7.

Jestliže je uvedena více nežli jedna norma pro použití stejných požadavků, může být použita pouze jedna z nich, ale v plném rozsahu, pokud není v tabulce níže specifikováno jinak.

Rozsah platnosti každé normy je uveden v klauzuli o rozsahu platnosti normy, pokud není uvedeno jinak v tabulce dole.

Odkaz	Název dokumentu	Příslušné pododdíly a odstavce	Použitelné pro schválení nového typu nebo obnovení	Poslední datum pro odejmutí existujícího typového schválení
(1)	(2)	(3)	(4)	(5)
EN 13807:2003	Přepřevitelné plynové nádoby – Bateriová vozidla – Konstrukce, výroba, identifikace a zkoušení	6.8.3.1.4 a 6.8.3.1.5, 6.8.3.2.18 až 6.8.3.2.26, 6.8.3.4.10 až 6.8.3.4.12 a 6.8.3.5.10 až 6.8.3.5.13	Až do odvolání	

6.8.3.7 **Požadavky na bateriová vozidla a MEGC, která nejsou konstruována, vyrobena a odzkoušena podle norem**

S ohledem na vědecký a technický pokrok nebo tam, kde není uvedena žádná norma v 6.8.3.6 nebo jde-li o specifické aspekty neuvedené v seznamu norem v 6.8.3.6, může příslušný orgán připustit používání technického předpisu zaručujícího stejnou úroveň bezpečnosti. Bateriová vozidla a MEGC však musí splňovat alespoň požadavky v 6.8.3.

V typovém schválení musí vydávající organizace specifikovat postup pro periodickou inspekci pokud normy odkazované v 6.2.2, 6.2.4 nebo 6.8.2.6 nejsou nebo nesmí být použity.

Příslušný orgán musí předat sekretariátu EHK OSN seznam technických předpisů, které připouští. Seznam by měl zahrnovat následující podrobnosti: název a datum předpisu, účel předpisu a informace, jak je možno je získat. Sekretariát musí tuto informaci zpřístupnit na svých webových stránkách.

Norma, která byla přijata pro odkaz do příštího vydání ADR může být schválena příslušným orgánem pro použití bez oznámení sekretariátu EHK OSN.

6.8.4

Zvláštní ustanovení

POZNÁMKA 1: Pro kapaliny mající bod vzplanutí nejvýše 60 °C a pro hořlavé plyny viz též 6.8.2.1.26, 6.8.2.1.27 a 6.8.2.2.9.

POZNÁMKA 2: Požadavky na cisterny, pro které je předepsán zkušební tlak nejméně 1 MPa (10 barů), nebo na cisterny určené pro přepravu hluboce zchlazených zkapalněných plynů, viz 6.8.5.

Pokud jsou uvedeny pod položkou ve sloupci (13) tabulky A kapitoly 3.2, platí následující zvláštní ustanovení:

(a) Konstrukce (TC)

- TC1** Požadavky uvedena v 6.8.5 se vztahují na materiály a konstrukci těchto nádrží.
- TC2** Nádrže a části jejich výstroje musí být vyrobeny z hliníku čistoty nejméně 99,5 % nebo vhodné oceli, která není náchylná vyvolat rozklad peroxidu vodíku. Jsou-li nádrže vyrobeny z hliníku čistoty nejméně 99,5 %, nemusí být tloušťka stěny větší než 15 mm, i když výpočet podle 6.8.2.1.17 stanoví vyšší hodnotu.
- TC3** Nádrže musí být vyrobeny z austenitické oceli.
- TC4** Nádrže musí být opatřeny smaltovaným nebo ekvivalentním vnitřním ochranným povlakem (vyložení), pokud materiál nádrže je narušován UN 3250 kyselinou chloroctovou.
- TC5** Nádrže musí být opatřeny olověným povlakem o tloušťce nejméně 5 mm nebo ekvivalentním povlakem.
- TC6** Pokud je nezbytné použít pro cisterny hliník, musí být takové cisterny vyrobeny z hliníku čistoty nejméně 99,5 %; tloušťka stěny nemusí být větší než 15 mm, i když výpočet podle 6.8.2.1.17 stanoví vyšší hodnotu.
- TC7** Účinná minimální tloušťka stěny nádrže nesmí být menší než 3 mm.

(b) Výstroj (TE)

- TE1** (vypuštěno)
- TE2** (vypuštěno)
- TE3** Cisterny musí navíc splňovat následující požadavky. Vyhřívací zařízení nesmí pronikat dovnitř nádrže, ale musí být vně nádrže. Avšak potrubí sloužící pro vyčerpávání fosforu může být opatřeno vyhřívacím pláštěm. Zařízení vyhřívací plášť musí být regulováno tak, aby teplota fosforu nepřekročila plnicí teplotu nádrže. Ostatní potrubí musí procházet nádrží v její horní části; otvory musí být umístěny nad nejvyšší dovolenou hladinou fosforu a být schopné úplného uzavření pod uzamykatelnými kryty. Cisterna musí být vybavena měřicím systémem pro ověření hladiny fosforu a, je-li používána voda jako ochranná látka, pevnou měrnou značkou ukazující nejvyšší dovolenou hladinu vody.
- TE4** Nádrže musí být opatřeny tepelnou izolací vyrobenou z materiálů, které nejsou snadno hořlavé.
- TE5** Pokud jsou nádrže opatřeny tepelnou izolací, taková izolace musí být vyrobena z materiálů, které nejsou snadno hořlavé.

- TE6** Cisterny mohou být vybaveny zařízením takové konstrukce, která zabrání jeho ucpání přepravovanou látkou a která zabrání úniku a nadměrnému přetlaku nebo podtlaku uvnitř nádrže.
- TE7** Vyprazdňovací systém nádrže musí být vybaven dvěma vzájemně nezávislými uzavíracími ventily namontovanými v sérii, první musí mít formu rychleuzavíracího vnitřního ventilu schváleného typu a druhý vnějšího uzavíracího ventilu, jeden na každém konci výpustného potrubí. Slepá příruba nebo jiné zařízení stejného stupně bezpečnosti musí být též upevněna na výstupu z každého vnějšího uzavíracího ventilu. Vnitřní uzavírací ventil musí být takový, aby při utržení potrubí uzavírací ventil zůstal v celku s nádrží a v uzavřené poloze.
- TE8** Přípojky vnějšího potrubí cisteren musí být vyrobeny z materiálů nenáchylných způsobit rozklad peroxidu vodíku.
- TE9** Cisterny musí být ve svých horních částech vybaveny uzavíracím zařízením zabraňujícím vytvoření jakéhokoli nadměrného tlaku uvnitř nádrže způsobenému rozkladem přepravovaných látek, úniku kapaliny a vniknutí cizích látek do nádrže.
- TE10** Uzavírací zařízení cisteren musí být konstruována tak, aby nemohlo dojít k jejich ucpání ztuhlou látkou během přepravy. Pokud jsou cisterny oplášťeny tepelně izolačním materiálem, tento materiál musí být anorganický a zcela prostý hořlavých hmot.
- TE11** Nádrže a jejich provozní výstroj musí být konstruovány tak, aby se zabránilo vniknutí cizích látek, úniku kapaliny nebo vytvoření jakéhokoli nadměrného tlaku uvnitř nádrže způsobenému rozkladem přepravovaných látek. Pojistný ventil zabraňující vniknutí cizích látek musí též splňovat toto ustanovení.
- TE12** Cisterny musí být vybaveny tepelnou izolací splňující požadavky uvedené v 6.8.3.2.14. Pokud je SADT organického peroxidu v cisterně 55 °C nebo nižší, nebo je-li cisterna vyrobena z hliníku, nádrž musí být zcela tepelně izolována. Sluneční štít a jakákoliv část cisterny jím nezakrytá nebo vnější kompletní tepelně izolační opláštění musí být nabarveny nabílo nebo povrchově upraveny lesklým kovem. Barva musí být vyčištěna před každou přepravou a obnovena v případě zežloutnutí nebo poškození. Tepelná izolace nesmí obsahovat žádné hořlavé materiály. Cisterny musí být vybaveny zařízením pro snímání teploty.
- Cisterny musí být vybaveny pojistnými ventily a nouzovými zařízeními na vyrovnávání tlaku. Mohou být též použity dekompresní ventily. Nouzová zařízení na vyrovnávání tlaku musí fungovat při tlacích stanovených jak podle vlastností organického peroxidu, tak podle konstrukčních charakteristik cisterny. V tělese nádrže nejsou povoleny tavné prvky.
- Cisterny musejí být vybaveny pružinovými pojistnými ventily, aby bylo zabráněno výraznému nárůstu tlaku uvnitř nádrže produkty rozkladu a parami, které se uvolňují při teplotě 50 °C. Objem a tlak uvádějící pojistný(é) ventil(y) v činnost za účelem vypouštění musí být stanoveny na základě výsledků zkoušek uvedených ve zvláštním ustanovení TA2. Tlak uvádějící ventil(y) v činnost však nesmí být v žádném případě takový, aby mohla kapalina z ventilu(ů) unikát, pokud se nádrž převrátí.
- Zařízení na vyrovnávání tlaku smějí být pružinového nebo průtržného typu konstruované tak, aby odvětraly veškeré produkty rozkladu a páry, které se vyvinou během doby nejméně jedné hodiny hoření vypočtené podle následujícího vzorce:

$$q = 70961 \times F \times A^{0.82}$$

kde:

q = absorpce tepla [W]

A = zvlhčená plocha [m²]

F = izolační součinitel [-]

$F = 1$ pro neizolované cisterny, nebo

$$F = \frac{U(923 - T_{PO})}{47032} \text{ pro izolované cisterny}$$

kde:

K = tepelná vodivost izolační vrstvy [W·m⁻¹·K⁻¹]

L = tloušťka izolační vrstvy [m]

$U = K/L$ = koeficient prostupu tepla izolací [W·m⁻²·K⁻¹]

T_{PO} = teplota peroxidu v okamžiku dekomprese [K]

Tlak uvádějící v činnost zařízení k jeho vyrovnávání musí být vyšší než ten, který je uveden výše, a stanoven na základě výsledků zkoušek uvedených ve zvláštním ustanovení TA2. Zařízení na vyrovnávání tlaku musí být dimenzováno tak, aby nejvyšší tlak v nádrži v žádném případě nepřekročil zkušební tlak nádrže.

POZNÁMKA: Příklad postupu pro stanovení rozměru zařízení pro vyrovnávání tlaku je uveden v Dodatku 5 Příručky zkoušek a kritérií.

Pro cisterny s tepelnou izolací musí být kapacita a umístění zařízení na vyrovnání tlaku určeny za předpokladu ztráty izolace 1 % povrchu cisterny.

Dekompresní ventily a pojistné ventily pružinového typu cisteren musejí být opatřeny ochranou proti prošlehnutí plamene, kromě případů, kdy přepravované látky a produkty jejich rozkladu nejsou hořlavé. Musí se přihlídnout ke snížení vyrovnávací kapacity způsobenému ochranou proti prošlehnutí plamene.

TE13	Cisterny musí být tepelně izolovány a vybaveny vytápěcím zařízením vně cisterny.
TE14	Cisterny musí být vybaveny tepelnou izolací. Tepelná izolace v přímém kontaktu s nádrží musí mít zápalnou teplotu nejméně o 50 °C vyšší než je nejvyšší teplota, pro niž byla cisterna konstruována .
TE15	(Vypuštěno)
TE16	(Vyhrazeno)
TE17	(Vyhrazeno)
TE18	Cisterny určené pro přepravu látek plněných při teplotě vyšší než 190 °C musí být vybaveny deflektorem umístěným v pravém úhlu k vnějším plnicím otvorům tak, aby se zabránilo náhlému místnímu zvýšení teploty během plnění.

TE19	<p>Části výstroje umístěné v horní části cisterny musí být:</p> <ul style="list-style-type: none"> – bud' vloženy do zapuštěné dutiny; nebo – opatřeny vnitřním pojistným ventilem; nebo – nebo chráněny krytem nebo příčnými a/nebo podélnými konstrukčními prvky nebo jinými zařízeními poskytujícími stejné záruky, takového průřezu, aby v případě převrácení nedošlo k poškození části výstroje. <p>Části výstroje umístěné ve spodní části cisterny: Potrubí a všechna boční uzavírací zařízení a všechny vyprazdňovací části výstroje musí být bud' umístěny nejméně o 200 mm dovnitř vzhledem k vnějšímu obrysu nádrže, nebo musí být chráněny lištou s modulem průřezu nejméně 20 cm³ příčně ke směru jízdy; jejich světlá výška musí být nejméně 300 mm při plné cisterně. Části výstroje umístěné na zadní straně cisterny musí být chráněny nárazníkem předepsaným v oddílu 9.7.6. Jejich výška nad zemí musí být taková, aby byly vhodně chráněny nárazníkem.</p>
TE20	<p>Bez ohledu na jiné kódy cisteren, které jsou povoleny v hierarchii cisteren racionálního přiblížení uvedeného v 4.3.4.1.2, cisterny musí být vybaveny pojistným ventilem.</p>
TE21	<p>Uzávěry musí být chráněny uzamykatelnými kryty.</p>
TE22	<p>(Vyhrazeno)</p>
TE23	<p>Cisterny musí být vybaveny zařízením takové konstrukce, která zabrání jeho ucpání přepravovanou látkou a která zabrání úniku a nadměrnému přetlaku nebo podtlaku uvnitř nádrže.</p>
TE24	<p>Jestliže jsou cisterny určené pro přepravu a zpracování kapalných dehtů vybaveny rozstřikovačem na konci vyprazdňovacího potrubí, může být uzavírací zařízení požadované v 6.8.2.2 nahrazeno uzavíracím ventilem umístěným na vyprazdňovacím potrubí před rozstřikovače.</p>
TE25	<p>(vyhrazeno)</p>

(c) **Schvalování typu (TA)**

- TA1 Cisterny nesmějí být schváleny pro přepravu organických látek.
- TA2 Tato látka smí být přepravována ve snímatelných nebo nesnímatelných cisternách nebo cisternových kontejnerech podle podmínek stanovených příslušným orgánem země původu, pokud se na základě dále uvedených zkoušek příslušný orgán přesvědčí o tom, že taková přeprava může být provedena bezpečně. Jestliže země původu není smluvní stranou ADR, tyto podmínky musejí být uznány příslušným orgánem první země ADR dotčené touto přepravou.
- Pro schválení typu musejí být provedeny zkoušky za účelem:
- ověření snášenlivosti všech materiálů, které jsou během přepravy normálně ve styku s přepravovanými látkami;
 - opatření údajů usnadňujících konstrukci nouzových pro vyrovnávání tlaku a pojistných ventilů s ohledem na charakteristické konstrukční prvky cisterny; a
 - stanovení zvláštních požadavků nezbytných pro bezpečnou přepravu látek.
- Výsledky zkoušek musejí být uvedeny v protokolu pro schválení typu.
- TA3 Tato látka může být přepravována pouze v cisternách s kódem cisterny LGAV nebo SGAV; hierarchie v 4.3.4.1.2 se na tento případ nevztahuje.
- TA4 Shodné stanovené postupy oddílu 1.8.7 musí být použity příslušným orgánem, jeho zástupcem nebo inspekční organizací odpovídající 1.8.6.2, 1.8.6.4, 1.8.6.5 a 1.8.6.8 a pověřeným podle EN ISO/IEC 17020:2012 (mimo oddíl 8.1.3).
- TA5 Tato látka může být přepravována pouze v cisternách s kódem cisterny S2.65AN(+); hierarchie v 4.3.4.1.2 se na tento případ nevztahuje.

(d) **Zkoušky (TT)**

- TT1 Cisterny z čistého hliníku je třeba podrobit prvním a periodickým hydraulickým tlakovým zkouškám tlakem pouze 250 kPa (2,5 baru) (přetlak).
- TT2 Podmínka povlaku (vyložení) nádrží musí být kontrolována každý rok znalcem schváleným příslušným orgánem, který musí provést inspekci vnitřku nádrže.
- TT3 Odlišně od požadavků uvedených v 6.8.2.4.2 periodické inspekce musí být provedeny nejméně každých osm roků a musí zahrnovat kontrolu tloušťky stěny použitím vhodných přístrojů. U takových cisteren zkouška těsnosti a kontrola, na kterou se vztahuje ustanovení uvedené v 6.8.2.4.3, musí být provedeny nejméně každé čtyři roky.
- TT4 (Vyhrazeno)
- TT5 Hydraulické tlakové zkoušky musí být provedeny nejméně každé
- | | |
|--------|---------|
| 3 roky | 2½ roku |
|--------|---------|
- TT6 Periodické zkoušky, včetně hydraulické tlakové zkoušky musí být provedeny nejméně každé 3 roky.
- TT7 Bez ohledu na požadavky uvedené v 6.8.2.4.2 periodická vnitřní inspekce může být nahrazena programem schváleným příslušným orgánem.

- TT8 Cisterny, na nichž je uvedeno oficiálního pojmenování pro přepravu UN čísla 1005 amoniak (čpavek) bezvodý podle 6.8.3.5.1 až 6.8.3.5.3 a vyrobené z jemnozrnné oceli s mezí průtažnosti vyšší než 460 N/mm² podle materiálové normy, musí být při každé periodické zkoušce podle 6.8.2.4.2 podrobeny magnetickým práškovým inspekčním za účelem zjištění povrchových trhlin.
- Dolní část každé nádrže, nejméně ve 20 % délky každého obvodového a podélného svaru, musí být zkontrolovány společně se všemi svary nástavců a všemi opravovanými a broušenými místy.
- Pokud je označení látky na cisterně nebo štítku cisterny odstraněno, musí být provedena magnetická prášková inspekce a tato činnost zaznamenána ve zkušebním protokolu připojeným ke složce dokladů cisterny.
- Takové práškové magnetické inspekce musí být prováděny kompetentní osobou kvalifikovanou pro tuto metodu podle EN ISO 9712:2012 (Nedestruktivní zkoušení – Kvalifikace a osvědčení personálu NDT – Všeobecné zásady).
- TT9 Pro inspekce a zkoušky (včetně dohledu výrobce) postupy oddílu 1.8.7 musí být použity příslušným orgánem, jeho zástupcem nebo inspekční organizací odpovídajícím 1.8.6.2, 1.8.6.4, 1.8.6.5 a 1.8.6.8 a pověřeným podle EN ISO/IEC 17020:2012 (mimo oddíl 8.1.3) typ A.
- TT10 Periodické inspekce podle 6.8.2.4.2 se musí provádět
- | | |
|------------------------|--------------------------------|
| nejméně každé tři roky | nejméně každého dva a půl roku |
|------------------------|--------------------------------|
- TT11 Pro nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny určené výlučně pro přepravu LPG, s nádržemi a provozní výstrojí z uhlíkové oceli, smí být hydraulická tlaková zkouška v době periodické inspekce a na žádost provozovatele, nahrazena nedestruktivní zkouškou (NDT) technickými postupy uvedenými níže. Tyto technické postupy mohou být použity samostatně nebo v kombinaci, jak to považuje za vhodné příslušný orgán, jeho zástupce nebo inspekční organizace (viz zvláštní ustanovení TT9):
- EN ISO 17640:2010 - Nedestruktivní zkoušení svarů - Zkoušení ultrazvukem – Technické postupy, úrovně zkoušení a hodnocení,
 - EN ISO 17638:2009 – Nedestruktivní zkoušení svarů - Zkoušení magnetoskopickou metodou s parametry přípustnosti podle normy EN ISO 23278:2009 - Zkoušení svarů magnetoskopickou metodou. Úrovně přípustnosti,

- EN 1711:2000 - Nedestruktivní zkoušení svarů - Zkouška svarů vířivými proudy analýzou v komplexní rovině,
- EN 14127:2011 – Nedestruktivní zkoušení - Měření tloušťky ultrazvukem.

Osoby účastnící na NDT musí být kvalifikované, certifikované a musí mít náležitě teoretické a praktické znalosti o nedestruktivních zkouškách, které provádějí, specifikují, dohlížejí, monitorují nebo vyhodnocují podle:

- EN ISO 9712:2012 - Nedestruktivní zkoušení - Kvalifikace a certifikace pracovníků NDT.

Po přímém působení tepla, jako je svařování nebo řezání dílů cisterny, které jsou pod tlakem, musí být provedena hydraulická zkouška kromě předepsaných NDT.

NDT musí být provedeny v zónách nádrže a výstroje uvedených v tabulce níže:

Zóna nádrže a výstroje	NDT
Podélné tupé svary nádrže	100% NDT, za použití jedné nebo více následujících metod: ultrazvukové, magnetoskopické nebo zkoušení vířivými proudy
Obvodové tupé svary nádrže	
(Vnitřní) svary úchytů, průlezů, potrubí a otvorů přímo na nádrži	
Silně namáhané zóny zdvojených plátů (nad koncem sedlového rohu, plus 400 mm dolů po obou stranách)	
Svary potrubí a další výstroje	Ultrazvukové měření tloušťky, z vnitřní strany, s mřížkou 150 mm (maximum)
Zóny nádrže, které nemohou být vizuálně kontrolovány zvnějšku	

Bez ohledu na originální konstrukční a výrobní normu nebo technický předpis použitý pro cisternu, musí být stupně přípustnosti poškození v souladu s požadavky příslušných částí normy EN 14025: 2013 (Cisterny pro přepravu nebezpečných věcí – Kovové tlakové cisterny - Konstrukce a výroba), EN 12493: 2013 (LPG zařízení a příslušenství - Svařované ocelové

cisterny na zkapalněný ropný plyn (LPG) – Silniční cisterny – Konstrukce a výroba), EN ISO 23278: 2009 (Nedestruktivní zkoušení svarů - Zkoušení svarů magnetoskopickou metodou - Úrovně přípustnosti), nebo norma přípustnosti, na níž se odkazuje v příslušné normě NDT.

Pokud je zjištěna nepřipustná závada v cisterně NDT metodou, musí být opravena a znovu vyzkoušena. Není dovoleno provádět hydraulickou zkoušku cisterny, bez provedení příslušných oprav.

Výsledky NDT musí být zaznamenány a být uchovávány po celou dobu životnosti cisterny.

(e) **Značení (TM)**

POZNÁMKA: *Nápisy a bezpečnostní značky musí být v úředním jazyce země registrace a, není-li tímto jazykem angličtina, francouzština ani němčina, rovněž v angličtině francouzštině nebo němčině, pokud případné dohody uzavřené mezi státy zúčastněnými na přepravě nestanoví jinak.*

- | | |
|-----|---|
| TM1 | Cisterny musí být kromě údajů předepsaných v 6.8.2.5.2 opatřeny nápisem: „Neotvírat během přepravy. Náchylné k samozapálení“ (viz též Poznámka výše). |
| TM2 | Cisterny musí být kromě údajů předepsaných v 6.8.2.5.2 opatřeny nápisem: „Neotvírat během přepravy. Vyvíjí hořlavé plyny při styku s vodou“ (viz též Poznámka výše). |
| TM3 | Cisterny musí být též opatřeny na štítku předepsaném v 6.8.2.5.1 oficiálním pojmenováním pro přepravu a maximální přípustnou hmotností nákladu v kg pro tuto látku. |
| TM4 | U cisteren musí být uvedeny následující doplňkové údaje vyražením nebo jiným podobným způsobem na štítku předepsaném v 6.8.2.5.2 nebo přímo na nádrži samé, pokud stěny jsou tak zesíleny, že pevnost cisterny není zmenšena: chemický název se schválenou koncentrací příslušné látky. |
| TM5 | Cisterny musí být opatřeny, kromě údajů uvedených v 6.8.2.5.1, datem (měsíc, rok) poslední inspekce vnitřku cisterny. |
| TM6 | (Vyhrazeno) |
| TM7 | Stylizovaný trojlístek uvedený v 5.2.1.7.6 musí být vyznačen vyražením nebo jiným rovnocenným způsobem na štítku předepsaném v 6.8.2.5.1. Tento trojlístek může být vyryt přímo na stěně nádoby samé, jestliže stěny jsou tak zesíleny, že pevnost cisterny není zmenšena. |

6.8.5 **Požadavky na materiály a konstrukci svařovaných nesnímatelných cisteren**, svařovaných snímatelných cisteren a svařovaných nádrží cisternových kontejnerů, pro které je požadován zkušební tlak nejméně 1 MPa (10 barů) a svařovaných nesnímatelných cisteren, svařovaných snímatelných cisteren a svařovaných nádrží cisternových kontejnerů určených pro přepravu hluboce zchlazených zkapalněných plynů třídy 2

6.8.5.1 Materiály a nádrže

- 6.8.5.1.1 (a) Nádrže určené pro přepravu:
- stlačených, zkapalněných plynů nebo rozpuštěných plynů třídy 2;
 - UN 1380, 2845, 2870, 3194, 3391 až 3394 třídy 4.2; a
 - UN 1052 fluorovodík, bezvodý a UN 1790 kyselina fluorovodíková s více než 85 % fluorovodíku třídy 8
- musí být vyrobeny z oceli.
- (b) Nádrže vyrobené z jemnozrné oceli určené pro přepravu:
- žíravých plynů třídy 2 a UN 2073 čpavek, roztok; a
 - UN 1052 fluorovodík, bezvodý a UN 1790 kyselina fluorovodíková s více než 85 % fluorovodíku třídy 8
- musí být podrobeny tepelnému zpracování k odstranění tepelných napětí.
- (c) Nádrže určené pro přepravu hluboko zchlazených zkapalněných plynů třídy 2 musí být vyrobeny z oceli, hliníku, slitiny hliníku, mědi nebo slitiny mědi (např. mosazi). Nádrže vyrobené z mědi nebo slitiny mědi jsou však dovoleny jen pro plyny, které neobsahují acetylen; ethylen, smí však obsahovat nanejvýše 0,005 % acetylenu.
- (d) Je dovoleno použít pouze materiálů vhodných pro nejnižší a nejvyšší provozní teplotu nádrží a jejich příslušenství.

6.8.5.1.2 Pro výrobu nádrží jsou dovoleny tyto materiály:

- (a) oceli, které nejsou náchylné ke křehkému lomu při nejnižší provozní teplotě (viz 6.8.5.2.1):
- měkké oceli (kromě pro hluboce zkapalněné plyny třídy 2);
 - jemnozrné nelegované oceli do teploty - 60 °C;
 - legované niklové oceli (s obsahem niklu 0,5 až 9 %) do teploty - 196 °C v závislosti na obsahu niklu;
 - austenitické chromniklové oceli do teploty - 270 °C;
- (b) hliník čistoty nejméně 99,5 % nebo hliníková slitina (viz 6.8.5.2.2);
- (c) dezoxidovaná měď čistoty nejméně 99,9 % nebo slitiny mědi s obsahem mědi nad 56 % (viz 6.8.5.2.3).

6.8.5.1.3 (a) Nádrže vyrobené z oceli, hliníku nebo slitin hliníku musí být buď bezešvé, nebo svařované.

(b) Nádrže vyrobené z austenitické oceli, z mědi nebo ze slitiny mědi smějí být natvrdo spájené.

6.8.5.1.4 Příslušenství může být k nádržím přišroubováno, nebo připevněno takto:

- (a) nádrže vyrobené z oceli, hliníku nebo hliníkové slitiny: svařením;
- (b) nádrže z austenitické oceli, mědi nebo slitiny mědi: svařením nebo spájením natvrdo.

- 6.8.5.1.5 Konstrukce nádrží a jejich upevnění na vozidlo, na podvozek nebo do kontejnerového rámu musí být takové, aby se bezpečně zamezilo snížení teploty nosných konstrukčních částí, které by mohlo způsobit jejich zkřehnutí. Upevňovací prvky nádrží musí být samy konstruovány tak, aby si zachovaly potřebné mechanické vlastnosti, i když nádrž dosáhne své nejnižší provozní teploty.

6.8.5.2 Zkušební požadavky

6.8.5.2.1 Ocelové nádrže

Materiály použité k výrobě nádrží a svarové housenky musí při své nejnižší provozní teplotě, avšak nejméně při - 20 °C, splňovat z hlediska vrubové houževnatosti nejméně dále uvedené požadavky:

- Zkoušky se provádějí na zkušebních vzorcích s vrubem tvaru V.
- Nejnižší vrubová houževnatost (viz 6.8.5.3.1 až 6.8.5.3.3) zkušebních vzorků, jejichž podélná osa je kolmá ke směru válcování a které mají vrub tvaru V (v souladu s ISO R 148) kolmý k povrchu plechu, musí mít minimální hodnotu 34 J/cm² pro měkkou ocel (přitom zkoušky mohou být provedeny na základě existujících norem ISO se zkušebními vzorky, jejichž podélná osa je ve směru válcování); jemnozrnnou ocel; feritickou legovanou ocel (Ni < 5 %); feritickou legovanou ocel (5 % ≤ Ni ≤ 9 %) nebo austenitickou Cr-Ni ocel;
- U austenitických ocelí se podrobí zkoušce vrubové houževnatosti pouze svarová housenka.
- Pro provozní teploty nižší než -196 °C se zkouška vrubové houževnatosti neprovádí při nejnižší provozní teplotě, nýbrž při teplotě - 196 °C.

6.8.5.2.2 Nádrže z hliníku nebo hliníkové slitiny

Spoje nádrží musí vyhovět podmínkám stanoveným příslušným orgánem.

6.8.5.2.3 Nádrže z mědi nebo slitiny mědi

Není nutné provádět zkoušky ke zjištění, zda je vrubová houževnatost dostatečná.

6.8.5.3 Zkoušky vrubové houževnatosti

- 6.8.5.3.1 U plechů tloušťky menší než 10 mm, avšak alespoň 5 mm, se použije zkušebních vzorků o příčném průřezu 10 mm x e mm, přičemž "e" je tloušťka plechu. Je-li to potřebné, je dovoleno předválcování na 7,5 mm nebo 5 mm. Nejmenší hodnota 34 J/cm² musí být ve všech případech dodržena.

POZNÁMKA: Zkouška vrubové houževnatosti se neprovádí u plechů tloušťky menší než 5 mm ani u jejich spojů.

- 6.8.5.3.2 (a) U plechů se vrubová houževnatost zjišťuje na třech zkušebních vzorcích. Zkušební vzorky se odebírají ve směru příčném ke směru válcování; jedná-li se však o měkkou ocel, mohou se odebírat ve směru válcování.

- (b) Pro zkoušení svarových spojů se zkušební vzorky odebírají takto:

když $e \leq 10$ mm

tři zkušební vzorky s vrubem ve středu svaru;

tři zkušební vzorky s vrubem ve středu zóny tepelně ovlivněné svarem (vrub tvaru V musí procházet okrajem tavné zóny ve středu zkušební vzorku);

když $10\text{ mm} < e \leq 20\text{ mm}$

tři zkušební vzorky s vrubem ve středu svaru;

tři zkušební vzorky s vrubem ve středu zóny tepelně ovlivněné svarem (vrub tvaru V musí procházet okrajem tavné zóny ve středu zkušební vzorku);

když $e > 20$ mm

dvě sady po třech zkušebních vzorcích, jedna sada na horní straně, jedna sada na dolní straně v každém z dále uvedených míst (u zkušebních vzorků odebraných v zóně tepelně ovlivněné svarem musí vrub tvaru V procházet okrajem tavné zóny ve středu zkušebního vzorku).

- 6.8.5.3.3 (a) U plechů musí průměr ze tří zkoušek vyhovovat minimální hodnotě 34 J/cm^2 uvedené v 6.8.5.2.1; nejvýše jedna z hodnot smí být nižší než udaná minimální hodnota, avšak ne nižší než 24 J/cm^2 .
- (b) U svarů průměrná hodnota získaná ze 3 zkušebních vzorků odebraných ze středu svaru nesmí být nižší než minimální hodnota 34 J/cm^2 , nejvýše jedna z hodnot smí být nižší než udané minimum, avšak ne nižší než 24 J/cm^2 .
- (c) Pro zónu tepelně ovlivněnou svarem (příčměž vrub tvaru V musí procházet okrajem tavné zóny ve středu zkušebního vzorku) smí být hodnota získaná nejvýše u jednoho ze tří zkušebních vzorků nižší než minimální hodnota 34 J/cm^2 , avšak ne nižší než 24 J/cm^2 .
- 6.8.5.3.4 Nejsou-li požadavky předepsané v 6.8.5.3.3 splněny, může se provést jedna nová zkouška jestliže:
- (a) průměrná hodnota vycházející ze tří prvních zkoušek je nižší než minimální hodnota 34 J/cm^2 ; nebo
- (b) více než jedna z jednotlivých hodnot je nižší než minimální hodnota 34 J/cm^2 , avšak ne nižší než 24 J/cm^2 .

