4.2.5.2.6

Portable tank instructions

Portable tank instructions specify the requirements applicable to a portable tank when used for the carriage of specific substances. Portable tank instructions T1 to T22 specify the applicable minimum test pressure, the minimum shell thickness (in mm reference steel), and the pressure-relief and bottom-opening requirements.

T1 - T22 PORTABLE TANK INSTRUCTIONS T1 - T22				
<i>These portable tank instructions apply to liquid and solid substances of Class 1 and Classes 3 to 9. The general provisions of Section 4.2.1 and the requirements of Section 6.7.2 shall be met.</i>				
Portable tank instruction	Minimum test pressure (bar)	Minimum shell thickness (in mm-reference steel) (see 6.7.2.4)	Pressure-relief requirements ^a (see 6.7.2.8)	Bottom opening requirements ^b (see 6.7.2.6)
T1	1.5	See 6.7.2.4.2	Normal	See 6.7.2.6.2
T2	1.5	See 6.7.2.4.2	Normal	See 6.7.2.6.3
T3	2.65	See 6.7.2.4.2	Normal	See 6.7.2.6.2
T4	2.65	See 6.7.2.4.2	Normal	See 6.7.2.6.3
T5	2.65	See 6.7.2.4.2	See 6.7.2.8.3	Not allowed
T6	4	See 6.7.2.4.2	Normal	See 6.7.2.6.2
T7	4	See 6.7.2.4.2	Normal	See 6.7.2.6.3
T8	4	See 6.7.2.4.2	Normal	Not allowed
T9	4	6mm	Normal	Not allowed
T10	4	6mm	See 6.7.2.8.3	Not allowed
T11	6	See 6.7.2.4.2	Normal	See 6.7.2.6.3
T12	6	See 6.7.2.4.2	See 6.7.2.8.3	See 6.7.2.6.3
T13	6	6mm	Normal	Not allowed
T14	6	6mm	See 6.7.2.8.3	Not allowed
T15	10	See 6.7.2.4.2	Normal	See 6.7.2.6.3
T16	10	See 6.7.2.4.2	See 6.7.2.8.3	See 6.7.2.6.3
T17	10	6mm	Normal	See 6.7.2.6.3
T18	10	6mm	See 6.7.2.8.3	See 6.7.2.6.3
T19	10	6mm	See 6.7.2.8.3	Not allowed
T20	10	8mm	See 6.7.2.8.3	Not allowed
T21	10	10mm	Normal	Not allowed
T22	10	10mm	See 6.7.2.8.3	Not allowed

^a When the word "Normal" is indicated, all the requirements of 6.7.2.8 apply except for 6.7.2.8.3.

^b When this column indicates "Not allowed", bottom openings are not permitted when the substance to be carried is a liquid (see 6.7.2.6.1). When the substance to be carried is a solid at all temperatures encountered under normal conditions of carriage, bottom openings conforming to the requirements of 6.7.2.6.2 are authorized.

T23 PORTABLE TANK INSTRUCTION T23								
<i>This portable tank instruction applies to self-reactive substances of Class 4.1 and organic peroxides of Class 5.2. The general provisions of Section 4.2.1 and the requirements of Section 6.7.2 shall be met. The additional provisions specific to self-reactive substances of Class 4.1 and organic peroxides of Class 5.2 in 4.2.1.13 shall also be met.</i>								
UN No.	Substance	Minimum test pressure (bar)	Minimum shell thickness (mm-reference steel)	Bottom opening requirements	Pressure-relief requirements	Degree of filling	Control temperature	Emergency temperature
3109	ORGANIC PEROXIDE, TYPE F, LIQUID tert-Butyl hydro-peroxide ^a , not more than 72% with water Cumyl hydro-peroxide, not more than 90% in diluent type A Di-tert-butyl peroxide, not more than 32% in diluent type A Isopropyl cumyl hydro-peroxide, not more than 72% in diluent type A p-Menthyl hydro-peroxide, not more than 72% in diluent type A Pinanyl hydro-peroxide, not more than 56% in diluent type A	4	See 6.7.2.4.2	See 6.7.2.6.3	See 6.7.2.8.2 4.2.1.13.6 4.2.1.13.7 4.2.1.13.8	See 4.2.1.13.13		
3110	ORGANIC PEROXIDE TYPE F, SOLID Dicumyl peroxide ^b	4	See 6.7.2.4.2	See 6.7.2.6.3	See 6.7.2.8.2 4.2.1.13.6 4.2.1.13.7 4.2.1.13.8	See 4.2.1.13.13		
3119	ORGANIC PEROXIDE, TYPE F, LIQUID, TEMPERATURE CONTROLLED	4	See 6.7.2.4.2	See 6.7.2.6.3	See 6.7.2.8.2 4.2.1.13.6 4.2.1.13.7 4.2.1.13.8	See 4.2.1.13.13	^c	^c
	tert-Amyl peroxyneodecanoate, not more than 47% in diluent type A						-10 °C	-5 °C
	tert-Butyl peroxyacetate, not more than 32% in diluent type B						+30 °C	+35 °C
	tert-Butyl peroxy-2-ethylhexanoate, not more than 32% in diluent type B						+15 °C	+20 °C

^a Provided that steps have been taken to achieve the safety equivalence of 65% tert-Butyl hydroperoxide and 35% water.

^b Maximum quantity per portable tank: 2000 kg.

^c As approved by the competent authority.

T23 PORTABLE TANK INSTRUCTION (cont'd) T23								
<i>This portable tank instruction applies to self-reactive substances of Class 4.1 and organic peroxides of Class 5.2. The general provisions of Section 4.2.1 and the requirements of Section 6.7.2 shall be met. The additional provisions specific to self-reactive substances of Class 4.1 and organic peroxides of Class 5.2 in 4.2.1.13 shall also be met.</i>								
UN No.	Substance	Minimum test pressure (bar)	Minimum shell thickness (mm-reference steel)	Bottom opening requirements	Pressure-relief requirements	Degree of filling	Control temperature	Emergency temperature
3119 (Cont'd)	tert-Butyl peroxy-pivalate, not more than 27% in diluent type B						+5 °C	+10 °C
	tert-Butyl peroxy-3,5,5-trimethyl-hexanoate, not more than 32% in diluent type B						+35 °C	+40 °C
	Di-(3,5,5-trimethyl-hexanoyl) peroxide, not more than 38% in diluent type A or type B						0 °C	+5 °C
	Peroxyacetic acid, distilled, type F, stabilized ^a						+30 °C	+35 °C
3120	ORGANIC PEROXIDE, TYPE F, SOLID, TEMPERATURE CONTROLLED	4	See 6.7.2.4.2	See 6.7.2.6.3	See 6.7.2.8.2 4.2.1.13.6 4.2.1.13.7 4.2.1.13.8	See 4.2.1.13.13	^c	^c
3229	SELF-REACTIVE LIQUID TYPE F	4	See 6.7.2.4.2	See 6.7.2.6.3	See 6.7.2.8.2 4.2.1.13.6 4.2.1.13.7 4.2.1.13.8	See 4.2.1.13.13

3239	SELF-REACTIVE LIQUID TYPE F, TEMPERATURE CONTROLLED	4	See 6.7.2.4.2	See 6.7.2.6.3	See 6.7.2.8.2 4.2.1.13.6 4.2.1.13.7 4.2.1.13.8	See 4.2.1.13.13	^c	^c
3240	SELF-REACTIVE SOLID TYPE F, TEMPERATURE CONTROLLED	4	See 6.7.2.4.2	See 6.7.2.6.3	See 6.7.2.8.2 4.2.1.13.6 4.2.1.13.7 4.2.1.13.8	See 4.2.1.13.13	^c	^c

^c As approved by the competent authority.

^d Formulation derived from distillation of peroxyacetic acid originating from peroxyacetic acid in concentration of not more than 41% with water, total active oxygen (Peroxyacetic acid+H₂O₂) ≤ 9.5%, which fulfils the criteria of the Manual of Tests and Criteria, paragraph 20.4.3 (f). "CORROSIVE" subsidiary risk placard required (Model No 8, see 5.2.2.2.2).

T50 PORTABLE TANK INSTRUCTION T50					
<i>This portable tank instruction applies to non-refrigerated liquefied gases and chemicals under pressure (UN Nos. 3500, 3501, 3502, 3503, 3504 and 3505). The general provisions of Section 4.2.2 and the requirements of Section 6.7.3 shall be met.</i>					
UN No.	Non-refrigerated liquefied gases	Max. allowable working pressure (bar): Small; Bare; Sunshield; Insulated; respectively ^a	Openings below liquid level	Pressure-relief requirements ^b (see 6.7.3.7)	Maximum filling ratio
1005	Ammonia, anhydrous	29.0 25.7 22.0 19.7	Allowed	See 6.7.3.7.3	0.53
1009	Bromotrifluoromethane (Refrigerant gas R 13B1)	38.0 34.0 30.0 27.5	Allowed	Normal	1.13
1010	Butadienes, stabilized	7.5 7.0 7.0 7.0	Allowed	Normal	0.55
1010	Butadienes and hydrocarbon mixture, stabilized	See MAWP definition in 6.7.3.1	Allowed	Normal	See 4.2.2.7
1011	Butane	7.0 7.0 7.0 7.0	Allowed	Normal	0.51
1012	Butylene	8.0 7.0 7.0 7.0	Allowed	Normal	0.53
1017	Chlorine	19.0 17.0 15.0 13.5	Not Allowed	See 6.7.3.7.3	1.25

1965	Hydrocarbon gas, mixture liquefied, n.o.s.	See MAWP definition in 6.7.3.1	Allowed	Normal	See 4.2.2.7
1969	Isobutane	8.5 7.5 7.0 7.0	Allowed	Normal	0.49

^a "Small" means tanks having a shell with a diameter of 1.5 m or less; "Bare" means tanks having a shell with a diameter of more than 1.5 m without insulation or sun shield (see 6.7.3.2.12); "Sunshield" means tanks having a shell with a diameter of more than 1.5 m with sun shield (see 6.7.3.2.12); "Insulated" means tanks having a shell with a diameter of more than 1.5 m with insulation (see 6.7.3.2.12); (See definition of "Design reference temperature" in 6.7.3.1).

^b The word "Normal" in the pressure relief requirements column indicates that a frangible disc as specified in 6.7.3.7.3 is not required.

T50 PORTABLE TANK INSTRUCTION (cont'd) T50					
<i>This portable tank instruction applies to non-refrigerated liquefied gases and chemicals under pressure (UN Nos. 3500, 3501, 3502, 3503, 3504 and 3505). The general provisions of Section 4.2.2 and the requirements of Section 6.7.3 shall be met.</i>					
UN No.	Non-refrigerated liquefied gases	Max. allowable working pressure (bar): Small; Bare; Sunshield; Insulated respectively ^a	Openings below liquid level	Pressure-relief requirements ^b (see 6.7.3.7)	Maximum filling ratio
1973	Chlorodifluoromethane and chloropentafluoroethane mixture with fixed boiling point, with approximately 49% chlorodifluoromethane (Refrigerant gas R 502)	28.3 25.3 22.8 20.3	Allowed	Normal	1.05
1974	Chlorodifluorobromomethane (Refrigerant gas R 12B1)	7.4 7.0 7.0 7.0	Allowed	Normal	1.61
1976	Octafluorocyclobutane (Refrigerant gas RC 318)	8.8 7.8 7.0 7.0	Allowed	Normal	1.34
1978	Propane	22.5 20.4 18.0 16.5	Allowed	Normal	0.42
1983	1-Chloro-2,2,2-trifluoroethane (Refrigerant gas R 133a)	7.0 7.0 7.0 7.0	Allowed	Normal	1.18
2035	1,1,1-Trifluoroethane (Refrigerant gas R 143a)	31.0 27.5 24.2 21.8	Allowed	Normal	0.76
2424	Octafluoropropane (Refrigerant gas R 218)	23.1 20.8 18.6 16.6	Allowed	Normal	1.07
2517	1-Chloro-1,1-difluoroethane (Refrigerant gas R 142b)	8.9 7.8 7.0 7.0	Allowed	Normal	0.99
2602	Dichlorodifluoromethane and 1,1-difluoroethane azeotropic mixture with approximately 74% dichlorodifluoromethane (Refrigerant gas R 500)	20.0 18.0 16.0 14.5	Allowed	Normal	1.01

^a "Small" means tanks having a shell with a diameter of 1.5 m or less; "Bare" means tanks having a shell with a diameter of more than 1.5 m without insulation or sun shield (see 6.7.3.2.12); "Sunshield" means tanks having a shell with a diameter of more than 1.5 m with sun shield (see 6.7.3.2.12); "Insulated" means tanks having a shell with a diameter of more than 1.5 m with insulation (see 6.7.3.2.12); (See definition of "Design reference temperature" in 6.7.3.1).

^b The word "Normal" in the pressure relief requirements column indicates that a frangible disc as specified in 6.7.3.7.3 is not required.

T50 PORTABLE TANK INSTRUCTION (cont'd) T50					
<i>This portable tank instruction applies to non-refrigerated liquefied gases and chemicals under pressure (UN Nos. 3500, 3501, 3502, 3503, 3504 and 3505). The general provisions of Section 4.2.2 and the requirements of Section 6.7.3 shall be met.</i>					
UN No.	Non-refrigerated liquefied gases	Max. allowable working pressure (bar): Small; Bare; Sunshield; Insulated; respectively ^a	Openings below liquid level	Pressure-relief requirements ^b (see 6.7.3.7)	Maximum filling ratio
3057	Trifluoroacetyl chloride	14.6 12.9 11.3 9.9	Not allowed	See 6.7.3.7.3	1.17
3070	Ethylene oxide and dichlorodifluoromethane mixture with not more than 12.5% ethylene oxide	14.0 12.0 11.0 9.0	Allowed	See 6.7.3.7.3	1.09
3153	Perfluoro (methyl vinyl ether)	14.3 13.4 11.2 10.2	Allowed	Normal	1.14
3159	1,1,1,2-Tetrafluoroethane (Refrigerant gas R 134a)	17.7 15.7 13.8 12.1	Allowed	Normal	1.04
3161	Liquefied gas, flammable, n.o.s.	See MAWP definition in 6.7.3.1	Allowed	Normal	See 4.2.2.7
3163	Liquefied gas, n.o.s.	See MAWP definition in 6.7.3.1	Allowed	Normal	See 4.2.2.7
3220	Pentafluoroethane (Refrigerant gas R 125)	34.4 30.8 27.5 24.5	Allowed	Normal	0.87
3252	Difluoromethane (Refrigerant gas R 32)	43.0 39.0 34.4 30.5	Allowed	Normal	0.78
3296	Heptafluoropropane (Refrigerant gas R 227)	16.0 14.0 12.5 11.0	Allowed	Normal	1.20
3297	Ethylene oxide and chlorotetrafluoroethane mixture, with not more than 8.8% ethylene oxide	8.1 7.0 7.0 7.0	Allowed	Normal	1.16

^a "Small" means tanks having a shell with a diameter of 1.5 m or less; "Bare" means tanks having a shell with a diameter of more than 1.5 m without insulation or sun shield (see 6.7.3.2.12); "Sunshield" means tanks having a shell with a diameter of more than 1.5 m with sun shield (see 6.7.3.2.12); "Insulated" means tanks having a shell with a diameter of more than 1.5 m with insulation (see 6.7.3.2.12); (See definition of "Design reference temperature" in 6.7.3.1).

^b The word "Normal" in the pressure relief requirements column indicates that a frangible disc as specified in 6.7.3.7.3 is not required.

T50 PORTABLE TANK INSTRUCTION (cont'd) T50					
<i>This portable tank instruction applies to non-refrigerated liquefied gases and chemicals under pressure (UN Nos. 3500, 3501, 3502, 3503, 3504 and 3505). The general provisions of Section 4.2.2 and the requirements of Section 6.7.3 shall be met.</i>					
UN No.	Non-refrigerated liquefied gases	Max. allowable working pressure (bar): Small; Bare; Sunshield; Insulated; respectively ^a	Openings below liquid level	Pressure-relief requirements ^b (see 6.7.3.7)	Maximum filling ratio
3298	Ethylene oxide and pentafluoroethane mixture, with not more than 7.9% ethylene oxide	25.9 23.4 20.9 18.6	Allowed	Normal	1.02
3299	Ethylene oxide and tetrafluoroethane mixture, with not more than 5.6% ethylene oxide	16.7 14.7 12.9 11.2	Allowed	Normal	1.03
3318	Ammonia solution, relative density less than 0.880 at 15 °C in water, with more than 50% ammonia	See MAWP definition in 6.7.3.1	Allowed	See 6.7.3.7.3	See 4.2.2.7
3337	Refrigerant gas R 404A	31.6 28.3 25.3 22.5	Allowed	Normal	0.84
3338	Refrigerant gas R 407A	31.3 28.1 25.1 22.4	Allowed	Normal	0.95
3339	Refrigerant gas R 407B	33.0 29.6 26.5 23.6	Allowed	Normal	0.95

3500	Chemical under pressure, n.o.s.	See MAWP definition in 6.7.3.1	Allowed	See 6.7.3.7.3	TP4 ^c
3501	Chemical under pressure, flammable, n.o.s.	See MAWP definition in 6.7.3.1	Allowed	See 6.7.3.7.3	TP4 ^c
3502	Chemical under pressure, toxic, n.o.s.	See MAWP definition in 6.7.3.1	Allowed	See 6.7.3.7.3	TP4 ^c
3503	Chemical under pressure, corrosive, n.o.s.	See MAWP definition in 6.7.3.1	Allowed	See 6.7.3.7.3	TP4 ^c
3504	Chemical under pressure, flammable, toxic, n.o.s.	See MAWP definition in 6.7.3.1	Allowed	See 6.7.3.7.3	TP4 ^c
3505	Chemical under pressure, flammable, corrosive, n.o.s.	See MAWP definition in 6.7.3.1	Allowed	See 6.7.3.7.3	TP4 ^c

^a "Small" means tanks having a shell with a diameter of 1.5 m or less; "Bare" means tanks having a shell with a diameter of more than 1.5 m without insulation or sun shield (see 6.7.3.2.12); "Sunshield" means tanks having a shell with a diameter of more than 1.5 m with sun shield (see 6.7.3.2.12); "Insulated" means tanks having a shell with a diameter of more than 1.5 m with insulation (see 6.7.3.2.12); (See definition of "Design reference temperature" in 6.7.3.1).

^b The word "Normal" in the pressure relief requirements column indicates that a frangible disc as specified in 6.7.3.7.3 is not required.

^c For UN Nos. 3500, 3501, 3502, 3503, 3504 and 3505, the degree of filling shall be considered instead of the maximum filling ratio.

T75	PORTABLE TANK INSTRUCTION	T75
<i>This portable tank instruction applies to refrigerated liquefied gases. The general provisions of Section 4.2.3 and the requirements of Section 6.7.4 shall be met.</i>		

4.2.5.3 *Portable tank special provisions*

Portable tank special provisions are assigned to certain substances to indicate provisions which are in addition to or in lieu of those provided by the portable tank instructions or the requirements in Chapter 6.7. Portable tank special provisions are identified by an alpha numeric code beginning with the letters "TP" (tank provision) and are assigned to specific substances in Column (11) of Table A of Chapter 3.2. The following is a list of the portable tank special provisions:

TP1 The degree of filling prescribed in 4.2.1.9.2 shall not be exceeded.

$$(\text{Degree of filling} = \frac{97}{1 + \alpha(t_r - t_f)})$$

TP2 The degree of filling prescribed in 4.2.1.9.3 shall not be exceeded.

$$(\text{Degree of filling} = \frac{95}{1 + \alpha(t_r - t_f)})$$

TP3 The maximum degree of filling (in %) for solids carried above their melting point and for elevated temperature liquids shall be determined in accordance with 4.2.1.9.5.

$$(\text{Degree of filling} = 95 \frac{d_r}{d_f})$$

TP4 The degree of filling shall not exceed 90% or, alternatively, any other value approved by the competent authority (see 4.2.1.16.2).

TP5 The degree of filling prescribed in 4.2.3.6 shall be met.

TP6 To prevent the tank bursting in any event, including fire engulfment, it shall be provided with pressure-relief devices which are adequate in relation to the capacity of the tank and to the nature of the substance carried. The device shall also be compatible with the substance.

TP7 Air shall be eliminated from the vapour space by nitrogen or other means.

TP8 The test pressure may be reduced to 1.5 bar when the flash point of the substances carried is greater than 0 °C.

TP9 A substance under this description shall only be carried in a portable tank under an approval granted by the competent authority.

TP10 A lead lining, not less than 5 mm thick, which shall be tested annually, or another suitable lining material approved by the competent authority is required.

TP12 *(Deleted)*

TP13 *(Reserved)*

TP16 The tank shall be fitted with a special device to prevent under-pressure and excess pressure during normal carriage conditions. This device shall be approved by the competent authority.

Pressure-relief requirements are as indicated in 6.7.2.8.3 to prevent crystallization of the product in the pressure-relief valve.

- TP17 Only inorganic non-combustible materials shall be used for thermal insulation of the tank.
- TP18 Temperature shall be maintained between 18 °C and 40 °C. Portable tanks containing solidified methacrylic acid shall not be reheated during carriage.
- TP19 The calculated shell thickness shall be increased by 3 mm. Shell thickness shall be verified ultrasonically at intervals midway between periodic hydraulic tests.
- TP20 This substance shall only be carried in insulated tanks under a nitrogen blanket.
- TP21 The shell thickness shall be not less than 8 mm. Tanks shall be hydraulically tested and internally inspected at intervals not exceeding 2.5 years.
- TP22 Lubricant for joints or other devices shall be oxygen compatible.
- TP23 Carriage permitted under special conditions prescribed by the competent authorities.
- TP24 The portable tank may be fitted with a device located under maximum filling conditions in the vapour space of the shell to prevent the build up of excess pressure due to the slow decomposition of the substance carried. This device shall also prevent an unacceptable amount of leakage of liquid in the case of overturning or entry of foreign matter into the tank. This device shall be approved by the competent authority or its authorized body.
- TP25 Sulphur trioxide 99.95% pure and above may be carried in tanks without an inhibitor provided that it is maintained at a temperature equal to or above 32.5 °C.
- TP26 When carried under heated conditions, the heating device shall be fitted outside the shell. For UN 3176 this requirement only applies when the substance reacts dangerously with water.
- TP27 A portable tank having a minimum test pressure of 4 bar may be used if it is shown that a test pressure of 4 bar or less is acceptable according to the test pressure definition in 6.7.2.1.
- TP28 A portable tank having a minimum test pressure of 2.65 bar may be used if it is shown that a test pressure of 2.65 bar or less is acceptable according to the test pressure definition in 6.7.2.1.
- TP29 A portable tank having a minimum test pressure of 1.5 bar may be used if it is shown that a test pressure of 1.5 bar or less is acceptable according to the test pressure definition in 6.7.2.1.
- TP30 This substance shall be carried in insulated tanks.
- TP31 This substance may only be carried in tanks in the solid state.
- TP32 For UN Nos. 0331, 0332 and 3375, portable tanks may be used subject to the following conditions:
- (a) To avoid unnecessary confinement, each portable tank constructed of metal shall be fitted with a pressure-relief device that may be of the reclosing spring-loaded type, a frangible disc or a fusible element. The set to discharge or burst pressure, as applicable, shall not be greater than 2.65 bar for portable tanks with minimum test pressures greater than 4 bar.
 - (b) For UN 3375 only, the suitability for carriage in tanks shall be demonstrated. One method to evaluate this suitability is test 8 (d) in Test Series 8 (see Manual of Tests and Criteria, Part 1, Sub-section 18.7).

- (c) Substances shall not be allowed to remain in the portable tank for any period that could result in caking. Appropriate measures shall be taken to avoid accumulation and packing of substances in the tank (e.g. cleaning, etc).
- TP33 The portable tank instruction assigned for this substance applies to granular and powdered solids and to solids which are filled and discharged at temperatures above their melting point which are cooled and carried as a solid mass. For solids which are carried above their melting point, see 4.2.1.19.
- TP34 Portable tanks need not be subjected to the impact test in 6.7.4.14.1 if the portable tank is marked "NOT FOR RAIL TRANSPORT" on the plate specified in 6.7.4.15.1 and also in letters of at least 10 cm high on both sides of the outer jacket.
- TP35 Portable tank instruction T14 prescribed in ADR applicable up to 31 December 2008 may continue to be applied until 31 December 2014.
- TP36 Fusible elements in the vapour space may be used on portable tanks.
- TP37 Portable tank instruction T14 may continue to be applied until 31 December 2016 except that until that date:
- (a) For UN Nos. 1810, 2474 and 2668, T7 may be applied;
- (b) For UN No. 2486, T8 may be applied; and
- (c) For UN No. 1838, T10 may be applied.
- TP38 Portable tank instruction T9 prescribed in ADR applicable up to 31 December 2012 may continue to be applied until 31 December 2018.
- TP39 Portable tank instruction T4 prescribed in ADR applicable up to 31 December 2012 may continue to be applied until 31 December 2018.
- TP40 Portable tanks shall not be carried when connected with spray application equipment.
- TP41 With the agreement of the competent authority, the 2.5 year internal examination may be waived or substituted by other test methods or inspection procedures, provided that the portable tank is dedicated to the carriage of the organometallic substances to which this tank special provision is assigned. However this examination is required when the conditions of 6.7.2.19.7 are met.

CHAPTER 4.3

USE OF FIXED TANKS (TANK-VEHICLES), DEMOUNTABLE TANKS, TANK-CONTAINERS AND TANK SWAP BODIES WITH SHELLS MADE OF METALLIC MATERIALS, AND BATTERY-VEHICLES AND MULTIPLE-ELEMENT GAS CONTAINERS (MEGCs)

NOTE: *For portable tanks and UN multiple-element gas containers (MEGCs) see Chapter 4.2; for fibre-reinforced plastics tanks, see Chapter 4.4; for vacuum operated waste tanks, see Chapter 4.5.*

4.3.1 Scope

4.3.1.1 Provisions which take up the whole width of the page apply both to fixed tanks (tank-vehicles), demountable tanks and battery-vehicles, and to tank-containers, tank swap bodies and MEGCs. Provisions contained in a single column apply only to:

- fixed tanks (tank-vehicles), demountable tanks and battery-vehicles (left-hand column);
- tank-containers, tank swap bodies and MEGCs (right-hand column).

4.3.1.2 These provisions apply to:

fixed tanks (tank-vehicles), demountable tanks and battery-vehicles		tank-containers, tank swap bodies and MEGCs
--	--	---

used for the carriage of gaseous, liquid, powdery or granular substances.

4.3.1.3 Section 4.3.2 lists the provisions applicable to fixed tanks (tank-vehicles), demountable tanks, tank-containers and tank swap bodies, intended for the carriage of substances of all classes, and to battery-vehicles and MEGCs intended for the carriage of gases of Class 2. Sections 4.3.3 and 4.3.4 contain special provisions adding to or amending the provisions of Section 4.3.2.

4.3.1.4 For requirements concerning the construction, equipment, type approval, tests and marking, see Chapter 6.8.

4.3.1.5 For transitional measures concerning the application of this Chapter, see:

1.6.3.		1.6.4.
--------	--	--------

4.3.2 Provisions applicable to all classes

4.3.2.1 Use

4.3.2.1.1 A substance subject to ADR may be carried in fixed tanks (tank-vehicles), demountable tanks, battery-vehicles, tank-containers, tank swap bodies and MEGCs only when provision is made for a tank code according to 4.3.3.1.1 and 4.3.4.1.1 in Column (12) of Table A in Chapter 3.2.

4.3.2.1.2 The required type of tank, battery-vehicle and MEGC is given in code form in Column (12) of Table A in Chapter 3.2. The explanations for reading the four parts of the code are given in 4.3.3.1.1 (when the substance to be carried belongs to Class 2) and in 4.3.4.1.1 (when the substance to be carried belongs to Classes 1 and 3 to 9)¹.

¹ An exception is made for tanks intended for the carriage of substances of classes 1, 5.2 or 7 (see 4.3.4.1.3).

- 4.3.2.1.3 The required type according to 4.3.2.1.2 corresponds to the least stringent construction requirements which are acceptable for the dangerous substance in question unless otherwise prescribed in this Chapter or in Chapter 6.8. It is possible to use tanks corresponding to codes prescribing a higher minimum calculation pressure, or more stringent requirements for filling or discharge openings or for safety valves/devices (see 4.3.3.1.1 for Class 2 and 4.3.4.1.1 for Classes 3 to 9).
- 4.3.2.1.4 For certain substances, tanks, battery-vehicles or MEGCs are subject to additional provisions which are included as special provisions in Column (13) of Table A in Chapter 3.2.
- 4.3.2.1.5 Tanks, battery-vehicles and MEGCs shall not be loaded with any dangerous substances other than those for the carriage of which they have been approved according to 6.8.2.3.1 and which, in contact with the materials of the shell, gaskets, equipment and protective linings, are not liable to react dangerously with them (see "dangerous reaction" in 1.2.1), to form dangerous products or appreciably to weaken these materials².
- 4.3.2.1.6 Foodstuffs shall not be carried in tanks used for dangerous substances unless the necessary steps have been taken to prevent any harm to public health.
- 4.3.2.1.7 The tank record shall be retained by the owner or the operator who shall be able to provide this documentation at the request of the competent authority. The tank record shall be maintained throughout the life of the tank and retained for 15 months after the tank is taken out of service.

Should a change of owner or operator occur during the life of the tank the tank record shall be transferred to the new owner or operator.

Copies of the tank record or all necessary documents shall be made available to the expert for tests, inspections and checks on tanks in accordance with 6.8.2.4.5 or 6.8.3.4.16, on the occasion of periodic inspections or exceptional checks.

4.3.2.2 Degree of filling

- 4.3.2.2.1 The following degrees of filling shall not be exceeded in tanks intended for the carriage of liquids at ambient temperatures:

- (a) for flammable substances, environmentally hazardous substances and flammable environmentally hazardous substances, without additional risks (e.g. toxicity or corrosivity), in tanks with a breather device or with safety valves (even where preceded by a bursting disc):

$$\text{Degree of filling} = \frac{100}{1 + \alpha (50 - t_F)} \% \text{ of capacity}$$

- (b) for toxic or corrosive substances (whether flammable or environmentally hazardous or not) in tanks with a breather device or with safety valves (even where preceded by a bursting disc):

$$\text{Degree of filling} = \frac{98}{1 + \alpha (50 - t_F)} \% \text{ of capacity}$$

- (c) for flammable substances, environmentally hazardous substances and slightly toxic or corrosive substances (whether flammable or environmentally hazardous or not) in hermetically closed tanks without a safety device:

$$\text{Degree of filling} = \frac{97}{1 + \alpha (50 - t_F)} \% \text{ of capacity}$$

² It may be necessary to consult the manufacturer of the substance and the competent authority for guidance on the compatibility of the substance with the materials of the tank, battery-vehicle or MEGC.

- (d) for highly toxic, toxic, highly corrosive or corrosive substances (whether flammable or environmentally hazardous or not) in hermetically closed tanks without a safety device:

$$\text{Degree of filling} = \frac{95}{1 + \alpha (50 - t_F)} \% \text{ of capacity}$$

- 4.3.2.2.2 In these formulae, α is the mean coefficient of cubical expansion of the liquid between 15 °C and 50 °C, i.e. for a maximum variation in temperature of 35 °C.

α is calculated by the formula:

$$\alpha = \frac{d_{15} - d_{50}}{35d_{50}}$$

where d_{15} and d_{50} are the relative densities of the liquid at 15 °C and 50 °C respectively.
 t_F is the mean temperature of the liquid during filling.

- 4.3.2.2.3 The provisions of 4.3.2.2.1 (a) to (d) above shall not apply to tanks whose contents are, by means of a heating device, maintained at a temperature above 50 °C during carriage. In this case the degree of filling at the outset shall be such, and the temperature so regulated, that the tank is not full to more than 95% of its capacity and that the filling temperature is not exceeded, at any time during carriage.

- 4.3.2.2.4 Shells intended for the carriage of substances in the liquid state or liquefied gases or refrigerated liquefied gases, which are not divided by partitions or surge plates into sections of not more than 7 500 litres capacity, shall be filled to not less than 80% or not more than 20% of their capacity.

This provision is not applicable to:

- liquids with a kinematic viscosity at 20 °C of at least 2 680 mm²/s;
- molten substances with a kinematic viscosity at the temperature of filling of at least 2 680 mm²/s;
- UN 1963 HELIUM, REFRIGERATED, LIQUID and UN 1966 HYDROGEN, REFRIGERATED, LIQUID.

4.3.2.3 *Operation*

- 4.3.2.3.1 The thickness of the walls of the shell shall not, throughout its use, fall below the minimum figure prescribed in:

6.8.2.1.17 to 6.8.2.1.21.

| 6.8.2.1.17 to 6.8.1.20.

- 4.3.2.3.2

During carriage tank-containers/MEGCs shall be loaded on the carrying vehicle in such a way as to be adequately protected by the fittings of the carrying vehicle or of the tank-container/MEGC itself against lateral and longitudinal impact and against overturning³. If the tank-containers/MEGCs, including the service equipment, are so constructed as to withstand impact or overturning they need not be protected in this way.

³ *Examples of protection of shells:*

- *protection against lateral impact may, for example, consist of longitudinal bars protecting the shell on both sides at the level of the median line;*
- *protection against overturning may, for example, consist of reinforcing rings or bars fixed transversally in relation to the frame;*
- *protection against rear impact, may, for example, consist of a bumper or frame.*

4.3.2.3.3 During filling and discharge of tanks, battery-vehicles and MEGCs, appropriate measures shall be taken to prevent the release of dangerous quantities of gases and vapours. Tanks, battery-vehicles and MEGCs shall be closed so that the contents cannot spill out uncontrolled. The openings of bottom-discharge tanks shall be closed by means of screw-threaded plugs, blank flanges or other equally effective devices. After filling, the filler shall ensure that all the closures of the tanks, battery-vehicles and MEGCs are in the closed position and there is no leakage. This also applies to the upper part of the dip tube.

4.3.2.3.4 Where several closure systems are fitted in series, that nearest to the substance being carried shall be closed first.

4.3.2.3.5 No dangerous residue of the filling substance shall adhere to the outside of the tank during carriage.

4.3.2.3.6 Substances which may react dangerously with each other shall not be carried in adjoining compartments of tanks.

Substances which may react dangerously with each other may be carried in adjoining compartments of tanks, when these compartments are separated by a partition with a wall thickness equal to or greater than that of the tank itself. They may also be carried separated by an empty space or an empty compartment between loaded compartments.

4.3.2.4 Empty tanks, battery-vehicles and MEGCs, uncleaned

NOTE: For empty tanks, battery-vehicles and MEGCs, uncleaned, special provisions TU1, TU2, TU4, TU16 and TU35 of 4.3.5 may apply.

4.3.2.4.1 No dangerous residue of the filling substance shall adhere to the outside of the tank during carriage.

4.3.2.4.2 To be accepted for carriage, empty tanks, battery-vehicles and MEGCs, uncleaned, shall be closed in the same manner and be leakproof to the same degree as if they were full.

4.3.2.4.3 Where empty tanks, battery-vehicles and MEGCs, uncleaned, are not closed in the same manner and are not leakproof to the same degree as if they were full and where the provisions of ADR cannot be complied with, they shall be carried, with due regard to adequate safety, to the nearest suitable place where cleaning or repair can be carried out. Carriage is adequately safe if suitable measures have been taken to ensure equivalent safety commensurate with the provisions of ADR and to prevent the uncontrolled release of the dangerous goods.

4.3.2.4.4 Empty fixed tanks (tank-vehicles), demountable tanks, battery-vehicles, tank-containers, tank swap bodies and MEGCs, uncleaned, may also be carried after the expiry of the periods established in 6.8.2.4.2 and 6.8.2.4.3 for undergoing the inspection.

4.3.3 Special provisions applicable to Class 2**4.3.3.1 Coding and hierarchy of tanks****4.3.3.1.1 Coding of tanks, battery-vehicles and MEGCs**

The four parts of the codes (tank codes) given in Column (12) of Table A in Chapter 3.2 have the following meanings:

Part	Description	Tank Code
1	Types of tank, battery-vehicle or MEGC	C = tank, battery-vehicle or MEGC for compressed gases; P = tank, battery-vehicle or MEGC for liquefied gases or dissolved gases; R = tank for refrigerated liquefied gases.
2	Calculation pressure	X = value of the minimum relevant test pressure according to the table in 4.3.3.2.5; or 22 = minimum calculation pressure in bar.
3	Openings (see 6.8.2.2 and 6.8.3.2)	B = tank with bottom filling or discharge openings with 3 closures; or battery-vehicle or MEGC with openings below the surface of the liquid or for compressed gases; C = tank with top filling or discharge openings with 3 closures with only cleaning openings below the surface of the liquid; D = tank with top filling or discharge openings with 3 closures; or battery-vehicle or MEGC with no openings below the surface of the liquid.
4	Safety valves/devices	N = tank, battery-vehicle or MEGC with safety valve according to 6.8.3.2.9 or 6.8.3.2.10 which is not hermetically closed; H = hermetically closed tank, battery-vehicle or MEGC (see 1.2.1);

NOTE 1: The special provision TU17 indicated in Column (13) of Table A in Chapter 3.2 for certain gases means that the gas may only be carried in a battery-vehicle or MEGC the elements of which are composed of receptacles.

NOTE 2: The special provision TU40 indicated in Column (13) of Table A in Chapter 3.2 for certain gases means that the gas may only be carried in a battery-vehicle or MEGC, the elements of which are composed of seamless receptacles.

NOTE 3: The pressures indicated on the tank itself or on the panel shall be not less than the value of "X" or the minimum calculation pressure.

4.3.3.1.2 *Hierarchy of tanks*

Tank code	Other tank code(s) permitted for the substances under this code
C*BN	C#BN, C#CN, C#DN, C#BH, C#CH, C#DH
C*BH	C#BH, C#CH, C#DH
C*CN	C#CN, C#DN, C#CH, C#DH
C*CH	C#CH, C#DH
C*DN	C#DN, C#DH
C*DH	C#DH
P*BN	P#BN, P#CN, P#DN, P#BH, P#CH, P#DH
P*BH	P#BH, P#CH, P#DH
P*CN	P#CN, P#DN, P#CH, P#DH
P*CH	P#CH, P#DH
P*DN	P#DN, P#DH
P*DH	P#DH
R*BN	R#BN, R#CN, R#DN
R*CN	R#CN, R#DN
R*DN	R#DN

The figure represented by "#" shall be equal to or greater than the figure represented by "*".

NOTE: This hierarchy does not take any special provisions into account (see 4.3.5 and 6.8.4) for each entry.

4.3.3.2 Filling conditions and test pressures

4.3.3.2.1 The test pressure for tanks intended for the carriage of compressed gases shall be at least 1.5 times the working pressure as defined in 1.2.1 for pressure receptacles.

4.3.3.2.2 The test pressure for tanks intended for the carriage of:

- high pressure liquefied gases; and
- dissolved gases

shall be such that, when the shell is filled to the maximum filling ratio, the pressure reached in the shell by the substance at 55 °C for tanks with thermal insulation or 65 °C for tanks without thermal insulation does not exceed the test pressure.

4.3.3.2.3 The test pressure for tanks intended for the carriage of low pressure liquefied gases will be:

- (a) If the tank is equipped with thermal insulation, at least equal to the vapour pressure, reduced by 0.1 MPa (1 bar) of the liquid at 60 °C, but not less than 1 MPa (10 bar);
- (b) If the tank is not equipped with thermal insulation, at least equal to the vapour pressure, reduced by 0.1 MPa (1 bar), of the liquid at 65 °C, but not less than 1 MPa (10 bar).

The maximum permissible mass of contents per litre of capacity is calculated as follows:

Maximum permissible mass of contents per litre of capacity = 0.95 × density of the liquid phase at 50 °C (in kg/l)

Moreover the vapour phase shall not disappear below 60 °C.

If the shells are not more than 1.5 m in diameter, the values of the test pressure and maximum filling ratio conforming to packing instruction P200 in 4.1.4.1 shall be applicable.

4.3.3.2.4 The test pressure for tanks intended for the carriage of refrigerated liquefied gases shall be not less than 1.3 times the maximum allowable working pressure and indicated on the tank but not less

than 300 kPa (3 bar) (gauge pressure); for tanks with vacuum insulation the test pressure shall be not less than 1.3 times the maximum allowable working pressure increased by 100 kPa (1 bar).

4.3.3.2.5

Table of gases and gas mixtures which may be carried in fixed tanks (tank-vehicles), battery-vehicles, demountable tanks, tank-containers or MEGCs indicating the minimum test pressure for tanks and as far as applicable the filling ratio

In the case of gases and gas mixtures classified under n.o.s. entries, the values of the test pressure and the filling ratio shall be prescribed by the expert approved by the competent authority.

When tanks for compressed or high pressure liquefied gases have been subjected to a test pressure lower than shown in the table, and the tanks are fitted with thermal insulation, a lower maximum load may be prescribed by the expert approved by the competent authority, provided that the pressure reached in the tank by the substance at 55 °C does not exceed the test pressure stamped on the tank.

^a Allowed if LC_{50} equal to or greater than 200 ppm.

4.3.3.3 Operation

4.3.3.3.1 When tanks, battery-vehicles or MEGCs are approved for different gases, the change of use shall include emptying, purging and evacuation operations to the extent necessary for safe operation.

4.3.3.3.2 When tanks, battery-vehicles or MEGCs are handed over for carriage, only the particulars specified in 6.8.3.5.6 applicable to the gas loaded or just discharged shall be visible; all particulars concerning other gases shall be covered up.

4.3.3.3.3 All the elements of a battery-vehicle or MEGC shall contain only one and the same gas.

4.3.3.3.4 When the external overpressure could be greater than the tank resistance to external pressure (e.g. due to low ambient temperatures), adequate measures shall be taken to protect tanks carrying low pressure liquefied gases against the risk of deformation, e.g. by filling them with nitrogen or another inert gas in order to maintain sufficient pressure inside the tank.

4.3.3.4 (Reserved)

4.3.4 Special provisions applicable to Classes 1 and 3 to 9

4.3.4.1 Coding, rationalized approach and hierarchy of tanks

4.3.4.1.1 Coding of tanks

The four parts of the codes (tank codes) given in Column (12) of Table A in Chapter 3.2 have the following meanings:

Part	Description	Tank code
1	Types of tank	<p>L = tank for substances in the liquid state (liquids or solids handed over for carriage in the molten state);</p> <p>S = tank for substances in the solid state (powdery or granular).</p>
2	Calculation pressure	<p>G = minimum calculation pressure according to the general requirements of 6.8.2.1.14; or</p> <p>1.5; 2.65; 4; 10; 15 or 21 = minimum calculation pressure in bar (see 6.8.2.1.14).</p>
3	Openings (see 6.8.2.2.2)	<p>A = tank with bottom-filling or bottom-discharge openings with 2 closures;</p> <p>B = tank with bottom-filling or bottom-discharge openings with 3 closures;</p> <p>C = tank with top-filling and discharge openings with only cleaning openings below the surface of the liquid;</p> <p>D = tank with top-filling and discharge openings with no openings below the surface of the liquid.</p>
4	Safety valves/devices	<p>V = tank with a breather device, according to 6.8.2.2.6, but no device protecting against the propagation of a flame; or non-explosion pressure shock resistant tank ;</p> <p>F = tank with a breather device, according to 6.8.2.2.6, fitted with a device protecting against the propagation of a flame; or explosion pressure shock resistant tank ;</p> <p>N = tank without a breather device according to 6.8.2.2.6 and not hermetically closed;</p> <p>H = hermetically closed tank (see 1.2.1).</p>

4.3.4.1.2

Rationalized approach for assignment of ADR tank codes to groups of substances and hierarchy of tanks

NOTE: Certain substances and groups of substances are not included in the rationalized approach, see 4.3.4.1.3.

Rationalized approach			
Tank code	Group of permitted substances

Hierarchy of tanks

Tanks with tank codes different from those indicated in this table or in Table A of Chapter 3.2 may also be used provided that any element (number or letter) of parts 1 to 4 of these tank codes correspond to a level of safety at least equivalent to the corresponding element of the tank code indicated in Table A of Chapter 3.2, according to the following increasing order:

Part 1: Types of tanks

S → L

Part 2: Calculation pressure

G → 1.5 → 2.65 → 4 → 10 → 15 → 21 bar

Part 3: Openings

A → B → C → D

Part 4: Safety valves/devices

V → F → N → H

For example:

- A tank with the tank code L10CN is authorized for the carriage of a substance to which the tank code L4BN has been assigned;
- A tank with the tank code L4BN is authorized for the carriage of a substance to which the tank code SGAN has been assigned.

NOTE: The hierarchy does not take account of any special provisions for each entry (see 4.3.5 and 6.8.4).

4.3.4.1.3

The following substances and groups of substances in respect of which a "(+)" is given after the tank code in Column (12) of Table A in Chapter 3.2 are subject to special provisions. In that case the alternate use of the tanks for other substances and groups of substances is permitted only where this is specified in the certificate of type approval. Higher value tanks according to the provisions at the end of the table in 4.3.4.1.2 may be used with due regard to the special provisions indicated in Column (13) of Table A in Chapter 3.2.

- (a) Class 1
Division 1.5, UN No 0331 explosive, blasting, type B: code S2.65AN;
- (b) Class 4.1:
UN No. 2448 sulphur, molten: code LGBV;
- (c) Class 4.2:
UN No. 1381 phosphorus, white or yellow, dry, or under water or in solution and UN No. 2447 phosphorus, white molten: code L10DH;
- (d) Class 4.3:
UN No. 1389 alkali metal amalgam, liquid, UN No. 1391 alkali metal dispersion or alkaline earth metal dispersion, UN No. 1392 alkaline earth metal amalgam, liquid, UN No. 1415 lithium, UN No. 1420 potassium metal alloys, liquid, UN No. 1421 alkali metal alloy, liquid, n.o.s., UN No. 1422 potassium sodium alloys, liquid, UN No. 1428 sodium, UN No. 2257 potassium, UN No. 3401 alkali metal amalgam, solid, UN No. 3402 alkaline earth metal amalgam, solid, 3403 potassium metal alloys, solid, UN No. 3404 potassium sodium alloys, solid and UN No. 3482 alkali metal dispersion, flammable or UN No. 3482 alkaline earth metal dispersion, flammable: code L10BN;
UN No. 1407 caesium and UN No. 1423 rubidium: code L10CH;
UN No. 1402 calcium carbide, packing group I: code S2.65AN;
- (e) Class 5.1:
UN No. 1873 perchloric acid 50-72%: code L4DN;
UN No. 2015 hydrogen peroxide, aqueous solution, stabilized with more than 70% hydrogen peroxide: code L4DV;
UN No. 2014 hydrogen peroxide, aqueous solution with 20-60% hydrogen peroxide, UN No. 2015 hydrogen peroxide, aqueous solution, stabilized with 60-70% hydrogen peroxide, UN No. 2426 ammonium nitrate, liquid, hot concentrated solution with more than 80% but not more than 93% and UN No. 3149 hydrogen peroxide and peroxyacetic acid mixture, stabilized: code L4BV;
UN No. 3375 ammonium nitrate emulsion, suspension or gel, liquid: code LGAV;
UN No. 3375 ammonium nitrate emulsion, suspension or gel, solid: code SGAV;
- (f) Class 5.2:
UN No. 3109 organic peroxide type F, liquid and UN No. 3119 organic peroxide, type F, liquid temperature controlled: code L4BN;
UN No. 3110 organic peroxide, type F, solid and UN No. 3120 organic peroxide, type F, solid, temperature controlled: code S4AN;
- (g) Class 6.1:
UN No. 1613 hydrogen cyanide, aqueous solution and UN No. 3294 hydrogen cyanide solution in alcohol: code L15DH;
- (h) Class 7:
All substances: special tanks;
Minimum requirements for liquids: code L2.65CN; for solids: code S2.65AN
Notwithstanding the general requirements of this paragraph, tanks used for radioactive material may also be used for the carriage of other goods provided the requirements of 5.1.3.2 are complied with.

(i) Class 8:

UN No. 1052 hydrogen fluoride, anhydrous, UN No. 1744 bromine or bromine solution and UN No. 1790 hydrofluoric acid, solution, with more than 85% hydrofluoric acid: code L21DH;

UN No. 1791 hypochlorite solution and UN No. 1908 chlorite solution: code L4BV.

- 4.3.4.1.4 Tanks intended for the carriage of liquid wastes complying with the requirements of Chapter 6.10 and equipped with two closures in accordance with 6.10.3.2, shall be assigned to tank code L4AH. If the tanks concerned are equipped for the alternate carriage of liquid and solid substances, they shall be assigned to the combined codes L4AH+S4AH.

4.3.4.2 General provisions

- 4.3.4.2.1 Where hot substances are loaded, the temperature of the outer surface of the tank or of the thermal insulation shall not exceed 70 °C during carriage.

- 4.3.4.2.2 The connecting pipes between independent but interconnected tanks of a transport unit shall be empty during carriage. Flexible filling and discharge pipes which are not permanently connected to the shells shall be empty during carriage.

- 4.3.4.2.3 (Reserved)

4.3.5 Special provisions

When they are shown under an entry in Column (13) of Table of A in Chapter 3.2, the following special provisions apply:

- TU1 The tanks shall not be handed over for carriage until the substance has solidified completely and been covered by an inert gas. Uncleaned empty tanks which have contained these substances shall be filled with an inert gas.
- TU2 The substance shall be covered by an inert gas. Uncleaned empty tanks which have contained these substances shall be filled with an inert gas.
- TU3 The inside of the shell and all parts liable to come into contact with the substance shall be kept clean. No lubricant capable of combining dangerously with the substance shall be used for pumps, valves or other devices.
- TU4 During carriage, these substances shall be under a layer of inert gas, the gauge pressure of which shall not be less than 50 kPa (0.5 bar).
- Uncleaned empty tanks which have contained these substances shall when handed over for carriage be filled with an inert gas at a gauge pressure of at least 50 kPa (0.5 bar).
- TU5 (Reserved)
- TU6 Not authorized for carriage in tanks, battery-vehicles and MEGCs when having a LC₅₀ lower than 200 ppm.
- TU7 The materials used to ensure leakproofness of the joints or for the maintenance of the closures shall be compatible with the contents.
- TU8 An aluminium-alloy tank shall not be used for carriage unless the tank is reserved solely for such carriage and the acetaldehyde is free from acid.
- TU9 UN No.1203 petrol (gasoline) with a vapour pressure at 50 °C of more than 110 kPa (1.1 bar) but not above 150 kPa (1.5 bar) may also be carried in tanks designed according to 6.8.2.1.14 (a) and having equipment conforming to 6.8.2.2.6.
- TU10 (Reserved)

- TU11 During filling, the temperature of this substance shall not exceed 60 °C. A maximum filling temperature of 80 °C is allowed provided that smoulder spots are prevented and that the following conditions are met. After filling, the tanks shall be pressurized (e.g. with compressed air) to check tightness. It shall be ensured that no depressurization takes place during carriage. Before discharge, it shall be checked if pressure in the tanks is still above atmospheric. If this is not the case, an inert gas shall be introduced into the tanks prior to discharge.
- TU12 In the event of a change of use, shells and equipment shall be thoroughly cleansed of all residues before and after the carriage of this substance.
- TU13 Tanks shall be free from impurities at the time of filling. Service equipment such as valves and external piping shall be emptied after filling or discharging.
- TU14 The protective caps of closures shall be locked during carriage.
- TU15 Tanks shall not be used for the carriage of foodstuffs, articles of consumption or animal feeds.
- TU16 Uncleaned empty tanks, shall, when handed over for carriage, either:
- be filled with nitrogen; or
 - be filled with water to not less than 96% and not more than 98% of their capacity; between 1 October and 31 March, this water shall contain sufficient anti-freeze agent to make it impossible for the water to freeze during carriage; the anti-freeze agent shall be free from corrosive action and not liable to react with phosphorus.
- TU17 Only to be carried in battery-vehicles or MEGCs the elements of which are composed of receptacles.
- TU18 The degree of filling shall remain below the level at which, if the contents were raised to a temperature at which the vapour pressure equalled the opening pressure of the safety valve, the volume of the liquid would reach 95% of the tank's capacity at that temperature. The provision in 4.3.2.3.4 shall not apply.
- TU19 Tanks may be filled to 98% at the filling temperature and pressure. The provision in 4.3.2.3.4 shall not apply.
- TU20 *(Reserved)*
- TU21 The substance shall, if water is used as a protective agent, be covered with a depth of not less than 12 cm of water at the time of filling; the degree of filling at a temperature of 60 °C shall not exceed 98%. If nitrogen is used as a protective agent, the degree of filling at a temperature of 60 °C shall not exceed 96%. The remaining space shall be filled with nitrogen in such a way that, even after cooling, the pressure at no time falls below atmospheric pressure. The tank shall be closed in such a way that no leakage of gas occurs.
- TU22 Tanks shall be filled to not more than 90% of their capacity; for liquids, a space of 5% shall remain empty when the liquid is at an average temperature of 50 °C.
- TU23 The degree of filling shall not exceed 0.93 kg per litre of capacity, if filling is by mass. If filling is by volume, the degree of filling shall not exceed 85%.
- TU24 The degree of filling shall not exceed 0.95 kg per litre of capacity, if filling is by mass. If filling is by volume, the degree of filling shall not exceed 85%.
- TU25 The degree of filling shall not exceed 1.14 kg per litre of capacity, if filling is by mass. If filling is by volume, the degree of filling shall not exceed 85%.
- TU26 The degree of filling shall not exceed 85%.
- TU27 Tanks shall not be filled to more than 98% of their capacity.