6.8.5.3.5 Při opakování zkoušky vrubové houževnatosti u plechů nebo svarů nesmí být žádná z jednotlivých hodnot nižší než 34 J/cm^2 . Průměrná hodnota ze všech výsledků původní zkoušky a opakované zkoušky musí být rovná minimu 34 J/cm^2 nebo vyšší.

Při opakování zkoušky vrubové houževnatosti zóny tepelné ovlivněné swarem nesmí být žádná z jednotlivých hodnot nižší než 34 J/cm^2 .

6.8.5.4 Odvolávka na normy

Požadavky pododdílů 6.8.5.2 a 6.8.5.3 se považují za splněné, pokud byly uplatněny dále uvedené příslušné normy:

EN 1252-1:1998 Kryogenní nádoby - Materiály - část 1: Pevnostní požadavky pro teplotu pod -80°C

EN 1252-2:2001 Kryogenní nádoby - Materiály - část 1: Pevnostní požadavky pro teplotu mezi -80°C a -20°C .

KAPITOLA 6.9

POŽADAVKY NA KONSTRUKCI, VÝROBU, VÝSTROJ, SCHVALOVÁNÍ TYPU, ZKOUŠENÍ A ZNAČENÍ NESNÍMATELNÝCH CISTEREN (CISTERNOVÝCH VOZIDEL), SNÍMATELNÝCH CISTEREN, CISTERNOVÝCH KONTEJNERŮ A VÝMĚNNÝCH CISTERNOVÝCH NÁSTAVEB Z VYZTUŽENÝCH PLASTU (FRP)

POZNÁMKA: Pro přemístitelné cisterny a UN MEGC viz kapitola 6.7; pro nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby s nádržemi vyrobenými z kovových materiálů, bateriová vozidla a vícečlánkové kontejnery na plyn (MEGC) viz kapitola 6.8; pro cisterny pro podtlakové vyčerpávání odpadů viz kapitola 6.10.

6.9.1 Všeobecně

- 6.9.1.1 Cisterny FRP musí být konstruovány, vyrobeny a zkoušeny podle programu zajištění kvality uznaného příslušným orgánem; zejména laminovací práce a svařování termoplastových vyložení musí být prováděny odborně kvalifikovanými pracovníky podle postupů uznaných příslušným orgánem.
- 6.9.1.2 Na konstrukci a zkoušení cisteren FRP se vztahují též ustanovení 6.8.2.1.1, 6.8.2.1.7, 6.8.2.1.13, 6.8.2.1.14 (a) a (b), 6.8.2.1.25, 6.8.2.1.27, 6.8.2.1.28 a 6.8.2.2.3.
- 6.9.1.3 Pro cisterny FRP nesmějí být použity žádné ohřívací prvky
- 6.9.1.4 Na stabilitu cisternových vozidel se vztahují požadavky 9.7.5.1.

6.9.2 Konstrukce

- 6.9.2.1 Nádrže musí být vyrobeny z vhodných materiálů, které jsou snášetlivé s přepravovanými látkami při provozní teplotě mezi -40 °C a +50 °C, pokud teplotní rozsah není stanoven pro specifické klimatické podmínky příslušným orgánem státu, ve které je přeprava prováděna.
- 6.9.2.2 Stěny nádrží musí tvořit tři dále uvedené elementy:
- vnitřní vrstva
 - konstrukční vrstva,
 - vnější vrstva.
- 6.9.2.2.1 Vnitřní potah je zóna vnitřní stěny nádrže tvořící prvotní překážku poskytující dlouhodobou chemickou odolnost proti přepravovaným látkám a zabraňující jakékoli nebezpečné reakci s obsahem cisterny nebo tvoření nebezpečných sloučenin a jakémukoli podstatnému zeslabení konstrukční vrstvy v důsledku pronikání látek skrze vnitřní vyložení.
- Vnitřní potah může být potah z vyztužených plastů nebo potah z termoplastů.
- 6.9.2.2.2 Potahy z vyztužených plastů musí tvořit:
- (a) povrchová vrstva („gelový potah“): povrchová vrstva s přiměřeným obsahem pryskyřice vyztužené tkaninou snášetlivou s pryskyřicí a plnidla. Tato vrstva smí mít hmotnost obsahu vláken nejvýše 30 % a tloušťku mezi 0,25 a 0,60 mm;
 - (b) vyztužující vrstva(y): vrstva nebo několik vrstev s minimální tloušťkou 2 mm obsahující nejméně 900 g/m² skelné výztuže nebo řezaných vláken s nejmenší hmotností obsahu skla 30 %, pokud dostatečná bezpečnost není prokázána pro nižší obsah skla.

- 6.9.2.2.3 Termoplastické vyložení musí tvořit termoplastický tenký materiál, jak je uvedeno v 6.9.2.3.4, svařený do požadovaného tvaru, který je spojen s konstrukčními vrstvami. Trvalého spojení mezi vyloženími a konstrukční vrstvou musí být dosaženo použitím vhodného lepidla.

POZNÁMKA: Pro přepravu hořlavých kapalin se pro vnitřní vrstvu mohou požadovat dodatečná opatření podle 6.9.2.14 pro ochranu proti akumulaci elektrostatických nábojů.

- 6.9.2.2.4 Konstrukční vrstva nádrže je zóna zvláště zkonstruovaná podle 6.9.2.4 až 6.9.2.6, aby odolala mechanickým namáháním. Tuto část tvoří normálně několik vrstev vyztužených vlákny orientovanými ve stanovených směrech.

- 6.9.2.2.5 Vnější vrstva je část nádrže, která je přímo vystavena klimatickým vlivům musí být tvořena vrstvou bohatou na pryskyřici o tloušťce nejméně 0,2 mm. Pro tloušťky větší než 0,5 mm musí být použit výztuž. Tato vrstva musí obsahovat méně než 30 % hmotnosti skla a musí být schopna odolát vnějším podmínkám, zejména náhodnému styku s přepravovanou látkou. Pryskyřice musí obsahovat plnidla nebo přísady zajišťující ochranu proti zhoršení konstrukční vrstvy nádrže ultrafialovým zářením.

6.9.2.3 **Suroviny**

- 6.9.2.3.1 Všechny materiály použité pro výrobu cisteren FRP musí být známého původu a známých vlastností.

6.9.2.3.2 **Pryskyřice**

Příprava směsi pryskyřice musí být prováděna přesně podle doporučení dodavatele. To se týká především tužidel, iniciátorů a urychlovačů. Tyto nenasycené polyesterové pryskyřice mohou být:

- nenasycené polyesterové pryskyřice;
- vinylesterové pryskyřice;
- epoxidové pryskyřice;
- fenolové pryskyřice.

Teplota tepelné deformace (HTD) pryskyřice stanovená podle EN ISO 75-1:2013 musí být nejméně o 20 °C vyšší než nejvyšší provozní teplota cisterny, avšak v žádném případě nesmí být nižší než 70 °C.

6.9.2.3.3 **Vyztužovací vlákna**

Vyztužovací materiál konstrukčních vrstev musí být vhodné kategorie skelných vláken, jako skelná vlákna typu E nebo ERC podle ISO 2078:1993. Pro vnitřní povrchový potah mohou být použita skelná vlákna typu C podle ISO 2078:1993. Termoplastická vyztužení smějí být použita pro vnitřní potah pouze tehdy, pokud je prokázána jejich snášenlivost s jejich předem určeným obsahem.

6.9.2.3.4 **Materiál pro termoplastické vyložení**

Termoplasty, takové jako neměkčený polyvinylchlorid (PVC-U), polypropylen (PP), polyvinylidenfluorid (PVDF), polytetrafluorethylen (PTFE) atd., smějí být použity pro potahové materiály.

6.9.2.3.5 **Přísady**

Přísady nezbytné pro zušlechťování pryskyřice, takové jako katalyzátory, urychlovače, tužidla a tixotropní látky, jakož i materiály používané pro zlepšení parametrů cisterny, takové jako plnidla, barvy, pigmenty atd. nesmějí způsobit zeslabení materiálu, při uvážení životnosti a očekávané provozní teploty dané konstrukce.

6.9.2.4 Nádrže, jejich výbava a jejich provozní a konstrukční výstroj musí být konstruovány tak, aby odolaly beze ztráty obsahu (jiné než množství plynu unikajícího jakýmkoli odplyňovacím otvorem) během životnosti konstrukce:

- statickým a dynamickým zatížením při normálních podmínkách přepravy;
- předepsaným minimálním zatížením uvedeným v 6.9.2.5 až 6.9.2.10.

6.9.2.5 Při tlacích uvedených v 6.8.2.1.14 (a) a (b) a při statických gravitačních silách tíže obsahu s maximální hustotou stanovenou pro konstrukci a při nejvyšším stupni plnění konstrukční napětí σ v podélném a obvodovém směru jakékoli vrstvy nádrže nesmí překročit dále uvedené hodnoty:

$$\sigma \leq \frac{R_m}{K}$$

kde:

R_m = hodnota pevnosti v tahu daná střední hodnotou výsledků zkoušek po odečtení dvojnásobku standardní odchylky výsledků zkoušek. Zkoušky musí být provedeny v souladu s požadavky EN ISO 527-4:1997 a EN ISO 527-5:2009 na nejméně šesti reprezentativních vzorcích konstrukčního typu a výrobních metod;

$$K = S \times K_0 \times K_1 \times K_2 \times K_3$$

kde:

K musí mít minimální hodnotu 4 a

S = koeficient bezpečnosti. Pro všeobecnou konstrukci, jestliže cisterny jsou uvedeny ve sloupci (12) tabulky A kapitoly 3.2 kódem cisterny zahrnujícím písmeno „G“ v jeho druhé části (viz 4.3.4.1.1), hodnota S musí být rovna nebo větší než 1,5. Pro cisterny určené pro přepravu látek, které vyžadují zvýšenou úroveň bezpečnosti, tj. jestliže cisterny jsou uvedeny ve sloupci (12) tabulky A kapitoly 3.2 kódem cisterny zahrnujícím číslici „4“ v jeho druhé části (viz 4.3.4.1.1), hodnota S musí být znásobena dvěma, pokud nádrž není opatřena ochranou proti poškození tvořenou celistvou kovovou kotrrou včetně podélných a příčných konstrukčních členů;

K_0 = součinitel zhoršení vlastností materiálu vlivem tečení a stárnutí a jako výsledek chemického působení přepravovaných látek. Stanoví se podle tohoto vzorce:

$$K_0 = \frac{1}{\alpha \cdot \beta}$$

kde „ α “ je součinitel tečení a „ β “ je součinitel stárnutí stanovený podle EN 978:1997 po provedení zkoušek podle EN 977:1997. Alternativně je možno použít normální hodnotu $K_0 = 2$. Pro stanovení α a β prvotní odchylka musí odpovídat 2σ ;

K_1 = součinitel vlivu provozní teploty a tepelných vlastností pryskyřice stanovený podle dále uvedené rovnice:

$$K_1 = 1,25 - 0,0125 (HDT - 70)$$

kde HDT je teplota tepelné deformace pryskyřice ve °C;

K_2 = součinitel únavy materiálu; hodnota $K_2 = 1,75$ musí být použita, pokud není dohodnuto jinak s příslušným orgánem. Pro dynamickou konstrukci, jak je uvedeno v pododdílu 6.9.2.6, musí být použita hodnota $K_2 = 1,1$;

K_3 = součinitel vytvrzování má následující hodnoty:

- 1,1 kde vytvrzení je provedeno podle schváleného a zdokumentovaného postupu;
- 1,5 v jiných případech.

6.9.2.6 Při dynamických namáháních, jak je uvedeno v 6.8.2.1.2, konstrukční napětí nesmí překročit hodnotu uvedenou v 6.9.2.5 dělenou součinitelem α .

6.9.2.7 Při jakémkoli jiném napětí, jak je uvedeno v 6.9.2.5 a 6.9.2.6, výsledné prodloužení v jakémkoli směru nesmí překročit nižší z těchto dvou hodnot: 0,2 % nebo jednu desetinu prodloužení při přetržení pryskyřice.

6.9.2.8 Při stanoveném zkušebním tlaku, který nesmí být nižší než příslušný výpočtový tlak, jak je uvedeno v 6.8.2.1.14 (a) a (b), nejvyšší napětí v nádrži nesmí být větší než prodloužení při přetržení pryskyřice.

6.9.2.9 Nádrž musí být schopna odolat zkoušce pádem podle 6.9.4.3.3 bez jakéhokoli viditelného vnitřního nebo vnějšího poškození.

6.9.2.10 Vnější laminované potahy používané ve spojích, včetně konců spojů, spoje peřejníků a přepážek s nádrží musí být schopny odolat statickým a dynamickým namáháním uvedeným výše. Pro zabránění koncentracím napětí v tenkých laminovaných potazích použité šroubení nesmí mít závitové stoupání větší než 1:6.

Pevnost ve stříhu mezi laminovaným potahem a částmi cisterny, k nimž jsou připojeny, nesmí být menší než:

$$\tau = \frac{Q}{l} \leq \frac{\tau_R}{K}$$

kde:

τ_R = ohybová pevnost ve stříhu podle EN ISO 14125:1998 + AC:2002 + A1:2011 (tříbodová metoda) s minimálním $\tau_R = 10 \text{ N/mm}^2$, jestliže žádná naměřená hodnota není k dispozici;

Q = zatížení na jednotku šířky, které musí spoj přenášet pod statickým a dynamickým zatížením;

K = součinitel výpočtený podle 6.9.2.5 pro statická a dynamická namáhání;

l = délka laminované vrstvy.

6.9.2.11 Otvory v nádrži musí být zesíleny, aby bylo dosaženo nejméně těchže bezpečnostních součinitelů proti statickým a dynamickým namáháním, jak je uvedeno v 6.9.2.5 a 6.9.2.6 pro samotné nádrže. Počet otvorů musí být co možno nejmenší. Poměr délek os oválných otvorů nesmí být větší než 2.

6.9.2.12 Pro konstrukci přírub a potrubí připojených k nádrži musí být též vzaty v úvahu manipulační síly a přítlak šroubů.

6.9.2.13 Cisterna musí být zkonstruována tak, aby odolala bez znatelných úniků účinkům otevřeného ohně po dobu 30 minut, jak je uvedeno ve zkušebních požadavcích v 6.9.4.3.4. Od zkoušek může být upuštěno se souhlasem příslušného orgánu, pokud dostatečná těsnost může být prokázána zkouškou srovnatelných cisternových konstrukcí.

6.9.2.14 **Zvláštní požadavky na přepravu látek s bodem vzplanutí nejvýše 60 °C**

Cisterny FRP používané pro přepravu látek s bodem vzplanutí nejvýše 60 °C musí být konstruovány tak, aby bylo zajištěno vyloučení statické elektřiny z různých částí a tak zabráněno akumulaci nebezpečných nábojů.

- 6.9.2.14.1 Povrchový elektrický odpor vnitřku a vnitřku nádrže zjištěný měřením nesmí být vyšší než 10^9 ohmů. Toho může být dosaženo použitím přísad v pryskyřici nebo zalaminovanými vnitřními proklady, takovými jako kovová nebo uhlíková síť.
- 6.9.2.14.2 Vybíjecí odpor vůči zemi stanovený měřením nesmí být vyšší než 10^7 ohmů.
- 6.9.2.14.3 Všechny prvky nádrže musí být elektricky propojeny vzájemně mezi sebou a připojeny ke kovovému částem provozní a konstrukční výstroje cisterny a k vozidlu. Elektrický odpor mezi prvky a výstrojí ve vzájemných spojkách nesmí překročit 10 ohmů.
- 6.9.2.14.4 Elektrický povrchový odpor a vybíjecí odpor musí být měřen nejprve na každé vyrobené cisterně nebo na vzorku nádrže v souladu s postupem uznávaným příslušným orgánem.
- 6.9.2.14.5 Vybíjecí odpor do země každé cisterny musí být měřen jako část periodické prohlídky v souladu s postupem uznávaným příslušným orgánem.

6.9.3 Části výstroje

- 6.9.3.1 Požadavky uvedené v 6.8.2.2.1, 6.8.2.2.2 a 6.8.2.2.4 až 6.8.2.2.8 musí být splněny.
- 6.9.3.2 Kromě toho musí být použita též zvláštní ustanovení uvedená v 6.8.4 (b) (TE), pokud jsou uvedena u položky ve sloupci (13) tabulky A kapitoly 3.2

6.9.4 Zkoušení a schválení typu

- 6.9.4.1 Pro každý konstrukční typ cisterny FRP musí být materiály cisterny a její reprezentativní prototyp podroben zkoušce konstrukčního typu, jak je uvedeno dále.

6.9.4.2 Zkoušení materiálů

- 6.9.4.2.1 Pro použitou pryskyřici musí být stanoveno prodloužení při přetržení podle EN ISO 527-4:1997 nebo EN ISO 527-5:2009 a teplota tepelné deformace podle EN ISO 75-1:2013.
- 6.9.4.2.2 Následující charakteristiky musí být stanoveny pro vzorky vyříznuté z nádrže. Vzorky vyrobené souběžně smějí být použity pouze tehdy, jestliže není možné použití výřezů z nádrže. Před zkouškou musí být sejmuto jakéhokoli vyložení.

Zkoušky musí zahrnovat zkoušky:

- tloušťky vrstev střední stěny nádrže a jejich den;
- hmotnostního obsahu a složení skla, směřování a uspořádání výztužných vrstev;
- pevnosti v tahu, prodloužení při přetržení a modulu pružnosti podle EN ISO 527-4:1997 nebo EN ISO 527-5:2009 ve směru namáhání. Kromě toho prodloužení při přetržení pryskyřice musí být stanoveno ultrazvukovou metodou;
- pevnosti v ohybu a odolnosti proti deformaci zkouškou ohybového tečení podle EN ISO 14125:1998 + AC: 2002 + A1:2011 po dobu 1000 hodin s použitím vzorku o nejmenší šířce 50 mm při vzdálenosti mezi podpěrami rovnající se nejméně 20 násobku tloušťky stěny. Kromě toho součinitel tečení α a součinitel stárnutí β musí být stanoveny zkouškou podle EN 978:1977.

- 6.9.4.2.3 Mezivrstvá stříhová pevnost spojů musí být změřena zkouškou reprezentativních vzorků v tahu podle EN ISO 75-1:2013.
- 6.9.4.2.4 Chemická snášenlivost nádrže s přepravovanými látkami musí být prokázána jednou z následujících metod se souhlasem příslušného orgánu. Toto prokázání musí vzít v úvahu všechna hlediska slučitelnosti materiálů nádrže a její výstroje s přepravovanými látkami, včetně chemického zhoršování nádrže, vzniku kritických reakcí obsahů a nebezpečných reakcí mezi nimi.

- Pro stanovení jakéhokoli zhoršení nádrže musí být reprezentativní vzorky vyjmuté z nádrže, včetně jakéhokoli vnitřního vyložení se svary, podrobeny zkoušce chemické snášenlivosti podle EN 977:1997 po dobu 1000 hodin při 50 °C. Ve srovnání s čerstvým vzorkem ztráta pevnosti a modulu pružnosti změřená ohybovou zkouškou podle EN 978:1997 nesmí překročit 25 %. Praskliny, výdutě, vypoukliny, jakož i separace vrstev a vyložení a nerovnosti nejsou přípustné.
- Snášenlivost může být stanovena rovněž na základě osvědčených a dokumentovaných údajů o kladných zkušenostech se snášenlivostí plněných látek s materiály nádrže, s nimiž přicházejí do styku při dané teplotě, po určitou dobu a za jakýchkoli jiných provozních podmínek.
- Mohou být použity též technické údaje uveřejněné v příslušné literatuře, normách nebo jiných zdrojích, přijatelné pro příslušný orgán.

6.9.4.3 Zkouška typu

Reprezentativní prototyp cisterny musí být podroben zkouškám uvedeným dále. Pro tento účel může být provozní výstroj nahrazena jinými prostředky, pokud je to nezbytné.

6.9.4.3.1 Prototyp musí být zkontrolován na shodnost se specifikací konstrukčního typu. Tato kontrola musí zahrnovat vnitřní a vnější vizuální prohlídku a změření hlavních rozměrů.

6.9.4.3.2 Prototyp opatřený tenzometry na všech místech, kde je požadováno srovnání s konstrukčním výpočtem, musí být podroben dále uvedeným zatížením a jimi vyvolané napětí musí být zaznamenáváno:

- Cisterna musí být naplněna vodou na nejvyšší stupeň plnění. Výsledky měření musí být použity pro ověření konstrukčních výpočtů podle 6.9.2.5;
- Cisterna musí být naplněna vodou na nejvyšší stupeň plnění a vystavena zrychlením ve všech třech směrech jízdní a brzdovou zkouškou s prototypem upevněným na vozidle. Pro porovnání skutečných výsledků s konstrukčním výpočtem podle 6.9.2.6 zaznamenaná napětí musí být extrapolována ve vztahu ke kvocientu zrychlení požadovaných v 6.8.2.1.2 a změřených;
- Cisterna musí být naplněna vodou a podrobena stanovené tlakové zkoušce. Při tomto zatížení nádrž nesmí vykazovat žádné viditelné poškození nebo netěsnost.

6.9.4.3.3 Prototyp musí být podroben zkoušce pádem podle EN 976-1:1997, č. 6.6. Nesmí se objevit žádné viditelné poškození vnějšku nebo vnitřku cisterny.

6.9.4.3.4 Prototyp zkompletovaný se svojí provozní a konstrukční výstrojí a naplněný vodou na 80 % svého maximálního vnitřního objemu musí být vystaven plnému ohni po dobu 30 minut, kterým je hoření topného oleje v otevřené vaně nebo jiný druh ohně s tímže účinkem. Rozměry vany musí přesahovat rozměry nádrže nejméně o 50 cm na každou stranu a vzdálenost mezi hladinou paliva a cisternou musí být mezi 50 a 80 cm. Zbytek cisterny pod hladinou kapaliny, včetně otvorů a uzávěrů, musí zůstat těsný kromě odkapů.

6.9.4.4 Schválení typu

6.9.4.4.1 Příslušný orgán nebo jím pověřená organizace vydá pro každý nový typ cisterny nebo cisternového kontejneru schválení osvědčující, že konstrukce je vhodná pro účel, pro který je určena, a splňuje požadavky této kapitoly na konstrukci a výstroj, jakož i zvláštní ustanovení vztahující se na přepravované látky.

6.9.4.4.2 Schválení typu musí být založeno na výpočtech a zkušebním protokolu, včetně všech výsledků materiálových a prototypových zkoušek a jejich srovnání s konstrukčními výpočty, a musí obsahovat specifikaci konstrukčního typu a programu zajištění kvality.

- 6.9.4.4.3 Schválení typu musí zahrnovat látky nebo skupiny látek, jejichž snášenlivost s nádrží je zaručena. Musí v něm být uvedeny chemické názvy nebo hromadná pojmenování (viz 2.1.1.2) a jejich třída a klasifikační kód.
- 6.9.4.4.4 Kromě toho musí obsahovat stanovené hodnoty konstrukční a zaručené mezní hodnoty (takové jako doba životnosti, rozsah provozní teploty, provozní a zkušební tlak, údaje materiálu) a všechna bezpečnostní opatření, které je třeba učinit pro výrobu, zkoušení, schvalování typu, označování a používání jakékoli cisterny vyrobené podle schváleného konstrukčního typu.
- 6.9.5 Inspekce**
- 6.9.5.1 Pro každou cisternu vyrobenou podle schváleného prototypu musí být provedeny zkoušky materiálů a inspekce, jak je uvedeno níže:
- 6.9.5.1.1 Zkoušky materiálů podle 6.9.4.2.2, kromě zkoušky v tahu a zkrácení doby ohybové zkoušky tečení na 100 hodin, musí být provedeny se vzorky vyříznutými z nádrže. Vzorky vyrobené souběžně směji být použity pouze tehdy, jestliže výřezy z nádrže nejsou možné. Schválené konstrukční hodnoty musí být dodrženy.
- 6.9.5.1.2 Nádrže a jejich výstroj musí být společně nebo odděleně podrobeny první prohlídce před jejich uvedením do provozu. Tato prohlídka zahrnuje:
- kontrolu shodnosti se schválenou konstrukcí;
 - kontrolu konstrukčních charakteristik;
 - vnitřní a vnější prohlídku;
 - hydraulickou tlakovou zkoušku při zkušebním tlaku uvedeném na štítku předepsaném v 6.8.2.5.1;
 - kontrolu provozuschopnosti výstroje;
 - zkoušku těsnosti, pokud nádrž a její výstroj byly tlakově zkoušeny odděleně.
- 6.9.5.2 Na periodickou inspekci a zkoušku cisteren se vztahují požadavky uvedené v 6.8.2.4.2 až 6.8.2.4.4. Zkouška podle odst. 6.8.2.4.3 musí navíc zahrnovat prohlídku vnitřního stavu nádrže.
- 6.9.5.3 Inspekce a zkoušky podle 6.9.5.1 a 6.9.5.2 musí být prováděny znalci schválenými příslušným orgánem. Ve vydaných osvědčeních musí být uvedeny výsledky těchto inspekci. V osvědčeních musí být uveden podle 6.9.4.4 seznam látek, jejichž přeprava je v této nádrži dovolena.
- 6.9.6 Značení**
- 6.9.6.1 Požadavky 6.8.2.5 se vztahují na značení cisteren FRP s následujícími změnami:
- štítek cisterny může být též nalaminován na nádrž nebo může být vyroben z vhodného plastu;
 - vždy musí být vyznačen projektovaný teplotní rozsah.
- 6.9.6.2 Kromě toho musí být dodržena zvláštní ustanovení uvedená v 6.8.4 (e) (TM), pokud jsou uvedena u některé položky ve sloupci (13) tabulky A kapitoly 3.2.

KAPITOLA 6.10

POŽADAVKY NA KONSTRUKCI, VÝSTROJ, SCHVALOVÁNÍ TYPU, INSPEKCI A ZNAČENÍ CISTEREN PRO PODTLAKOVÉ VYČERPÁVÁNÍ ODPADŮ

POZNÁMKA1: Pro přemístitelné cisterny a UN MEGC viz kapitola 6.7; pro nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby s nádržemi vyrobenými z kovových materiálů a pro bateriová vozidla a vícečláňkové kontejnery na plyny (MEGC) viz kapitola 6.8; pro cisterny z vyztužených plastů viz kapitola 6.9.

POZNÁMKA 2: Tato kapitola se vztahuje na nesnímatelné a snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby.

6.10.1 Všeobecně

6.10.1.1 Definice

POZNÁMKA: Cisterna, která plně odpovídá požadavkům kapitoly 6.8, se nepovažuje za „cisternu pro podtlakové vyčerpávání odpadů“.

6.10.1.1.1 Pojmem „chráněná zóna“ se rozumí tyto zóny:

- (a) Spodní část cisterny v sektoru ohraničeném vně úhlem 60° a obě strany od nejnižšího obrýsu cisterny;
- (b) Horní část cisterny v sektoru ohraničeném vně úhlem 30° na obě strany od nejvyššího obrýsu cisterny;
- (c) Přední dno cisterny na motorovém vozidle;
- (d) Zadní dno cisterny v chráněném prostoru tvořeném zařízením uvedeným v 9.7.6.

6.10.1.2 Rozsah platnosti

6.10.1.2.1 Zvláštní požadavky 6.10.2 až 6.10.4 doplňují nebo pozměňují kapitola 6.8 a vztahují se na cisterny pro podtlakové vyčerpávání odpadů.

Cisterny pro podtlakové vyčerpávání odpadů smějí být vybaveny otevíratelnými dny, pokud požadavky kapitoly 4.3 dovolují vyprazdňování přepravovaných látek spodem (označených písmeny „A“ nebo „B“ v části 3 kódu cisterny uvedeném ve sloupci (12) tabulky A kapitoly 3.2 v souladu s 4.3.4.1.1).

Cisterny pro podtlakové vyčerpávání odpadů musí odpovídat všem požadavkům kapitoly 6.8, kromě požadavků upravených zvláštním ustanovením této kapitoly. Požadavky 6.8.2.1.19, 6.8.2.1.20 a 6.8.2.1.21 se však na ně nevztahují.

6.10.2 Konstrukce

6.10.2.1 Cisterny musí být konstruovány pro výpočtový tlak rovný 1,3 násobku plnicího nebo vyprazdňovacího tlaku, avšak nejméně 400 kPa (4 bary) (přetlak). Pro přepravu látek, pro které je v 6.8 předepsán vyšší výpočtový tlak, musí být použit tento vyšší tlak.

6.10.2.2 Cisterny musí být konstruovány tak, aby odolaly vnitřnímu podtlaku 100 kPa (1 bar).

6.10.3 Části výstroje

- 6.10.3.1 Části výstroje musí být uspořádány tak, aby byly chráněny proti nebezpečí utržení nebo poškození během přepravy a manipulace. Tento požadavek může být splněn umístěním výstroje v tzv. "chráněné zóně" (viz 6.10.1.1.1).
- 6.10.3.2 Spodní vyprazdňování nádrží může být tvořeno vnějším potrubím s uzavíracím ventilem umístěným co možno nejbližší k nádrži a druhým uzávěrem, kterým může být slepá příruba nebo jiné stejně účinné zařízení.
- 6.10.3.3 Poloha a směr uzavírání uzavíracího(ch) ventilu(ů) připojeného(ných) k nádrži nebo k jakékoli komoře vícekomorové nádrže musí být jednoznačné a musí být kontrolovatelné ze země.
- 6.10.3.4 K zamezení úniku obsahu při poškození vnějších plnicích a vyprazdňovacích zařízení (potrubí, boční uzavírací zařízení) musí být vnitřní uzavírací ventil nebo (popřípadě) první vnější uzavírací ventil a jeho sedlo chráněny proti nebezpečí utržení vnějším namáháním, nebo musí být konstruovány tak, aby těmto namáháním odolaly. Plnici a vyprazdňovací zařízení (včetně přírub nebo šroubových uzávěrů) a ochranné kryty (pokud jsou) musí umožňovat zajištění proti jakémukoli nežádoucímu otevření.
- 6.10.3.5 Cisterny smí být vybaveny otevíratelnými dny. Otevíratelná dna musí odpovídat těmto podmínkám:
- (a) Dna musí být konstruována tak, aby byla zajištěna jejich těsnost po uzavření;
 - (b) Nežádoucí otevření nesmí být možné;
 - (c) Pokud je otevírací mechanismus ovládán silovým pohonem, dno musí zůstat bezpečně uzavřeno v případě poruchy tohoto pohonu;
 - (d) Je nutno zabudovat pojistné nebo blokovací zařízení zajišťující, aby se otevíratelné dno nemohlo otevřít, pokud je v cisterně ještě zbytkový tlak. Tento požadavek se nevztahuje na otevíratelná dna, která jsou ovládána silovým pohonem, kde pohyb je pozitivně řízen. V tomto případě musí být ovládání typu "mrtvého muže" a musí být v takovém místě, aby obsluha mohla pozorovat neustále pohyb dna, aniž by byla ohrožena během otevírání a zavírání dna; a
 - (e) Je nutno učinit opatření k ochraně otevíratelného dna, které musí zůstat uzavřeno v případě převrácení vozidla, cisternového kontejneru nebo cisternové výměnné nástavby.
- 6.10.3.6 Cisterny pro podtlakové vyčerpávání odpadů vybavené vnitřním pístem pro usnadnění čištění nebo vyprazdňování musí být opatřeny uzavíracími zařízeními zabraňujícími, aby píst v žádné provozní poloze nebyl vytažen z cisterny, když na píst působí síla rovná nejvyššímu provoznímu tlaku cisterny. Nejvyšší provozní tlak pro cisterny nebo komory s pneumaticky ovládaným pístem nesmí překročit 100 kPa (1 bar). Vnitřní píst musí být vyroben takovým způsobem a z takového materiálu, aby nezapříčinil vznik zdroje vznícení, pokud se píst pohybuje.
- Vnitřní píst může být použit jako přepážka komory, pokud je v zajištěné poloze. Pokud jakákoli část prostředků, jimiž je vnitřní píst zajištěn, je na vnějšku cisterny, musí být umístěna v poloze vylučující jakékoli riziko náhodného poškození.
- 6.10.3.7 Cisterny mohou být vybaveny sacími nástavci, jestliže
- (a) nástavec je opatřen vnitřním nebo vnějším uzavíracím ventilem upevněným přímo na nádrži, nebo přímo ke kolenu, které je přivařeno k nádrži. Mezi nádrží, nebo kolenem a vnějším uzavíracím ventilem může být namontováno rotační talířové kolo, je-li toto rotační kolo umístěno v chráněné zóně a ovládací ústrojí uzavíracího ventilu je chráněno krytem/víkem proti nebezpečí vytržení vnějším namáháním.
 - (b) uzavírací ventil uvedený výše v odstavci a) je uspořádán tak, aby bylo zabráněno přepravě s ventilem v otevřené poloze; a

- (c) nástavec je vyroben takovým způsobem, že z cisterny nedojde k úniku následkem náhodného nárazu do nástavce.

6.10.3.8

Cisterny musí být vybaveny dále uvedenou doplňkovou provozní výstrojí:

- (a) Výstup z čerpadlové/sací jednotky musí být uspořádán tak, aby zajistil, že jakékoli hořlavé nebo jedovaté páry jsou odvedeny na místo, kde nemohou způsobit nebezpečí.
- (b) Zařízení zamezující bezprostřednímu proniknutí plamene musí být upevněno ke všem otvorům z čerpadlové/sací jednotky, která může poskytnout zápalný zdroj a která je upevněna na cisternu používanou pro přepravu hořlavých odpadů nebo musí být nádrž cisterny odolná proti tlaku vyvolanému výbuchem, což znamená být schopná bez úniku, ale s deformacemi, odolat výbuchu způsobenému proniknutím plamene.
- (c) Čerpadla, která mohou dodávat přetlak, musí být vybavena bezpečnostním zařízením připojeným k potrubí, které může být natlakováno. Bezpečnostní zařízení musí být nastaveno na vyprazdňování při tlaku nepřevyšujícím nejvyšší dovolený provozní tlak cisterny.
- (d) Uzavírací ventil musí být vložen mezi nádrž, nebo výstup ze zařízení zabráňujícího přeplnění, upevněného k nádrži, a potrubí spojující nádrž s čerpadlovou/sací jednotkou.
- (e) Cisterna musí být vybavena vhodným přetlakovým/podtlakovým tlakoměrem, který musí být namontován v poloze, v níž může být snadno čitelný osobou obsluhující čerpadlovou/sací jednotku. Na stupnici musí být rozlišovací čarou vyznačen nejvyšší provozní tlak cisterny.
- (f) Cisterna, nebo v případě komorových cisteren každá komora, musí být vybavena hladinoměrem. Průzorná skla mohou být použita jako zařízení ukazující hladinu, pokud:
- (i) tvoří část stěny cisterny a mají odolnost proti tlaku srovnatelnou s cisternou; nebo jsou upevněny na vnější stranu cisterny;
- (ii) vrchní a spodní připojení k cisterně je vybaveno uzavíracími ventily upevněnými přímo k nádrži a uspořádanými tak, aby bylo zabráněno přepravě s ventily v otevřené poloze;
- (iii) jsou vhodné pro provoz při nejvyšším provozním tlaku cisterny; a
- (iv) jsou umístěny v zóně, v níž je vyloučeno jakékoli riziko náhodného poškození.

6.10.3.9

Nádrže cisteren pro podtlakové vyčerpávání odpadů musí mít pojistný ventil s předřazeným průtržným kotoučem.

Tento ventil musí být schopen automaticky se otevřít při tlaku rovném 0,9 až 1,0 násobku zkušebního tlaku nádrže, na kterou je namontován. Používání ventilů se zátěží nebo ventilů s protizávažím je zakázáno.

Průtržný kotouč se musí protrhnout nejdříve při dosažení počátečního otevíracího tlaku a nejpozději při dosažení zkušebního tlaku cisterny, na které je namontován.

Bezpečnostní zařízení musí být takového typu, aby odolaly dynamickým účinkům včetně pohybu kapalin v nádrži.

Prostor mezi průtržným kotoučem a pojistným ventilem musí být vybaven tlakoměrem nebo vhodným indikátorem pro zjištění protržení kotouče, vzniku trhlin nebo úniku, který může zapříčinit špatnou funkci pojistného ventilu.

6.10.4**Inspekce**

Cisterny pro podtlakové vyčerpávání odpadů musí být podrobeny zkouškám předepsaným v 6.8.2.4.3 pro nesnímatelné a snímatelné cisterny nejméně každé tři roky a pro cisternové kontejnery a cisternové výměnné nástavby každého dva a půl roku, a kromě toho ještě prohlídce svého vnitřního stavu.

KAPITOLA 6.11

POŽADAVKY NA KONSTRUKCI, VÝROBU, INSPEKCE A ZKOUŠENÍ
KONTEJNERŮ PRO VOLNĚ LOŽENÉ LÁTKY

6.11.1 (Vyhrazeno)

6.11.2 Platnost a všeobecné požadavky

6.11.2.1 Kontejnery pro volně ložené látky a jejich provozní a konstrukční výstroj musí být tak konstruovány a vyrobeny, aby odolávaly, beze ztráty obsahu, vnitřnímu tlaku obsahu a namáháním při normální manipulaci a přepravě.

6.11.2.2 Pokud je namontován vyprazdňovací ventil, musí se dát zajistit v uzavřené poloze a celý vyprazdňovací systém musí být vhodně chráněn proti poškození. Ventily mající pákové uzávěry musí být zajištěny proti nežádoucímu otevření a poloha jeho otevření nebo uzavření musí být zřetelně vyznačena.

6.11.2.3 Kód pro značení typů kontejnerů pro volně ložené látky

Následující tabulka uvádí kódy, které je nutno používat pro značení typů kontejnerů pro volně ložené látky:

Typy kontejnerů pro volně ložené látky	Kód
Kontejner s plachtou pro volně ložené látky	BK1
Uzavřený kontejner pro volně ložené látky	BK2

6.11.2.4 S ohledem na vědecký a technický pokrok, použití alternativních uspořádání, která nabízejí nejméně rovnocennou bezpečnost jako požadavky uvedené v této kapitole, mohou být příslušným orgánem považována za vyhovující.

6.11.3 Požadavky na konstrukci, výrobu, inspekce a zkoušení kontejnerů odpovídajících KBK používaných jako BK1 nebo BK2 kontejnery pro volně ložené látky**6.11.3.1 Konstrukční a výrobní požadavky**

6.11.3.1.1 Všeobecné konstrukční a výrobní požadavky tohoto pododdílu musí být splněny, jestliže kontejner pro volně ložené látky splňuje požadavky normy ISO 1496-4:1991 „Série 1 Nákladní kontejnery – Specifikace a zkoušení – část 4: Netlakové kontejnery pro volně ložené suché látky“ a kontejner je prachotěsný.

6.11.3.1.2 Kontejnery konstruované a zkoušené podle normy ISO 1496-1:1990 „Série 1 Nákladní kontejnery – Specifikace a zkoušení – část 1: Všeobecné nákladní kontejnery pro všeobecné účely“ musí být vybaveny provozní výstrojí, která je, včetně jejího připojení ke kontejneru, konstruována, aby vyztužovala konec stěn a zlepšovala podélné uchycení, jak je to nutné pro splnění zkušebních požadavků normy ISO 1496-4:1991.

6.11.3.1.3 Kontejnery pro volně ložené látky musí být prachotěsné. Pokud je použito vyložení pro zajištění prachotěsnosti kontejneru, musí být toto vyložení vyrobeno z vhodného materiálu. Pevnost a konstrukce použitého materiálu vyložení musí být přiměřená vnitřnímu objemu kontejneru a jeho předpokládanému použití. Spoje a uzávěry vyložení musí odolat tlakům a rázům, ke kterým může docházet během normální manipulace a přepravy. Pro větrané kontejnery pro volně ložené látky jakékoli vyložení nesmí omezovat provoz ventilačních zařízení.

6.11.3.1.4 Provozní výstroj kontejnerů pro volně ložené látky konstruovaných pro vyprazdňování sklápěním musí být schopna odolat celkové naplněné hmotnosti ve sklápěcí poloze.

- 6.11.3.1.5 Jakákoli posuvná střecha nebo postranní stěna nebo koncová stěna musí být vybavena uzamykatelnými zařízeními se zabezpečovacími zařízeními ukazujícími uzamčený stav viditelně pozorovatelný z úrovně země.

6.11.3.2 Provozní výstroj

- 6.11.3.2.1 Plnicí a vyprazdňovací zařízení musí být tak konstruováno a uspořádáno, aby bylo chráněno proti riziku vytržení nebo poškození během přepravy a manipulace. Plnicí a vyprazdňovací zařízení musí být schopny zajištění proti nežádoucímu otevření. Otevřená a uzavřená poloha a směr uzavření musí být zřetelně vyznačeny.

- 6.11.3.2.2 Těsnění otvorů musí být uspořádána tak, aby se zabránilo jakémukoli poškození při provozu, plnění a vyprazdňování kontejnerů pro volně ložené látky.

- 6.11.3.2.3 Jestliže je vyžadováno větrání, kontejnery pro volně ložené látky musí být vybaveny prostředky pro výměnu vzduchu, buď přírodním způsobem, např. pouze otvory, nebo aktivními prvky, např. ventilátory. Větrání musí být konstruováno tak, aby se po celou dobu zabránilo podtlakům v kontejneru. Větrací prvky kontejnerů pro volně ložené látky pro přepravu hořlavých látek nebo látek vyvíjejících hořlavé plyny nebo páry musí být konstruovány tak, aby nebyly zápalným zdrojem.

6.11.3.3 Inspekce a zkoušení

- 6.11.3.3.1 Kontejnery používané, udržované a schválené jako kontejnery pro volně ložené látky v souladu s požadavky tohoto oddílu musí být zkoušeny a schváleny podle KBK.

- 6.11.3.3.2 Kontejnery používané a kvalifikované jako kontejnery pro volně ložené látky musí být podrobeny periodickým inspekcím podle KBK.

6.11.3.4 Značení

- 6.11.3.4.1 Kontejnery používané jako kontejnery pro volně ložené látky musí být označeny bezpečnostním schvalovacím štítkem podle KBK.

6.11.4 Požadavky na konstrukci, výrobu a schválení BK1 nebo BK2 kontejnerů pro volně ložené látky jiných než kontejnerů odpovídajících KBK

POZNÁMKA: Pokud kontejnery odpovídající ustanovením tohoto oddílu jsou používány pro přepravu tuhých volně ložených látek, v nákladním listu musí být uveden tento zápis:

„Kontejner pro volně ložené látky BK(x) schválený příslušným orgánem“. (viz 5.4.1.1.17).“

- 6.11.4.1 Kontejnery pro volně ložené látky podle tohoto oddílu zahrnují skipové nádoby, kontejnery pro přepravu volně ložených látek v systému off shore, zásobníky na volně ložené látky, výměnné nástavby, násypné kontejnery, válivé kontejnery a ložné komory vozidel.

POZNÁMKA: Tyto kontejnery pro volně ložené látky zahrnují též kontejnery odpovídající vyhláškám UIC, 591, 592 a 592-2 až 592-4, jak je uvedeno v 7.1.3, které neodpovídají KBK.

- 6.11.4.2 Tyto kontejnery pro volně ložené látky musí být konstruovány a vyrobeny tak, aby byly dostatečně odolné proti rázům a namáháním normálně se vyskytujícím během přepravy případně včetně překládky mezi různými druhy dopravy.

- 6.11.4.3 (Vyhrazeno)

- 6.11.4.4 Tyto kontejnery pro volně ložené látky musí být schváleny příslušným orgánem a schválení musí zahrnovat kód pro značení typů kontejnerů pro volně ložené látky podle 6.11.2.3 a případně požadavky pro inspekce a zkoušení.

- 6.11.4.5 Pokud je nezbytné použití vyložení pro udržení nebezpečných věcí, toto vyložení musí plnit ustanovení uvedené v 6.11.3.1.3.

KAPITOLA 6.12

POŽADAVKY NA VÝROBU, VÝSTROJ, SCHVALOVÁNÍ TYPU, INSPEKCE A ZKOUŠENÍ A ZNAČENÍ CISTEREN, KONTEJNERŮ PRO VOLNĚ LOŽENÉ LÁTKY A ZVLÁŠTNÍCH KOMOR PRO VÝBUŠNINY MOBILNÍCH JEDNOTEK PŘIPRAVUJÍCÍCH VÝBUŠNINY (MEMU)

POZNÁMKA 1: Pro přemístitelné cisterny viz kapitola 6.7; pro nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby s nádržemi z kovových materiálů viz kapitola 6.8; pro cisterny z vyztužených plastů viz kapitola 6.9; pro cisterny pro podtlakové vyčerpávání odpadů viz kapitola 6.10; pro kontejner pro volně ložené látky viz kapitola 6.11.

POZNÁMKA 2: Tato kapitola se vztahuje na nesnímatelné cisterny, snímatelné cisterny, cisternové kontejnery a cisternové výměnné nástavby, které nesplňují požadavky kapitol uvedených v Poznámce 1, jakož i cisternové kontejnery a zvláštní komory pro výbušniny.

6.12.1 Rozsah použití

Požadavky této kapitoly se vztahují na cisterny, cisternové kontejnery a zvláštní komory určené pro přepravu nebezpečných věcí na MEMU.

6.12.2 Všeobecná ustanovení

6.12.2.1 Cisterny musí splňovat ustanovení třídy 6.8, neodporující minimálnímu vnitřnímu objemu definovanému v oddílu 1.2.1 pro nesnímatelné cisterny, jak je uvedeno ve zvláštních ustanoveních této kapitoly.

6.12.2.2 Kontejnery pro volně ložené látky určené pro přepravu nebezpečných věcí na MEMU musí splňovat požadavky na kontejnery pro volně ložené látky typu BK2.

6.12.2.3 Pokud jednotlivá cisterna nebo kontejner pro volně ložené látky obsahuje více než jednu látku, každá musí být oddělena nejméně dvěma stěnami s odvětrávaným prostorem mezi nimi.

6.12.3 Cisterny

6.12.3.1 Cisterny s vnitřním objemem 1 000 litrů nebo více

6.12.3.1.1 Tyto cisterny musí splňovat požadavky oddílu 6.8.2.

6.12.3.1.2 Pro UN 1942 a 3375 musí cisterna splňovat požadavky kapitol 4.3 a 6.8 týkající se podtlakových zařízení, a kromě toho musí mít průtržné kotouče nebo jiné vhodné prostředky nouzových zařízení pro vyrovnávání tlaku schválené příslušným orgánem země používání.

6.12.3.1.3 U nádrží nekruhového průřezu, např. pravoúhlých nebo elipsovitých nádrží, které nemohou být zkonstruovány podle 6.8.2.1.4 a norem nebo technického předpisu v nich uvedeného, schopnost odolat dovolenému napětí může být prokázána tlakovou zkouškou stanovenou příslušným orgánem.

Tyto cisterny musí splňovat požadavky pododdílu 6.8.2.1 kromě 6.8.2.1.3, 6.8.2.1.4 a 6.8.2.1.13 až 6.8.2.1.22.

Tloušťka těchto nádrží nesmí být menší než hodnoty v níže uvedené tabulce:

Materiál	Minimální tloušťka
Nerezavějící austenitické oceli	2,5 mm
Jiné oceli	3 mm

Hliníkové slitiny	4 mm
Hliník 99,80 % čistoty	6 mm

Musí být provedena ochrana proti poškození při bočním nárazu nebo převrácení. Vybavení ochranou musí být provedeno podle 6.8.2.1.20 nebo příslušný orgán musí schválit alternativní ochranná opatření.

- 6.12.3.1.4 Odchylně od požadavků 6.8.2.5.2 cisterny nemusí být označeny kódem cisterny a zvláštním ustanovením, pokud je to vhodné.

6.12.3.2 Cisterny s vnitřním objemem menším než 1 000 litrů

- 6.12.3.2.1 Konstrukce těchto cisteren musí splňovat požadavky pododdílu 6.8.2.1 kromě 6.8.2.1.3, 6.8.2.1.4, 6.8.2.1.6, 6.8.2.1.10 až 6.8.2.1.23 a 6.8.2.1.28.

- 6.12.3.2.2 Výstroj těchto cisteren musí splňovat požadavky 6.8.2.2.1. Pro UN 1942 a 3375 musí cisterna splňovat požadavky kapitoly 4.3 a 6.8 týkající se podtlakových zařízení, a kromě toho musí mít průtržné kotouče nebo jiné vhodné prostředky nouzových zařízení pro vyrovnávání tlaku schválené příslušným orgánem země používání.

- 6.12.3.2.3 Tloušťka těchto nádrží nesmí být menší než hodnoty v níže uvedené tabulce:

Materiál	Minimální tloušťka
Nerezavějící austenitické oceli	2,5 mm
Jiné oceli	3 mm
Hliníkové slitiny	4 mm
Hliník 99,80 % čistoty	6 mm

- 6.12.3.2.4 Cisterny mohou mít konstrukční části bez poloměru vypouklosti. Alternativní podpůrná opatření mohou být zakřivené stěny, vlnité stěny nebo žebra. V nejméně jednom směru vzdálenost mezi dvěma paralelními podpěrami na každé straně cisterny nesmí být větší než 100 násobek tloušťky stěny.

- 6.12.3.2.5 Svary musí být odborně provedené a musí zaručit naprostou bezpečnost. Svářečské operace musí provádět kvalifikovaní svářeči používající svářecí postup, jehož kvalita (včetně potřebného tepelného zpracování) byla prokázána technologickou zkouškou.

- 6.12.3.2.6 Požadavky 6.8.2.4 se nepoužijí. Avšak první a periodické inspekce těchto cisteren musí být provedeny pod odpovědností uživatele nebo vlastníka MEMU. Nádrže a jejich výstroj musí být podrobeny vizuální prohlídce jejich vnějšího a vnitřního stavu a zkoušce těsnosti pro uspokojení příslušného orgánu nejméně každé tři roky.

- 6.12.3.2.7 Požadavky na schválení typu 6.8.2.3 a na značení 6.8.2.5 se nepoužijí.

6.12.4 Části výstroje

- 6.12.4.1 Cisterny se spodním vyprazdňováním pro UN 1942 a UN 3375 musí mít nejméně dva uzávěry. Jeden z těchto uzávěrů může být čerpadlo mísící nebo nabíjecí produkt nebo šnek.

- 6.12.4.2 Jakékoli potrubí za prvním uzávěrem musí být z tavného materiálu (tj. gumová hadice) nebo mít jiný tavný prvek.

- 6.12.4.3 K zamezení jakékoli ztráty obsahu v případě poškození vnějších čerpadel a vyprazdňovacích prvků (potrubí), první uzávěr a jeho sedla musí být chráněny proti nebezpečí utržení vnějšími namáháními nebo musí být tak konstruovány, aby jim odolaly. Plnicí a vyprazdňovací zařízení (včetně slepých přírub nebo šroubových uzávěrů) a ochranné kryty (pokud jsou) musí být zajištěny proti jakémukoli nežádoucímu otevření.

- 6.12.4.4 Podtlaková zařízení podle 6.8.2.2.6 na cisternách pro UN 3375 může být nahrazen „labutími krky“. Taková výstroj musí být chráněna proti nebezpečí utržení vnějšími namáháními nebo musí být tak konstruována, aby jim odolala.

6.12.5 Zvláštní komory pro výbušniny

Komory pro kusy s výbušninami obsahující rozbušky a/nebo skupiny rozbušek a ty, které obsahují látky a předměty skupiny snášlivosti D musí být konstruovány pro zabezpečení účinného oddělení tak, že zde není žádné nebezpečí přenosu výbuchu z rozbušek a/nebo skupiny rozbušek na látky a předměty skupiny snášlivosti D. Oddělení musí být dosaženo použitím oddělených komor nebo uložením jednoho nebo dvou typů výbušnin ve zvláštním ochranném systému. Jedna z obou metod oddělení musí být schválena příslušným orgánem. Pokud materiál použitý pro komory je kov, celý vnitřek komory musí být pokryt materiálem zajišťujícím uspokojivou ohnivzdornost. Komory pro výbušniny musí být umístěny tam, kde jsou chráněny před nárazem a před poškozením na nerovném terénu a nebezpečným vzájemným působením s ostatními nebezpečnými věcmi ve vozidle a před zápalnými zdroji na vozidle, např. výfuky atd.

POZNÁMKA: Materiály zařazené jako třída B-s3-d2 podle normy EN 13501-1:2007 + A1:2009 se považují za splňující požadavek ohnivzdornosti.

ČÁST 7

USTANOVENÍ O PODMÍNKÁCH PŘEPRAVY, NAKLÁDKY, VYKLÁDKY A MANIPULACE

KAPITOLA 7.1

VŠEOBECNÁ USTANOVENÍ

- 7.1.1** Přeprava nebezpečných věcí musí být prováděna stanovenými dopravními a přepravními prostředky v souladu s ustanoveními této kapitoly a kapitoly 7.2 pro přepravu kusů, kapitoly 7.3 pro přepravu ve volně loženém stavu a kapitoly 7.4 pro přepravu v cisternách. Kromě toho musí být dodržena ustanovení kapitoly 7.5 týkající se nakládky, vykládky a manipulace.

Sloupce (16), (17) a (18) tabulky A kapitoly 3.2 udávají příslušná ustanovení této části, která se vztahují na jednotlivé nebezpečné věci.

- 7.1.2** Kromě ustanovení této části musí vozidla používaná pro přepravu nebezpečných věcí z hlediska své konstrukce, výroby, a pokud je to předepsáno, svého schválení splňovat příslušná ustanovení části 9.

- 7.1.3** Velké kontejnery, přemístitelné cisterny a cisternové kontejnery, které odpovídají definici "kontejner" uvedené v Mezinárodní konvenci o bezpečných kontejnerech (KBK, 1972) ve znění pozdějších změn a doplňků, nebo ve vyhlášce UIC, 591 (z 1.10.2007, 3. vydání), 592 (z 1.10.2013, 2. vydání), 592-2 (z 1.10.2004, 6. vydání), 592-3 (z 1.1.1998, 2. vydání) a 592-4 (z 1.5.2007, 3. vydání) nesmějí být používány pro přepravu nebezpečných věcí, pokud velký kontejner nebo rám přemístitelné cisterny nebo cisternového kontejneru nesplňuje ustanovení KBK, nebo vyhlášek UIC, 591, 592 a 592-2 až 592-4.

- 7.1.4** Velký kontejner smí být předán k přepravě, jen pokud je konstrukčně provozuschopný.

"Konstrukčně provozuschopný" znamená, že kontejner je bez vážných závad na svých konstrukčních prvcích, např. horních a dolních podélnících, horních a dolních příčnících, dveřních prazích a překladech, podlahových příčnících, rohových sloupcích a rohových prvcích. "Vážné závady" jsou vruby nebo ohyby v konstrukčních prvcích hlubší než 19 mm, bez ohledu na délku této deformace; praskliny nebo lomy v konstrukčních prvcích; více než jeden spoj nebo nevhodně provedené spoje (např. přeplátování) na horních nebo spodních příčnících nebo překladech dveří nebo více než dva spoje na jakémkoli horním nebo dolním podélníku nebo jakýkoli spoj ve dveřním prahu nebo rohovém sloupku; utržené, zkroucené, zlomené, chybějící nebo jinak neprovozuschopné dveřní závěsy a kování; netěsné švy (spoje) a těsnění nebo jakákoli deformace kontejneru znemožňující správné umístění manipulačního zařízení, uložení a zajištění kontejneru na podvozku nebo vozidle.

Kromě toho poškození jakékoli části kontejneru, jako je zrezivělý kov v bočních stěnách nebo uvolněné části v prvcích ze skelných vláken, je nepřipustné bez ohledu na konstrukční materiál. Normální opotřebení, včetně oxidace (rez), drobné stopy po nárazu a škrábance a jiná poškození, která neovlivňují provozuschopnost kontejneru nebo jeho těsnost vůči povětrnosti, jsou však přípustná.

Před nakládkou kontejneru musí být provedena jeho kontrola, aby bylo zajištěno, že neobsahuje zbytky předchozího nákladu a že podlaha a vnitřní stěny nemají výčnělky.

- 7.1.5** Velké kontejnery musí splňovat požadavky na nastavbu vozidla uvedené v této části, a pokud je to vhodné, požadavky týkající se dotyčného nákladu uvedené v části 9; nastavba vozidla pak nemusí tato ustanovení splňovat.

Avšak velké kontejnery přepravované na vozidlech, jejichž podlahy mají izolační vlastnosti a odolnost proti teplu splňující tyto požadavky, nemusí uvedené požadavky splňovat.

Toto ustanovení se vztahuje též na malé kontejnery pro přepravu výbušných látek a předmětů třídy 1.

7.1.6

S výhradou ustanovení poslední části první věty oddílu 7.1.5, skutečnost, že nebezpečné věci jsou uloženy v jednom nebo více kontejnerech, nemá vliv na podmínky, které musí splňovat vozidlo z důvodů povahy a množství přepravovaných nebezpečných věcí.

KAPITOLA 7.2

USTANOVENÍ O PŘEPRAVĚ V KUSECH

7.2.1

Pokud není v oddílech 7.2.2 až 7.2.4 stanoveno jinak, smějí být kusy přepravovány

- (a) v uzavřených vozidlech nebo v uzavřených kontejnerech; nebo
- (b) ve vozidlech s plachtou nebo v kontejnerech s plachtou; nebo
- (c) v nekrytých vozidlech nebo v nekrytých kontejnerech.

7.2.2

Kusy obsahující obaly zhotovené z materiálů citlivých na vlhkost musí být přepravovány v uzavřených vozidlech nebo vozidlech s plachtou, nebo v uzavřených kontejnerech nebo kontejnerech s plachtou.

7.2.3

(Vyhrazeno)

7.2.4

Pokud jsou uvedena u položky ve sloupci (16) tabulky A kapitoly 3.2, použijí se tato zvláštní ustanovení:

V1 Kusy musí být přepravovány v uzavřených vozidlech nebo vozidlech s plachtou, nebo v uzavřených kontejnerech nebo kontejnerech s plachtou.

V2 (1) Kusy musí být přepravovány pouze ve vozidlech EX/II nebo EX/III, která splňují příslušné požadavky části 9. Volba vozidla závisí na množství určeném k přepravě, které je na jednu dopravní jednotku omezeno podle ustanovení týkajících se nakládky (viz 7.5.5.2).

(2) Přípojná vozidla, kromě návěsů, která splňují požadavky na vozidla EX/II nebo EX/III, smějí být tažena motorovými vozidly, která tyto požadavky nesplňují.

K přepravě v kontejnerech viz též 7.1.3 až 7.1.6.

Pokud jsou látky nebo předměty třídy 1 přepravovány v množstvích vyžadujících dopravní jednotku tvořenou vozidlem(y) EX/III v kontejnerech do nebo z přístavu, železničních stanic nebo příletových nebo odletových letišť jako část multimodální (kombinované) přepravy, smí být použito dopravní jednotky tvořené vozidlem(y) EX/II, jestliže přepravované kontejnery splňují příslušné požadavky námořních (IMDG Code), železničních (RID) nebo leteckých (ICAO Technical Instructions) předpisů.

V3 Pro volně sypné práškové látky a pro výrobky zábavné pyrotechniky musí mít kontejner podlahu s nekovovým povrchem nebo potahem.

V4 (Vyhrazeno)

V5 Kusy nesmějí být přepravovány v malých kontejnerech.

V6 Flexibilní IBC musí být přepravovány v uzavřených vozidlech nebo uzavřených kontejnerech, nebo ve vozidlech nebo kontejnerech s plachtou. Plachta musí být z nepromokavého a nehořlavého materiálu.

V7 (Vyhrazeno)

V8 (1) Látky stabilizované řízením teploty musí být přepravovány takovým způsobem, aby řízené teploty uvedené v 2.2.41.1.17 a 2.2.41.4 nebo v 2.2.52.1.16 a 2.2.52.4, které se na ně vztahují, nebyly nikdy překročeny.

- (2) Vybrané prostředky řízení teploty pro přepravu závisejí na řadě faktorů, jako jsou:
- řízená(é) teplota(y) přepravované(ých) látky(ek);
 - rozdíl mezi řízenou teplotou a očekávanou teplotou okolí;
 - účinnost tepelné izolace;
 - doba trvání přepravy; a
 - míra bezpečnosti s ohledem na zpoždění během přepravy.
- (3) Vhodné metody pro zamezení překročení řízené teploty v posloupném pořadí podle jejich účinnosti jsou uvedeny dále:
- R1 Tepelná izolace, pokud je počáteční teplota látky(tek) dostatečně nižší než řízená teplota;
- R2 Tepelná izolace a chladicí systém, pokud:
- je přepravováno dostatečné množství nehořlavé chladicí látky (např. kapalného dusíku nebo tuhého oxidu uhličitého) dovolující rozumnou míru bezpečnosti s ohledem na zdržení během přepravy, nebo je zajištěn způsob jejího doplnění;
 - jako chladivo nejsou použity zkapalněný kyslík nebo zkapalněný vzduch;
 - účinek chladicího systému je stálý, dokonce, i když je většina chladiva spotřebována; a
 - nutnost vyvětrat dopravní jednotku před vstupem do ní je jasně uvedena ve varovném upozornění na dveřích.
- R3 Tepelná izolace a jedno strojní chlazení, pokud pro látky s bodem vzplanutí nižším než je kritická teplota zvýšená o 5 °C, je v chlazeném prostoru použito nevýbušné elektrické příslušenství EEx IIB T3, aby se předešlo nebezpečí vznícení hořlavých par látek;
- R4 Tepelná izolace a kombinovaný strojní chladicí systém a systém s chladicí látkou, pokud:
- tyto dva systémy jsou na sobě nezávislé; a
 - požadavky metod R2 a R3 výše jsou splněny;
- R5 Tepelná izolace a dvojité strojní chladicí systém, pokud:
- nehledě na integrální pohonnou jednotku jsou tyto dva systémy na sobě nezávislé;
 - každý systém sám o sobě je schopen udržet dostatečnou regulaci teploty; a
 - pro látky s bodem vzplanutí nižším než je kritická teplota zvýšená o 5 °C, je v chlazeném prostoru použito nevýbušné elektrické příslušenství EEx IIB T3, aby se předešlo nebezpečí vznícení hořlavých par látek.
- (4) Metody R4 a R5 mohou být použity pro všechny organické peroxidy a samovolně se rozkládající látky.

Metoda R3 může být použita pro organické peroxidy a samovolně se rozkládající látky typů C, D, E a F a, pokud nejvyšší teplota okolí očekávaná během přepravy nepřekročí řízenou teplotu o více než 10 °C, pro organické peroxidy a samovolně se rozkládající látky typu B.

Metoda R2 může být použita pro organické peroxidy a samovolně se rozkládající látky typů C, D, E a F, pokud nejvyšší teplota okolí očekávaná během přepravy nepřekročí řízenou teplotu o více než 30 °C.

Metoda R1 může být použita pro organické peroxidy a samovolně se rozkládající látky typů C, D, E a F, pokud nejvyšší teplota okolí očekávaná během přepravy je nejméně o 10 °C nižší než řízená teplota.

- (5) Pokud látky vyžadují přepravu v izotermických, chlazených nebo chladicích a mrazicích vozidlech nebo kontejnerech, tato vozidla nebo kontejnery musí splňovat ustanovení kapitoly 9.6.
- (6) Jestliže jsou látky obsaženy v ochranných obalech naplněných chladicí látkou, musí být přepravovány v uzavřených vozidlech nebo vozidlech s plachtou, nebo v uzavřených kontejnerech nebo kontejnerech s plachtou. Pokud jsou používána uzavřená vozidla nebo kontejnery, musí být přiměřeně větrány. Vozidla a kontejnery s plachtou musí být vybaveny bočnicemi a zadním čelem. Plachty těchto vozidel a kontejnerů musí být z nepromokavých a těžko hořlavých materiálů.
- (7) Každé zařízení řídící a snímající teplotu v chladicím systému musí být snadno přístupné a všechna elektrická spojení musí být odolná proti povětrnostním vlivům. Teplota vzduchu uvnitř dopravní jednotky musí být snímána dvěma nezávislými snímači (čidly) a údaje musí být zaznamenávány tak, aby jakákoli změna teploty byla snadno identifikovatelná. Jestliže jsou přepravovány látky mající řízenou teplotu nižší než + 25 °C, dopravní jednotka musí být vybavena vizuálním a akustickým poplašným zařízením napájeným nezávisle na chladicím systému a seřízeným tak, aby fungovalo při teplotě rovnající se řízené teplotě nebo nižší.
- (8) Nouzový chladicí systém nebo náhradní díly musí být k dispozici.

POZNÁMKA: Toto ustanovení V8 se nepoužije pro látky zmíněné v pododdílu 3.1.2.6, jsou-li tyto látky stabilizovány přidáním chemických inhibitorů tak, že SADT je vyšší než 50 °C. V tomto případě může být řízení teploty vyžadováno za podmínek přepravy, kdy teplota může přesáhnout 55 °C.