- TU28 Tanks shall be filled to not more than 95% of their capacity at a reference temperature of 15 °C.
- TU29 Tanks shall be filled to not more than 97% of their capacity and the maximum temperature after filling shall not exceed 140 °C.
- TU30 Tanks shall be filled as set out in the test report for the type approval of the tank but shall be filled to not more than 90% of their capacity.
- TU31 Tanks shall not be filled to more than 1 kg per litre of capacity.
- TU32 Tanks shall not be filled to more than 88% of their capacity.
- TU33 Tanks shall be filled to not less than 88% and not more than 92% of their capacity or to 2.86 kg per litre of capacity.
- TU34 Tanks shall not be filled to more than 0.84 kg per litre of capacity.
- TU35 Empty fixed tanks (tank-vehicles), empty demountable tanks and empty tank-containers, uncleaned, which have contained these substances are not subject to the requirements of ADR if adequate measures have been taken to nullify any hazard.
- TU36 The degree of filling according to 4.3.2.2, at the reference temperature of 15 °C, shall not exceed 93% of the capacity.
- TU37 Carriage in tanks is limited to substances containing pathogens which are unlikely to be a serious hazard, and for which, while capable of causing serious infection on exposure, effective treatment and preventive measures are available and the risk of spread of infection is limited (i.e. moderate individual risk and low community risk).
- TU38 *(Reserved)*
- TU39 The suitability of the substance for carriage in tanks shall be demonstrated. The method to evaluate this suitability shall be approved by the competent authority. One method is test 8(d) in Test Series 8 (see Manual of Tests and Criteria, Part 1, sub-section 18.7).
- Substances shall not be allowed to remain in the tank for any period that could result in caking. Appropriate measures shall be taken to avoid accumulation and packing of substances in the tank (e.g. cleaning etc.).
- TU40 Only to be carried in battery-vehicles or MEGCs, the elements of which are composed of seamless receptacles.
- TU41 The suitability of the substance for carriage in tanks shall be demonstrated to the satisfaction of the competent authority of every country through or into which the carriage is performed.
- The method to evaluate this suitability shall be approved by the competent authority of any ADR Contracting Party who may also recognize an approval granted by the competent authority of a country which is not an ADR Contracting Party provided that this approval has been granted in accordance with the procedures applicable according to ADR, RID, ADN or the IMDG Code.
- Substances shall not be allowed to remain in the tank for any period that could result in caking. Appropriate measures shall be taken to avoid accumulation and packing of substances in the tank (e.g. cleaning etc.).

CHAPTER 4.4

USE OF FIBRE-REINFORCED PLASTICS (FRP) TANKS, FIXED TANKS (TANK-VEHICLES), DEMOUNTABLE TANKS, TANK-CONTAINERS AND TANK SWAP BODIES

NOTE: *For portable tanks and UN multiple-element gas containers (MEGCs), see Chapter 4.2; for fixed tanks (tank-vehicles), demountable tanks, tank-containers and tank swap bodies, with shells made of metallic materials, and battery-vehicles and multiple elements gas containers (MEGCs) other than UN MEGCs, see Chapter 4.3; for vacuum operated waste containers, see Chapter 4.5.*

4.4.1 General

The carriage of dangerous substances in fibre-reinforced plastics (FRP) tanks is permitted only when the following conditions are met:

- (a) The substance is classified in Class 3, 5.1, 6.1, 6.2, 8 or 9;
- (b) The maximum vapour pressure (absolute pressure) at 50 °C of the substance does not exceed 110 kPa (1.1 bar);
- (c) The carriage of the substance in metallic tanks is authorized according to 4.3.2.1.1;
- (d) The calculation pressure specified for that substance in part 2 of the tank code given in Column (12) of Table A in Chapter 3.2 does not exceed 4 bar (see also 4.3.4.1.1); and
- (e) The tank complies with the provisions of Chapter 6.9 applicable for the carriage of the substance.

4.4.2 Operation

- 4.4.2.1 The provisions of 4.3.2.1.5 to 4.3.2.2.4, 4.3.2.3.3 to 4.3.2.3.6, 4.3.2.4.1, 4.3.2.4.2, 4.3.4.1 and 4.3.4.2 shall apply.
- 4.4.2.2 The temperature of the substance carried shall not exceed, at the time of filling, the maximum service temperature indicated on the tank plate referred to in 6.9.6.
- 4.4.2.3 When applicable to carriage in metallic tanks, the special provisions (TU) of 4.3.5 shall also apply, as indicated in Column (13) of Table A in Chapter 3.2.

CHAPTER 4.5

USE OF VACUUM OPERATED WASTE TANKS

NOTE: *For portable tanks and UN multiple-element gas containers (MEGCs), see Chapter 4.2; for fixed tanks (tank-vehicles), demountable tanks, tank-containers and tank swap bodies, with shells made of metallic materials, and battery-vehicles and multiple elements gas containers (MEGCs) other than UN MEGCs, see Chapter 4.3; for fibre reinforced plastics tanks, see Chapter 4.4.*

4.5.1 Use

4.5.1.1 Wastes consisting of substances in Classes 3, 4.1, 5.1, 6.1, 6.2, 8 and 9 may be carried in vacuum-operated waste tanks conforming to Chapter 6.10 if their carriage in fixed tanks, demountable tanks, tank-containers or tank swap bodies is permitted according to Chapter 4.3. Wastes consisting of substances assigned to tank code L4BH in Column (12) of Table A of Chapter 3.2 or to another tank code permitted under the hierarchy in 4.3.4.1.2 may be carried in vacuum operated waste tanks with the letter "A" or "B" in part 3 of the tank code, as indicated in No. 9.5 of the vehicle approval certificate conforming to 9.1.3.5.

4.5.1.2 Non waste substances may be carried in vacuum-operated waste tanks under the same conditions as mentioned under 4.5.1.1.

4.5.2 Operation

4.5.2.1 The provisions of Chapter 4.3 except those of 4.3.2.2.4 and 4.3.2.3.3 apply to the carriage in vacuum operated waste tanks and are supplemented by the provisions of 4.5.2.2 to 4.5.2.6 below.

4.5.2.2 For carriage of liquids meeting the flash point criteria of Class 3, vacuum-operated waste tanks shall be filled through filling devices which discharge into the tank at a low level. Measures shall be taken to minimize the production of spray.

4.5.2.3 When discharging flammable liquids with a flash-point below 23 °C by using air pressure, the maximum allowed pressure is 100 kPa (1 bar).

4.5.2.4 The use of tanks fitted with an internal piston operating as a compartment wall is allowed only when the substances on either side of the wall (piston) do not react dangerously with each other (see 4.3.2.3.6).

4.5.2.5 *(Reserved)*

4.5.2.6 When a vacuum pump/exhauster unit which may provide a source of ignition is used to fill or discharge flammable liquids, precautions shall be taken to avoid ignition of the substance or to avoid the propagation of the effects of the ignition outside the tank itself.

CHAPTER 4.6

(Reserved)

CHAPTER 4.7

USE OF MOBILE EXPLOSIVES MANUFACTURING UNITS (MEMUs)

NOTE 1: *For packagings, see Chapter 4.1; for portable tanks, see Chapter 4.2; for fixed tanks (tank vehicles), demountable tanks, tank-containers and tank swap bodies with shells made of metallic materials, see Chapter 4.3; for fibre-reinforced plastics (FRP) tanks, see Chapter 4.4; for vacuum operated waste tanks, see Chapter 4.5.*

NOTE 2: *For requirements concerning construction, equipment, type approval, tests and marking, see Chapters 6.7, 6.8, 6.9, 6.11 and 6.12.*

4.7.1 Use

4.7.1.1 Substances of Classes 3, 5.1, 6.1 and 8 may be carried on MEMUs conforming to Chapter 6.12, in portable tanks if their carriage is permitted according to Chapter 4.2; or in fixed tanks, demountable tanks, tank containers or tank swap bodies if their carriage is permitted according to Chapter 4.3; or in fibre-reinforced plastics (FRP) tanks if their carriage is permitted according to Chapter 4.4; or in bulk containers, if their carriage is permitted according to Chapter 7.3.

4.7.1.2 Subject to the approval of the competent authority (see 7.5.5.2.3) explosive substances or articles of Class 1 may be carried in packages, in special compartments conforming to section 6.12.5, if their packaging is permitted according to Chapter 4.1 and their carriage is permitted according to Chapter 7.2 and 7.5.

4.7.2 Operation

4.7.2.1 The following provisions apply for operation of tanks according to Chapter 6.12:

- (a) For tanks with a capacity of 1 000 litres or more, the provisions of Chapter 4.2, Chapter 4.3, except 4.3.1.4, 4.3.2.3.1, 4.3.3 and 4.3.4, or Chapter 4.4 apply to the carriage on MEMUs, and are supplemented by the provisions of 4.7.2.2, 4.7.2.3 and 4.7.2.4 below.
- (b) For tanks with a capacity of less than 1 000 litres, the provisions of Chapter 4.2, Chapter 4.3, except 4.3.1.4, 4.3.2.1, 4.3.2.3.1, 4.3.3 and 4.3.4, or Chapter 4.4 apply to the carriage on MEMUs, and are supplemented by the provisions of 4.7.2.2, 4.7.2.3 and 4.7.2.4 below.

4.7.2.2 The thickness of the walls of the shell shall not, throughout its use, fall below the minimum figure prescribed in the appropriate construction requirements.

4.7.2.3 Flexible discharge pipes, whether permanently connected or not, and hoppers shall be empty of mixed or sensitised explosive substances during carriage.

4.7.2.4 When applicable to carriage in tanks, the special provisions (TU) of 4.3.5 shall also apply as indicated in Column (13) of Table A in Chapter 3.2.

4.7.2.5 Operators shall ensure that the locks specified in 9.8.8 are used during carriage.

PART 5

Consignment procedures

CHAPTER 5.1

GENERAL PROVISIONS

5.1.1 Application and general provisions

This Part sets forth the provisions for dangerous goods consignments relative to marking, labelling, and documentation, and, where appropriate, authorization of consignments and advance notifications.

5.1.2 Use of overpacks

5.1.2.1 (a) An overpack shall be:

- (i) marked with the word "OVERPACK"; and
- (ii) marked with the UN number preceded by the letters "UN" as required for packages in 5.2.1.1 and 5.2.1.2, labelled as required for packages in 5.2.2 and marked with the environmentally hazardous substance mark if required for packages in 5.2.1.8, for each item of dangerous goods contained in the overpack;

unless the UN numbers, the labels and the environmentally hazardous substance mark representative of all dangerous goods contained in the overpack are visible, except as required in 5.2.2.1.11. If the same UN number, the same label or the environmentally hazardous substance mark is required for different packages, it only needs to be applied once.

The lettering of the "OVERPACK" marking shall be at least 12 mm high. The marking of the word "OVERPACK", which shall be readily visible and legible, shall be in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German, unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise.

- (b) Orientation arrows illustrated in 5.2.1.9 shall be displayed on two opposite sides of overpacks containing packages which shall be marked in accordance with 5.2.1.9.1, unless the marking remains visible.

5.1.2.2 Each package of dangerous goods contained in an overpack shall comply with all applicable provisions of ADR. The intended function of each package shall not be impaired by the overpack.

5.1.2.3 Each package bearing package orientation markings as prescribed in 5.2.1.9 and which is overpacked or placed in a large packaging shall be oriented in accordance with such markings.

5.1.2.4 The prohibitions on mixed loading also apply to these overpacks.

5.1.3 Empty uncleaned packagings (including IBCs and large packagings), tanks, MEMUs, vehicles and containers for carriage in bulk

5.1.3.1 Empty uncleaned packagings (including IBCs and large packagings), tanks (including tank-vehicles, battery-vehicles, demountable tanks, portable tanks, tank-containers, MEGCs), MEMUs, vehicles and containers for carriage in bulk having contained dangerous goods of the different classes other than Class 7, shall be marked and labelled as if they were full.

NOTE: For documentation, see Chapter 5.4.

5.1.3.2 Containers, tanks, IBCs, as well as other packagings and overpacks, used for the carriage of radioactive material shall not be used for the storage or carriage of other goods unless decontaminated below the level of 0.4 Bq/cm² for beta and gamma emitters and low toxicity alpha emitters and 0.04 Bq/cm² for all other alpha emitters.

5.1.4 Mixed packing

When two or more dangerous goods are packed within the same outer packaging, the package shall be labelled and marked as required for each substance or article. If the same label is required for different goods, it only needs to be applied once.

5.1.5 General provisions for Class 7**5.1.5.1 Approval of shipments and notification****5.1.5.1.1 General**

In addition to the approval of package designs described in Chapter 6.4, multilateral shipment approval is also required in certain circumstances (5.1.5.1.2 and 5.1.5.1.3). In some circumstances it is also necessary to notify competent authorities of a shipment (5.1.5.1.4).

5.1.5.1.2 Shipment approvals

Multilateral approval shall be required for:

- (a) the shipment of Type B(M) packages not conforming with the requirements of 6.4.7.5 or designed to allow controlled intermittent venting;
- (b) the shipment of Type B(M) packages containing radioactive material with an activity greater than 3 000 A₁ or 3 000 A₂, as appropriate, or 1 000 TBq, whichever is the lower; and
- (c) The shipment of packages containing fissile materials if the sum of the criticality safety indexes of the packages in a single vehicle or container exceeds 50;

except that a competent authority may authorize carriage into or through its country without shipment approval, by a specific provision in its design approval (see 5.1.5.2.1).

5.1.5.1.3 Shipment approval by special arrangement

Provisions may be approved by a competent authority under which a consignment, which does not satisfy all of the applicable requirements of ADR may be carried under special arrangement (see 1.7.4).

5.1.5.1.4 Notifications

Notification to competent authorities is required as follows:

- (a) Before the first shipment of any package requiring competent authority approval, the consignor shall ensure that copies of each applicable competent authority certificate applying to that package design have been submitted to the competent authority of the country of origin of the shipment and to the competent authority of each country through or into which the consignment is to be carried. The consignor is not required to await an acknowledgement from the competent authority, nor is the competent authority required to make such acknowledgement of receipt of the certificate;
- (b) For each of the following types of shipments:
 - (i) Type C packages containing radioactive material with an activity greater than 3 000 A₁ or 3 000 A₂, as appropriate, or 1 000 TBq, whichever is the lower;
 - (ii) Type B(U) packages containing radioactive material with an activity greater than 3 000 A₁ or 3 000 A₂, as appropriate, or 1 000 TBq, whichever is the lower;
 - (iii) Type B(M) packages;
 - (iv) Shipment under special arrangement;

The consignor shall notify the competent authority of the country of origin of the shipment and the competent authority of each country through or into which the consignment is to be carried. This notification shall be in the hands of each competent authority prior to the commencement of the shipment, and preferably at least 7 days in advance;

- (c) The consignor is not required to send a separate notification if the required information has been included in the application for approval of shipment (see 6.4.23.2);
- (d) The consignment notification shall include:
 - (i) sufficient information to enable the identification of the package or packages including all applicable certificate numbers and identification marks;
 - (ii) information on the date of shipment, the expected date of arrival and proposed routeing;
 - (iii) the name(s) of the radioactive material(s) or nuclide(s);
 - (iv) descriptions of the physical and chemical forms of the radioactive material, or whether it is special form radioactive material or low dispersible radioactive material; and
 - (v) the maximum activity of the radioactive contents during carriage expressed in becquerels (Bq) with an appropriate SI prefix symbol (see 1.2.2.1). For fissile material, the mass of fissile material (or of each fissile nuclide for mixtures when appropriate) in grams (g), or multiples thereof, may be used in place of activity.

5.1.5.2 *Certificates issued by the competent authority*

5.1.5.2.1 Certificates issued by the competent authority are required for the following:

- (a) Designs for:
 - (i) special form radioactive material;
 - (ii) low dispersible radioactive material;
 - (iii) fissile material excepted under 2.2.7.2.3.5 (f);
 - (iv) packages containing 0.1 kg or more of uranium hexafluoride;
 - (v) packages containing fissile material unless excepted by 2.2.7.2.3.5, 6.4.11.2 or 6.4.11.3;
 - (vi) Type B(U) packages and Type B(M) packages;
 - (vii) Type C packages;
- (b) Special arrangements;
- (c) Certain shipments (see 5.1.5.1.2);
- (d) Determination of the basic radionuclide values referred to in 2.2.7.2.2.1 for individual radionuclides which are not listed in Table 2.2.7.2.2.1 (see 2.2.7.2.2.2 (a));
- (e) Alternative activity limits for an exempt consignment of instruments or articles (see 2.2.7.2.2.2 (b)).

The certificates shall confirm that the applicable requirements are met, and for design approvals shall attribute to the design an identification mark.

The certificates of approval for the package design and the shipment may be combined into a single certificate.

Certificates and applications for these certificates shall be in accordance with the requirements in 6.4.23.

5.1.5.2.2 The consignor shall be in possession of a copy of each applicable certificate.

5.1.5.2.3 For package designs where it is not required that a competent authority issue a certificate of approval, the consignor shall, on request, make available for inspection by the competent authority, documentary evidence of the compliance of the package design with all the applicable requirements.

5.1.5.3 *Determination of transport index (TI) and criticality safety index (CSI)*

5.1.5.3.1 The transport index (TI) for a package, overpack or container, or for unpackaged LSA-I or SCO-I, shall be the number derived in accordance with the following procedure:

- (a) Determine the maximum radiation level in units of millisieverts per hour (mSv/h) at a distance of 1 m from the external surfaces of the package, overpack, container, or unpackaged LSA-I and SCO-I. The value determined shall be multiplied by 100 and the resulting number is the transport index. For uranium and thorium ores and their concentrates, the maximum radiation level at any point 1 m from the external surface of the load may be taken as:

0.4 mSv/h for ores and physical concentrates of uranium and thorium;

0.3 mSv/h for chemical concentrates of thorium;

0.02 mSv/h for chemical concentrates of uranium, other than uranium hexafluoride;

- (b) For tanks, containers and unpackaged LSA-I and SCO-I, the value determined in step (a) above shall be multiplied by the appropriate factor from Table 5.1.5.3.1;
- (c) The value obtained in steps (a) and (b) above shall be rounded up to the first decimal place (e.g. 1.13 becomes 1.2), except that a value of 0.05 or less may be considered as zero.

Table 5.1.5.3.1: Multiplication factors for tanks, containers and unpackaged LSA-I and SCO-I

Size of load ^a	Multiplication factor
size of load $\leq 1 \text{ m}^2$	1
$1 \text{ m}^2 < \text{size of load} \leq 5 \text{ m}^2$	2
$5 \text{ m}^2 < \text{size of load} \leq 20 \text{ m}^2$	3
$20 \text{ m}^2 < \text{size of load}$	10

^a Largest cross-sectional area of the load being measured.

5.1.5.3.2 The transport index for each overpack, container or vehicle shall be determined as either the sum of the TIs of all the packages contained, or by direct measurement of radiation level, except in the case of non-rigid overpacks for which the transport index shall be determined only as the sum of the TIs of all the packages.

5.1.5.3.3 The criticality safety index for each overpack or container shall be determined as the sum of the CSIs of all the packages contained. The same procedure shall be followed for determining the total sum of the CSIs in a consignment or aboard a vehicle.

5.1.5.3.4 Packages, overpacks and containers shall be assigned to either category I-WHITE, II-YELLOW or III-YELLOW in accordance with the conditions specified in Table 5.1.5.3.4 and with the following requirements:

- (a) For a package, overpack or container, both the transport index and the surface radiation level conditions shall be taken into account in determining which is the appropriate category. Where the transport index satisfies the condition for one category but the surface radiation level satisfies the condition for a different category, the package, overpack or container shall be assigned to the higher category. For this purpose, category I-WHITE shall be regarded as the lowest category;
- (b) The transport index shall be determined following the procedures specified in 5.1.5.3.1 and 5.1.5.3.2;
- (c) If the surface radiation level is greater than 2 mSv/h, the package or overpack shall be carried under exclusive use and under the provisions of 7.5.11, CV33 (1.3) and (3.5) (a);

- (d) A package carried under a special arrangement shall be assigned to category III-YELLOW except under the provisions of 5.1.5.3.5;
- (e) An overpack or container which contains packages carried under special arrangement shall be assigned to category III-YELLOW except under the provisions of 5.1.5.3.5.

Table 5.1.5.3.4: Categories of packages, overpacks and containers

Conditions		
Transport index	Maximum radiation level at any point on external surface	Category
0 ^a	Not more than 0.005 mSv/h	I-WHITE
More than 0 but not more than 1 ^a	More than 0.005 mSv/h but not more than 0.5 mSv/h	II-YELLOW
More than 1 but not more than 10	More than 0.5 mSv/h but not more than 2 mSv/h	III-YELLOW
More than 10	More than 2 mSv/h but not more than 10 mSv/h	III-YELLOW ^b

^a If the measured TI is not greater than 0.05, the value quoted may be zero in accordance with 5.1.5.3.1 (c).

^b Shall also be carried under exclusive use except for containers (see Table D in 7.5.11 CV33 (3.3)).

- 5.1.5.3.5 In all cases of international carriage of packages requiring competent authority approval of design or shipment, for which different approval types apply in the different countries concerned by the shipment, the categorization shall be in accordance with the certificate of the country of origin of design.

5.1.5.4 Specific provisions for excepted packages of radioactive material of Class 7

- 5.1.5.4.1 Excepted packages of radioactive material of Class 7 shall be legibly and durably marked on the outside of the packaging with:

- (a) The UN number preceded by the letters "UN";
- (b) An identification of either the consignor or consignee, or both; and
- (c) The permissible gross mass if this exceeds 50 kg.

- 5.1.5.4.2 The documentation requirements of Chapter 5.4 do not apply to excepted packages of radioactive material of Class 7, except that:

- (a) The UN number preceded by the letters "UN" and the name and address of the consignor and the consignee and, if relevant, the identification mark for each competent authority certificate of approval (see 5.4.1.2.5.1 (g)) shall be shown on a transport document such as a bill of lading, air waybill or CMR or CIM consignment note;
- (b) If relevant, the requirements of 5.4.1.2.5.1 (g), 5.4.1.2.5.3 and 5.4.1.2.5.4 shall apply;
- (c) The requirements of 5.4.2 and 5.4.4 shall apply.

- 5.1.5.4.3 The requirements of 5.2.1.7.8 and 5.2.2.1.11.5 shall apply if relevant.

5.1.5.5 Summary of approval and prior notification requirements

NOTE 1: Before first shipment of any package requiring competent authority approval of the design, the consignor shall ensure that a copy of the approval certificate for that design has been submitted to the competent authority of each country en route (see 5.1.5.1.4 (a)).

NOTE 2: Notification required if contents exceed $3 \times 10^3 A_1$, or $3 \times 10^3 A_2$, or 1 000 TBq; (see 5.1.5.1.4 (b)).

NOTE 3: Multilateral approval of shipment required if contents exceed $3 \times 10^3 A_1$, or $3 \times 10^3 A_2$, or 1 000 TBq, or if controlled intermittent venting is allowed (see 5.1.5.1).

NOTE 4: See approval and prior notification provisions for the applicable package for carrying this material.

Subject	UN Number	Competent Authority approval required		Consignor required to notify the competent authorities of the country of origin and of the countries en route ^a before each shipment	Reference
		Country of origin	Countries en route ^a

^c Designs of packages for fissile material may also require approval in respect of one of the other items in the table.

^d Shipments may, however, require approval in respect of one of the other items in the table.

CHAPTER 5.2

MARKING AND LABELLING

5.2.1 Marking of packages

NOTE: For markings related to the construction, testing and approval of packagings, large packagings, gas receptacles and IBCs, see Part 6.

5.2.1.1 Unless provided otherwise in ADR, the UN number corresponding to the dangerous goods contained, preceded by the letters "UN" shall be clearly and durably marked on each package. The UN number and the letters "UN" shall be at least 12 mm high, except for packages of 30 litres capacity or less or of 30 kg maximum net mass and for cylinders of 60 litres water capacity or less, when they shall be at least 6 mm in height and except for packages of 5 litres or 5 kg or less when they shall be of an appropriate size. In the case of unpackaged articles the marking shall be displayed on the article, on its cradle or on its handling, storage or launching device.

5.2.1.2 All package markings required by this Chapter:

- (a) shall be readily visible and legible;
- (b) shall be able to withstand open weather exposure without a substantial reduction in effectiveness.

5.2.1.3 Salvage packagings and salvage pressure receptacles shall additionally be marked with the word "SALVAGE". The lettering of the "SALVAGE" marking shall be at least 12 mm high.

5.2.1.4 Intermediate bulk containers of more than 450 litres capacity and large packagings shall be marked on two opposite sides.

5.2.1.5 Additional provisions for goods of Class 1

For goods of Class 1, packages shall, in addition, bear the proper shipping name as determined in accordance with 3.1.2. The marking, which shall be clearly legible and indelible, shall be in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German unless any agreements concluded between the countries concerned in the transport operation provide otherwise.

5.2.1.6 Additional provisions for goods of Class 2

Refillable receptacles shall bear the following particulars in clearly legible and durable characters:

- (a) the UN number and the proper shipping name of the gas or mixture of gases, as determined in accordance with 3.1.2.
In the case of gases classified under an N.O.S. entry, only the technical name¹ of the gas has to be indicated in addition to the UN number.
In the case of mixtures, not more than the two constituents which most predominantly contribute to the hazards have to be indicated;

¹ Instead of the technical name the use of one of the following names is permitted:

- for UN No. 1078 refrigerant gas, n.o.s.: mixture F1, mixture F2, mixture F3;
- for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;
- for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.: mixture A or butane, mixture A01 or butane, mixture A02 or butane, mixture A0 or butane, mixture A1, mixture B1, mixture B2, mixture B, mixture C or propane;
- for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.

- (b) for compressed gases filled by mass and for liquefied gases, either the maximum filling mass and the tare of the receptacle with fittings and accessories as fitted at the time of filling, or the gross mass;
- (c) the date (year) of the next periodic inspection.

These marks can either be engraved or indicated on a durable information disk or label attached on the receptacle or indicated by an adherent and clearly visible marking such as by printing or by any equivalent process.

NOTE 1: See also 6.2.2.7.

NOTE 2: For non refillable receptacles, see 6.2.2.8.

5.2.1.7 Special marking provisions for radioactive material

- 5.2.1.7.1 Each package shall be legibly and durably marked on the outside of the packaging with an identification of either the consignor or consignee, or both. Each overpack shall be legibly and durably marked on the outside of the overpack with an identification of either the consignor or consignee, or both unless these markings of all packages within the overpack are clearly visible.
- 5.2.1.7.2 For each package, other than excepted packages, the UN number preceded by the letters "UN" and the proper shipping name shall be legibly and durably marked on the outside of the packaging. The marking of excepted packages shall be as required by 5.1.5.4.1.
- 5.2.1.7.3 Each package of gross mass exceeding 50 kg shall have its permissible gross mass legibly and durably marked on the outside of the packaging.
- 5.2.1.7.4 Each package which conforms to:
 - (a) a Type IP-1 package, a Type IP-2 package or a Type IP-3 package design shall be legibly and durably marked on the outside of the packaging with "TYPE IP-1", "TYPE IP-2" or "TYPE IP-3" as appropriate;
 - (b) a Type A package design shall be legibly and durably marked on the outside of the packaging with "TYPE A";
 - (c) a Type IP-2 package, a Type IP-3 package or a Type A package design shall be legibly and durably marked on the outside of the packaging with the international vehicle registration code (VRI Code)² of the country of origin of design and either the name of the manufacturer or other identification of the packaging specified by the competent authority of the country of origin of design.
- 5.2.1.7.5 Each package which conforms to a design approved under one or more of paragraphs 5.1.5.2.1, 6.4.22.1 to 6.4.22.4, 6.4.23.4 to 6.4.23.7 and 6.4.24.2 shall be legibly and durably marked on the outside of the package with the following information:
 - (a) the identification mark allocated to that design by the competent authority;
 - (b) a serial number to uniquely identify each packaging which conforms to that design;
 - (c) "Type B(U)", "Type B(M)" or "Type C", in the case of a Type B(U), Type B(M) or Type C package design.
- 5.2.1.7.6 Each package which conforms to a Type B(U), Type B(M) or Type C package design shall have the outside of the outermost receptacle which is resistant to the effects of fire and water plainly marked by embossing, stamping or other means resistant to the effects of fire and water with the trefoil symbol shown in the figure below.

² Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

Basic trefoil symbol with proportions based on a central circle of radius X .
The minimum allowable size of X shall be 4 mm.

5.2.1.7.7 Where LSA-I or SCO-I material is contained in receptacles or wrapping materials and is carried under exclusive use as permitted by 4.1.9.2.4, the outer surface of these receptacles or wrapping materials may bear the marking "RADIOACTIVE LSA-I" or "RADIOACTIVE SCO-I", as appropriate.

5.2.1.7.8 In all cases of international carriage of packages requiring competent authority approval of design or shipment, for which different approval types apply in the different countries concerned by the shipment, marking shall be in accordance with the certificate of the country of origin of the design.

5.2.1.8 *Special marking provisions for environmentally hazardous substances*

5.2.1.8.1 Packages containing environmentally hazardous substances meeting the criteria of 2.2.9.1.10 shall be durably marked with the environmentally hazardous substance mark shown in 5.2.1.8.3 with the exception of single packagings and combination packagings where such single packagings or inner packagings of such combination packagings have:

- a quantity of 5 l or less for liquids; or
- a net mass of 5 kg or less for solids.

5.2.1.8.2 The environmentally hazardous substance mark shall be located adjacent to the markings required by 5.2.1.1. The requirements of 5.2.1.2 and 5.2.1.4 shall be met.

5.2.1.8.3 The environmentally hazardous substance mark shall be as shown in Figure 5.2.1.8.3.

Figure 5.2.1.8.3

Environmentally hazardous substance mark

The marking shall be in the form of a square set at an angle of 45° (diamond-shaped). The symbol (fish and tree) shall be black on white or suitable contrasting background. The minimum dimensions shall be 100 mm x 100 mm and the minimum width of the line forming the diamond shall be 2 mm. If the size of the package so requires, the dimensions/line thickness may be reduced, provided the marking remains clearly visible. Where dimensions are not specified, all features shall be in approximate proportion to those shown.

NOTE: The labelling provisions of 5.2.2 apply in addition to any requirement for packages to bear the environmentally hazardous substance mark.

5.2.1.9 **Orientation arrows**

5.2.1.9.1 Except as provided in 5.2.1.9.2:

- Combination packagings having inner packagings containing liquids;
- Single packagings fitted with vents; and
- Cryogenic receptacles intended for the carriage of refrigerated liquefied gases,

shall be legibly marked with package orientation arrows which are similar to the illustration shown below or with those meeting the specifications of ISO 780:1997. The orientation arrows shall appear on two opposite vertical sides of the package with the arrows pointing in the correct upright direction. They shall be rectangular and of a size that is clearly visible commensurate with the size of the package. Depicting a rectangular border around the arrows is optional.

Figure 5.2.1.9.1.1

Figure 5.2.1.9.1.2

or

Two black or red arrows on white or suitable contrasting background.

The rectangular border is optional.

All features shall be in approximate proportion to those shown.

5.2.1.9.2 Orientation arrows are not required on:

- (a) Outer packagings containing pressure receptacles except cryogenic receptacles;
- (b) Outer packagings containing dangerous goods in inner packagings each containing not more than 120 ml, with sufficient absorbent material between the inner and outer packagings to completely absorb the liquid contents;
- (c) Outer packagings containing Class 6.2 infectious substances in primary receptacles each containing not more than 50 ml;
- (d) Type IP-2, type IP-3, type A, type B(U), type B(M) or type C packages containing Class 7 radioactive material;
- (e) Outer packagings containing articles which are leak-tight in all orientations (e.g. alcohol or mercury in thermometers, aerosols, etc.); or
- (f) Outer packagings containing dangerous goods in hermetically sealed inner packagings each containing not more than 500 ml.

5.2.1.9.3 Arrows for purposes other than indicating proper package orientation shall not be displayed on a package marked in accordance with this sub-section.

5.2.2 Labelling of packages

5.2.2.1 Labelling provisions

5.2.2.1.1 For each article or substance listed in Table A of Chapter 3.2, the labels shown in Column (5) shall be affixed unless otherwise provided for by a special provision in Column (6).

5.2.2.1.2 Indelible danger markings corresponding exactly to the prescribed models may be used instead of labels.

5.2.2.1.3 to 5.2.2.1.5 *(Reserved)*

5.2.2.1.6 Except as provided in 5.2.2.2.1.2, each label shall:

- (a) be affixed to the same surface of the package, if the dimensions of the package allow; for packages of Class 1 and 7, near the mark indicating the proper shipping name;
- (b) be so placed on the package that it is not covered or obscured by any part or attachment to the packaging or any other label or marking; and
- (c) be displayed next to each other when more than one label is required.

Where a package is of such an irregular shape or small size that a label cannot be satisfactorily affixed, the label may be attached to the package by a securely affixed tag or other suitable means.

5.2.2.1.7 Intermediate bulk containers of more than 450 litres capacity and large packagings shall be labelled on two opposite sides.

5.2.2.1.8 *(Reserved)*

5.2.2.1.9 *Special provisions for the labelling of self-reactive substances and organic peroxides*

- (a) The label conforming to model No. 4.1 also implies that the product may be flammable and hence no label conforming to model No. 3 is required. In addition, a label conforming to model No. 1 shall be applied for self-reactive substances Type B, unless the competent authority has permitted this label to be dispensed with for a specific packaging because test data have proven that the self-reactive substance in such a packaging does not exhibit explosive behaviour.
- (b) The label conforming to model No. 5.2 also implies that the product may be flammable and hence no label conforming to model No. 3 is required. In addition, the following labels shall be applied:
 - (i) A label conforming to model No. 1 for organic peroxides type B, unless the competent authority has permitted this label to be dispensed with for a specific packaging because test data have proven that the organic peroxide in such a packaging does not exhibit explosive behaviour;
 - (ii) A label conforming to model No. 8 is required when Packing Group I or II criteria of Class 8 are met.

For self-reactive substances and organic peroxides mentioned by name, the labels to be affixed are indicated in the list found in 2.2.41.4 and 2.2.52.4 respectively.

5.2.2.1.10 *Special provisions for the labelling of infectious substances packages*

In addition to the label conforming to model No. 6.2, infectious substances packages shall bear any other label required by the nature of the contents.

5.2.2.1.11 *Special provisions for the labelling of radioactive material*

5.2.2.1.11.1 Except when enlarged labels are used in accordance with 5.3.1.1.3, each package, overpack and container containing radioactive material shall bear the labels conforming to the applicable models Nos. 7A, 7B or 7C, according to the appropriate category. Labels shall be affixed to two opposite sides on the outside of the package or overpack or on the outside of all four sides of a container or tank. In addition, each package, overpack and container containing fissile material, other than fissile material excepted under the provisions of 2.2.7.2.3.5 shall bear labels conforming to model No. 7E; such labels, where applicable, shall be affixed adjacent to the labels conforming to the applicable model Nos. 7A, 7B or 7C.. Labels shall not cover the markings specified in 5.2.1. Any labels which do not relate to the contents shall be removed or covered.

5.2.2.1.11.2 Each label conforming to the applicable model No. 7A, 7B or 7C shall be completed with the following information.

(a) *Contents:*

(i) except for LSA-I material, the name(s) of the radionuclide(s) as taken from Table 2.2.7.2.2.1, using the symbols prescribed therein. For mixtures of radionuclides, the most restrictive nuclides shall be listed to the extent the space on the line permits. The group of LSA or SCO shall be shown following the name(s) of the radionuclide(s). The terms "LSA-II", "LSA-III", "SCO-I" and "SCO-II" shall be used for this purpose;

(ii) for LSA-I material, only the term "LSA-I" is necessary; the name of the radionuclide is not necessary;

(b) *Activity:* The maximum activity of the radioactive contents during carriage expressed in becquerels (Bq) with the appropriate SI prefix symbol (see 1.2.2.1). For fissile material, the total mass of fissile nuclides in units of grams (g), or multiples thereof, may be used in place of activity;

(c) For overpacks and containers the "contents" and "activity" entries on the label shall bear the information required in (a) and (b) above, respectively, totalled together for the entire contents of the overpack or container except that on labels for overpacks or containers containing mixed loads of packages containing different radionuclides, such entries may read "See Transport Documents";

(d) *Transport index:* The number determined in accordance with 5.1.5.3.1 and 5.1.5.3.2 (no transport index entry is required for category I-WHITE).

5.2.2.1.11.3 Each label conforming to the model No. 7E shall be completed with the criticality safety index (CSI) as stated in the certificate of approval applicable in the countries through or into which the consignment is carried and issued by the competent authority or as specified in 6.4.11.2 or 6.4.11.3.

5.2.2.1.11.4 For overpacks and containers, the label conforming to model No. 7E shall bear the sum of the criticality safety indexes of all the packages contained therein.

5.2.2.1.11.5 In all cases of international carriage of packages requiring competent authority approval of design or shipment, for which different approval types apply in the different countries concerned by the shipment, labelling shall be in accordance with the certificate of the country of origin of design.

5.2.2.2 *Provisions for labels*

5.2.2.2.1 Labels shall satisfy the provisions below and conform, in terms of colour, symbols and general format, to the models shown in 5.2.2.2.2. Corresponding models required for other modes of transport, with minor variations which do not affect the obvious meaning of the label, are also acceptable.

NOTE: Where appropriate, labels in 5.2.2.2.2 are shown with a dotted outer boundary as provided for in 5.2.2.2.1.1. This is not required when the label is applied on a background of contrasting colour.

5.2.2.2.1.1 Labels shall be configured as shown in Figure 5.2.2.2.1.1.

Figure 5.2.2.2.1.1

Class/division label

- * The class or for Classes 4.1, 4.2 and 4.3, the figure "4" or for Classes 6.1 and 6.2, the figure "6", shall be shown in the bottom corner.
- ** Additional text/numbers/letters shall (if mandatory) or may (if optional) be shown in this bottom half.
- *** The class symbol or, for divisions 1.4, 1.5 and 1.6, the division number and for Model No 7E the word "FISSILE" shall be shown in this top half.

5.2.2.2.1.1.1 Labels shall be displayed on a background of contrasting colour, or shall have either a dotted or solid outer boundary line.

5.2.2.2.1.1.2 The label shall be in the form of a square set at an angle of 45° (diamond-shaped). The minimum dimensions shall be 100 mm x 100 mm and the minimum width of the line inside the edge forming the diamond shall be 2 mm. The line inside the edge shall be parallel and 5 mm from the outside of that line to the edge of the label. The line inside the edge on the upper half of the label shall be the same colour as the symbol and the line inside the edge on the lower half of the label shall be the same colour as the class or division number in the bottom corner. Where dimensions are not specified, all features shall be in approximate proportion to those shown.

5.2.2.2.1.1.3 If the size of the package so requires the dimensions may be reduced, provided the symbols and other elements of the label remain clearly visible. The line inside the edge shall remain 5 mm to the edge of the label. The minimum width of the line inside the edge shall remain 2 mm. Dimensions for cylinders shall comply with 5.2.2.2.1.2.

5.2.2.2.1.2 Cylinders for Class 2 may, on account of their shape, orientation and securing mechanisms for carriage, bear labels representative of those specified in this section and the environmentally hazardous substance mark when appropriate, which have been reduced in size, according to the dimensions outlined in ISO 7225:2005, "*Gas cylinders - Precautionary labels*", for display on the non-cylindrical part (shoulder) of such cylinders.

Notwithstanding the provisions of 5.2.2.1.6, labels and the environmentally hazardous substance mark (see 5.2.1.8.3) may overlap to the extent provided for by ISO 7225:2005. However, in all cases, the primary risk label and the figures appearing on any label shall remain fully visible and the symbols recognizable.

Empty uncleaned pressure receptacles for gases of Class 2 may be carried with obsolete or damaged labels for the purposes of refilling or inspection as appropriate and the application of a new label in conformity with current regulations or for the disposal of the pressure receptacle.

- 5.2.2.2.1.3 With the exception of labels for Divisions 1.4, 1.5 and 1.6 of Class 1, the upper half of the label shall contain the pictorial symbol and the lower half shall contain:
- (a) For Classes 1, 2, 3, 5.1, 5.2, 7, 8 and 9, the class number;
 - (b) For Classes 4.1, 4.2 and 4.3, the figure "4";
 - (c) For Classes 6.1 and 6.2, the figure "6".
- The labels may include text such as the UN number or words describing the hazard (e.g. "flammable") in accordance with 5.2.2.2.1.5 provided the text does not obscure or detract from the other required label elements.
- 5.2.2.2.1.4 In addition, except for Divisions 1.4, 1.5 and 1.6, labels for Class 1 shall show in the lower half, above the class number, the division number and the compatibility group letter for the substance or article. Labels for Divisions 1.4, 1.5 and 1.6 shall show in the upper half the division number, and in the lower half the class number and the compatibility group letter.
- 5.2.2.2.1.5 On labels other than those for material of Class 7, the optional insertion of any text (other than the class number) in the space below the symbol shall be confined to particulars indicating the nature of the risk and precautions to be taken in handling.
- 5.2.2.2.1.6 The symbols, text and numbers shall be clearly legible and indelible and shall be shown in black on all labels except for:
- (a) the Class 8 label, where the text (if any) and class number shall appear in white;
 - (b) labels with entirely green, red or blue backgrounds where they may be shown in white;
 - (c) the Class 5.2 label, where the symbol may be shown in white; and
 - (d) labels conforming to model No. 2.1 displayed on cylinders and gas cartridges for gases of UN Nos. 1011, 1075, 1965 and 1978, where they may be shown in the background colour of the receptacle if adequate contrast is provided.
- 5.2.2.2.1.7 All labels shall be able to withstand open weather exposure without a substantial reduction in effectiveness.

5.2.2.2.2 Specimen labels

CLASS 1 HAZARD**Explosive substances or articles**

(No. 1)

Divisions 1.1, 1.2 and 1.3

Symbol (exploding bomb): black; Background: orange; Figure '1' in bottom corner

(No. 1.4)

Division 1.4

(No. 1.5)

Division 1.5

(No. 1.6)

Division 1.6

Background: orange; Figures: black; Numerals shall be about 30 mm in height and be about 5 mm thick (for a label measuring 100 mm x 100 mm); Figure '1' in bottom corner

** Place for division - to be left blank if explosive is the subsidiary risk

* Place for compatibility group - to be left blank if explosive is the subsidiary risk

CLASS 2 HAZARD**Gases**

(No. 2.1)

Flammable gases

Symbol (flame): black or white;
(except as provided for in 5.2.2.2.1.6 (d))

Background: red; Figure '2' in bottom corner

(No. 2.2)

Non flammable, non-toxic gases

Symbol (gas cylinder): black or white;
Background: green; Figure '2' in bottom corner**CLASS 3 HAZARD****Flammable liquids**

(No. 2.3)

Toxic gases

Symbol (skull and crossbones): black;
Background: white; Figure '2' in bottom corner

(No. 3)

Symbol (flame): black or white;
Background: red; Figure '3' in bottom corner

CLASS 4.1 HAZARD
Flammable solids, self-reactive
substances and solid desensitized
explosives

(No. 4.1)
Symbol (flame): black;
Background: white with
seven vertical red stripes;
Figure '4' in bottom corner

CLASS 4.2 HAZARD
Substances liable to
spontaneous combustion

(No. 4.2)
Symbol (flame): black;
Background: upper half white,
lower half red;
Figure '4' in bottom corner

CLASS 4.3 HAZARD
Substances which, in contact with water,
emit flammable gases

(No. 4.3)
Symbol (flame): black or white;
Background: blue;
Figure '4' in bottom corner

CLASS 5.1 HAZARD
Oxidizing substances

(No. 5.1)
Symbol (flame over circle): black;
Background: yellow;
Figure '5.1' in bottom corner

CLASS 5.2 HAZARD
Organic peroxides

(No. 5.2)
Symbol (flame): black or white;
Background: upper half red; lower half yellow;
Figure '5.2' in bottom corner

CLASS 6.1 HAZARD
Toxic substances

(No. 6.1)
Symbol (skull and crossbones): black;
Background: white; Figure '6' in bottom corner

CLASS 6.2 HAZARD
Infectious substances

(No. 6.2)
The lower half of the label may bear the inscriptions: 'INFECTIOUS SUBSTANCE'
and 'In the case of damage or leakage immediately notify Public Health Authority';
Symbol (three crescents superimposed on a circle) and inscriptions: black;
Background: white; Figure '6' in bottom corner

CLASS 7 HAZARD **Radioactive material**

(No. 7A)

Category I - White
 Symbol (trefoil): black;
 Background: white;
 Text (mandatory): black in lower half of label:
 'RADIOACTIVE'
 'CONTENTS'
 'ACTIVITY'
 One red bar shall
 follow the word 'RADIOACTIVE';
 Figure '7' in bottom corner.

(No. 7B)

Category II - Yellow
 Symbol (trefoil): black;
 Background: upper half yellow with white border, lower half white;
 Text (mandatory): black in lower half of label:
 'RADIOACTIVE'
 'CONTENTS'
 'ACTIVITY'
 In a black outlined box: 'TRANSPORT INDEX';
 Two red vertical bars shall
 follow the word 'RADIOACTIVE';
 Figure '7' in bottom corner.

(No. 7C)

Category III - Yellow
 Symbol (trefoil): black;
 Background: upper half yellow with white border, lower half white;
 Text (mandatory): black in lower half of label:
 'RADIOACTIVE'
 'CONTENTS'
 'ACTIVITY'
 In a black outlined box: 'TRANSPORT INDEX';
 Three red vertical bars shall
 follow the word 'RADIOACTIVE';
 Figure '7' in bottom corner.

(No. 7E)

Class 7 fissile material
 Background: white;
 Text (mandatory): black in upper half of label: 'FISSILE';
 In a black outlined box in the lower half of the label:
 'CRITICALITY SAFETY INDEX'
 Figure '7' in bottom corner.

CLASS 8 HAZARD **Corrosive substances**

(No. 8)

Symbol (liquids, spilling from two glass vessels
 and attacking a hand and a metal): black;
 Background: upper half white;
 lower half black with white border;
 Figure '8' in bottom corner

CLASS 9 HAZARD **Miscellaneous dangerous substances and articles**

(No. 9)

Symbol (seven vertical stripes in upper half): black;
 Background: white;
 Figure '9' underlined in bottom corner

CHAPTER 5.3

PLACARDING AND MARKING OF CONTAINERS, MEGCs, MEMUs, TANK-CONTAINERS, PORTABLE TANKS AND VEHICLES

NOTE: *For marking and placarding of containers, MEGCs, tank-containers and portable tanks for carriage in a transport chain including a maritime journey, see also 1.1.4.2.1. If the provisions of 1.1.4.2.1 (c) are applied, only 5.3.1.3 and 5.3.2.1.1 of this Chapter are applicable.*

5.3.1 Placarding

5.3.1.1 General provisions

5.3.1.1.1 As and when required in this section, placards shall be affixed to the exterior surface of containers, MEGCs, MEMUs, tank-containers, portable tanks and vehicles. Placards shall correspond to the labels required in Column (5) and, where appropriate, Column (6) of Table A of Chapter 3.2 for the dangerous goods contained in the container, MEGC, MEMU, tank-container, portable tank or vehicle and shall conform to the specifications given in 5.3.1.7. Placards shall be displayed on a background of contrasting colour, or shall have either a dotted or solid outer boundary line.

5.3.1.1.2 For Class 1, compatibility groups shall not be indicated on placards if the vehicle, container or special compartments of MEMUs are carrying substances or articles belonging to two or more compatibility groups. Vehicles, containers or special compartments of MEMUs carrying substances or articles of different divisions shall bear only placards conforming to the model of the most dangerous division in the order:

1.1 (most dangerous), 1.5, 1.2, 1.3, 1.6, 1.4 (least dangerous).

When 1.5 D substances are carried with substances or articles of Division 1.2, the vehicle or container shall be placarded as Division 1.1.

Placards are not required for the carriage of explosives of Division 1.4, compatibility group S.

5.3.1.1.3 For Class 7, the primary risk placard shall conform to model No. 7D as specified in 5.3.1.7.2. This placard is not required for vehicles or containers carrying excepted packages and for small containers.

Where both Class 7 labels and placards would be required to be affixed to vehicles, containers, MEGCs, tank-containers or portable tanks, an enlarged label corresponding to the required label of model No. 7A, 7B or 7C may be displayed instead of placard No. 7D to serve both purposes. In that case, the dimensions shall be not less than 250 mm by 250 mm.

5.3.1.1.4 Containers, MEGCs, MEMUs, tank-containers, portable tanks or vehicles containing goods of more than one class need not bear a subsidiary risk placard if the hazard represented by that placard is already indicated by a primary or subsidiary risk placard.

5.3.1.1.5 Placards which do not relate to the dangerous goods being carried, or residues thereof, shall be removed or covered.

5.3.1.1.6 When the placarding is affixed to folding panels, they shall be designed and secured so that they cannot unfold or come loose from the holder during carriage (especially as a result of impacts or unintentional actions).

5.3.1.2 Placarding of containers, MEGCs, tank-containers and portable tanks

NOTE: *This sub-section does not apply to swap bodies, except tank swap bodies or swap bodies carried in combined road/rail transport.*

The placards shall be affixed to both sides and at each end of the container, MEGC, tank-container or portable tank.

When the tank-container or portable tank has multiple compartments and carries two or more dangerous goods, the appropriate placards shall be displayed along each side at the position of the relevant compartments and one placard of each model shown on each side at both ends.

5.3.1.3 *Placarding of vehicles carrying containers, MEGCs, tank-containers or portable tanks*

NOTE: This sub-section does not apply to the placarding of vehicles carrying swap bodies other than tank swap bodies or than swap bodies carried in combined road/rail transport; for such vehicles, see 5.3.1.5.

If the placards affixed to the containers, MEGCs, tank-containers or portable tanks are not visible from outside the carrying vehicles, the same placards shall also be affixed to both sides and at the rear of the vehicle. Otherwise, no placard need be affixed on the carrying vehicle.

5.3.1.4 *Placarding of vehicles for carriage in bulk, tank-vehicles, battery-vehicles, MEMUs and vehicles with demountable tanks*

5.3.1.4.1 Placards shall be affixed to both sides and at the rear of the vehicle.

When the tank-vehicle or the demountable tank carried on the vehicle has multiple compartments and carries two or more dangerous goods, the appropriate placards shall be displayed along each side at the position of the relevant compartments and one placard of each model shown on each side at the rear of the vehicle. However, in such case, if all compartments have to bear the same placards, these placards need be displayed only once along each side and at the rear of the vehicle.

Where more than one placard is required for the same compartment, these placards shall be displayed adjacent to each other.

NOTE: When, in the course of an ADR journey or at the end of an ADR journey, a tank semi-trailer is separated from its tractor to be loaded on board a ship or an inland navigation vessel, placards shall also be displayed at the front of the semi-trailer.

5.3.1.4.2 MEMUs with tanks and bulk containers shall be placarded in accordance with 5.3.1.4.1 for the substances contained therein. For tanks with a capacity of less than 1 000 litres placards may be replaced by labels conforming to 5.2.2.2.

5.3.1.4.3 For MEMUs carrying packages containing substances or articles of Class 1 (other than of Division 1.4, Compatibility group S), placards shall be affixed to both sides and at the rear of the MEMU.

Special compartments for explosives shall be placarded in accordance with the provisions of 5.3.1.1.2. The last sentence of 5.3.1.1.2 does not apply.

5.3.1.5 *Placarding of vehicles carrying packages only*

NOTE: This sub-section applies also to vehicles carrying swap bodies loaded with packages, except for combined road/rail transport; for combined road/rail transport, see 5.3.1.2 and 5.3.1.3.

5.3.1.5.1 For vehicles carrying packages containing substances or articles of Class 1 (other than of Division 1.4, compatibility group S), placards shall be affixed to both sides and at the rear of the vehicle.

5.3.1.5.2 For vehicles carrying radioactive material of Class 7 in packagings or IBCs (other than excepted packages), placards shall be affixed to both sides and at the rear of the vehicle.

5.3.1.6 *Placarding of empty tank-vehicles, battery-vehicles, MEGCs, MEMUs, tank-containers, portable tanks and empty vehicles and containers for carriage in bulk*

5.3.1.6.1 Empty tank-vehicles, vehicles with demountable tanks, battery-vehicles, MEGCs, MEMUs, tank-containers and portable tanks uncleaned and not degassed, and empty vehicles and containers for carriage in bulk, uncleaned, shall continue to display the placards required for the previous load.

5.3.1.7 *Specifications for placards*

- 5.3.1.7.1 Except as provided in 5.3.1.7.2 for the Class 7 placard, and in 5.3.6.2 for the environmentally hazardous substance mark, a placard shall be configured as shown in Figure 5.3.1.7.1.

Figure 5.3.1.7.1

Placard (except for Class 7)

The placard shall be in the form of a square set at an angle of 45° (diamond-shaped). The minimum dimensions shall be 250 mm x 250 mm (to the edge of the placard). The line inside the edge shall be parallel and 12.5 mm from the outside of that line to the edge of the placard. The symbol and line inside the edge shall correspond in colour to the label for the class or division of the dangerous goods in question. The class or division symbol/numeral shall be positioned and sized in proportion to those prescribed in 5.2.2.2 for the corresponding class or division of the dangerous goods in question. The placard shall display the number of the class or division (and for goods in Class 1, the compatibility group letter) of the dangerous goods in question in the manner prescribed in 5.2.2.2 for the corresponding label, in digits not less than 25 mm high. Where dimensions are not specified, all features shall be in approximate proportion to those shown.

- 5.3.1.7.2 The Class 7 placard shall be not less than 250 mm by 250 mm with a black line running 5 mm inside the edge and parallel with it and is otherwise as shown below (Model No. 7D). The number "7" shall not be less than 25 mm high. The background colour of the upper half of the placard shall be yellow and of the lower half white, the colour of the trefoil and the printing shall be black. The use of the word "RADIOACTIVE" in the bottom half is optional to allow the use of this placard to display the appropriate UN number for the consignment.

Placard for radioactive material of Class 7

(No.7D)

Symbol (trefoil): black; Background: upper half yellow with white border, lower half white;

The lower half shall show the word "RADIOACTIVE" or alternatively, the appropriate UN Number, and the figure "7" in the bottom corner.

5.3.1.7.3 For tanks with a capacity of not more than 3 m³ and for small containers, placards may be replaced by labels conforming to 5.2.2.2. If these labels are not visible from outside the carrying vehicle, placards according to 5.3.1.7.1 shall also be affixed to both sides and at the rear of the vehicle.

5.3.1.7.4 For Classes 1 and 7, if the size and construction of the vehicle are such that the available surface area is insufficient to affix the prescribed placards, their dimensions may be reduced to 100 mm on each side.

5.3.2 Orange-coloured plate marking

5.3.2.1 General orange-coloured plate marking provisions

5.3.2.1.1 Transport units carrying dangerous goods shall display two rectangular orange-coloured plates conforming to 5.3.2.2.1, set in a vertical plane. They shall be affixed one at the front and the other at the rear of the transport unit, both perpendicular to the longitudinal axis of the transport unit. They shall be clearly visible.

If a trailer containing dangerous goods is detached from its motor vehicle during carriage of dangerous goods, an orange-coloured plate shall remain affixed to the rear of the trailer. When tanks are marked in accordance with 5.3.2.1.3, this plate shall correspond to the most hazardous substance carried in the tank.

5.3.2.1.2 When a hazard identification number is indicated in Column (20) of table A of Chapter 3.2, tank-vehicles, battery vehicles or transport units having one or more tanks carrying dangerous goods shall in addition display on the sides of each tank, each tank compartment or each element of battery vehicles, clearly visible and parallel to the longitudinal axis of the vehicle, orange-coloured plates identical with those prescribed in 5.3.2.1.1. These orange-coloured plates shall bear the hazard identification number and the UN number prescribed respectively in Columns (20) and (1) of table A of Chapter 3.2 for each of the substances carried in the tank, in a compartment of the tank or in an element of a battery vehicle. For MEMUs these requirements shall only apply to tanks with a capacity of 1 000 litres or more and bulk containers.

5.3.2.1.3 For tank-vehicles or transport units having one or more tanks carrying substances with UN Nos. 1202, 1203 or 1223, or aviation fuel classified under UN Nos. 1268 or 1863, but no other dangerous substance, the orange-coloured plates prescribed in 5.3.2.1.2 need not be affixed if the plates affixed to the front and rear in accordance with 5.3.2.1.1 bear the hazard identification number and the UN number prescribed for the most hazardous substance carried, i.e. the substance with the lowest flash-point.

5.3.2.1.4 When a hazard identification number is indicated in Column (20) of Table A of Chapter 3.2, transport units and containers carrying unpackaged solids or articles or packaged radioactive material with a single UN number required to be carried under exclusive use and no other dangerous goods shall in addition display on the sides of each transport unit or container, clearly visible and parallel to the longitudinal axis of the vehicle, orange-coloured plates identical with those prescribed in 5.3.2.1.1. These orange-coloured plates shall bear the hazard identification number and the UN number prescribed respectively in Columns (20) and (1) of table A of Chapter 3.2 for each of the substances carried in bulk in the transport unit or in the container or for the packaged radioactive material when required to be carried under exclusive use in the transport unit or in the container.

5.3.2.1.5 If the orange-coloured plates prescribed in 5.3.2.1.2 and 5.3.2.1.4 affixed to the containers, tank-containers, MEGCs or portable tanks are not clearly visible from outside the carrying vehicle, the same plates shall also be affixed to both sides of the vehicle.

NOTE: *This paragraph need not be applied to the marking with orange coloured plates of closed and sheeted vehicles, carrying tanks with a maximum capacity of 3 000 litres.*

5.3.2.1.6 For transport units carrying only one dangerous substance and no non-dangerous substance, the orange-coloured plates prescribed in 5.3.2.1.2, 5.3.2.1.4 and 5.3.2.1.5 shall not be necessary provided that those displayed at the front and rear in accordance with 5.3.2.1.1 bear the hazard identification number and the UN number for that substance prescribed respectively in Columns (20) and (1) of Table A of Chapter 3.2.

5.3.2.1.7 The requirements of 5.3.2.1.1 to 5.3.2.1.5 are also applicable to empty fixed or demountable tanks, battery-vehicles, tank-containers, portable tanks and MEGCs, uncleaned, not degassed or not decontaminated, MEMUs, uncleaned as well as to empty vehicles and containers for carriage in bulk, uncleaned or not decontaminated.

5.3.2.1.8 Orange-coloured marking which does not relate to dangerous goods carried, or residues thereof, shall be removed or covered. If plates are covered, the covering shall be total and remain effective after 15 minutes' engulfment in fire.

5.3.2.2 *Specifications for the orange-coloured plates*

5.3.2.2.1 The orange-coloured plates shall be reflectorized and shall be of 40 cm base and of 30 cm high; they shall have a black border of 15 mm wide. The material used shall be weather-resistant and ensure durable marking. The plate shall not become detached from its mount in the event of 15 minutes' engulfment in fire. It shall remain affixed irrespective of the orientation of the vehicle. The orange-coloured plates may be separated in their middle with a black horizontal line of 15 mm thickness.

If the size and construction of the vehicle are such that the available surface area is insufficient to affix these orange-coloured plates, their dimensions may be reduced to a minimum of 300 mm for the base, 120 mm for the height and 10 mm for the black border. In this case, a different set of dimensions within the specified range may be used for the two orange-coloured plates specified in 5.3.2.1.1.

When reduced dimensions of orange-coloured plates are used for a packaged radioactive material carried under exclusive use, only the UN number is required and the size of the digits stipulated in 5.3.2.2.2 may be reduced to 65 mm in height and 10 mm in stroke thickness.

For containers carrying dangerous solid substances in bulk and for tank-containers, MEGCs and portable tanks, the plates prescribed in 5.3.2.1.2, 5.3.2.1.4 and 5.3.2.1.5 may be replaced by a self-adhesive sheet, by paint or by any other equivalent process. This alternative marking shall conform to the specifications set in this sub-section except for the provisions concerning resistance to fire mentioned in 5.3.2.2.1 and 5.3.2.2.2.

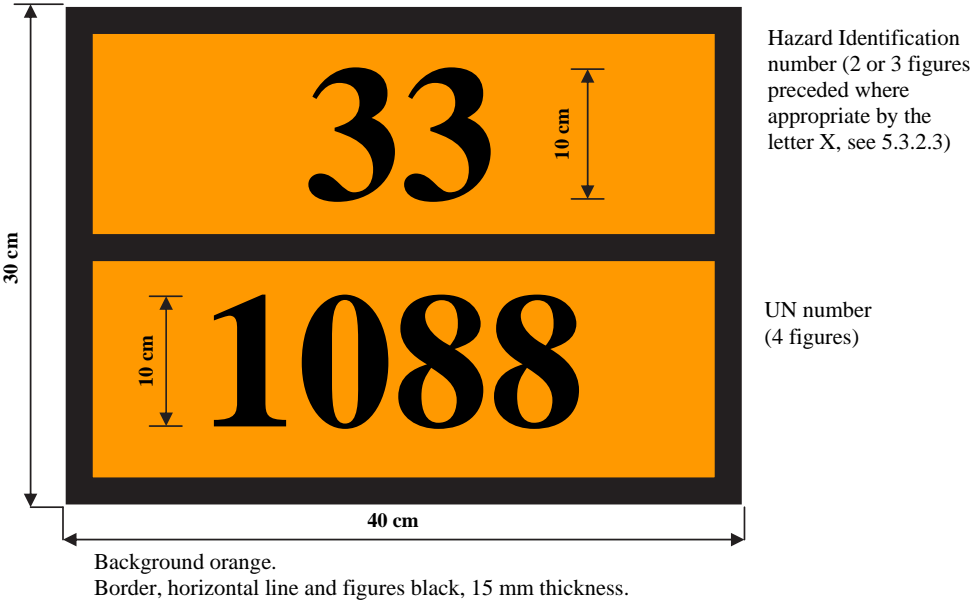

NOTE: The colour of the orange plates in conditions of normal use should have chromaticity co-ordinates lying within the area on the chromaticity diagram formed by joining the following co-ordinates:

Chromaticity co-ordinates of points at the corners of the area on the chromaticity diagram				
x	0.52	0.52	0.578	0.618
y	0.38	0.40	0.422	0.38

Luminance factor of reflectorized colour: $\beta > 0.12$.
Reference centre E, standard illuminant C, normal incidence 45°, viewed at 0°.
Co-efficient of reflex luminous intensity at an angle of illumination of 5°, viewed at 0.2°: not less than 20 candelas per lux per m².

5.3.2.2.2 The hazard identification number and the UN number shall consist of black digits 100 mm high and of 15 mm stroke thickness. The hazard-identification number shall be inscribed in the upper part of the plate and the UN number in the lower part; they shall be separated by a horizontal black line, 15 mm in stroke width, extending from side to side of the plate at mid-height (see 5.3.2.2.3).The hazard identification number and the UN number shall be indelible and shall remain legible after 15 minute’ engulfment in fire. Interchangeable numbers and letters on plates presenting the hazard identification number and the UN number shall remain in place during carriage and irrespective of the orientation of the vehicle.

5.3.2.2.3 Example of orange-coloured plate with hazard identification number and UN number

5.3.2.2.4 The permitted tolerances for dimensions specified in this sub-section are $\pm 10\%$.

5.3.2.2.5 When the orange-coloured plate is affixed to folding panels, they shall be designed and secured so that they cannot unfold or come loose from the holder during carriage (especially as a result of impacts or unintentional actions).

5.3.2.3 **Meaning of hazard identification numbers**

5.3.2.3.1 The hazard identification number consists of two or three figures. In general, the figures indicate the following hazards:

- 2 Emission of gas due to pressure or to chemical reaction
- 3 Flammability of liquids (vapours) and gases or self-heating liquid
- 4 Flammability of solids or self-heating solid

- 5 Oxidizing (fire-intensifying) effect
- 6 Toxicity or risk of infection
- 7 Radioactivity
- 8 Corrosivity
- 9 Risk of spontaneous violent reaction

NOTE: The risk of spontaneous violent reaction within the meaning of figure 9 include the possibility following from the nature of a substance of a risk of explosion, disintegration and polymerization reaction following the release of considerable heat or flammable and/or toxic gases.

Doubling of a figure indicates an intensification of that particular hazard.

Where the hazard associated with a substance can be adequately indicated by a single figure, this is followed by zero.

The following combinations of figures, however, have a special meaning: 22, 323, 333, 362, 382, 423, 44, 446, 462, 482, 539, 606, 623, 642, 823, 842, 90 and 99, see 5.3.2.3.2 below.

If a hazard identification number is prefixed by the letter "X", this indicates that the substance will react dangerously with water. For such substances, water may only be used by approval of experts.

For substances of Class 1, the classification code in accordance with Column (3 b) of Table A of Chapter 3.2, shall be used as the hazard identification number. The classification code consists of:

- the division number in accordance with 2.2.1.1.5; and
- the compatibility group letter in accordance with 2.2.1.1.6.

5.3.2.3.2 The hazard identification numbers listed in Column (20) of table A of Chapter 3.2 have the following meanings:

- 20 asphyxiant gas or gas with no subsidiary risk
- 22 refrigerated liquefied gas, asphyxiant
- 223 refrigerated liquefied gas, flammable
- 225 refrigerated liquefied gas, oxidizing (fire-intensifying)
- 23 flammable gas
- 238 gas, flammable corrosive
- 239 flammable gas, which can spontaneously lead to violent reaction
- 25 oxidizing (fire-intensifying) gas
- 26 toxic gas
- 263 toxic gas, flammable
- 265 toxic gas, oxidizing (fire-intensifying)
- 268 toxic gas, corrosive
- 28 gas, corrosive
- 30 flammable liquid (flash-point between 23 °C and 60 °C, inclusive) or flammable liquid or solid in the molten state with a flash-point above 60 °C, heated to a temperature equal to or above its flash-point, or self-heating liquid
- 323 flammable liquid which reacts with water, emitting flammable gases
- X323 flammable liquid which reacts dangerously with water, emitting flammable gases¹
- 33 highly flammable liquid (flash-point below 23 °C)
- 333 pyrophoric liquid
- X333 pyrophoric liquid which reacts dangerously with water¹
- 336 highly flammable liquid, toxic
- 338 highly flammable liquid, corrosive
- X338 highly flammable liquid, corrosive, which reacts dangerously with water¹
- 339 highly flammable liquid which can spontaneously lead to violent reaction
- 36 flammable liquid (flash-point between 23 °C and 60 °C, inclusive), slightly toxic, or self-heating liquid, toxic
- 362 flammable liquid, toxic, which reacts with water, emitting flammable gases
- X362 flammable liquid toxic, which reacts dangerously with water, emitting flammable gases¹

¹ Water not to be used except by approval of experts.

368	flammable liquid, toxic, corrosive
38	flammable liquid (flash-point between 23 °C and 60 °C, inclusive), slightly corrosive or self-heating liquid, corrosive
382	flammable liquid, corrosive, which reacts with water, emitting flammable gases
X382	flammable liquid, corrosive, which reacts dangerously with water, emitting flammable gases ¹
39	flammable liquid, which can spontaneously lead to violent reaction
40	flammable solid, or self-reactive substance, or self-heating substance
423	solid which reacts with water, emitting flammable gases, or flammable solid which reacts with water, emitting flammable gases or self-heating solid which reacts with water, emitting flammable gases
X423	solid which reacts dangerously with water, emitting flammable gases, or flammable solid which reacts dangerously with water, emitting flammable gases, or self-heating solid which reacts dangerously with water, emitting flammable gases ¹
43	spontaneously flammable (pyrophoric) solid
X432	spontaneously flammable (pyrophoric) solid which reacts dangerously with water, emitting flammable gases ¹
44	flammable solid, in the molten state at an elevated temperature
446	flammable solid, toxic, in the molten state, at an elevated temperature
46	flammable or self-heating solid, toxic
462	toxic solid which reacts with water, emitting flammable gases
X462	solid which reacts dangerously with water, emitting toxic gases ¹
48	flammable or self-heating solid, corrosive
482	corrosive solid which reacts with water, emitting flammable gases
X482	solid which reacts dangerously with water, emitting corrosive gases ¹
50	oxidizing (fire-intensifying) substance
539	flammable organic peroxide
55	strongly oxidizing (fire-intensifying) substance
556	strongly oxidizing (fire-intensifying) substance, toxic
558	strongly oxidizing (fire-intensifying) substance, corrosive
559	strongly oxidizing (fire-intensifying) substance, which can spontaneously lead to violent reaction
56	oxidizing substance (fire-intensifying), toxic
568	oxidizing substance (fire-intensifying), toxic, corrosive
58	oxidizing substance (fire-intensifying), corrosive
59	oxidizing substance (fire-intensifying) which can spontaneously lead to violent reaction
60	toxic or slightly toxic substance
606	infectious substance
623	toxic liquid, which reacts with water, emitting flammable gases
63	toxic substance, flammable (flash-point between 23 °C and 60 °C, inclusive)
638	toxic substance, flammable (flash-point between 23 °C and 60 °C, inclusive), corrosive
639	toxic substance, flammable (flash-point not above 60 °C) which can spontaneously lead to violent reaction
64	toxic solid, flammable or self-heating
642	toxic solid, which reacts with water, emitting flammable gases
65	toxic substance, oxidizing (fire-intensifying)
66	highly toxic substance
663	highly toxic substance, flammable (flash-point not above 60 °C)
664	highly toxic solid, flammable or self-heating
665	highly toxic substance, oxidizing (fire-intensifying)
668	highly toxic substance, corrosive
X668	highly toxic substance, corrosive, which reacts dangerously with water ¹
669	highly toxic substance which can spontaneously lead to violent reaction
68	toxic substance, corrosive
69	toxic or slightly toxic substance, which can spontaneously lead to violent reaction
70	radioactive material
78	radioactive material, corrosive

¹ Water not to be used except by approval of experts.

80	corrosive or slightly corrosive substance
X80	corrosive or slightly corrosive substance, which reacts dangerously with water ¹
823	corrosive liquid which reacts with water, emitting flammable gases
83	corrosive or slightly corrosive substance, flammable (flash-point between 23 °C and 60 °C, inclusive)
X83	corrosive or slightly corrosive substance, flammable, (flash-point between 23 °C and 60 °C, inclusive), which reacts dangerously with water ¹
839	corrosive or slightly corrosive substance, flammable (flash-point between 23 °C and 60 °C inclusive) which can spontaneously lead to violent reaction
X839	corrosive or slightly corrosive substance, flammable (flash-point between 23 °C and 60 °C inclusive), which can spontaneously lead to violent reaction and which reacts dangerously with water ¹
84	corrosive solid, flammable or self-heating
842	corrosive solid which reacts with water, emitting flammable gases
85	corrosive or slightly corrosive substance, oxidizing (fire-intensifying)
856	corrosive or slightly corrosive substance, oxidizing (fire-intensifying) and toxic
86	corrosive or slightly corrosive substance, toxic
88	highly corrosive substance
X88	highly corrosive substance, which reacts dangerously with water ¹
883	highly corrosive substance, flammable (flash-point between 23 °C and 60 °C inclusive)
884	highly corrosive solid, flammable or self-heating
885	highly corrosive substance, oxidizing (fire-intensifying)
886	highly corrosive substance, toxic
X886	highly corrosive substance, toxic, which reacts dangerously with water ¹
89	corrosive or slightly corrosive substance, which can spontaneously lead to violent reaction
90	environmentally hazardous substance; miscellaneous dangerous substances
99	miscellaneous dangerous substance carried at an elevated temperature.

5.3.3

Elevated temperature substance mark

Tank-vehicles, tank-containers, portable tanks, special vehicles or containers or specially equipped vehicles or containers containing a substance that is carried or handed over for carriage in a liquid state at or above 100 °C or in a solid state at or above 240 °C shall bear on both sides and at the rear for vehicles, and on both sides and at each end for containers, tank-containers and portable tanks, the mark shown in Figure 5.3.3.

Mark for carriage at elevated temperature

¹ Water not to be used except by approval of experts.

The marking shall be an equilateral triangle. The colour of the mark shall be red. The minimum dimension of the sides shall be 250 mm. Where dimensions are not specified, all features shall be in approximate proportion to those shown.

5.3.4 *(Reserved)*

5.3.5 *(Reserved)*

5.3.6 Environmentally hazardous substance mark

5.3.6.1 When a placard is required to be displayed in accordance with the provisions of section 5.3.1, containers, MEGCs, tank-containers, portable tanks and vehicles containing environmentally hazardous substances meeting the criteria of 2.2.9.1.10 shall be marked with the environmentally hazardous substance mark shown in 5.2.1.8.3.

5.3.6.2 The environmentally hazardous substance mark for containers, MEGCs, tank-containers, portable tanks and vehicles shall be as described in 5.2.1.8.3 and Figure 5.2.1.8.3, except that the minimum dimensions shall be 250 mm x 250 mm. The other provisions of section 5.3.1 concerning placards shall apply mutatis mutandis to the mark.

CHAPTER 5.4

DOCUMENTATION

5.4.0 General

5.4.0.1 Unless otherwise specified, any carriage of goods governed by ADR shall be accompanied by the documentation prescribed in this Chapter, as appropriate.

NOTE: For the list of documentation to be carried on board transport units, see 8.1.2.

5.4.0.2 The use of electronic data processing (EDP) or electronic data interchange (EDI) techniques as an aid to or instead of paper documentation is permitted, provided that the procedures used for the capture, storage and processing of electronics data meet the legal requirements as regards the evidential value and availability of data during transport in a manner at least equivalent to that of paper documentation.

5.4.0.3 When the dangerous goods transport information is given to the carrier by EDP or EDI techniques, the consignor shall be able to give the information to the carrier as a paper document, with the information in the sequence required by this Chapter.

5.4.1 Dangerous goods transport document and related information

5.4.1.1 General information required in the transport document

5.4.1.1.1 The transport document(s) shall contain the following information for each dangerous substance, material or article offered for carriage:

- (a) the UN number preceded by the letters "UN";
- (b) the proper shipping name supplemented, when applicable (see 3.1.2.8.1) with the technical name in brackets (see 3.1.2.8.1.1), as determined in accordance with 3.1.2;
- (c) - for substances and articles of Class 1: the classification code given in Column (3b) of Table A in Chapter 3.2.

When, in Column (5) of Table A in Chapter 3.2, label model numbers other than 1, 1.4, 1.5 and 1.6 are given, these label model numbers, in brackets, shall follow the classification code;

- for radioactive material of Class 7: the Class number: "7";

NOTE: For radioactive material with a subsidiary risk, see also special provision 172 in Chapter 3.3.

- for substances and articles of other classes: the label model numbers given in Column (5) of Table A in Chapter 3.2 or applicable according to a special provision referred to in Column (6). When more than one label model numbers are given, the numbers following the first one shall be given in brackets. For substances and articles for which no label model is given in Column (5) of Table A in Chapter 3.2, their class according to Column (3a) shall be given instead;

- (d) where assigned, the packing group for the substance which may be preceded by the letters "PG" (e.g. "PG II"), or the initials corresponding to the words "Packing Group" in the languages used according to 5.4.1.4.1;

NOTE: For radioactive material of Class 7 with subsidiary risks, see special provision 172 (d) in Chapter 3.3.

- (e) the number and a description of the packages when applicable. UN packaging codes may only be used to supplement the description of the kind of package (e.g. one box (4G));

NOTE: The number, type and capacity of each inner packaging within the outer packaging of a combination packaging is not required to be indicated.

- (f) the total quantity of each item of dangerous goods bearing a different UN number, proper shipping name or, when applicable, packing group (as a volume or as a gross mass, or as a net mass as appropriate);

NOTE 1: In the case of intended application of 1.1.3.6, the total quantity of dangerous goods for each transport category shall be indicated in the transport document in accordance with 1.1.3.6.3.

NOTE 2: For dangerous goods in machinery or equipment specified in this Annex, the quantity indicated shall be the total quantity of dangerous goods contained therein in kilograms or litres as appropriate.

- (g) the name and address of the consignor;
- (h) the name and address of the consignee(s). With the agreement of the competent authorities of the countries concerned by the carriage, when dangerous goods are carried to be delivered to multiple consignees who cannot be identified at the start of the carriage, the words "Delivery Sale" may be given instead;
- (i) a declaration as required by the terms of any special agreement;
- (j) *(Reserved)*
- (k) where assigned, the tunnel restriction code given in Column (15) of Table A of Chapter 3.2, in capitals within parenthesis. The tunnel restriction code need not be added in the transport document where the carriage is known beforehand not to pass through a tunnel with restrictions for carriage of dangerous goods.

The location and order in which the elements of information required appear in the transport document is left optional, except that (a), (b), (c), (d) and (k) shall be shown in the order listed above (i.e. (a), (b), (c), (d), (k)) with no information interspersed, except as provided in ADR.

Examples of such permitted dangerous goods descriptions are:

**"UN 1098 ALLYL ALCOHOL, 6.1 (3), I, (C/D)" or
"UN 1098, ALLYL ALCOHOL, 6.1 (3), PG I, (C/D)"**

5.4.1.1.2 The information required on a transport document shall be legible.

Although upper case is used in Chapter 3.1 and in Table A in Chapter 3.2 to indicate the elements which shall be part of the proper shipping name, and although upper and lower case are used in this Chapter to indicate the information required in the transport document, except for the provisions in 5.4.1.1.1 (k), the use of upper or of lower case for entering the information in the transport document is left optional.

5.4.1.1.3 *Special provisions for wastes*

If waste containing dangerous goods (other than radioactive wastes) is being carried, the proper shipping name shall be preceded by the word **"WASTE"**, unless this term is part of the proper shipping name, e.g.:

**"UN 1230 WASTE METHANOL, 3 (6.1), II, (D/E)", or
"UN 1230 WASTE METHANOL, 3 (6.1), PG II, (D/E)", or
"UN 1993 WASTE FLAMMABLE LIQUID, N.O.S. (toluene and ethyl alcohol), 3, II, (D/E)", or
"UN 1993 WASTE FLAMMABLE LIQUID, N.O.S. (toluene and ethyl alcohol), 3, PG II, (D/E)".**

If the provision for waste as set out in 2.1.3.5.5 is applied, the following shall be added to the dangerous goods description required in 5.4.1.1.1 (a) to (d) and (k):

"WASTE IN ACCORDANCE WITH 2.1.3.5.5" (e.g. "UN 3264, CORROSIVE LIQUID, ACIDIC, INORGANIC, N.O.S., 8, II, (E), WASTE IN ACCORDANCE WITH 2.1.3.5.5").

The technical name, as prescribed in Chapter 3.3, special provision 274, need not be added.

5.4.1.1.4 *(Deleted)*

5.4.1.1.5 *Special provisions for salvage packagings and salvage pressure receptacles*

When dangerous goods are carried in a salvage packaging or salvage pressure receptacle, the words "**SALVAGE PACKAGING**" or "**SALVAGE PRESSURE RECEPTACLE**" shall be added after the description of the goods in the transport document.

5.4.1.1.6 *Special provision for empty means of containment, uncleaned*

5.4.1.1.6.1 For empty means of containment, uncleaned, which contain the residue of dangerous goods of classes other than Class 7, the words "EMPTY, UNCLEANED" or "RESIDUE, LAST CONTAINED" shall be indicated before or after the dangerous goods description specified in 5.4.1.1.1 (a) to (d) and (k). Moreover, 5.4.1.1.1 (f) does not apply.

5.4.1.1.6.2 The special provision of 5.4.1.1.6.1 may be replaced with the provisions of 5.4.1.1.6.2.1, 5.4.1.1.6.2.2 or 5.4.1.1.6.2.3, as appropriate.

5.4.1.1.6.2.1 For empty packagings, uncleaned, which contain the residue of dangerous goods of classes other than Class 7, including empty uncleaned receptacles for gases with a capacity of not more than 1 000 litres, the particulars according to 5.4.1.1.1 (a), (b), (c), (d), (e) and (f) are replaced with "EMPTY PACKAGING", "EMPTY RECEPTACLE", "EMPTY IBC" or "EMPTY LARGE PACKAGING", as appropriate, followed by the information of the goods last loaded, as described in 5.4.1.1.1 (c).

See example as follows: "EMPTY PACKAGING, 6.1 (3)".

In addition, in such a case, if the dangerous goods last loaded are goods of Class 2, the information prescribed in 5.4.1.1.1 (c) may be replaced by the number of the class "2".

5.4.1.1.6.2.2 For empty means of containment other than packagings, uncleaned, which contain the residue of dangerous goods of classes other than Class 7 and for empty uncleaned receptacles for gases with a capacity of more than 1 000 litres, the particulars according to 5.4.1.1.1 (a) to (d) and (k) are preceded by "EMPTY TANK-VEHICLE", "EMPTY DEMOUNTABLE TANK", "EMPTY TANK-CONTAINER", "EMPTY PORTABLE TANK", "EMPTY BATTERY-VEHICLE", "EMPTY MEGC", "EMPTY MEMU", "EMPTY VEHICLE", "EMPTY CONTAINER" or "EMPTY RECEPTACLE", as appropriate, followed by the words "LAST LOAD:". Moreover, paragraph 5.4.1.1.1 (f) does not apply.

See examples as follows:

"EMPTY TANK-VEHICLE, LAST LOAD: UN 1098 ALLYL ALCOHOL, 6.1 (3), I, (C/D)" or
"EMPTY TANK-VEHICLE, LAST LOAD: UN 1098 ALLYL ALCOHOL, 6.1 (3), PG I, (C/D)".

5.4.1.1.6.2.3 When empty means of containment, uncleaned, which contain the residue of dangerous goods of classes other than Class 7, are returned to the consignor, the transport documents prepared for the full-capacity carriage of these goods may also be used. In such cases, the indication of the quantity is to be eliminated (by effacing it, striking it out or any other means) and replaced by the words "EMPTY, UNCLEANED RETURN".

5.4.1.1.6.3 (a) If empty tanks, battery- vehicles and MEGCs, uncleaned, are carried to the nearest place where cleaning or repair can be carried out in accordance with the provisions of 4.3.2.4.3, the following additional entry shall be made in the transport document: "**Carriage in accordance with 4.3.2.4.3**".

- (b) If empty vehicles and containers, uncleaned, are carried to the nearest place where cleaning or repair can be carried out in accordance with the provisions of 7.5.8.1, the following additional entry shall be made in the transport document: **"Carriage in accordance with 7.5.8.1"**.

5.4.1.1.6.4 For the carriage of fixed tanks (tank vehicles), demountable tanks, battery-vehicles, tank-containers and MEGCs under the conditions of 4.3.2.4.4, the following entry shall be included in the transport document: "Carriage in accordance with 4.3.2.4.4".

5.4.1.1.7 *Special provisions for carriage in a transport chain including maritime or air carriage*

For carriage in accordance with 1.1.4.2.1, a statement shall be included in the transport document, as follows: **"Carriage in accordance with 1.1.4.2.1"**.

5.4.1.1.8 and 5.4.1.1.9 (Reserved)

5.4.1.1.10 (Deleted)

5.4.1.1.11 *Special provisions for the carriage of IBCs or portable tanks after the date of expiry of the last periodic test or inspection*

For carriage in accordance with 4.1.2.2 (b), 6.7.2.19.6 (b), 6.7.3.15.6 (b) or 6.7.4.14.6 (b), a statement to this effect shall be included in the transport document, as follows: **"Carriage in accordance with 4.1.2.2 (b)"**, **"Carriage in accordance with 6.7.2.19.6 (b)"**, **"Carriage in accordance with 6.7.3.15.6 (b)"** or **"Carriage in accordance with 6.7.4.14.6 (b)"** as appropriate.

5.4.1.1.12 (Reserved)

5.4.1.1.13 *Special provisions for carriage in multi-compartment tank-vehicles or transport units with more than one tank*

When by derogation from 5.3.2.1.2 a multi-compartment tank-vehicle or a transport unit with more than one tank is marked in accordance with 5.3.2.1.3, the substances contained in each tank or in each compartment of a tank shall be specified in the transport document.

5.4.1.1.14 *Special provisions for the carriage of substances carried under elevated temperature*

If the proper shipping name of a substance which is carried or offered for carriage in a liquid state at a temperature equal to or exceeding 100 °C, or in a solid state at a temperature equal to or exceeding 240 °C, does not convey the elevated temperature condition (for example, by using the term "MOLTEN" or "ELEVATED TEMPERATURE" as part of the proper shipping name), the word **"HOT"** shall immediately precede the proper shipping name.

5.4.1.1.15 *Special provisions for the carriage of substances stabilized by temperature control*

If the word "STABILIZED" is part of the proper shipping name (see also 3.1.2.6), when stabilization is by means of temperature control, the control and emergency temperatures (see 2.2.41.1.17) shall be indicated in the transport document, as follows:

"Control temperature:°C Emergency temperature: °C"

5.4.1.1.16 *Information required in accordance with special provision 640 in Chapter 3.3*

Where it is required by special provision 640 of Chapter 3.3, the transport document shall bear the inscription **"Special provision 640X"** where "X" is the capital letter appearing after the pertinent reference to special provision 640 in column (6) of Table A of Chapter 3.2.

5.4.1.1.17 *Special provisions for the carriage of solids in bulk containers conforming to 6.11.4*

When solid substances are carried in bulk containers conforming to 6.11.4, the following statement shall be shown on the transport document (see NOTE at the beginning of 6.11.4):

"Bulk container BK(x)¹ approved by the competent authority of..."

5.4.1.1.18 *Special provisions for carriage of environmentally hazardous substances (aquatic environment)*

When a substance belonging to one of classes 1 to 9 meets the classification criteria of 2.2.9.1.10, the transport document shall bear the additional inscription "ENVIRONMENTALLY HAZARDOUS" or "MARINE POLLUTANT/ENVIRONMENTALLY HAZARDOUS". This additional requirement does not apply to UN Nos. 3077 and 3082 or for the exceptions listed in 5.2.1.8.1.

The inscription "MARINE POLLUTANT" (according to 5.4.1.4.3 of the IMDG Code) is acceptable for carriage in a transport chain including maritime carriage.

5.4.1.1.19 *Special provisions for carriage of packagings, discarded, empty, uncleaned (UN 3509)*

For packagings, discarded, empty, uncleaned, the proper shipping name specified in 5.4.1.1.1 (b) shall be complemented with the words "(WITH RESIDUES OF [...])" followed by the class(es) and subsidiary risk(s) corresponding to the residues, in the class numbering order. Moreover, 5.4.1.1.1 (f) does not apply.

Example: Packagings, discarded, empty, uncleaned having contained goods of Class 4.1 packed together with packagings, discarded, empty, uncleaned having contained goods of Class 3 with a Class 6.1 subsidiary risk should be referred to in the transport document as:

"UN 3509 PACKAGINGS, DISCARDED, EMPTY, UNCLEARED (WITH RESIDUES OF 3, 4.1, 6.1), 9".

5.4.1.2 *Additional or special information required for certain classes*

5.4.1.2.1 *Special provisions for Class 1*

(a) The transport document shall indicate, in addition to the requirements in 5.4.1.1.1 (f):

- the total net mass, in kg, of explosive contents² for each substance or article bearing a different UN number;
- the total net mass, in kg, of explosive contents² for all substances and articles covered by the transport document;

(b) For mixed packing of two different goods, the description of the goods in the transport document shall include the UN numbers and names printed in capitals in Columns (1) and (2) of Table A of Chapter 3.2 of both substances or articles. If more than two different goods are contained in the same package in conformity with the mixed packing provisions given in 4.1.10 special provisions MP1, MP2 and MP20 to MP24, the transport document shall indicate under the description of the goods the UN numbers of all the substances and articles contained in the package, in the form, "**Goods of UN Nos...**";

(c) For the carriage of substances and articles assigned to an n.o.s. entry or the entry "0190 SAMPLES, EXPLOSIVE" or packed conforming to packing instruction P101 of 4.1.4.1, a copy of the competent authority approval with the conditions of carriage shall be attached to the transport document. It shall be drafted in an official language of the forwarding country and also, if that language is not English, French or German, in English, French or German unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise;

¹ (x) shall be replaced with "1" or "2" as appropriate.

² For articles, "explosive contents" means the explosive substance contained in the article.

- (d) If packages containing substances and articles of compatibility groups B and D are loaded together in the same vehicle in accordance with the requirements of 7.5.2.2, a copy of the competent authority approval of the protective compartment or containment system in accordance with 7.5.2.2, note ^a under the table, shall be attached to the transport document. It shall be drafted in an official language of the forwarding country and also, if that language is not English, French or German, in English, French or German unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise;
- (e) When explosive substances or articles are carried in packagings conforming to packing instruction P101, the transport document shall bear the inscription "**Packaging approved by the competent authority of ...**" (see 4.1.4.1, packing instruction P101);
- (f) *(Reserved)*
- (g) When fireworks of UN Nos. 0333, 0334, 0335, 0336 and 0337 are carried, the transport document shall bear the inscription:

"Classification of fireworks by the competent authority of XX with the firework reference XX/YYZZZZ".

The classification approval certificate need not be carried with the consignment, but shall be made available by the consignor to the carrier or the competent authorities for control purposes. The classification approval certificate or a copy of it shall be in an official language of the forwarding country, and also, if that language is not German, English or French, in German, English or French.

NOTE 1: *The commercial or technical name of the goods may be entered additionally to the proper shipping name in the transport document.*

NOTE 2: *The classification reference(s) shall consist of the ADR Contracting Party in which the classification code according to special provision 645 of 3.3.1 was approved, indicated by the distinguishing sign for motor vehicles in international traffic (XX)³, the competent authority identification (YY) and a unique serial reference (ZZZZ). Examples of such classification references are:*

*GB/HSE123456
D/BAM1234.*

5.4.1.2.2 *Additional provisions for Class 2*

- (a) For the carriage of mixtures (see 2.2.2.1.1) in tanks (demountable tanks, fixed tanks, portable tanks, tank-containers or elements of battery-vehicles or of MEGCs), the composition of the mixture as a percentage of the volume or as a percentage of the mass shall be given. Constituents below 1% need not be indicated (see also 3.1.2.8.1.2). The composition of the mixture need not be given when the technical names authorized by special provisions 581, 582 or 583 are used to supplement the proper shipping name;
- (b) For the carriage of cylinders, tubes, pressure drums, cryogenic receptacles and bundles of cylinders under the conditions of 4.1.6.10, the following entry shall be included in the transport document: "**Carriage in accordance with 4.1.6.10**".

5.4.1.2.3 *Additional provisions for self-reactive substances of Class 4.1 and organic peroxides of Class 5.2*

- 5.4.1.2.3.1 For self-reactive substances of Class 4.1 and for organic peroxides of Class 5.2 that require temperature control during carriage (for self-reactive substances see 2.2.41.1.17; for organic peroxides, see 2.2.52.1.15 to 2.2.52.1.17), the control and emergency temperatures shall be indicated in the transport document, as follows:

"**Control temperature:** ... °C **Emergency temperature:** ... °C".

³ *Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).*

- 5.4.1.2.3.2 When for certain self-reactive substances of Class 4.1 and certain organic peroxides of Class 5.2 the competent authority has permitted the label conforming to model No.1 to be dispensed with for a specific packaging (see 5.2.2.1.9), a statement to this effect shall be included in the transport document, as follows:

"The label conforming to model No. 1 is not required".

- 5.4.1.2.3.3 When organic peroxides and self-reactive substances are carried under conditions where approval is required (for organic peroxides see 2.2.52.1.8, 4.1.7.2.2 and special provision TA2 of 6.8.4; for self-reactive substances see 2.2.41.1.13 and 4.1.7.2.2, a statement to this effect shall be included in the transport document, e.g. **"Carriage in accordance with 2.2.52.1.8"**.

A copy of the competent authority approval with the conditions of carriage shall be attached to the transport document. It shall be drafted in an official language of the forwarding country and also, if that language is not English, French or German, in English, French or German unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise.

- 5.4.1.2.3.4 When a sample of an organic peroxide (see 2.2.52.1.9) or a self-reactive substance (see 2.2.41.1.15) is carried, a statement to this effect shall be included in the transport document, e.g. **"Carriage in accordance with 2.2.52.1.9"**.

- 5.4.1.2.3.5 When self-reactive substances type G (see Manual of Tests and Criteria, Part II, paragraph 20.4.2 (g)) are carried, the following statement may be given in the transport document: **"Not a self-reactive substance of Class 4.1"**.

When organic peroxides type G (see Manual of Tests and Criteria, Part II, paragraph 20.4.3 (g)) are carried, the following statement may be given in the transport document: **"Not a substance of Class 5.2"**.

- 5.4.1.2.4 *Additional provisions for Class 6.2*

In addition to the information concerning the consignee (see 5.4.1.1.1 (h)), the name and telephone number of a responsible person shall be indicated.

- 5.4.1.2.5 *Additional provisions for Class 7*

- 5.4.1.2.5.1 The following information shall be inserted in the transport document for each consignment of Class 7 material, as applicable, in the order given and immediately after the information required under 5.4.1.1.1 (a) to (c) and (k):

- (a) The name or symbol of each radionuclide or, for mixtures of radionuclides, an appropriate general description or a list of the most restrictive nuclides;
- (b) A description of the physical and chemical form of the material, or a notation that the material is special form radioactive material or low dispersible radioactive material. A generic chemical description is acceptable for chemical form. For radioactive material with a subsidiary risk, see sub-paragraph (c) of special provision 172 of Chapter 3.3;
- (c) The maximum activity of the radioactive contents during carriage expressed in becquerels (Bq) with an appropriate SI prefix symbol (see 1.2.2.1). For fissile material, the mass of fissile material (or mass of each fissile nuclide for mixtures when appropriate) in grams (g), or appropriate multiples thereof, may be used in place of activity;
- (d) The category of the package, i.e. I-WHITE, II-YELLOW, III-YELLOW;
- (e) The transport index (categories II-YELLOW and III-YELLOW only);

- (f) For fissile material:
 - (i) Shipped under one exception of 2.2.7.2.3.5 (a) to (f), reference to that paragraph;
 - (ii) Shipped under 2.2.7.2.3.5 (c) to (e), the total mass of fissile nuclides;
 - (iii) Contained in a package for which one of 6.4.11.2 (a) to (c) or 6.4.11.3 is applied, reference to that paragraph;
 - (iv) The criticality safety index, where applicable;
- (g) The identification mark for each competent authority certificate of approval (special form radioactive material, low dispersible radioactive material, fissile material excepted under 2.2.7.2.3.5 (f), special arrangement, package design, or shipment) applicable to the consignment;
- (h) For consignments of more than one package, the information required in 5.4.1.1.1 and in (a) to (g) above shall be given for each package. For packages in an overpack, container, or vehicle, a detailed statement of the contents of each package within the overpack, container, or vehicle and, where appropriate, of each overpack, container, or vehicle shall be included. If packages are to be removed from the overpack, container, or vehicle at a point of intermediate unloading, appropriate transport documents shall be made available;
- (i) Where a consignment is required to be shipped under exclusive use, the statement "**EXCLUSIVE USE SHIPMENT**"; and
- (j) For LSA-II and LSA-III substances, SCO-I and SCO-II, the total activity of the consignment as a multiple of A_2 . For radioactive material for which the A_2 value is unlimited, the multiple of A_2 shall be zero.

5.4.1.2.5.2 The consignor shall provide in the transport documents a statement regarding actions, if any, that are required to be taken by the carrier. The statement shall be in the languages deemed necessary by the carrier or the authorities concerned, and shall include at least the following information:

- (a) Supplementary requirements for loading, stowage, carriage, handling and unloading of the package, overpack or container including any special stowage provisions for the safe dissipation of heat (see special provision CV33 (3.2) of 7.5.11), or a statement that no such requirements are necessary;
- (b) Restrictions on the mode of carriage or vehicle and any necessary routeing instructions;
- (c) Emergency arrangements appropriate to the consignment.

5.4.1.2.5.3 In all cases of international carriage of packages requiring competent authority approval of design or shipment, for which different approval types apply in the different countries concerned by the shipment, the UN number and proper shipping name required in 5.4.1.1.1 shall be in accordance with the certificate of the country of origin of design.

5.4.1.2.5.4 The applicable competent authority certificates need not necessarily accompany the consignment. The consignor shall make them available to the carrier(s) before loading and unloading.

5.4.1.3 *(Reserved)*

5.4.1.4 *Format and language*

5.4.1.4.1 The document containing the information in 5.4.1.1 and 5.4.1.2 may be that already required by other regulations in force for carriage by another mode of carriage. In case of multiple consignees, the name and address of the consignees and the quantities delivered enabling the nature and quantities carried to be evaluated at any time, may be entered in other documents which are to be used or in any other documents made mandatory according to other specific regulations and which shall be on board the vehicle.

The particulars to be entered in the document shall be drafted in an official language of the forwarding country, and also, if that language is not English, French, or German, in English, French or German, unless international road carriage tariffs, if any, or agreements concluded between the countries concerned in the transport operation, provide otherwise.

- 5.4.1.4.2 If by reason of the size of the load, a consignment cannot be loaded in its entirety on a single transport unit, at least as many separate documents, or copies of the single document, shall be made out as transport units loaded. Furthermore, in all cases, separate transport documents shall be made out for consignments or parts of consignments which may not be loaded together on the same vehicle by reason of the prohibitions set forth in 7.5.2.

The information relative to the hazards of the goods to be carried (as indicated in 5.4.1.1) may be incorporated in, or combined with, an existing transport or cargo handling document. The layout of the information in the document (or the order of transmission of the corresponding data by electronic data processing (EDP) or electronic data interchange (EDI) techniques) shall be as provided in 5.4.1.1.1.

When an existing transport document or cargo handling document cannot be used for the purposes of dangerous goods documentation for multimodal transport, the use of documents corresponding to the example shown in 5.4.5 is considered advisable⁴.

5.4.1.5 ***Non-dangerous goods***

When goods mentioned by name in Table A of Chapter 3.2, are not subject to ADR because they are considered as non-dangerous according to Part 2, the consignor may enter in the transport document a statement to that effect, e.g.: "**Not goods of Class ...**"

NOTE: *This provision may be used in particular when the consignor considers that, due to the chemical nature of the goods (e.g. solutions and mixtures) carried or to the fact that such goods are deemed dangerous for other regulatory purposes the consignment might be subject to control during the journey.*

⁴ If used, the relevant recommendations of the UNECE United Nations Centre for Trade Facilitation and Electronic Business (UN/CEFACT) may be consulted, in particular Recommendation No. 1 (United Nations Layout Key for Trade Documents) (ECE/TRADE/137, edition 81.3), UN Layout Key for Trade Documents - Guidelines for Applications (ECE/TRADE/270, edition 2002), Recommendation No. 11 (Documentary Aspects of the International Transport of Dangerous Goods) (ECE/TRADE/204, edition 96.1 – currently under revision) and Recommendation No. 22 (Layout Key for Standard Consignment Instructions) (ECE/TRADE/168, edition 1989). Refer also to the UN/CEFACT Summary of Trade Facilitation Recommendations (ECE/TRADE/346, edition 2006) and the United Nations Trade Data Elements Directory (UNTDDED) (ECE/TRADE/362, edition 2005).

5.4.2 Large container or vehicle packing certificate

If the carriage of dangerous goods in a large container precedes a voyage by sea, a container packing certificate conforming to section 5.4.2 of the IMDG Code⁵ shall be provided with the transport document⁶.

The functions of the transport document required under 5.4.1 and of the container packing certificate as provided above may be incorporated into a single document; if not, these documents shall be attached one to the other. If these functions are incorporated into a single document, the inclusion in the transport document of a statement that the loading of the container has been carried out in accordance with the applicable modal regulations together with the identification of the person responsible for the container packing certificate shall be sufficient.

NOTE: The container packing certificate is not required for portable tanks, tank-containers and MEGCs.

⁵ Guidelines for use in practice and in training for loading goods in transport units have also been drawn up by the International Maritime Organization (IMO), the International Labour Organization (ILO) and the United Nations Economic Commission for Europe (UNECE) and have been published by IMO ("IMO/ILO/UNECE Guidelines for Packing of Cargo Transport Units (CTUs)").

⁶ Section 5.4.2 of the IMDG Code requires the following:

"5.4.2 Container/vehicle packing certificate

5.4.2.1 When dangerous goods are packed or loaded into any container or vehicle, those responsible for packing the container or vehicle shall provide a "container/vehicle packing certificate" specifying the container/vehicle identification number(s) and certifying that the operation has been carried out in accordance with the following conditions:

- .1 The container/vehicle was clean, dry and apparently fit to receive the goods;
- .2 Packages, which need to be segregated in accordance with applicable segregation requirements, have not been packed together onto or in the container/vehicle [unless approved by the competent authority concerned in accordance with 7.2.2.3 (of the IMDG Code)];
- .3 All packages have been externally inspected for damage, and only sound packages have been loaded;
- .4 Drums have been stowed in an upright position, unless otherwise authorized by the competent authority, and all goods have been properly loaded, and, where necessary, adequately braced with securing material to suit the mode(s) of transport for the intended journey;
- .5 Goods loaded in bulk have been evenly distributed within the container/vehicle;
- .6 For consignments including goods of class 1, other than division 1.4, the container/vehicle is structurally serviceable in conformity with 7.4.6 (of the IMDG Code);
- .7 The container/vehicle and packages are properly marked, labelled, and placarded, as appropriate;
- .8 When substances presenting a risk of asphyxiation are used for cooling or conditioning purposes (such as dry ice (UN 1845) or nitrogen, refrigerated liquid (UN 1977) or argon, refrigerated liquid (UN 1951)), the container/vehicle is externally marked in accordance with 5.5.3.6 (of the IMDG Code); and
- .9 A dangerous goods transport document, as indicated in 5.4.1 (of the IMDG Code) has been received for each dangerous goods consignment loaded in the container/vehicle.

NOTE: The container/vehicle packing certificate is not required for tanks

5.4.2.2 The information required in the dangerous goods transport document and the container/vehicle packing certificate may be incorporated into a single document; if not, these documents shall be attached one to the other. If the information is incorporated into a single document, the document shall include a signed declaration such as "It is declared that the packing of the goods into the container/vehicle has been carried out in accordance with the applicable provisions". This declaration shall be dated and the person signing this declaration shall be identified on the document. Facsimile signatures are acceptable where applicable laws and regulations recognize the legal validity of facsimile signatures.

5.4.2.3 If the container/vehicle packing certificate is presented to the carrier by means of EDP or EDI transmission techniques, the signature(s) may be electronic signature(s) or may be replaced by the name(s) (in capitals) of the person authorized to sign.

5.4.2.4 When the container/vehicle packing certificate is given to a carrier by EDP or EDI techniques and subsequently the dangerous goods are transferred to a carrier that requires a paper dangerous goods transport document, the carrier shall ensure that the paper document indicates "Original received electronically" and the name of the signatory shall be shown in capital letters.

5.4.3 Instructions in writing

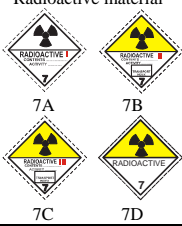

- 5.4.3.1 As an aid during an accident emergency situation that may occur or arise during carriage, instructions in writing in the form specified in 5.4.3.4 shall be carried in the vehicle crew's cab and shall be readily available.
- 5.4.3.2 These instructions shall be provided by the carrier to the vehicle crew in language(s) that each member can read and understand before the commencement of the journey. The carrier shall ensure that each member of the vehicle crew concerned understands and is capable of carrying out the instructions properly.
- 5.4.3.3 Before the start of the journey, the members of the vehicle crew shall inform themselves of the dangerous goods loaded and consult the instructions in writing for details on actions to be taken in the event of an accident or emergency.
- 5.4.3.4 The instructions in writing shall correspond to the following four page model as regards its form and contents.

INSTRUCTIONS IN WRITING ACCORDING TO ADRActions in the event of an accident or emergency

In the event of an accident or emergency that may occur or arise during carriage, the members of the vehicle crew shall take the following actions where safe and practicable to do so:

- Apply the braking system, stop the engine and isolate the battery by activating the master switch where available;
- Avoid sources of ignition, in particular, do not smoke, use electronic cigarettes or similar devices or switch on any electrical equipment;
- Inform the appropriate emergency services, giving as much information about the incident or accident and substances involved as possible;
- Put on the warning vest and place the self-standing warning signs as appropriate;
- Keep the transport documents readily available for responders on arrival;
- Do not walk into or touch spilled substances and avoid inhalation of fumes, smoke, dusts and vapours by staying up wind;
- Where appropriate and safe to do so, use the fire extinguishers to put out small/initial fires in tyres, brakes and engine compartments;
- Fires in load compartments shall not be tackled by members of the vehicle crew;
- Where appropriate and safe to do so, use on-board equipment to prevent leakages into the aquatic environment or the sewage system and to contain spillages;
- Move away from the vicinity of the accident or emergency, advise other persons to move away and follow the advice of the emergency services;
- Remove any contaminated clothing and used contaminated protective equipment and dispose of it safely.

Additional guidance to members of the vehicle crew on the hazard characteristics of dangerous goods by class and on actions subject to prevailing circumstances		
Danger labels and placards	Hazard characteristics	Additional guidance
(1)	(2)	(3)
Explosive substances and articles  1 1.5 1.6	May have a range of properties and effects such as mass detonation; projection of fragments; intense fire/heat flux; formation of bright light, loud noise or smoke. Sensitive to shocks and/or impacts and/or heat.	Take cover but stay away from windows.
Explosive substances and articles  1.4	Slight risk of explosion and fire.	Take cover.
Flammable gases  2.1	Risk of fire. Risk of explosion. May be under pressure. Risk of asphyxiation. May cause burns and/or frostbite. Containments may explode when heated.	Take cover. Keep out of low areas.
Non-flammable, non-toxic gases  2.2	Risk of asphyxiation. May be under pressure. May cause frostbite. Containments may explode when heated.	Take cover. Keep out of low areas.
Toxic gases  2.3	Risk of intoxication. May be under pressure. May cause burns and/or frostbite. Containments may explode when heated.	Use emergency escape mask. Take cover. Keep out of low areas.
Flammable liquids  3	Risk of fire. Risk of explosion. Containments may explode when heated.	Take cover. Keep out of low areas.
Flammable solids, self-reactive substances and solid desensitized explosives  4.1	Risk of fire. Flammable or combustible, may be ignited by heat, sparks or flames. May contain self-reactive substances that are liable to exothermic decomposition in the case of heat supply, contact with other substances (such as acids, heavy-metal compounds or amines), friction or shock. This may result in the evolution of harmful and flammable gases or vapours or self-ignition. Containments may explode when heated. Risk of explosion of desensitized explosives after loss of desensitizer.	
Substances liable to spontaneous combustion  4.2	Risk of fire by spontaneous combustion if packages are damaged or contents are spilled. May react vigorously with water	
Substances which, in contact with water, emit flammable gases  4.3	Risk of fire and explosion in contact with water.	Spilled substances should be kept dry by covering the spillages.