- V9 (Vyhrazeno)
- V10 IBC musí být přepravovány v uzavřených vozidlech nebo vozidlech s plachtou, nebo v uzavřených kontejnerech nebo kontejnerech s plachtou.
- V11 IBC, jiné než IBC z kovu nebo tuhého plastu, musí být přepravovány v uzavřených vozidlech nebo vozidlech s plachtou, nebo v uzavřených kontejnerech nebo kontejnerech s plachtou.
- V12 IBC typu 31HZ2, 31HA2, 31HB2, 31HN2, 31HD2 a 31HH2 musí být přepravovány v uzavřených vozidlech nebo kontejnerech.
- V13 Jsou-li zabaleny do pytlů 5H1, 5L1 nebo 5M1, musí být přepravovány v uzavřených vozidlech nebo kontejnerech.
- V14 Aerosoly přepravované pro účely recyklace nebo likvidace podle zvláštního ustanovení 327 musí být přepravovány v odvětrávaných nebo nekrytých vozidlech nebo kontejnerech.

KAPITOLA 7.3

USTANOVENÍ O PŘEPRAVĚ VE VOLNĚ LOŽENÉM STAVU

7.3.1 Všeobecná ustanovení

7.3.1.1 Věci nesmějí být přepravovány volně ložené v kontejnerech pro volně ložené látky, kontejnerech nebo vozidlech, ledaže

- (a) zvláštní ustanovení označené kódem BK nebo odkaz na specifický odstavec, výslovně dovolující tento způsob přepravy, je uvedeno ve sloupci (10) tabulky A kapitoly 3.2 a kromě ustanovení tohoto oddílu jsou splněna rovněž zvláštní ustanovení oddílu 7.3.2; nebo
- (b) ve sloupci (17) tabulky A kapitoly 3.2 je uvedeno zvláštní ustanovení označené kódem VC nebo odkaz na specifický odstavec, výslovně dovolující tento způsob přepravy a jsou splněny podmínky tohoto zvláštního ustanovení společně s dodatečnými podmínkami označenými kódem(y) „AP“, jak jsou uvedeny v oddílu 7.3.3, navíc k podmínkám tohoto oddílu.

Avšak prázdné nevyčištěné obaly smějí být přepravovány volně ložené, jestliže tento způsob přepravy není výslovně zakázán jinými ustanoveními ADR.

POZNÁMKA: *K přepravě v cisternách viz kapitoly 4.2 a 4.3.*

7.3.1.2 Látky, které mohou zkapalnit při teplotách, které se mohou vyskytnout během přepravy, není dovoleno přepravovat ve volně loženém stavu.

7.3.1.3 Kontejnery pro volně ložené látky, kontejnery nebo nástavby vozidel musí být prachotěsné a musí být uzavřeny tak, aby nic z obsahu nemohlo uniknout za normálních podmínek přepravy, včetně účinku vibrací, nebo změn teploty, vlhkosti nebo tlaku.

7.3.1.4 Látky musí být naloženy a rovnoměrně rozloženy způsobem, který minimalizuje pohyb, který by mohl vyústit v poškození kontejneru pro volně ložené látky, kontejneru nebo vozidla nebo únik nebezpečných věcí.

7.3.1.5 Jsou-li namontována odvětrávací zařízení, musí být udržována v průchodném a funkčním stavu.

7.3.1.6 Látky nesmějí nebezpečně reagovat s materiálem kontejneru pro volně ložené látky, kontejneru, vozidla, těsnění, výstroje včetně vík a plachet ani s ochranným vyložením, které je ve styku s obsahem, nebo významně snižovat jejich odolnost. Kontejnery pro volně ložené látky, kontejnery nebo vozidla musí být konstruovány nebo uzpůsobeny tak, aby látky nemohly vniknout mezi části krytu dřevěné podlahy nebo přijít do styku s těmi částmi kontejneru pro volně ložené látky, kontejneru nebo vozidla, které by mohly být poškozeny těmito látkami nebo jejich zbytky.

7.3.1.7 Před naplněním a podáním k přepravě musí být každý kontejner pro volně ložené látky, kontejner nebo vozidlo prohlédnut(o) a vyčištěn(o), aby bylo zajištěno, že neobsahuje žádné zbytky na vnitřní nebo vnější straně kontejneru pro volně ložené látky, kontejneru nebo vozidla, které by mohly

- vyvolat nebezpečnou reakci s látkou určenou k přepravě;
- poškodit konstrukci kontejneru pro volně ložené látky, kontejneru nebo vozidla; nebo
- zhoršit zádržné schopnosti kontejneru pro volně ložené látky, kontejneru nebo vozidla vůči nebezpečným látkám.

7.3.1.8 Během přepravy nesmějí na vnějších površích kontejnerů pro volně ložené látky, kontejnerů nebo nástaveb vozidel ulpívat žádné nebezpečné zbytky.

- 7.3.1.9** Je-li namontováno více uzávěrů za sebou, musí se před plněním uzavřít jako první ten, který je nejbližší k látce, která se má přepravovat.
- 7.3.1.10** Prázdné kontejnery pro volně ložené látky, kontejnery nebo vozidla, které přepravovaly tuhous nebezpečnou látku ve volně loženém stavu, podléhají stejným předpisům ADR jako naplněný kontejner pro volně ložené látky, kontejner nebo naložené vozidlo, ledaže byla učiněna přiměřená opatření k vyloučení jakéhokoli nebezpečí.
- 7.3.1.11** Jsou-li kontejnery pro volně ložené látky, kontejnery nebo vozidla používány pro přepravu volně ložených látek náchylných k vyvolání výbuchu prachu nebo k vyvíjení hořlavých par (např. některé odpady), musí být učiněna opatření k vyloučení zápalných zdrojů a k zamezení nebezpečnému elektrostatickému výboji během přepravy, plnění nebo vyprazdňování látky.
- 7.3.1.12** Látky, např. odpady, které spolu mohou nebezpečně reagovat a látky různých tříd a věci nepodléhající ADR, které jsou náchylné k vzájemné nebezpečné reakci, nesmějí být smíchány v jednom kontejneru pro volně ložené látky, kontejneru nebo vozidle. Nebezpečné reakce jsou:
- (a) hoření a/nebo vývin značného tepla;
 - (b) vyvíjení hořlavých a/nebo toxických plynů;
 - (c) tvoření žíravých kapalin;
 - (d) tvoření nestabilních látek.
- 7.3.1.13** Kontejner pro volně ložené látky, kontejner nebo vozidlo musí být před naplněním (nakládkou) podroben(o) vizuální prohlídce za účelem ověření, že je konstrukčně provozuschopný(é), že vnitřní stěny, strop a podlaha jsou bez výčnělků nebo poškození a že vnitřní vyložení nebo zádržné prostředky látek jsou prosty děr, trhlin nebo jakýchkoli poškození, které by zhoršily jejich zádržnou schopnost vůči nákladu. Konstrukčně provozuschopný(é) znamená, že kontejner pro volně ložené látky, kontejner nebo vozidlo nemá vážné závady na svých konstrukčních prvcích, jako jsou horní a dolní podélníky, horní a dolní koncové příčnický, dveřní prahy a překlady, podlahové příčnický, rohové sloupky a rohové prvky u kontejneru. Vážné závady zahrnují:
- (a) ohyby, praskliny nebo lomy konstrukčních nebo podpěrných prvků, které mají vliv na integritu kontejneru pro volně ložené látky, kontejneru nebo nástavby vozidla;
 - (b) více než jeden spoj nebo nevhodně provedený spoj (např. přeplátováním) na horních nebo spodních koncových příčnicích nebo překladech dveří;
 - (c) více než dva spoje na jakémkoli horním nebo dolním podélníku;
 - (d) jakýkoli spoj ve dveřním prahu nebo rohovém sloupku;
 - (e) dveřní závěsy a kování, které jsou zadřené, zkroucené, zlomené, chybějící nebo jinak nefunkční;
 - (f) švy (spoje) a těsnění, které jsou netěsné;
 - (g) jakákoli deformace kontejneru pro volně ložené látky, kontejneru, zabráňující správnému umístění manipulačního zařízení, uložení a zajištění kontejneru na podvozku nebo vozidle, nebo uložení do komory plavidla.
 - (h) jakékoli poškození úchytů pro zdvihání nebo úchytného rámu manipulačního zařízení;
 - (i) jakékoli poškození obslužné a provozní výstroje.

7.3.2 Ustanovení pro přepravu ve volně loženém stavu, použijí-li se ustanovení pododdílu 7.3.1.1 (a)

7.3.2.1 Kromě obecných ustanovení oddílu 7.3.1 se použijí ustanovení tohoto oddílu. Kódy BK1 a BK2 ve sloupci (10) tabulky A kapitoly 3.2 mají tento význam:

BK1: Přeprava ve volně loženém stavu v kontejnerech pro volně ložené látky s plachtou je povolena;
BK2: Přeprava ve volně loženém stavu v uzavřených kontejnerech pro volně ložené látky je povolena.

7.3.2.2 Použitý kontejner pro volně ložené látky musí odpovídat požadavkům kapitoly 6.11.

7.3.2.3 Věci třídy 4.2

Celková hmotnost nákladu přepravovaného v kontejneru pro volně ložené látky musí být taková, aby samozápalná teplota nákladu byla vyšší než 55 °C.

7.3.2.4 Věci třídy 4.3

Tyto věci musí být přepravovány v kontejnerech pro volně ložené látky, které jsou vodotěsné.

7.3.2.5 Věci třídy 5.1

Kontejnery pro volně ložené látky musí být konstruovány nebo upraveny tak, aby se věci nemohly dostat do styku se dřevem nebo jakýmkoli jiným hořlavým materiálem.

7.3.2.6 Věci třídy 6.2

7.3.2.6.1 Materiál živočišného původu obsahující infekční látky (UN čísel 2814, 2900 a 3373) je povoleno přepravovat v kontejnerech pro volně ložené látky, pokud jsou splněny následující podmínky:

- (a) Jsou dovoleny kontejnery pro volně ložené látky s plachtou BK1 za podmínky, že nejsou naplněny do své maximální kapacity, aby se zamezilo dotyku látek s plachtou. Uzavřené kontejnery pro volně ložené látky BK2 jsou rovněž dovoleny;
- (b) Uzavřené kontejnery pro volně ložené látky, nebo kontejnery pro volně ložené látky plachtou a jejich otvory musí být těsné svou konstrukcí nebo jejich opatřením vhodným vnitřním vyložení;
- (c) Materiál živočišného původu musí být před nakládkou pro přepravu důkladně napuštěn vhodným dezinfekčním prostředkem;
- (d) Kontejnery pro volně ložené látky s plachtou musí být přikryty přídatným potahem zatíženým absorpčním materiálem napuštěným vhodným desinfekčním prostředkem;
- (e) Uzavřené kontejnery pro volně ložené látky, nebo kontejnery pro volně ložené látky s plachtou nesmějí být znovu použity, dokud nebyly řádně vyčištěny a desinfikovány.

POZNÁMKA: *Dodatečná opatření mohou být vyžadována příslušnými národními zdravotnickými orgány.*

7.3.2.6.2 Odpady třídy 6.2 (UN 3291)

- (a) (Vyhrazeno)

- (b) Uzavřené kontejnery pro volně ložené látky a jejich otvory musí být těsné svou konstrukcí. Tyto kontejnery pro volně ložené látky musí mít neporézní vnitřní povrchy a musí být prosty prasklin nebo jiných vad, které by mohly poškodit obaly uvnitř, bránit desinfekci nebo dovolit nežádoucí únik odpadů.
- (c) Odpady UN čísla 3291 musí být uloženy v uzavřeném kontejneru pro volně ložené látky v těsných, hermeticky uzavřených plastových pytlích konstrukčního typu odzkoušeného a schváleného podle OSN, které vyhověly příslušným zkouškám pro přepravu tuhých látek obalové skupiny II, a značených podle 6.1.3.1. Takové plastové pytle musí z hlediska odolnosti proti nárazu a proti roztržení vyhovět normám ISO 7765-1:1988 „Plastový film a fólie – Určení odolnosti proti nárazu metodou volného pádu tělesa – Část 1: Metody zvané „schodiště“ a ISO 6383-2:1983 „Plasty – Film a fólie – Určení odolnosti proti roztržení – Část 2: Elmendorfova metoda“. Každý pytel musí mít odolnost proti nárazu nejméně 165 g a odolnost proti roztržení nejméně 480 g jak v rovnoběžné, tak i v kolmé rovině vzhledem k podélné rovině pytle. Nejvyšší čistá (netto) hmotnost každého plastového pytle musí být 30 kg.
- (d) Jednotlivé předměty překračující 30 kg, jako jsou znečištěné matrace, smějí být přepravovány bez plastového pytle, pokud to povolí příslušný orgán.
- (e) Odpady UN čísla 3291, které obsahují kapaliny, musí být přepravovány jen v plastových pytlích obsahujících dostatečné množství absorpčního materiálu, aby pohltil všechnu kapalinu, bez jejího úniku do kontejneru pro volně ložené látky.
- (f) Odpady UN čísla 3291 obsahující ostré předměty, musí být přepravovány jen v tuhých obalech konstrukčního typu odzkoušeného a schváleného podle OSN, které vyhovují ustanovením pokynů pro balení P621, IBC620 nebo LP621.
- (g) Tuhé obaly uvedené v pokynech pro balení P621, IBC620 nebo LP621 mohou být rovněž použity. Musí být řádně zajištěny, aby se zamezilo poškození za normálních podmínek přepravy. Odpady přepravované v tuhých obalech a plastových pytlích společně v tomtéž uzavřeném kontejneru pro volně ložené látky musí být přiměřeně navzájem odděleny, např. vhodnými tuhými přepážkami, kovovými mřížkami nebo jinými zajišťovacími prostředky, aby se zamezilo poškození obalů za normálních podmínek přepravy.
- (h) Odpady UN čísla 3291 v plastových pytlích nesmějí být napěchovány do uzavřeného kontejneru pro volně ložené látky takovým způsobem, že by se pytle mohly stát netěsnými.
- (i) Uzavřené kontejnery pro volně ložené látky musí být po každé jízdě prohlédnuty, aby se odhalil každý případný únik nebo rozliti. Jestliže odpady UN čísla 3291 unikly nebo se rozlily do uzavřeného kontejneru pro volně ložené látky, smí být znovu použit až po důkladném vyčištění a, pokud je to nutné, po desinfekci a dekontaminaci vhodným prostředkem. S odpady UN čísla 3291 nesmějí být společně přepravovány žádné jiné věci, než jsou medicínální nebo veterinární odpady. Tyto jiné odpady přepravované v tomtéž uzavřeném kontejneru pro volně ložené látky musí být prohlédnuty, aby se odhalila případná kontaminace.

7.3.2.7 *Látky třídy 7*

K přepravě nebalených radioaktivních látek viz 4.1.9.2.4.

7.3.2.8 *Věci třídy 8*

Tyto věci musí být přepravovány v kontejnerech pro volně ložené látky, které jsou vodotěsné.

7.3.2.9 Látky třídy 9

- 7.3.2.9.1 Pro UN 3509 mohou být použity pouze uzavřené kontejnery pro volně ložené látky (kód BK2). Kontejnery pro volně ložené látky musí být těsné nebo musí být vybaveny vložkou nebo pytletem nepropustným a odolným proti proražení a musí mít prostředky k udržení jakékoliv volné kapaliny, která by mohla uniknout během přepravy, např. absorpční materiál. Obaly, vyřazené, prázdné, nevyčištěné se zbytky látek třídy 5.1 musí být přepravovány v takových kontejnerech pro volně ložené látky, které jsou konstruovány nebo upraveny tak, aby se věci nemohly dostat do styku se dřevem nebo jakýmkoli jiným hořlavým materiálem.

7.3.3 Ustanovení pro přepravu ve volně loženém stavu, použijí-li se ustanovení pododdílu 7.3.1.1. (b)

- 7.3.3.1 Kromě obecných ustanovení oddílu 7.3.1 se použijí ustanovení toho oddílu, pokud jsou uvedena ve sloupci (17) tabulky A kapitoly 3.2. Uzavřená vozidla nebo vozidla s plachtou nebo uzavřené kontejnery nebo kontejnery s plachtou v rámci tohoto oddílu, nemusí být v souladu s požadavky uvedenými v kapitole 6.11. Kódy VC1, VC2 a VC3 ve sloupci (17) tabulky A kapitoly 3.2 mají tento význam:

- VC1 Přeprava ve volně loženém stavu je povolena ve vozidlech s plachtou nebo kontejnerech s plachtou nebo v kontejnerech pro volně ložené látky s plachtou.
- VC2 Přeprava ve volně loženém stavu je povolena v uzavřených vozidlech, uzavřených kontejnerech nebo v uzavřených kontejnerech pro volně ložené látky.
- VC3 Přeprava ve volně loženém stavu je povolena ve speciálně vybavených vozidlech nebo kontejnerech podle norem stanovených příslušným orgánem země původu. V případě, že země původu není smluvní stranou ADR, stanovené podmínky musí být uznány příslušným orgánem prvního státu smluvní strany ADR, do něhož se zásilka dostane.

- 7.3.3.2 Pokud jsou použity kódy VC, musí platit tato dodatečná ustanovení uvedená ve sloupci (17) tabulky A kapitoly 3.2:

7.3.3.2.1 Věci třídy 4.1

- AP1 Vozidla a kontejnery musí mít kovovou konstrukci a je-li na vozidle plachta, musí být nehořlavá.
- AP2 Vozidla a kontejnery musí mít přiměřené větrání.

7.3.3.2.2 Věci třídy 4.2

- AP1 Vozidla a kontejnery musí mít kovovou konstrukci a je-li na vozidle plachta, musí být nehořlavá.

7.3.3.2.3 Věci třídy 4.3

- AP2 Vozidla a kontejnery musí mít přiměřené větrání.
- AP3 Uzavřená vozidla a uzavřené kontejnery smějí být použity pouze tehdy, když je látka kusovitá (ne ve formě prášku, zrn, prachu nebo popela).
- AP4 Uzavřená vozidla a uzavřené kontejnery musí být vybaveny hermeticky uzavíratelnými otvory pro nakládku a vykládku, aby se zabránilo úniku plynu a vniknutí vlhkosti.

- AP5 Dveře do nákladového prostoru uzavřených vozidel a uzavřených kontejnerů musí být opatřeny následujícím nápisem o výšce písmen nejméně 25 mm:

„POZOR,
NEODVĚTRÁVANÝ PROSTOR,
OTEVÍRAT OPATRNĚ“

Tento nápis musí být v jazyce, který považuje za vhodný odesílatel.

7.3.3.2.4 *Věci třídy 5.1*

- AP6 Pokud je vozidlo nebo kontejner vyroben ze dřeva nebo jiného hořlavého materiálu, musí být opatřen nepropustným a nehořlavým povlakem nebo být napuštěn křemičitanem sodným nebo podobnou látkou. Plachta musí být nepropustná a nehořlavá.

- AP7 Přeprava ve volně loženém stavu je povolena pouze jako vozová zásilka.

7.3.3.2.5 *Věci třídy 6.1*

- AP7 Přeprava ve volně loženém stavu je povolena pouze jako vozová zásilka.

7.3.3.2.6 *Věci třídy 8*

- AP7 Přeprava ve volně loženém stavu je povolena pouze jako vozová zásilka.

- AP8 Ložné prostory vozidel nebo kontejnerů musí být zkonstruovány tak, aby odolaly jakýmkoli zbytkovým elektrickým proudům a vlivům z baterie.

Ložné prostory vozidel nebo kontejnerů musí být z oceli odolné proti žíravým látkám obsažených v akumulátorech. Méně odolné oceli mohou být použity, pokud jsou dostatečně velké tloušťky stěn nebo jsou opatřeny vyložení nebo potahem z plastů odolných proti žíravým látkám.

POZNÁMKA: Ocel vykazující nejvyšší stupeň progresivního zeslabení působením žíravých látek 0,1 mm za rok může být považována za odolnou.

Ložné prostory vozidel nebo kontejnerů nesmějí být naloženy nad horní okraj jejich bočních stěn.

Přeprava je též povolena v malých kontejnerech z plastů, které musí být schopny odolat, plně naložené, volnému pádu z výšky 0,8 m na tvrdý povrch při teplotě -18°C bez prasknutí.

7.3.3.2.7 *Věci třídy 9*

- AP2 Vozidla a kontejnery musí mít přiměřené větrání.

- AP9 Přeprava ve volně loženém stavu je povolena pro tuhé látky (látky nebo směsi, jako přípravky nebo odpady) obsahující v průměru nejvýše 1000 mg/kg látky která je přiřazena pod UN číslo. V žádném místě nákladu nesmí být koncentrace této látky nebo těchto látek vyšší než 10 000 mg/kg.

- AP10 Vozidla a kontejnery musí být těsné nebo musí být vybaveny vložkou nebo pytlkem nepropustným a odolným proti proražení a musí mít prostředky k udržení jakékoliv volné kapaliny, která by mohla uniknout během přepravy, např. absorpční materiál. Obaly, vyřazené, prázdné, nevyčištěné se zbytky látek třídy 5.1 musí být přepravovány v takových kontejnerech pro volně ložené látky, které jsou konstruovány nebo upraveny tak, aby se věci nemohly dostat do styku se dřevem nebo jakýmkoli jiným hořlavým materiálem.

KAPITOLA 7.4

USTANOVENÍ O PŘEPRAVĚ V CISTERNÁCH

7.4.1

Nebezpečné věci smějí být přepravovány v cisternách, jen pokud je ve sloupcích (10) nebo (12) tabulky A kapitoly 3.2 uveden kód cisterny, nebo pokud je uděleno schválení příslušného orgánu, jak je podrobně uvedeno v pododdílu 6.7.1.3. Přeprava musí být v souladu s ustanoveními kapitol 4.2, 4.3, 4.4 nebo 4.5, jak je to náležité. Vozidla, ať už jsou to vozidla bez přívěsu, tažná vozidla, přívěsy nebo návěsy, musí splňovat příslušná ustanovení kapitol 9.1, 9.2 a 9.7.2 týkající se vozidel, která se mají použít, jak je udáno ve sloupci (14) tabulky A v kapitole 3.2.

7.4.2

Vozidla označená kódy EX/III, FL, OX nebo AT v pododdílu 9.1.1.2 musí být používána takto:

- Kde je předepsáno vozidlo EX/III, smí být použito pouze vozidlo EX/III;
- Kde je předepsáno vozidlo FL, smí být použito pouze vozidlo FL;
- Kde je předepsáno vozidlo OX, smí být použito pouze vozidlo OX;
- Kde je předepsáno vozidlo AT, smí být použita vozidla AT, FL a OX.

KAPITOLA 7.5

USTANOVENÍ O NAKLÁDCE, VYKLÁDCE A MANIPULACI

7.5.1 Všeobecná ustanovení o nakládce, vykládce a manipulaci

POZNÁMKA: Ve smyslu tohoto oddílu se uložení kontejneru, kontejneru pro volně ložené látky, cisternového kontejneru nebo přemístitelné cisterny na vozidlo považuje za nakládku a jeho (její) sejmutí z vozidla se považuje za vykládku.

7.5.1.1 Vozidlo a jeho řidič, jakož i velký(é) kontejner(y), kontejner(y) pro volně ložené látky, cisternový(é) kontejner(y) nebo přemístitelná(é) cisterna(y), jsou-li, musí při příjezdu na místa nakládky a vykládky, která zahrnují kontejnerové terminály, splňovat příslušné předpisy (zejména týkající se bezpečnosti, zabezpečení, čistoty a správné činnosti zařízení používaného při nakládce a vykládce).

7.5.1.2 Pokud není v ADR stanoveno jinak, nakládka nesmí být provedena, jestliže

- (a) kontrola dokladů; nebo
- (b) vizuální kontrola vozidla nebo velkého(ých) kontejneru(ů), kontejneru(ů) pro volně ložené látky, cisternového(ých) kontejneru(ů) nebo přemístitelné(ých) cisterny(en), jsou-li, jakož i jejich výbavy používané při nakládce a vykládce,

prokazuje, že vozidlo, řidič, velký kontejner, kontejner pro volně ložené látky, cisternový kontejner, přemístitelná cisterna nebo jejich výbava nesplňují příslušné předpisy. Před nakládkou musí být prohlédnut vnitřek a vnějšek vozidla nebo kontejneru, aby se zajistilo, že neexistuje žádné poškození, které by mohlo ovlivnit jejich celistvost nebo celistvost kusů, které se do něj mají naložit.

7.5.1.3 Pokud není v ADR stanoveno jinak, vykládka nesmí být provedena, jestliže výše uvedené kontroly odhalí nedostatky, které by mohly ohrozit bezpečnost nebo zabezpečení vykládky.

7.5.1.4 Podle zvláštních ustanovení uvedených v oddílu 7.3.3 nebo 7.5.11, v souladu s údaji ve sloupcích (17) a (18) tabulky A kapitoly 3.2, smějí být určité nebezpečné věci přepravovány pouze jako „vozová zásilka“ (viz definici v oddílu 1.2.1). V takovém případě může příslušný orgán požadovat, aby vozidlo nebo velký kontejner používané pro takovou přepravu byly pouze na jednom místě naloženy a pouze na jednom místě vyloženy.

7.5.1.5 Jsou-li vyžadovány směrové šipky, musí být kusy a přepravní obalové soubory orientovány v souladu s takovým označením.

POZNÁMKA: Pokud je to možné, musí být kapalné nebezpečné věci naloženy pod suché nebezpečné věci.

7.5.1.6 Všechny obalové prostředky musí být nakládány a vykládány takovým manipulačním způsobem, pro který byly zkonstruovány a, kde je to vyžadováno, odzkoušeny.

7.5.2 Zákaz společné nakládky

7.5.2.1 Kusy označené rozdílnými bezpečnostními značkami nesmějí být naloženy společně do téhož vozidla nebo kontejneru, ledaže je společná nakládka dovolena podle následující tabulky na základě bezpečnostních značek, jimiž jsou kusy označeny.

POZNÁMKA: Podle 5.4.1.4.2 musí být vystaveny samostatné přepravní doklady pro zásilky, které nesmějí být naloženy společně do téhož vozidla nebo kontejneru.

X Společná nakládka povolena.

a Společná nakládka povolena s látkami a předměty 1.4S.

b Společná nakládka věcí třídy 1 a záchranných prostředků třídy 9 (UN čísel 2990, 3072 a 3268) povolena.

c Společná nakládka povolena mezi bezpečnostními zařízeními, pyrotechnikou podtřídy 1.4, skupiny snášlivosti G (UN číslo 0503) a elektricky iniciovanými bezpečnostními zařízeními třídy 9 (UN číslo 3268).

d Společná nakládka povolena mezi trhavinami (kromě UN 0083 trhavina, typ C) a dusičnanem amonným (UN čísel 1942 a 2067) a dusičnany alkalických kovů a dusičnany kovů alkalických zemin za podmínky, že se celý náklad pro účely označování velkými bezpečnostními značkami, oddělování, ukládání a nejvyšší přípustné hmotnosti nákladu považuje za trhaviny třídy 1.

Dusičnany alkalických kovů včetně dusičnanu cesného (UN 1451), dusičnanu lithného (UN 2722), dusičnanu draselného (UN 1486), dusičnanu rubidného (UN 1477) a dusičnanu sodného (UN 1498). Dusičnany kovů alkalických zemin včetně dusičnanu barnatého (UN 1446), dusičnanu berylnatého (UN 2464), dusičnanu vápenatého (UN 1454), dusičnanu hořečnatého (UN 1474) a dusičnanu strontnatého (UN 1507).

7.5.2.2

Kusy obsahující látky nebo předměty třídy 1 označené bezpečnostní značkou podle vzorů č. 1, 1.4, 1.5 nebo 1.6, které jsou zařazeny do rozdílných skupin snášenlivosti, nesmějí být nakládány společně do téhož vozidla nebo kontejneru, ledaže je společná nakládka dovolena podle následující tabulky pro odpovídající skupiny snášenlivosti.

Skupina snášenlivosti	A	B	C	D	E	F	G	H	J	L	N	S
A	X											
B		X		a								X
C			X	X	X		X				b c	X
D		a	X	X	X		X				b c	X
E			X	X	X		X				b c	X
F						X						X
G			X	X	X		X					X
H								X				X
J									X			X
L										d		
N			b c	b c	b c						b	X
S		X	X	X	X	X	X	X	X		X	X

X Společná nakládka dovolena.

- a Kusy obsahující předměty skupiny snášenlivosti B a látky nebo předměty skupiny snášenlivosti D smějí být nakládány společně do jednoho vozidla nebo do jednoho kontejneru, pokud jsou účinně navzájem odděleny tak, že není žádné nebezpečí přenosu výbuchu z předmětů skupiny snášenlivosti B na látky nebo předměty skupiny snášenlivosti D. Vzájemného oddělení musí být dosaženo použitím oddělených komor nebo umístěním jednoho z těchto dvou druhů výbušniny do speciálního kontejnmentového systému. Každý způsob vzájemného oddělení musí být schválen příslušným orgánem.
- b Rozdílné druhy předmětů podtřídy 1.6, skupiny snášenlivosti N mohou být přepravovány společně jako předměty podtřídy 1.6, skupiny snášenlivosti N pouze tehdy, je-li prokázáno zkouškou nebo obdobou, že neexistuje dodatečné nebezpečí výbuchu přenosem mezi těmito předměty. Jinak musí být považovány za předměty podtřídy 1.1.
- c Jestliže jsou předměty skupiny snášenlivosti N přepravovány s látkami nebo předměty skupin snášenlivosti C, D nebo E, předměty skupiny snášenlivosti N musí být považovány za předměty mající charakteristiky skupiny snášenlivosti D.
- d Kusy obsahující látky a předměty skupiny snášenlivosti L smějí být nakládány společně do jednoho vozidla nebo do jednoho kontejneru s kusy obsahujícími tentýž druh látek nebo předmětů této skupiny snášenlivosti.

7.5.2.3 Pro účely uplatnění zákazů společné nakládky do jednoho vozidla se neberou v úvahu látky obsažené v uzavřených plnostěnných kontejnerech. Nicméně zákazy společné nakládky uvedené v pododdílu 7.5.2.1, týkající se společné nakládky kusů označených bezpečnostními značkami podle vzorů č. 1, 1.4, 1.5 nebo 1.6 s jinými kusy, a v pododdílu 7.5.2.2 týkající se společné nakládky výbušných látek a předmětů různých skupin snášenlivosti musí být dodrženy rovněž mezi nebezpečnými věcmi obsaženými v kontejneru a jinými nebezpečnými věcmi naloženými v tomtéž vozidle, ať jsou nebo nejsou posledně jmenované věci uloženy v jednom nebo více jiných kontejnerech.

7.5.2.4 Společná nakládka nebezpečných věcí balených v omezených množstvích s jakýmkoli druhem výbušných látek a předmětů, s výjimkou podtřídy 1.4 a UN čísel 0161 a 0499, je zakázána.

7.5.3 (Vyhrazeno)

7.5.4 Preventivní opatření se zřetelem na potraviny, poživatiny a krmiva

Pokud je pro látky nebo předměty uvedeno ve sloupci (18) tabulky A kapitoly 3.2 zvláštní ustanovení CV28, musí být dodržena preventivní opatření se zřetelem na potraviny, poživatiny a krmiva, jak je uvedeno dále.

Kusy, jakož i prázdné nevyčištěné obaly, včetně velkých obalů a IBC, označené bezpečnostními značkami podle vzorů č. 6.1 nebo 6.2, a ty, které jsou označeny bezpečnostními značkami podle vzoru č. 9 a obsahují věci UN čísel 2212, 2315, 2590, 3151, 3152 nebo 3245, nesmějí být ukládány na kusy nebo do bezprostřední blízkosti kusů, o nichž je známo, že obsahují potraviny, poživatiny nebo krmiva ve vozidlech, v kontejnerech a na místech nakládky, vykládky nebo překládky.

Pokud jsou tyto kusy označené uvedenými bezpečnostními značkami ukládány do bezprostřední blízkosti kusů, o nichž je známo, že obsahují potraviny, poživatiny nebo krmiva, musí být od nich odděleny tímto způsobem:

- (a) plnostěnnými přepážkami, které musí být tak vysoké jako kusy označené uvedenými bezpečnostními značkami;
- (b) kusy neoznačenými bezpečnostními značkami podle vzorů č. 6.1, 6.2 nebo 9 nebo kusy označenými bezpečnostními značkami podle vzoru č. 9, ale neobsahujícími věci UN čísel 2212, 2315, 2590, 3151, 3152 nebo 3245, nebo
- (c) volným prostorem nejméně 0.8 m,

pokud tyto kusy opatřené uvedenými bezpečnostními značkami nejsou přepravovány v dodatečném obalu nebo nejsou úplně zakryty (např. fólií, lepenkovým krytem nebo jiným způsobem).

7.5.5 Omezení přepravovaných množství

7.5.5.1 Pokud ustanovení uvedená níže nebo dodatečná ustanovení v oddílu 7.5.11 vyžadují omezení přepravovaných množství pro určité věci podle údajů ve sloupci (18) tabulky A kapitoly 3.2, skutečnost, že nebezpečné věci jsou obsaženy v jednom nebo více kontejnerech, nemá vliv na hmotnostní omezení na dopravní jednotku uvedená v těchto ustanoveních.