Danger labels and placards (1)	Hazard characteristics (2)	Additional guidance (3)
<p>Oxidizing substances</p>  <p>5.1</p>	<p>Risk of vigorous reaction, ignition and explosion in contact with combustible or flammable substances.</p>	<p>Avoid mixing with flammable or combustible substances (e.g. sawdust).</p>
<p>Organic peroxides</p>  <p>5.2</p>	<p>Risk of exothermic decomposition at elevated temperatures, contact with other substances (such as acids, heavy-metal compounds or amines), friction or shock. This may result in the evolution of harmful and flammable gases or vapours or self-ignition.</p>	<p>Avoid mixing with flammable or combustible substances (e.g. sawdust).</p>
<p>Toxic substances</p>  <p>6.1</p>	<p>Risk of intoxication by inhalation, skin contact or ingestion. Risk to the aquatic environment or the sewerage system.</p>	<p>Use emergency escape mask.</p>
<p>Infectious substances</p>  <p>6.2</p>	<p>Risk of infection. May cause serious disease in humans or animals. Risk to the aquatic environment or the sewerage system.</p>	
<p>Radioactive material</p>  <p>7A 7B 7C 7D</p>	<p>Risk of intake and external radiation.</p>	<p>Limit time of exposure.</p>
<p>Fissile material</p>  <p>7E</p>	<p>Risk of nuclear chain reaction.</p>	
<p>Corrosive substances</p>  <p>8</p>	<p>Risk of burns by corrosion. May react vigorously with each other, with water and with other substances. Spilled substance may evolve corrosive vapours. Risk to the aquatic environment or the sewerage system.</p>	
<p>Miscellaneous dangerous substances and articles</p>  <p>9</p>	<p>Risk of burns. Risk of fire. Risk of explosion. Risk to the aquatic environment or the sewerage system.</p>	

NOTE 1: For dangerous goods with multiple risks and for mixed loads, each applicable entry shall be observed.

NOTE 2: Additional guidance shown above may be adapted to reflect the classes of dangerous goods to be carried and their means of transport.

Additional guidance to members of the vehicle crew on the hazard characteristics of dangerous goods, indicated by marks, and on actions subject to prevailing circumstances		
Mark (1)	Hazard characteristics (2)	Additional guidance (3)
 Environmentally hazardous substances	Risk to the aquatic environment or the sewerage system	
 Elevated temperature substances	Risk of burns by heat.	Avoid contact with hot parts of the transport unit and the spilled substance.

**Equipment for personal and general protection
to carry out general actions and hazard specific emergency actions
to be carried on board the vehicle in accordance with section 8.1.5 of ADR**

The following equipment shall be carried on board the transport unit:

- for each vehicle, a wheel chock of a size suited to the maximum mass of the vehicle and to the diameter of the wheel;
- two self-standing warning signs;
- eye rinsing liquid^a; and

for each member of the vehicle crew

- a warning vest;
- portable lighting apparatus;
- a pair of protective gloves; and
- eye protection.

Additional equipment required for certain classes:

- an emergency escape mask for each member of the vehicle crew shall be carried on board the vehicle for danger label numbers 2.3 or 6.1;
- a shovel^b;
- a drain seal^b;
- a collecting container^b.

^a Not required for danger label numbers 1, 1.4, 1.5, 1.6, 2.1, 2.2 and 2.3.

^b Only required for solids and liquids with danger label numbers 3, 4.1, 4.3, 8 or 9.

5.4.4 Retention of dangerous goods transport information

5.4.4.1 The consignor and the carrier shall retain a copy of the dangerous goods transport document and additional information and documentation as specified in ADR, for a minimum period of three months.

5.4.4.2 When the documents are kept electronically or in a computer system, the consignor and the carrier shall be able to reproduce them in a printed form.

5.4.5 Example of a multimodal dangerous goods form

Example of a form which may be used as a combined dangerous goods declaration and container packing certificate for multimodal carriage of dangerous goods.

MULTIMODAL DANGEROUS GOODS FORM

1. Shipper / Consignor / Sender		2. Transport document number				
		3. Page 1 of Pages		4. Shipper's reference		
		5. Freight Forwarder's reference				
6. Consignee		7. Carrier (to be completed by the carrier)				
		SHIPPER'S DECLARATION I hereby declare that the contents of this consignment are fully and accurately described below by the proper shipping name, and are classified, packaged, marked and labeled /placarded and are in all respects in proper condition for transport according to the applicable international and national governmental regulations.				
8. This shipment is within the limitations prescribed for: (Delete non-applicable) <div style="display: flex; justify-content: space-around;"> PASSENGER AND CARGO AIRCRAFT CARGO AIRCRAFT ONLY </div>		9. Additional handling information				
10. Vessel / flight no. and date	11. Port / place of loading					
12. Port / place of discharge	13. Destination					
14. Shipping marks		* Number and kind of packages; description of goods Gross mass (kg) Net mass Cube (m³)				
15. Container identification No./ vehicle registration No.		16. Seal number (s)	17. Container/vehicle size & type	18. Tare (kg)	19. Total gross mass (including tare) (kg)	
CONTAINER/VEHICLE PACKING CERTIFICATE I hereby declare that the goods described above have been packed/loaded into the container/vehicle identified above in accordance with the applicable provisions ** MUST BE COMPLETED AND SIGNED FOR ALL CONTAINER/VEHICLE LOADS BY PERSON RESPONSIBLE FOR PACKING/LOADING		21. RECEIVING ORGANISATION RECEIPT Received the above number of packages/containers/trailers in apparent good order and condition unless stated hereon: RECEIVING ORGANISATION REMARKS:				
20. Name of company		Haulier's name		22. Name of company (OF SHIPPER PREPARING THIS NOTE)		
Name / Status of declarant		Vehicle reg. no.		Name / Status of declarant		
Place and date		Signature and date		Place and date		
Signature of declarant		DRIVER'S SIGNATURE		Signature of declarant		

FOR DANGEROUS GOODS: you must specify: UN no., proper shipping name, hazard class, packing group (where assigned) and any other element of information required under applicable national and international regulations

[illegible]

** See 5.4.2.

CHAPTER 5.5

SPECIAL PROVISIONS

5.5.1 *(Deleted)*

5.5.2 **Special provisions applicable to fumigated cargo transport units (UN 3359)**

5.5.2.1 **General**

5.5.2.1.1 Fumigated cargo transport units (UN 3359) containing no other dangerous goods are not subject to any provisions of ADR other than those of this section.

NOTE: For the purposes of this Chapter, cargo transport unit means a vehicle, a container, a tank-container, a portable tank or a MEGC.

5.5.2.1.2 When the fumigated cargo transport unit is loaded with dangerous goods in addition to the fumigant, any provision of ADR relevant to these goods (including placarding, marking and documentation) applies in addition to the provisions of this section.

5.5.2.1.3 Only cargo transport units that can be closed in such a way that the escape of gas is reduced to a minimum shall be used for the carriage of cargo under fumigation.

5.5.2.2 **Training**

Persons engaged in the handling of fumigated cargo transport units shall be trained commensurate with their responsibilities.

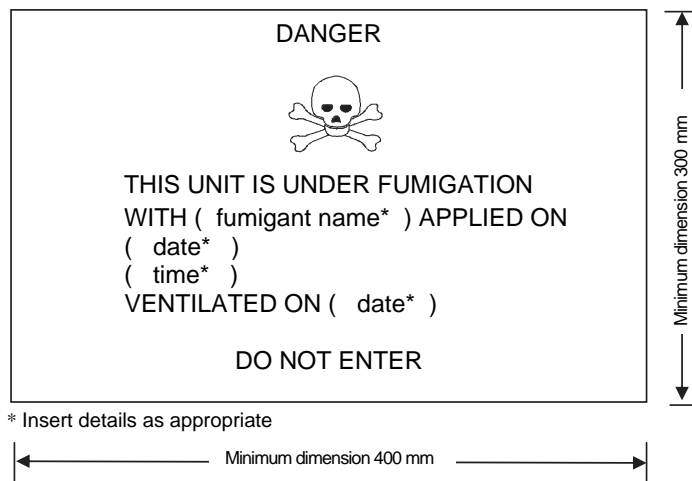

5.5.2.3 **Marking and placarding**

5.5.2.3.1 A fumigated cargo transport unit shall be marked with a warning mark, as specified in 5.5.2.3.2, affixed at each access point in a location where it will be easily seen by persons opening or entering the cargo transport unit. This mark shall remain on the cargo transport unit until the following provisions are met:

- (a) The fumigated cargo transport unit has been ventilated to remove harmful concentrations of fumigant gas; and
- (b) The fumigated goods or materials have been unloaded.

5.5.2.3.2 The fumigation warning mark shall be as shown in Figure 5.5.2.3.2.

Figure 5.5.2.3.2

Fumigation warning mark

The marking shall be a rectangle. The minimum dimensions shall be 400 mm wide x 300 mm high and the minimum width of the outer line shall be 2 mm. The marking shall be in black print on a white background with lettering not less than 25 mm high. Where dimensions are not specified, all features shall be in approximate proportion to those shown.

5.5.2.3.3 If the fumigated cargo transport unit has been completely ventilated either by opening the doors of the unit or by mechanical ventilation after fumigation, the date of ventilation shall be marked on the fumigation warning mark.

5.5.2.3.4 When the fumigated cargo transport unit has been ventilated and unloaded, the fumigation warning mark shall be removed.

5.5.2.3.5 Placards conforming to model No. 9 (see 5.2.2.2.2) shall not be affixed to a fumigated cargo transport unit except as required for other Class 9 substances or articles packed therein.

5.5.2.4 *Documentation*

5.5.2.4.1 Documents associated with the carriage of cargo transport units that have been fumigated and have not been completely ventilated before carriage shall include the following information:

- "UN 3359, fumigated cargo transport unit, 9", or "UN 3359, fumigated cargo transport unit, Class 9";
- The date and time of fumigation; and
- The type and amount of the fumigant used.

These particulars shall be drafted in an official language of the forwarding country and also, if the language is not English, French or German, in English, French or German, unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise.

5.5.2.4.2 The documents may be in any form, provided they contain the information required in 5.5.2.4.1. This information shall be easy to identify, legible and durable.

5.5.2.4.3 Instructions for disposal of any residual fumigant including fumigation devices (if used) shall be provided.

5.5.2.4.4 A document is not required when the fumigated cargo transport unit has been completely ventilated and the date of ventilation has been marked on the warning mark (see 5.5.2.3.3 and 5.5.2.3.4).

5.5.3 Special provisions applicable to packages and vehicles and containers containing substances presenting a risk of asphyxiation when used for cooling or conditioning purposes (such as dry ice (UN 1845) or nitrogen, refrigerated liquid (UN 1977) or argon, refrigerated liquid (UN 1951))

5.5.3.1 Scope

5.5.3.1.1 This section is not applicable to substances which may be used for cooling or conditioning purposes when carried as a consignment of dangerous goods. When they are carried as a consignment, these substances shall be carried under the relevant entry of Table A in Chapter 3.2 in accordance with the associated conditions of carriage.

5.5.3.1.2 This section is not applicable to gases in cooling cycles.

5.5.3.1.3 Dangerous goods used for cooling or conditioning tanks or MEGCs during carriage are not subject to this section.

5.5.3.1.4 Vehicles and containers containing substances used for cooling or conditioning purposes include vehicles and containers containing substances used for cooling or conditioning purposes inside packages as well as vehicles and containers with unpackaged substances used for cooling or conditioning purposes.

5.5.3.1.5 Sub-sections 5.5.3.6 and 5.5.3.7 only apply when there is an actual risk of asphyxiation in the vehicle or container. It is for the participants concerned to assess this risk, taking into consideration the hazards presented by the substances being used for cooling or conditioning, the amount of substance to be carried, the duration of the journey and the types of containment to be used.

5.5.3.2 General

5.5.3.2.1 Vehicles and containers containing substances used for cooling or conditioning purposes (other than fumigation) during carriage are not subject to any provisions of ADR other than those of this section.

5.5.3.2.2 When dangerous goods are loaded in vehicles or containers containing substances used for cooling or conditioning purposes any provisions of ADR relevant to these dangerous goods apply in addition to the provisions of this section.

5.5.3.2.3 *(Reserved)*

5.5.3.2.4 Persons engaged in the handling or carriage of vehicles and containers containing substances used for cooling or conditioning purposes shall be trained commensurate with their responsibilities.

5.5.3.3 Packages containing a coolant or conditioner

5.5.3.3.1 Packaged dangerous goods requiring cooling or conditioning assigned to packing instructions P203, P620, P650, P800, P901 or P904 of 4.1.4.1 shall meet the appropriate requirements of that packing instruction.

5.5.3.3.2 For packaged dangerous goods requiring cooling or conditioning assigned to other packing instructions, the packages shall be capable of withstanding very low temperatures and shall not be affected or significantly weakened by the coolant or conditioner. Packages shall be designed and constructed to permit the release of gas to prevent a build-up of pressure that could rupture the packaging. The dangerous goods shall be packed in such a way as to prevent movement after the dissipation of any coolant or conditioner.

5.5.3.3.3 Packages containing a coolant or conditioner shall be carried in well ventilated vehicles and containers. This provision does not apply when such packages are carried in insulated, refrigerated or mechanically refrigerated equipment, as defined in the Agreement on the International Carriage of Perishable Foodstuffs and on the Special Equipment to be Used for such Carriage (ATP).

5.5.3.4 *Marking of packages containing a coolant or conditioner*

5.5.3.4.1 Packages containing dangerous goods used for cooling or conditioning shall be marked with the name indicated in Column (2) of Table A of Chapter 3.2 of these dangerous goods followed by the words "AS COOLANT" or "AS CONDITIONER" as appropriate in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German, unless agreements concluded between the countries concerned in the transport operation provide otherwise.

5.5.3.4.2 The markings shall be durable, legible and placed in such a location and of such a size relative to the package as to be readily visible.

5.5.3.5 *Vehicles and containers containing unpackaged dry ice*

5.5.3.5.1 If dry ice in unpackaged form is used, it shall not come into direct contact with the metal structure of a vehicle or container to avoid embrittlement of the metal. Measures shall be taken to provide adequate insulation between the dry ice and the vehicle or container by providing a minimum of 30 mm separation (e.g. by using suitable low heat conducting materials such as timber planks, pallets etc).

5.5.3.5.2 Where dry ice is placed around packages, measures shall be taken to ensure that packages remain in the original position during carriage after the dry ice has dissipated.

5.5.3.6 *Marking of vehicles and containers*

5.5.3.6.1 Vehicles and containers containing dangerous goods used for cooling or conditioning purposes shall be marked with a warning mark, as specified in 5.5.3.6.2 affixed at each access point in a location where it will be easily seen by persons opening or entering the vehicle or container. This mark shall remain on the vehicle or container until the following provisions are met:

- (a) The vehicle or container has been ventilated to remove harmful concentrations of coolant or conditioner; and
- (b) The cooled or conditioned goods have been unloaded.

5.5.3.6.2 The warning mark shall be as shown in Figure 5.5.3.6.2.

Figure 5.5.3.6.2

Coolant/conditioning warning mark for vehicles and containers

* Insert the name indicated in Column (2) of Table A of Chapter 3.2 of the coolant/conditioner. The lettering shall be in capitals, all be on one line and shall be at least 25 mm high. If the length of the proper shipping name is too long to fit in the space provided, the lettering may be reduced to the maximum size possible to fit. For example: "CARBON DIOXIDE, SOLID".

** Insert "AS COOLANT" or "AS CONDITIONER" as appropriate. The lettering shall be in capitals, all be on one line and be at least 25 mm high. The marking shall be a rectangle. The minimum dimensions shall be 150 mm wide x 250 mm high. The word "WARNING" shall be in red or white and be at least 25 mm high. Where dimensions are not specified, all features shall be in approximate proportion to those shown.

The word "WARNING" and the words "AS COOLANT" or "AS CONDITIONER", as appropriate, shall be in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German, unless agreements concluded between the countries concerned in the transport operation provide otherwise.

5.5.3.7 ***Documentation***

5.5.3.7.1 Documents (such as a bill of lading, cargo manifest or CMR/CIM consignment note) associated with the carriage of vehicles or containers containing or having contained substances used for cooling or conditioning purposes and have not been completely ventilated before carriage shall include the following information:

- (a) The UN number preceded by the letters "UN"; and
- (b) The name indicated in Column (2) of Table A of Chapter 3.2 followed by the words "AS COOLANT" or "AS CONDITIONER" as appropriate in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German, unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise.

For example: UN 1845, CARBON DIOXIDE, SOLID, AS COOLANT.

5.5.3.7.2 The transport document may be in any form, provided it contains the information required in 5.5.3.7.1. This information shall be easy to identify, legible and durable.

PART 6

**Requirements for the construction
and testing of packagings,
intermediate bulk containers (IBCs),
large packagings, tanks and bulk containers**

CHAPTER 6.1

REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF PACKAGINGS

6.1.1 General

6.1.1.1 The requirements of this Chapter do not apply to:

- (a) Packages containing radioactive material of Class 7, unless otherwise provided (see 4.1.9);
- (b) Packages containing infectious substances of Class 6.2, unless otherwise provided (see Chapter 6.3, Note and packing instruction P621 of 4.1.4.1);
- (c) Pressure receptacles containing gases of Class 2;
- (d) Packages whose net mass exceeds 400 kg;
- (e) Packagings for liquids, other than combination packagings, with a capacity exceeding 450 litres.

6.1.1.2 The requirements for packagings in 6.1.4 are based on packagings currently used. In order to take into account progress in science and technology, there is no objection to the use of packagings having specifications different from those in 6.1.4, provided that they are equally effective, acceptable to the competent authority and able successfully to withstand the tests described in 6.1.1.3 and 6.1.5. Methods of testing other than those described in this Chapter are acceptable, provided they are equivalent, and are recognized by the competent authority.

6.1.1.3 Every packaging intended to contain liquids shall successfully undergo a suitable leakproofness test, and be capable of meeting the appropriate test level indicated in 6.1.5.4.3:

- (a) Before it is first used for carriage;
- (b) After remanufacturing or reconditioning, before it is re-used for carriage;

For this test, packagings need not have their own closures fitted.

The inner receptacle of composite packagings may be tested without the outer packaging provided the test results are not affected.

This test is not necessary for:

- Inner packagings of combination packagings;
- Inner receptacles of composite packagings (glass, porcelain or stoneware), marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii);
- Light gauge metal packagings, marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii).

6.1.1.4 Packagings shall be manufactured, reconditioned and tested under a quality assurance programme which satisfies the competent authority in order to ensure that each packaging meets the requirements of this Chapter.

NOTE: ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.

6.1.1.5 Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

6.1.2 Code for designating types of packagings

6.1.2.1 The code consists of:

- (a) An Arabic numeral indicating the kind of packaging, e.g. drum, jerrican, etc., followed by;
- (b) A capital letter(s) in Latin characters indicating the nature of the material, e.g. steel, wood, etc., followed where necessary by;
- (c) An Arabic numeral indicating the category of packaging within the kind to which the packaging belongs.

6.1.2.2 In the case of composite packagings, two capital letters in Latin characters are used in sequence in the second position of the code. The first indicates the material of the inner receptacle and the second that of the outer packaging.

6.1.2.3 In the case of combination packagings only the code number for the outer packaging is used.

6.1.2.4 The letters "T", "V" or "W" may follow the packaging code. The letter "T" signifies a salvage packaging conforming to the requirements of 6.1.5.1.11. The letter "V" signifies a special packaging conforming to the requirements of 6.1.5.1.7. The letter "W" signifies that the packaging, although of the same type indicated by the code, is manufactured to a specification different to that in 6.1.4 and is considered equivalent under the requirements of 6.1.1.2.

6.1.2.5 The following numerals shall be used for the kinds of packaging:

- 1. Drum
- 2. (Reserved)
- 3. Jerrican
- 4. Box
- 5. Bag
- 6. Composite packaging
- 7. (Reserved)
- 0. Light gauge metal packagings

6.1.2.6 The following capital letters shall be used for the types of material:

- A. Steel (all types and surface treatments)
- B. Aluminium
- C. Natural wood
- D. Plywood
- F. Reconstituted wood
- G. Fibreboard
- H. Plastics material
- L. Textile
- M. Paper, multiwall
- N. Metal (other than steel or aluminium)
- P. Glass, porcelain or stoneware

NOTE: Plastics material is taken to include other polymeric materials such as rubber.

6.1.2.7 The following table indicates the codes to be used for designating types of packagings depending on the kind of packagings, the material used for their construction and their category; it also refers to the sub-sections to be consulted for the appropriate requirements:

Kind	Material	Category	Code	Sub-section
1. Drums	A. Steel	non-removable head	1A1	6.1.4.1
		removable head	1A2	
	B. Aluminium	non-removable head	1B1	6.1.4.2
		removable head	1B2	
	D. Plywood		1D	6.1.4.5
	G. Fibre		1G	6.1.4.7
	H. Plastics	non-removable head	1H1	6.1.4.8
		removable head	1H2	
	N. Metal, other than steel or aluminium	non-removable head	1N1	6.1.4.3
		removable head	1N2	
2. (Reserved)				
3. Jerricans	A. Steel	non-removable head	3A1	6.1.4.4
		removable head	3A2	
	B. Aluminium	non-removable head	3B1	6.1.4.4
		removable head	3B2	
	H. Plastics	non-removable head	3H1	6.1.4.8
		removable head	3H2	
4. Boxes	A. Steel		4A	6.1.4.14
	B. Aluminium		4B	6.1.4.14
	C. Natural wood	ordinary	4C1	6.1.4.9
		with sift-proof walls	4C2	
	D. Plywood		4D	6.1.4.10
	F. Reconstituted wood		4F	6.1.4.11
	G. Fibreboard		4G	6.1.4.12
	H. Plastics	expanded	4H1	6.1.4.13
		solid	4H2	
	N. Metal, other than steel or aluminium		4N	6.1.4.14
5. Bags	H. Woven plastics	without inner liner or coating	5H1	6.1.4.16
		sift-proof	5H2	
		water resistant	5H3	
	H. Plastics film		5H4	6.1.4.17
	L. Textile	without inner liner or coating	5L1	6.1.4.15
		sift-proof	5L2	
		water resistant	5L3	
	M. Paper	multiwall	5M1	6.1.4.18
		multiwall, water resistant	5M2	

Kind	Material	Category	Code	Sub-section
6. Composite packagings	H. Plastics receptacle	with outer steel drum	6HA1	6.1.4.19
		with outer steel crate or box	6HA2	
		with outer aluminium drum	6HB1	
		with outer aluminium crate or box	6HB2	
		with outer wooden box	6HC	
		with outer plywood drum	6HD1	
		with outer plywood box	6HD2	
		with outer fibre drum	6HG1	
		with outer fibreboard box	6HG2	
		with outer plastics drum	6HH1	
		with outer solid plastics box	6HH2	
		P. Glass, porcelain or stoneware receptacle	with outer steel drum	
	with outer steel crate or box		6PA2	
	with outer aluminium drum		6PB1	
	with outer aluminium crate or box		6PB2	
	with outer wooden box		6PC	
	with outer plywood drum		6PD1	
	with outer wickerwork hamper		6PD2	
	with outer fibre drum		6PG1	
	with outer fibreboard box		6PG2	
	with outer expanded plastics packaging		6PH1	
	with outer solid plastics packaging	6PH2		
7. (Reserved)				
0. Light gauge metal packagings	A. Steel	non-removable head	0A1	6.1.4.22
		removable head	0A2	

6.1.3

Marking

NOTE 1: The marking indicates that the packaging which bears it corresponds to a successfully tested design type and that it complies with the requirements of this Chapter which are related to the manufacture, but not to the use, of the packaging. In itself, therefore, the mark does not necessarily confirm that the packaging may be used for any substance: generally the type of packaging (e.g. steel drum), its maximum capacity and/or mass, and any special requirements are specified for each substance in Table A of Chapter 3.2.

NOTE 2: The marking is intended to be of assistance to packaging manufacturers, reconditioners, packaging users, carriers and regulatory authorities. In relation to the use of a new packaging, the original marking is a means for its manufacturer(s) to identify the type and to indicate those performance test regulations that have been met.

NOTE 3: The marking does not always provide full details of the test levels, etc., and these may need to be taken further into account, e.g. by reference to a test certificate, to test reports or to a register of successfully tested packagings. For example, a packaging having an X or Y marking may be used for substances to which a packing group having a lesser degree of danger has been assigned with the relevant maximum permissible value of the relative density¹ determined by taking into account the factor 1.5 or 2.25 indicated in the packaging test requirements in 6.1.5 as appropriate, i.e. packing group I packaging tested for products of relative density 1.2 could be used as a packing group II packaging for products of relative density 1.8 or a packing group III packaging for products of relative density 2.7, provided of course that all the performance criteria can still be met with the higher relative density product.

- 6.1.3.1 Each packaging intended for use according to the ADR shall bear markings which are durable, legible and placed in a location and of such a size relative to the packaging as to be readily visible. For packages with a gross mass of more than 30 kg, the markings or a duplicate thereof shall appear on the top or on a side of the packaging. Letters, numerals and symbols shall be at least 12 mm high, except for packagings of 30 litres or 30 kg capacity or less, when they shall be at least 6 mm in height and for packagings of 5 litres or 5 kg or less when they shall be of an appropriate size.

The marking shall show:

- (a) (i) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7². This symbol shall not be used for packagings which comply with the simplified conditions of 6.1.1.3, 6.1.5.3.1 (e), 6.1.5.3.5 (c), 6.1.5.4, 6.1.5.5.1 and 6.1.5.6 (see also (ii) below). For embossed metal packagings, the capital letters "UN" may be applied instead of the symbol; or

- (ii) The symbol "RID/ADR" for composite packagings (glass, porcelain or stoneware) and light gauge metal packagings conforming to simplified conditions (see 6.1.1.3, 6.1.5.3.1 (e), 6.1.5.3.5 (c), 6.1.5.4, 6.1.5.5.1 and 6.1.5.6);

NOTE: Packagings bearing this symbol are approved for rail, road and inland waterways transport operations which are subject to the provisions of RID, ADR and ADN respectively. They are not necessarily accepted for carriage by other modes of transport or for transport operations by road, rail or inland waterways which are governed by other regulations.

- (b) The code designating the type of packaging according to 6.1.2;

- (c) A code in two parts:

- (i) a letter designating the packing group(s) for which the design type has been successfully tested:

X for packing groups I, II and III;
Y for packing groups II and III;
Z for packing group III only;

- (ii) the relative density, rounded off to the first decimal, for which the design type has been tested for packagings without inner packagings intended to contain liquids; this may be omitted when the relative density does not exceed 1.2. For packagings intended to contain solids or inner packagings, the maximum gross mass in kilograms.

¹ Relative density (*d*) is considered to be synonymous with Specific Gravity (*SG*) and is used throughout this text.

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

For light-gauge metal packagings, marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii) intended to contain liquids having a viscosity at 23 °C exceeding 200 mm²/s, the maximum gross mass in kg;

- (d) Either the letter "S" denoting that the packaging is intended for the carriage of solids or inner packagings or, for packagings (other than combination packagings) intended to contain liquids, the hydraulic test pressure which the packaging was shown to withstand in kPa rounded down to the nearest 10 kPa.

For light-gauge metal packagings, marked with the symbol "RID/ADR, according to 6.1.3.1(a) (ii) intended to contain liquids having a viscosity at 23 °C exceeding 200 mm²/s, the letter "S";

- (e) The last two digits of the year during which the packaging was manufactured. Packagings of types 1H and 3H shall also be appropriately marked with the month of manufacture; this may be marked on the packaging in a different place from the remainder of the marking. An appropriate method is:

- * The last two digits of the year of manufacture may be displayed at that place. In such a case, the two digits of the year in the type approval marking and in the inner circle of the clock shall be identical.

NOTE: Other methods that provide the minimum required information in a durable, visible and legible form are also acceptable.

- (f) The State authorizing the allocation of the mark, indicated by the distinguishing sign for motor vehicles in international traffic³;
- (g) The name of the manufacturer or other identification of the packaging specified by the competent authority.

6.1.3.2 In addition to the durable markings prescribed in 6.1.3.1, every new metal drum of a capacity greater than 100 litres shall bear the marks described in 6.1.3.1 (a) to (e) on the bottom, with an indication of the nominal thickness of at least the metal used in the body (in mm, to 0.1 mm), in permanent form (e.g. embossed). When the nominal thickness of either head of a metal drum is thinner than that of the body, the nominal thickness of the top head, body, and bottom head shall be marked on the bottom in permanent form (e.g. embossed), for example "1.0-1.2-1.0" or "0.9-1.0-1.0". Nominal thickness of metal shall be determined according to the appropriate ISO standard, for example ISO 3574:1999 for steel. The marks indicated in 6.1.3.1 (f) and (g) shall not be applied in a permanent form except as provided in 6.1.3.5.

6.1.3.3 Every packaging other than those referred to in 6.1.3.2 liable to undergo a reconditioning process shall bear the marks indicated in 6.1.3.1 (a) to (e) in a permanent form. Marks are permanent if they are able to withstand the reconditioning process (e.g. embossed). For packagings other than metal drums of a capacity greater than 100 litres, these permanent marks may replace the corresponding durable markings prescribed in 6.1.3.1.

³ Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

- 6.1.3.4 For remanufactured metal drums, if there is no change to the packaging type and no replacement or removal of integral structural components, the required markings need not be permanent. Every other remanufactured metal drum shall bear the markings in 6.1.3.1 (a) to (e) in a permanent form (e.g. embossed) on the top head or side.
- 6.1.3.5 Metal drums made from materials (e.g. stainless steel) designed to be reused repeatedly may bear the markings indicated in 6.1.3.1 (f) and (g) in a permanent form (e.g. embossed).
- 6.1.3.6 The marking in accordance with 6.1.3.1 is valid for only one design type or series of design types. Different surface treatments may fall within the same design type.
- A "series of design types" means packagings of the same structural design, wall thickness, material and cross-section, which differ only in their lesser design heights from the design type approved.
- The closures of receptacles shall be identifiable as those referred to in the test report.
- 6.1.3.7 Marking shall be applied in the sequence of the sub-paragraphs in 6.1.3.1; each element of the marking required in these sub-paragraphs and when appropriate sub-paragraphs (h) to (j) of 6.1.3.8 shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable. For examples, see 6.1.3.11.
- Any additional markings authorized by a competent authority shall still enable the parts of the mark to be correctly identified with reference to 6.1.3.1.
- 6.1.3.8 After reconditioning a packaging, the reconditioner shall apply to it a durable marking showing, in the following sequence:
- (h) The State in which the reconditioning was carried out, indicated by the distinguishing sign for motor vehicles in international traffic³;
 - (i) The name of the reconditioner or other identification of the packaging specified by the competent authority;
 - (j) The year of reconditioning; the letter "R"; and, for every packaging successfully passing the leakproofness test in 6.1.1.3, the additional letter "L".
- 6.1.3.9 When, after reconditioning, the markings required by 6.1.3.1 (a) to (d) no longer appear on the top head or the side of a metal drum, the reconditioner also shall apply them in a durable form followed by 6.1.3.8 (h), (i) and (j). These markings shall not identify a greater performance capability than that for which the original design type had been tested and marked.
- 6.1.3.10 Packagings manufactured with recycled plastics material as defined in 1.2.1 shall be marked "REC". This mark shall be placed near the mark prescribed in 6.1.3.1.

³ *Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).*

6.1.3.11 *Examples of markings for NEW packagings*

	4G/Y145/S/02 NL/VL823	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new fibreboard box
	1A1/Y1.4/150/98 NL/VL824	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new steel drum to contain liquids
	1A2/Y150/S/01 NL/VL825	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new steel drum to contain solids, or inner packagings
	4HW/Y136/S/98 NL/VL826	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new plastics box of equivalent specification
	1A2/Y/100/01 USA/MM5	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a remanufactured steel drum to contain liquids
	RID/ADR/0A1/Y100/89 NL/VL123	as in 6.1.3.1 (a) (ii), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new light gauge metal packaging, non-removable head
	RID/ADR/0A2/Y20/S/04 NL/VL124	as in 6.1.3.1 (a) (ii), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)	For a new light gauge metal packaging, removable head, intended to contain solids, or liquids with a viscosity at 23 °C exceeding 200 mm ² /s.

6.1.3.12 *Examples of markings for RECONDITIONED packagings*

	1A1/Y1.4/150/97 NL/RB/01 RL	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.8 (h), (i) and (j)
	1A2/Y150/S/99 USA/RB/00 R	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.8 (h), (i) and (j)

6.1.3.13 *Example of marking for SALVAGE packagings*

	1A2T/Y300/S/01 USA/abc	as in 6.1.3.1 (a) (i), (b), (c), (d) and (e) as in 6.1.3.1 (f) and (g)
---	---------------------------	--

NOTE: The markings, for which examples are given in 6.1.3.11, 6.1.3.12 and 6.1.3.13 may be applied in a single line or in multiple lines provided the correct sequence is respected.

6.1.3.14 *Certification*

By affixing marking in accordance with 6.1.3.1, it is certified that mass-produced packagings correspond to the approved design type and that the requirements referred to in the approval have been met.

6.1.4 *Requirements for packagings***6.1.4.0** *General requirements*

Any permeation of the substance contained in the packaging shall not constitute a danger under normal conditions of carriage.

6.1.4.1 Steel drums

1A1 non-removable head

1A2 removable head

- 6.1.4.1.1 Body and heads shall be constructed of steel sheet of a suitable type and of adequate thickness in relation to the capacity of the drum and to its intended use.

NOTE: In the case of carbon steel drums, "suitable" steels are identified in ISO 3573:1999 "Hot rolled carbon steel sheet of commercial and drawing qualities" and ISO 3574:1999 "Cold-reduced carbon steel sheet of commercial and drawing qualities". For carbon steel drums below 100 litres "suitable" steels in addition to the above standards are also identified in ISO 11949:1995 "Cold-reduced electrolytic tinplate", ISO 11950:1995 "Cold-reduced electrolytic chromium/chromium oxide-coated steel" and ISO 11951:1995 "Cold-reduced blackplate in coil form for the production of tinplate or electrolytic chromium/chromium-oxide coated steel".

- 6.1.4.1.2 Body seams shall be welded on drums intended to contain more than 40 litres of liquid. Body seams shall be mechanically seamed or welded on drums intended to contain solids or 40 litres or less of liquids.

- 6.1.4.1.3 Chimes shall be mechanically seamed or welded. Separate reinforcing rings may be applied.

- 6.1.4.1.4 The body of a drum of a capacity greater than 60 litres shall, in general, have at least two expanded rolling hoops or, alternatively, at least two separate rolling hoops. If there are separate rolling hoops they shall be fitted tightly on the body and so secured that they cannot shift. Rolling hoops shall not be spot welded.

- 6.1.4.1.5 Openings for filling, emptying and venting in the bodies or heads of non-removable head (1A1) drums shall not exceed 7 cm in diameter. Drums with larger openings are considered to be of the removable head type (1A2). Closures for openings in the bodies and heads of drums shall be so designed and applied that they will remain secure and leakproof under normal conditions of carriage. Closure flanges may be mechanically seamed or welded in place. Gaskets or other sealing elements shall be used with closures, unless the closure is inherently leakproof.

- 6.1.4.1.6 Closure devices for removable head (1A2) drums shall be so designed and applied that they will remain secure and drums will remain leakproof under normal conditions of carriage. Gaskets or other sealing elements shall be used with all removable heads.

- 6.1.4.1.7 If materials used for body, heads, closures and fittings are not in themselves compatible with the contents to be carried, suitable internal protective coatings or treatments shall be applied. These coatings or treatments shall retain their protective properties under normal conditions of carriage.

- 6.1.4.1.8 Maximum capacity of drum: 450 litres.

- 6.1.4.1.9 Maximum net mass: 400 kg.

6.1.4.2 Aluminium drums

1B1 non-removable head

1B2 removable head

- 6.1.4.2.1 Body and heads shall be constructed of aluminium at least 99% pure or of an aluminium base alloy. Material shall be of a suitable type and of adequate thickness in relation to the capacity of the drum and to its intended use.

- 6.1.4.2.2 All seams shall be welded. Chime seams, if any, shall be reinforced by the application of separate reinforcing rings.

- 6.1.4.2.3 The body of a drum of a capacity greater than 60 litres shall, in general, have at least two expanded rolling hoops or, alternatively, at least two separate rolling hoops. If there are separate rolling hoops they shall be fitted tightly on the body and so secured that they cannot shift. Rolling hoops shall not be spot welded.

6.1.4.2.4 Openings for filling, emptying and venting in the bodies or heads of non-removable head (1B1) drums shall not exceed 7 cm in diameter. Drums with larger openings are considered to be of the removable head type (1B2). Closures for openings in the bodies and heads of drums shall be so designed and applied that they will remain secure and leakproof under normal conditions of carriage. Closure flanges shall be welded in place so that the weld provides a leakproof seam. Gaskets or other sealing elements shall be used with closures, unless the closure is inherently leakproof.

6.1.4.2.5 Closure devices for removable head (1B2) drums shall be so designed and applied that they will remain secure and drums will remain leakproof under normal conditions of carriage. Gaskets or other sealing elements shall be used with all removable heads.

6.1.4.2.6 Maximum capacity of drum: 450 litres.

6.1.4.2.7 Maximum net mass: 400 kg.

6.1.4.3 *Drums of metal other than aluminium or steel*

1N1 non-removable head

1N2 removable head

6.1.4.3.1 The body and heads shall be constructed of a metal or of a metal alloy other than steel or aluminium. Material shall be of a suitable type and of adequate thickness in relation to the capacity of the drum and to its intended use.

6.1.4.3.2 Chime seams, if any, shall be reinforced by the application of separate reinforcing rings. All seams, if any, shall be joined (welded, soldered, etc.) in accordance with the technical state of the art for the used metal or metal alloy.

6.1.4.3.3 The body of a drum of a capacity greater than 60 litres shall, in general, have at least two expanded rolling hoops or, alternatively, at least two separate rolling hoops. If there are separate rolling hoops they shall be fitted tightly on the body and so secured that they cannot shift. Rolling hoops shall not be spot welded.

6.1.4.3.4 Openings for filling, emptying and venting in the bodies or heads of non-removable head (1N1) drums shall not exceed 7 cm in diameter. Drums with larger openings are considered to be of the removable head type (1N2). Closures for openings in the bodies and heads of drums shall be so designed and applied that they will remain secure and leakproof under normal conditions of carriage. Closure flanges shall be joined in place (welded, soldered, etc.) in accordance with the technical state of the art for the used metal or metal alloy so that the seam join is leakproof. Gaskets or other sealing elements shall be used with closures, unless the closure is inherently leakproof.

6.1.4.3.5 Closure devices for removable head (1N2) drums shall be so designed and applied that they will remain secure and drums will remain leakproof under normal conditions of carriage. Gaskets or other sealing elements shall be used with all removable heads.

6.1.4.3.6 Maximum capacity of drum: 450 litres.

6.1.4.3.7 Maximum net mass: 400 kg.

6.1.4.4 *Steel or aluminium jerricans*

3A1 steel, non-removable head

3A2 steel, removable head

3B1 aluminium, non-removable head

3B2 aluminium, removable head

6.1.4.4.1 Body and heads shall be constructed of steel sheet, of aluminium at least 99% pure or of an aluminium base alloy. Material shall be of a suitable type and of adequate thickness in relation to the capacity of the jerrican and to its intended use.

6.1.4.4.2 Chimes of steel jerricans shall be mechanically seamed or welded. Body seams of steel jerricans intended to contain more than 40 litres of liquid shall be welded. Body seams of steel jerricans intended to contain 40 litres or less shall be mechanically seamed or welded. For aluminium jerricans,

all seams shall be welded. Chime seams, if any, shall be reinforced by the application of a separate reinforcing ring.

6.1.4.4.3 Openings in non-removable head jerricans (3A1 and 3B1) shall not exceed 7 cm in diameter. Jerricans with larger openings are considered to be of the removable head type (3A2 and 3B2). Closures shall be so designed that they will remain secure and leakproof under normal conditions of carriage. Gaskets or other sealing elements shall be used with closures, unless the closure is inherently leakproof.

6.1.4.4.4 If materials used for body, heads, closures and fittings are not in themselves compatible with the contents to be carried, suitable internal protective coatings or treatments shall be applied. These coatings or treatments shall retain their protective properties under normal conditions of carriage.

6.1.4.4.5 Maximum capacity of jerrican: 60 litres.

6.1.4.4.6 Maximum net mass: 120 kg.

6.1.4.5 Plywood drums

1D

6.1.4.5.1 The wood used shall be well seasoned, commercially dry and free from any defect likely to lessen the effectiveness of the drum for the purpose intended. If a material other than plywood is used for the manufacture of the heads, it shall be of a quality equivalent to the plywood.

6.1.4.5.2 At least two-ply plywood shall be used for the body and at least three-ply plywood for the heads; the plies shall be firmly glued together by a water resistant adhesive with their grain crosswise.

6.1.4.5.3 The body and heads of the drum and their joins shall be of a design appropriate to the capacity of the drum and to its intended use.

6.1.4.5.4 In order to prevent sifting of the contents, lids shall be lined with kraft paper or some other equivalent material which shall be securely fastened to the lid and extend to the outside along its full circumference.

6.1.4.5.5 Maximum capacity of drum: 250 litres.

6.1.4.5.6 Maximum net mass: 400 kg.

6.1.4.6 (Deleted)

6.1.4.7 Fibre drums

1G

6.1.4.7.1 The body of the drum shall consist of multiple plies of heavy paper or fibreboard (without corrugations) firmly glued or laminated together and may include one or more protective layers of bitumen, waxed kraft paper, metal foil, plastics material, etc.

6.1.4.7.2 Heads shall be of natural wood, fibreboard, metal, plywood, plastics or other suitable material and may include one or more protective layers of bitumen, waxed kraft paper, metal foil, plastics material, etc.

6.1.4.7.3 The body and heads of the drum and their joins shall be of a design appropriate to the capacity of the drum and to its intended use.

6.1.4.7.4 The assembled packaging shall be sufficiently water resistant so as not to delaminate under normal conditions of carriage.

6.1.4.7.5 Maximum capacity of drum: 450 litres.

6.1.4.7.6 Maximum net mass: 400 kg.

6.1.4.8 *Plastics drums and jerricans*

- 1H1 drums, non-removable head
- 1H2 drums, removable head
- 3H1 jerricans, non-removable head
- 3H2 jerricans, removable head

- 6.1.4.8.1 The packaging shall be manufactured from suitable plastics material and be of adequate strength in relation to its capacity and intended use. Except for recycled plastics material as defined in 1.2.1, no used material other than production residues or regrind from the same manufacturing process may be used. The packaging shall be adequately resistant to ageing and to degradation caused either by the substance contained or by ultra-violet radiation. Any permeation of the substance contained in the package, or recycled plastics material used to produce new packaging, shall not constitute a danger under normal conditions of carriage.
- 6.1.4.8.2 If protection against ultra-violet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, retesting may be waived if the carbon black content does not exceed 2% by mass or if the pigment content does not exceed 3% by mass; the content of inhibitors of ultra-violet radiation is not limited.
- 6.1.4.8.3 Additives serving purposes other than protection against ultra-violet radiation may be included in the composition of the plastics material provided that they do not adversely affect the chemical and physical properties of the material of the packaging. In such circumstances, retesting may be waived.
- 6.1.4.8.4 The wall thickness at every point of the packaging shall be appropriate to its capacity and intended use, taking into account the stresses to which each point is liable to be exposed.
- 6.1.4.8.5 Openings for filling, emptying and venting in the bodies or heads of non-removable head drums (1H1) and jerricans (3H1) shall not exceed 7 cm in diameter. Drums and jerricans with larger openings are considered to be of the removable head type (1H2 and 3H2). Closures for openings in the bodies or heads of drums and jerricans shall be so designed and applied that they will remain secure and leakproof under normal conditions of carriage. Gaskets or other sealing elements shall be used with closures unless the closure is inherently leakproof.
- 6.1.4.8.6 Closure devices for removable head drums and jerricans (1H2 and 3H2) shall be so designed and applied that they will remain secure and leakproof under normal conditions of carriage. Gaskets shall be used with all removable heads unless the drum or jerrican design is such that, where the removable head is properly secured, the drum or jerrican is inherently leakproof.
- 6.1.4.8.7 The maximum permissible permeability for flammable liquids shall be 0.008 g/l.h at 23 °C (see 6.1.5.7).
- 6.1.4.8.8 Where recycled plastics material is used for production of new packaging, the specific properties of the recycled material shall be assured and documented regularly as part of a quality assurance programme recognised by the competent authority. The quality assurance programme shall include a record of proper pre-sorting and verification that each batch of recycled plastics material has the proper melt flow rate, density, and tensile yield strength, consistent with that of the design type manufactured from such recycled material. This necessarily includes knowledge about the packaging material from which the recycled plastics have been derived, as well as the awareness of the prior contents of those packagings if those prior contents might reduce the capability of new packaging produced using that material. In addition, the packaging manufacturer's quality assurance programme under 6.1.1.4 shall include performance of the mechanical design type test in 6.1.5 on packagings manufactured from each batch of recycled plastics material. In this testing, stacking performance may be verified by appropriate dynamic compression testing rather than static load testing.

NOTE: ISO 16103:2005 – "Packaging – Transport packaging for dangerous goods - Recycled plastics material" provides additional guidance on procedures to be followed in approving the use of recycled plastics material.

6.1.4.8.9 Maximum capacity of drums and jerricans: 1H1, 1H2: 450 litres
3H1, 3H2: 60 litres.

6.1.4.8.10 Maximum net mass: 1H1, 1H2: 400 kg
3H1, 3H2: 120 kg.

6.1.4.9 Boxes of natural wood

4C1 ordinary
4C2 with sift-proof walls

6.1.4.9.1 The wood used shall be well seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the box. The strength of the material used and the method of construction shall be appropriate to the capacity and intended use of the box. The tops and bottoms may be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type.

6.1.4.9.2 Fastenings shall be resistant to vibration experienced under normal conditions of carriage. End grain nailing shall be avoided whenever practicable. Joins which are likely to be highly stressed shall be made using clenched or annular ring nails or equivalent fastenings.

6.1.4.9.3 Box 4C2: each part shall consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when one of the following methods of glued assembly is used: Lindermann joint, tongue and groove joint, ship lap or rabbet joint or butt joint with at least two corrugated metal fasteners at each joint.

6.1.4.9.4 Maximum net mass: 400 kg.

6.1.4.10 Plywood boxes

4D

6.1.4.10.1 Plywood used shall be at least 3-ply. It shall be made from well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the box. The strength of the material used and the method of construction shall be appropriate to the capacity and intended use of the box. All adjacent plies shall be glued with water resistant adhesive. Other suitable materials may be used together with plywood in the construction of boxes. Boxes shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.

6.1.4.10.2 Maximum net mass: 400 kg.

6.1.4.11 Reconstituted wood boxes

4F

6.1.4.11.1 The walls of boxes shall be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type. The strength of the material used and the method of construction shall be appropriate to the capacity of the boxes and to their intended use.

6.1.4.11.2 Other parts of the boxes may be made of other suitable material.

6.1.4.11.3 Boxes shall be securely assembled by means of suitable devices.

6.1.4.11.4 Maximum net mass: 400 kg.

6.1.4.12 Fibreboard boxes

4G

- 6.1.4.12.1 Strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) shall be used, appropriate to the capacity of the box and to its intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m² - see ISO 535:1991. It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting of corrugated fibreboard shall be firmly glued to the facings.
- 6.1.4.12.2 The ends of boxes may have a wooden frame or be entirely of wood or other suitable material. Reinforcements of wooden battens or other suitable material may be used.
- 6.1.4.12.3 Manufacturing joints in the body of boxes shall be taped, lapped and glued, or lapped and stitched with metal staples. Lapped joints shall have an appropriate overlap.
- 6.1.4.12.4 Where closing is effected by gluing or taping, a water resistant adhesive shall be used.
- 6.1.4.12.5 Boxes shall be designed so as to provide a good fit to the contents.
- 6.1.4.12.6 Maximum net mass: 400 kg.
- 6.1.4.13 *Plastics boxes***
- 4H1 expanded plastics boxes
4H2 solid plastics boxes
- 6.1.4.13.1 The box shall be manufactured from suitable plastics material and be of adequate strength in relation to its capacity and intended use. The box shall be adequately resistant to ageing and to degradation caused either by the substance contained or by ultra-violet radiation.
- 6.1.4.13.2 An expanded plastics box shall comprise two parts made of a moulded expanded plastics material, a bottom section containing cavities for the inner packagings and a top section covering and interlocking with the bottom section. The top and bottom sections shall be designed so that the inner packagings fit snugly. The closure cap for any inner packaging shall not be in contact with the inside of the top section of this box.
- 6.1.4.13.3 For dispatch, an expanded plastics box shall be closed with a self-adhesive tape having sufficient tensile strength to prevent the box from opening. The adhesive tape shall be weather resistant and its adhesive compatible with the expanded plastics material of the box. Other closing devices at least equally effective may be used.
- 6.1.4.13.4 For solid plastics boxes, protection against ultra-violet radiation, if required, shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the box. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, retesting may be waived if the carbon black content does not exceed 2% by mass or if the pigment content does not exceed 3% by mass; the content of inhibitors of ultra-violet radiation is not limited.
- 6.1.4.13.5 Additives serving purposes other than protection against ultra-violet radiation may be included in the composition of the plastics material provided that they do not adversely affect the chemical or physical properties of the material of the box. In such circumstances, retesting may be waived.
- 6.1.4.13.6 Solid plastics boxes shall have closure devices made of a suitable material of adequate strength and so designed as to prevent the box from unintentional opening.

6.1.4.16 *Woven plastics bags*

- 5H1 without inner liner or coating
- 5H2 sift-proof
- 5H3 water resistant

- 6.1.4.16.1 Bags shall be made from stretched tapes or monofilaments of a suitable plastics material. The strength of the material used and the construction of the bag shall be appropriate to the capacity of the bag and to its intended use.
- 6.1.4.16.2 If the fabric is woven flat, the bags shall be made by sewing or some other method ensuring closure of the bottom and one side. If the fabric is tubular, the bag shall be closed by sewing, weaving or some other equally strong method of closure.
- 6.1.4.16.3 Bags, sift-proof, 5H2: the bag shall be made sift-proof, for example by means of:
- (a) paper or a plastics film bonded to the inner surface of the bag; or
 - (b) one or more separate inner liners made of paper or plastics material.
- 6.1.4.16.4 Bags, water resistant, 5H3: to prevent the entry of moisture, the bag shall be made waterproof, for example by means of:
- (a) separate inner liners of water resistant paper (e.g. waxed kraft paper, double-tarred kraft paper or plastics-coated kraft paper); or
 - (b) plastics film bonded to the inner or outer surface of the bag; or
 - (c) one or more inner plastics liners.
- 6.1.4.16.5 Maximum net mass: 50 kg.

6.1.4.17 *Plastics film bags*

5H4

- 6.1.4.17.1 Bags shall be made of a suitable plastics material. The strength of the material used and the construction of the bag shall be appropriate to the capacity of the bag and to its intended use. Joins and closures shall withstand pressures and impacts liable to occur under normal conditions of carriage.
- 6.1.4.17.2 Maximum net mass: 50 kg.

6.1.4.18 *Paper bags*

- 5M1 multiwall
- 5M2 multiwall, water resistant

- 6.1.4.18.1 Bags shall be made of a suitable kraft paper or of an equivalent paper with at least three plies, the middle ply of which may be net-cloth and adhesive bonding to the outer paper plies. The strength of the paper and the construction of the bags shall be appropriate to the capacity of the bag and to its intended use. Joins and closures shall be sift-proof.
- 6.1.4.18.2 Bags 5M2: to prevent the entry of moisture, a bag of four plies or more shall be made waterproof by the use of either a water resistant ply as one of the two outermost plies or a water resistant barrier made of a suitable protective material between the two outermost plies; a bag of three plies shall be made waterproof by the use of a water resistant ply as the outermost ply. Where there is a danger of the substance contained reacting with moisture or where it is packed damp, a waterproof ply or barrier, such as double-tarred kraft paper, plastics-coated kraft paper, plastics film bonded to the inner surface of the bag, or one or more inner plastics liners, shall also be placed next to the substance. Joins and closures shall be waterproof.
- 6.1.4.18.3 Maximum net mass: 50 kg.

6.1.4.19 *Composite packagings (plastics material)*

6HA1	plastics receptacle with outer steel drum
6HA2	plastics receptacle with outer steel crate or box
6HB1	plastics receptacle with outer aluminium drum
6HB2	plastics receptacle with outer aluminium crate or box
6HC	plastics receptacle with outer wooden box
6HD1	plastics receptacle with outer plywood drum
6HD2	plastics receptacle with outer plywood box
6HG1	plastics receptacle with outer fibre drum
6HG2	plastics receptacle with outer fibreboard box
6HH1	plastics receptacle with outer plastics drum
6HH2	plastics receptacle with outer solid plastics box

6.1.4.19.1 *Inner receptacle*

6.1.4.19.1.1 The requirements of 6.1.4.8.1 and 6.1.4.8.4 to 6.1.4.8.7 apply to plastics inner receptacles.

6.1.4.19.1.2 The plastics inner receptacle shall fit snugly inside the outer packaging, which shall be free of any projection that might abrade the plastics material.

6.1.4.19.1.3 Maximum capacity of inner receptacle:

6HA1, 6HB1, 6HD1, 6HG1, 6HH1:	250 litres
6HA2, 6HB2, 6HC, 6HD2, 6HG2, 6HH2:	60 litres.

6.1.4.19.1.4 Maximum net mass:

6HA1, 6HB1, 6HD1, 6HG1, 6HH1:	400 kg
6HA2, 6HB2, 6HC, 6HD2, 6HG2, 6HH2:	75 kg.

6.1.4.19.2 *Outer packaging*

6.1.4.19.2.1 Plastics receptacle with outer steel or aluminium drum 6HA1 or 6HB1; the relevant requirements of 6.1.4.1 or 6.1.4.2, as appropriate, apply to the construction of the outer packaging.

6.1.4.19.2.2 Plastics receptacle with outer steel or aluminium crate or box 6HA2 or 6HB2; the relevant requirements of 6.1.4.14 apply to the construction of the outer packaging.

6.1.4.19.2.3 Plastics receptacle with outer wooden box 6HC; the relevant requirements of 6.1.4.9 apply to the construction of the outer packaging.

6.1.4.19.2.4 Plastics receptacle with outer plywood drum 6HD1; the relevant requirements of 6.1.4.5 apply to the construction of the outer packaging.

6.1.4.19.2.5 Plastics receptacle with outer plywood box 6HD2; the relevant requirements of 6.1.4.10 apply to the construction of the outer packaging.

6.1.4.19.2.6 Plastics receptacle with outer fibre drum 6HG1; the requirements of 6.1.4.7.1 to 6.1.4.7.4 apply to the construction of the outer packaging.

6.1.4.19.2.7 Plastics receptacle with outer fibreboard box 6HG2; the relevant requirements of 6.1.4.12 apply to the construction of the outer packaging.

6.1.4.19.2.8 Plastics receptacle with outer plastics drum 6HH1; the requirements of 6.1.4.8.1 to 6.1.4.8.6 apply to the construction of the outer packaging.

6.1.4.19.2.9 Plastics receptacles with outer solid plastics box (including corrugated plastics material) 6HH2; the requirements of 6.1.4.13.1 and 6.1.4.13.4 to 6.1.4.13.6 apply to the construction of the outer packaging.

6.1.4.20 *Composite packagings (glass, porcelain or stoneware)*

6PA1	receptacle with outer steel drum
6PA2	receptacle with outer steel crate or box
6PB1	receptacle with outer aluminium drum
6PB2	receptacle with outer aluminium crate or box
6PC	receptacle with outer wooden box
6PD1	receptacle with outer plywood drum
6PD2	receptacle with outer wickerwork hamper
6PG1	receptacle with outer fibre drum
6PG2	receptacle with outer fibreboard box
6PH1	receptacle with outer expanded plastics packaging
6PH2	receptacle with outer solid plastics packaging

6.1.4.20.1 *Inner receptacle*

6.1.4.20.1.1 Receptacles shall be of a suitable form (cylindrical or pear-shaped) and be made of good quality material free from any defect that could impair their strength. The walls shall be sufficiently thick at every point and free from internal stresses.

6.1.4.20.1.2 Screw-threaded plastics closures, ground glass stoppers or closures at least equally effective shall be used as closures for receptacles. Any part of the closure likely to come into contact with the contents of the receptacle shall be resistant to those contents. Care shall be taken to ensure that the closures are so fitted as to be leakproof and are suitably secured to prevent any loosening during carriage. If vented closures are necessary, they shall comply with 4.1.1.8.

6.1.4.20.1.3 The receptacle shall be firmly secured in the outer packaging by means of cushioning and/or absorbent materials.

6.1.4.20.1.4 Maximum capacity of receptacle: 60 litres.

6.1.4.20.1.5 Maximum net mass: 75 kg.

6.1.4.20.2 *Outer packaging*

6.1.4.20.2.1 Receptacle with outer steel drum 6PA1; the relevant requirements of 6.1.4.1 apply to the construction of the outer packaging. The removable lid required for this type of packaging may nevertheless be in the form of a cap.

6.1.4.20.2.2 Receptacle with outer steel crate or box 6PA2; the relevant requirements of 6.1.4.14 apply to the construction of the outer packaging. For cylindrical receptacles the outer packaging shall, when upright, rise above the receptacle and its closure. If the crate surrounds a pear-shaped receptacle and is of matching shape, the outer packaging shall be fitted with a protective cover (cap).

6.1.4.20.2.3 Receptacle with outer aluminium drum 6PB1; the relevant requirements of 6.1.4.2 apply to the construction of the outer packaging.

6.1.4.20.2.4 Receptacle with outer aluminium crate or box 6PB2; the relevant requirements of 6.1.4.14 apply to the construction of the outer packaging.

6.1.4.20.2.5 Receptacle with outer wooden box 6PC; the relevant requirements of 6.1.4.9 apply to the construction of the outer packaging.

6.1.4.20.2.6 Receptacle with outer plywood drum 6PD1; the relevant requirements of 6.1.4.5 apply to the construction of the outer packaging.

6.1.4.20.2.7 Receptacle with outer wickerwork hamper 6PD2. The wickerwork hamper shall be properly made with material of good quality. It shall be fitted with a protective cover (cap) so as to prevent damage to the receptacle.

6.1.4.20.2.8 Receptacle with outer fibre drum 6PG1; the relevant requirements of 6.1.4.7.1 to 6.1.4.7.4 apply to the construction of the outer packaging.

6.1.4.20.2.9 Receptacle with outer fibreboard box 6PG2; the relevant requirements of 6.1.4.12 apply to the construction of the outer packaging.

6.1.4.20.2.10 Receptacle with outer expanded plastics or solid plastics packaging (6PH1 or 6PH2); the materials of both outer packagings shall meet the relevant requirements of 6.1.4.13. Outer solid plastics packaging shall be manufactured from high density polyethylene or some other comparable plastics material. The removable lid for this type of packaging may nevertheless be in the form of a cap.

6.1.4.21 *Combination packagings*

The relevant requirements of section 6.1.4 for the outer packagings to be used, are applicable.

NOTE: For the inner and outer packagings to be used, see the relevant packing instructions in Chapter 4.1.

6.1.4.22 *Light gauge metal packagings*

0A1 non-removable-head

0A2 removable-head

6.1.4.22.1 The sheet metal for the body and ends shall be of suitable steel, and of a gauge appropriate to the capacity and intended use of the packaging.

6.1.4.22.2 The joints shall be welded, at least double-seamed by welting or produced by a method ensuring a similar degree of strength and leakproofness.

6.1.4.22.3 Inner coatings of zinc, tin, lacquer, etc. shall be tough and shall adhere to the steel at every point, including the closures.

6.1.4.22.4 Openings for filling, emptying and venting in the bodies or heads of non-removable head (0A1) packagings shall not exceed 7 cm in diameter. Packagings with larger openings shall be considered to be of the removable-head type (0A2).

6.1.4.22.5 The closures of non-removable-head packagings (0A1) shall either be of the screw-threaded type or be capable of being secured by a screwable device or a device at least equally effective. The closures of removable-head packagings (0A2) shall be so designed and fitted that they stay firmly closed and the packagings remain leakproof in normal conditions of carriage.

6.1.4.22.6 Maximum capacity of packagings: 40 litres.

6.1.4.22.7 Maximum net mass: 50 kg.

6.1.5 *Test requirements for packagings*

6.1.5.1 *Performance and frequency of tests*

6.1.5.1.1 The design type of each packaging shall be tested as provided in 6.1.5 in accordance with procedures established by the competent authority allowing the allocation of the mark and shall be approved by this competent authority.

6.1.5.1.2 Each packaging design type shall successfully pass the tests prescribed in this Chapter before being used. A packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes packagings which differ from the design type only in their lesser design height.

6.1.5.1.3 Tests shall be repeated on production samples at intervals established by the competent authority. For such tests on paper or fibreboard packagings, preparation at ambient conditions is considered equivalent to the requirements of 6.1.5.2.3.

6.1.5.1.4 Tests shall also be repeated after each modification which alters the design, material or manner of construction of a packaging.

6.1.5.1.5 The competent authority may permit the selective testing of packagings that differ only in minor respects from a tested type, e.g. smaller sizes of inner packagings or inner packagings of lower net mass; and packagings such as drums, bags and boxes which are produced with small reductions in external dimension(s).

6.1.5.1.6 *(Reserved)*

NOTE: For the conditions for assembling different inner packagings in an outer packaging and permissible variations in inner packagings, see 4.1.1.5.1.

6.1.5.1.7 Articles or inner packagings of any type for solids or liquids may be assembled and carried without testing in an outer packaging under the following conditions:

- (a) The outer packaging shall have been successfully tested in accordance with 6.1.5.3 with fragile (e.g. glass) inner packagings containing liquids using the packing group I drop height;
- (b) The total combined gross mass of inner packagings shall not exceed one half the gross mass of inner packagings used for the drop test in (a) above;
- (c) The thickness of cushioning material between inner packagings and between inner packagings and the outside of the packaging shall not be reduced below the corresponding thicknesses in the originally tested packaging; and if a single inner packaging was used in the original test, the thicknesses of cushioning between inner packagings shall not be less than the thickness of cushioning between the outside of the packaging and the inner packaging in the original test. If either fewer or smaller inner packagings are used (as compared to the inner packagings used in the drop test), sufficient additional cushioning material shall be used to take up void spaces;
- (d) The outer packaging shall have passed successfully the stacking test in 6.1.5.6 while empty. The total mass of identical packages shall be based on the combined mass of inner packagings used for the drop test in (a) above;
- (e) Inner packagings containing liquids shall be completely surrounded with a sufficient quantity of absorbent material to absorb the entire liquid contents of the inner packagings;
- (f) If the outer packaging is intended to contain inner packagings for liquids and is not leakproof, or is intended to contain inner packagings for solids and is not siftproof, a means of containing any liquid or solid contents in the event of leakage shall be provided in the form of a leakproof liner, plastics bag or other equally efficient means of containment. For packagings containing liquids, the absorbent material required in (e) above shall be placed inside the means of containing the liquid contents;
- (g) Packagings shall be marked in accordance with 6.1.3 as having been tested to packing group I performance for combination packagings. The marked gross mass in kilograms shall be the sum of the mass of the outer packaging plus one half of the mass of the inner packaging(s) as used for the drop test referred to in (a) above. Such a package mark shall also contain a letter "V" as described in 6.1.2.4.

6.1.5.1.8 The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced packagings meet the requirements of the design type tests. For verification purposes records of such tests shall be maintained.

6.1.5.1.9 If an inner treatment or coating is required for safety reasons, it shall retain its protective properties even after the tests.

6.1.5.1.10 Provided the validity of the test results is not affected and with the approval of the competent authority, several tests may be made on one sample.

6.1.5.1.11 *Salvage packagings*

Salvage packagings (see 1.2.1) shall be tested and marked in accordance with the requirements applicable to packing group II packagings intended for the carriage of solids or inner packagings, except as follows:

- (a) The test substance used in performing the tests shall be water, and the packagings shall be filled to not less than 98% of their maximum capacity. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass so long as they are placed so that the test results are not affected. Alternatively, in performing the drop test, the drop height may be varied in accordance with 6.1.5.3.5 (b);
- (b) Packagings shall, in addition, have been successfully subjected to the leakproofness test at 30 kPa, with the results of this test reflected in the test report required by 6.1.5.8; and
- (c) Packagings shall be marked with the letter "T" as described in 6.1.2.4.

6.1.5.2 *Preparation of packagings for testing*

6.1.5.2.1 Tests shall be carried out on packagings prepared as for carriage including, with respect to combination packagings, the inner packagings used. Inner or single receptacles or packagings other than bags shall be filled to not less than 98% of their maximum capacity for liquids or 95% for solids. Bags shall be filled to the maximum mass at which they may be used. For combination packagings where the inner packaging is designed to carry liquids and solids, separate testing is required for both liquid and solid contents. The substances or articles to be carried in the packagings may be replaced by other substances or articles except where this would invalidate the results of the tests. For solids, when another substance is used it shall have the same physical characteristics (mass, grain size, etc.) as the substance to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

6.1.5.2.2 In the drop tests for liquids, when another substance is used, it shall be of similar relative density and viscosity to those of the substance being carried. Water may also be used for the liquid drop test under the conditions in 6.1.5.3.5.

6.1.5.2.3 Paper or fibreboard packagings shall be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h.). There are three options, one of which shall be chosen. The preferred atmosphere is 23 ± 2 °C and $50\% \pm 2\%$ r.h. The two other options are 20 ± 2 °C and $65\% \pm 2\%$ r.h. or 27 ± 2 °C and $65\% \pm 2\%$ r.h.

NOTE: Average values shall fall within these limits. Short-term fluctuations and measurement limitations may cause individual measurements to vary by up to $\pm 5\%$ relative humidity without significant impairment of test reproducibility.

6.1.5.2.4 *(Reserved)*

6.1.5.2.5 To check that their chemical compatibility with the liquids is sufficient, plastics drums and jerricans in accordance with 6.1.4.8 and if necessary composite packagings (plastics material) in accordance with 6.1.4.19 shall be subjected to storage at ambient temperature for six months, during which time the test samples shall be kept filled with the goods they are intended to carry.

For the first and last 24 hours of storage, the test samples shall be placed with the closure downwards. However, packagings fitted with a vent shall be so placed on each occasion for five minutes only. After this storage the test samples shall undergo the tests prescribed in 6.1.5.3 to 6.1.5.6.

When it is known that the strength properties of the plastics material of the inner receptacles of composite packagings (plastics material) are not significantly altered by the action of the filling substance, it shall not be necessary to check that the chemical compatibility is sufficient.

A significant alteration in strength properties means:

- (a) distinct embrittlement; or
- (b) a considerable decrease in elasticity, unless related to a not less than proportionate increase in the elongation under load.

Where the behaviour of the plastics material has been established by other means, the above compatibility test may be dispensed with. Such procedures shall be at least equivalent to the above compatibility test and be recognized by the competent authority.

NOTE: For plastics drums and jerricans and composite packagings (plastics material) made of polyethylene, see also 6.1.5.2.6 below.

- 6.1.5.2.6 For polyethylene drums and jerricans in accordance with 6.1.4.8 and if necessary, polyethylene composite packagings in accordance with 6.1.4.19, chemical compatibility with filling liquids assimilated in accordance with 4.1.1.21 may be verified as follows with standard liquids (see 6.1.6).

The standard liquids are representative for the processes of deterioration on polyethylene, as there are softening through swelling, cracking under stress, molecular degradation and combinations thereof. The sufficient chemical compatibility of the packagings may be verified by storage of the required test samples for three weeks at 40 °C with the appropriate standard liquid(s); where this standard liquid is water, storage in accordance with this procedure is not required. Storage is not required either for test samples which are used for the stacking test in case of the standard liquids "wetting solution" and "acetic acid".

For the first and last 24 hours of storage, the test samples shall be placed with the closure downwards. However, packagings fitted with a vent shall be so placed on each occasion for five minutes only. After this storage, the test samples shall undergo the tests prescribed in 6.1.5.3 to 6.1.5.6.

The compatibility test for tert-Butyl hydroperoxide with more than 40% peroxide content and peroxyacetic acids of Class 5.2 shall not be carried out using standard liquids. For these substances, sufficient chemical compatibility of the test samples shall be verified during a storage period of six months at ambient temperature with the substances they are intended to carry.

Results of the procedure in accordance with this paragraph from polyethylene packagings can be approved for an equal design type, the internal surface of which is fluorinated.

- 6.1.5.2.7 For packagings made of polyethylene, as specified in 6.1.5.2.6, which have passed the test in 6.1.5.2.6, filling substances other than those assimilated in accordance with 4.1.1.21 may also be approved. Such approval shall be based on laboratory tests verifying that the effect of such filling substances on the test specimens is less than that of the appropriate standard liquid(s) taking into account the relevant processes of deterioration. The same conditions as those set out in 4.1.1.21.2 shall apply with respect to relative density and vapour pressure.

- 6.1.5.2.8 Provided that the strength properties of the plastics inner packagings of a combination packaging are not significantly altered by the action of the filling substance, proof of chemical compatibility is not necessary. A significant alteration in strength properties means:

- (a) distinct embrittlement;
- (b) a considerable decrease in elasticity, unless related to a not less than proportionate increase in elastic elongation.

6.1.5.3 Drop test⁴

6.1.5.3.1 Number of test samples (per design type and manufacturer) and drop orientation

For other than flat drops the centre of gravity shall be vertically over the point of impact.

Where more than one orientation is possible for a given drop test, the orientation most likely to result in failure of the packaging shall be used.

⁴ See ISO Standard 2248.

Packaging	No. of test samples	Drop orientation
(a) Steel drums Aluminium drums Drums of metal other than steel or aluminium Steel jerricans Aluminium jerricans Plywood drums Fibre drums Plastics drums and jerricans Composite packagings which are in the shape of a drum Light gauge metal packagings	Six (three for each drop)	First drop (using three samples): the packaging shall strike the target diagonally on the chime or, if the packaging has no chime, on a circumferential seam or an edge. Second drop (using the other three samples): the packaging shall strike the target on the weakest part not tested by the first drop, for example a closure or, for some cylindrical drums, the welded longitudinal seam of the drum body
(b) Boxes of natural wood Plywood boxes Reconstituted wood boxes Fibreboard boxes Plastics boxes Steel or aluminium boxes Composite packagings which are in the shape of a box	Five (one for each drop)	First drop: flat on the bottom Second drop: flat on the top Third drop: flat on the long side Fourth drop: flat on the short side Fifth drop: on a corner
(c) Bags - single-ply with a side seam	Three (three drops per bag)	First drop: flat on a wide face Second drop: flat on a narrow face Third drop: on an end of the bag
(d) Bags - single-ply without a side seam, or multi-ply	Three (two drops per bag)	First drop: flat on a wide face Second drop: on an end of the bag
(e) Composite packagings (glass, stoneware or porcelain), marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii) and which are in the shape of a drum or box	Three (one for each drop)	Diagonally on the bottom chime, or, if there is no chime, on a circumferential seam or the bottom edge

6.1.5.3.2 *Special preparation of test samples for the drop test*

The temperature of the test sample and its contents shall be reduced to -18°C or lower for the following packagings:

- (a) Plastics drums (see 6.1.4.8);
- (b) Plastics jerricans (see 6.1.4.8);
- (c) Plastics boxes other than expanded plastics boxes (see 6.1.4.13);
- (d) Composite packagings (plastics material) (see 6.1.4.19); and
- (e) Combination packagings with plastics inner packagings, other than plastics bags intended to contain solids or articles.

Where test samples are prepared in this way, the conditioning in 6.1.5.2.3 may be waived. Test liquids shall be kept in the liquid state by the addition of anti-freeze if necessary.

6.1.5.3.3 Removable head packagings for liquids shall not be dropped until at least 24 hours after filling and closing to allow for any possible gasket relaxation.

6.1.5.3.4 *Target*

The target shall be a non-resilient and horizontal surface and shall be:

- Integral and massive enough to be immovable;
- Flat with a surface kept free from local defects capable of influencing the test results;
- Rigid enough to be non-deformable under test conditions and not liable to become damaged by the tests; and
- Sufficiently large to ensure that the test package falls entirely upon the surface.

6.1.5.3.5 *Drop height*

For solids and liquids, if the test is performed with the solid or liquid to be carried or with another substance having essentially the same physical characteristics:

Packing Group I	Packing Group II	Packing Group III
1.8 m	1.2 m	0.8 m

For liquids in single packagings and for inner packagings of combination packagings, if the test is performed with water:

NOTE: The term water includes water/antifreeze solutions with a minimum specific gravity of 0.95 for testing at - 18 °C.

- (a) where the substances to be carried have a relative density not exceeding 1.2:

Packing Group I	Packing Group II	Packing Group III
1.8 m	1.2 m	0.8 m

- (b) where the substances to be carried have a relative density exceeding 1.2, the drop height shall be calculated on the basis of the relative density (d) of the substance to be carried, rounded up to the first decimal, as follows:

Packing Group I	Packing Group II	Packing Group III
$d \times 1.5$ (m)	$d \times 1.0$ (m)	$d \times 0.67$ (m)

- (c) for light-gauge metal packagings, marked with symbol "RID/ADR" according to 6.1.3.1(a) (ii) intended for the carriage of substances having a viscosity at 23 °C greater than 200 mm²/s (corresponding to a flow time of 30 seconds with an ISO flow cup having a jet orifice of 6 mm diameter in accordance with ISO Standard 2431:1993)

- (i) if the relative density does not exceed 1.2:

Packing group II	Packing group III
0.6 m	0.4 m

- (ii) where the substances to be carried have a relative density (d) exceeding 1.2 the drop height shall be calculated on the basis of the relative density (d) of the substance to be carried, rounded up to the first decimal place, as follows:

Packing group II	Packing group III
$d \times 0.5$ m	$d \times 0.33$ m

6.1.5.3.6 *Criteria for passing the test*

- 6.1.5.3.6.1 Each packaging containing liquid shall be leakproof when equilibrium has been reached between the internal and external pressures, however for inner packagings of combination packagings and except for inner receptacles of composite packagings (glass, porcelain or stoneware), marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii) it is not necessary that the pressures be equalized.
- 6.1.5.3.6.2 Where a packaging for solids undergoes a drop test and its upper face strikes the target, the test sample passes the test if the entire contents are retained by an inner packaging or inner receptacle (e.g. a plastics bag), even if the closure while retaining its containment function, is no longer sift-proof.
- 6.1.5.3.6.3 The packaging or outer packaging of a composite or combination packaging shall not exhibit any damage liable to affect safety during carriage. Inner receptacles, inner packagings, or articles shall remain completely within the outer packaging and there shall be no leakage of the filling substance from the inner receptacle(s) or inner packaging(s).
- 6.1.5.3.6.4 Neither the outermost ply of a bag nor an outer packaging may exhibit any damage liable to affect safety during carriage.
- 6.1.5.3.6.5 A slight discharge from the closure(s) upon impact is not considered to be a failure of the packaging provided that no further leakage occurs.
- 6.1.5.3.6.6 No rupture is permitted in packagings for goods of Class 1 which would permit the spillage of loose explosive substances or articles from the outer packaging.

6.1.5.4 *Leakproofness test*

The leakproofness test shall be performed on all design types of packagings intended to contain liquids; however, this test is not required for

- inner packagings of combination packagings;
- inner receptacles of composite packagings (glass, porcelain or stoneware), marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii);
- light gauge metal packagings, marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii) intended for substances with a viscosity at 23 °C exceeding 200 mm²/s.

6.1.5.4.1 *Number of test samples:* three test samples per design type and manufacturer.

6.1.5.4.2 *Special preparation of test samples for the test:* either vented closures shall be replaced by similar non-vented closures or the vent shall be sealed.

6.1.5.4.3 *Test method and pressure to be applied:* the packagings including their closures shall be restrained under water for 5 minutes while an internal air pressure is applied, the method of restraint shall not affect the results of the test.

The air pressure (gauge) to be applied shall be:

Packing Group I	Packing Group II	Packing Group III
Not less than 30 kPa (0.3 bar)	Not less than 20 kPa (0.2 bar)	Not less than 20 kPa (0.2 bar)

Other methods at least equally effective may be used.

6.1.5.4.4 *Criterion for passing the test:* there shall be no leakage.

6.1.5.5 *Internal pressure (hydraulic) test***6.1.5.5.1** *Packagings to be tested*

The internal pressure (hydraulic) test shall be carried out on all design types of metal, plastics and composite packagings intended to contain liquids. This test is not required for:

- Inner packagings of combination packagings;
- Inner receptacles of composite packagings (glass, porcelain or stoneware), marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii);
- Light gauge metal packagings, marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii) intended for substances with a viscosity at 23 °C exceeding 200 mm²/s.

6.1.5.5.2 *Number of test samples:* three test samples per design type and manufacturer.

6.1.5.5.3 *Special preparation of packagings for testing:* either vented closures shall be replaced by similar non-vented closures or the vent shall be sealed.

6.1.5.5.4 *Test method and pressure to be applied:* metal packagings and composite packagings (glass, porcelain or stoneware), including their closures, shall be subjected to the test pressure for 5 minutes. Plastics packagings and composite packagings (plastics material) including their closures shall be subjected to the test pressure for 30 minutes. This pressure is the one to be included in the marking required by 6.1.3.1 (d). The manner in which the packagings are supported shall not invalidate the test. The test pressure shall be applied continuously and evenly; it shall be kept constant throughout the test period. The hydraulic pressure (gauge) applied, as determined by any one of the following methods, shall be:

- (a) not less than the total gauge pressure measured in the packaging (i.e. the vapour pressure of the filling liquid and the partial pressure of the air or other inert gases, minus 100 kPa) at 55 °C, multiplied by a safety factor of 1.5; this total gauge pressure shall be determined on the basis of a maximum degree of filling in accordance with 4.1.1.4 and a filling temperature of 15 °C; or
- (b) not less than 1.75 times the vapour pressure at 50 °C of the liquid to be carried, minus 100 kPa but with a minimum test pressure of 100 kPa; or
- (c) not less than 1.5 times the vapour pressure at 55 °C of the liquid to be carried, minus 100 kPa but with a minimum test pressure of 100 kPa.

6.1.5.5.5 In addition, packagings intended to contain liquids of packing group I shall be tested to a minimum test pressure of 250 kPa (gauge) for a test period of 5 or 30 minutes depending upon the material of construction of the packaging.

6.1.5.5.6 *Criterion for passing the test:* no packaging may leak.

6.1.5.6 *Stacking test*

All design types of packagings other than bags, and other than non-stackable composite packagings (glass, porcelain, or stoneware) marked with the symbol "RID/ADR" according to 6.1.3.1 (a) (ii), shall be subjected to a stacking test.

6.1.5.6.1 *Number of test samples:* three test samples per design type and manufacturer.

6.1.5.6.2 *Test method:* the test sample shall be subjected to a force applied to the top surface of the test sample equivalent to the total weight of identical packages which might be stacked on it during carriage; where the contents of the test sample are liquids with relative density different from that of the liquid to be carried, the force shall be calculated in relation to the latter. The minimum height of the stack including the test sample shall be 3 metres. The duration of the test shall be 24 hours except that plastics drums, jerricans, and composite packagings 6HH1 and 6HH2 intended for liquids shall be subjected to the stacking test for a period of 28 days at a temperature of not less than 40 °C.

For the test in accordance with 6.1.5.2.5, the original filling substance shall be used. For the test in accordance with 6.1.5.2.6, a stacking test shall be carried out with a standard liquid.

6.1.5.6.3 *Criteria for passing the test:* no test sample shall leak. In composite packagings or combination packagings, there shall be no leakage of the filling substance from the inner receptacle or inner packaging. No test sample shall show any deterioration which could adversely affect transport safety or any distortion liable to reduce its strength or cause instability in stacks of packages. Plastics packagings shall be cooled to ambient temperature before the assessment.

6.1.5.7 *Supplementary permeability test for plastics drums and jerricans in accordance with 6.1.4.8 and for composite packagings (plastics material) in accordance with 6.1.4.19 intended for the carriage of liquids having a flash-point ≤ 60 °C, other than 6HA1 packagings*

Polyethylene packagings need be subjected to this test only if they are to be approved for the carriage of benzene, toluene, xylene or mixtures and preparations containing those substances.

6.1.5.7.1 *Number of test samples:* three packagings per design type and manufacturer.

6.1.5.7.2 *Special preparation of the test sample for the test:* the test samples are to be pre-stored with the original filling substance in accordance with 6.1.5.2.5, or, for polyethylene packagings, with the standard liquid mixture of hydrocarbons (white spirit) in accordance with 6.1.5.2.6.

6.1.5.7.3 *Test method:* the test samples filled with the substance for which the packaging is to be approved shall be weighed before and after storage for 28 days at 23 °C and 50% relative atmospheric humidity. For polyethylene packagings, the test may be carried out with the standard liquid mixture of hydrocarbons (white spirit) in place of benzene, toluene or xylene.

6.1.5.7.4 *Criterion for passing the test:* permeability shall not exceed 0.008 g/l.h.

6.1.5.8 *Test Report*

6.1.5.8.1 A test report containing at least the following particulars shall be drawn up and shall be available to the users of the packaging:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test report;
5. Manufacturer of the packaging;
6. Description of the packaging design type (e.g. dimensions, materials, closures, thickness, etc.), including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s);
7. Maximum capacity;
8. Characteristics of test contents, e.g. viscosity and relative density for liquids and particle size for solids;
9. Test descriptions and results;
10. The test report shall be signed with the name and status of the signatory.

6.1.5.8.2 The test report shall contain statements that the packaging prepared as for carriage was tested in accordance with the appropriate requirements of this section and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

6.1.6 Standard liquids for verifying the chemical compatibility testing of polyethylene packagings, including IBCs, in accordance with 6.1.5.2.6 and 6.5.6.3.5, respectively

6.1.6.1 The following standard liquids shall be used for this plastics material.

- (a) **Wetting Solution** for substances causing severe cracking in polyethylene under stress, in particular for all solutions and preparations containing wetting agents.

An aqueous solution of 1% of alkyl benzene sulphonate, or an aqueous solution of 5% nonylphenol ethoxylate which has been preliminary stored for at least 14 days at a temperature of 40 °C before being used for the first time for the tests, shall be used. The surface tension of this solution shall be 31 to 35 mN/m at 23 °C.

The stacking test shall be carried out on the basis of a relative density of not less than 1.20.

A compatibility test with acetic acid is not required if adequate chemical compatibility is proved with a wetting solution.

For filling substances causing cracking in polyethylene under stress which is resistant to the wetting solution, adequate chemical compatibility may be proved after preliminary storing for three weeks at 40 °C in accordance with 6.1.5.2.6, but with the original filling matter;

- (b) **Acetic acid** for substances and preparations causing cracking in polyethylene under stress, in particular for monocarboxylic acids and monovalent alcohols.

Acetic acid in 98 to 100% concentration shall be used.

Relative density = 1.05.

The stacking test shall be carried out on the basis of a relative density not less than 1.1.

In the case of filling substances causing polyethylene to swell more than acetic acid and to such an extent that the polyethylene mass is increased by up to 4%, adequate chemical compatibility may be proved after preliminary storing for three weeks at 40 °C, in accordance with 6.1.5.2.6 but with the original filling matter;

- (c) **Normal butyl acetate/normal butyl acetate-saturated wetting solution** for substances and preparations causing polyethylene to swell to such an extent that the polyethylene mass is increased by about 4% and at the same time causing cracking under stress, in particular for phyto-sanitary products, liquid paints and esters. Normal butyl acetate in 98 to 100% concentration shall be used for preliminary storage in accordance with 6.1.5.2.6.

For the stacking test in accordance with 6.1.5.6, a test liquid consisting of a 1 to 10% aqueous wetting solution mixed with 2% normal butyl acetate conforming to (a) above shall be used.

The stacking test shall be carried out on the basis of a relative density not less than 1.0.

In the case of filling substances causing polyethylene to swell more than normal butyl acetate and to such an extent that the polyethylene mass is increased by up to 7.5%, adequate chemical compatibility may be proved after preliminary storing for three weeks at 40 °C, in accordance with 6.1.5.2.6 but with the original filling matter;

- (d) **Mixture of hydrocarbons (white spirit)** for substances and preparations causing polyethylene to swell, in particular for hydrocarbons, esters and ketones.

A mixture of hydrocarbons having a boiling range 160 °C to 220 °C, relative density 0.78-0.80, flash-point > 50 °C and an aromatic content 16% to 21% shall be used.

The stacking test shall be carried out on the basis of a relative density not less than 1.0.

In the case of filling substances causing polyethylene to swell to such an extent that the polyethylene mass is increased by more than 7.5%, adequate chemical compatibility may be proved after preliminary storing for three weeks at 40 °C, in accordance with 6.1.5.2.6 but with the original filling matter;

- (e) **Nitric acid** for all substances and preparations having an oxidizing effect on polyethylene and causing molecular degradation identical to or less than 55% nitric acid.

Nitric acid in a concentration of not less than 55% shall be used.

The stacking test shall be carried out on the basis of a relative density of not less than 1.4.

In the case of filling substances more strongly oxidizing than 55% nitric acid or causing degradation of the molecular mass proceed in accordance with 6.1.5.2.5.

The period of use shall be determined in such cases by observing the degree of damage (e.g. two years for nitric acid in not less than 55% concentration);

- (f) **Water** for substances which do not attack polyethylene in any of the cases referred to under (a) to (e), in particular for inorganic acids and lyes, aqueous saline solutions, polyvalent alcohols and organic substances in aqueous solution.

The stacking test shall be carried out on the basis of a relative density of not less than 1.2.

A design type test with water is not required if adequate chemical compatibility is proved with wetting solution or nitric acid.

CHAPTER 6.2

REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF PRESSURE RECEPTACLES, AEROSOL DISPENSERS, SMALL RECEPTACLES CONTAINING GAS (GAS CARTRIDGES) AND FUEL CELL CARTRIDGES CONTAINING LIQUEFIED FLAMMABLE GAS

NOTE: *Aerosol dispensers, small receptacles containing gas (gas cartridges) and fuel cell cartridges containing liquefied flammable gas are not subject to the requirements of 6.2.1 to 6.2.5.*

6.2.1 General requirements

6.2.1.1 Design and construction

6.2.1.1.1 Pressure receptacles and their closures shall be designed, manufactured, tested and equipped in such a way as to withstand all conditions, including fatigue, to which they will be subjected during normal conditions of carriage and use.

6.2.1.1.2 *(Reserved)*

6.2.1.1.3 In no case shall the minimum wall thickness be less than that specified in the design and construction technical standards.

6.2.1.1.4 For welded pressure receptacles, only metals of weldable quality shall be used.

6.2.1.1.5 The test pressure of cylinders, tubes, pressure drums and bundles of cylinders shall be in accordance with packing instruction P200 of 4.1.4.1, or, for a chemical under pressure, with packing instruction P206 of 4.1.4.1. The test pressure for closed cryogenic receptacles shall be in accordance with packing instruction P203 of 4.1.4.1. The test pressure of a metal hydride storage system shall be in accordance with packing instruction P205 of 4.1.4.1. The test pressure of a cylinder for an adsorbed gas shall be in accordance with packing instruction P208 of 4.1.4.1.

6.2.1.1.6 Pressure receptacles assembled in bundles shall be structurally supported and held together as a unit. Pressure receptacles shall be secured in a manner that prevents movement in relation to the structural assembly and movement that would result in the concentration of harmful local stresses. Manifold assemblies (e.g. manifold, valves, and pressure gauges) shall be designed and constructed such that they are protected from impact damage and forces normally encountered in carriage. Manifolds shall have at least the same test pressure as the cylinders. For toxic liquefied gases, each pressure receptacle shall have an isolation valve to ensure that each pressure receptacle can be filled separately and that no interchange of pressure receptacle contents can occur during carriage.

NOTE: *Toxic liquefied gases have the classification codes 2T, 2TF, 2TC, 2TO, 2TFC or 2TOC.*

6.2.1.1.7 Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.

6.2.1.1.8 *Additional requirements for the construction of closed cryogenic receptacles for refrigerated liquefied gases*

6.2.1.1.8.1 The mechanical properties of the metal used shall be established for each pressure receptacle, including the impact strength and the bending coefficient.

NOTE: *With regard to the impact strength, sub-section 6.8.5.3 gives details of test requirements which may be used.*

6.2.1.1.8.2 The pressure receptacles shall be thermally insulated. The thermal insulation shall be protected against impact by means of a jacket. If the space between the pressure receptacle and the jacket is evacuated of air (vacuum-insulation), the jacket shall be designed to withstand without permanent deformation an external pressure of at least 100 kPa (1 bar) calculated in accordance with a recognised technical code or a calculated critical collapsing pressure of not less than 200 kPa (2 bar) gauge pressure. If the jacket is so closed as to be gas-tight (e.g. in the case of vacuum-insulation), a device shall be provided

to prevent any dangerous pressure from developing in the insulating layer in the event of inadequate gas-tightness of the pressure receptacle or its fittings. The device shall prevent moisture from penetrating into the insulation.

6.2.1.1.8.3 Closed cryogenic receptacles intended for the carriage of refrigerated liquefied gases having a boiling point below -182°C at atmospheric pressure shall not include materials which may react with oxygen or oxygen enriched atmospheres in a dangerous manner, when located in parts of the thermal insulation where there is a risk of contact with oxygen or with oxygen enriched liquid.

6.2.1.1.8.4 Closed cryogenic receptacles shall be designed and constructed with suitable lifting and securing arrangements.

6.2.1.1.9 *Additional requirements for the construction of pressure receptacles for acetylene*

Pressure receptacles for UN 1001 acetylene, dissolved, and UN 3374 acetylene, solvent free, shall be filled with a porous material, uniformly distributed, of a type that conforms to the requirements and testing specified by the competent authority and which:

- (a) Is compatible with the pressure receptacle and does not form harmful or dangerous compounds either with the acetylene or with the solvent in the case of UN 1001; and
- (b) Is capable of preventing the spread of decomposition of the acetylene in the porous material.

In the case of UN 1001, the solvent shall be compatible with the pressure receptacle.

6.2.1.2 *Materials*

6.2.1.2.1 Construction materials of pressure receptacles and their closures which are in direct contact with dangerous goods shall not be affected or weakened by the dangerous goods intended to be carried and shall not cause a dangerous effect e.g. catalysing a reaction or reacting with the dangerous goods.

6.2.1.2.2 Pressure receptacles and their closures shall be made of the materials specified in the design and construction technical standards and the applicable packing instruction for the substances intended for carriage in the pressure receptacle. The materials shall be resistant to brittle fracture and to stress corrosion cracking as indicated in the design and construction technical standards.

6.2.1.3 *Service equipment*

6.2.1.3.1 Valves, piping and other fittings subjected to pressure, excluding pressure relief devices, shall be designed and constructed so that the burst pressure is at least 1.5 times the test pressure of the pressure receptacle.

6.2.1.3.2 Service equipment shall be configured or designed to prevent damage that could result in the release of the pressure receptacle contents during normal conditions of handling and carriage. Manifold piping leading to shut-off valves shall be sufficiently flexible to protect the valves and the piping from shearing or releasing the pressure receptacle contents. The filling and discharge valves and any protective caps shall be capable of being secured against unintended opening. Valves shall be protected as specified in 4.1.6.8.

6.2.1.3.3 Pressure receptacles which are not capable of being handled manually or rolled, shall be fitted with devices (skids, rings, straps) ensuring that they can be safely handled by mechanical means and so arranged as not to impair the strength of, nor cause undue stresses in, the pressure receptacle.

6.2.1.3.4 Individual pressure receptacles shall be equipped with pressure relief devices as specified in packing provision P200 (2) or P205 of 4.1.4.1 or in 6.2.1.3.6.4 and 6.2.1.3.6.5. Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure. When fitted, pressure relief devices on manifolded horizontal pressure receptacles filled with flammable gas shall be arranged to discharge freely to the open air in such a manner as to prevent any impingement of escaping gas upon the pressure receptacle itself under normal conditions of carriage.

6.2.1.3.5 Pressure receptacles whose filling is measured by volume shall be provided with a level indicator.

6.2.1.3.6 *Additional requirements for closed cryogenic receptacles*

6.2.1.3.6.1 Each filling and discharge opening in a closed cryogenic receptacle used for the carriage of flammable refrigerated liquefied gases shall be fitted with at least two mutually independent shut-off devices in series, the first being a stop-valve, the second being a cap or equivalent device.

6.2.1.3.6.2 For sections of piping which can be closed at both ends and where liquid product can be trapped, a method of automatic pressure-relief shall be provided to prevent excess pressure build-up within the piping.

6.2.1.3.6.3 Each connection on a closed cryogenic receptacle shall be clearly marked to indicate its function (e.g. vapour or liquid phase).

6.2.1.3.6.4 Pressure-relief devices

6.2.1.3.6.4.1 Every closed cryogenic receptacle shall be provided with at least one pressure-relief device. The pressure-relief device shall be of the type that will resist dynamic forces including surge.

6.2.1.3.6.4.2 Closed cryogenic receptacles may, in addition, have a frangible disc in parallel with the spring loaded device(s) in order to meet the requirements of 6.2.1.3.6.5.

6.2.1.3.6.4.3 Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the pressure-relief device.

6.2.1.3.6.4.4 All pressure-relief device inlets shall under maximum filling conditions be situated in the vapour space of the closed cryogenic receptacle and the devices shall be so arranged as to ensure that the escaping vapour is discharged unrestrictedly.

6.2.1.3.6.5 Capacity and setting of pressure-relief devices

NOTE: *In relation to pressure-relief devices of closed cryogenic receptacles, maximum allowable working pressure (MAWP) means the maximum effective gauge pressure permissible at the top of a loaded closed cryogenic receptacle in its operating position including the highest effective pressure during filling and discharge.*

6.2.1.3.6.5.1 The pressure-relief device shall open automatically at a pressure not less than the MAWP and be fully open at a pressure equal to 110% of the MAWP. It shall, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and shall remain closed at all lower pressures.

6.2.1.3.6.5.2 Frangible discs shall be set to rupture at a nominal pressure which is the lower of either the test pressure or 150% of the MAWP.

6.2.1.3.6.5.3 In the case of the loss of vacuum in a vacuum-insulated closed cryogenic receptacle the combined capacity of all pressure-relief devices installed shall be sufficient so that the pressure (including accumulation) inside the closed cryogenic receptacle does not exceed 120% of the MAWP.

6.2.1.3.6.5.4 The required capacity of the pressure-relief devices shall be calculated in accordance with an established technical code recognized by the competent authority¹.

6.2.1.4 *Approval of pressure receptacles*

6.2.1.4.1 The conformity of pressure receptacles shall be assessed at time of manufacture as required by the competent authority. Pressure receptacles shall be inspected, tested and approved by an inspection body. The technical documentation shall include full specifications on design and construction, and full documentation on the manufacturing and testing.

6.2.1.4.2 Quality assurance systems shall conform to the requirements of the competent authority.

¹ See for example CGA Publications S-1.2-2003 "Pressure Relief Device Standards-Part 2-Cargo and Portable Tanks for Compressed Gases" and S-1.1-2003 "Pressure Relief Device Standards-Part 1-Cylinders for Compressed Gases".

6.2.1.5 Initial inspection and test

6.2.1.5.1 New pressure receptacles, other than closed cryogenic receptacles and metal hydride storage systems, shall be subjected to testing and inspection during and after manufacture in accordance with the applicable design standards including the following:

On an adequate sample of pressure receptacles:

- (a) Testing of the mechanical characteristics of the material of construction;
- (b) Verification of the minimum wall thickness;
- (c) Verification of the homogeneity of the material for each manufacturing batch;
- (d) Inspection of the external and internal conditions of the pressure receptacles;
- (e) Inspection of the neck threads;
- (f) Verification of the conformance with the design standard;

For all pressure receptacles:

- (g) A hydraulic pressure test. Pressure receptacles shall withstand the test pressure without expansion greater than that allowed in the design specification;

NOTE: *With the agreement of the competent authority, the hydraulic pressure test may be replaced by a test using a gas, where such an operation does not entail any danger.*

- (h) Inspection and assessment of manufacturing defects and either repairing them or rendering the pressure receptacles unserviceable. In the case of welded pressure receptacles, particular attention shall be paid to the quality of the welds;
- (i) An inspection of the markings on the pressure receptacles;
- (j) In addition, pressure receptacles intended for the carriage of UN No. 1001 acetylene, dissolved, and UN No. 3374 acetylene, solvent free, shall be inspected to ensure proper installation and condition of the porous material and, if applicable, the quantity of solvent.

6.2.1.5.2 On an adequate sample of closed cryogenic receptacles, the inspections and tests specified in 6.2.1.5.1 (a), (b), (d) and (f) shall be performed. In addition, welds shall be inspected by radiographic, ultrasonic or another suitable non-destructive test method on a sample of closed cryogenic receptacles according to the applicable design and construction standard. This weld inspection does not apply to the jacket.

Additionally, all closed cryogenic receptacles shall undergo the initial inspections and tests specified in 6.2.1.5.1 (g), (h) and (i), as well as a leakproofness test and a test of the satisfactory operation of the service equipment after assembly.

6.2.1.5.3 For metal hydride storage systems, it shall be verified that the inspections and tests specified in 6.2.1.5.1 (a), (b), (c), (d), (e) if applicable, (f), (g), (h) and (i) have been performed on an adequate sample of the receptacles used in the metal hydride storage system. In addition, on an adequate sample of metal hydride storage systems, the inspections and tests specified in 6.2.1.5.1 (c) and (f) shall be performed, as well as 6.2.1.5.1 (e), if applicable, and inspection of the external conditions of the metal hydride storage system.

Additionally, all metal hydride storage systems shall undergo the initial inspections and tests specified in 6.2.1.5.1 (h) and (i), as well as a leakproofness test and a test of the satisfactory operation of the service equipment.

6.2.1.6 ***Periodic inspection and test***

6.2.1.6.1 Refillable pressure receptacles, other than cryogenic receptacles, shall be subjected to periodic inspections and tests by a body authorised by the competent authority, in accordance with the following:

- (a) Check of the external conditions of the pressure receptacle and verification of the equipment and the external markings;
- (b) Check of the internal conditions of the pressure receptacle (e.g. internal inspection, verification of minimum wall thickness);
- (c) Checking of the threads if there is evidence of corrosion or if the fittings are removed;
- (d) A hydraulic pressure test and, if necessary, verification of the characteristics of the material by suitable tests;
- (e) Check of service equipment, other accessories and pressure-relief devices, if to be reintroduced into service.

NOTE 1: *With the agreement of the competent authority, the hydraulic pressure test may be replaced by a test using a gas, where such an operation does not entail any danger.*

NOTE 2: *With the agreement of the competent authority, the hydraulic pressure test of cylinders or tubes may be replaced by an equivalent method based on acoustic emission testing or a combination of acoustic emission testing and ultrasonic examination. ISO 16148:2006 may be used as a guide for acoustic emission testing procedures.*

NOTE 3: *The hydraulic pressure test may be replaced by ultrasonic examination carried out in accordance with ISO 10461:2005+A1:2006 for seamless aluminium alloy gas cylinders and in accordance with ISO 6406:2005 for seamless steel gas cylinders.*

NOTE 4: *For the periodic inspection and test frequencies, see packing instruction P200 of 4.1.4.1 or, for a chemical under pressure, packing instruction P206 of 4.1.4.1.*

6.2.1.6.2 Pressure receptacles intended for the carriage of UN No. 1001 acetylene, dissolved and UN No. 3374 acetylene, solvent free, shall be examined only as specified in 6.2.1.6.1 (a), (c) and (e). In addition the condition of the porous material (e.g. cracks, top clearance, loosening, settlement) shall be examined.

6.2.1.6.3 Pressure relief valves for closed cryogenic receptacles shall be subject to periodic inspections and tests.

6.2.1.7 ***Requirements for manufacturers***

6.2.1.7.1 The manufacturer shall be technically able and shall possess all resources required for the satisfactory manufacture of pressure receptacles; this relates in particular to qualified personnel:

- (a) To supervise the entire manufacturing process;
- (b) To carry out joining of materials; and
- (c) To carry out the relevant tests.

6.2.1.7.2 The proficiency test of a manufacturer shall in all instances be carried out by an inspection body approved by the competent authority of the country of approval.

6.2.1.8 ***Requirements for inspection bodies***

6.2.1.8.1 Inspection bodies shall be independent from manufacturing enterprises and competent to perform the tests, inspections and approvals required.

6.2.2 Requirements for UN pressure receptacles

In addition to the general requirements of section 6.2.1, UN pressure receptacles shall comply with the requirements of this section, including the standards, as applicable. Manufacture of new pressure receptacles or service equipment according to any particular standard in 6.2.2.1 and 6.2.2.3 is not permitted after the date shown in the right hand column of the tables.

NOTE: UN pressure receptacles and service equipment constructed according to standards applicable at the date of manufacture may continue in use subject to the periodic inspection provisions of ADR.

6.2.2.1 Design, construction and initial inspection and test

6.2.2.1.1 The following standards apply for the design, construction, and initial inspection and test of UN cylinders, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

Reference	Title	Applicable for manufacture
ISO 9809-1:1999	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 1: Quenched and tempered steel cylinders with tensile strength less than 1 100 MPa NOTE: The note concerning the F factor in section 7.3 of this standard shall not be applied for UN cylinders.	Until 31 December 2018
ISO 9809-1:2010	Gas cylinders -- Refillable seamless steel gas cylinders -- Design, construction and testing -- Part 1: Quenched and tempered steel cylinders with tensile strength less than 1 100 MPa	Until further notice
ISO 9809-2:2000	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 2: Quenched and tempered steel cylinders with tensile strength greater than or equal to 1 100 MPa	Until 31 December 2018
ISO 9809-2:2010	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 2: Quenched and tempered steel cylinders with tensile strength greater than or equal to 1 100 MPa	Until further notice
ISO 9809-3:2000	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 3: Normalized steel cylinders	Until 31 December 2018
ISO 9809-3:2010	Gas cylinders -- Refillable seamless steel gas cylinders -- Design, construction and testing -- Part 3: Normalized steel cylinders	Until further notice
ISO 7866:1999	Gas cylinders – Refillable seamless aluminium alloy gas cylinders – Design, construction and testing NOTE: The note concerning the F factor in section 7.2 of this standard shall not be applied for UN cylinders. Aluminium alloy 6351A – T6 or equivalent shall not be authorised.	Until 31 December 2020
ISO 7866: 2012	Gas cylinders – Refillable seamless aluminium alloy gas cylinders – Design, construction and testing NOTE: Aluminium alloy 6351A or equivalent shall not be used.	Until further notice
ISO 4706:2008	Gas cylinders – Refillable welded steel cylinders – Test pressure 60 bar and below	Until further notice
ISO 18172-1:2007	Gas cylinders – Refillable welded stainless steel cylinders – Part 1: Test pressure 6 MPa and below	Until further notice
ISO 20703:2006	Gas cylinders – Refillable welded aluminium-alloy cylinders – Design, construction and testing	Until further notice
ISO 11118:1999	Gas cylinders – Non-refillable metallic gas cylinders – Specification and test methods	Until further notice

Reference	Title	Applicable for manufacture
ISO 11119-1:2002	Gas cylinders of composite construction – Specification and test methods – Part 1: Hoop wrapped composite gas cylinders	Until further notice
ISO 11119-2:2002	Gas cylinders of composite construction – Specification and test methods – Part 2: Fully wrapped fibre reinforced composite gas cylinders with load-sharing metal liners	Until further notice
ISO 11119-3:2002	Gas cylinders of composite construction – Specification and test methods – Part 3: Fully wrapped fibre reinforced composite gas cylinders with non-load-sharing metallic or non-metallic liners	Until further notice

NOTE 1: In the above referenced standards composite cylinders shall be designed for unlimited service life.

NOTE 2: After the first 15 years of service, composite cylinders manufactured according to these standards, may be approved for extended service by the competent authority which was responsible for the original approval of the cylinders and which will base its decision on the test information supplied by the manufacturer or owner or user.

6.2.2.1.2

The following standard apply for the design, construction, and initial inspection and test of UN tubes, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

Reference	Title	Applicable for manufacture
ISO 11120:1999	Gas cylinders – Refillable seamless steel tubes for compressed gas transport, of water capacity between 150 l and 3 000 l – Design, construction and testing NOTE: The note concerning the <i>F</i> factor in section 7.1 of this standard shall not be applied for UN tubes.	Until further notice

6.2.2.1.3

The following standards apply for the design, construction and initial inspection and test of UN acetylene cylinders, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

For the cylinder shell:

Reference	Title	Applicable for manufacture
ISO 9809-1:1999	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 1: Quenched and tempered steel cylinders with tensile strength less than 1 100 MPa NOTE: The note concerning the <i>F</i> factor in section 7.3 of this standard shall not be applied for UN cylinders.	Until 31 December 2018
ISO 9809-1:2010	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 1: Quenched and tempered steel cylinders with tensile strength less than 1 100 MPa	Until further notice
ISO 9809-3:2000	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 3: Normalized steel cylinders	Until 31 December 2018
ISO 9809-3:2010	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 3: Normalized steel cylinders	Until further notice

For the porous material in the cylinder:

Reference	Title	Applicable for manufacture
ISO 3807-1:2000	Cylinders for acetylene – Basic requirements – Part 1: Cylinders without fusible plugs	Until further notice
ISO 3807-2:2000	Cylinders for acetylene – Basic requirements – Part 2: Cylinders with fusible plugs	Until further notice

- 6.2.2.1.4 The following standard apply for the design, construction, and initial inspection and test of UN cryogenic receptacles, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

Reference	Title	Applicable for manufacture
ISO 21029-1:2004	Cryogenic vessels – Transportable vacuum insulated vessels of not more than 1 000 l volume – Part 1: Design, fabrication, inspection and tests	Until further notice

- 6.2.2.1.5 The following standard applies for the design, construction, and initial inspection and test of UN metal hydride storage systems, except that inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5:

Reference	Title	Applicable for manufacture
ISO 16111:2008	Transportable gas storage devices – Hydrogen absorbed in reversible metal hydride	Until further notice

- 6.2.2.1.6 The standard shown below applies to the design, construction and initial inspection and test of UN bundles of cylinders. Each cylinder in a UN bundle of cylinders shall be a UN cylinder complying with the requirements of 6.2.2. The inspection requirements related to the conformity assessment system and approval for UN bundles of cylinders shall be in accordance with 6.2.2.5.