7.5.5.2 Omezení pro výbušné látky a předměty

7.5.5.2.1 Látky a přepravovaná množství

Celková čistá hmotnost (v kg) výbušné látky (nebo v případě výbušných předmětů celková čistá hmotnost výbušné látky obsažené ve všech předmětech zásilky), která smí být přepravována jednou dopravní jednotkou, je omezena, jak je uvedeno v následující tabulce (viz též pododdíl 7.5.2.2, pokud jde o zákaz společné nakládky).

Nejvyšší přípustná čistá hmotnost (v kg) výbušné látky obsažené ve věcech třídy 1 naložených do dopravní jednotky

Dopravní jednotka	Podtřída	1.1		1.2	1.3	1.4		1.5 a 1.6	Prázdné nevyčištěné obaly
	Skupina snášenlivosti	1.1A	Jiná než 1.1A			Jiná než 1.4S	1.4S		
EX/II ^a		6,25	1 000	3 000	5 000	15 000	Neomezeno	5 000	Neomezeno
EX/III _a		18,75	16 000	16 000	16 000	16 000	Neomezeno	16 000	Neomezeno

^a Definice vozidel EX/II a EX/III viz část 9.

7.5.5.2.2 Pokud jsou do téže dopravní jednotky naloženy látky a předměty rozdílných podtříd třídy 1, při dodržení zákazů společné nakládky uvedených v pododdílu 7.5.2.2, musí se náklad posuzovat jako celek tak, jakoby celý patřil do nejnebezpečnější podtřídy (v pořadí 1.1, 1.5, 1.2, 1.3, 1.6, 1.4). Nepřihlíží se však k čisté hmotnosti výbušných látek skupiny snášenlivosti S z hlediska omezení přepravovaných množství.

Pokud jsou látky zařazené jako 1.5D přepravovány v jedné dopravní jednotce společně s látkami nebo předměty podtřídy 1.2, musí se celý náklad pro přepravu posuzovat, jakoby patřil do podtřídy 1.1.

7.5.5.2.3 Přeprava výbušnin v MEMU

Přeprava výbušnin v MEMU je povolena pouze za následujících podmínek:

- Příslušný orgán musí povolit přepravu na svém území;
- Druh a množství přepravovaných balených výbušnin musí být omezeny na druh a množství potřebné pro množství materiálu, které se má připravit v MEMU, a v žádném případě nesmí překročit:
 - 200 kg výbušnin skupiny snášenlivosti D; a
 - celkem 400 jednotek rozbušek nebo rozbuškových sestav, nebo směsi obou,
 pokud není schváleno jinak příslušným orgánem;
- Balené výbušniny musí být přepravovány jen v komorách, které splňují požadavky uvedené v 6.12.5;
- Žádné jiné nebezpečné věci nesmějí být přepravovány v téže komoře než balené výbušniny;
- Balené výbušniny musí být naloženy do MEMU, jakmile byla dokončena nakládka jiných nebezpečných věcí, a bezprostředně před přepravou;

- (f) Je-li dovolena společná nakládká výbušnin a látek třídy 5.1 (UN 1942 a UN 3375) celý náklad se považuje pro účely oddělování, ukládání a nejvyšší přípustné hmotnosti nákladu za trhaviny třídy 1.

7.5.5.3 Největší množství organických peroxidů třídy 5.2 a samovolně se rozkládajících látek třídy 4.1, typů B, C, D, E nebo F je omezeno na 20 000 kg na dopravní jednotku.

7.5.6 (Vyhrazeno)

7.5.7 Manipulace a ukládání

7.5.7.1 Kde je to vhodné, musí být vozidlo nebo kontejner vybaven(o) prostředky usnadňujícími zajištění a manipulaci s nebezpečnými věcmi. Kusy obsahující nebezpečné věci a nebalené nebezpečné předměty musí být ve vozidle nebo v kontejneru zajištěny vhodnými prostředky schopnými zadržet věci (jako jsou upínací pásy, posuvné přepážky, stavitelné opěrky) takovým způsobem, aby se zabránilo jakémukoli pohybu během přepravy, který by mohl změnit orientaci kusů nebo je poškodit. Jsou-li nebezpečné věci přepravovány s jinými věcmi (např. těžkými stroji nebo laťovými bednami), musí být všechny věci bezpečně uloženy a upevněny ve vozidlech nebo kontejnerech, aby se zabránilo uvolnění nebezpečných věcí. Pohybu kusů může být zabráněno také vyplněním všech mezer za použití zaklíňovacích nebo blokačních a fixačních prostředků. Pokud se používají zadržovací prostředky, jako pásy nebo popruhy, nesmějí být tyto prostředky příliš utaženy, aby nezpůsobily poškození nebo deformaci kusu¹. Požadavky tohoto odstavce se považují za splněné, je-li náklad zajištěn v souladu s normou EN 12195-1:2010.

7.5.7.2 Kusy se nesmějí stohovat, pokud nejsou pro tento účel konstruovány. Mají-li se společně nakládat různé druhy kusů konstruovaných pro stohování, je třeba vzít v úvahu jejich kompatibilitu z hlediska stohování. Je-li to nutné, musí se zabránit poškození spodních kusů použitím nosných prostředků.

7.5.7.3 Během nakládky a vykládky musí být kusy obsahující nebezpečné věci chráněny před poškozením.

POZNÁMKA: Zvláštní pozornost musí být věnována manipulaci s kusy během jejich přípravy k přepravě, druhu vozidla nebo kontejneru, v němž se mají přepravovat a způsobu nakládky nebo vykládky tak, aby nedošlo k poškození kusů jejich vlečením po zemi nebo nesprávným zacházením.

7.5.7.4 Ustanovení pododdílu 7.5.7.1 se vztahují též na nakládku a uložení kontejnerů, cisternových kontejnerů, přemístitelných cisteren a MEGC ve vozidlech, jakož i na jejich vykládku z vozidel.

7.5.7.5 Členové osádky vozidla nesmí otevřít kus obsahující nebezpečné věci.

7.5.8 Čištění po vykládce

7.5.8.1 Bylo-li po vykládce vozidla nebo kontejneru, v němž byly naloženy balené nebezpečné věci, zjištěno, že část obsahu z obalů unikla, vozidlo nebo kontejner musí být pokud možno co nejdříve a v každém případě před novou nakládkou vyčištěn(o).

Pokud není možno provést vyčištění na místě, vozidlo nebo kontejner musí být přepraven(o) s přiměřenou bezpečností do nejbližšího vhodného místa, kde může být vyčištění provedeno.

¹ Návod k ukládání nebezpečných věcí je možno nalézt v publikaci Evropské komise *European Best Practice Guidelines on Cargo Securing for Road Transport*. Jiné návody jsou rovněž k dispozici u příslušných orgánů a průmyslových institucí.

Přeprava je přiměřeně bezpečná, jestliže byla provedena vhodná opatření, aby se zabránilo nekontrolovanému úniku nebezpečných látek.

7.5.8.2 Vozidla nebo kontejnery, v nichž byly nebezpečné látky volně loženy, musí být před další nakládkou řádně vyčištěny, ledaže nový náklad sestává z téže nebezpečné látky jako předcházející náklad.

7.5.9 Zákaz kouření

Při provádění ložných operací je zakázáno kouřit ve vozidlech nebo kontejnerech a v jejich blízkosti. Tento zákaz kouření se vztahuje také na použití elektronických cigaret a podobných prostředků.

7.5.10 Preventivní opatření proti elektrickým nábojům

V případě hořlavých plynů nebo kapalin s bodem vzplanutí 60°C nebo nižším nebo UN 1361 uhlí nebo uhlí černé, obalové skupiny II, musí být před plněním nebo vyprazdňováním cisteren zajištěno dobré elektrické spojení mezi podvozkem vozidla, přemístitelnou cisternou nebo cisternovým kontejnerem a zemí (uzemnění). Kromě toho musí být omezena rychlost plnění.

7.5.11 Dodatečná ustanovení vztahující se na určité třídy nebo věci

Kromě ustanovení oddílů 7.5.1 až 7.5.10 se musí dodržovat následující ustanovení, pokud jsou uvedena u položky ve sloupci (18) tabulky A kapitoly 3.2.

- CV1 (1) Následující operace jsou zakázány:
- (a) Nakládka a vykládka věcí na veřejném prostranství v zastavěném území bez zvláštního povolení příslušných orgánů;
 - (b) Nakládka a vykládka věcí na veřejném prostranství mimo zastavěné území bez předchozího oznámení příslušným orgánům, pokud tyto operace nejsou nezbytné z důvodů bezpečnosti.
- (2) Pokud ložné operace z jakýchkoli důvodů musí být prováděny na veřejném prostranství, pak látky a předměty různých druhů musí být odděleny podle bezpečnostních značek.
- CV2 (1) Před nakládkou musí být ložný prostor vozidla nebo kontejneru řádně vyčištěn.
- (2) Použití ohně nebo otevřeného plamene ve vozidlech a kontejnerech přepravujících věci, v jejich blízkosti a během nakládky a vykládky těchto věcí je zakázáno.
- CV3 Viz pododdíl 7.5.5.2.
- CV4 Látky a předměty skupiny snášenlivosti L smějí být přepravovány jen jako vozová zásilka.
- CV5 až CV8 (Vyhrazeno)
- CV9 Kusy nesmějí být házeny ani vystaveny nárazům.
- Nádoby musí být ve vozidle nebo v kontejneru uloženy tak, aby se nemohly převrátit ani padnout.
- CV10 Láhve definované v oddílu 1.2.1 musí být uloženy souběžně nebo příčně k podélné ose vozidla nebo kontejneru; avšak láhve v blízkosti předního čela musí být uloženy příčně k podélné ose vozidla nebo kontejneru.

Krátké láhve velkého průměru (asi 30 cm a více) smějí být uloženy podélně, svými ochrannými zařízeními ventilů směrem ke středu vozidla nebo kontejneru.

Láhve, které jsou dostatečně stabilní nebo jsou přepravovány ve vhodných zařízeních, která je účinně chrání proti převrácení, smějí být uloženy nastojato.

Láhve, které jsou položeny, musí být zaklíněny, přivázány nebo připevněny bezpečným a vhodným způsobem tak, aby se nemohly posunout.

CV11 Nádoby musí být vždy uloženy v té poloze, pro niž byly konstruovány, a musí být chráněny proti jakékoli možnosti poškození jinými kusy.

CV12 Jsou-li předměty uloženy na paletách a jsou-li tyto palety stohovány, musí být každá vrstva palet rozložena rovnoměrně na nižší vrstvě, v případě nezbytnosti s proložkou z materiálu přiměřené pevnosti.

CV13 Pokud jakékoli látky unikly a rozsypaly se nebo se rozlily ve vozidle nebo v kontejneru, nesmí být toto vozidlo ani kontejner znovu použit(o) před tím, než byl(o) řádně vyčištěn(o) a, pokud je to nezbytné, desinfikován(o) a dekontaminován(o). Jakékoli jiné věci a předměty, které byly přepravovány v tomtéž vozidle nebo kontejneru, musí být překontrolovány z hlediska jejich možné kontaminace.

CV14 Věci musí být chráněny před slunečním zářením a ohříváním během přepravy.

Kusy musí být skladovány pouze na chladných, dobře větraných místech, vzdáleny od tepelných zdrojů.

CV15 Viz pododdíl 7.5.5.3.

CV16 až CV19 *(Vyhrazeno)*

CV20 Ustanovení kapitoly 5.3 a zvláštní ustanovení V1 a V8(5) a (6) kapitoly 7.2 se nepoužijí, pokud je látka balena podle způsobu balení OP1 nebo OP2 pokynu pro balení P520 v pododdílu 4.1.4.1 a celkové množství látek, na které se vztahuje tato odchylka, nepřekročí 10 kg na dopravní jednotku.

CV21 Dopravní jednotka musí být před nakládkou řádně prohlédnuta.

Před přepravou musí být dopravce informován o:

- provozu chladicího systému, popřípadě včetně seznamu dodavatelů chladicí látky na přepravní trase;
- postupech v případě poruchy řízení teploty.

V případě řízení teploty podle metod R2 nebo R4 zvláštního ustanovení V8(3) kapitoly 7.2, musí být přepravováno dostatečné množství nehořlavé chladicí látky (např. kapalného dusíku nebo suchého ledu), včetně přiměřené zásoby pro možná zpoždění, pokud není zajištěno její doplňování.

Kusy musí být ukládány tak, aby byly snadno přístupné.

Předepsaná řízená teplota musí být udržována během celé přepravy, včetně nakládky a vykládky, jakož i během případných provozních zastávek.

CV22 Kusy musí být naloženy tak, aby volné proudění vzduchu v ložném prostoru zajišťovalo stejnou teplotu nákladu. Jestliže obsah jednoho vozidla nebo velkého kontejneru

převyšuje 5 000 kg hořlavých tuhých látek a/nebo organických peroxidů, náklad musí být rozdělen do stohů o hmotnosti nejvýše 5 000 kg oddělených vzduchovými mezerami nejméně 0,05 m.

CV23 Při manipulaci s kusy musí být učiněna zvláštní opatření zajišťující, že nepřijdou do styku s vodou.

CV24 Před nakládkou musí být vozidla a kontejnery řádně vyčištěny a musí být zbaveny zejména jakýchkoli hořlavých zbytků (slámy, sena, papíru atd.).

Používání snadno hořlavých materiálů pro fixaci kusů ve vozidle nebo kontejneru je zakázáno.

- CV25 (1) Kusy musí být ukládány tak, aby byly snadno přístupné.
- (2) Pokud mají být kusy přepravovány při teplotě okolí nepřevyšující 15 °C nebo zchlazené, tato teplota musí být udržována během vykládky a skladování.
- (3) Kusy musí být skladovány pouze na chladných místech, vzdálené od tepelných zdrojů.

CV26 Dřevěné části vozidla nebo kontejneru, které přišly do styku s těmito látkami, musí být sejmuty a spáleny.

- CV27 (1) Kusy musí být ukládány tak, aby byly snadno přístupné.
- (2) Pokud jsou kusy přepravovány zchlazené, provoz chladicího systému musí být zajištěn během vykládky a skladování.
- (3) Kusy musí být skladovány pouze na chladných místech, vzdálené od tepelných zdrojů.

CV28 Viz oddíl 7.5.4.

CV29 až CV32 (Vyhrazeno)

CV33 **POZNÁMKA 1:** „Kritická skupina“ je skupina členů veřejnosti, která je důvodně homogenní z hlediska jejího vystavení danému zdroji záření a dané dráze vystavení a je typická individuální nejvyšší účinnou dávkou z dané dráhy vystavení z daného zdroje.

POZNÁMKA 2: „Členové veřejnosti“ jsou v obecném smyslu jakékoli osoby z populace kromě těch, které jsou vystaveny záření v zaměstnání nebo v lékařství.

POZNÁMKA 3: „Pracovníci“ jsou jakékoli osoby, které pracují plně, částečně nebo příležitostně pro zaměstnavatele, které mají právo a povinnost na ochranu proti záření v zaměstnání.

- (1) Oddělování
- (1.1) Kusy, přepravní obalové soubory, kontejnery a cisterny obsahující radioaktivní látky a nebalené radioaktivní látky musí být odděleny během přepravy:
- (a) od pracovníků řádně zaměstnaných v pracovních prostorech buď:
- (i) podle tabulky A níže; nebo
- (ii) vzdálenostmi vypočtenými použitím dávkového limitu 5 mSv za rok při konzervativních parametrech výpočtového modelu;

POZNÁMKA: Pracovníci podléhající individuálnímu monitorování za účelem radiční ochrany nesmějí být bráni v úvahu za účelem oddělování.

- (b) od členů obyvatelstva v prostorech veřejně přístupných:
- (i) podle tabulky A níže; nebo
 - (ii) vzdálenostmi vypočtenými použitím dávkového limitu 1 mSv za rok při konzervativních parametrech výpočtového modelu;
- (c) od nevyvolaných fotografických filmů a poštovních pytlů:
- (i) podle tabulky B níže; nebo
 - (ii) vzdálenostmi vypočtenými použitím dávkového limitu působení přepravy radioaktivních látek na nevyvolané fotografické filmy dávkou 0.1 mSv na zásilku takových filmů; a

POZNÁMKA: U poštovních pytlů se musí předpokládat, že obsahují nevyvolané filmy a desky a proto musí být odděleny od radioaktivních látek tímtéž způsobem.

- (d) od ostatních nebezpečných věcí v souladu s oddílem 7.5.2

Tabulka A: Nejmenší vzdálenosti mezi kusy kategorie II-ŽLUTÁ nebo kategorie III-ŽLUTÁ a osobami

Součet přepravních indexů nejvýše	Doba expozice za rok (hodiny)			
	Prostory normálně veřejně přístupné		Normálně obsazované pracovní prostory	
	50	250	50	250
	Vzdálenost oddělení v metrech, žádný stínící materiál, od:			
2	1	3	0,5	1
4	1,5	4	0,5	1,5
8	2,5	6	1,0	2,5
12	3	7,5	1,0	3
20	4	9,5	1,5	4
30	5	12	2	5
40	5,5	13,5	2,5	5,5
50	6,5	15,5	3	6,5

Tabulka B: Nejmenší vzdálenosti mezi kusy kategorie II-ŽLUTÁ nebo kategorie III-ŽLUTÁ a kusy označenými slovem "FOTO", nebo poštovními pytli

Celkový počet kusů nejvýše		Součet přepravních indexů nejvýše	Doba trvání přepravy nebo uskladnění, v hodinách							
KATEGORIE ŽLUTÁ			1	2	4	10	24	48	120	240
III	II		Nejmenší vzdálenost, v metrech							
1 2 3 4 5		0,2	0,5	0,5	0,5	0,5	1	1	2	3
		0,5	0,5	0,5	0,5	1	1	2	3	5
	1	1	0,5	0,5	1	1	2	3	5	7
	2	2	0,5	1	1	1,5	3	4	7	9
	4	4	1	1	1,5	3	4	6	9	13
	8	8	1	1,5	2	4	6	8	13	18
	10	10	1	2	3	4	7	9	14	20
	20	20	1,5	3	4	6	9	13	20	30
	30	30	2	3	5	7	11	16	25	35
	40	40	3	4	5	8	13	18	30	40
50	50	50	3	4	6	9	14	20	32	45

(1.2) Kusy nebo přepravní obalové soubory kategorie II-ŽLUTÁ nebo III-ŽLUTÁ nesmějí být přepravovány v odděleních obsazených cestujícími, kromě oddělení výlučně vyhrazených pro průvodce zvlášť pověřené doprovázet takové kusy nebo přepravní obalové soubory.

(1.3) Žádným osobám, kromě členů osádky vozidla, není dovoleno být ve vozidlech přepravujících kusy, přepravní obalové soubory nebo kontejnery označené bezpečnostními značkami kategorie II-ŽLUTÁ nebo III-ŽLUTÁ.

(2) *Meze aktivity*

Celková aktivita ve vozidle při přepravě látek LSA nebo SCO v průmyslových kusech typu 1 (Typ IP-1), typu 2 (Typ IP-2), typu 3 (Typ IP-3) nebo nebalených nesmí překročit meze dále uvedené v tabulce C.

Tabulka C: Meze aktivity ve vozidle pro látky LSA a SCO v průmyslových kusech nebo nebalené

Druh látky nebo předmětů	Meze aktivity ve vozidle
LSA-I	Žádné omezení
LSA-II a LSA-III nehořlavé tuhé látky	Žádné omezení
LSA-II a LSA-III hořlavé tuhé látky a všechny kapaliny a plyny	100 A ₂
SCO	100 A ₂

(3) *Uložení během přepravy a skladování při tranzitu*

(3.1) Zásilký musejí být bezpečně uloženy.

(3.2) Pokud střední tepelný tok na vnějším povrchu nepřekročí 15 W/m^2 a pokud věci nacházející se v bezprostřední blízkosti nejsou zabaleny v pytlích, kus nebo přepravní obalový soubor může být přepravován nebo uložen s jinými balenými věcmi bez jakýchkoli zvláštních ustanovení o ukládání, kromě těch, které může požadovat příslušný orgán v příslušném osvědčení o schválení.

(3.3) Nakládka kontejnerů a shromažďování kusů, přepravních obalových souborů a kontejnerů se řídí těmito předpisy:

- (a) Kromě přepravy za podmínek výlučného použití a pro zásilký látek LSA-I, celkový počet kusů, přepravních obalových souborů a kontejnerů v jednom vozidle musí být omezen tak, aby součet přepravních indexů ve vozidle nepřekročil hodnoty uvedené v tabulce D dále;
- (b) Dávkový příkon za běžných podmínek přepravy nesmí přesáhnout 2 mSv/h v jakémkoli místě vnějšího povrchu vozidla a $0,1 \text{ mSv/h}$ ve vzdálenosti 2 m od něho, vyjma zásilek přepravovaných za výlučného použití, pro které jsou uvedeny meze aktivity v (3.5) (b) a (c).
- (c) Celkový součet kritických bezpečnostních indexů v kontejneru a ve vozidle nesmí překročit hodnoty v tabulce E dále.

Tabulka D: Mezní hodnoty přepravních indexů pro kontejnery a vozidla bez výlučného použití

Druh kontejneru nebo vozidla	Meze součtu přepravních indexů v kontejneru nebo ve vozidle
Malý kontejner	50
Velký kontejner	50
Vozidlo	50

Tabulka E: Kritický bezpečnostní index pro kontejnery a vozidla obsahující štěpné látky

Druh kontejneru nebo vozidla	Meze součtů kritických bezpečnostních indexů	
	Bez výlučného použití	Pod výlučným použitím
Malý kontejner	50	Bezpředmětné
Velký kontejner	50	100
Vozidlo	50	100

(3.4) Jakýkoli kus nebo přepravní obalový soubor mající buď přepravní index větší než 10 nebo jakákoli zásilka mající kritický bezpečnostní index větší než 50 musí být přepravovány pouze pod výlučným použitím.

(3.5) Pro zásilký pod výlučným použitím nesmějí meze aktivity překročit:

- (a) 10 mSv/h v jakémkoli místě vnějšího povrchu jakéhokoli kusu nebo přepravního obalového souboru a smějí překročit 2 mSv/h jen pokud:

- (i) vozidlo je vybaveno uzávěrem, který během běžných podmínek přepravy zabraňuje přístupu nepovolaných osob do vnitřku pod uzávěr;
 - (ii) jsou učiněna opatření, která zabezpečují kus nebo přepravní obalový soubor tak, že jejich poloha ve vozidle zůstává nezměněna během běžných podmínek přepravy, a
 - (iii) není žádná nakládka nebo vykládka během přepravy;
 - (b) 2 mSv/h v jakémkoli místě vnějšího povrchu vozidla, včetně horních a spodních povrchů, nebo, v případě nekrytého vozidla v jakémkoli místě na svislých rovinách promítnutých z vnějších hran vozidla, na vnějším místě povrchu nákladu a na spodním vnějším povrchu vozidla; a
 - (c) 0.1 mSv/h v jakémkoli místě vzdáleném 2 m od svislých rovin tvořených vnějšími podélnými povrchy vozidla nebo, jestliže náklad je přepravován v nekrytém vozidle, v jakémkoli místě vzdáleném 2 m od svislých rovin promítnutých z vnějších hran vozidla.
- (4) *Dodatečné požadavky vztahující se k přepravě a skladování při transitu štěpných látek*
- (4.1) Počet kusů, přepravních obalových souborů a kontejnerů obsahujících štěpné látky uložené při tranzitu v jakémkoli skladovacím prostoru musí být tak omezen, aby součet kritických bezpečnostních indexů v jakékoli skupině takových kusů, přepravních obalových souborů nebo kontejnerů nepřekročil 50. Skupiny takových kusů, přepravních obalových souborů a kontejnerů musí být skladovány tak, aby byl udržen prostor nejméně 6 m od ostatních skupin takových kusů, přepravních obalových souborů nebo kontejnerů.
- (4.2) Pokud celkový součet kritických bezpečnostních indexů ve vozidle nebo v kontejneru překročí 50, jak je dovoleno v tabulce E výše, musí se skladovat tak, aby byl udržen prostor nejméně 6 m od jiných skupin takových kusů, přepravních obalových souborů nebo kontejnerů obsahujících štěpné látky nebo jiných vozidel přepravujících radioaktivní látky.
- (4.3) Štěpné látky splňující jedno z ustanovení (a) až (f) pododdílu 2.2.7.2.3.5 musí splňovat tyto požadavky:
- (a) V rámci zásilky smí být uplatněno pouze jedno z ustanovení (a) až (f) pododdílu 2.2.7.2.3.5;
 - (b) V rámci zásilky smí být pouze jedna schválená štěpná látka v kusech klasifikovaná v souladu s 2.2.7.2.3.5 (f), pokud není v osvědčení o schválení dovolena přeprava více látek;
 - (c) Štěpné látky v kusech klasifikované dle 2.2.7.2.3.5 (c) musí být přepravovány v zásilce, která neobsahuje více než 45 g štěpných nuklidů;
 - (d) Štěpné látky v kusech klasifikované dle 2.2.7.2.3.5 (d) musí být přepravovány v zásilce, která neobsahuje více než 15 g štěpných nuklidů;
 - (e) Nebalené nebo balené štěpné látky klasifikované dle 2.2.7.2.3.5 (e) musí být přepravovány za výlučného použití ve vozidle, které neobsahuje více než 45 g štěpných nuklidů.
- (5) Poškozené nebo dřevé kusy, kontaminované obaly

- (5.1) Pokud je zřejmé, že kus je poškozený nebo děravý, nebo pokud je podezření, že kus může být děravý nebo poškozený, přístup ke kusu musí být omezen a kvalifikovaná osoba musí co možno nejdříve odhadnout rozsah kontaminace a výslednou dávkovou intenzitu kusu. Rozsah odhadu musí zahrnovat kus, vozidlo, sousední nakládací a vykládací prostory, a pokud je to nezbytné, všechny ostatní věci, které byly přepravovány ve vozidle. Pokud je to nezbytné, musí být učiněny dodatečné kroky pro ochranu osob, majetku a prostředí v souladu s ustanoveními vydanými příslušným orgánem, aby se zdolaly a minimalizovaly následky takového úniku nebo poškození.
- (5.2) Kusy poškozené nebo s únikem radioaktivního obsahu převyšujícím přípustné meze pro normální podmínky přepravy mohou být přemístěny pod dozorem na jiné místo, ale nesmí být odeslány, aniž byly opraveny nebo obnoveny a dekontaminovány.
- (5.3) Vozidlo a zařízení používané pravidelně pro přepravu radioaktivních látek musí být periodicky kontrolována pro stanovení úrovně kontaminace. Četnost takových kontrol musí být přiměřená pravděpodobnosti kontaminace a objemu přepravovaných radioaktivních látek.
- (5.4) S výhradou ustanovení odstavce (5.5), jakékoli vozidlo nebo zařízení nebo jejich část, které byly kontaminovány nad meze uvedené v 4.1.9.1.2 během přepravy radioaktivních látek nebo které vykazují dávkovou intenzitu na povrchu překračující 5 $\mu\text{Sv/h}$, musí být dekontaminovány co možno nejdříve kvalifikovanou osobou a nesmí být znovu použity, pokud nejsou splněny následující podmínky:
- (a) nefixovaná radioaktivní kontaminace nepřekročí mezní hodnoty stanovené v 4.1.9.1.2;
 - (b) dávková intenzita následkem fixované radioaktivní kontaminace nepřekročí 5 $\mu\text{Sv/h}$ na povrchu.
- (5.5) Přepravní obalový soubor, kontejner, cisterna, IBC nebo vozidlo určené pro přepravu radioaktivních látek při výlučném použití jsou vyňaty z požadavků uvedených v předchozím odstavci (5.4) a v 4.1.9.1.4 jedině s hlediska svých vnitřních povrchů a jen po dobu, po kterou zůstávají ve výlučném použití.
- (6) Jiné požadavky
- Pokud není možno zásilku dodat, musí být uložena na bezpečném místě a příslušný orgán musí být co možno nejdříve informován a požádán o pokyny pro další činnost.
- CV34 Před přepravou tlakových nádob musí být zajištěno, aby se nezvýšil tlak v důsledku případné tvorby vodíku.
- CV35 Jsou-li použity pytle jako samostatné obaly, musí být vzájemně od sebe dostatečně vzdáleny, aby se dosáhlo dobrého rozptylu tepla.
- CV36 Kusy musí být nakládány nejlépe do nekrytých nebo odvětrávaných vozidel nebo nekrytých nebo odvětrávaných kontejnerů. Pokud toto není možné a kusy jsou přepravovány v jiných uzavřených vozidlech nebo kontejnerech, musí být dveře do nákladového prostoru opatřeny následujícím nápisem o výšce písmen nejméně 25 mm:

„POZOR
NEODVĚTRÁVANÝ PROSTOR
OTEVÍRAT OPATRNĚ“

Tento nápis musí být v jazyce, který považuje za vhodný odesílatel.

- CV37 Před přepravou musí být vedlejší produkty z tavení nebo přetavování hliníku zchlazeny na teplotu okolí předtím, než budou naloženy. Vozidla s plachtou a kontejnery s plachtou musí být vodotěsné. Dveře nákladového prostoru uzavřených vozidel a uzavřených kontejnerů musí být označeny následujícím nápisem o výšce písmen nejméně 25 mm:

„POZOR
UZAVŘENÝ LOŽNÝ PROSTOR
OTEVÍRAT OPATRNĚ“

Tento nápis musí být v jazyce, který považuje za vhodný odesílatel.

PŘÍLOHA B

USTANOVENÍ O DOPRAVNÍCH PROSTŘEDCÍCH A O PŘEPRAVĚ

ČÁST 8

POŽADAVKY NA OSÁDKY VOZIDEL, JEJICH VÝBAVU, PROVOZ A PRŮVODNÍ DOKLADY

KAPITOLA 8.1

VŠEOBECNÉ POŽADAVKY NA DOPRAVNÍ JEDNOTKY A JEJICH VYBAVENÍ

8.1.1 Dopravní jednotky

Dopravní jednotka naložená nebezpečnými věcmi nesmí mít v žádném případě více než jeden přívěs (nebo návěs).

8.1.2 Průvodní doklady

8.1.2.1 Kromě dokladů vyžadovaných jinými předpisy musí být dopravní jednotka vybavena těmito doklady:

- (a) přepravními doklady předepsanými v oddílu 5.4.1, které zahrnují všechny přepravované nebezpečné věci, a pokud je to vhodné, osvědčením o naložení velkého kontejneru nebo vozidla předepsané v oddílu 5.4.2;
- (b) písemnými pokyny předepsanými v oddílu 5.4.3;
- (c) *(vyhrazeno)*;
- (d) průkazy totožnosti s fotografií každého člena osádky vozidla podle pododdílu 1.10.1.4.

8.1.2.2 Stanoví-li tak ustanovení ADR, musí být dopravní jednotka vybavena ještě těmito dalšími doklady:

- (a) osvědčením o schválení uvedeným v oddílu 9.1.3 pro každou dopravní jednotku nebo vozidlo této dopravní jednotky;
- (b) osvědčením o školení řidiče, které je předepsáno v oddílu 8.2.1;
- (c) kopii schválení příslušného orgánu, pokud je vyžadováno 5.4.1.2.1(c) nebo (d) nebo 5.4.1.2.3.3.

8.1.2.3 Písemné pokyny předepsané v 5.4.3 musí být uloženy takovým způsobem, aby je bylo možno snadno nalézt.

8.1.2.4 *(Vypuštěno)*

8.1.3 Označování

Dopravní jednotky přepravující nebezpečné věci musí být označeny podle kapitoly 5.3.

8.1.4 Hasicí přístroje

8.1.4.1 Následující tabulka ukazuje minimální ustanovení pro přenosné hasicí přístroje pro třídy hořlavosti¹ A, B a C, která se vztahují na dopravní jednotky přepravující nebezpečné věci, s výjimkou těch, které jsou uvedeny v 8.1.4.2:

¹ K definici tříd hořlavosti viz normu EN 2:1992 + A1:2004 Klasifikace požárů.

(1) <i>Největší povolená hmotnost dopravní jednotky</i>	(2) <i>Nejmenší počet hasicích přístrojů</i>	(3) <i>Nejmenší celková kapacita na dopravní jednotku</i>	(4) <i>Hasicí přístroj vhodný pro požár motoru nebo kabiny. Alespoň jeden s nejmenší kapacitou:</i>	(5) <i>Dodatečný požadavek na hasicí přístroj(e). Alespoň jeden hasicí přístroj musí mít nejmenší kapacitu:</i>
≤ 3,5 tuny	2	4 kg	2 kg	2 kg
> 3,5 tuny ≤ 7,5 tuny	2	8 kg	2 kg	6 kg
> 7,5 tuny	2	12 kg	2 kg	6 kg

Tyto kapacity jsou pro přístroje se suchým práškem (v případě jiné vhodné hasicí látky musí být kapacita ekvivalentní).

8.1.4.2 Dopravní jednotky přepravující nebezpečné věci podle pododdílu 1.1.3.6 musí být vybaveny jedním přenosným hasicím přístrojem pro třídy hořlavosti² A, B a C s obsahem nejméně 2 kg suchého prášku (nebo s odpovídajícím obsahem jiné vhodné hasicí látky).

8.1.4.3 Přenosné hasicí přístroje musí být vhodné pro použití na vozidle a musí splňovat příslušné požadavky normy EN 3 Přenosné hasicí přístroje, části 7 (EN 3-7:2004 + A1:2007).

Jestliže je vozidlo vybaveno pevným hasicím přístrojem pro hašení požáru v motoru, automaticky nebo snadno uváděným v činnost, přenosný hasicí přístroj nemusí být vhodný pro hašení požáru motoru. Hasicí látky musí být takové, aby nebyly náchylné k uvolňování toxických plynů do kabiny řidiče nebo vlivem horka způsobeného požárem.

8.1.4.4 Přenosné hasicí přístroje podle ustanovení pododdílu 8.1.4.1 nebo 8.1.4.2 musí být opatřeny plombou, která umožňuje ověřit, že jich nebylo použito.

Hasicí přístroje se musí podrobovat periodickým kontrolám podle uznávaných vnitrostátních norem, aby byla zaručena jejich funkční bezpečnost. Musí být opatřeny značkou osvědčující, že odpovídají normě uznávané příslušným orgánem, jakož i nápisem udávajícím datum (měsíc, rok) příští periodické kontroly nebo popřípadě maximální dovolenou dobu používání.

8.1.4.5 Hasicí přístroje musí být na dopravní jednotce instalovány takovým způsobem, aby byly snadno přístupné pro osádku vozidla. Instalace musí být provedena takovým způsobem, aby hasicí přístroje byly chráněny proti účinkům počasí a nebyla tak ovlivněna jejich funkční bezpečnost. Datum periodické kontroly vyžadované dle 8.1.4.4 nesmí během přepravy pozbýt platnost.

8.1.5 Další výbava a výbava pro osobní ochranu

8.1.5.1 Každá dopravní jednotka, kterou se přepravují nebezpečné věci, musí být vybavena částmi výbavy pro obecnou a osobní ochranu podle 8.1.5.2. Části výbavy musí být vybrány podle čísla bezpečnostní značky naložených věcí. Čísla bezpečnostních značek mohou být identifikována z přepravního dokladu.

8.1.5.2 Následující výbava musí být při přepravě v dopravní jednotce:

- pro každé vozidlo zakládací klín, jehož velikost odpovídá maximální hmotnosti vozidla;
- dva stojací výstražné prostředky;
- kapalina pro výplach očí²; a

² K definici tříd hořlavosti viz norma EN 2:1992 + A1:2004 Klasifikace požárů

² Nevyžaduje se pro čísla bezpečnostních značek 1, 1.4, 1.5, 1.6, 2.1, 2.2 a 2.3.

pro každého člena osádky vozidla

- fluoreskující výstražná vesta (např. jak je popsána v normě EN 471:2003 + A1:2007);
- přenosná svítlna odpovídající ustanovením 8.3.4;
- pár ochranných rukavic; a
- ochrana očí (např. ochranné brýle).

8.1.5.3

Dodatečná výbava vyžadovaná pro určité třídy:

- nouzová úniková maska³ pro každého člena osádky vozidla musí být při přepravě ve vozidle pro čísla bezpečnostních značek 2.3 nebo 6.1;
- lopata⁴;
- ucpávka kanalizační vpusti⁴;
- sběrná nádoba⁴.

³ Například nouzová úniková maska s kombinovaným plynovým/prachovým filtrem typu A1B1E1K1-P1 nebo A2B2E2K2 P2, která je podobná masce popsané v normě EN 14387:2004 + A1:2008.

⁴ Vyžaduje se jen pro tuhé látky a kapaliny s čísly bezpečnostních značek 3, 4.1, 4.3, 8 nebo 9.

KAPITOLA 8.2

POŽADAVKY NA ŠKOLENÍ OSÁDKY VOZIDLA

8.2.1 Rozsah platnosti a všeobecné požadavky na školení řidičů

8.2.1.1 Řidiči vozidel přepravujících nebezpečné věci musí být držiteli osvědčení vydaného příslušným orgánem, jímž se osvědčuje, že absolvovali školení a prošli úspěšně zkouškou ze zvláštních požadavků, které musí být splněny při přepravě nebezpečných věcí.

8.2.1.2 Řidiči vozidel přepravujících nebezpečné věci musí absolvovat základní školicí kurz. Školení musí mít formu kurzu schváleného příslušným orgánem. Jeho hlavním posláním je seznámit řidiče s riziky vznikajícími při přepravě nebezpečných věcí a poskytnout jim základní informace nezbytné pro minimalizaci pravděpodobnosti vzniku případné nehody, a pokud k ní dojde, umožnit jim provést bezpečnostní opatření nezbytná pro jejich vlastní bezpečnost, pro bezpečnost veřejnosti, pro ochranu životního prostředí a pro omezení následků nehody. Toto školení, které musí zahrnovat rovněž individuální praktická cvičení, musí jako základní školení pro všechny kategorie řidičů obsahovat alespoň náplň stanovenou v 8.2.2.3.2. Příslušný orgán může schválit základní školicí kurzy omezené na určité nebezpečné věci nebo na určitou třídu nebo třídy. Tyto omezené základní školicí kurzy nedovolují účastnit se školení uvedených v 8.2.1.4.

8.2.1.3 Řidiči vozidel nebo MEMU přepravujících nebezpečné věci v nesnímatelných nebo snímatelných cisternách s vnitřním objemem větším než 1 m³, řidiči bateriových vozidel s celkovým vnitřním objemem větším než 1 m³ a řidiči vozidel nebo MEMU přepravujících nebezpečné věci na dopravní jednotce v cisternových kontejnerech, přemístitelných cisternách a MEGC s vnitřním objemem každé(ho) z nich větším než 3 m³ musí absolvovat specializační kurz pro přepravu v cisternách, jehož náplň musí být nejméně taková, jaká je uvedena v 8.2.2.3.3. Příslušný orgán může schválit specializační školicí kurzy pro přepravu v cisternách omezené na určité nebezpečné věci nebo na určitou třídu nebo třídy. Tyto omezené specializační školicí kurzy pro přepravu v cisternách nesmějí být poskytovány řidičům vozidel uvedených v 8.2.1.4.

8.2.1.4 Řidiči vozidel přepravujících nebezpečné látky nebo předměty třídy 1 kromě látek a předmětů podtřídy 1.4, skupiny snášenlivosti S nebo řidiči vozidel přepravujících nebezpečné látky nebo předměty třídy 7 musí absolvovat specializační školení obsahující nejméně náplň stanovenou v 8.2.2.3.4 nebo 8.2.2.3.5, jak je to vhodné.

8.2.1.5 Všechna školení, praktická cvičení a zkoušky, jakož i úloha příslušných orgánů musí odpovídat ustanovením uvedeným v oddílu 8.2.2.

8.2.1.6 Všechna osvědčení o školení odpovídající požadavkům tohoto oddílu a vydaná podle 8.2.2.8. příslušným orgánem smluvní strany ADR musí být uznávána během své doby platnosti příslušnými orgány ostatních smluvních stran ADR.

8.2.2 Zvláštní požadavky na školení řidičů

8.2.2.1 Školení musí poskytovat nezbytné znalosti a dovednosti teoretickým školením a praktickými cvičeními. Znalosti musí být ověřeny zkouškou.

8.2.2.2 Školicí organizace musí zajistit, aby školitelé měli dobré znalosti a brali v úvahu poslední vývoj v předpisech a požadavcích na školení týkající se přepravy nebezpečných věcí. Školení musí být prováděno s ohledem na praxi. Program školení musí odpovídat schválení uvedenému v 8.2.2.6, s náplní uvedenou v 8.2.2.3.2 až 8.2.2.3.5. Školení musí zahrnovat také individuální praktická cvičení (viz 8.2.2.3.8).

8.2.2.3 *Struktura školení*

8.2.2.3.1 Školení musí mít formu základního školícího kurzu, a pokud je to potřebné, specializačních školících kurzů. Základní školící kurzy a specializační školící kurzy mohou být ve formě rozšířeného kurzu, spojení v jeden u stejné školící organizace.

8.2.2.3.2 Náplň základního školícího kurzu musí obsahovat nejméně:

- (a) všeobecné předpisy vztahující se na přepravu nebezpečných věcí;
- (b) hlavní druhy nebezpečí;
- (c) informace o ochraně životního prostředí kontrolou pohybu odpadů;
- (d) preventivní a bezpečnostní opatření vhodná pro různé druhy nebezpečí;
- (e) co dělat v případě nehody (první pomoc, bezpečnost silničního provozu, základní znalosti o používání ochranných prostředků, písemné pokyny atd.);
- (f) označování nápisy, bezpečnostními značkami, velkými bezpečnostními značkami a oranžovými tabulkami;
- (g) co řidič během přepravy musí a co nesmí dělat;
- (h) účel a funkce technických zařízení na vozidlech;
- (i) zákazy společné nakládky do jednoho vozidla nebo do jednoho kontejneru;
- (j) bezpečnostní opatření při nakládce a vykládce nebezpečných věcí;
- (k) všeobecné informace týkající se právní odpovědnosti;
- (l) informace o provozu kombinované dopravy;
- (m) manipulaci a uložení kusů (ve vozidle);
- (n) omezení provozu v tunelech a pokyny pro chování se v tunelech (prevence nehod, bezpečnost, činnost v případě požáru nebo v jiných případech nouze atd.);
- (o) povědomí o bezpečnosti

8.2.2.3.3 Náplň specializačního školícího kurzu pro přepravu v cisternách musí obsahovat nejméně:

- (a) chování vozidel při jízdě po silnici, včetně pohybů nákladu;
- (b) zvláštní požadavky týkající se vozidel;
- (c) všeobecné teoretické znalosti různých systémů plnění a vyprazdňování;
- (d) specifická dodatečná ustanovení vztahující se na používání těchto vozidel (osvědčení o schválení, schvalovací značení, označování velkými bezpečnostními značkami a oranžovými tabulkami atd.).

8.2.2.3.4 Náplň specializačního školícího kurzu pro přepravu látek a předmětů třídy 1 musí obsahovat nejméně:

- (a) zvláštní rizika, která jsou vlastní výbušninám a pyrotechnickým látkám a předmětům;
- (b) zvláštní požadavky týkající se společné nakládky látek a předmětů třídy 1.

8.2.2.3.5 Náplň specializačního školícího kurzu pro přepravu radioaktivních látek třídy 7 musí obsahovat nejméně:

- (a) zvláštní rizika vzhledem k ionizujícímu záření;
- (b) zvláštní požadavky týkající se balení, manipulace, společné nakládky a uložení radioaktivních látek ve vozidle;
- (c) zvláštní opatření, která musí být učiněna při nehodě za přítomnosti radioaktivních látek.

8.2.2.3.6 Vyučovací hodina trvá zásadně 45 minut.

8.2.2.3.7 Za normálních okolností není dovoleno pro každý den školícího kurzu více než 8 vyučovacích hodin.

8.2.2.3.8 Individuální praktická cvičení musí být prováděna v návaznosti na teoretické školení a musí zahrnovat nejméně první pomoc, hašení ohně a co dělat v případě poruchy nebo nehody.

8.2.2.4 *Program prvního školení*

8.2.2.4.1 Nejkratší časový rozsah teoretické části každého prvního kurzu nebo části rozšířeného kurzu musí být následující:

Základní školící kurz	18 vyučovacích hodin
-----------------------	----------------------

Specializační školící kurz pro přepravu v cisternách	12 vyučovacích hodin
--	----------------------

Specializační školící kurz pro přepravu látek a předmětů třídy 1	8 vyučovacích hodin
--	---------------------

Specializační školící kurz pro přepravu radioaktivních látek třídy 7	8 vyučovacích hodin
--	---------------------

Pro základní školící kurz a specializační školící kurz pro přepravu v cisternách, jsou vyžadovány dodatečné vyučovací hodiny pro praktická cvičení uvedená v 8.2.2.3.8, jejichž počet bude různý v závislosti na počtu školených řidičů.

8.2.2.4.2 Celkový časový rozsah rozšířeného kurzu může být stanoven příslušným orgánem, kde musí dodržet časový rozsah základního školícího kurzu a specializačního školícího kurzu pro přepravu v cisternách, ale může ho doplnit zkrácenými specializačními školícími kurzy pro třídy 1 a 7.

8.2.2.5 *Program obnovovacího školení*

8.2.2.5.1 Obnovovací školení prováděné v pravidelných časových intervalech má za cíl aktualizovat znalosti řidičů; musí zahrnovat novinky v oblasti techniky, právních předpisů a nebezpečných věcí.

8.2.2.5.2 Časový rozsah obnovovacího školení včetně individuálních praktických cvičení musí být nejméně dva dny pro rozšířené školící kurzy, nebo nejméně polovina časového rozsahu stanoveného pro odpovídající první základní nebo první specializační kurzy, jak je pro jednotlivé kurzy uvedeno v 8.2.2.4.1.

8.2.2.5.3 Řidič smí nahradit obnovovací školící kurz a zkoušku odpovídajícím prvním školícím kurzem a zkouškou.

8.2.2.6 *Schvalování školení*

8.2.2.6.1 Školící kurzy musí být schváleny příslušným orgánem.

8.2.2.6.2 Toto schválení smí být vydáno pouze na písemnou žádost.

8.2.2.6.3 K žádosti o schválení musí být připojeny tyto doklady:

- (a) podrobný program školení upřesňující náplň výuky a uvádějící časový rozvrh a plánované vyučovací metody;
- (b) kvalifikace a obor činnosti vyučujících;
- (c) informace o místech konání kurzů a o učebních pomůckách, jakož i o prostředcích pro praktická cvičení;
- (d) podmínky pro účast na kurzech, např. počet účastníků.

8.2.2.6.4 Příslušný orgán musí zajišťovat dozor nad školením a zkouškami.

8.2.2.6.5 Schválení bude uděleno příslušným orgánem písemně při splnění těchto podmínek:

- (a) školení musí být prováděno v souladu s doklady připojenými k žádosti o schválení;
- (b) příslušný orgán si vyhrazuje právo vyslat pověřené osoby k účasti na školících kurzech a zkouškách;

- (c) příslušný orgán musí být včas informován o době a místě konání jednotlivých školicích kurzů;
- (d) schválení může být odebráno, jestliže podmínky schválení nejsou plněny.

8.2.2.6.6 Ve schvalovacím dokladu musí být uvedeno, zda jde o základní nebo specializační školicí kurzy, první nebo obnovovací školicí kurzy a zda jsou omezeny na určité nebezpečné věci nebo na určitou třídu nebo třídy.

8.2.2.6.7 Jestliže školicí organizace po obdržení schválení školicího kurzu hodlá provést změny, které jsou závažné vzhledem k udělenému schválení, musí k tomu předem získat povolení od příslušného orgánu. Toto ustanovení se vztahuje zejména na změny týkající se programu školení.

8.2.2.7 Zkoušky

8.2.2.7.1 Zkoušky pro první základní školicí kurz

8.2.2.7.1.1 Po ukončení školení, včetně praktických cvičení, musí být provedeny zkoušky odpovídající základnímu školicímu kurzu.

8.2.2.7.1.2 Při zkoušce musí kandidát prokázat, že má znalosti, přehled a dovednosti potřebné pro výkon povolání řidiče vozidel přepravujících nebezpečné věci, které jsou náplní základního kurzu.

8.2.2.7.1.3 Pro tento účel musí příslušný orgán připravit seznam otázek, které odpovídají bodům náplně uvedeným v 8.2.2.3.2. Otázky při zkoušce musí být vybrány z tohoto seznamu. Kandidáti nesmějí před zkouškou znát otázky vybrané pro zkoušku z tohoto seznamu.

8.2.2.7.1.4 Po ukončení rozšířeného školicího kurzu může být uspořádána pouze jedna zkouška.

8.2.2.7.1.5 Každý příslušný orgán musí dohlížet na způsoby zkoušek.

8.2.2.7.1.6 Zkouška musí mít formu písemné zkoušky nebo kombinace písemné a ústní zkoušky. Každý kandidát musí dostat nejméně 25 písemných otázek pro základní školicí kurz. Pokud zkouška následuje po obnovovacím školicím kurzu, musí dostat nejméně 15 písemných otázek. Doba trvání těchto zkoušek musí být nejméně 45 resp. 30 minut. Otázky mohou být různého stupně obtížnosti a mohou být hodnoceny různou vahou.

8.2.2.7.2 Zkoušky pro první specializační školicí kurzy pro přepravu v cisternách nebo pro přepravu výbušných látek a předmětů třídy 1 nebo radioaktivních látek třídy 7

8.2.2.7.2.1 Po úspěšném složení zkoušky ze základního školicího kurzu a po absolvování specializačního školicího kurzu pro přepravu v cisternách nebo pro přepravu výbušných látek a předmětů třídy 1 nebo radioaktivních látek třídy 7 se kandidát může účastnit zkoušky odpovídající školení.

8.2.2.7.2.2 Zkouška musí být provedena a dohlížena stejným způsobem, jak je uvedeno v 8.2.2.7.1. Seznam otázek se musí týkat témat shrnutých v 8.2.2.3.3, 8.2.2.3.4 nebo 8.2.2.3.5, jak je to náležité.

8.2.2.7.2.3 V každém specializačním kurzu musí být při zkoušce položeno nejméně 15 písemných otázek. Pokud zkouška následuje po obnovovacím školicím kurzu, musí dostat nejméně 10 písemných otázek. Doba trvání těchto zkoušek musí být nejméně 30 resp. 20 minut.

8.2.2.7.2.4 Je-li zkouška založena na omezeném základním školicím kurzu, omezuje se tím zkouška specializačního kurzu na stejný rozsah.

8.2.2.8 Osvědčení o školení řidiče

8.2.2.8.1 Podle 8.2.1.8 bude osvědčení vydáno:

- (a) po absolvování základního kurzu, za podmínky, že kandidát úspěšně složil zkoušku podle 8.2.2.7.1;
- (b) případně po absolvování specializačního kurzu pro přepravu v cisternách nebo pro přepravu látek a předmětů třídy 1 nebo radioaktivních látek třídy 7, nebo po získání znalostí

uvedených ve zvláštních ustanoveních S1 a S11 v kapitole 8.5, za podmínky, že kandidát úspěšně složil zkoušku podle 8.2.2.7.2.;

- (c) případně po absolvování omezeného základního školicího kurzu nebo omezeného specializačního školicího kurzu pro přepravu v cisternách, za podmínky, že kandidát úspěšně složil zkoušku podle 8.2.2.7.1 nebo 8.2.2.7.2. Na vydaném osvědčení musí být jasně uveden jeho omezený rozsah platnosti na příslušné nebezpečné věci nebo třídu (třídy).

8.2.2.8.2 Doba platnosti osvědčení o školení řidiče je pět let ode dne, kdy řidič úspěšně složil zkoušku z prvního základního nebo prvního rozšiřovacího školení.

Doba platnosti osvědčení se prodlouží, jestliže řidič prokáže, že se zúčastnil obnovovacího školení podle 8.2.2.5 a úspěšně složil zkoušku podle 8.2.2.7 v těchto případech:

- (a) v období dvanácti měsíců před datem skončení platnosti osvědčení. Příslušný orgán vydá nové osvědčení, platné na pět let, jehož doba platnosti započne datem skončení platnosti předchozího osvědčení;
- (b) před obdobím dvanácti měsíců před datem skončení platnosti osvědčení. Příslušný orgán vydá nové osvědčení, platné na pět let, jehož doba platnosti započne datem, v němž byla úspěšně složena obnovovací zkouška.

Pokud řidič rozšíří rozsah platnosti svého osvědčení v průběhu jeho doby platnosti splněním požadavků uvedených v 8.2.2.8.1 (b) a (c), zůstává doba platnosti nového osvědčení stejná jako u předchozího osvědčení. Jestliže řidič úspěšně složil zkoušku ze specializačního školení, je specializace platná až do dne skončení platnosti osvědčení.

8.2.2.8.3 Osvědčení musí mít formu vzoru uvedeného v 8.2.2.8.5. Jeho rozměry musí vyhovovat normě ISO 7810: 2003 ID-1 a musí být zhotoveno z plastu. Jeho barva musí být bílá, s černým písmem. Musí obsahovat dodatečný bezpečnostní prvek, jako je hologram, UV tisk nebo gilošovaný vzorek.

8.2.2.8.4 Osvědčení musí být vystaveno v jazyce (jazycích) nebo v jednom z jazyků státu příslušného orgánu, který osvědčení vydal. Pokud žádný z těchto jazyků není angličtina, francouzština nebo němčina, musí být nadpis položky 8 a nadpisy na zadní straně napsány také v angličtině, francouzštině nebo němčině.

** Rozlišovací značka používaná pro motorová vozidla v mezinárodním provozu (pro smluvní strany Úmluvy o silničním provozu 1968 nebo Úmluvy o silničním provozu 1949, jak oznámeno generálnímu tajemníkovi Organizace spojených národů podle článku 45 (4) nebo popřípadě přílohy 4 těchto úmluv).

8.2.2.8.6

Smluvní strany poskytnou sekretariátu EHK OSN příklad národního vzoru jakéhokoliv osvědčení určeného pro vystavení v souladu s tímto oddílem, spolu s příklady vzorů osvědčení, která jsou dosud platná. Smluvní strana může dodatečně poskytnout vysvětlující poznámky. Sekretariát EHK OSN zpřístupní získané informace všem smluvním stranám.

8.2.3 Školení všech osob, kromě řidičů majících osvědčení podle oddílu 8.2.1, podílejících se na silniční přepravě nebezpečných věcí

Osoby, jejichž pracovní povinnosti se týkají silniční přepravy nebezpečných věcí, musí být podle kapitoly 1.3 vyškoleny o předpisech pro dopravu takových věcí podle své odpovědnosti a pracovní náplně. Tento požadavek se vztahuje na osoby, jako jsou zaměstnanci silničních dopravců nebo odesílatelů, personál provádějící nakládku nebo vykládku nebezpečných věcí, personál zasílatelů nebo nakládců a řidiči vozidel, kromě řidičů majících osvědčení podle odstavce 8.2.1, podílejících se na silniční přepravě nebezpečných věcí.

KAPITOLA 8.3

DALŠÍ POŽADAVKY, KTERÉ MUSÍ PLNIT OSÁDKA VOZIDLA

8.3.1 Osoby

V dopravních jednotkách, jimiž se přepravují nebezpečné věci, je zakázáno přepravovat osoby, kromě členů osádky vozidla.

8.3.2 Používání hasicích přístrojů

Členové osádky vozidla musí být řádně obeznámeni s obsluhou hasicích přístrojů.

8.3.3 Zákaz otevírání kusů

Řidič ani žádný jiný člen osádky nesmí otevřít kus obsahující nebezpečné věci.

8.3.4 Přenosná osvětlovací zařízení

Přenosné svítidly nesmějí mít kovový povrch, který by mohl vyvolat jiskření.

8.3.5 Zákaz kouření

Při provádění ložných operací je zakázáno kouřit ve vozidlech a v jejich blízkosti. Tento zákaz kouření se vztahuje také na použití elektronických cigaret a podobných prostředků.

8.3.6 Běh motoru při nakládce nebo vykládce

Během nakládky a vykládky musí být motor zastaven, kromě případů, kdy je nutno použít motoru pro pohon čerpadel nebo jiných zařízení pro nakládku nebo vykládku vozidla a kdy toto použití připouštějí právní předpisy státu, v němž se vozidlo nachází.

8.3.7 Používání parkovacích brzd a zakládacích klínů

Žádná vozidla přepravující nebezpečné věci nesmí stát bez zatažených parkovacích brzd. Přípojná vozidla bez brzdových ústrojí musí být při stání mimo provoz založena nejméně jedním zakládacím klínem, jak je uvedeno v 8.1.5.2.

8.3.8 Použití kabelových spojů

V případě dopravní jednotky vybavené antiblokovacím brzdovým systémem sestávající z motorového vozidla a přípojného vozidla s nejvyšší celkovou hmotností přesahující 3,5 tuny, elektrická instalace uvedená v odstavci 9.2.2.6.3 musí spojovat tažné vozidlo a přípojně vozidlo po celou dobu přepravy.

KAPITOLA 8.4

POŽADAVKY NA DOZOR NAD VOZIDLY

8.4.1

Vozidla přepravující nebezpečné věci v množstvích uvedených ve zvláštních ustanoveních S1 (6) a S14 až S24 kapitoly 8.5 pro dané látky podle sloupce (19) tabulky A kapitoly 3.2 musejí být pod dozorem, nebo smějí být zaparkována bez dozoru v objektu dopravního nebo průmyslového závodu, který poskytuje plnou záruku bezpečnosti. Nejsou-li tyto možnosti parkování, může být vozidlo po vhodných bezpečnostních opatřeních zaparkováno na izolovaném místě odpovídajícím podmínkám stanoveným pod písmeny (a), (b) nebo (c) níže:

- (a) parkoviště hlídané dozorcem, který byl informován o povaze nákladu a místě, kde se zdržuje řidič,
- (b) veřejné nebo soukromé parkoviště, na němž vozidlo nebude pravděpodobně vystaveno žádnému nebezpečí poškození jinými vozidly; nebo
- (c) vhodné volné prostranství situované stranou od veřejných pozemních komunikací a obývaných míst, které normálně neslouží veřejnosti jako cesta nebo shromaždiště.

Parkovišť uvedených pod písmenem (b) se smí použít jen v případě, že nejsou k dispozici parkoviště uvedená pod písmenem (a), a parkovišť uvedených pod písmenem (c) se smí použít, jen nejsou-li k dispozici parkoviště uvedená pod písmeny (a) a (b).

8.4.2

Naložené MEMU musejí být pod dozorem nebo alternativně smějí být zaparkovány bez dozoru v objektu dopravního nebo průmyslového závodu, který poskytuje plnou záruku bezpečnosti. Prázdné nevyčištěné MEMU jsou vyňaty z platnosti tohoto požadavku.

KAPITOLA 8.5

DODATEČNÉ POŽADAVKY NA JEDNOTLIVÉ TŘÍDY NEBO LÁTKY

Kromě požadavků kapitol 8.1 až 8.4 se na přepravu látek nebo předmětů, u nichž jsou ve sloupci (19) tabulky A kapitoly 3.2 příslušné odvolávky, vztahují ještě dále uvedené požadavky. V případě rozporu s požadavky kapitol 8.1 až 8.4 mají požadavky této kapitoly přednost.

S1: Požadavky na přepravu výbušných látek a předmětů (třída 1)

(1) Zvláštní školení řidičů

Jestliže podle jiných předpisů platných ve státě smluvní strany řidič již absolvoval rovnocenné školení v odlišném režimu nebo pro odlišný účel, zahrnující náplň stanovenou v 8.2.2.3.4, může mu být absolvování specializačního školicího kurzu buď částečně, nebo úplně prominuto.

(2) Úřední osoba

Příslušný orgán státu smluvní strany ADR může na náklady dopravce požadovat, aby ve vozidle byla přítomna schválená úřední osoba, pokud to stanoví jeho vnitrostátní předpisy.

(3) Zakaz kouření, ohně a otevřeného plamene

Kouření, použití ohně nebo otevřeného plamene je zakázáno ve vozidlech přepravujících látky a předměty třídy 1, v jejich blízkosti a během nakládky a vykládky těchto látek a předmětů. Tento zákaz kouření se vztahuje také na použití elektronických cigaret a podobných prostředků.

(4) Místa nakládky a vykládky

- (a) Je zakázáno nakládat a vykládat látky a předměty třídy 1 na veřejném místě v zastavěném území bez zvláštního povolení příslušných orgánů.
- (b) Je zakázáno nakládat a vykládat látky a předměty třídy 1 na veřejném místě mimo zastavěné území bez předchozího oznámení příslušným orgánům, pokud tyto ložné operace nejsou ospravedlněny vážnými bezpečnostními důvody.
- (c) Je-li z nějakého důvodu nutno provádět manipulační operace na veřejném místě, musí se látky a předměty různého druhu od sebe oddělit podle bezpečnostních značek.
- (d) Jsou-li vozidla přepravující látky nebo předměty třídy 1 nucena stát na veřejných místech z důvodů nakládky nebo vykládky, musí být mezi stojícími vozidly dodržena vzdálenost nejméně 50 m. Tato vzdálenost se nevztahuje na vozidla, která patří do stejné dopravní jednotky.

(5) Kolony

- (a) Jedou-li vozidla přepravující látky a předměty třídy 1 v koloně, musí být mezi každou dopravní jednotkou a dopravní jednotkou následující dodržena vzdálenost nejméně 50 m.
- (b) Příslušný orgán může stanovit pravidla pro pořadí nebo složení kolon.

(6) Dozor nad vozidly

Požadavky kapitoly 8.4 se použijí pouze tehdy, když látky a předměty třídy 1 přepravované ve vozidle obsahují celkovou čistou hmotnost výbušné látky překračující limitní množství uvedené níže:

Podtřída 1.1:	0 kg
Podtřída 1.2:	0 kg
Podtřída 1.3, skupina snášenlivosti C:	0 kg
Podtřída 1.3, kromě skupiny snášenlivosti C:	50 kg
Podtřída 1.4, kromě níže uvedených:	50 kg
Podtřída 1.5:	0 kg
Podtřída 1.6:	50 kg

Látky a předměty podtřídy 1.4 zařazené do UN čísel 0104, 0237, 0255, 0267, 0289, 0361, 0365, 0366, 0440, 0441, 0455, 0456 a 0500: 0 kg

Pro společnou nákladku se musí použít nejnižší limit pro jakékoli přepravované látky nebo předměty pro náklad jako celek.

Kromě toho musí být tyto látky a předměty pod stálým dozorem, aby se předešlo jakémukoli jednání ze zlého úmyslu a aby byli uvědoměni řidič a příslušné orgány v případě ztráty nebo požáru.

Tato ustanovení se nevztahují na prázdné nevyčištěné obaly.

(7) Uzamčení vozidel

Dveře a pevné střechy ložných prostorů vozidel EX/II a všechny otvory do ložných prostorů vozidel EX/III přepravujících látky a předměty třídy 1 musí být během přepravy uzamčeny, kromě doby nakládky a vykládky.

S2: Dodatečné požadavky na přepravu hořlavých kapalin nebo plynů**(1) Přenosné svítilny**

Je zakázáno vstupovat do ložného prostoru uzavřeného vozidla, kterým se přepravují kapaliny s bodem vzplanutí nejvýše 60°C, nebo hořlavé látky nebo předměty třídy 2, s přenosnými svítilnami jinými než konstruovanými a vyrobenými tak, aby nemohly zapálit hořlavé páry nebo plyny, které se mohly rozšířit ve vnitřním prostoru vozidla.

(2) Provoz vytápěcího systému s vnitřním spalováním během nakládky a vykládky

Provoz vytápěcího systému s vnitřním spalováním vozidel typu FL (viz část 9) je zakázán během nakládky a vykládky a na nakládacích místech.

(3) Opatření proti akumulaci elektrostatických nábojů

V případě vozidel typu FL (viz část 9) musí být před plněním nebo vyprazdňováním cisteren zajištěno dobré elektrické spojení mezi podvozkem vozidla a zemí. Kromě toho se musí omezit rychlost plnění.

S3: Zvláštní ustanovení o přepravě infekčních látek

Požadavky uvedené ve sloupcích (2), (3) a (5) tabulky v 8.1.4.1 a v oddílu 8.3.4 neplatí.

S4: Dodatečné požadavky na přepravu při řízené teplotě

Udržení předepsané teploty je nezbytnou podmínkou pro bezpečnou přepravu. Všeobecně musí být zajištěno:

- provedení dokonalé kontroly dopravní jednotky před nakládkou;
- poučení dopravce o provozu chladicího systému, včetně seznamu možných dodavatelů chladicí látky na přepravní trase;
- postupy v případě poruchy řízení teploty;
- pravidelné monitorování provozních teplot; a
- možnost náhradního chladicího systému nebo náhradních dílů.

Teplota vzduchu uvnitř ložného prostoru dopravní jednotky musí být měřena dvěma nezávislými snímači (čidly) a údaje o teplotě musí být registrovány tak, aby jakékoli změny teploty byly snadno pozorovatelné.