Reference	Title	Applicable for manufacture
ISO 10961:2010	Gas cylinders – Cylinder bundles – Design, manufacture, testing and inspection	Until further notice

NOTE: Changing one or more cylinders of the same design type, including the same test pressure, in an existing UN bundle of cylinders does not require re-certification of the existing bundle.

- 6.2.2.1.7 The following standards apply to the design, construction and initial inspection and test of UN cylinders for adsorbed gases except that the inspection requirements related to the conformity assessment system and approval shall be in accordance with 6.2.2.5.

Reference	Title	Applicable for manufacture
ISO 11513:2011	Gas cylinders – Refillable welded steel cylinders containing materials for sub-atmospheric gas packaging (excluding acetylene) – Design, construction, testing, use and periodic inspection	Until further notice
ISO 9809-1:2010	Gas cylinders – Refillable seamless steel gas cylinders – Design, construction and testing – Part 1: Quenched and tempered steel cylinders with tensile strength less than 1 100 MPa	Until further notice

6.2.2.2**Materials**

In addition to the material requirements specified in the pressure receptacle design and construction standards, and any restrictions specified in the applicable packing instruction for the gas(es) to be carried (e.g. packing instruction P200 or P205 of 4.1.4.1), the following standards apply to material compatibility:

ISO 11114-1:2012	Gas cylinders – Compatibility of cylinder and valve materials with gas contents – Part 1: Metallic materials
ISO 11114-2:2000	Transportable gas cylinders – Compatibility of cylinder and valve materials with gas contents – Part 2: Non-metallic materials

6.2.2.3**Service equipment**

The following standards apply to closures and their protection:

Reference	Title	Applicable for manufacture
ISO 11117:1998	Gas cylinders – Valve protection caps and valve guards for industrial and medical gas cylinders – Design, construction and tests	Until 31 December 2014
ISO 11117:2008 + Cor 1:2009	Gas cylinders – Valve protection caps and valve guards – Design, construction and tests	Until further notice
ISO 10297:1999	Gas cylinders – Refillable gas cylinder valves – Specification and type testing	Until 31 December 2008
ISO 10297:2006	Gas cylinders – Refillable gas cylinder valves – Specification and type testing <i>NOTE: The EN version of this ISO standard fulfils the requirements and may also be used.</i>	Until further notice
ISO 13340:2001	Transportable gas cylinders – Cylinder valves for non-refillable cylinders – Specification and prototype testing	Until further notice

For UN metal hydride storage systems, the requirements specified in the following standard apply to closures and their protection:

Reference	Title	Applicable for manufacture
ISO 16111:2008	Transportable gas storage devices – Hydrogen absorbed in reversible metal hydride	Until further notice

6.2.2.4**Periodic inspection and test**

The following standards apply to the periodic inspection and testing of UN cylinders and UN metal hydride storage systems:

Reference	Title	Applicable for manufacture
ISO 6406:2005	Periodic inspection and testing of seamless steel gas cylinders	Until further notice
ISO 10460:2005	Gas cylinders – Welded carbon-steel gas cylinders – Periodic inspection and testing <i>NOTE: The repair of welds described in clause 12.1 of this standard shall not be permitted. Repairs described in clause 12.2 require the approval of the competent authority which approved the periodic inspection and test body in accordance with 6.2.2.6.</i>	Until further notice
ISO 10461:2005 + A1:2006	Seamless aluminium-alloy gas cylinders – Periodic inspection and testing	Until further notice
ISO 10462:2005	Gas cylinders – Transportable cylinders for dissolved acetylene – Periodic inspection and maintenance	Until further notice

Reference	Title	Applicable for manufacture
ISO 11513:2011	Gas cylinders – Refillable welded steel cylinders containing materials for sub-atmospheric gas packaging (excluding acetylene) – Design, construction, testing, use and periodic inspection	Until further notice
ISO 11623:2002	Transportable gas cylinders – Periodic inspection and testing of composite gas cylinders	Until further notice
ISO 16111:2008	Transportable gas storage devices – Hydrogen absorbed in reversible metal hydride	Until further notice

6.2.2.5 *Conformity assessment system and approval for manufacture of pressure receptacles*

6.2.2.5.1 *Definitions*

For the purposes of this sub-section:

Conformity assessment system means a system for competent authority approval of a manufacturer, by pressure receptacle design type approval, approval of manufacturer's quality system and approval of inspection bodies;

Design type means a pressure receptacle design as specified by a particular pressure receptacle standard;

Verify means confirm by examination or provision of objective evidence that specified requirements have been fulfilled.

6.2.2.5.2 *General requirements*

Competent authority

6.2.2.5.2.1 The competent authority that approves the pressure receptacle shall approve the conformity assessment system for the purpose of ensuring that pressure receptacles conform to the requirements of ADR. In instances where the competent authority that approves a pressure receptacle is not the competent authority in the country of manufacture, the marks of the approval country and the country of manufacture shall be indicated in the pressure receptacle marking (see 6.2.2.7 and 6.2.2.8).

The competent authority of the country of approval shall supply, upon request, evidence demonstrating compliance to this conformity assessment system to its counterpart in a country of use.

6.2.2.5.2.2 The competent authority may delegate its functions in this conformity assessment system in whole or in part.

6.2.2.5.2.3 The competent authority shall ensure that a current list of approved inspection bodies and their identity marks and approved manufacturers and their identity marks is available.

Inspection body

6.2.2.5.2.4 The inspection body shall be approved by the competent authority for the inspection of pressure receptacles and shall:

- Have a staff with an organizational structure, capable, trained, competent, and skilled, to satisfactorily perform its technical functions;
- Have access to suitable and adequate facilities and equipment;
- Operate in an impartial manner and be free from any influence which could prevent it from doing so;
- Ensure commercial confidentiality of the commercial and proprietary activities of the manufacturer and other bodies;

- (e) Maintain clear demarcation between actual inspection body functions and unrelated functions;
- (f) Operate a documented quality system;
- (g) Ensure that the tests and inspections specified in the relevant pressure receptacle standard and ADR are performed; and
- (h) Maintain an effective and appropriate report and record system in accordance with 6.2.2.5.6.

6.2.2.5.2.5 The inspection body shall perform design type approval, pressure receptacle production testing and inspection, and certification to verify conformity with the relevant pressure receptacle standard (see 6.2.2.5.4 and 6.2.2.5.5).

Manufacturer

6.2.2.5.2.6 The manufacturer shall:

- (a) Operate a documented quality system in accordance with 6.2.2.5.3;
- (b) Apply for design type approvals in accordance with 6.2.2.5.4;
- (c) Select an inspection body from the list of approved inspection bodies maintained by the competent authority in the country of approval; and
- (d) Maintain records in accordance with 6.2.2.5.6.

Testing laboratory

6.2.2.5.2.7 The testing laboratory shall have:

- (a) Staff with an organizational structure, sufficient in number, competence, and skill; and
- (b) Suitable and adequate facilities and equipment to perform the tests required by the manufacturing standard to the satisfaction of the inspection body.

6.2.2.5.3 *Manufacturer's quality system*

6.2.2.5.3.1 The quality system shall contain all the elements, requirements, and provisions adopted by the manufacturer. It shall be documented in a systematic and orderly manner in the form of written policies, procedures and instructions.

The contents shall in particular include adequate descriptions of:

- (a) The organizational structure and responsibilities of personnel with regard to design and product quality;
- (b) The design control and design verification techniques, processes, and procedures that will be used when designing the pressure receptacles;
- (c) The relevant pressure receptacle manufacturing, quality control, quality assurance and process operation instructions that will be used;
- (d) Quality records, such as inspection reports, test data and calibration data;
- (e) Management reviews to ensure the effective operation of the quality system arising from the audits in accordance with 6.2.2.5.3.2;
- (f) The process describing how customer requirements are met;
- (g) The process for control of documents and their revision;

- (h) The means for control of non-conforming pressure receptacles, purchased components, in-process and final materials; and
- (i) Training programmes and qualification procedures for relevant personnel.

6.2.2.5.3.2 Audit of the quality system

The quality system shall be initially assessed to determine whether it meets the requirements in 6.2.2.5.3.1 to the satisfaction of the competent authority.

The manufacturer shall be notified of the results of the audit. The notification shall contain the conclusions of the audit and any corrective actions required.

Periodic audits shall be carried out, to the satisfaction of the competent authority, to ensure that the manufacturer maintains and applies the quality system. Reports of the periodic audits shall be provided to the manufacturer.

6.2.2.5.3.3 Maintenance of the quality system

The manufacturer shall maintain the quality system as approved in order that it remains adequate and efficient.

The manufacturer shall notify the competent authority that approved the quality system, of any intended changes. The proposed changes shall be evaluated in order to determine whether the amended quality system will still satisfy the requirements in 6.2.2.5.3.1.

6.2.2.5.4 Approval process

Initial design type approval

6.2.2.5.4.1 The initial design type approval shall consist of approval of the manufacturer's quality system and approval of the pressure receptacle design to be produced. An application for an initial design type approval shall meet the requirements of 6.2.2.5.4.2 to 6.2.2.5.4.6 and 6.2.2.5.4.9.

6.2.2.5.4.2 A manufacturer desiring to produce pressure receptacles in accordance with a pressure receptacle standard and ADR shall apply for, obtain, and retain a design type approval certificate issued by the competent authority in the country of approval for at least one pressure receptacle design type in accordance with the procedure given in 6.2.2.5.4.9. This certificate shall, on request, be submitted to the competent authority of the country of use.

6.2.2.5.4.3 An application shall be made for each manufacturing facility and shall include:

- (a) The name and registered address of the manufacturer and in addition, if the application is submitted by an authorised representative, its name and address;
- (b) The address of the manufacturing facility (if different from the above);
- (c) The name and title of the person(s) responsible for the quality system;
- (d) The designation of the pressure receptacle and the relevant pressure receptacle standard;
- (e) Details of any refusal of approval of a similar application by any other competent authority;
- (f) The identity of the inspection body for design type approval;
- (g) Documentation on the manufacturing facility as specified under 6.2.2.5.3.1; and
- (h) The technical documentation required for design type approval, which shall enable verification of the conformity of the pressure receptacles with the requirements of the relevant pressure receptacle design standard. The technical documentation shall cover the design and method of manufacture and shall contain, as far as is relevant for assessment, at least the following:

- (i) pressure receptacle design standard, design and manufacturing drawings, showing components and subassemblies, if any;
- (ii) descriptions and explanations necessary for the understanding of the drawings and intended use of the pressure receptacles;
- (iii) a list of the standards necessary to fully define the manufacturing process;
- (iv) design calculations and material specifications; and
- (v) design type approval test reports, describing the results of examinations and tests carried out in accordance with 6.2.2.5.4.9.

6.2.2.5.4.4 An initial audit in accordance with 6.2.2.5.3.2 shall be performed to the satisfaction of the competent authority.

6.2.2.5.4.5 If the manufacturer is denied approval, the competent authority shall provide written detailed reasons for such denial.

6.2.2.5.4.6 Following approval, changes to the information submitted under 6.2.2.5.4.3 relating to the initial approval shall be provided to the competent authority.

Subsequent design type approvals

6.2.2.5.4.7 An application for a subsequent design type approval shall meet the requirements of 6.2.2.5.4.8 and 6.2.2.5.4.9, provided a manufacturer is in the possession of an initial design type approval. In such a case, the manufacturer's quality system according to 6.2.2.5.3 shall have been approved during the initial design type approval and shall be applicable for the new design.

6.2.2.5.4.8 The application shall include:

- (a) The name and address of the manufacturer and in addition, if the application is submitted by an authorised representative, its name and address;
- (b) Details of any refusal of approval of a similar application by any other competent authority;
- (c) Evidence that initial design type approval has been granted; and
- (d) The technical documentation, as described in 6.2.2.5.4.3 (h).

Procedure for design type approval

6.2.2.5.4.9 The inspection body shall:

- (a) Examine the technical documentation to verify that:
 - (i) the design is in accordance with the relevant provisions of the standard, and
 - (ii) the prototype lot has been manufactured in conformity with the technical documentation and is representative of the design;
- (b) Verify that the production inspections have been carried out as required in accordance with 6.2.2.5.5;
- (c) Select pressure receptacles from a prototype production lot and supervise the tests of these pressure receptacles as required for design type approval;

- (d) Perform or have performed the examinations and tests specified in the pressure receptacle standard to determine that:
 - (i) the standard has been applied and fulfilled, and
 - (ii) the procedures adopted by the manufacturer meet the requirements of the standard; and
- (e) Ensure that the various type approval examinations and tests are correctly and competently carried out.

After prototype testing has been carried out with satisfactory results and all applicable requirements of 6.2.2.5.4 have been satisfied, a design type approval certificate shall be issued, which shall include the name and address of the manufacturer, results and conclusions of the examination, and the necessary data for identification of the design type.

If the manufacturer is denied a design type approval, the competent authority shall provide written detailed reasons for such denial.

6.2.2.5.4.10 Modifications to approved design types

The manufacturer shall either:

- (a) Inform the issuing competent authority of modifications to the approved design type, where such modifications do not constitute a new design, as specified in the pressure receptacle standard; or
- (b) Request a subsequent design type approval where such modifications constitute a new design according to the relevant pressure receptacle standard. This additional approval shall be given in the form of an amendment to the original design type approval certificate.

6.2.2.5.4.11 Upon request, the competent authority shall communicate to any other competent authority, information concerning design type approval, modifications of approvals and withdrawn approvals.

6.2.2.5.5 *Production inspection and certification*

General requirements

An inspection body, or its delegate, shall carry out the inspection and certification of each pressure receptacle. The inspection body selected by the manufacturer for inspection and testing during production may be different from the inspection body used for the design type approval testing.

Where it can be demonstrated to the satisfaction of the inspection body that the manufacturer has trained competent inspectors, independent of the manufacturing operations, inspection may be performed by those inspectors. In such a case, the manufacturer shall maintain training records of the inspectors.

The inspection body shall verify that the inspections by the manufacturer, and tests performed on those pressure receptacles, fully conform to the standard and the requirements of ADR. Should non-conformance in conjunction with this inspection and testing be determined, the permission to have inspection performed by the manufacturer's inspectors may be withdrawn.

The manufacturer shall, after approval by the inspection body, make a declaration of conformity with the certified design type. The application of the pressure receptacle certification marking shall be considered a declaration that the pressure receptacle complies with the applicable pressure receptacle standards and the requirements of this conformity assessment system and ADR. The inspection body shall affix or delegate the manufacturer to affix the pressure receptacle certification marking and the registered mark of the inspection body to each approved pressure receptacle.

A certificate of compliance, signed by the inspection body and the manufacturer, shall be issued before the pressure receptacles are filled.

6.2.2.5.6 *Records*

Design type approval and certificate of compliance records shall be retained by the manufacturer and the inspection body for not less than 20 years.

6.2.2.6 *Approval system for periodic inspection and test of pressure receptacles***6.2.2.6.1** *Definition*

For the purposes of this section:

Approval system means a system for competent authority approval of a body performing periodic inspection and test of pressure receptacles (hereinafter referred to as "periodic inspection and test body"), including approval of that body's quality system.

6.2.2.6.2 *General requirements**Competent authority*

6.2.2.6.2.1 The competent authority shall establish an approval system for the purpose of ensuring that the periodic inspection and test of pressure receptacles conform to the requirements of ADR. In instances where the competent authority that approves a body performing periodic inspection and test of a pressure receptacle is not the competent authority of the country approving the manufacture of the pressure receptacle, the marks of the approval country of periodic inspection and test shall be indicated in the pressure receptacle marking (see 6.2.2.7).

The competent authority of the country of approval for the periodic inspection and test shall supply, upon request, evidence demonstrating compliance to this approval system including the records of the periodic inspection and test to its counterpart in a country of use.

The competent authority of the country of approval may terminate the approval certificate referred to in 6.2.2.6.4.1, upon evidence demonstrating non-compliance with the approval system.

6.2.2.6.2.2 The competent authority may delegate its functions in this approval system, in whole or in part.

6.2.2.6.2.3 The competent authority shall ensure that a current list of approved periodic inspection and test bodies and their identity marks is available.

Periodic inspection and test body

6.2.2.6.2.4 The periodic inspection and test body shall be approved by the competent authority and shall:

- (a) Have a staff with an organizational structure, capable, trained, competent, and skilled, to satisfactorily perform its technical functions;
- (b) Have access to suitable and adequate facilities and equipment;
- (c) Operate in an impartial manner and be free from any influence which could prevent it from doing so;
- (d) Ensure commercial confidentiality;
- (e) Maintain clear demarcation between actual periodic inspection and test body functions and unrelated functions;
- (f) Operate a documented quality system accordance with 6.2.2.6.3;
- (g) Apply for approval in accordance with 6.2.2.6.4;
- (h) Ensure that the periodic inspections and tests are performed in accordance with 6.2.2.6.5; and
- (i) Maintain an effective and appropriate report and record system in accordance with 6.2.2.6.6.

6.2.2.6.3 *Quality system and audit of the periodic inspection and test body*

6.2.2.6.3.1 Quality system

The quality system shall contain all the elements, requirements, and provisions adopted by the periodic inspection and test body. It shall be documented in a systematic and orderly manner in the form of written policies, procedures, and instructions.

The quality system shall include:

- (a) A description of the organizational structure and responsibilities;
- (b) The relevant inspection and test, quality control, quality assurance, and process operation instructions that will be used;
- (c) Quality records, such as inspection reports, test data, calibration data and certificates;
- (d) Management reviews to ensure the effective operation of the quality system arising from the audits performed in accordance with 6.2.2.6.3.2;
- (e) A process for control of documents and their revision;
- (f) A means for control of non-conforming pressure receptacles; and
- (g) Training programmes and qualification procedures for relevant personnel.

6.2.2.6.3.2 Audit

The periodic inspection and test body and its quality system shall be audited in order to determine whether it meets the requirements of ADR to the satisfaction of the competent authority.

An audit shall be conducted as part of the initial approval process (see 6.2.2.6.4.3). An audit may be required as part of the process to modify an approval (see 6.2.2.6.4.6).

Periodic audits shall be conducted, to the satisfaction of the competent authority, to ensure that the periodic inspection and test body continues to meet the requirements of ADR.

The periodic inspection and test body shall be notified of the results of any audit. The notification shall contain the conclusions of the audit and any corrective actions required.

6.2.2.6.3.3 Maintenance of the quality system

The periodic inspection and test body shall maintain the quality system as approved in order that it remains adequate and efficient.

The periodic inspection and test body shall notify the competent authority that approved the quality system, of any intended changes, in accordance with the process for modification of an approval in 6.2.2.6.4.6.

6.2.2.6.4 *Approval process for periodic inspection and test bodies*

Initial approval

6.2.2.6.4.1 A body desiring to perform periodic inspection and test of pressure receptacles in accordance with a pressure receptacle standard and ADR shall apply for, obtain, and retain an approval certificate issued by the competent authority.

This written approval shall, on request, be submitted to the competent authority of a country of use.

6.2.2.6.4.2 An application shall be made for each periodic inspection and test body and shall include:

- (a) The name and address of the periodic inspection and test body and, if the application is submitted by an authorised representative, its name and address;

- (b) The address of each facility performing periodic inspection and test;
- (c) The name and title of the person(s) responsible for the quality system;
- (d) The designation of the pressure receptacles, the periodic inspection and test methods, and the relevant pressure receptacle standards met by the quality system;
- (e) Documentation on each facility, the equipment, and the quality system as specified under 6.2.2.6.3.1;
- (f) The qualifications and training records of the periodic inspection and test personnel; and
- (g) Details of any refusal of approval of a similar application by any other competent authority.

6.2.2.6.4.3 The competent authority shall:

- (a) Examine the documentation to verify that the procedures are in accordance with the requirements of the relevant pressure receptacle standards and ADR; and
- (b) Conduct an audit in accordance with 6.2.2.6.3.2 to verify that the inspections and tests are carried out as required by the relevant pressure receptacle standards and ADR, to the satisfaction of the competent authority.

6.2.2.6.4.4 After the audit has been carried out with satisfactory results and all applicable requirements of 6.2.2.6.4 have been satisfied, an approval certificate shall be issued. It shall include the name of the periodic inspection and test body, the registered mark, the address of each facility, and the necessary data for identification of its approved activities (e.g. designation of pressure receptacles, periodic inspection and test method and pressure receptacle standards).

6.2.2.6.4.5 If the periodic inspection and test body is denied approval, the competent authority shall provide written detailed reasons for such denial.

Modifications to periodic inspection and test body approvals

6.2.2.6.4.6 Following approval, the periodic inspection and test body shall notify the issuing competent authority of any modifications to the information submitted under 6.2.2.6.4.2 relating to the initial approval.

The modifications shall be evaluated in order to determine whether the requirements of the relevant pressure receptacle standards and ADR will be satisfied. An audit in accordance with 6.2.2.6.3.2 may be required. The competent authority shall accept or reject these modifications in writing, and an amended approval certificate shall be issued as necessary.

6.2.2.6.4.7 Upon request, the competent authority shall communicate to any other competent authority, information concerning initial approvals, modifications of approvals, and withdrawn approvals.

6.2.2.6.5 *Periodic inspection and test and certification*

The application of the periodic inspection and test marking to a pressure receptacle shall be considered a declaration that the pressure receptacle complies with the applicable pressure receptacle standards and the requirements of ADR. The periodic inspection and test body shall affix the periodic inspection and test marking, including its registered mark, to each approved pressure receptacle (see 6.2.2.7.7).

A record certifying that a pressure receptacle has passed the periodic inspection and test shall be issued by the periodic inspection and test body, before the pressure receptacle is filled.

6.2.2.6.6 *Records*

The periodic inspection and test body shall retain records of pressure receptacle periodic inspection and tests (both passed and failed) including the location of the test facility, for not less than 15 years.

The owner of the pressure receptacle shall retain an identical record until the next periodic inspection and test unless the pressure receptacle is permanently removed from service.

6.2.2.7 Marking of refillable UN pressure receptacles

NOTE: Marking requirements for UN metal hydride storage systems are given in 6.2.2.9 and marking requirements for UN bundles of cylinders are given in 6.2.2.10.

6.2.2.7.1 Refillable UN pressure receptacles shall be marked clearly and legibly with certification, operational and manufacturing marks. These marks shall be permanently affixed (e.g. stamped, engraved, or etched) on the pressure receptacle. The marks shall be on the shoulder, top end or neck of the pressure receptacle or on a permanently affixed component of the pressure receptacle (e.g. welded collar or corrosion resistant plate welded on the outer jacket of a closed cryogenic receptacle). Except for the UN packaging symbol, the minimum size of the marks shall be 5 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 2.5 mm for pressure receptacles with a diameter less than 140 mm. The minimum size of the UN packaging symbol shall be 10 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 5 mm for pressure receptacles with a diameter less than 140 mm.

6.2.2.7.2 The following certification marks shall be applied:

(a) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7². This symbol shall not be used for pressure receptacles which only conform to the requirements of 6.2.3 to 6.2.5 (see 6.2.3.9).

(b) The technical standard (e.g. ISO 9809-1) used for design, manufacture and testing;

(c) The character(s) identifying the country of approval as indicated by the distinguishing signs for motor vehicles in international traffic³;

NOTE: The country of approval shall be understood to be the country that approved the body which inspected the individual receptacle at time of manufacture.

(d) The identity mark or stamp of the inspection body that is registered with the competent authority of the country authorizing the marking;

(e) The date of the initial inspection, the year (four digits) followed by the month (two digits) separated by a slash (i.e. "/");

6.2.2.7.3 The following operational marks shall be applied:

(f) The test pressure in bar, preceded by the letters "PH" and followed by the letters "BAR";

(g) The mass of the empty pressure receptacle including all permanently attached integral parts (e.g. neck ring, foot ring, etc.) in kilograms, followed by the letters "KG". This mass shall not include the mass of valve, valve cap or valve guard, any coating or porous material for acetylene. The mass shall be expressed to three significant figures rounded up to the last digit. For cylinders of less than 1 kg, the mass shall be expressed to two significant figures rounded up to the last digit. In the case of pressure receptacles for UN No. 1001 acetylene, dissolved and UN No. 3374 acetylene, solvent free, at least one decimal shall be shown after the decimal point and two digits for pressure receptacles of less than 1 kg;

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

- (h) The minimum guaranteed wall thickness of the pressure receptacle in millimetres followed by the letters "MM". This mark is not required for pressure receptacles with a water capacity less than or equal to 1 litre or for composite cylinders or for closed cryogenic receptacles;
- (i) In the case of pressure receptacles for compressed gases, UN No. 1001 acetylene, dissolved, and UN No. 3374 acetylene, solvent free, the working pressure in bar, preceded by the letters "PW". In the case of closed cryogenic receptacles, the maximum allowable working pressure preceded by the letters "MAWP";
- (j) In the case of pressure receptacles for liquefied gases and refrigerated liquefied gases, the water capacity in litres expressed to three significant figures rounded down to the last digit, followed by the letter "L". If the value of the minimum or nominal water capacity is an integer, the figures after the decimal point may be neglected;
- (k) In the case of pressure receptacles for UN No. 1001 acetylene, dissolved, the total of the mass of the empty receptacle, the fittings and accessories not removed during filling, any coating, the porous material, the solvent and the saturation gas expressed to three significant figures rounded down to the last digit followed by the letters "KG". At least one decimal shall be shown after the decimal point. For pressure receptacles of less than 1 kg, the mass shall be expressed to two significant figures rounded down to the last digit;
- (l) In the case of pressure receptacles for UN No. 3374 acetylene, solvent free, the total of the mass of the empty receptacle, the fittings and accessories not removed during filling, any coating and the porous material expressed to three significant figures rounded down to the last digit followed by the letters "KG". At least one decimal shall be shown after the decimal point. For pressure receptacles of less than 1 kg, the mass shall be expressed to two significant figures rounded down to the last digit;

6.2.2.7.4 The following manufacturing marks shall be applied:

- (m) Identification of the cylinder thread (e.g. 25E). This mark is not required for closed cryogenic receptacles;
- (n) The manufacturer's mark registered by the competent authority. When the country of manufacture is not the same as the country of approval, then the manufacturer's mark shall be preceded by the character(s) identifying the country of manufacture as indicated by the distinguishing signs for motor vehicles in international traffic³. The country mark and the manufacturer's mark shall be separated by a space or slash;
- (o) The serial number assigned by the manufacturer;
- (p) In the case of steel pressure receptacles and composite pressure receptacles with steel liner intended for the carriage of gases with a risk of hydrogen embrittlement, the letter "H" showing compatibility of the steel (see ISO 11114-1:2012).

6.2.2.7.5 The above marks shall be placed in three groups:

- Manufacturing marks shall be the top grouping and shall appear consecutively in the sequence given in 6.2.2.7.4.
- The operational marks in 6.2.2.7.3 shall be the middle grouping and the test pressure (f) shall be immediately preceded by the working pressure (i) when the latter is required.
- Certification marks shall be the bottom grouping and shall appear in the sequence given in 6.2.2.7.2.

³ *Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).*

The following is an example of the markings applied to a cylinder.

6.2.2.7.6 Other marks are allowed in areas other than the side wall, provided they are made in low stress areas and are not of a size and depth that will create harmful stress concentrations. In the case of closed cryogenic receptacles, such marks may be on a separate plate attached to the outer jacket. Such marks shall not conflict with required marks.

6.2.2.7.7 In addition to the preceding marks, each refillable pressure receptacle that meets the periodic inspection and test requirements of 6.2.2.4 shall be marked indicating:

- (a) The character(s) identifying the country authorizing the body performing the periodic inspection and test as indicated by the distinguishing signs of motor vehicles in international traffic³. This marking is not required if this body is approved by the competent authority of the country approving manufacture;
- (b) The registered mark of the body authorised by the competent authority for performing periodic inspection and test;
- (c) The date of the periodic inspection and test, the year (two digits) followed by the month (two digits) separated by a slash (i.e. "/"). Four digits may be used to indicate the year.

The above marks shall appear consecutively in the sequence given.

6.2.2.7.8 For acetylene cylinders, with the agreement of the competent authority, the date of the most recent periodic inspection and the stamp of the body performing the periodic inspection and test may be engraved on a ring held on the cylinder by the valve. The ring shall be configured so that it can only be removed by disconnecting the valve from the cylinder.

6.2.2.7.9 *(Deleted)*

6.2.2.8 *Marking of non-refillable UN pressure receptacles*

6.2.2.8.1 Non-refillable UN pressure receptacles shall be marked clearly and legibly with certification and gas or pressure receptacle specific marks. These marks shall be permanently affixed (e.g. stencilled, stamped, engraved, or etched) on the pressure receptacle. Except when stencilled, the marks shall be on the shoulder, top end or neck of the pressure receptacle or on a permanently affixed component of the pressure receptacle (e.g. welded collar). Except for the UN packaging symbol and the "DO NOT REFILL" mark, the minimum size of the marks shall be 5 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 2.5 mm for pressure receptacles with a diameter less than 140 mm. The minimum size of the UN packaging symbol shall be 10 mm for pressure receptacles with a diameter greater than or equal to 140 mm and 5 mm for pressure receptacles with a diameter less than 140 mm. The minimum size of the "DO NOT REFILL" mark shall be 5 mm.

³ Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

6.2.2.8.2 The marks listed in 6.2.2.7.2 to 6.2.2.7.4 shall be applied with the exception of (g), (h) and (m). The serial number (o) may be replaced by the batch number. In addition, the words "DO NOT REFILL" in letters of at least 5 mm in height are required.

6.2.2.8.3 The requirements of 6.2.2.7.5 shall apply.

NOTE: *Non-refillable pressure receptacles may, on account of their size, substitute this marking by a label.*

6.2.2.8.4 Other marks are allowed provided they are made in low stress areas other than the side wall and are not of a size and depth that will create harmful stress concentrations. Such marks shall not conflict with required marks.

6.2.2.9 Marking of UN metal hydride storage systems

6.2.2.9.1 UN metal hydride storage systems shall be marked clearly and legibly with the marks listed below. These marks shall be permanently affixed (e.g. stamped, engraved, or etched) on the metal hydride storage system. The marks shall be on the shoulder, top end or neck of the metal hydride storage system or on a permanently affixed component of the metal hydride storage system. Except for the United Nations packaging symbol, the minimum size of the marks shall be 5 mm for metal hydride storage systems with a smallest overall dimension greater than or equal to 140 mm and 2.5 mm for metal hydride storage systems with a smallest overall dimension less than 140 mm. The minimum size of the United Nations packaging symbol shall be 10 mm for metal hydride storage systems with a smallest overall dimension greater than or equal to 140 mm and 5 mm for metal hydride storage systems with a smallest overall dimension less than 140 mm.

6.2.2.9.2 The following marks shall be applied:

- (a) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7²;

- (b) "ISO 16111" (the technical standard used for design, manufacture and testing);
- (c) The character(s) identifying the country of approval as indicated by the distinguishing signs of motor vehicles in international traffic³;

NOTE: *The country of approval shall be understood to be the country that approved the body which inspected the individual receptacle at the time of manufacture.*

- (d) The identity mark or stamp of the inspection body that is registered with the competent authority of the country authorizing the marking;
- (e) The date of the initial inspection, the year (four digits) followed by the month (two digits) separated by a slash (i.e. "/");
- (f) The test pressure of the receptacle in bar, preceded by the letters "PH" and followed by the letters "BAR";
- (g) The rated charging pressure of the metal hydride storage system in bar, preceded by the letters "RCP" and followed by the letters "BAR";

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

- (h) The manufacturer's mark registered by the competent authority. When the country of manufacture is not the same as the country of approval, then the manufacturer's mark shall be preceded by the character(s) identifying the country of manufacture as indicated by the distinguishing signs of motor vehicles in international traffic³. The country mark and the manufacturer's mark shall be separated by a space or slash;
- (i) The serial number assigned by the manufacturer;
- (j) In the case of steel receptacles and composite receptacles with steel liner, the letter "H" showing compatibility of the steel (see ISO 11114-1:2012); and,
- (k) In the case of metal hydride storage systems having limited life, the date of expiry, denoted by the letters "FINAL" followed by the year (four digits) followed by the month (two digits) separated by a slash (i.e. "/").

The certification marks specified in (a) to (e) above shall appear consecutively in the sequence given. The test pressure (f) shall be immediately preceded by the rated charging pressure (g). The manufacturing marks specified in (h) to (k) above shall appear consecutively in the sequence given.

6.2.2.9.3 Other marks are allowed in areas other than the side wall, provided they are made in low stress areas and are not of a size and depth that will create harmful stress concentrations. Such marks shall not conflict with required marks.

6.2.2.9.4 In addition to the preceding marks, each metal hydride storage system that meets the periodic inspection and test requirements of 6.2.2.4 shall be marked indicating:

- (a) The character(s) identifying the country authorizing the body performing the periodic inspection and test, as indicated by the distinguishing sign of motor vehicles in international traffic³. This marking is not required if this body is approved by the competent authority of the country approving manufacture;
- (b) The registered mark of the body authorised by the competent authority for performing periodic inspection and test;
- (c) The date of the periodic inspection and test, the year (two digits) followed by the month (two digits) separated by a slash (i.e. "/"). Four digits may be used to indicate the year.

The above marks shall appear consecutively in the sequence given.

6.2.2.10 Marking of UN bundles of cylinders

6.2.2.10.1 Individual cylinders in a bundle of cylinders shall be marked in accordance with 6.2.2.7.

6.2.2.10.2 Refillable UN bundles of cylinders shall be marked clearly and legibly with certification, operational, and manufacturing marks. These marks shall be permanently affixed (e.g. stamped, engraved, or etched) on a plate permanently attached to the frame of the bundle of cylinders. Except for the UN packaging symbol, the minimum size of the marks shall be 5 mm. The minimum size of the UN packaging symbol shall be 10 mm.

6.2.2.10.3 The following marks shall be applied:

- (a) The certification marks specified in 6.2.2.7.2 (a), (b), (c), (d) and (e);
- (b) The operational marks specified in 6.2.2.7.3 (f), (i), (j) and the total of the mass of the frame of the bundle and all permanently attached parts (cylinders, manifold, fittings and valves). Bundles intended for the carriage of UN 1001 acetylene, dissolved and UN 3374 acetylene, solvent free shall bear the tare mass as specified in clause B.4.2 of ISO 10961:2010; and
- (c) The manufacturing marks specified in 6.2.2.7.4 (n), (o) and, where applicable, (p).

³ Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

6.2.2.10.4 The marks shall be placed in three groups:

- (a) The manufacturing marks shall be the top grouping and shall appear consecutively in the sequence given in 6.2.2.10.3 (c);
- (b) The operational marks in 6.2.2.10.3 (b) shall be the middle grouping and the operational mark specified in 6.2.2.7.3 (f) shall be immediately preceded by the operational mark specified in 6.2.2.7.3 (i) when the latter is required;
- (c) Certification marks shall be the bottom grouping and shall appear in the sequence given in 6.2.2.10.3 (a).

6.2.2.11 *Equivalent procedures for conformity assessment and periodic inspection and test*

For UN pressure receptacles the requirements of 6.2.2.5 and 6.2.2.6 are considered to have been complied with when the following procedures are applied:

Procedure	Relevant body
Type approval (1.8.7.2)	Xa
Supervision of manufacture (1.8.7.3)	Xa or IS
Initial inspection and tests (1.8.7.4)	Xa or IS
Periodic inspection (1.8.7.5)	Xa or Xb or IS

Xa means the competent authority, its delegate or inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2012 (except clause 8.1.3) type A.

Xb means inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2012 (except clause 8.1.3) type B.

IS means an in-house inspection service of the applicant under the surveillance of an inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2012 (except clause 8.1.3) type A. The in-house inspection service shall be independent from design process, manufacturing operations, repair and maintenance.

6.2.3 **General requirements for non-UN pressure receptacles**

6.2.3.1 *Design and construction*

6.2.3.1.1 Pressure receptacles and their closures not designed, constructed, inspected, tested and approved according to the requirements of 6.2.2 shall be designed, constructed, inspected, tested and approved in accordance with the general requirements of 6.2.1 as supplemented or modified by the requirements of this section and those of 6.2.4 or 6.2.5.

6.2.3.1.2 Whenever possible the wall thickness shall be determined by calculation, accompanied, if needed, by experimental stress analysis. Otherwise the wall thickness may be determined by experimental means.

Appropriate design calculations for the pressure envelope and supporting components shall be used to ensure the safety of the pressure receptacles concerned.

The minimum wall thickness to withstand pressure shall be calculated in particular with regard to:

- The calculation pressures, which shall not be less than the test pressure;
- The calculation temperatures allowing for appropriate safety margins;
- The maximum stresses and peak stress concentrations where necessary;
- Factors inherent to the properties of the material.

6.2.3.1.3 For welded pressure receptacles, only metals of weldable quality whose adequate impact strength at an ambient temperature of -20°C can be guaranteed shall be used.

6.2.3.1.4 For closed cryogenic receptacles, the impact strength to be established as required by 6.2.1.1.8.1 shall be tested as laid down in 6.8.5.3.

6.2.3.1.5 Acetylene cylinders shall not be fitted with fusible plugs.

6.2.3.2 *(Reserved)*

6.2.3.3 *Service equipment*

6.2.3.3.1 Service equipment shall comply with 6.2.1.3.

6.2.3.3.2 *Openings*

Pressure drums may be provided with openings for filling and discharge and with other openings intended for level gauges, pressure gauges or relief devices. The number of openings shall be kept to a minimum consistent with safe operations. Pressure drums may also be provided with an inspection opening, which shall be closed by an effective closure.

6.2.3.3.3 *Fittings*

- (a) If cylinders are fitted with a device to prevent rolling, this device shall not be integral with the valve cap;
- (b) Pressure drums which are capable of being rolled shall be equipped with rolling hoops or be otherwise protected against damage due to rolling (e.g. by corrosion resistant metal sprayed on to the pressure receptacle surface);
- (c) Bundles of cylinders shall be fitted with appropriate devices ensuring that they can be handled and carried safely;
- (d) If level gauges, pressure gauges or relief devices are installed, they shall be protected in the same way as is required for valves in 4.1.6.8.

6.2.3.4 *Initial inspection and test*

6.2.3.4.1 New pressure receptacles shall be subjected to testing and inspection during and after manufacture in accordance with the requirements of 6.2.1.5.

6.2.3.4.2 *Specific provisions applying to aluminium alloy pressure receptacles*

- (a) In addition to the initial inspection required by 6.2.1.5.1, it is necessary to test for possible intercrystalline corrosion of the inside wall of the pressure receptacles where use is made of an aluminium alloy containing copper, or where use is made of an aluminium alloy containing magnesium and manganese and the magnesium content is greater than 3.5% or the manganese content lower than 0.5%;
- (b) In the case of an aluminium/copper alloy the test shall be carried out by the manufacturer at the time of approval of a new alloy by the competent authority; it shall thereafter be repeated in the course of production, for each pour of the alloy;
- (c) In the case of an aluminium/magnesium alloy the test shall be carried out by the manufacturer at the time of approval of a new alloy and of the manufacturing process by the competent authority. The test shall be repeated whenever a change is made in the composition of the alloy or in the manufacturing process.

6.2.3.5 Periodic inspection and test

6.2.3.5.1 Periodic inspection and test shall be in accordance with 6.2.1.6.

NOTE: With the agreement of the competent authority of the country that issued the type approval, the hydraulic pressure test of each welded steel cylinder intended for the carriage of gases of UN No. 1965, hydrocarbon gas mixture liquefied, n.o.s., with a capacity below 6.5 l may be replaced by another test ensuring an equivalent level of safety.

6.2.3.5.2 Closed cryogenic receptacles shall be subject to periodic inspections and tests in accordance with the periodicity defined in packing instruction P203 (8) (b) of 4.1.4.1, in accordance with the following:

- (a) Check of the external condition of the receptacle and verification of the equipment and the external markings;
- (b) The leakproofness test.

6.2.3.6 Approval of pressure receptacles

6.2.3.6.1 The procedures for conformity assessment and periodic inspection of section 1.8.7 shall be performed by the relevant body according to the following table.

Procedure	Relevant body
Type approval (1.8.7.2)	Xa
Supervision of manufacture (1.8.7.3)	Xa or IS
Initial inspection and tests (1.8.7.4)	Xa or IS
Periodic inspection (1.8.7.5)	Xa or Xb or IS

For refillable pressure receptacles, the conformity assessment of valves and other demountable accessories having a direct safety function may be carried out separately from the receptacles and the conformity assessment procedure shall be at least as stringent as that undergone by the pressure receptacle to which they are fitted.

Xa means the competent authority, its delegate or inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2012 (except clause 8.1.3) type A.

Xb means inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2012 (except clause 8.1.3) type B.

IS means an in-house inspection service of the applicant under the surveillance of an inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2012 (except clause 8.1.3) type A. The in-house inspection service shall be independent from design process, manufacturing operations, repair and maintenance.

6.2.3.6.2 If the country of approval is not a Contracting Party to ADR, the competent authority mentioned in 6.2.1.7.2 shall be the competent authority of a Contracting Party to ADR.

6.2.3.7 Requirements for manufacturers

6.2.3.7.1 The relevant requirements of 1.8.7 shall be met.

6.2.3.8 Requirements for inspection bodies

The requirements of 1.8.6 shall be met.

6.2.3.9 Marking of refillable pressure receptacles

6.2.3.9.1 Markings shall be in accordance with sub-section 6.2.2.7 with the following variations.

- 6.2.3.9.2 The United Nations packaging symbol specified in 6.2.2.7.2 (a) shall not be applied.
- 6.2.3.9.3 The requirements of 6.2.2.7.3 (j) shall be replaced by the following:
- (j) The water capacity of the pressure receptacle in litres followed by the letter "L". In the case of pressure receptacles for liquefied gases the water capacity in litres shall be expressed to three significant figures rounded down to the last digit. If the value of the minimum or nominal water capacity is an integer, the figures after the decimal point may be neglected.
- 6.2.3.9.4 The marks specified in 6.2.2.7.3 (g) and (h) and 6.2.2.7.4 (m) are not required for pressure receptacles for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.
- 6.2.3.9.5 When marking the date required by 6.2.2.7.7 (c), the month need not be indicated for gases for which the interval between periodic inspections is 10 years or more (see packing instructions P200 and P203 of 4.1.4.1).
- 6.2.3.9.6 The marks in accordance with 6.2.2.7.7 may be engraved on a ring of an appropriate material affixed to the cylinder when the valve is installed and which is removable only by disconnecting the valve from the cylinder.
- 6.2.3.9.7 *Marking of bundles of cylinders*
- 6.2.3.9.7.1 Individual cylinders in a bundle of cylinders shall be marked in accordance with 6.2.3.9.1 to 6.2.3.9.6.
- 6.2.3.9.7.2 Marking of bundles of cylinders shall be in accordance with 6.2.2.10.2 and 6.2.2.10.3, except that the United Nations packaging symbol specified in 6.2.2.7.2 (a) shall not be applied.
- 6.2.3.9.7.3 In addition to the preceding marks, each bundle of cylinders that meets the periodic inspection and test requirements of 6.2.4.2 shall be marked indicating:
- (a) The character(s) identifying the country authorizing the body performing the periodic inspection and test, as indicated by the distinguishing sign of motor vehicles in international traffic³. This marking is not required if this body is approved by the competent authority of the country approving manufacture;
- (b) The registered mark of the body authorised by the competent authority for performing periodic inspection and test;
- (c) The date of the periodic inspection and test, the year (two digits) followed by the month (two digits) separated by a slash (i.e. "/"). Four digits may be used to indicate the year.
- The above marks shall appear consecutively in the sequence given either on the plate specified in 6.2.2.10.2 or on a separate plate permanently attached to the frame of the bundle of cylinders.
- 6.2.3.10 *Marking of non-refillable pressure receptacles***
- 6.2.3.10.1 Markings shall be in accordance with 6.2.2.8, except that the United Nations packaging symbol specified in 6.2.2.7.2 (a) shall not be applied.
- 6.2.3.11 *Salvage pressure receptacles***
- 6.2.3.11.1 To permit the safe handling and disposal of the pressure receptacles carried within the salvage pressure receptacle, the design may include equipment not otherwise used for cylinders or pressure drums such as flat heads, quick opening devices and openings in the cylindrical part.

³ *Distinguishing signs for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).*

- 6.2.3.11.2 Instructions on the safe handling and use of the salvage pressure receptacle shall be clearly shown in the documentation for the application to the competent authority of the country of approval and shall form part of the approval certificate. In the approval certificate, the pressure receptacles authorized to be carried in a salvage pressure receptacle shall be indicated. A list of the materials of construction of all parts likely to be in contact with the dangerous goods shall also be included.
- 6.2.3.11.3 A copy of the approval certificate shall be delivered by the manufacturer to the owner of a salvage pressure receptacle.
- 6.2.3.11.4 The marking of salvage pressure receptacles according to 6.2.3 shall be determined by the competent authority of the country of approval taking into account suitable marking provisions of 6.2.3.9 as appropriate. The marking shall include the water capacity and test pressure of the salvage pressure receptacle.

6.2.4 Requirements for non-UN pressure receptacles designed, constructed and tested according to referenced standards

NOTE: Persons or bodies identified in standards as having responsibilities in accordance with ADR shall meet the requirements of ADR.

6.2.4.1 Design, construction and initial inspection and test

The standards referenced in the table below shall be applied for the issue of type approvals as indicated in column (4) to meet the requirements of Chapter 6.2 referred to in column (3). The requirements of Chapter 6.2 referred to in column (3) shall prevail in all cases. Column (5) gives the latest date when existing type approvals shall be withdrawn according to 1.8.7.2.4; if no date is shown the type approval remains valid until it expires.

Since 1 January 2009 the use of the referenced standards has been mandatory. Exceptions are dealt with in 6.2.5.

If more than one standard is referenced for the application of the same requirements, only one of them shall be applied, but in full unless otherwise specified in the table below.

The scope of application of each standard is defined in the scope clause of the standard unless otherwise specified in the Table below.

6.2.4.2 *Periodic inspection and test*

The standards referenced in the table below shall be applied for the periodic inspection and test of pressure receptacles as indicated in column (3) to meet the requirements of 6.2.3.5 which shall prevail in all cases.

The use of a referenced standard is mandatory.

When a pressure receptacle is constructed in accordance with the provisions of 6.2.5 the procedure for periodic inspection if specified in the type approval shall be followed.

If more than one standard is referenced for the application of the same requirements, only one of them shall be applied, but in full unless otherwise specified in the table below.

The scope of application of each standard is defined in the scope clause of the standard unless otherwise specified in the Table below.

6.2.5 Requirements for non-UN pressure receptacles not designed, constructed and tested according to referenced standards

To reflect scientific and technical progress or where no standard is referenced in 6.2.2 or 6.2.4, or to deal with specific aspects not addressed in a standard referenced in 6.2.2 or 6.2.4, the competent authority may recognize the use of a technical code providing the same level of safety.

In the type approval the issuing body shall specify the procedure for periodic inspections if the standards referenced in 6.2.2 or 6.2.4 are not applicable or shall not be applied.

The competent authority shall transmit to the secretariat of UNECE a list of the technical codes that it recognises. The list should include the following details: name and date of the code, purpose of the code and details of where it may be obtained. The secretariat shall make this information publicly available on its website.

A standard which has been adopted for reference in a future edition of the ADR may be approved by the competent authority for use without notifying the secretariat of UNECE.

The requirements of 6.2.1, 6.2.3 and the following requirements however shall be met.

NOTE: For this section, the references to technical standards in 6.2.1 shall be considered as references to technical codes.

6.2.5.1 Materials

The following provisions contain examples of materials that may be used to comply with the requirements for materials in 6.2.1.2:

- (a) Carbon steel for compressed, liquefied, refrigerated liquefied gases and dissolved gases as well as for substances not in Class 2 listed in Table 3 of packing instruction P200 of 4.1.4.1;
- (b) Alloy steel (special steels), nickel, nickel alloy (such as monel) for compressed, liquefied, refrigerated liquefied gases and dissolved gases as well as for substances not in Class 2 listed in Table 3 of packing instruction P200 of 4.1.4.1;
- (c) Copper for:
 - (i) gases of classification codes 1A, 1O, 1F and 1TF, whose filling pressure referred to a temperature of 15 °C does not exceed 2 MPa (20 bar);
 - (ii) gases of classification code 2A and also UN No. 1033 dimethyl ether; UN No. 1037 ethyl chloride; UN No. 1063 methyl chloride; UN No. 1079 sulphur dioxide; UN No. 1085 vinyl bromide; UN No. 1086 vinyl chloride; and UN No. 3300 ethylene oxide and carbon dioxide mixture with more than 87% ethylene oxide;
 - (iii) gases of classification codes 3A, 3O and 3F;
- (d) Aluminium alloy: see special requirement "a" of packing instruction P200 (10) of 4.1.4.1;
- (e) Composite material for compressed, liquefied, refrigerated liquefied gases and dissolved gases;

- (f) Synthetic materials for refrigerated liquefied gases; and
- (g) Glass for the refrigerated liquefied gases of classification code 3A other than UN No. 2187 carbon dioxide, refrigerated, liquid or mixtures thereof, and gases of classification code 3O.

6.2.5.2 *Service equipment*

(Reserved)

6.2.5.3 *Metal cylinders, tubes, pressure drums and bundles of cylinders*

At the test pressure, the stress in the metal at the most severely stressed point of the pressure receptacle shall not exceed 77% of the guaranteed minimum yield stress (Re).

"Yield stress" means the stress at which a permanent elongation of 2 per thousand (i.e. 0.2%) or, for austenitic steels, 1% of the gauge length on the test-piece, has been produced.

NOTE: In the case of sheet-metal the axis of the tensile test-piece shall be at right angles to the direction of rolling. The permanent elongation at fracture, shall be measured on a test-piece of circular cross-section in which the gauge length "l" is equal to five times the diameter "d" ($l = 5d$); if test pieces of rectangular cross-section are used, the gauge length "l" shall be calculated by the formula:

$$l = 5.65 \sqrt{F_0}$$

where F_0 indicates the initial cross-sectional area of the test-piece.

Pressure receptacles and their closures shall be made of suitable materials which shall be resistant to brittle fracture and to stress corrosion cracking between $-20\text{ }^{\circ}\text{C}$ and $+50\text{ }^{\circ}\text{C}$.

Welds shall be skilfully made and shall afford the fullest safety.

6.2.5.4 *Additional provisions relating to aluminium-alloy pressure receptacles for compressed gases, liquefied gases, dissolved gases and non pressurized gases subject to special requirements (gas samples) as well as articles containing gas under pressure other than aerosol dispensers and small receptacles containing gas (gas cartridges)*

6.2.5.4.1 The materials of aluminium-alloy pressure receptacles which are to be accepted shall satisfy the following requirements:

	A	B	C	D
Tensile strength, R_m , in MPa (= N/mm ²)	49 to 186	196 to 372	196 to 372	343 to 490
Yield stress, R_e , in MPa (= N/mm ²) (permanent set $\lambda = 0.2\%$)	10 to 167	59 to 314	137 to 334	206 to 412
Permanent elongation at fracture ($l = 5d$) in per cent	12 to 40	12 to 30	12 to 30	11 to 16
Bend test (diameter of former $d = n \times e$, where e is the thickness of the test piece)	$n=5(R_m \leq 98)$ $n=6(R_m > 98)$	$n=6(R_m \leq 325)$ $n=7(R_m > 325)$	$n=6(R_m \leq 325)$ $n=7(R_m > 325)$	$n=7(R_m \leq 392)$ $n=8(R_m > 392)$
Aluminium Association Series Number ^a	1 000	5 000	6 000	2 000

^a See "Aluminium Standards and Data", Fifth edition, January 1976, published by the Aluminium Association, 750 Third Avenue, New York.

The actual properties will depend on the composition of the alloy concerned and on the final treatment of the pressure receptacle, but whatever alloy is used the thickness of the pressure receptacle shall be calculated by one of the following formulae:

$$e = \frac{P_{\text{MPa}} D}{\frac{2R_e}{1.3} + P_{\text{MPa}}} \quad \text{or} \quad e = \frac{P_{\text{bar}} D}{\frac{20R_e}{1.3} + P_{\text{bar}}}$$

where

- e = minimum thickness of pressure receptacle wall, in mm
 P_{MPa} = test pressure, in MPa
 P_{bar} = test pressure, in bar
 D = nominal external diameter of the pressure receptacle, in mm and
 R_e = guaranteed minimum proof stress with 0.2% proof stress, in MPa
 (= N/mm²)

In addition, the value of the minimum guaranteed proof stress (R_e) introduced into the formula is in no case to be greater than 0.85 times the guaranteed minimum tensile strength (R_m), whatever the type of alloy used.

NOTE 1: The above characteristics are based on previous experience with the following materials used for pressure receptacles:

Column A: Aluminium, unalloyed, 99.5% pure;

Column B: Alloys of aluminium and magnesium;

Column C: Alloys of aluminium, silicon and magnesium, such as ISO/R209-Al-Si-Mg (Aluminium Association 6351);

Column D: Alloys of aluminium, copper and magnesium.

NOTE 2: The permanent elongation at fracture is measured by means of test-pieces of circular cross-section in which the gauge length "l" is equal to five times the diameter "d" ($l = 5d$); if test-pieces of rectangular section are used the gauge length shall be calculated by the formula:

$$l = 5.65 \sqrt{F_0}$$

where F_0 is the initial cross-section area of the test-piece.