Teplota musí být kontrolována každé čtyři až šest hodin a zaznamenána.

Jestliže se během přepravy překročí řízená teplota, musí být učiněna pohotovostní opatření zahrnující nezbytné opravy chladicího zařízení nebo zvýšení chladicí kapacity (např. doplněním kapalně nebo tuhé chladicí látky). Musí se též často provádět kontrola teploty a připravovat se na použití nouzových postupů. Jestliže je dosaženo kritické teploty (viz též 2.2.41.1.17 a 2.2.52.1.15 až 2.2.52.1.18), musí být zahájeny nouzové postupy.

POZNÁMKA: Toto ustanovení S4 se nepoužije pro látky zmíněné v 3.1.2.6, jsou-li tyto látky stabilizovány přidáním chemických inhibitorů tak, že SADT je vyšší než 50 °C. V tomto případě může být řízení teploty vyžadováno za podmínek přepravy, kdy teplota může přesáhnout 55 °C.

S5: Zvláštní ustanovení společná pro přepravu radioaktivních látek třídy 7 pouze ve vyjmutých kusech (UN čísla 2908, 2909, 2910 a 2911)

Na tyto přepravy se ustanovení o písemných pokynech uvedená v pododdílu 8.1.2.1 (b) a ustanovení uvedená v oddílech 8.2.1, 8.3.1 a 8.3.4 nevztahují.

S6: Zvláštní ustanovení společná pro přepravu radioaktivních látek třídy 7, jiných než látek ve vyjmutých kusech

Ustanovení uvedená v oddílu 8.3.1 se nevztahují na vozidla, která přepravují pouze kusy, přepravní obalové soubory nebo kontejnery opatřené bezpečnostními značkami kategorie I – BÍLÁ.

Ustanovení uvedená v 8.3.4 se nepoužijí, pokud neexistuje vedlejší nebezpečí.

Další dodatečné požadavky nebo zvláštní ustanovení

S7: (Vypuštěno)

S8: Pokud je v dopravní jednotce naloženo více než 2 000 kg těchto látek, nesmějí být zastávky z provozních důvodů, pokud je to možné, v blízkosti obydlených míst nebo shromaždišť. Zastávka v blízkosti takových míst smí být prodloužena pouze se souhlasem příslušných orgánů.

S9: Během přepravy těchto látek nesmějí být zastávky z provozních důvodů, pokud je to možné, v blízkosti obydlených míst nebo shromaždišť. Zastávka v blízkosti takových míst smí být prodloužena pouze se souhlasem příslušných orgánů.

- S10:** Během měsíců dubna až října musí být kusy přepravované vozidlem, které zůstalo stát, účinně chráněny proti slunci, např. plachtami umístěnými alespoň 20 cm nad nákladem, pokud to vyžadují právní předpisy státu, v němž vozidlo zastavilo.
- S11:** Jestliže podle jiných předpisů platných ve státě smluvní strany řidič již absolvoval rovnocenné školení v odlišném režimu nebo pro odlišný účel, zahrnující náplň stanovenou v 8.2.2.3.5, může mu být absolvování specializačního školicího kurzu buď částečně, nebo úplně prominuto.
- S12:** Jestliže celkový počet kusů obsahující radioaktivní látky přepravovaných v jedné dopravní jednotce nepřesahuje 10 a součet přepravních indexů nepřevyšuje 3 a neexistují žádná vedlejší nebezpečí, nemusí se použít ustanovení oddílu 8.2.1 týkající se školení řidičů. Avšak řidiči musí absolvovat vhodné školení o předpisech pro přepravu radioaktivních látek odpovídající jejich pracovní náplni. Toto školení je poučí o radiačních nebezpečích při přepravě radioaktivních látek. Takové informativní školení musí být potvrzeno osvědčením vystaveným jejich zaměstnavatelem. Viz též 8.2.3.
- S13:** (Vypuštěno)
- S14:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí pro vozidla přepravující jakékoli množství těchto látek.
- S15:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí pro vozidla přepravující jakékoli množství těchto látek. Avšak ustanovení kapitoly 8.4 se nemusejí použít, pokud ložný prostor je uzamčen a přepravované kusy jsou jinak chráněny proti jakékoli nedovolené vykládce.
- S16:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí, jen jsou-li vozidlem přepravovány látky, které mají celkovou hmotnost větší než 500 kg.
- Kromě toho vozidla přepravující více než 500 kg těchto látek musí být pod stálým dozorem, aby se předešlo jakémukoli jednání ze zlého úmyslu a aby byli uvědoměni řidič a příslušné orgány v případě ztráty nebo požáru.
- S17:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí, jen jsou-li vozidlem přepravovány látky, které mají celkovou hmotnost větší než 1 000 kg.
- S18:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí, jen jsou-li vozidlem přepravovány látky, které mají celkovou hmotnost větší než 2 000 kg.
- S19:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí, jen jsou-li vozidlem přepravovány látky, které mají celkovou hmotnost větší než 5 000 kg.
- S20:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí, pokud celková hmotnost nebo objem těchto látek ve vozidle překračuje 10 000 kg věcí v kusech nebo 3 000 litrů v cisternách.
- S21:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí pro všechny látky bez ohledu na jejich hmotnost. Kromě toho musí být tyto věci pod stálým dozorem, aby se předešlo jakémukoli jednání ze zlého úmyslu a aby byli uvědoměni řidič a příslušné orgány v případě ztráty nebo požáru. Avšak ustanovení kapitoly 8.4 se nemusí použít, pokud:
- (a) je ložný prostor uzamčen, anebo jsou přepravované kusy jinak chráněny proti jakékoli nedovolené vykládce; a
 - (b) dávková intenzita nepřesáhne 5 $\mu\text{Sv/h}$ na jakémkoli přístupném místě vnějšího povrchu vozidla.
- S22:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí, pokud celková hmotnost nebo objem těchto látek ve vozidle překračuje 5 000 kg věcí v kusech nebo více než 3 000 litrů v cisternách.

- S23:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí, pokud je látka přepravovaná ve volně loženém stavu nebo v cisternách a celková hmotnost nebo objem ve vozidle přesahuje 3 000 kg nebo 3 000 litrů.
- S24:** Ustanovení kapitoly 8.4 o dozoru nad vozidly se použijí, pokud celková hmotnost ve vozidle překračuje 100 kg.

KAPITOLA 8.6

OMEZENÍ PRŮJEZDU VOZIDEL PŘEPRAVUJÍCÍCH NEBEZPEČNÉ VĚCI SILNIČNÍMI TUNELY

8.6.1 Všeobecná ustanovení

Ustanovení této kapitoly se použijí, pokud průjezd vozidel silničními vozidly je omezen v souladu s oddílem 1.9.5.

8.6.2 Silniční dopravní značky a signály upravující průjezd vozidel přepravujících nebezpečné věci

Kategorie tunelu přiřazená podle 1.9.5.1 příslušným orgánem danému tunelu za účelem omezení průjezdu dopravních jednotek přepravujících nebezpečné věci musí být vyznačena dále uvedenými silničními dopravními značkami a signály.

Značka a signál	Kategorie tunelu
Žádné	Kategorie tunelu A
Značka s dodatečnou tabulkou opatřenou písmenem B	Kategorie tunelu B
Značka s dodatečnou tabulkou opatřenou písmenem C	Kategorie tunelu C
Značka s dodatečnou tabulkou opatřenou písmenem D	Kategorie tunelu D
Značka s dodatečnou tabulkou opatřenou písmenem E	Kategorie tunelu E

8.6.3 Kódy omezení průjezdu tunelem

8.6.3.1 Omezení pro přepravu specifických nebezpečných věcí tunely vycházejí z kódu omezení průjezdu tunelu těchto věcí uvedeného ve sloupci (15) tabulky A kapitoly 3.2. Kódy omezení průjezdu tunelem jsou vloženy do závorek na spodku buňky. Pokud „(-)“ je uvedeno místo jednoho z kódů omezení průjezdu tunelu, nebezpečné věci nepodléhají žádnému omezení průjezdu tunely; pro nebezpečné věci zařazené do UN 2919 a UN 3331 omezení průjezdu tunely může být však částí zvláštního ujednání příslušného(ých) orgánu(ů) na základě 1.7.4.2.

8.6.3.2 Pokud dopravní jednotka obsahuje nebezpečné věci, jimž byly přiřazeny různé kódy omezení průjezdu tunely, nejprísrnější z těchto kódů omezení průjezdu se musí přiřadit celému nákladu.

8.6.3.3 Nebezpečné věci přepravované podle 1.1.3 nepodléhají omezením průjezdu tunely a nesmí být brány v úvahu při určování kódu omezení průjezdu pro celý náklad dopravní jednotky, s výjimkou případů, kdy je vyžadováno označení dopravní jednotky podle 3.4.13 s výhradou ustanovení v 3.4.14¹.

8.6.4 Omezení průjezdu dopravních jednotek přepravujících nebezpečné věci tunely

Omezení průjezdu tunely se vztahují na:

- dopravní jednotky, pro které je vyžadováno označení podle 3.4.13 s výhradou ustanovení v 3.4.14¹, pro průjezd tunely kategorie E; a
- dopravní jednotky, pro které je vyžadováno označení oranžovými tabulkami podle 5.3.2, podle ustanovení dále uvedené tabulky, jakmile byl určen kód omezení průjezdu tunely, který musí být přiřazen celému nákladu dopravní jednotky.

¹ nebo podle 3.4.10 s výhradou ustanovení v 3.4.11 ADR platné do 31. prosince 2010, jestliže se použije přechodných ustanovení uvedených v 1.6.1.20.

Kód omezení průjezdu tunelem celého nákladu	Omezení
B	Průjezd zakázán tunely kategorie B, C, D a E
B1000C	Přeprava, kde celková čistá hmotnost výbušnin v dopravní jednotce <ul style="list-style-type: none"> - přesahuje 1000 kg: Průjezd zakázán tunely kategorie B, C, D a E; - nepřesahuje 1000 kg: Průjezd zakázán tunely kategorie C, D a E
B/D	Přeprava v cisternách: Průjezd zakázán tunely kategorie B, C, D a E; Jiná přeprava: Průjezd zakázán tunely kategorie D a E
B/E	Přeprava v cisternách: Průjezd zakázán tunely kategorie B, C, D a E; Jiná přeprava: Průjezd zakázán tunely kategorie E
C	Průjezd zakázán tunely kategorie C, D a E
C5000D	Přeprava, kde celková čistá hmotnost výbušnin v dopravní jednotce <ul style="list-style-type: none"> - přesahuje 5000 kg: Průjezd zakázán tunely kategorie C, D a E - nepřesahuje 5000 kg: Průjezd zakázán tunely kategorie D a E
C/D	Přeprava v cisternách: Průjezd zakázán tunely kategorie C, D a E; Jiná přeprava: Průjezd zakázán tunely kategorie D a E
C/E	Přeprava v cisternách: Průjezd zakázán tunely kategorie C, D a E; Jiná přeprava: Průjezd zakázán tunely kategorie E
D	Průjezd zakázán tunely kategorie D a E
D/E	Přeprava volně ložených látek nebo v cisternách: Průjezd zakázán tunely kategorie D a E; Jiná přeprava: Průjezd zakázán tunely kategorie E
E	Průjezd zakázán tunely kategorie E
—	Průjezd dovolen všemi tunely (pro UN 2919 a UN 3331, viz též 8.6.3.1).

POZNÁMKA 1: Například průjezd dopravní jednotky přepravující UN 0161 prach bezdýmný, klasifikační kód 1.3C, kód omezení průjezdu tunely C5000D, v množství představující celkovou čistou výbušnou hmotnost 3000 kg tunely kategorií D a E, je zakázán.

POZNÁMKA 2: Nebezpečné věci balené v omezených množstvích, přepravované v kontejnerech nebo dopravních jednotkách označených podle IMDG Code, nepodléhají omezením průjezdu tunely kategorie E, pokud celková (brutto) hmotnost kusů obsahujících nebezpečné věci balené v omezených množstvích nepřekračuje 8 tun na dopravní jednotku.

ČÁST 9

POŽADAVKY NA KONSTRUKCI A SCHVALOVÁNÍ VOZIDEL

KAPITOLA 9.1

ROZSAH PLATNOSTI, DEFINICE A POŽADAVKY NA SCHVALOVÁNÍ VOZIDEL

9.1.1. Rozsah platnosti a definice

9.1.1.1 Rozsah platnosti

Požadavky části 9 se vztahují na vozidla kategorií N a O, jak je definováno v příloze 7 Souhrnné rezoluce o konstrukci vozidel (R.E.3)¹ určená pro přepravu nebezpečných věcí.

Tyto požadavky se týkají vozidel z hlediska jejich konstrukce, schválení typu, schválení ADR a roční technické prohlídky.

9.1.1.2 Definice

Pro účely části 9 se rozumí pojmem:

„Vozidlo“ jakékoli vozidlo, ať kompletní, nekompletní nebo zkompleťované, určené pro silniční přepravu nebezpečných věcí;

„Vozidlo EX/II“ nebo „Vozidlo EX/III“ vozidlo určené pro přepravu výbušných látek a předmětů (Třída 1);

„Vozidlo FL“:

- (a) Vozidlo určené pro přepravu kapalin s bodem vzplanutí nejvýše 60 °C (kromě motorové nafty odpovídající evropské normě EN 590:2009 + A1:2010, plynového oleje a lehkého topného oleje – UN 1202 – s bodem vzplanutí stanoveným v evropské normě EN 590:2009 + A1:2010) v nesnímatelných cisternách nebo snímatelných cisternách s vnitřním objemem větším než 1 m³ nebo v cisternových kontejnerech nebo v přemístitelných cisternách s jednotlivým vnitřním objemem větším než 3 m³; nebo
- (b) vozidlo určené pro přepravu hořlavých plynů v nesnímatelných cisternách nebo snímatelných cisternách s vnitřním objemem větším než 1 m³ nebo v cisternových kontejnerech, v přemístitelných cisternách nebo MEGC s jednotlivým vnitřním objemem větším než 3 m³; nebo
- (c) bateriové vozidlo s celkovým vnitřním objemem větším než 1 m³ určené pro přepravu hořlavých plynů;

„Vozidlo OX“ vozidlo určené pro přepravu peroxidu vodíku, stabilizovaného nebo peroxidu vodíku, vodného roztoku, stabilizovaného s více než 60 % peroxidu vodíku (Třída 5.1, UN 2015) v nesnímatelných cisternách nebo snímatelných cisternách s vnitřním objemem větším než 1 m³ nebo v cisternových kontejnerech nebo přemístitelných cisternách s jednotlivým vnitřním objemem větším než 3 m³;

„Vozidlo AT“:

- (a) vozidlo, jiné než vozidlo EX/III, FL nebo OX nebo jiné než MEMU, určené pro přepravu nebezpečných věcí v nesnímatelných cisternách nebo snímatelných cisternách s vnitřním objemem větším než 1 m³ nebo v cisternových kontejnerech, přemístitelných cisternách nebo MEGC s jednotlivým vnitřním objemem větším než 3 m³; nebo
- (b) bateriové vozidlo s celkovým vnitřním objemem větším než 1 m³ jiné než vozidlo FL;

„MEMU“ znamená vozidlo odpovídající definici Mobilní jednotka připravující výbušniny v 1.2.1.

¹ Dokument Spojených národů ECE/TRANS/WP.29/78/Rev.3.

„Kompletní vozidlo“ jakékoli vozidlo, které nevyžaduje žádnou další kompletaci (např. skříňová vozidla, nákladní automobily, tahače, přípojná vozidla);

„Nekompletní vozidlo“ jakékoli vozidlo, které vyžaduje nejméně jeden další stupeň kompletace (např. podvozky s kabinou, podvozky přípojných vozidel);

„Zkompleťované vozidlo“ vozidlo, které je výsledkem vícestupňového kompletačního procesu (např. podvozky nebo podvozky s kabinou s namontovanou nástavbou);

„Typově schválené vozidlo“ jakékoli vozidlo, které bylo schváleno podle předpisu EHK č. 105²;

„Schválení ADR“ potvrzení příslušného orgánu smluvní strany, že jednotlivé vozidlo určené pro přepravu nebezpečných věcí splňuje relevantní technické požadavky této části jako vozidlo EX/II, EX/III, FL, OX nebo AT nebo jako MEMU.

9.1.2 Schvalování vozidel EX/II, EX/III, FL, OX a AT a MEMU

POZNÁMKA: Pro vozidla jiná, než jsou vozidla typů EX/II, EX/III, FL, OX a AT a MEMU, se nevyžaduje žádné zvláštní osvědčení o schválení, nehledě na ta, která jsou vyžadována všeobecnými bezpečnostními předpisy obecně se vztahujícím na vozidla v zemi jejich původu (registrace).

9.1.2.1 Všeobecná ustanovení

Vozidla EX/II, EX/III, FL, OX a AT a MEMU musí splňovat příslušné technické požadavky této části.

Každé kompletní nebo zkompleťované vozidlo musí být podrobeno první prohlídce příslušným orgánem v souladu se správními požadavky této kapitoly pro ověření shodnosti s příslušnými technickými požadavky kapitol 9.2 až 9.8.

Příslušný orgán může upustit od první inspekce tahače pro návěs schváleného typu podle 9.1.2.2, pro který výrobce, jeho odpovědný pověřený zástupce nebo instituce uznávaná příslušným orgánem vydala prohlášení o shodnosti s požadavky kapitoly 9.2.

Shodnost vozidla musí být osvědčena vydáním osvědčení o schválení podle oddílu 9.1.3.

Pokud se požaduje, aby vozidla byla vybavena zpomalovacím brzdovým systémem, musí výrobce vozidla nebo jeho řádně pověřený zástupce vydat prohlášení o shodě s příslušnými předpisy Přílohy 5 předpisu EHK č. 13³. Toto prohlášení musí být předloženo při první technické prohlídce.

9.1.2.2 Požadavky na typově schválená vozidla

Na základě požadavku výrobce nebo jeho řádně pověřeného zástupce mohou být vozidla podléhající schválení podle 9.1.2.1 typově schválena příslušným orgánem. Příslušné technické požadavky kapitoly 9.2 musí být považovány za splněné, jestliže osvědčení o schválení typu bylo vydáno příslušným orgánem podle předpisu EHK č. 105² za podmínky, že technické požadavky uvedeného předpisu odpovídají požadavkům kapitoly 9.2 této části a že žádná modifikace vozidla nezměnila jeho platnost. V případě MEMU schvalovací značka typu upevněná podle předpisu EHK č. 105 může identifikovat vozidlo buď jako MEMU nebo EX/III. MEMU je pouze třeba identifikovat jako takové v osvědčení o schválení vydaném podle 9.1.3.

Toto typové schválení, vydané jednou smluvní stranou Dohody, musí být uznáváno ostatními smluvními stranami Dohody jako zajišťující shodnost vozidla, pokud jednotlivé vozidlo bylo podrobeno prohlídce pro schválení ADR.

Při prohlídce pro schválení ADR musí být podrobeny prohlídce pouze ty části typově schváleného nekompletního vozidla, které byly dodatečně namontovány nebo pozměněny v procesu kompletace, zda odpovídají příslušným požadavkům kapitoly 9.2.

² Předpis č. 105 (Jednotná ustanovení pro schvalování vozidel určených pro přepravu nebezpečných věcí s ohledem na jejich specifické konstrukční vlastnosti).

³ Předpis EHK č. 13 (Jednotná ustanovení týkající se schvalování vozidel kategorií M, N a O z hlediska brzdění).

9.1.2.3 ***Roční technická prohlídka***

Vozidla EX/II, EX/III, FL, OX a AT a MEMU musí být podrobena roční technické prohlídce v zemi jejich registrace, aby bylo zajištěno, že odpovídají příslušným ustanovením této části a všeobecným bezpečnostním předpisům (týkajícím se brzd, osvětlení atd.) platným v zemi jejich registrace.

Shodnost vozidla musí být potvrzena buď rozšířením platnosti osvědčení o schválení, nebo vydáním nového osvědčení o schválení podle 9.1.3.

9.1.3 **Osvědčení o schválení**

9.1.3.1 Shodnost vozidel EX/II, EX/III, FL, OX a AT a MEMU s požadavky této části je předmětem osvědčení o schválení (osvědčení o schválení ADR) vydaného příslušným orgánem státu registrace pro každé vozidlo, při jehož prohlídce bylo dosaženo uspokojivých výsledků, nebo je uvedeno v prohlášení o shodnosti s požadavky kapitoly 9.2 podle 9.1.2.1.

9.1.3.2 Osvědčení o schválení vydané příslušným orgánem jedné smluvní strany pro vozidlo registrované na území této smluvní strany se uznává po dobu jeho platnosti příslušnými orgány ostatních smluvních stran.

9.1.3.3 Osvědčení o schválení musí mít formu podle vzoru uvedeného v 9.1.3.5. Jeho rozměry musí být 210 mm x 297 mm (formát A4). Může se použít přední i zadní strana. Barva musí být bílá, s úhlopříčným pruhem v růžové barvě.

Osvědčení musí být vydáno v jazyce nebo v jednom z jazyků vydávajícího státu. Není-li tento jazyk anglický, francouzský nebo německý, název osvědčení o schválení a jakékoli poznámky pod bodem 11 musí být uvedeny též v angličtině nebo ve francouzštině nebo v němčině.

Osvědčení o schválení cisternového vozidla pro podtlakové vyčerpávání odpadů musí obsahovat zápis: „cisternové vozidlo pro podtlakové vyčerpávání odpadů“.

9.1.3.4 Platnost osvědčení o schválení končí nejpozději jeden rok po dnu technické prohlídky vozidla předcházející vydání osvědčení. Datum ukončení příští platnosti osvědčení o schválení však musí být vztaženo k poslednímu dni ukončení předchozí platnosti, jestliže je technická prohlídka uskutečněna v průběhu jednoho měsíce před tímto datem nebo jednoho měsíce po tomto datu.

Toto ustanovení však nevyžaduje, aby se u cisteren, které podléhají povinným periodickým inspekcím, prováděly zkoušky těsnosti, hydraulické tlakové zkoušky nebo prohlídky vnitřku cisteren v kratších lhůtách, než jsou stanoveny v kapitolách 6.8 a 6.9.

9.1.3.5 Vzor osvědčení o schválení vozidel pro přepravu některých nebezpečných věcí

OSVĚDČENÍ O SCHVÁLENÍ VOZIDEL PRO PŘEPRAVU NĚKTERÝCH NEBEZPEČNÝCH VĚCÍ Toto osvědčení potvrzuje, že níže uvedené vozidlo splňuje podmínky předepsané Evropskou dohodou o mezinárodní silniční přepravě nebezpečných věcí (ADR). CERTIFICATE OF APPROVAL FOR VEHICLES CARRYING CERTAIN DANGEROUS GOODS This certificate testifies that the vehicle specified below fulfils the conditions prescribed by the European Agreement concerning the International Carriage of Dangerous Goods by Road (ADR).			
1. Osvědčení č.	2. Výrobce vozidla:	3. Identifikační číslo vozidla:	4. Registrační značka (existuje-li):
5. Název a obchodní adresa dopravce, uživatele nebo vlastníka:

¹ Podle definicí motorových vozidel a přípojných vozidel kategorií N a O, jak je uvedeno v Souhrnné rezoluci o konstrukci vozidel (R.E.3) nebo ve Směrnici 2007/46/ES.

² Nehodící se škrtněte

³ Příslušné označte

⁴ Uveďte příslušnou veličinu. Veličina 44 t neomezuje "registrační / největší povolenou hmotnost" uvedenou v registračním(ch) dokumentu(ech)/technickém průkazu/osvědčení.

⁵ Látky podle kódu cisterny uvedeného v předchozím bodě 9 nebo podle jiného kódu cisterny dovoleného podle pořadí v 4.3.3.1.2 nebo 4.3.4.1.2, se zřetelem ke zvláštnímu(m) ustanovení(m), jsou-li.

⁶ Nevýžaduje se, pokud látky schválené pro přepravu jsou uvedeny v č. 10.2.

13. Prodloužení platnosti

Platnost prodloužena do	Razítko vydávajícího orgánu, místo, datum, podpis:
-------------------------	--

POZNÁMKA: Toto osvědčení musí být vráceno vydávajícímu orgánu, je-li vozidlo vyřazeno z provozu, v případě změny dopravce, uživatele nebo vlastníka uvedeného v bodě 5, po uplynutí doby platnosti a při významné změně podstatných charakteristik vozidla.

KAPITOLA 9.2

POŽADAVKY NA KONSTRUKCI VOZIDEL

9.2.1 Shoda s požadavky této kapitoly

9.2.1.1

Vozidla EX/II, EX/III, FL, OX a AT musí splňovat požadavky této kapitoly uvedené v následující tabulce.

Pro jiná vozidla, než vozidla EX/II, EX/III, FL, OX a AT:

- požadavky uvedené v 9.2.3.1.1 (brzdový systém podle předpisu EHK č. 13 nebo Směrnice 71/320/EHS) se vztahují na všechna vozidla poprvé registrovaná (nebo uvedená do provozu, není-li jejich registrace povinná) po 30. červnu 1997;
- požadavky uvedené v oddílu 9.2.5 (omezovač rychlosti podle předpisu EHK č. 89 nebo 92/24/EHS) se vztahují na všechna motorová vozidla s největší povolenou hmotností převyšující 12 tun poprvé registrovaná po 31. prosinci 1987 a všechna motorová vozidla s největší povolenou hmotností převyšující 3,5 tuny avšak nejvýše 12 tun poprvé registrovaná po 31. prosinci 2007.

		VOZIDLA					VYSVĚTLIVKY

9.2.6	SPOJOVACÍ ZAŘÍZENÍ PŘÍPOJNÝCH VOZIDEL	X			X			

9.2.1.2 MEMU musí splňovat požadavky této kapitoly, které se vztahují na vozidla EX/III.

9.2.2 Elektrické příslušenství

9.2.2.1 Všeobecná ustanovení

Elektrická instalace jako celek musí odpovídat ustanovením pododdílů 9.2.2.2 až 9.2.2.6 v souladu s tabulkou uvedenou v oddílu 9.2.1.

9.2.2.2 Elektrické vedení

9.2.2.2.1 Elektrické vodiče musí být dostatečně dimenzovány, aby nedocházelo k jejich přehřívání. Vedení musí být izolováno přiměřeným způsobem. Všechny okruhy musí být chráněny pojistkami nebo automatickými jističi, s výjimkou následujících okruhů:

- od akumulátoru ke spínači studeného startu a vypínači chodu motoru;
- od akumulátoru k alternátoru;
- od alternátoru k pojistkové skříňce nebo skříňce jističů;
- od akumulátoru ke spouštěči;
- od akumulátoru k ovládací skříňce zpomalovacího brzdového systému (viz 9.2.3.1.2), pokud je tento systém elektrický nebo elektromagnetický;
- od akumulátoru k elektrickému zdvihacímu mechanismu zadní zdvižné nápravy.

Výše uvedené nechráněné okruhy musí být co možno nejkratší.

9.2.2.2.2 Kabely musí být bezpečně uchyceny a umístěny tak, aby elektrické vodiče byly přiměřeně chráněny proti mechanickému a tepelnému namáhání.

9.2.2.3 Odpojovač akumulátorů

9.2.2.3.1 Odpojovač pro přerušení elektrických okruhů musí být umístěn co možno nejbližší akumulátoru, jak je to jen prakticky možné. Jestliže je použit jednopólový odpojovač, musí být umístěn v přívodovém vedení a nikoli v ukotřovacím vedení.

9.2.2.3.2 Ovládací zařízení usnadňující rozpojovací a zapojovací funkce odpojovače akumulátoru musí být umístěno v kabině řidiče. Musí být pro řidiče snadno přístupné a zřetelně označené. Musí být chráněno před neúmyslným uvedením v činnost buď ochrannou schránkou, zdvojeným ovládacím zařízením nebo jiným vhodným způsobem. Dodatečné ovládací zařízení může být instalováno, pokud je zřetelně označeno a chráněno před neúmyslným uvedením v činnost. Jestliže je (jsou) ovládací zařízení elektricky ovládána(a), musí obvody ovládacího(ch) zařízení splňovat požadavky uvedené v pododdílu 9.2.2.5.

9.2.2.3.3 Odpojovač musí být umístěn ve skříňce s ochranou stupně IP 65 podle normy IEC 60529.

9.2.2.3.4 Kabelové konektory odpojovače akumulátorů musí mít ochranu stupně IP 54. Tento požadavek se však nevztahuje na konektory v pouzdře, kterým smí být chráněna akumulátorů. V tomto případě je dostatečnou izolace konektorů proti zkratu, například gumovou čepičkou.

9.2.2.4 Akumulátory

Svorky akumulátorů musí být elektricky izolované nebo zakryty izolovaným víkem akumulátoru. Pokud akumulátory nejsou umístěny pod kapotou motoru, musí být pevně uloženy v odvětrávané schránce.

9.2.2.5 Příslušenství pod stálým napětím

9.2.2.5.1 (a) Ty části elektrického příslušenství včetně vedení, které musí zůstat pod napětím i při vypnutí odpojovači akumulátoru, musí být vhodné pro použití v nebezpečné zóně. Takové části musí splňovat všeobecné požadavky normy IEC 60079, část 0 a 14¹ a dodatečné požadavky použitelné z normy IEC 60079, části 1, 2, 5, 6, 7, 11, 15 nebo 18.

¹ Požadavky normy IEC 60079, části 14 nemají přednost před požadavky této části.

- (b) K aplikaci normy IEC 60079, část 14¹ se musí použít tato klasifikace:

Elektrická zařízení pod stálým napětím včetně vedení, která nepodléhají ustanovením v pododdílech 9.2.2.3 a 9.2.2.4, musí splňovat požadavky pro zónu 1 pro elektrické zařízení všeobecně nebo splňovat požadavky pro zónu 2 pro elektrická zařízení umístěná v kabině řidiče. Požadavky pro skupinu výbušnosti IIC, teplotní třída T6 musí být splněny.

Avšak pro elektrická zařízení pod stálým napětím instalovaná v zóně, kde teplota způsobená neelektrickým zařízením umístěným v této zóně přesahuje teplotní limit T6, teplotní klasifikace tohoto elektrického zařízení pod stálým napětím musí být nejméně teplotní třídy T4.

- (c) Přírodní vedení elektrického zařízení pod stálým napětím musí odpovídat buď ustanovením normy IEC 60079, část 7 („Zvýšená bezpečnost“) a být chráněna tavnou pojistkou nebo automatickým jističem umístěným co možno nejblíže zdroji proudu, jak je to jen prakticky možné, nebo v případě „vlastního (intrinzického) bezpečnostního zařízení“ musí být chráněna bezpečnostní pojistkou umístěnou co možno nejblíže zdroji proudu, jak je to jen prakticky možné.

9.2.2.5.2 Elektrické vedení od akumulátoru k elektrickému zařízení, které zůstává pod stálým napětím při vypnutém odpojovači akumulátoru, musí být chráněno proti přehřátí vhodným způsobem, jako je tavná pojistka, přerušovač proudu nebo bezpečností pojistka (omezovač proudu).

9.2.2.6 Ustanovení o částech elektrické instalace umístěné za kabinou řidiče

Veškerá tato instalace musí být navržena, provedena a chráněna tak, aby nemohla způsobit vznícení nebo zkrat za normálních podmínek používání vozidla a aby tato rizika byla minimalizována i v případě nárazu nebo deformace. Zejména:

9.2.2.6.1 Elektrické vedení

Vedení umístěné za kabinou řidiče musí být chráněno proti nárazu, odírání a tření v průběhu normálního provozu vozidla. Příklady vyhovující ochrany jsou uvedeny na následujících obrázcích 1, 2, 3 a 4. Kabely ovladačů antiblokovacího brzdového systému však nevyžadují dodatečnou ochranu.

¹ Požadavky normy IEC 60079, části 14 nemají přednost před požadavky této části.

Obrázek č. 1

Obrázek č. 2

Obrázek č. 3

Obrázek č. 4

9.2.2.6.2 Osvětlení

Žárovky se závitovou patičí nesmějí být používány.

9.2.2.6.3 Elektrická spojení

Elektrická spojení mezi motorovými vozidly a přípojnými vozidly musí mít ochranu stupně IP54 podle normy IEC 60529 a musí být konstruována tak, aby se zabránilo náhodnému přerušení spojení. Konektory musí být v souladu s ISO 25981:2008², ISO 12098:2004², ISO 7638:2003² a EN 15207:2006, jak je to nutné.

9.2.3 Brzdový systém

9.2.3.1 Všeobecná ustanovení

9.2.3.1.1 Motorová vozidla a přípojná vozidla určená k použití jako dopravní jednotky pro přepravu nebezpečných věcí, musí splňovat všechny příslušné technické požadavky předpisu EHK č. 13³ včetně posledních změn, v souladu s daty jejich vstupu v platnost v nich uvedených.