- NOTE 3:**
- (a) The bend test (see diagram) shall be carried out on specimens obtained by cutting into two equal parts of width $3e$, but in no case less than 25 mm, an annular section of a cylinder. The specimens shall not be machined elsewhere than on the edges;
 - (b) The bend test shall be carried out between a mandrel of diameter (d) and two circular supports separated by a distance of $(d + 3e)$. During the test the inner faces shall be separated by a distance not greater than the diameter of the mandrel;
 - (c) The specimen shall not exhibit cracks when it has been bent inwards around the mandrel until the inner faces are separated by a distance not greater than the diameter of the mandrel;
 - (d) The ratio (n) between the diameter of the mandrel and the thickness of the specimen shall conform to the values given in the table.

Diagram of bend test

6.2.5.4.2 A lower minimum elongation value is acceptable on condition that an additional test approved by the competent authority of the country in which the pressure receptacles are made proves that safety of carriage is ensured to the same extent as in the case of pressure receptacles constructed to comply with the characteristics given in the table in 6.2.5.4.1 (see also EN 1975:1999 + A1:2003).

6.2.5.4.3 The wall thickness of the pressure receptacles at the thinnest point shall be the following:

- where the diameter of the pressure receptacle is less than 50 mm: not less than 1.5 mm;
- where the diameter of the pressure receptacle is from 50 to 150 mm: not less than 2 mm; and
- where the diameter of the pressure receptacle is more than 150 mm: not less than 3 mm.

6.2.5.4.4 The ends of the pressure receptacles shall have a semicircular, elliptical or "basket-handle" section; they shall afford the same degree of safety as the body of the pressure receptacle.

6.2.5.5 *Pressure receptacles in composite materials*

For composite cylinders, tubes, pressure drums and bundles of cylinders which make use of composite materials, the construction shall be such that a minimum burst ratio (burst pressure divided by test pressure) is:

- 1.67 for hoop wrapped pressure receptacles;
- 2.00 for fully wrapped pressure receptacles.

6.2.5.6 *Closed cryogenic receptacles*

The following requirements apply to the construction of closed cryogenic receptacles for refrigerated liquefied gases:

6.2.5.6.1 If non-metallic materials are used, they shall resist brittle fracture at the lowest working temperature of the pressure receptacle and its fittings.

6.2.5.6.2 The pressure relief devices shall be so constructed as to work perfectly even at their lowest working temperature. Their reliability of functioning at that temperature shall be established and checked by testing each device or a sample of devices of the same type of construction.

6.2.5.6.3 The vents and pressure relief devices of pressure receptacles shall be so designed as to prevent the liquid from splashing out.

6.2.6 General requirements for aerosol dispensers, small receptacles containing gas (gas cartridges) and fuel cell cartridges containing liquefied flammable gas**6.2.6.1 Design and construction**

6.2.6.1.1 Aerosol dispensers (UN No.1950 aerosols) containing only a gas or a mixture of gases, and small receptacles containing gas (gas cartridges) (UN No. 2037), shall be made of metal. This requirement shall not apply to aerosols and small receptacles containing gas (gas cartridges) with a maximum capacity of 100 ml for UN No. 1011 butane. Other aerosol dispensers (UN No.1950 aerosols) shall be made of metal, synthetic material or glass. Receptacles made of metal and having an outside diameter of not less than 40 mm shall have a concave bottom.

6.2.6.1.2 The capacity of receptacles made of metal shall not exceed 1 000 ml; that of receptacles made of synthetic material or of glass shall not exceed 500 ml.

6.2.6.1.3 Each model of receptacles (aerosol dispensers or cartridges) shall, before being put into service, satisfy a hydraulic pressure test carried out in conformity with 6.2.6.2.

6.2.6.1.4 The release valves and dispersal devices of aerosol dispensers (UN No.1950 aerosols) and the valves of UN No. 2037 small receptacles containing gas (gas cartridges) shall ensure that the receptacles are so closed as to be leakproof and shall be protected against accidental opening. Valves and dispersal devices which close only by the action of the internal pressure are not to be accepted.

6.2.6.1.5 The internal pressure of aerosol dispensers at 50 °C shall exceed neither two-thirds of the test pressure nor 1.32 MPa (13.2 bar). They shall be so filled that at 50 °C the liquid phase does not exceed 95% of their capacity. Small receptacles containing gas (gas cartridges) shall meet the test pressure and filling requirements of P200 of 4.1.4.1.

6.2.6.2 Hydraulic pressure test

6.2.6.2.1 The internal pressure to be applied (test pressure) shall be 1.5 times the internal pressure at 50 °C, with a minimum pressure of 1 MPa (10 bar).

6.2.6.2.2 The hydraulic pressure tests shall be carried out on at least five empty receptacles of each model:

- (a) until the prescribed test pressure is reached, by which time no leakage or visible permanent deformation shall have occurred; and
- (b) until leakage or bursting occurs; the dished end, if any, shall yield first and the receptacle shall not leak or burst until a pressure 1.2 times the test pressure has been reached or passed.

6.2.6.3 Tightness (leakproofness) test

Each filled aerosol dispenser or gas cartridge or fuel cell cartridge shall be subjected to a test in a hot water bath in accordance with 6.2.6.3.1 or an approved water bath alternative in accordance with 6.2.6.3.2.

6.2.6.3.1 Hot water bath test

6.2.6.3.1.1 The temperature of the water bath and the duration of the test shall be such that the internal pressure reaches that which would be reached at 55 °C (50 °C if the liquid phase does not exceed 95% of the capacity of the aerosol dispenser, gas cartridge or the fuel cell cartridge at 50 °C). If the contents are sensitive to heat or if the aerosol dispensers, gas cartridges or the fuel cell cartridges are made of plastics material which softens at this test temperature, the temperature of the bath shall be set at between 20 °C and 30 °C but, in addition, one aerosol dispenser, gas cartridge or the fuel cell cartridge in 2 000 shall be tested at the higher temperature.

6.2.6.3.1.2 No leakage or permanent deformation of an aerosol dispenser, gas cartridge or the fuel cell cartridge may occur, except that a plastic aerosol dispenser, gas cartridge or the fuel cell cartridge may be deformed through softening provided that it does not leak.

6.2.6.3.2 *Alternative methods*

With the approval of the competent authority alternative methods that provide an equivalent level of safety may be used provided that the requirements of 6.2.6.3.2.1 and, as appropriate, 6.2.6.3.2.2 or 6.2.6.3.2.3 are met.

6.2.6.3.2.1 *Quality system*

Aerosol dispenser, gas cartridge or the fuel cell cartridge fillers and component manufacturers shall have a quality system. The quality system shall implement procedures to ensure that all aerosol dispensers, gas cartridges or the fuel cell cartridges that leak or that are deformed are rejected and not offered for transport.

The quality system shall include:

- (a) A description of the organizational structure and responsibilities;
- (b) The relevant inspection and test, quality control, quality assurance, and process operation instructions that will be used;
- (c) Quality records, such as inspection reports, test data, calibration data and certificates;
- (d) Management reviews to ensure the effective operation of the quality system;
- (e) A process for control of documents and their revision;
- (f) A means for control of non-conforming aerosol dispensers, gas cartridges or the fuel cell cartridges;
- (g) Training programmes and qualification procedures for relevant personnel; and
- (h) Procedures to ensure that there is no damage to the final product.

An initial audit and periodic audits shall be conducted to the satisfaction of the competent authority. These audits shall ensure the approved system is and remains adequate and efficient. Any proposed changes to the approved system shall be notified to the competent authority in advance.

6.2.6.3.2.2 *Aerosol dispensers*6.2.6.3.2.2.1 *Pressure and leak testing of aerosol dispensers before filling*

Each empty aerosol dispenser shall be subjected to a pressure equal to or in excess of the maximum expected in the filled aerosol dispensers at 55 °C (50 °C if the liquid phase does not exceed 95% of the capacity of the receptacle at 50 °C). This shall be at least two-thirds of the design pressure of the aerosol dispenser. If any aerosol dispenser shows evidence of leakage at a rate equal to or greater than 3.3×10^{-2} mbar.l.s⁻¹ at the test pressure, distortion or other defect, it shall be rejected.

6.2.6.3.2.2.2 *Testing of the aerosol dispensers after filling*

Prior to filling the filler shall ensure that the crimping equipment is set appropriately and the specified propellant is used.

Each filled aerosol dispenser shall be weighed and leak tested. The leak detection equipment shall be sufficiently sensitive to detect at least a leak rate of 2.0×10^{-3} mbar.l.s⁻¹ at 20 °C.

Any filled aerosol dispenser that shows evidence of leakage, deformation or excessive mass shall be rejected.

6.2.6.3.2.3 *Gas cartridges and fuel cell cartridges*6.2.6.3.2.3.1 *Pressure testing of gas cartridges and fuel cell cartridges*

Each gas cartridge or fuel cell cartridge shall be subjected to a test pressure equal to or in excess of the maximum expected in the filled receptacle at 55 °C (50 °C if the liquid phase does not exceed 95% of the capacity of the receptacle at 50 °C). This test pressure shall be that specified for the gas cartridge or fuel cell cartridge and shall not be less than two thirds the design pressure of the gas cartridge or fuel cell cartridge. If any gas cartridge or fuel cell cartridge shows evidence of leakage at a rate equal to or greater than 3.3×10^{-2} mbar.l.s⁻¹ at the test pressure or distortion or any other defect, it shall be rejected.

6.2.6.3.2.3.2 Leak testing gas cartridges and fuel cell cartridges

Prior to filling and sealing, the filler shall ensure that the closures (if any), and the associated sealing equipment are closed appropriately and the specified gas is used.

Each filled gas cartridge or fuel cell cartridge shall be checked for the correct mass of gas and shall be leak tested. The leak detection equipment shall be sufficiently sensitive to detect at least a leak rate of 2.0×10^{-3} mbar.l.s⁻¹ at 20 °C.

Any gas cartridge or fuel cell cartridge that has gas masses not in conformity with the declared mass limits or shows evidence of leakage or deformation, shall be rejected.

6.2.6.3.3 With the approval of the competent authority, aerosols and receptacles, small, are not subject to 6.2.6.3.1 and 6.2.6.3.2, if they are required to be sterile but may be adversely affected by water bath testing, provided:

- (a) They contain a non-flammable gas and either
 - (i) contain other substances that are constituent parts of pharmaceutical products for medical, veterinary or similar purposes;
 - (ii) contain other substances used in the production process for pharmaceutical products; or
 - (iii) are used in medical, veterinary or similar applications;
- (b) An equivalent level of safety is achieved by the manufacturer's use of alternative methods for leak detection and pressure resistance, such as helium detection and water bathing a statistical sample of at least 1 in 2000 from each production batch; and
- (c) For pharmaceutical products according to (a) (i) and (iii) above, they are manufactured under the authority of a national health administration. If required by the competent authority, the principles of Good Manufacturing Practice (GMP) established by the World Health Organization (WHO)⁴ shall be followed.

6.2.6.4 *Reference to standards*

The requirements of this section are deemed to be met if the following standards are complied with:

- for aerosol dispensers (UN No. 1950 aerosols): Annex to Council Directive 75/324/EEC⁵ as amended and applicable at the date of manufacture;
- for UN No. 2037, small receptacles containing gas (gas cartridges) containing UN No. 1965, hydrocarbon gas mixture n.o.s, liquefied: EN 417:2012 Non-refillable metallic gas cartridges for liquefied petroleum gases, with or without a valve, for use with portable appliances - Construction, inspection, testing and marking.

⁴ WHO Publication: "Quality assurance of pharmaceuticals. A compendium of guidelines and related materials. Volume 2: Good manufacturing practices and inspection".

⁵ Council Directive 75/324/EEC of 20 May 1975 on the approximation of the laws of the Member States relating to aerosol dispensers, published in the Official Journal of the European Communities No. L 147 of 9.06.1975.

CHAPTER 6.3

REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF PACKAGINGS FOR CLASS 6.2 INFECTIOUS SUBSTANCES OF CATEGORY A

NOTE: *The requirements of this Chapter don't apply to packagings used for the carriage of Class 6.2 substances according to packing instruction P621 of 4.1.4.1.*

6.3.1 General

6.3.1.1 The requirements of this Chapter apply to packagings intended for the carriage of infectious substances of Category A.

6.3.2 Requirements for packagings

6.3.2.1 The requirements for packagings in this section are based on packagings, as specified in 6.1.4, currently used. In order to take into account progress in science and technology, there is no objection to the use of packagings having specifications different from those in this Chapter provided that they are equally effective, acceptable to the competent authority and able successfully to withstand the tests described in 6.3.5. Methods of testing other than those described in ADR are acceptable provided they are equivalent, and are recognized by the competent authority.

6.3.2.2 Packagings shall be manufactured and tested under a quality assurance programme which satisfies the competent authority in order to ensure that each packaging meets the requirements of this Chapter.

NOTE: *ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.*

6.3.2.3 Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

6.3.3 Code for designating types of packagings

6.3.3.1 The codes for designating types of packagings are set out in 6.1.2.7.

6.3.3.2 The letters "U" or "W" may follow the packaging code. The letter "U" signifies a special packaging conforming to the requirements of 6.3.5.1.6. The letter "W" signifies that the packaging, although, of the same type indicated by the code is manufactured to a specification different from that in 6.1.4 and is considered equivalent under the requirements of 6.3.2.1.

6.3.4 Marking

NOTE 1: *The marking indicates that the packaging which bears it corresponds to a successfully tested design type and that it complies with the requirements of this Chapter which are related to the manufacture, but not to the use, of the packaging.*

NOTE 2: *The marking is intended to be of assistance to packaging manufacturers, reconditioners, packaging users, carriers and regulatory authorities.*

NOTE 3: *The marking does not always provide full details of the test levels, etc., and these may need to be taken further into account, e.g. by reference to a test certificate, to test reports or to a register of successfully tested packagings.*

6.3.4.1 Each packaging intended for use according to ADR shall bear markings which are durable, legible and placed in a location and of such a size relative to the packaging as to be readily visible. For packages with a gross mass of more than 30 kg, the markings or a duplicate thereof shall appear on the top or on a side of the packaging. Letters, numerals and symbols shall be at least 12 mm high, except for packagings of 30 litres or 30 kg capacity or less, when they shall be at least 6 mm in height and for packagings of 5 litres or 5 kg or less when they shall be of an appropriate size.

6.3.4.2 A packaging that meets the requirements of this section and of 6.3.5 shall be marked with:

(a) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7¹;

(b) The code designating the type of packaging according to the requirements of 6.1.2;

(c) The text "CLASS 6.2";

(d) The last two digits of the year of manufacture of the packaging;

(e) The state authorizing the allocation of the mark, indicated by the distinguishing sign for motor vehicles in international traffic²;

(f) The name of the manufacturer or other identification of the packaging specified by the competent authority;

(g) For packagings meeting the requirements of 6.3.5.1.6, the letter "U", inserted immediately following the marking required in (b) above.

6.3.4.3 Marking shall be applied in the sequence shown in 6.3.4.2 (a) to (g); each element of the marking required in these sub-paragraphs shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable. For examples, see 6.3.4.4.

Any additional markings authorized by a competent authority shall still enable the parts of the mark to be correctly identified with reference to 6.3.4.1.

6.3.4.4 *Example of marking*

4G/CLASS 6.2/06
S/SP-9989-ERIKSSON

as in 6.3.4.2 (a), (b), (c) and (d)
as in 6.3.4.2 (e) and (f)

6.3.5 **Test requirements for packagings**

6.3.5.1 *Performance and frequency of tests*

6.3.5.1.1 The design type of each packaging shall be tested as provided in this section in accordance with procedures established by the competent authority allowing the allocation of the mark and shall be approved by this competent authority.

¹ This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

² Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

- 6.3.5.1.2 Each packaging design type shall successfully pass the tests prescribed in this Chapter before being used. A packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes packagings which differ from the design type only in their lesser design height.
- 6.3.5.1.3 Tests shall be repeated on production samples at intervals established by the competent authority.
- 6.3.5.1.4 Tests shall also be repeated after each modification which alters the design, material or manner of construction of a packaging.
- 6.3.5.1.5 The competent authority may permit the selective testing of packagings that differ only in minor respects from a tested type, e.g. smaller sizes or lower net mass of primary receptacles; and packagings such as drums and boxes which are produced with small reductions in external dimension(s).
- 6.3.5.1.6 Primary receptacles of any type may be assembled within a secondary packaging and carried without testing in the rigid outer packaging under the following conditions:
- (a) The rigid outer packaging shall have been successfully tested in accordance with 6.3.5.2.2 with fragile (e.g. glass) primary receptacles;
 - (b) The total combined gross mass of primary receptacles shall not exceed one half the gross mass of primary receptacles used for the drop test in (a) above;
 - (c) The thickness of cushioning between primary receptacles and between primary receptacles and the outside of the secondary packaging shall not be reduced below the corresponding thicknesses in the originally tested packaging; and if a single primary receptacle was used in the original test, the thickness of cushioning between primary receptacles shall not be less than the thickness of cushioning between the outside of the secondary packaging and the primary receptacle in the original test. When either fewer or smaller primary receptacles are used (as compared to the primary receptacles used in the drop test), sufficient additional cushioning material shall be used to take up the void spaces;
 - (d) The rigid outer packaging shall have successfully passed the stacking test in 6.1.5.6 while empty. The total mass of identical packages shall be based on the combined mass of packagings used in the drop test in (a) above;
 - (e) For primary receptacles containing liquids, an adequate quantity of absorbent material to absorb the entire liquid content of the primary receptacles shall be present;
 - (f) If the rigid outer packaging is intended to contain primary receptacles for liquids and is not leakproof, or is intended to contain primary receptacles for solids and is not siftproof, a means of containing any liquid or solid contents in the event of leakage shall be provided in the form of a leakproof liner, plastics bag or other equally effective means of containment;
 - (g) In addition to the markings prescribed in 6.3.4.2 (a) to (f), packagings shall be marked in accordance with 6.3.4.2 (g).
- 6.3.5.1.7 The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced packagings meet the requirements of the design type tests.
- 6.3.5.1.8 Provided the validity of the test results is not affected and with the approval of the competent authority, several tests may be made on one sample.

6.3.5.2 *Preparation of packagings for testing*

- 6.3.5.2.1 Samples of each packaging shall be prepared as for carriage, except that a liquid or solid infectious substance shall be replaced by water or, where conditioning at -18°C is specified, by water/antifreeze. Each primary receptacle shall be filled to not less than 98% of its capacity.

NOTE: The term water includes water/antifreeze solution with a minimum specific gravity of 0.95 for testing at -18°C .

6.3.5.2.2 Tests and number of samples required

Tests required for packaging types

Type of packaging ^a			Tests required					
Rigid outer packaging	Primary receptacle		Water spray 6.3.5.3.6.1	Cold conditioning 6.3.5.3.6.2	Drop 6.3.5.3	Additional drop 6.3.5.3.6.3	Puncture 6.3.5.4	Stack 6.1.5.6
	Plastics	Other	No. of samples	No. of samples	No. of samples	No. of samples	No. of samples	No. of samples
Fibreboard box	x		5	5	10	Required on one sample when the packaging is intended to contain dry ice.	2	Required on three samples when testing a "U"-marked packaging as defined in 6.3.5.1.6 for specific provisions.
		x	5	0	5		2	
Fibreboard drum	x		3	3	6		2	
		x	3	0	3		2	
Plastics box	x		0	5	5		2	
		x	0	5	5		2	
Plastics drum/jerrican	x		0	3	3		2	
		x	0	3	3		2	
Boxes of other material	x		0	5	5		2	
		x	0	0	5		2	
Drums/jerricans of other material	x		0	3	3		2	
		x	0	0	3		2	

^a "Type of packaging" categorizes packagings for test purposes according to the kind of packaging and its material characteristics.

NOTE 1: In instances where a primary receptacle is made of two or more materials, the material most liable to damage determines the appropriate test.

NOTE 2: The material of the secondary packagings are not taken into consideration when selecting the test or conditioning for the test.

Explanation for use of the table:

If the packaging to be tested consists of a fibreboard outer box with a plastics primary receptacle, five samples must undergo the water spray test (see 6.3.5.3.6.1) prior to dropping and another five must be conditioned to – 18 °C (see 6.3.5.3.6.2) prior to dropping. If the packaging is to contain dry ice then one further single sample shall be dropped five times after conditioning in accordance with 6.3.5.3.6.3.

Packagings prepared as for carriage shall be subjected to the tests in 6.3.5.3 and 6.3.5.4. For outer packagings, the headings in the table relate to fibreboard or similar materials whose performance may be rapidly affected by moisture; plastics which may embrittle at low temperature; and other materials such as metal whose performance is not affected by moisture or temperature.

6.3.5.3 Drop test

6.3.5.3.1 Samples shall be subjected to free-fall drops from a height of 9 m onto a non-resilient, horizontal, flat, massive and rigid surface in conformity with 6.1.5.3.4.

6.3.5.3.2 Where the samples are in the shape of a box, five shall be dropped one in each of the following orientations:

- (a) flat on the base;
- (b) flat on the top;
- (c) flat on the longest side;

(d) flat on the shortest side;

(e) on a corner.

6.3.5.3.3 Where the samples are in the shape of a drum, three shall be dropped one in each of the following orientations:

(a) diagonally on the top chime, with the centre of gravity directly above the point of impact;

(b) diagonally on the base chime;

(c) flat on the side.

6.3.5.3.4 While the sample shall be released in the required orientation, it is accepted that for aerodynamic reasons the impact may not take place in that orientation.

6.3.5.3.5 Following the appropriate drop sequence, there shall be no leakage from the primary receptacle(s) which shall remain protected by cushioning/absorbent material in the secondary packaging.

6.3.5.3.6 *Special preparation of test sample for the drop test*

6.3.5.3.6.1 Fibreboard - Water spray test

Fibreboard outer packagings: The sample shall be subjected to a water spray that simulates exposure to rainfall of approximately 5 cm per hour for at least one hour. It shall then be subjected to the test described in 6.3.5.3.1.

6.3.5.3.6.2 Plastics material – Cold conditioning

Plastics primary receptacles or outer packagings: The temperature of the test sample and its contents shall be reduced to – 18 °C or lower for a period of at least 24 hours and within 15 minutes of removal from that atmosphere the test sample shall be subjected to the test described in 6.3.5.3.1. Where the sample contains dry ice, the conditioning period shall be reduced to 4 hours.

6.3.5.3.6.3 Packagings intended to contain dry ice – Additional drop test

Where the packaging is intended to contain dry ice, a test additional to that specified in 6.3.5.3.1 and, when appropriate, in 6.3.5.3.6.1 or 6.3.5.3.6.2 shall be carried out. One sample shall be stored so that all the dry ice dissipates and then that sample shall be dropped in one of the orientations described in 6.3.5.3.2 which shall be that most likely to result in failure of the packaging.

6.3.5.4 Puncture test

6.3.5.4.1 *Packagings with a gross mass of 7 kg or less*

Samples shall be placed on a level hard surface. A cylindrical steel rod with a mass of at least 7 kg, a diameter of 38 mm and whose impact end edges have a radius not exceeding 6 mm (see Figure 6.3.5.4.2), shall be dropped in a vertical free fall from a height of 1 m, measured from the impact end to the impact surface of the sample. One sample shall be placed on its base. A second sample shall be placed in an orientation perpendicular to that used for the first. In each instance the steel rod shall be aimed to impact the primary receptacle. Following each impact, penetration of the secondary packaging is acceptable, provided that there is no leakage from the primary receptacle(s).

6.3.5.4.2 *Packagings with a gross mass exceeding 7 kg*

Samples shall be dropped on to the end of a cylindrical steel rod. The rod shall be set vertically in a level hard surface. It shall have a diameter of 38 mm and the edges of the upper end a radius not exceeding 6 mm (see Figure 6.3.5.4.2). The rod shall protrude from the surface a distance at least equal to that between the centre of the primary receptacle(s) and the outer surface of the outer packaging with a minimum of 200 mm. One sample shall be dropped with its top face lowermost in a vertical free fall from a height of 1 m, measured from the top of the steel rod. A second sample shall be dropped from the same height in an orientation perpendicular to that used for the first. In each instance, the packaging shall be so orientated that the steel rod would be capable of penetrating the primary receptacle(s). Following each impact, penetration of the secondary packaging is acceptable provided that there is no leakage from the primary receptacle(s).

Figure 6.3.5.4.2**6.3.5.5** *Test report*

6.3.5.5.1 A written test report containing at least the following particulars shall be drawn up and shall be available to the users of the packaging:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test and of the report;
5. Manufacturer of the packaging;
6. Description of the packaging design type (e.g. dimensions, materials, closures, thickness, etc.), including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s);
7. Maximum capacity;
8. Test contents;
9. Test descriptions and results;
10. The test report shall be signed with the name and status of the signatory.

6.3.5.5.2 The test report shall contain statements that the packaging prepared as for carriage was tested in accordance with the appropriate requirements of this Chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

CHAPTER 6.4

REQUIREMENTS FOR THE CONSTRUCTION, TESTING AND APPROVAL OF PACKAGES FOR RADIOACTIVE MATERIAL AND FOR THE APPROVAL OF SUCH MATERIAL

6.4.1 (Reserved)

6.4.2 General requirements

6.4.2.1 The package shall be so designed in relation to its mass, volume and shape that it can be easily and safely carried. In addition, the package shall be so designed that it can be properly secured in or on the vehicle during carriage.

6.4.2.2 The design shall be such that any lifting attachments on the package will not fail when used in the intended manner and that, if failure of the attachments should occur, the ability of the package to meet other requirements of this Annex would not be impaired. The design shall take account of appropriate safety factors to cover snatch lifting.

6.4.2.3 Attachments and any other features on the outer surface of the package which could be used to lift it shall be designed either to support its mass in accordance with the requirements of 6.4.2.2 or shall be removable or otherwise rendered incapable of being used during carriage.

6.4.2.4 As far as practicable, the packaging shall be so designed and finished that the external surfaces are free from protruding features and can be easily decontaminated.

6.4.2.5 As far as practicable, the outer layer of the package shall be so designed as to prevent the collection and the retention of water.

6.4.2.6 Any features added to the package at the time of carriage which are not part of the package shall not reduce its safety.

6.4.2.7 The package shall be capable of withstanding the effects of any acceleration, vibration or vibration resonance which may arise under routine conditions of carriage without any deterioration in the effectiveness of the closing devices on the various receptacles or in the integrity of the package as a whole. In particular, nuts, bolts and other securing devices shall be so designed as to prevent them from becoming loose or being released unintentionally, even after repeated use.

6.4.2.8 The materials of the packaging and any components or structures shall be physically and chemically compatible with each other and with the radioactive contents. Account shall be taken of their behaviour under irradiation.

6.4.2.9 All valves through which the radioactive contents could escape shall be protected against unauthorized operation.

6.4.2.10 The design of the package shall take into account ambient temperatures and pressures that are likely to be encountered in routine conditions of carriage.

6.4.2.11 A package shall be so designed that it provides sufficient shielding to ensure that, under routine conditions of carriage and with the maximum radioactive contents that the package is designed to contain, the radiation level at any point on the external surface of the package would not exceed the values specified in 2.2.7.2.4.1.2, 4.1.9.1.10 and 4.1.9.1.11, as applicable, with account taken of 7.5.11 CV33 (3.3) (b) and (3.5).

6.4.2.12 For radioactive material having other dangerous properties the package design shall take into account those properties; see 2.1.3.5.3 and 4.1.9.1.5.

6.4.2.13 Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

6.4.3 *(Reserved)*

6.4.4 Requirements for excepted packages

An excepted package shall be designed to meet the requirements specified in 6.4.2.

6.4.5 Requirements for Industrial packages

6.4.5.1 Types IP-1, IP-2, and IP-3 packages shall meet the requirements specified in 6.4.2 and 6.4.7.2.

6.4.5.2 A Type IP-2 package shall, if it were subjected to the tests specified in 6.4.15.4 and 6.4.15.5, prevent:

- (a) Loss or dispersal of the radioactive contents; and
- (b) More than a 20% increase in the maximum radiation level at any external surface of the package.

6.4.5.3 A Type IP-3 package shall meet all the requirements specified in 6.4.7.2 to 6.4.7.15.

6.4.5.4 Alternative requirements for Types IP-2 and IP-3 packages

6.4.5.4.1 Packages may be used as Type IP-2 package provided that:

- (a) They satisfy the requirements of 6.4.5.1;
- (b) They are designed to satisfy the requirements prescribed for packing group I or II in Chapter 6.1; and
- (c) When subjected to the tests required for packing groups I or II in Chapter 6.1, they would prevent:
 - (i) Loss or dispersal of the radioactive contents; and
 - (ii) More than a 20% increase in the maximum radiation level at any external surface of the package.

6.4.5.4.2 Portable tanks may also be used as Types IP-2 or IP-3 packages, provided that:

- (a) They satisfy the requirements of 6.4.5.1;
- (b) They are designed to satisfy the requirements prescribed in Chapter 6.7 and are capable of withstanding a test pressure of 265 kPa; and
- (c) They are designed so that any additional shielding which is provided shall be capable of withstanding the static and dynamic stresses resulting from handling and routine conditions of carriage and of preventing more than a 20% increase in the maximum radiation level at any external surface of the portable tanks.

6.4.5.4.3 Tanks, other than portable tanks, may also be used as Types IP-2 or IP-3 packages for carrying LSA-I and LSA-II liquids and gases as prescribed in Table 4.1.9.2.5, provided that:

- (a) They satisfy the requirements of 6.4.5.1;
- (b) They are designed to satisfy the requirements prescribed in Chapter 6.8; and

- (c) They are designed so that any additional shielding which is provided shall be capable of withstanding the static and dynamic stresses resulting from handling and routine conditions of carriage and of preventing more than a 20% increase in the maximum radiation level at any external surface of the tanks.

6.4.5.4.4 Containers with the characteristics of a permanent enclosure may also be used as Types IP-2 or IP-3 packages, provided that:

- (a) The radioactive contents are restricted to solid materials;
- (b) They satisfy the requirements of 6.4.5.1; and
- (c) They are designed to conform to ISO 1496-1:1990: "Series 1 Containers - Specifications and Testing - Part 1: General Cargo Containers" and subsequent amendments 1:1993, 2:1998, 3:2005, 4:2006 and 5:2006, excluding dimensions and ratings. They shall be designed such that if subjected to the tests prescribed in that document and the accelerations occurring during routine conditions of carriage they would prevent:
 - (i) loss or dispersal of the radioactive contents; and
 - (ii) more than a 20% increase in the maximum radiation level at any external surface of the containers.

6.4.5.4.5 Metal intermediate bulk containers may also be used as Types IP-2 or IP-3 packages provided that:

- (a) They satisfy the requirements of 6.4.5.1; and
- (b) They are designed to satisfy the requirements prescribed in Chapter 6.5 for packing group I or II, and if they were subjected to the tests prescribed in that Chapter, but with the drop test conducted in the most damaging orientation, they would prevent:
 - (i) loss or dispersal of the radioactive contents; and
 - (ii) more than a 20% increase in the maximum radiation level at any external surface of the intermediate bulk container.

6.4.6 Requirements for packages containing uranium hexafluoride

6.4.6.1 Packages designed to contain uranium hexafluoride shall meet the requirements which pertain to the radioactive and fissile properties of the material prescribed elsewhere in ADR. Except as allowed in 6.4.6.4, uranium hexafluoride in quantities of 0.1 kg or more shall also be packaged and carried in accordance with the provisions of ISO 7195:2005 "Nuclear Energy – Packaging of uranium hexafluoride (UF₆) for transport", and the requirements of 6.4.6.2 and 6.4.6.3.

6.4.6.2 Each package designed to contain 0.1 kg or more of uranium hexafluoride shall be designed so that it would meet the following requirements:

- (a) Withstand without leakage and without unacceptable stress, as specified in ISO 7195:2005, the structural test as specified in 6.4.21.5 except as allowed in 6.4.6.4;
- (b) Withstand without loss or dispersal of the uranium hexafluoride the free drop test specified in 6.4.15.4; and
- (c) Withstand without rupture of the containment system the thermal test specified in 6.4.17.3 except as allowed in 6.4.6.4.

6.4.6.3 Packages designed to contain 0.1 kg or more of uranium hexafluoride shall not be provided with pressure relief devices.

6.4.6.4 Subject to multilateral approval, packages designed to contain 0.1 kg or more of uranium hexafluoride may be carried if the packages are designed:

- (a) to international or national standards other than ISO 7195:2005 provided an equivalent level of safety is maintained; and/or

- (b) to withstand without leakage and without unacceptable stress a test pressure of less than 2.76 MPa as specified in 6.4.21.5; and/or
- (c) to contain 9 000 kg or more of uranium hexafluoride and the packages do not meet the requirement of 6.4.6.2 (c).

In all other respects the requirements specified in 6.4.6.1 to 6.4.6.3 shall be satisfied.

6.4.7 Requirements for Type A packages

- 6.4.7.1 Type A packages shall be designed to meet the general requirements of 6.4.2 and of 6.4.7.2 to 6.4.7.17.
- 6.4.7.2 The smallest overall external dimension of the package shall not be less than 10 cm.
- 6.4.7.3 The outside of the package shall incorporate a feature such as a seal, which is not readily breakable and which, while intact, will be evidence that it has not been opened.
- 6.4.7.4 Any tie-down attachments on the package shall be so designed that, under normal and accident conditions of carriage, the forces in those attachments shall not impair the ability of the package to meet the requirements of ADR.
- 6.4.7.5 The design of the package shall take into account temperatures ranging from -40°C to +70°C for the components of the packaging. Attention shall be given to freezing temperatures for liquids and to the potential degradation of packaging materials within the given temperature range.
- 6.4.7.6 The design and manufacturing techniques shall be in accordance with national or international standards, or other requirements, acceptable to the competent authority.
- 6.4.7.7 The design shall include a containment system securely closed by a positive fastening device which cannot be opened unintentionally or by a pressure which may arise within the package.
- 6.4.7.8 Special form radioactive material may be considered as a component of the containment system.
- 6.4.7.9 If the containment system forms a separate unit of the package, it shall be capable of being securely closed by a positive fastening device which is independent of any other part of the packaging.
- 6.4.7.10 The design of any component of the containment system shall take into account, where applicable, the radiolytic decomposition of liquids and other vulnerable materials and the generation of gas by chemical reaction and radiolysis.
- 6.4.7.11 The containment system shall retain its radioactive contents under a reduction of ambient pressure to 60 kPa.
- 6.4.7.12 All valves, other than pressure relief valves, shall be provided with an enclosure to retain any leakage from the valve.
- 6.4.7.13 A radiation shield which encloses a component of the package specified as a part of the containment system shall be so designed as to prevent the unintentional release of that component from the shield. Where the radiation shield and such component within it form a separate unit, the radiation shield shall be capable of being securely closed by a positive fastening device which is independent of any other packaging structure.
- 6.4.7.14 A package shall be so designed that if it were subjected to the tests specified in 6.4.15, it would prevent:
 - (a) Loss or dispersal of the radioactive contents; and
 - (b) More than a 20% increase in the maximum radiation level at any external surface of the package.

- 6.4.7.15 The design of a package intended for liquid radioactive material shall make provision for ullage to accommodate variations in the temperature of the contents, dynamic effects and filling dynamics.

Type A packages to contain liquids

- 6.4.7.16 A Type A package designed to contain liquid radioactive material shall, in addition:

- (a) Be adequate to meet the conditions specified in 6.4.7.14 (a) above if the package is subjected to the tests specified in 6.4.16; and
- (b) Either
 - (i) be provided with sufficient absorbent material to absorb twice the volume of the liquid contents. Such absorbent material shall be suitably positioned so as to contact the liquid in the event of leakage; or
 - (ii) be provided with a containment system composed of primary inner and secondary outer containment components designed to enclose the liquid contents completely and ensure their retention, within the secondary outer containment components, even if the primary inner components leak.

Type A packages to contain gas

- 6.4.7.17 A package designed for gases shall prevent loss or dispersal of the radioactive contents if the package were subjected to the tests specified in 6.4.16. A Type A package designed for tritium gas or for noble gases shall be excepted from this requirement.

6.4.8 Requirements for Type B(U) packages

- 6.4.8.1 Type B(U) packages shall be designed to meet the requirements specified in 6.4.2, and of 6.4.7.2 to 6.4.7.15, except as specified in 6.4.7.14 (a), and, in addition, the requirements specified in 6.4.8.2 to 6.4.8.15.

- 6.4.8.2 A package shall be so designed that, under the ambient conditions specified in 6.4.8.5 and 6.4.8.6 heat generated within the package by the radioactive contents shall not, under normal conditions of carriage, as demonstrated by the tests in 6.4.15, adversely affect the package in such a way that it would fail to meet the applicable requirements for containment and shielding if left unattended for a period of one week. Particular attention shall be paid to the effects of heat, which may cause one or more of the following:

- (a) Alter the arrangement, the geometrical form or the physical state of the radioactive contents or, if the radioactive material is enclosed in a can or receptacle (for example, clad fuel elements), cause the can, receptacle or radioactive material to deform or melt;
- (b) Lessen the efficiency of the packaging through differential thermal expansion or cracking or melting of the radiation shielding material;
- (c) In combination with moisture, accelerate corrosion.

- 6.4.8.3 A package shall be so designed that, under the ambient condition specified in 6.4.8.5 and in the absence of insolation, the temperature of the accessible surfaces of a package shall not exceed 50 °C, unless the package is carried under exclusive use.

- 6.4.8.4 The maximum temperature of any surface readily accessible during carriage of a package under exclusive use shall not exceed 85 °C in the absence of insolation under the ambient conditions specified in 6.4.8.5. Account may be taken of barriers or screens intended to give protection to persons without the need for the barriers or screens being subject to any test.

- 6.4.8.5 The ambient temperature shall be assumed to be 38 °C.

- 6.4.8.6 The solar insolation conditions shall be assumed to be as specified in Table 6.4.8.6.

Table 6.4.8.6: Insolation data

Case	Form and location of surface	Insolation for 12 hours per day (W/m ²)
1	Flat surfaces carried horizontally-downward facing	0
2	Flat surfaces carried horizontally-upward facing	800
3	Surfaces carried vertically	200 ^a
4	Other downward facing (not horizontal) surfaces	200 ^a
5	All other surfaces	400 ^a

^a Alternatively, a sine function may be used, with an absorption coefficient adopted and the effects of possible reflection from neighbouring objects neglected.

6.4.8.7 A package which includes thermal protection for the purpose of satisfying the requirements of the thermal test specified in 6.4.17.3 shall be so designed that such protection will remain effective if the package is subjected to the tests specified in 6.4.15 and 6.4.17.2 (a) and (b) or 6.4.17.2 (b) and (c), as appropriate. Any such protection on the exterior of the package shall not be rendered ineffective by ripping, cutting, skidding, abrasion or rough handling.

6.4.8.8 A package shall be so designed that, if it were subjected to:

- (a) The tests specified in 6.4.15, it would restrict the loss of radioactive contents to not more than 10^{-6} A₂ per hour; and
- (b) The tests specified in 6.4.17.1, 6.4.17.2 (b), 6.4.17.3, and 6.4.17.4 and either the test in
 - (i) 6.4.17.2 (c), when the package has a mass not greater than 500 kg, an overall density not greater than 1 000 kg/m³ based on the external dimensions, and radioactive contents greater than 1 000 A₂ not as special form radioactive material, or
 - (ii) 6.4.17.2 (a), for all other packages,

it would meet the following requirements:

- retain sufficient shielding to ensure that the radiation level at 1 m from the surface of the package would not exceed 10 mSv/h with the maximum radioactive contents which the package is designed to contain; and
- restrict the accumulated loss of radioactive contents in a period of one week to not more than 10 A₂ for krypton-85 and not more than A₂ for all other radionuclides.

Where mixtures of different radionuclides are present, the provisions of 2.2.7.2.2.4 to 2.2.7.2.2.6 shall apply except that for krypton-85 an effective A₂(i) value equal to 10 A₂ may be used. For case (a) above, the assessment shall take into account the external contamination limits of 4.1.9.1.2.

6.4.8.9 A package for radioactive contents with activity greater than 10^5 A₂ shall be so designed that if it were subjected to the enhanced water immersion test specified in 6.4.18, there would be no rupture of the containment system.

6.4.8.10 Compliance with the permitted activity release limits shall depend neither upon filters nor upon a mechanical cooling system.

6.4.8.11 A package shall not include a pressure relief system from the containment system which would allow the release of radioactive material to the environment under the conditions of the tests specified in 6.4.15 and 6.4.17.

6.4.8.12 A package shall be so designed that if it were at the maximum normal operating pressure and it were subjected to the tests specified in 6.4.15 and 6.4.17, the level of strains in the containment system would not attain values which would adversely affect the package in such a way that it would fail to meet the applicable requirements.

- 6.4.8.13 A package shall not have a maximum normal operating pressure in excess of a gauge pressure of 700 kPa.
- 6.4.8.14 A package containing low dispersible radioactive material shall be so designed that any features added to the low dispersible radioactive material that are not part of it, or any internal components of the packaging shall not adversely affect the performance of the low dispersible radioactive material.
- 6.4.8.15 A package shall be designed for an ambient temperature range from -40 °C to +38 °C.

6.4.9 Requirements for Type B(M) packages

- 6.4.9.1 Type B(M) packages shall meet the requirements for Type B(U) packages specified in 6.4.8.1, except that for packages to be carried solely within a specified country or solely between specified countries, conditions other than those given in 6.4.7.5, 6.4.8.4 to 6.4.8.6, and 6.4.8.9 to 6.4.8.15 above may be assumed with the approval of the competent authorities of these countries. Notwithstanding, the requirements for Type B(U) packages specified in 6.4.8.4 and 6.4.8.9 to 6.4.8.15 shall be met as far as practicable.
- 6.4.9.2 Intermittent venting of Type B(M) packages may be permitted during carriage, provided that the operational controls for venting are acceptable to the relevant competent authorities.

6.4.10 Requirements for Type C packages

- 6.4.10.1 Type C packages shall be designed to meet the requirements specified in 6.4.2 and of 6.4.7.2 to 6.4.7.15, except as specified in 6.4.7.14 (a), and of the requirements specified in 6.4.8.2 to 6.4.8.6, 6.4.8.10 to 6.4.8.15, and, in addition, of 6.4.10.2 to 6.4.10.4.
- 6.4.10.2 A package shall be capable of meeting the assessment criteria prescribed for tests in 6.4.8.8 (b) and 6.4.8.12 after burial in an environment defined by a thermal conductivity of $0.33 \text{ W.m}^{-1}.\text{K}^{-1}$ and a temperature of 38 °C in the steady state. Initial conditions for the assessment shall assume that any thermal insulation of the package remains intact, the package is at the maximum normal operating pressure and the ambient temperature is 38 °C.
- 6.4.10.3 A package shall be so designed that, if it were at the maximum normal operating pressure and subjected to:
- (a) The tests specified in 6.4.15, it would restrict the loss of radioactive contents to not more than $10^{-6} A_2$ per hour; and
 - (b) The test sequences in 6.4.20.1,
 - (i) it would retain sufficient shielding to ensure that the radiation level at 1 m from the surface of the package would not exceed 10 mSv/h with the maximum radioactive contents which the package is designed to contain; and
 - (ii) it would restrict the accumulated loss of radioactive contents in a period of 1 week to not more than $10 A_2$ for krypton-85 and not more than A_2 for all other radionuclides.

Where mixtures of different radionuclides are present, the provisions of 2.2.7.2.2.4 to 2.2.7.2.2.6 shall apply except that for krypton-85 an effective $A_2(i)$ value equal to $10 A_2$ may be used. For case (a) above, the assessment shall take into account the external contamination limits of 4.1.9.1.2.

- 6.4.10.4 A package shall be so designed that there will be no rupture of the containment system following performance of the enhanced water immersion test specified in 6.4.18.

6.4.11 Requirements for packages containing fissile material

6.4.11.1 Fissile material shall be carried so as to:

- (a) Maintain sub-criticality during routine, normal and accident conditions of carriage; in particular, the following contingencies shall be considered:
 - (i) water leaking into or out of packages;
 - (ii) the loss of efficiency of built-in neutron absorbers or moderators;
 - (iii) rearrangement of the contents either within the package or as a result of loss from the package;
 - (iv) reduction of spaces within or between packages;
 - (v) packages becoming immersed in water or buried in snow; and
 - (vi) temperature changes; and
- (b) Meet the requirements:
 - (i) of 6.4.7.2 except for unpackaged material when specifically allowed by 2.2.7.2.3.5 (e);
 - (ii) prescribed elsewhere in ADR which pertain to the radioactive properties of the material;
 - (iii) of 6.4.7.3 unless the material is excepted by 2.2.7.2.3.5;
 - (iv) of 6.4.11.4 to 6.4.11.14, unless the material is excepted by 2.2.7.2.3.5, 6.4.11.2 or 6.4.11.3.

6.4.11.2 Packages containing fissile material that meet the provisions of subparagraph (d) and one of the provisions of (a) to (c) below are excepted from the requirements of 6.4.11.4 to 6.4.11.14.

- (a) Packages containing fissile material in any form provided that:
 - (i) The smallest external dimension of the package is not less than 10 cm;
 - (ii) The criticality safety index of the package is calculated using the following formula:

$$CSI = 50 \times 5 \times \left(\frac{\text{Mass of U - 235 in package (g)}}{Z} + \frac{\text{Mass of other fissile nuclides* in package (g)}}{280} \right)$$

* Plutonium may be of any isotopic composition provided that the amount of Pu-241 is less than that of Pu-240 in the package

where the values of Z are taken from Table 6.4.11.2;

- (iii) The CSI of any package does not exceed 10;
- (b) Packages containing fissile material in any form provided that:
 - (i) The smallest external dimension of the package is not less than 30 cm;

- (ii) The package, after being subjected to the tests specified in 6.4.15.1 to 6.4.15.6:
- Retains its fissile material contents;
 - Preserves the minimum overall outside dimensions of the package to at least 30 cm;
 - Prevents the entry of a 10 cm cube;
- (iii) The criticality safety index of the package is calculated using the following formula:

$$CSI = 50 \times 2 \times \left(\frac{\text{Mass of U - 235 in package (g)}}{Z} + \frac{\text{Mass of other fissile nuclides* in package (g)}}{280} \right)$$

* Plutonium may be of any isotopic composition provided that the amount of Pu-241 is less than that of Pu-240 in the package

where the values of Z are taken from Table 6.4.11.2;

- (iv) The criticality safety index of any package does not exceed 10;

- (c) Packages containing fissile material in any form provided that:

- (i) The smallest external dimension of the package is not less than 10 cm;
- (ii) The package, after being subjected to the tests specified in 6.4.15.1 to 6.4.15.6:
- Retains its fissile material contents;
 - Preserves the minimum overall outside dimensions of the package to at least 10 cm;
 - Prevents the entry of a 10 cm cube;
- (iii) The CSI of the package is calculated using the following formula:

$$CSI = 50 \times 2 \times \left(\frac{\text{Mass of U - 235 in package (g)}}{450} + \frac{\text{Mass of other fissile nuclides* in package (g)}}{280} \right)$$

* Plutonium may be of any isotopic composition provided that the amount of Pu-241 is less than that of Pu-240 in the package

- (iv) The maximum mass of fissile nuclides in any package does not exceed 15 g;

- (d) The total mass of beryllium, hydrogenous material enriched in deuterium, graphite and other allotropic forms of carbon in an individual package shall not be greater than the mass of fissile nuclides in the package except where their total concentration does not exceed 1 g in any 1 000 g of material. Beryllium incorporated in copper alloys up to 4% in weight of the alloy does not need to be considered.

Table 6.4.11.2 Values of Z for calculation of criticality safety index in accordance with 6.4.11.2

<i>Enrichment^a</i>	<i>Z</i>
Uranium enriched up to 1.5%	2200
Uranium enriched up to 5%	850
Uranium enriched up to 10%	660
Uranium enriched up to 20%	580
Uranium enriched up to 100%	450

^a If a package contains uranium with varying enrichments of U-235, then the value corresponding to the highest enrichment shall be used for Z.

6.4.11.3 Packages containing not more than 1 000 g of plutonium are excepted from the application of 6.4.11.4 to 6.4.11.14 provided that:

- (a) Not more than 20% of the plutonium by mass is fissile nuclides;
- (b) The criticality safety index of the package is calculated using the following formula:

$$CSI = 50 \times 2 \times \frac{\text{mass of plutonium (g)}}{1000}$$

- (c) If uranium is present with the plutonium, the mass of uranium shall be no more than 1% of the mass of the plutonium.

6.4.11.4 Where the chemical or physical form, isotopic composition, mass or concentration, moderation ratio or density, or geometric configuration is not known, the assessments of 6.4.11.8 to 6.4.11.13 shall be performed assuming that each parameter that is not known has the value which gives the maximum neutron multiplication consistent with the known conditions and parameters in these assessments.

6.4.11.5 For irradiated nuclear fuel the assessments of 6.4.11.8 to 6.4.11.13 shall be based on an isotopic composition demonstrated to provide either:

- (a) The maximum neutron multiplication during the irradiation history; or
- (b) A conservative estimate of the neutron multiplication for the package assessments. After irradiation but prior to shipment, a measurement shall be performed to confirm the conservatism of the isotopic composition.

6.4.11.6 The package, after being subjected to the tests specified in 6.4.15, shall:

- (a) Preserve the minimum overall outside dimensions of the package to at least 10 cm; and
- (b) Prevent the entry of a 10 cm cube.

6.4.11.7 The package shall be designed for an ambient temperature range of -40°C to + 38°C unless the competent authority specifies otherwise in the certificate of approval for the package design.

6.4.11.8 For a package in isolation, it shall be assumed that water can leak into or out of all void spaces of the package, including those within the containment system. However, if the design incorporates special features to prevent such leakage of water into or out of certain void spaces, even as a result of error, absence of leakage may be assumed in respect of those void spaces. Special features shall include either of the following:

- (a) Multiple high standard water barriers, not less than two of which would remain watertight if the package were subject to the tests prescribed in 6.4.11.13 (b), a high degree of quality control in the manufacture, maintenance and repair of packagings and tests to demonstrate the closure of each package before each shipment; or
- (b) For packages containing uranium hexafluoride only, with maximum enrichment of 5 mass percent uranium-235:
 - (i) packages where, following the tests prescribed in 6.4.11.13 (b), there is no physical contact between the valve and any other component of the packaging other than at its original point of attachment and where, in addition, following the test prescribed in 6.4.17.3 the valves remain leaktight; and
 - (ii) a high degree of quality control in the manufacture, maintenance and repair of packagings coupled with tests to demonstrate closure of each package before each shipment.

- 6.4.11.9 It shall be assumed that the confinement system is closely reflected by at least 20 cm of water or such greater reflection as may additionally be provided by the surrounding material of the packaging. However, when it can be demonstrated that the confinement system remains within the packaging following the tests prescribed in 6.4.11.13 (b), close reflection of the package by at least 20 cm of water may be assumed in 6.4.11.10 (c).
- 6.4.11.10 The package shall be subcritical under the conditions of 6.4.11.8 and 6.4.11.9 with the package conditions that result in the maximum neutron multiplication consistent with:
- (a) Routine conditions of carriage (incident free);
 - (b) The tests specified in 6.4.11.12 (b);
 - (c) The tests specified in 6.4.11.13 (b).
- 6.4.11.11 *(Reserved)*
- 6.4.11.12 For normal conditions of carriage a number "N" shall be derived, such that five times "N" packages shall be subcritical for the arrangement and package conditions that provide the maximum neutron multiplication consistent with the following:
- (a) There shall not be anything between the packages, and the package arrangement shall be reflected on all sides by at least 20 cm of water; and
 - (b) The state of the packages shall be their assessed or demonstrated condition if they had been subjected to the tests specified in 6.4.15.
- 6.4.11.13 For accident conditions of carriage a number "N" shall be derived, such that two times "N" packages shall be subcritical for the arrangement and package conditions that provide the maximum neutron multiplication consistent with the following:
- (a) Hydrogenous moderation between packages, and the package arrangement reflected on all sides by at least 20 cm of water; and
 - (b) The tests specified in 6.4.15 followed by whichever of the following is the more limiting:
 - (i) the tests specified in 6.4.17.2 (b) and, either 6.4.17.2 (c) for packages having a mass not greater than 500 kg and an overall density not greater than 1 000 kg/m³ based on the external dimensions, or 6.4.17.2 (a) for all other packages; followed by the test specified in 6.4.17.3 and completed by the tests specified in 6.4.19.1 to 6.4.19.3; or
 - (ii) the test specified in 6.4.17.4; and
 - (c) Where any part of the fissile material escapes from the containment system following the tests specified in 6.4.11.13 (b), it shall be assumed that fissile material escapes from each package in the array and all of the fissile material shall be arranged in the configuration and moderation that results in the maximum neutron multiplication with close reflection by at least 20 cm of water.
- 6.4.11.14 The criticality safety index (CSI) for packages containing fissile material shall be obtained by dividing the number 50 by the smaller of the two values of N derived in 6.4.11.12 and 6.4.11.13 (i.e. $CSI = 50/N$). The value of the criticality safety index may be zero, provided that an unlimited number of packages is subcritical (i.e. N is effectively equal to infinity in both cases).
- 6.4.12 Test procedures and demonstration of compliance**
- 6.4.12.1 Demonstration of compliance with the performance standards required in 2.2.7.2.3.1.3, 2.2.7.2.3.1.4, 2.2.7.2.3.3.1, 2.2.7.2.3.3.2, 2.2.7.2.3.4.1, 2.2.7.2.3.4.2, and 6.4.2 to 6.4.11 must be accomplished by any of the methods listed below or by a combination thereof:

- (a) Performance of tests with specimens representing LSA-III material, or special form radioactive material, or low dispersible radioactive material or with prototypes or samples of the packaging, where the contents of the specimen or the packaging for the tests shall simulate as closely as practicable the expected range of radioactive contents and the specimen or packaging to be tested shall be prepared as presented for carriage;
- (b) Reference to previous satisfactory demonstrations of a sufficiently similar nature;
- (c) Performance of tests with models of appropriate scale incorporating those features which are significant with respect to the item under investigation when engineering experience has shown results of such tests to be suitable for design purposes. When a scale model is used, the need for adjusting certain test parameters, such as penetrator diameter or compressive load, shall be taken into account;
- (d) Calculation, or reasoned argument, when the calculation procedures and parameters are generally agreed to be reliable or conservative.