9.2.3.1.2 Vozidla EX/III, FL, OX a AT musí splňovat požadavky předpisu EHK č. 13³, Příloha 5.

9.2.3.2 (Vypuštěno)

² ISO 4009, zmíněná v této normě, nemusí být použita.

³ Předpis EHK č. 13 (Jednotná ustanovení týkající se schvalování vozidel kategorií M, N a O z hlediska brzdění)

9.2.4 Prevence nebezpečí požáru

9.2.4.1 Všeobecná ustanovení

Následující technická ustanovení se vztahují na vozidla v souladu s tabulkou uvedenou v oddílu 9.2.1.

9.2.4.2 Kabina vozidla

Pokud není kabina řidiče vyrobena z nesnadno hořlavých materiálů, musí být na zadní stěně kabiny upevněn štít z kovu nebo jiného vhodného materiálu, který bude mít stejnou šířku jako cisterna. Jakákoliv okna v zadní části kabiny nebo ve štítu musí být hermeticky uzavřena a musí být z ohnivzdorného bezpečnostního skla s ohnivzdornými rámy. Kromě toho musí být ponechán volný prostor široký minimálně 15 cm mezi cisternou a kabinou nebo štítem.

9.2.4.3 Palivové nádrže

Nádrže na palivo pro pohon motoru vozidla musí vyhovovat následujícím požadavkům:

- (a) V případě jakéhokoli netěsnosti nádrže musí palivo vytékat přímo na zem, aniž by se dostalo do styku s horkými částmi vozidla nebo nákladu.
- (b) Palivová nádrž obsahující benzin musí být opatřena účinnou pojistkou proti prošlehnutí plamene v plnicím otvoru nádrže nebo uzávěrem, který zajistí hermetické uzavření plnicího otvoru.

9.2.4.4 Motor

Hnací motor vozidla musí být vybaven a umístěn tak, aby se zamezilo ohrožení nákladu zahřátím nebo vznícením. Vozidla EX/II a EX/III musí mít vždy vznětový motor.

9.2.4.5 Výfukový systém

Výfukový systém (včetně výfukového potrubí) musí být umístěn nebo chráněn tak, aby se zamezilo ohrožení nákladu zahřátím či vznícením. Části výfukového systému umístěné přímo pod palivovou nádrží (motorová nafta) musí být od ní vzdáleny minimálně 100 mm nebo musí být chráněny tepelným štítem.

9.2.4.6 Zpomalovací brzdový systém

Vozidla vybavená zpomalovacími brzdovými systémy, vytvářejícími vysoké teploty, umístěnými za zadní stěnou kabiny řidiče, musí být vybavena bezpečně upevněným tepelným štítem, umístěným mezi tímto zpomalovacím brzdovým systémem a cisternou nebo nákladem tak, aby se zabránilo jakémukoli zahřátí, i lokálnímu, stěny cisterny nebo nákladu.

Navíc musí tento tepelný štít chránit zpomalovací brzdový systém proti vytékání nebo úniku, i náhodnému, přepravovaného nákladu. Například ochrana zahrnující dvojitý štít je považována za uspokojivou.

9.2.4.7 Vytápěcí systémy s vnitřním spalováním

9.2.4.7.1 Vytápěcí systémy s vnitřním spalováním musí odpovídat příslušným technickým požadavkům Předpis EHK č. 122⁴ se změnami a doplňky se změnami a doplňky v souladu s daty jejich zavádění v ní uvedenými a s ustanoveními 9.2.4.7.2 až 6.2.4.7.6 aplikovatelnými podle tabulky v oddílu 9.2.1.

9.2.4.7.2 Vytápěcí systémy s vnitřním spalováním a jejich výfuková potrubí musí být konstruovány, umístěny, chráněny nebo zakryty tak, aby se zabránilo jakémukoli nepřijatelnému riziku přehřátí nebo vznícení nákladu. Tyto požadavky se považují za splněné, jestliže palivová nádrž a výfukový systém zařízení

⁴ Předpis EHK č. 122 (Jednotná technická ustanovení pro homologaci vozidel kategorií M, N a O s hlediska jejich systémů vytápění)

odpovídají obdobným ustanovením, která jsou předepsána pro palivové nádrže a výfukové systémy vozidel, uvedeným v pododdílech 9.2.4.3 a 9.2.4.5.

9.2.4.7.3 Vytápěcí systémy s vnitřním spalováním musí být vypínány alespoň jedním z těchto způsobů:

- (a) úmyslným ručním vypnutím z kabiny řidiče;
- (b) zastavením chodu motoru vozidla; v tomto případě systém může být znovu uveden do provozu ručně řidičem;
- (c) zapnutím sacího čerpadla přepravovaných nebezpečných věcí instalovaného na motorovém vozidle.

9.2.4.7.4 Doběh vytápěcího systému s vnitřním spalováním po jeho vypnutí je dovolen. Pro způsoby uvedené v 9.2.4.7.3 (b) a (c) dodávka spalovacího vzduchu musí být přerušena vhodnými opatřeními po doběhovém cyklu trvajícím nejvýše 40 s. Smějí být používány pouze vytápěcí systémy, u nichž bylo prokázáno, že výměník tepla je odolný proti sníženému doběhovému cyklu 40 s po dobu jejich normálního používání.

9.2.4.7.5 Vytápěcí systém s vnitřním spalováním musí být zapínán ručně. Programovaná zařízení jsou zakázána.

9.2.4.7.6 Vytápěcí systémy s vnitřním spalováním plynného paliva jsou zakázány.

9.2.5 Omezovač rychlosti

Motorová vozidla (nákladní automobily a tahače návěsů) o největší povolené hmotnosti převyšující 3,5 tuny musí být vybavena omezovačem rychlosti odpovídajícím ustanovením aktuálního znění předpisu EHK č. 89⁵. Omezovač rychlosti musí být seřízen s přihlédnutím k technické toleranci přístroje tak, aby rychlost nemohla překročit 90 km/h.

9.2.6 Spojovací zařízení přípojných vozidel

Spojovací zařízení přípojných vozidel musí splňovat aktuální technické požadavky předpisu EHK č. 55⁶ v souladu s daty jejich vstupu v platnost v nich uvedenými.

⁵ Předpis EHK č. 89: jednotná ustanovení týkající se schvalování:

- I. vozidel z hlediska omezení jejich nejvyšší rychlosti;
- II. vozidel z hlediska jejich vybavení omezovačem rychlosti (SLD) schváleného typu;
- III. omezovačů rychlosti (SLD).

⁶ Předpis EHK č. 55 (Jednotná ustanovení týkající se schvalování mechanických spojovacích zařízení souprav vozidel).

KAPITOLA 9.3

DODATEČNÉ POŽADAVKY NA KOMPLETNÍ NEBO ZKOMPLETOVANÁ VOZIDLA EX/II NEBO EX/III

9.3.1 Materiály používané pro konstrukci nástaveb vozidel

Ke konstrukci nástavby se nesmí použít materiálů, které mohou tvořit s přepravovanými výbušnými látkami nebezpečné sloučeniny.

9.3.2 Vytápěcí systémy s vnitřním spalováním

9.3.2.1 Vytápěcí systémy s vnitřním spalováním smějí být instalovány do vozidel EX/II a EX/III pouze pro vyhřívání kabiny řidiče nebo motoru.

9.3.2.2 Vytápěcí systémy s vnitřním spalováním musí splňovat požadavky uvedené v 9.2.4.7.1, 9.2.4.7.2, 9.2.4.7.5 a 9.2.4.7.6.

9.3.2.3 Vypínač vytápěcího systému s vnitřním spalováním může být instalován zvnějšku kabiny řidiče.

Není nezbytné prokazovat, že výměník tepla je odolný proti sníženému doběhovému cyklu.

9.3.2.4 Žádné vytápěcí systémy s vnitřním spalováním nebo palivové nádrže, zdroje energie, vstupy spalovacího a vyhřívacího vzduchu, ani vyústění výfukového potrubí, potřebné pro provoz vytápěcího systému nesmějí být instalovány v ložném prostoru.

9.3.3 Vozidla EX/II

Vozidla musí být konstruována, vyrobena a vybavena tak, aby výbušné látky a předměty byly chráněny před vnějšími riziky a nepříznivým počasím. Tato vozidla musí být uzavřená, nebo krytá plachtou. Plachta vozidel musí být odolná proti roztržení a musí být zhotovena z nepromokavého a těžko hořlavého materiálu¹. Musí být dobře napjata tak, aby pokrývala ložný prostor vozidla ze všech stran.

Všechny otvory ložného prostoru uzavřených vozidel musí mít uzamykatelné, těsně přiléhající dveře nebo tuhé kryty. Kabina řidiče musí být od ložného prostoru oddělena celistvou stěnou (beze spár).

9.3.4 Vozidla EX/III

9.3.4.1 Vozidla musí být konstruována, vyrobena a vybavena tak, aby výbušné látky a předměty byly chráněny před vnějšími riziky a nepříznivým počasím. Tato vozidla musí být uzavřená. Kabina řidiče musí být od ložného prostoru oddělena celistvou stěnou (beze spár). Povrch ložného prostoru musí být celistvý (beze spár). Kotevní úchyty pro upevnění nákladu mohou být instalovány. Všechny spoje musí být utěsněny. Všechny otvory musí být uzamykatelné. Jejich dveře nebo uzávěry musí být zkonstruovány a umístěny tak, aby překrývaly spoje.

9.3.4.2 Nástavba musí být vyrobena z tepelně odolných a ohnivzdorných materiálů o minimální tloušťce 10 mm. Materiály klasifikované jako Třída B-S₃-d₂ podle normy EN 13501-1:2007 + A1:2009 se považují za splňující tento požadavek.

Pokud je materiálem použitým pro nástavbu kov, musí být celý vnitřek nástavby pokryt materiály splňujícími tentýž požadavek.

¹ V případě hořlavosti se tento požadavek považuje za splněný, jestliže podle postupu uvedeného v mezinárodní normě ISO 3795:1989 "Silniční vozidla, traktory a zemědělské a lesnické stroje – Stanovení průběhu hoření vnitřních materiálů" stupeň hořlavosti vzorků plachty nepřevyší 100 mm/min.

9.3.5 Motor a ložný prostor

Motor pohánějící vozidla EX/II nebo EX/III musí být umístěn před čelní stěnou ložného prostoru; může však být umístěn i pod ložným prostorem, pokud je to provedeno takovým způsobem, aby jakékoli nadměrné teplo nevyvolalo riziko pro náklad zvýšením teploty na vnitřním povrchu ložného prostoru nad 80 °C.

9.3.6 Vnější zdroje tepla a ložný prostor

Výfukový systém vozidel EX/II a EX/III nebo jiné části kompletních nebo zkompletovaných vozidel musí být konstruovány a umístěny tak, aby jakékoli nadměrné teplo nevyvolalo riziko pro náklad zvýšením teploty na vnitřním povrchu ložného prostoru nad 80 °C.

9.3.7 Elektrické příslušenství

9.3.7.1 Jmenovité napětí elektrického systému nesmí přesáhnout 24 voltů.

9.3.7.2 Jakékoli osvětlení v ložném prostoru vozidel EX/II musí být umístěno na stropě a zakryto, tj. s žádným vyčnívajícím vedením nebo žárovkou.

V případě skupiny snášenlivosti J musí být ochrana elektrické instalace nejméně IP65 (např. způsob antideflační ochrany EEx d). Jakékoli elektrické zařízení přístupné z vnitřku ložného prostoru musí být dostatečně chráněno proti mechanickému nárazu zevnitř.

9.3.7.3 Elektrická instalace vozidel EX/III musí splňovat příslušné požadavky uvedené v 9.2.2.2, 9.2.2.3, 9.2.2.4, 9.2.2.5.2 a 9.2.2.6.

Elektrická instalace v ložném prostoru musí být chráněna proti prachu (ochrana nejméně IP 54 nebo ekvivalentní), nebo, v případě skupiny snášenlivosti J, nejméně IP 65 (např. způsob antideflační ochrany EEx d).

KAPITOLA 9.4

DODATEČNÉ POŽADAVKY NA KONSTRUKCI NÁSTAVEB KOMPLETNÍCH NEBO ZKOMPLETOVANÝCH VOZIDEL URČENÝCH PRO PŘEPRAVU NEBEZPEČNÝCH VĚCÍ V KUSECH (KROMĚ VOZIDEL EX/II A EX/III)

9.4.1 Vytápěcí systémy s vnitřním spalováním musí splňovat následující požadavky:

- (a) Vypínač může být instalován zvnějšku kabiny řidiče;
- (b) Zařízení může být možno vypnout zvnějšku ložného prostoru; a
- (c) Není nezbytné prokazovat, že výměník tepla je odolný proti sníženému doběhovému cyklu.

9.4.2 U vozidel určených pro přepravu nebezpečných věcí, pro které je předepsáno označení bezpečnostní značkou podle vzorů č. 1, 1.4, 1.5, 1.6, 3, 4.1, 4.3, 5.1 nebo 5.2, nesmějí být žádné palivové nádrže, zdroje energie, nasávání vzduchu pro spalování nebo ohřívacího vzduchu, ani vyústění výfukového potrubí potřebné pro provoz vytápěcího systému s vnitřním spalováním umístěny v ložném prostoru. Musí být zajištěno, že výstup horkého vzduchu nemůže být blokován přepravovaným nákladem. Teplota, na kterou jsou kusy zahřívány, nesmí překročit 50 °C. Vytápěcí systém instalovaný uvnitř ložného prostoru musí být konstruován tak, aby se zabránilo vznícení výbušné atmosféry za provozních podmínek.

9.4.3 Dodatečné požadavky na konstrukci nástaveb vozidel určených pro přepravu daných nebezpečných věcí nebo zvláštních obalů mohou být uvedeny v části 7, kapitole 7.2 v souladu s údaji ve sloupci (16) tabulky A kapitoly 3.2 pro danou látku.

KAPITOLA 9.5

DODATEČNÉ POŽADAVKY NA KONSTRUKCI NÁSTAVEB KOMPLETNÍCH NEBO ZKOMPLETOVANÝCH VOZIDEL URČENÝCH PRO PŘEPRAVU VOLNĚ LOŽENÝCH TUHÝCH NEBEZPEČNÝCH LÁTEK

9.5.1

Vytápěcí systémy s vnitřním spalováním musí splňovat následující požadavky:

- (a) Vypínač může být instalován zvnějšku kabiny řidiče;
- (b) Zařízení může být možné vypnout z vnějšku strany ložného prostoru; a
- (c) Není nezbytné prokazovat, že výměník tepla je odolný proti sníženému doběhovému cyklu.

9.5.2

U vozidel určených pro přepravu nebezpečných věcí, pro které je předepsáno označení bezpečnostní značkou podle vzorů č. 4.1, 4.3 nebo 5.1, nesmějí být žádné palivové nádrže, zdroje energie, nasávání vzduchu pro spalování nebo ohřívacího vzduchu, ani vyústění výfukového potrubí potřebné pro provoz vytápěcího systému s vnitřním spalováním umístěny v ložném prostoru. Musí být zajištěno, že výstup horkého vzduchu nemůže být blokován přepravovaným nákladem. Teplota, na kterou je zahříván náklad, nesmí překročit 50°C. Vytápěcí systém instalovaný uvnitř ložného prostoru musí být konstruován tak, aby se zabránilo vznícení výbušné atmosféry za provozních podmínek.

9.5.3

Nástavby vozidel určených pro přepravu volně ložených tuhých nebezpečných látek musí splňovat příslušné požadavky kapitol 6.11 a 7.3, včetně požadavků uvedených v oddílech 7.3.2 nebo 7.3.3, které se na ně mohou vztahovat podle údajů ve sloupcích (10) nebo (17) tabulky A kapitoly 3.2 pro danou látku.

KAPITOLA 9.6

DODATEČNÉ POŽADAVKY NA KOMPLETNÍ NEBO ZKOMPLETOVANÁ VOZIDLA URČENÁ PRO PŘEPRAVU LÁTEK PŘI ŘÍZENÉ TEPLOTĚ

9.6.1 Izotermická, chlazená a chladicí a mrazicí vozidla určená pro přepravu látek při řízené teplotě musí splňovat následující podmínky:

- (a) vozidlo musí být takové a tak vybaveno, pokud se týče izolace a prostředků chlazení, aby řízená teplota předepsaná v 2.2.41.1.17 a 2.2.52.1.16 a v pododdílech 2.2.41.4 a 2.2.52.4 pro přepravovanou látku nebyla překročena. Celkový koeficient prostupu tepla nesmí být vyšší než $0,4 \text{ W/m}^2 \text{ K}$;
- (b) vozidlo musí být vybaveno tak, aby páry přepravovaných látek nebo chladicí látky nemohly proniknout do kabiny řidiče;
- (c) vhodný přístroj musí umožnit kdykoli zjistit teplotu v ložném prostoru z kabiny řidiče,
- (d) ložný prostor musí být opatřen větracími otvory nebo větracími ventily, jestliže existuje jakékoli riziko nebezpečného nadměrného tlaku vznikajícího v ložném prostoru. Je nutno učinit opatření, aby se v případě potřeby zajistilo, že se chlazení větracími otvory nebo ventily nezhorší;
- (e) používaná chladicí látka nesmí být hořlavá; a
- (f) chladicí jednotka chladicího a mrazicího vozidla musí být schopna provozu nezávisle na hnacím motoru vozidla.

9.6.2 Vhodné metody [viz V8(3)] pro zabránění, aby byla překročena řízená teplota, jsou uvedeny v kapitole 7.2 (R1 až R5). V závislosti na použité metodě mohou být použita dodatečná ustanovení týkající se konstrukce nástaveb vozidel uvedená v kapitole 7.2.

KAPITOLA 9.7

DODATEČNÉ POŽADAVKY NA NESNÍMATELNÉ CISTERNY (CISTERNOVÁ VOZIDLA), BATERIOVÁ VOZIDLA A KOMPLETNÍ NEBO ZKOMPLETOVANÁ VOZIDLA POUŽÍVANÁ PRO PŘEPRAVU NEBEZPEČNÝCH VĚCÍ VE SNÍMATELNÝCH CISTERNÁCH S VNITŘNÍM OBJEMEM VĚTŠÍM NEŽ 1 m³ NEBO V CISTERNOVÝCH KONTEJNERECH, PŘEMÍSTITELNÝCH CISTERNÁCH NEBO MEGC S VNITŘNÍM OBJEMEM VĚTŠÍM NEŽ 3 m³ (VOZIDLA FL, OX A AT)

9.7.1 Všeobecná ustanovení

9.7.1.1 Kromě vlastního vozidla nebo podvozkových jednotek používaných místo něho tvoří cisternové vozidlo jedna nebo více nádrží, jejich výstroj a spojovací prvky pro jejich připevnění k vozidlu nebo k podvozkovým jednotkám.

9.7.1.2 Jakmile je snímatelná cisterna připevněna na nosné vozidlo, musí tento celek vyhovovat požadavkům předepsaným pro cisternová vozidla.

9.7.2 Požadavky na cisterny

9.7.2.1 Kovové nesnímatelné nebo snímatelné cisterny musí splňovat příslušné požadavky kapitoly 6.8.

9.7.2.2 Články bateriových vozidel a MEGC musí splňovat příslušné požadavky kapitoly 6.2 v případě lahví, trubkových nádob, tlakových sudů a svazků lahví a požadavky kapitoly 6.8, pokud jde o cisterny.

9.7.2.3 Kovové cisternové kontejnery musí splňovat požadavky kapitoly 6.8, přemístitelné cisterny musí splňovat požadavky kapitoly 6.7, nebo pokud je to vhodné, požadavky IMDG Code (viz 1.1.4.2).

9.7.2.4 Cisterny vyrobené z vyztužených plastů musí splňovat požadavky kapitoly 6.9.

9.7.2.5 Cisterny pro podtlakové vyčerpávání odpadů musí splňovat požadavky kapitoly 6.10.

9.7.3 Upevňovací prvky

Upevňovací prvky musí být konstruovány tak, aby odolávaly statickým a dynamickým namáháním za normálních podmínek přepravy a nejmenším namáháním uvedeným v 6.8.2.1.2, 6.8.2.1.11 až 6.8.2.1.15 a 6.8.2.1.16 v případě cisternových vozidel, bateriových vozidel a vozidel přepravujících snímatelné cisterny.

9.7.4 Uzemnění vozidel FL

Kovové cisterny nebo cisterny z vyztužených plastů cisternových vozidel FL a články bateriových vozidel FL musí být připojeny k podvozku nejméně jedním dobrým elektrickým spojem. Musí být vyloučen každý dotyk kovů, který by mohl způsobit elektrochemickou korozi.

POZNÁMKA: Viz též 6.9.1.2 a 6.9.2.14.3.

9.7.5 Stabilita cisternových vozidel

9.7.5.1 Celková šířka plochy, kterou zaujímá podvozek cisternového vozidla na vozovce (vzdálenost mezi krajními body dotyku pravé pneumatiky a levé pneumatiky téže nápravy s vozovkou), musí být rovna nejméně 90 % výšky těžiště naloženého cisternového vozidla. U návěsové soupravy nesmí hmotnost na nápravu naloženého návěsu překročit 60 % největší povolené hmotnosti návěsové soupravy.

9.7.5.2 Kromě toho cisterny s nesnímatelnými cisternami o vnitřním objemu větším než 3 m³ určená pro přepravu nebezpečných věcí v kapalném nebo roztaveném stavu a zkoušená tlakem menším než 4 bary musí splňovat technické požadavky předpisu EHK č. 111¹ na boční stabilitu, se změnami a doplňky, v souladu s daty jejich vstupu v platnost v nich uvedenými. Tyto požadavky se vztahují na cisterny poprvé registrované po 1. červenci 2003.

9.7.6 Ochrana vozidel proti nárazu zezadu

Na zadní straně vozidla musí být přes celou šířku cisterny připevněn nárazník dostatečně odolný proti nárazům zezadu. Mezi zadní stěnou cisterny a zadní stranou nárazníku musí být světlá vzdálenost nejméně 100 mm; tato vzdálenost se měří od nejzadnějšího bodu cisternové stěny nebo od vyčnívající výstroje nebo příslušenství, které jsou ve styku s přepravovanou látkou. Vozidla se sklápěcí nádrží určená pro přepravu práškových nebo zrnitých látek a cisterny pro podtlakové vyčerpávání odpadů se sklápěcí nádrží se zadním vyprazdňováním nemusí být vybavena předepsaným zadním nárazníkem, pokud je zadní část cisterny vybavena způsobem zajišťujícím cisterně stejnou ochranu jako nárazník.

POZNÁMKA 1: Toto ustanovení se nevztahuje na vozidla používaná pro přepravu nebezpečných věcí v cisternových kontejnerech, MEGC nebo přemístitelných cisternách.

POZNÁMKA 2: K ochraně cisteren proti poškození v důsledku bočního nárazu nebo převrácení viz 6.8.2.1.20 a 6.8.2.1.21 nebo pro přemístitelné cisterny 6.7.2.4.3 a 6.7.2.4.5.

9.7.7 Vytápěcí systémy s vnitřním spalováním

9.7.7.1 Vytápěcí systémy s vnitřním spalováním musí splňovat požadavky uvedené v 9.2.4.7.1, 9.2.4.7.2, 9.2.4.7.5 a následující požadavky:

- (a) Vypínač může být instalován zevnějšku kabiny řidiče.
- (b) Zařízení může být možno vypnout z vnějšku ložného prostoru; a
- (c) Není nezbytné prokazovat, že výměník tepla je odolný proti sníženému doběhovému cyklu.

Kromě toho vozidla FL musí splňovat požadavky uvedené v 9.2.4.7.3 a 9.2.4.7.4.

9.7.7.2 U vozidel určených pro přepravu nebezpečných věcí, pro které je předepsáno označení bezpečnostní značkou podle vzorů č. 3, 4.1, 4.3, 5.1 nebo 5.2, nesmějí být žádné palivové nádrže, zdroje energie, nasávání vzduchu pro spalování nebo ohřívacího vzduchu, ani vyústění výfukového potrubí potřebné pro provoz vytápěcího systému s vnitřním spalováním umístěny v ložném prostoru. Musí být zajištěno, že výstup horkého vzduchu nemůže být blokován přepravovaným nákladem. Teplota, na kterou je zahříván náklad, nesmí překročit 50 °C. Vytápěcí systém instalovaný uvnitř ložného prostoru musí být konstruován tak, aby se zabránilo vznícení výbušné atmosféry za provozních podmínek.

9.7.8 Elektrické příslušenství

9.7.8.1 Elektrická instalace vozidel FL musí splňovat příslušné požadavky uvedené v 9.2.2.2, 9.2.2.3, 9.2.2.4, 9.2.2.5.1 a 9.2.2.6.

Avšak dodatečná elektrická instalace nebo modifikace elektrické instalace vozidla musí splňovat požadavky na elektrické přístroje příslušné skupiny a teplotní třídy podle látek, které se mají přepravovat.

POZNÁMKA: Přejícná ustanovení, viz též 1.6.5.

9.7.8.2 Elektrické příslušenství vozidel FL, umístěné v prostorech, kde je výbušná atmosféra nebo kde je možno ji očekávat v takových koncentracích, že si vyžaduje zvláštní opatření, musí být vhodné pro použití v nebezpečné zóně. Takové příslušenství musí splňovat všeobecné požadavky normy IEC 60079, částí 0 a 14 a dodatečné použitelné požadavky normy IEC 60079, částí 1, 2, 5, 6, 7, 11 nebo 18. Musí být splněny požadavky na elektrické přístroje příslušné skupiny a teplotní třídy podle látek, které se mají přepravovat.

1 Předpis EHK č. 111: Jednotná ustanovení o schvalování cisternových vozidel kategorií N a O z hlediska stability proti převrácení.

Pro aplikaci normy IEC 60079, části 14 se musí použít následující klasifikace:

ZÓNA 0

Vnitřek cisternových komor, plnicí a vyprazdňovací armatury a potrubí zpětného vedení par.

ZÓNA 1

Vnitřek skříněk pro zařízení používaná pro plnění a vyprazdňování a zóna do vzdálenosti 0,5 m od odvětrávacích zařízení a pojistných ventilů pro vyrovnávání tlaku.

- 9.7.8.3** Elektrické příslušenství pod stálým napětím, včetně vedení, které je umístěno vně zón 0 a 1, musí splňovat všeobecné požadavky na zónu 1 pro elektrické příslušenství nebo požadavky na zónu 2 pro elektrické zařízení umístěné v kabině řidiče podle normy IEC 60079, části 14. Musí být splněny požadavky na příslušnou skupinu elektrických přístrojů podle látek, které se mají přepravovat.

9.7.9 Dodatečné bezpečnostní požadavky na vozidla EX/III

- 9.7.9.1** Vozidla EX/III musí být vybavena automatickými systémy pro hašení požáru v motorovém prostoru.
- 9.7.9.2** Ochrana nákladu proti požáru pneumatik musí být zajištěna kovovými tepelnými stínicími kryty.

KAPITOLA 9.8

DODATEČNÉ POŽADAVKY NA KOMPLETNÍ A ZKOMPLETOVANÉ MEMU

9.8.1 Všeobecná ustanovení

Kromě vlastního vozidla nebo podvozkových jednotek používaných místo něho tvoří MEMU jedna nebo více nádrží a kontejnerů pro volně ložené látky, jejich výstroj a spojovací prvky pro jejich připevnění k vozidlu nebo k podvozkovým jednotkám.

9.8.2 Požadavky na cisterny a kontejnery pro volně ložené látky

Cisterny, kontejnery pro volně ložené látky a zvláštní komory pro kusy výbušnin MEMU musí splňovat požadavky kapitoly 6.12.

9.8.3 Uzemnění MEMU

Cisterny, kontejnery pro volně ložené látky a zvláštní komory pro kusy výbušnin vyrobené z kovu nebo z vyztužených plastů musí být připojeny k podvozku nejméně jedním dobrým elektrickým spojem. Musí být vyloučen jakýkoli dotyk kovů, který by mohl způsobit elektrochemickou korozi nebo reakci s nebezpečnými věcmi přepravovanými v cisternách a kontejnerech pro volně ložené látky.

9.8.4 Stabilita MEMU

Celková šířka plochy, kterou zaujímá podvozek cisternového vozidla na vozovce (vzdálenost mezi krajními body dotyku pravé pneumatiky a levé pneumatiky téže nápravy s vozovkou), musí být rovna nejméně 90 % výšky těžiště naloženého vozidla. U návěsové soupravy nesmí hmotnost na nápravu naloženého návěsu překročit 60 % největší povolené hmotnosti návěsové soupravy.

9.8.5 Ochrana MEMU proti nárazu zezadu

Na zadní straně vozidla musí být přes celou šířku cisterny připevněn nárazník dostatečně odolný proti nárazům zezadu. Mezi zadní stěnou cisterny a zadní stranou nárazníku musí být světlá vzdálenost nejméně 100 mm (tato vzdálenost se měří od nejzadnějšího bodu cisternové stěny nebo od vyčnívající výstroje nebo příslušenství, které jsou ve styku s přepravovanou látkou). Vozidla se sklápěcí nádrží se zadním vyprazdňováním nemusí být vybavena předepsaným zadním nárazníkem, pokud jsou zadní části cisterny provedeny způsobem zajišťujícím cisterně stejnou ochranu jako nárazník.

POZNÁMKA: Toto ustanovení se nevztahuje na MEMU, kde cisterny jsou přiměřeně chráněny proti nárazu zezadu jinými prostředky, např. strojním zařízením nebo potrubím neobsahujícím nebezpečné věci.

9.8.6 Vytápěcí systémy s vnitřním spalováním

9.8.6.1 Vytápěcí systémy s vnitřním spalováním musí splňovat požadavky uvedené v 9.2.4.7.1, 9.2.4.7.2, 9.2.4.7.5, 9.2.4.7.6 a následující požadavky:

- (a) vypínač může být instalován z vnějšku kabiny řidiče;
- (b) zařízení musí být možno vypnout z vnějšku komory MEMU; a
- (c) není nezbytné prokazovat, že výměník tepla je odolný proti sníženému doběhovému cyklu.

9.8.6.2 Žádné palivové nádrže, zdroje energie, nasávání vzduchu pro spalování nebo ohřívacího vzduchu, ani vyústění výfukového potrubí potřebné pro provoz vytápěcího systému s vnitřním spalováním nesmějí být umístěny v ložném prostoru obsahujícím cisterny. Musí být zajištěno, že výstup horkého vzduchu nemůže být uzavřen. Teplota, na kterou je zahřívána jakákoli výstroj, nesmí překročit 50 °C. Vytápěcí systém instalovaný uvnitř ložného prostoru musí být konstruován tak, aby se zabránilo vznícení výbušné atmosféry za provozních podmínek.

9.8.7 Dodatečné bezpečnostní požadavky

9.8.7.1 MEMU musí být vybavena automatickým hasicím systémem pro prostor motoru.

9.8.7.2 Musí být provedena ochrana nákladu proti požáru pneumatik kovovými tepelnými štíty.

9.8.8 Dodatečné další bezpečnostní požadavky

Připravující a nabíjecí výstroj a zvláštní komory v MEMU musí být opatřeny zámky.

Vydává a tiskne: Tiskárna Ministerstva vnitra, p. o., Bartůňkova 4, pošt. schr. 10, 149 01 Praha 415, telefon: 272 927 011, fax: 974 887 395 – **Redakce:** Ministerstvo vnitra, nám. Hrdinů 1634/3, pošt. schr. 155/SB, 140 21 Praha 4, telefon: 974 817 289, fax: 974 816 871 – **Administrace:** písemné objednávky předplatného, změny adres a počtu odebíraných výtisků – MORAVIAPRESS, a. s., U Póny 3061, 690 02 Břeclav, tel.: 516 205 175, e-mail: sbirky@moraviapress.cz. **Roční předplatné** se stanovuje za dodávku kompletního ročníku včetně rejstříku z předcházejícího roku a je od předplatitelů vybíráno formou záloh ve výši oznámené ve Sbírce mezinárodních smluv. Závěrečné vyúčtování se provádí po dodání kompletního ročníku na základě počtu skutečně vydaných částek (první záloha na rok 2015 činí 6 000,- Kč) – Vychází podle potřeby – **Distribuce:** MORAVIAPRESS, a. s., U Póny 3061, 690 02 Břeclav, celoroční předplatné a objednávky jednotlivých částek (dobírky) – 516 205 175, objednávky – knihkupci – 516 205 175, e-mail – sbirky@moraviapress.cz, zelená linka – 800 100 314. **Internetová prodejna:** www.sbirkyzakonu.cz – **Drobný prodej – Brno:** Ing.