6.4.12.2 After the specimen, prototype or sample has been subjected to the tests, appropriate methods of assessment shall be used to assure that the requirements for the test procedures have been fulfilled in compliance with the performance and acceptance standards prescribed in 2.2.7.2.3.1.3, 2.2.7.2.3.1.4, 2.2.7.2.3.3.1, 2.2.7.2.3.3.2, 2.2.7.2.3.4.1, 2.2.7.2.3.4.2, and 6.4.2 to 6.4.11.

6.4.12.3 All specimens shall be inspected before testing in order to identify and record faults or damage including the following:

- (a) Divergence from the design;
- (b) Defects in manufacture;
- (c) Corrosion or other deterioration; and
- (d) Distortion of features.

The containment system of the package shall be clearly specified. The external features of the specimen shall be clearly identified so that reference may be made simply and clearly to any part of such specimen.

6.4.13 Testing the integrity of the containment system and shielding and evaluating criticality safety

After each of the applicable tests specified in 6.4.15 to 6.4.21:

- (a) Faults and damage shall be identified and recorded;
- (b) It shall be determined whether the integrity of the containment system and shielding has been retained to the extent required in 6.4.2 to 6.4.11 for the package under test; and
- (c) For packages containing fissile material, it shall be determined whether the assumptions and conditions used in the assessments required by 6.4.11.1 to 6.4.11.14 for one or more packages are valid.

6.4.14 Target for drop tests

The target for the drop tests specified in 2.2.7.2.3.3.5 (a), 6.4.15.4, 6.4.16 (a), 6.4.17.2 and 6.4.20.2 shall be a flat, horizontal surface of such a character that any increase in its resistance to displacement or deformation upon impact by the specimen would not significantly increase the damage to the specimen.

6.4.15 Tests for demonstrating ability to withstand normal conditions of carriage

6.4.15.1 The tests are: the water spray test, the free drop test, the stacking test and the penetration test. Specimens of the package shall be subjected to the free drop test, the stacking test and the penetration test, preceded in each case by the water spray test. One specimen may be used for all the tests, provided that the requirements of 6.4.15.2 are fulfilled.

6.4.15.2 The time interval between the conclusion of the water spray test and the succeeding test shall be such that the water has soaked in to the maximum extent, without appreciable drying of the exterior of the specimen. In the absence of any evidence to the contrary, this interval shall be taken to be two hours if the water spray is applied from four directions simultaneously. No time interval shall elapse, however, if the water spray is applied from each of the four directions consecutively.

6.4.15.3 Water spray test: The specimen shall be subjected to a water spray test that simulates exposure to rainfall of approximately 5 cm per hour for at least one hour.

6.4.15.4 Free drop test: The specimen shall drop onto the target so as to suffer maximum damage in respect of the safety features to be tested.

- (a) The height of drop measured from the lowest point of the specimen to the upper surface of the target shall be not less than the distance specified in Table 6.4.15.4 for the applicable mass. The target shall be as defined in 6.4.14;
- (b) For rectangular fibreboard or wood packages not exceeding a mass of 50 kg, a separate specimen shall be subjected to a free drop onto each corner from a height of 0.3 m;
- (c) For cylindrical fibreboard packages not exceeding a mass of 100 kg, a separate specimen shall be subjected to a free drop onto each of the quarters of each rim from a height of 0.3 m.

Table 6.4.15.4: Free drop distance for testing packages to normal conditions of carriage

Package mass (kg)	Free drop distance (m)
Package mass < 5 000	1.2
5 000 ≤ Package mass < 10 000	0.9
10 000 ≤ Package mass < 15 000	0.6
15 000 ≤ Package mass	0.3

6.4.15.5 Stacking test: Unless the shape of the packaging effectively prevents stacking, the specimen shall be subjected, for a period of 24 h, to a compressive load equal to the greater of the following:

- (a) The equivalent of 5 times the maximum weight of the package; and
- (b) The equivalent of 13 kPa multiplied by the vertically projected area of the package.

The load shall be applied uniformly to two opposite sides of the specimen, one of which shall be the base on which the package would typically rest.

6.4.15.6 Penetration test: The specimen shall be placed on a rigid, flat, horizontal surface which will not move significantly while the test is being carried out.

- (a) A bar of 3.2 cm in diameter with a hemispherical end and a mass of 6 kg shall be dropped and directed to fall, with its longitudinal axis vertical, onto the centre of the weakest part of the specimen, so that, if it penetrates sufficiently far, it will hit the containment system. The bar shall not be significantly deformed by the test performance;
- (b) The height of drop of the bar measured from its lower end to the intended point of impact on the upper surface of the specimen shall be 1 m.

6.4.16 Additional tests for Type A packages designed for liquids and gases

A specimen or separate specimens shall be subjected to each of the following tests unless it can be demonstrated that one test is more severe for the specimen in question than the other, in which case one specimen shall be subjected to the more severe test.

- (a) Free drop test: The specimen shall drop onto the target so as to suffer the maximum damage in respect of containment. The height of the drop measured from the lowest part of the specimen to the upper surface of the target shall be 9 m. The target shall be as defined in 6.4.14;
- (b) Penetration test: The specimen shall be subjected to the test specified in 6.4.15.6 except that the height of drop shall be increased to 1.7 m from the 1 m specified in 6.4.15.6 (b).

6.4.17 Tests for demonstrating ability to withstand accident conditions in carriage

6.4.17.1 The specimen shall be subjected to the cumulative effects of the tests specified in 6.4.17.2 and 6.4.17.3, in that order. Following these tests, either this specimen or a separate specimen shall be subjected to the effect(s) of the water immersion test(s) as specified in 6.4.17.4 and, if applicable, 6.4.18.

6.4.17.2 Mechanical test: The mechanical test consists of three different drop tests. Each specimen shall be subjected to the applicable drops as specified in 6.4.8.8 or 6.4.11.13. The order in which the specimen is subjected to the drops shall be such that, on completion of the mechanical test, the specimen shall have suffered such damage as will lead to the maximum damage in the thermal test which follows.

- (a) For drop I, the specimen shall drop onto the target so as to suffer the maximum damage, and the height of the drop measured from the lowest point of the specimen to the upper surface of the target shall be 9 m. The target shall be as defined in 6.4.14;
- (b) For drop II, the specimen shall drop onto a bar rigidly mounted perpendicularly on the target so as to suffer the maximum damage. The height of the drop measured from the intended point of impact of the specimen to the upper surface of the bar shall be 1 m. The bar shall be of solid mild steel of circular section, $(15.0 \text{ cm} \pm 0.5 \text{ cm})$ in diameter and 20 cm long unless a longer bar would cause greater damage, in which case a bar of sufficient length to cause maximum damage shall be used. The upper end of the bar shall be flat and horizontal with its edge rounded off to a radius of not more than 6 mm. The target on which the bar is mounted shall be as described in 6.4.14;
- (c) For drop III, the specimen shall be subjected to a dynamic crush test by positioning the specimen on the target so as to suffer maximum damage by the drop of a 500 kg mass from 9 m onto the specimen. The mass shall consist of a solid mild steel plate 1 m by 1 m and shall fall in a horizontal attitude. The lower face of the steel plate shall have its edges and corners rounded off to a radius of not more than 6 mm. The height of the drop shall be measured from the underside of the plate to the highest point of the specimen. The target on which the specimen rests shall be as defined in 6.4.14.

6.4.17.3 Thermal test: The specimen shall be in thermal equilibrium under conditions of an ambient temperature of 38 °C, subject to the solar insolation conditions specified in Table 6.4.8.6 and subject to the design maximum rate of internal heat generation within the package from the radioactive contents. Alternatively, any of these parameters are allowed to have different values prior to and during the test, providing due account is taken of them in the subsequent assessment of package response.

The thermal test shall then consist of:

- (a) Exposure of a specimen for a period of 30 minutes to a thermal environment which provides a heat flux at least equivalent to that of a hydrocarbon fuel/air fire in sufficiently quiescent ambient conditions to give a minimum average flame emissivity coefficient of 0.9 and an average temperature of at least 800 °C, fully engulfing the specimen, with a surface absorptivity coefficient of 0.8 or that value which the package may be demonstrated to possess if exposed to the fire specified, followed by;
- (b) Exposure of the specimen to an ambient temperature of 38 °C, subject to the solar insolation conditions specified in Table 6.4.8.6 and subject to the design maximum rate of internal heat generation within the package by the radioactive contents for a sufficient period to ensure that temperatures in the specimen are everywhere decreasing and/or are approaching initial steady state conditions. Alternatively, any of these parameters are allowed to have different values following cessation of heating, providing due account is taken of them in the subsequent assessment of package response.

During and following the test the specimen shall not be artificially cooled and any combustion of materials of the specimen shall be permitted to proceed naturally.

6.4.17.4 Water immersion test: The specimen shall be immersed under a head of water of at least 15 m for a period of not less than eight hours in the attitude which will lead to maximum damage. For demonstration purposes, an external gauge pressure of at least 150 kPa shall be considered to meet these conditions.

6.4.18 Enhanced water immersion test for Type B(U) and Type B(M) packages containing more than 10^5 A₂ and Type C packages

Enhanced water immersion test: The specimen shall be immersed under a head of water of at least 200 m for a period of not less than one hour. For demonstration purposes, an external gauge pressure of at least 2 MPa shall be considered to meet these conditions.

6.4.19 Water leakage test for packages containing fissile material

6.4.19.1 Packages for which water in-leakage or out-leakage to the extent which results in greatest reactivity has been assumed for purposes of assessment under 6.4.11.8 to 6.4.11.13 shall be excepted from the test.

6.4.19.2 Before the specimen is subjected to the water leakage test specified below, it shall be subjected to the tests in 6.4.17.2 (b), and either 6.4.17.2 (a) or (c) as required by 6.4.11.13, and the test specified in 6.4.17.3.

6.4.19.3 The specimen shall be immersed under a head of water of at least 0.9 m for a period of not less than 8 hours and in the attitude for which maximum leakage is expected.

6.4.20 Tests for Type C packages

6.4.20.1 Specimens shall be subjected to the effects of each of the following test sequences in the orders specified:

- (a) The tests specified in 6.4.17.2 (a), 6.4.17.2 (c), 6.4.20.2 and 6.4.20.3; and
- (b) The test specified in 6.4.20.4.

Separate specimens are allowed to be used for each of the sequences (a) and (b).

6.4.20.2 Puncture/tearing test: The specimen shall be subjected to the damaging effects of a vertical solid probe made of mild steel. The orientation of the package specimen and the impact point on the package surface shall be such as to cause maximum damage at the conclusion of the test sequence specified in 6.4.20.1 (a).

- (a) The specimen, representing a package having a mass less than 250 kg, shall be placed on a target and subjected to a probe having a mass of 250 kg falling from a height of 3 m above the intended impact point. For this test the probe shall be a 20 cm diameter cylindrical bar with the striking end forming a frustum of a right circular cone with the following dimensions: 30 cm height and 2.5 cm in diameter at the top with its edge rounded off to a radius of not more than 6 mm. The target on which the specimen is placed shall be as specified in 6.4.14;
- (b) For packages having a mass of 250 kg or more, the base of the probe shall be placed on a target and the specimen dropped onto the probe. The height of the drop, measured from the point of impact with the specimen to the upper surface of the probe shall be 3 m. For this test the probe shall have the same properties and dimensions as specified in (a) above, except that the length and mass of the probe shall be such as to incur maximum damage to the specimen. The target on which the base of the probe is placed shall be as specified in 6.4.14.

6.4.20.3 Enhanced thermal test: The conditions for this test shall be as specified in 6.4.17.3, except that the exposure to the thermal environment shall be for a period of 60 minutes.

6.4.20.4 Impact test: The specimen shall be subject to an impact on a target at a velocity of not less than 90 m/s, at such an orientation as to suffer maximum damage. The target shall be as defined in 6.4.14, except that the target surface may be at any orientation as long as the surface is normal to the specimen path.

6.4.21 Inspections for packagings designed to contain 0.1 kg or more of uranium hexafluoride

6.4.21.1 Every manufactured packaging and its service and structural equipment shall, either jointly or separately, undergo an inspection initially before being put into service and periodically thereafter. These inspections shall be performed and certified by agreement with the competent authority.

6.4.21.2 The initial inspection shall consist of a check of the design characteristics, a structural test, a leakproofness test, a water capacity test and a check of satisfactory operation of the service equipment.

6.4.21.3 The periodic inspections shall consist of a visual examination, a structural test, a leakproofness test and a check of satisfactory operation of the service equipment. The maximum intervals for periodic inspections shall be five years. Packagings which have not been inspected within this five-year period shall be examined before carriage in accordance with a programme approved by the competent authority. They shall not be refilled before completion of the full programme for periodic inspections.

6.4.21.4 The check of design characteristics shall demonstrate compliance with the design type specifications and the manufacturing programme.

6.4.21.5 For the initial structural test, packagings designed to contain 0.1 kg or more of uranium hexafluoride shall be tested hydraulically at an internal pressure of at least 1.38 MPa but, when the test pressure is less than 2.76 MPa, the design shall require multilateral approval. For retesting packagings, any other equivalent non-destructive testing may be applied subject to multilateral approval.

6.4.21.6 The leakproofness test shall be performed in accordance with a procedure which is capable of indicating leakages in the containment system with a sensitivity of 0.1 Pa.l/s (10^{-6} bar.l/s).

6.4.21.7 The water capacity of the packagings shall be established with an accuracy of $\pm 0.25\%$ at a reference temperature of 15 °C. The volume shall be stated on the plate described in 6.4.21.8.

6.4.21.8 A plate made of non-corroding metal shall be durably attached to every packaging in a readily accessible place. The method of attaching the plate must not impair the strength of the packaging. The following particulars, at least, shall be marked on the plate by stamping or by any other equivalent method:

- Approval number;
- Manufacturer's serial number;
- Maximum working pressure (gauge pressure);

- Test pressure (gauge pressure);
- Contents: uranium hexafluoride;
- Capacity in litres;
- Maximum permissible filling mass of uranium hexafluoride;
- Tare mass;
- Date (month, year) of the initial test and the most recent periodic test;
- Stamp of the expert who performed the tests.

6.4.22 Approvals of package designs and materials

6.4.22.1 The approval of designs for packages containing 0.1 kg or more of uranium hexafluoride requires that:

- (a) Each design that meets the requirements of 6.4.6.4 shall require multilateral approval;
- (b) Each design that meets the requirements of 6.4.6.1 to 6.4.6.3 shall require unilateral approval by the competent authority of the country of origin of the design, unless multilateral approval is otherwise required by ADR.

6.4.22.2 Each Type B(U) and Type C package design shall require unilateral approval, except that:

- (a) A package design for fissile material, which is also subject to 6.4.22.4, 6.4.23.7, and 5.1.5.2.1 shall require multilateral approval; and
- (b) A Type B(U) package design for low dispersible radioactive material shall require multilateral approval.

6.4.22.3 Each Type B(M) package design, including those for fissile material which are also subject to the requirements of 6.4.22.4, 6.4.23.7, and 5.1.5.2.1 and those for low dispersible radioactive material, shall require multilateral approval.

6.4.22.4 Each package design for fissile material which is not excepted by any of the paragraphs 2.2.7.2.3.5 (a) to (f), 6.4.11.2 and 6.4.11.3 shall require multilateral approval.

6.4.22.5 The design for special form radioactive material shall require unilateral approval. The design for low dispersible radioactive material shall require multilateral approval (see also 6.4.23.8).

6.4.22.6 The design for a fissile material excepted from "FISSILE" classification in accordance with 2.2.7.2.3.5 (f) shall require multilateral approval.

6.4.22.7 Alternative activity limits for an exempt consignment of instruments or articles in accordance with 2.2.7.2.2.2 (b) shall require multilateral approval.

6.4.22.8 Any design that requires unilateral approval originating in a country Contracting Party to ADR shall be approved by the competent authority of this country; if the country where the package has been designed is not a Contracting Party to ADR, carriage is possible on condition that:

- (a) A certificate has been supplied by this country, proving that the package design satisfies the technical requirements of ADR, and that this certificate is countersigned by the competent authority of the first country Contracting Party to ADR reached by the consignment;
- (b) If no certificate and no existing package design approval by a country Contracting Party to ADR has been supplied, the package design is approved by the competent authority of the first country Contracting Party to ADR reached by the consignment.

6.4.22.9 For designs approved under the transitional measures see 1.6.6.

6.4.23 Applications and approvals for radioactive material carriage

6.4.23.1 *(Reserved)*

6.4.23.2 An application for approval of shipment shall include:

- (a) The period of time, related to the shipment, for which the approval is sought;
- (b) The actual radioactive contents, the expected modes of carriage, the type of vehicle, and the probable or proposed route; and
- (c) The details of how the precautions and administrative or operational controls, referred to in the certificate of approval for the package design, if applicable, issued under 5.1.5.2.1 (a) (v), (vi) or (vii), are to be put into effect.

6.4.23.3 An application for approval of shipments under special arrangement shall include all the information necessary to satisfy the competent authority that the overall level of safety in carriage is at least equivalent to that which would be provided if all the applicable requirements of ADR had been met.

The application shall also include:

- (a) A statement of the respects in which, and of the reasons why, the shipment cannot be made in full accordance with the applicable requirements of ADR; and
- (b) A statement of any special precautions or special administrative or operational controls which are to be employed during carriage to compensate for the failure to meet the applicable requirements of ADR.

6.4.23.4 An application for approval of Type B(U) or Type C package design shall include:

- (a) A detailed description of the proposed radioactive contents with reference to their physical and chemical states and the nature of the radiation emitted;
- (b) A detailed statement of the design, including complete engineering drawings and schedules of materials and methods of manufacture;
- (c) A statement of the tests which have been done and their results, or evidence based on calculative methods or other evidence that the design is adequate to meet the applicable requirements;
- (d) The proposed operating and maintenance instructions for the use of the packaging;
- (e) If the package is designed to have a maximum normal operating pressure in excess of 100 kPa gauge, a specification of the materials of manufacture of the containment system, the samples to be taken, and the tests to be made;
- (f) Where the proposed radioactive contents are irradiated nuclear fuel, a statement and a justification of any assumption in the safety analysis relating to the characteristics of the fuel and a description of any pre-shipment measurement as required by 6.4.11.5 (b);
- (g) Any special stowage provisions necessary to ensure the safe dissipation of heat from the package considering the various modes of carriage to be used and type of vehicle or container;
- (h) A reproducible illustration, not larger than 21 cm by 30 cm, showing the make-up of the package; and
- (i) A specification of the applicable management system as required in 1.7.3.

6.4.23.5 An application for approval of a Type B(M) package design shall include, in addition to the general information required in 6.4.23.4 for Type B(U) packages:

- (a) A list of the requirements specified in 6.4.7.5, 6.4.8.4 to 6.4.8.6 and 6.4.8.9 to 6.4.8.15 with which the package does not conform;

- (b) Any proposed supplementary operational controls to be applied during carriage not regularly provided for in this Annex, but which are necessary to ensure the safety of the package or to compensate for the deficiencies listed in (a) above;
 - (c) A statement relative to any restrictions on the mode of carriage and to any special loading, carriage, unloading or handling procedures; and
 - (d) A statement of the range of ambient conditions (temperature, solar radiation) which are expected to be encountered during carriage and which have been taken into account in the design.
- 6.4.23.6 The application for approval of designs for packages containing 0.1 kg or more of uranium hexafluoride shall include all information necessary to satisfy the competent authority that the design meets the applicable requirements of 6.4.6.1, and a description of the applicable management system as required in 1.7.3.
- 6.4.23.7 An application for a fissile package approval shall include all information necessary to satisfy the competent authority that the design meets the applicable requirements of 6.4.11.1, and a specification of the applicable management system as required by 1.7.3.
- 6.4.23.8 An application for approval of design for special form radioactive material and design for low dispersible radioactive material shall include:
 - (a) A detailed description of the radioactive material or, if a capsule, the contents; particular reference shall be made to both physical and chemical states;
 - (b) A detailed statement of the design of any capsule to be used;
 - (c) A statement of the tests which have been done and their results, or evidence based on calculative methods to show that the radioactive material is capable of meeting the performance standards, or other evidence that the special form radioactive material or low dispersible radioactive material meets the applicable requirements of ADR;
 - (d) A specification of the applicable management system as required in 1.7.3; and
 - (e) Any proposed pre-shipment actions for use in the consignment of special form radioactive material or low dispersible radioactive material.
- 6.4.23.9 An application for approval of design for fissile material excepted from "FISSILE" classification in accordance with Table 2.2.7.2.1.1, under 2.2.7.2.3.5 (f) shall include:
 - (a) A detailed description of the material; particular reference shall be made to both physical and chemical states;
 - (b) A statement of the tests that have been carried out and their results, or evidence based on calculation methods to show that the material is capable of meeting the requirements specified in 2.2.7.2.3.6;
 - (c) A specification of the applicable management system as required in 1.7.3;
 - (d) A statement of specific actions to be taken prior to shipment.
- 6.4.23.10 An application for approval of alternative activity limits for an exempt consignment of instruments or articles shall include:
 - (a) An identification and detailed description of the instrument or article, its intended uses and the radionuclide(s) incorporated;
 - (b) The maximum activity of the radionuclide(s) in the instrument or article;
 - (c) Maximum external radiation levels arising from the instrument or article;
 - (d) The chemical and physical forms of the radionuclide(s) contained in the instrument or article;

- (e) Details of the construction and design of the instrument or article, particularly as related to the containment and shielding of the radionuclide in routine, normal and accident conditions of carriage;
- (f) The applicable management system, including the quality testing and verification procedures to be applied to radioactive sources, components and finished products to ensure that the maximum specified activity of radioactive material or the maximum radiation levels specified for the instrument or article are not exceeded, and that the instruments or articles are constructed according to the design specifications;
- (g) The maximum number of instruments or articles expected to be shipped per consignment and annually;
- (h) Dose assessments in accordance with the principles and methodologies set out in the International Basic Safety Standards for Protection against Ionizing Radiation and for the Safety of Radiation Sources, Safety Series No.115, IAEA, Vienna (1996), including individual doses to transport workers and members of the public and, if appropriate, collective doses arising from routine, normal and accident conditions of carriage, based on representative carriage scenarios the consignments are subject to.

6.4.23.11 Each certificate of approval issued by a competent authority shall be assigned an identification mark. The identification mark shall be of the following generalized type:

VRI/Number/Type Code

- (a) Except as provided in 6.4.23.12 (b), VRI represents the international vehicle registration identification code of the country issuing the certificate¹;
- (b) The number shall be assigned by the competent authority, and shall be unique and specific with regard to the particular design or shipment or alternative activity limit for exempt consignment. The identification mark of the approval of shipment shall be clearly related to the identification mark of the approval of design;
- (c) The following type codes shall be used in the order listed to indicate the types of certificate of approval issued:

AF	Type A package design for fissile material
B(U)	Type B(U) package design [B(U) F if for fissile material]
B(M)	Type B(M) package design [B(M) F if for fissile material]
C	Type C package design (CF if for fissile material)
IF	Industrial package design for fissile material
S	Special form radioactive material
LD	Low dispersible radioactive material
FE	Fissile material complying with the requirements of 2.2.7.2.3.6
T	Shipment
X	Special arrangement
AL	Alternative activity limits for an exempt consignment of instruments or articles

In the case of package designs for non-fissile or fissile excepted uranium hexafluoride, where none of the above codes apply, then the following type codes shall be used:

H(U)	Unilateral approval
H(M)	Multilateral approval;

- (d) For certificates of approval of package design and special form radioactive material, other than those issued under the transitional provisions of 1.6.6.2 to 1.6.6.4, and for low dispersible radioactive material, the symbols "-96" shall be added to the type code.

¹ See the Vienna Convention on Road Traffic (1968).

6.4.23.12 These identification marks shall be applied as follows:

- (a) Each certificate and each package shall bear the appropriate identification mark, comprising the symbols prescribed in 6.4.23.11 (a), (b), (c) and (d) above, except that, for packages, only the applicable design type codes including, if applicable, the symbols "-96", shall appear following the second stroke, that is, the "T" or "X" shall not appear in the identification marking on the package. Where the approval of design and the approval of shipment are combined, the applicable type codes do not need to be repeated. For example:

A/132/B(M)F-96: A Type B(M) package design approved for fissile material, requiring multilateral approval, for which the competent authority of Austria has assigned the design number 132 (to be marked on both the package and on the certificate of approval for the package design);

A/132/B(M)F-96T: The approval of shipment issued for a package bearing the identification mark elaborated above (to be marked on the certificate only);

A/137/X: An approval of special arrangement issued by the competent authority of Austria, to which the number 137 has been assigned (to be marked on the certificate only);

A/139/IF-96: An industrial package design for fissile material approved by the competent authority of Austria, to which package design number 139 has been assigned (to be marked on both the package and on the certificate of approval for the package design); and

A/145/H(U)-96: A package design for fissile excepted uranium hexafluoride approved by the competent authority of Austria, to which package design number 145 has been assigned (to be marked on both the package and on the certificate of approval for the package design);

- (b) Where multilateral approval is effected by validation in accordance with 6.4.23.20, only the identification mark issued by the country of origin of the design or shipment shall be used. Where multilateral approval is effected by issue of certificates by successive countries, each certificate shall bear the appropriate identification mark and the package whose design was so approved shall bear all appropriate identification marks. For example:

A/132/B(M)F-96
CH/28/B(M)F-96

would be the identification mark of a package which was originally approved by Austria and was subsequently approved, by separate certificate, by Switzerland. Additional identification marks would be tabulated in a similar manner on the package;

- (c) The revision of a certificate shall be indicated by a parenthetical expression following the identification mark on the certificate. For example, A/132/B(M)F-96 (Rev.2) would indicate revision 2 of the Austrian certificate of approval for the package design; or A/132/B(M)F-96 (Rev.0) would indicate the original issuance of the Austrian certificate of approval for the package design. For original issuances, the parenthetical entry is optional and other words such as "original issuance" may also be used in place of "Rev.0". Certificate revision numbers may only be issued by the country issuing the original certificate of approval;
- (d) Additional symbols (as may be necessitated by national regulations) may be added in brackets to the end of the identification mark; for example, A/132/B(M)F-96(SP503);
- (e) It is not necessary to alter the identification mark on the packaging each time that a revision to the design certificate is made. Such re-marking shall be required only in those cases where the revision to the package design certificate involves a change in the letter type codes for the package design following the second stroke.

6.4.23.13 Each certificate of approval issued by a competent authority for special form radioactive material or low dispersible radioactive material shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark;
- (c) The issue date and an expiry date;
- (d) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the special form radioactive material or low dispersible radioactive material is approved;
- (e) The identification of the special form radioactive material or low dispersible radioactive material;
- (f) A description of the special form radioactive material or low dispersible radioactive material;
- (g) Design specifications for the special form radioactive material or low dispersible radioactive material which may include references to drawings;
- (h) A specification of the radioactive contents which includes the activities involved and which may include the physical and chemical form;
- (i) A specification of the applicable management system as required in 1.7.3;
- (j) Reference to information provided by the applicant relating to specific actions to be taken prior to shipment;
- (k) If deemed appropriate by the competent authority, reference to the identity of the applicant;
- (l) Signature and identification of the certifying official.

6.4.23.14 Each certificate of approval issued by a competent authority for material excepted from classification as "FISSILE" shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark;
- (c) The issue date and an expiry date;
- (d) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the exception is approved;
- (e) A description of the excepted material;
- (f) Limiting specifications for the excepted material;
- (g) A specification of the applicable management system as required in 1.7.3;
- (h) Reference to information provided by the applicant relating to specific actions to be taken prior to shipment;
- (i) If deemed appropriate by the competent authority, reference to the identity of the applicant;
- (j) Signature and identification of the certifying official;
- (k) Reference to documentation that demonstrates compliance with 2.2.7.2.3.6.

6.4.23.15 Each certificate of approval issued by a competent authority for a special arrangement shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark;
- (c) The issue date and an expiry date;
- (d) Mode(s) of carriage;
- (e) Any restrictions on the modes of carriage, type of vehicle, container, and any necessary routing instructions;
- (f) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the special arrangement is approved;
- (g) The following statement:

"This certificate does not relieve the consignor from compliance with any requirement of the government of any country through or into which the package will be carried.";
- (h) References to certificates for alternative radioactive contents, other competent authority validation, or additional technical data or information, as deemed appropriate by the competent authority;
- (i) Description of the packaging by a reference to the drawings or a specification of the design. If deemed appropriate by the competent authority, a reproducible illustration, not larger than 21 cm by 30 cm, showing the make-up of the package shall also be provided, accompanied by a brief description of the packaging, including materials of manufacture, gross mass, general outside dimensions and appearance;
- (j) A specification of the authorized radioactive contents, including any restrictions on the radioactive contents which might not be obvious from the nature of the packaging. This shall include the physical and chemical forms, the activities involved (including those of the various isotopes, if appropriate), mass in grams (for fissile material or for each fissile nuclide when appropriate), and whether special form radioactive material, low dispersible radioactive material or fissile material excepted under 2.2.7.2.3.5 (f) if applicable;
- (k) Additionally, for packages containing fissile material:
 - (i) a detailed description of the authorized radioactive contents;
 - (ii) the value of the criticality safety index;
 - (iii) reference to the documentation that demonstrates the criticality safety of the contents;
 - (iv) any special features, on the basis of which the absence of water from certain void spaces has been assumed in the criticality assessment;
 - (v) any allowance (based on 6.4.11.5 (b)) for a change in neutron multiplication assumed in the criticality assessment as a result of actual irradiation experience; and
 - (vi) the ambient temperature range for which the special arrangement has been approved;
- (l) A detailed listing of any supplementary operational controls required for preparation, loading, carriage, unloading and handling of the consignment, including any special stowage provisions for the safe dissipation of heat;
- (m) If deemed appropriate by the competent authority, reasons for the special arrangement;

- (n) Description of the compensatory measures to be applied as a result of the shipment being under special arrangement;
- (o) Reference to information provided by the applicant relating to the use of the packaging or specific actions to be taken prior to the shipment;
- (p) A statement regarding the ambient conditions assumed for purposes of design if these are not in accordance with those specified in 6.4.8.5, 6.4.8.6, and 6.4.8.15, as applicable;
- (q) Any emergency arrangements deemed necessary by the competent authority;
- (r) A specification of the applicable management system as required in 1.7.3;
- (s) If deemed appropriate by the competent authority, reference to the identity of the applicant and to the identity of the carrier;
- (t) Signature and identification of the certifying official.

6.4.23.16 Each certificate of approval for a shipment issued by a competent authority shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark(s);
- (c) The issue date and an expiry date;
- (d) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the shipment is approved;
- (e) Any restrictions on the modes of carriage, type of vehicle, container, and any necessary routing instructions;
- (f) The following statement:
"This certificate does not relieve the consignor from compliance with any requirement of the government of any country through or into which the package will be carried.";
- (g) A detailed listing of any supplementary operational controls required for preparation, loading, carriage, unloading and handling of the consignment, including any special stowage provisions for the safe dissipation of heat or maintenance of criticality safety;
- (h) Reference to information provided by the applicant relating to specific actions to be taken prior to shipment;
- (i) Reference to the applicable certificate(s) of approval of design;
- (j) A specification of the actual radioactive contents, including any restrictions on the radioactive contents which might not be obvious from the nature of the packaging. This shall include the physical and chemical forms, the total activities involved (including those of the various isotopes, if appropriate), mass in grams (for fissile material or for each fissile nuclide when appropriate), and whether special form radioactive material, low dispersible radioactive material or fissile material excepted under 2.2.7.2.3.5 (f) if applicable;;
- (k) Any emergency arrangements deemed necessary by the competent authority;
- (l) A specification of the applicable management system as required in 1.7.3;
- (m) If deemed appropriate by the competent authority, reference to the identity of the applicant;
- (n) Signature and identification of the certifying official.

6.4.23.17 Each certificate of approval of the design of a package issued by a competent authority shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark;
- (c) The issue date and an expiry date;
- (d) Any restriction on the modes of carriage, if appropriate;
- (e) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the design is approved;
- (f) The following statement;

"This certificate does not relieve the consignor from compliance with any requirement of the government of any country through or into which the package will be carried.";
- (g) References to certificates for alternative radioactive contents, other competent authority validation, or additional technical data or information, as deemed appropriate by the competent authority;
- (h) A statement authorizing shipment where approval of shipment is required under 5.1.5.1.2, if deemed appropriate;
- (i) Identification of the packaging;
- (j) Description of the packaging by a reference to the drawings or specification of the design. If deemed appropriate by the competent authority, a reproducible illustration, not larger than 21 cm by 30 cm, showing the make-up of the package shall also be provided, accompanied by a brief description of the packaging, including materials of manufacture, gross mass, general outside dimensions and appearance;
- (k) Specification of the design by reference to the drawings;
- (l) A specification of the authorized radioactive content, including any restrictions on the radioactive contents which might not be obvious from the nature of the packaging. This shall include the physical and chemical forms, the activities involved (including those of the various isotopes, if appropriate), mass in grams (for fissile material the total mass of fissile nuclides or the mass for each fissile nuclide, when appropriate) and whether special form radioactive material, low dispersible radioactive material or fissile material excepted under 2.2.7.2.3.5 (f), if applicable;
- (m) A description of the containment system;
- (n) For package designs containing fissile material which require multilateral approval of the package design in accordance with 6.4.22.4:
 - (i) a detailed description of the authorized radioactive contents;
 - (ii) a description of the confinement system;
 - (iii) the value of the criticality safety index;
 - (iv) reference to the documentation that demonstrates the criticality safety of the contents;
 - (v) any special features, on the basis of which the absence of water from certain void spaces has been assumed in the criticality assessment;
 - (vi) any allowance (based on 6.4.11.5 (b)) for a change in neutron multiplication assumed in the criticality assessment as a result of actual irradiation experience; and
 - (vii) the ambient temperature range for which the package design has been approved;

- (o) For Type B(M) packages, a statement specifying those requirements of 6.4.7.5, 6.4.8.4, 6.4.8.5, 6.4.8.6 and 6.4.8.9 to 6.4.8.15 with which the package does not conform and any amplifying information which may be useful to other competent authorities;
- (p) For packages containing more than 0.1 kg of uranium hexafluoride, a statement specifying those prescriptions of 6.4.6.4 which apply if any and any amplifying information which may be useful to other competent authorities;
- (q) A detailed listing of any supplementary operational controls required for preparation, loading, carriage, unloading and handling of the consignment, including any special stowage provisions for the safe dissipation of heat;
- (r) Reference to information provided by the applicant relating to the use of the packaging or specific actions to be taken prior to shipment;
- (s) A statement regarding the ambient conditions assumed for purposes of design if these are not in accordance with those specified in 6.4.8.5, 6.4.8.6 and 6.4.8.15, as applicable;
- (t) A specification of the applicable management system as required in 1.7.3;
- (u) Any emergency arrangements deemed necessary by the competent authority;
- (v) If deemed appropriate by the competent authority, reference to the identity of the applicant;
- (w) Signature and identification of the certifying official.

6.4.23.18 Each certificate issued by a competent authority for alternative activity limits for an exempt consignment of instruments or articles according to 5.1.5.2.1 (d) shall include the following information:

- (a) Type of certificate;
- (b) The competent authority identification mark;
- (c) The issue date and an expiry date;
- (d) List of applicable national and international regulations, including the edition of the IAEA Regulations for the Safe Transport of Radioactive Material under which the exemption is approved;
- (e) The identification of the instrument or article;
- (f) A description of the instrument or article;
- (g) Design specifications for the instrument or article;
- (h) A specification of the radionuclide(s), the approved alternative activity limit(s) for the exempt consignment(s) of the instrument(s) or article(s);
- (i) Reference to documentation that demonstrates compliance with 2.2.7.2.2.2 (b);
- (j) If deemed appropriate by the competent authority, reference to the identity of the applicant;
- (k) Signature and identification of the certifying official.

6.4.23.19 The competent authority shall be informed of the serial number of each packaging manufactured to a design approved by them under 1.6.6.2.1, 1.6.6.2.2, 6.4.22.2, 6.4.22.3 and 6.4.22.4.

6.4.23.20 Multilateral approval may be by validation of the original certificate issued by the competent authority of the country of origin of the design or shipment. Such validation may take the form of an endorsement on the original certificate or the issuance of a separate endorsement, annex, supplement, etc., by the competent authority of the country through or into which the shipment is made.

CHAPTER 6.5

REQUIREMENTS FOR THE CONSTRUCTION AND TESTING
OF INTERMEDIATE BULK CONTAINERS (IBCs)**6.5.1 General requirements****6.5.1.1 Scope**

6.5.1.1.1 The requirements of this Chapter apply to intermediate bulk containers (IBCs) the use of which is expressly authorized for the carriage of certain dangerous goods according to the packing instructions indicated in Column (8) of Table A in Chapter 3.2. Portable tanks and tank-containers which meet the requirements of Chapter 6.7 or 6.8 respectively are not considered to be IBCs. IBCs which meet the requirements of this Chapter are not considered to be containers for the purposes of ADR. The letters IBC only will be used in the rest of the text to refer to intermediate bulk containers.

6.5.1.1.2 Exceptionally, IBCs and their service equipment not conforming strictly to the requirements herein, but having acceptable alternatives, may be considered by the competent authority for approval. In addition, in order to take into account progress in science and technology, the use of alternative arrangements which offer at least equivalent safety in use in respect of compatibility with the properties of the substances carried and equivalent or superior resistance to impact, loading and fire, may be considered by the competent authority.

6.5.1.1.3 The construction, equipment, testing, marking and operation of IBCs shall be subject to acceptance by the competent authority of the country in which the IBCs are approved.

NOTE: Parties performing inspections and tests in other countries, after the IBC has been put into service, need not be accepted by the competent authority of the country in which the IBC has been approved, but the inspections and tests have to be performed according to the rules specified in the IBC's approval.

6.5.1.1.4 Manufacturers and subsequent distributors of IBCs shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that IBCs as presented for carriage are capable of passing the applicable performance tests of this Chapter.

6.5.1.2 (Reserved)

6.5.1.3 (Reserved)

6.5.1.4 Designatory code system for IBCs

6.5.1.4.1 The code shall consist of two Arabic numerals as specified in (a), followed by a capital letter(s) specified in (b), followed, when specified in an individual section, by an Arabic numeral indicating the category of IBC.

(a)

Type	For solids, filled or discharged		For liquids
	by gravity	under pressure of more than 10 kPa (0.1 bar)	
Rigid	11	21	31
Flexible	13	-	-

(b) Materials

- A. Steel (all types and surface treatments)
- B. Aluminium
- C. Natural wood
- D. Plywood
- F. Reconstituted wood
- G. Fibreboard
- H. Plastics material
- L. Textile
- M. Paper, multiwall
- N. Metal (other than steel or aluminium).

6.5.1.4.2 For composite IBCs, two capital letters in Latin characters shall be used in sequence in the second position of the code. The first shall indicate the material of the inner receptacle of the IBC and the second that of the outer packaging of the IBC.

6.5.1.4.3 The following types and codes of IBC are assigned:

Material	Category	Code	Sub-section
Metal			
A. Steel	for solids, filled or discharged by gravity	11A	6.5.5.1
	for solids, filled or discharged under pressure	21A	
	for liquids	31A	
B. Aluminium	for solids, filled or discharged by gravity	11B	
	for solids, filled or discharged under pressure	21B	
	for liquids	31B	
N. Other than steel or aluminium	for solids, filled or discharged by gravity	11N	
	for solids, filled or discharged under pressure	21N	
	for liquids	31N	
Flexible			
H. Plastics	woven plastics without coating or liner	13H1	6.5.5.2
	woven plastics, coated	13H2	
	woven plastics with liner	13H3	
	woven plastics, coated and with liner	13H4	
	plastics film	13H5	
L. Textile	without coating or liner	13L1	
	coated	13L2	
	with liner	13L3	
	coated and with liner	13L4	
M. Paper	multiwall	13M1	6.5.5.3
	multiwall, water resistant	13M2	
H. Rigid plastics	for solids, filled or discharged by gravity, fitted with structural equipment	11H1	
	for solids, filled or discharged by gravity, freestanding	11H2	
	for solids, filled or discharged under pressure, fitted with structural equipment	21H1	
	for solids, filled or discharged under pressure, freestanding	21H2	
	for liquids, fitted with structural equipment	31H1	
	for liquids, freestanding	31H2	

Material	Category	Code	Sub-section
HZ. Composite with plastics inner receptacle ^a	for solids, filled or discharged by gravity, with rigid plastics inner receptacle	11HZ1	6.5.5.4
	for solids, filled or discharged by gravity, with flexible plastics inner receptacle	11HZ2	
	for solids, filled or discharged under pressure, with rigid plastics inner receptacle	21HZ1	
	for solids, filled or discharged under pressure, with flexible plastics inner receptacle	21HZ2	
	for liquids, with rigid plastics inner receptacle	31HZ1	
	for liquids, with flexible plastics inner receptacle	31HZ2	
G. Fibreboard	for solids, filled or discharged by gravity	11G	6.5.5.5
Wooden			
C. Natural wood	for solids, filled or discharged by gravity with inner liner	11C	6.5.5.6
D. Plywood	for solids, filled or discharged by gravity, with inner liner	11D	
F. Reconstituted wood	for solids, filled or discharged by gravity, with inner liner	11F	

^a The code shall be completed by replacing the letter Z by a capital letter in accordance with 6.5.1.4.1 (b) to indicate the nature of the material used for the outer casing.

6.5.1.4.4 The letter "W" may follow the IBC code. The letter "W" signifies that the IBC, although of the same type indicated by the code, is manufactured to a specification different from those in 6.5.5 and is considered equivalent in accordance with the requirements in 6.5.1.1.2.

6.5.2 Marking

6.5.2.1 Primary marking

6.5.2.1.1 Each IBC manufactured and intended for use according to ADR shall bear markings which are durable, legible and placed in a location so as to be readily visible. Letters, numerals and symbols shall be at least 12 mm high and shall show:

- (a) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7¹. For metal IBCs on which the marking is stamped or embossed, the capital letters "UN" may be applied instead of the symbol;

- (b) The code designating the type of IBC according to 6.5.1.4;
- (c) A capital letter designating the packing group(s) for which the design type has been approved:
- (i) X for packing groups I, II and III (IBCs for solids only);
 - (ii) Y for packing groups II and III;
 - (iii) Z for packing group III only;

¹ This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

- (d) The month and year (last two digits) of manufacture;
- (e) The State authorizing the allocation of the mark; indicated by the distinguishing sign for motor vehicles in international traffic²;
- (f) The name or symbol of the manufacturer and other identification of the IBC as specified by the competent authority;
- (g) The stacking test load in kg. For IBCs not designed for stacking, the figure "0" shall be shown;
- (h) The maximum permissible gross mass in kg.

The primary marking required above shall be applied in the sequence of the subparagraphs below. The marking required by 6.5.2.2 and any further marking authorized by a competent authority shall still enable the parts of the mark to be correctly identified.

Each element of the marking applied in accordance with (a) to (h) and with 6.5.2.2 shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable.

6.5.2.1.2

Examples of markings for various types of IBC in accordance with 6.5.2.1.1 (a) to (h) above:

11A/Y/02 99
NL/Mulder 007
5500/1500

For a metal IBC for solids discharged by gravity and made from steel/for packing groups II and III/ manufactured in February 1999/authorized by the Netherlands/manufactured by Mulder and of a design type to which the competent authority has allocated serial number 007/the stacking test load in kg/the maximum permissible gross mass in kg.

13H3/Z/03 01
F/Meunier 1713
0/1500

For a flexible IBC for solids discharged for instance by gravity and made from woven plastics with a liner/not designed to be stacked.

31H1/Y/04 99
GB/9099
10800/1200

For a rigid plastics IBC for liquids made from plastics with structural equipment withstanding the stack load.

31HA1/Y/05 01
D/Muller 1683
10800/1200

For a composite IBC for liquids with a rigid plastics inner receptacle and a steel outer casing.

11C/X/01 02
S/Aurigny 9876
3000/910

For a wooden IBC for solids with an inner liner authorized for packing groups I, II and III solids.

² Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

6.5.2.2Additional marking

6.5.2.2.1Each IBC shall bear the markings required in 6.5.2.1 and, in addition, the following information which may appear on a corrosion-resistant plate permanently attached in a place readily accessible for inspection:

Additional marking	Category of IBC				
	Metal	Rigid plastics	Composite	Fibreboard	Wooden
Capacity in litres ^a at 20 °C	X	X	X		
Tare mass in kg ^a	X	X	X	X	X
Test (gauge) pressure, in kPa or bar ^a , if applicable		X	X		
Maximum filling / discharge pressure in kPa or bar ^a , if applicable	X	X	X		
Body material and its minimum thickness in mm	X				
Date of last leakproofness test, if applicable (month and year)	X	X	X		
Date of last inspection (month and year)	X	X	X		
Serial number of the manufacturer	X				
Maximum permitted stacking load ^b	X	X	X	X	X

^a The unit used shall be indicated.
^b See 6.5.2.2.2. This additional marking shall apply to all IBCs manufactured, repaired or remanufactured as from 1 January 2011 (see also 1.6.1.15).

6.5.2.2.2The maximum permitted stacking load applicable when the IBC is in use shall be displayed on a symbol as shown in Figure 6.5.2.2.2.1 or Figure 6.5.2.2.2.2. The symbol shall be durable and clearly visible.

The minimum dimensions shall be 100 mm x 100 mm. The letters and numbers indicating the mass shall be at least 12 mm high. The area within the printer's marks indicated by the dimensional arrows shall be square. Where dimensions are not specified, all features shall be in approximate proportion to those shown. The mass marked above the symbol shall not exceed the load imposed during the design type test (see 6.5.6.6.4) divided by 1.8.

6.5.2.2.3 In addition to the markings required in 6.5.2.1, flexible IBCs may bear a pictogram indicating recommended lifting methods.

6.5.2.2.4 The inner receptacle of composite IBCs manufactured after 1 January 2011 shall bear the markings indicated in 6.5.2.1.1 (b), (c), (d) where this date is that of the manufacture of the plastics inner receptacle, (e) and (f). The UN packaging symbol shall not be applied. The marking shall be applied in the sequence shown in 6.5.2.1.1. It shall be durable, legible and placed in a location so as to be readily visible when the inner receptacle is placed in the outer casing.

The date of the manufacture of the plastics inner receptacle may alternatively be marked on the inner receptacle adjacent to the remainder of the marking. In such a case, the two digits of the year in the marking and in the inner circle of the clock shall be identical. An example of an appropriate marking method is:

NOTE: Other methods that provide the minimum required information in a durable, visible and legible form are also acceptable.

6.5.2.2.5 Where a composite IBCs is designed in such a manner that the outer casing is intended to be dismantled for carriage when empty (such as for return of the IBC for reuse to the original consignor), each of the parts intended to be detached when so dismantled shall be marked with the month and year of manufacture and the name or symbol of the manufacturer and other identification of the IBC as specified by the competent authority (see 6.5.2.1.1 (f)).

6.5.2.3 *Conformity to design type*

The marking indicates that IBCs correspond to a successfully tested design type and that the requirements referred to in the certificate have been met.

6.5.2.4 *Marking of remanufactured composite IBCs (31HZ1)*

The marking specified in 6.5.2.1.1 and 6.5.2.2 shall be removed from the original IBC or made permanently illegible and new markings shall be applied to an IBC remanufactured in accordance with ADR.

6.5.3 **Construction requirements**

6.5.3.1 *General requirements*

6.5.3.1.1 IBCs shall be resistant to or adequately protected from deterioration due to the external environment.

6.5.3.1.2 IBCs shall be so constructed and closed that none of the contents can escape under normal conditions of carriage including the effect of vibration, or by changes in temperature, humidity or pressure.

6.5.3.1.3 IBCs and their closures shall be constructed of materials compatible with their contents, or be protected internally, so that they are not liable:

- (a) To be attacked by the contents so as to make their use dangerous;
- (b) To cause the contents to react or decompose, or form harmful or dangerous compounds with the IBCs.

6.5.3.1.4 Gaskets, where used, shall be made of materials not subject to attack by the contents of the IBCs.

- 6.5.3.1.5 All service equipment shall be so positioned or protected as to minimize the risk of escape of the contents owing to damage during handling and carriage.
- 6.5.3.1.6 IBCs, their attachments and their service and structural equipment shall be designed to withstand, without loss of contents, the internal pressure of the contents and the stresses of normal handling and carriage. IBCs intended for stacking shall be designed for stacking. Any lifting or securing features of IBCs shall be of sufficient strength to withstand the normal conditions of handling and carriage without gross distortion or failure and shall be so positioned that no undue stress is caused in any part of the IBC.
- 6.5.3.1.7 Where an IBC consists of a body within a framework it shall be so constructed that:
- (a) The body does not chafe or rub against the framework so as to cause material damage to the body;
 - (b) The body is retained within the framework at all times;
 - (c) The items of equipment are fixed in such a way that they cannot be damaged if the connections between body and frame allow relative expansion or movement.
- 6.5.3.1.8 Where a bottom discharge valve is fitted, it shall be capable of being made secure in the closed position and the whole discharge system shall be suitably protected from damage. Valves having lever closures shall be able to be secured against accidental opening and the open or closed position shall be readily apparent. For IBCs containing liquids, a secondary means of sealing the discharge aperture shall also be provided, e.g. a blank flange or equivalent device.

6.5.4 Testing, certification and inspection

- 6.5.4.1 *Quality assurance:* the IBCs shall be manufactured, remanufactured, repaired and tested under a quality assurance programme which satisfies the competent authority, in order to ensure that each manufactured, remanufactured or repaired IBC meets the requirements of this Chapter.

NOTE: ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.

- 6.5.4.2 *Test requirements:* IBCs shall be subject to design type tests and, if applicable, to initial and periodic inspections and tests in accordance with 6.5.4.4.
- 6.5.4.3 *Certification:* in respect of each design type of IBC a certificate and mark (as in 6.5.2) shall be issued attesting that the design type, including its equipment, meets the test requirements.

6.5.4.4 Inspection and testing

NOTE: See also 6.5.4.5 for tests and inspections on repaired IBCs.

- 6.5.4.4.1 Every metal, rigid plastics and composite IBC shall be inspected to the satisfaction of the competent authority:
- (a) Before it is put into service (including after remanufactured), and thereafter at intervals not exceeding five years, with regard to:
 - (i) conformity to design type including marking;
 - (ii) internal and external condition;
 - (iii) proper functioning of service equipment.

Thermal insulation, if any, need be removed only to the extent necessary for a proper examination of the body of the IBC.

(b) At intervals of not more than two and a half years, with regard to:

- (i) external condition;
- (ii) proper functioning of service equipment.

Thermal insulation, if any, need be removed only to the extent necessary for a proper examination of the body of the IBC.

Each IBC shall correspond in all respects to its design type.

6.5.4.4.2 Every metal, rigid plastics and composite IBC for liquids, or for solids which are filled or discharged under pressure, shall undergo a suitable leakproofness test at least equally effective as the test prescribed in 6.5.6.7.3 and be capable of meeting the test level indicated in 6.5.6.7.3:

- (a) Before it is first used for carriage;
- (b) At intervals of not more than two and a half years.

For this test the IBC shall be fitted with the primary bottom closure. The inner receptacle of a composite IBC may be tested without the outer casing, provided that the test results are not affected.

6.5.4.4.3 A report of each inspection and test shall be kept by the owner of the IBC at least until the next inspection or test. The report shall include the results of the inspection and test and shall identify the party performing the inspection and test (see also the marking requirements in 6.5.2.2.1).

6.5.4.4.4 The competent authority may at any time require proof, by tests in accordance with this Chapter, that IBCs meet the requirements of the design type tests.

6.5.4.5 *Repaired IBCs*

6.5.4.5.1 When an IBC is impaired as a result of impact (e.g. accident) or any other cause, it shall be repaired or otherwise maintained (see definition of "*Routine maintenance of IBCs*" in 1.2.1), so as to conform to the design type. The bodies of rigid plastics IBCs and the inner receptacles of composite IBCs that are impaired shall be replaced.

6.5.4.5.2 In addition to any other testing and inspection requirements in ADR, an IBC shall be subjected to the full testing and inspection requirements set out in 6.5.4.4, and the required reports shall be prepared, whenever it is repaired.

6.5.4.5.3 The Party performing the tests and inspections after the repair shall durably mark the IBC near the manufacturer's UN design type marking to show:

- (a) The State in which the tests and inspections were carried out;
- (b) The name or authorized symbol of the party performing the tests and inspections; and
- (c) The date (month, year) of the tests and inspections.

6.5.4.5.4 Test and inspections performed in accordance with 6.5.4.5.2 may be considered to satisfy the requirements for the two and a half and five year periodic tests and inspections.

6.5.5 *Specific requirements for IBCs*

6.5.5.1 *Specific requirements for metal IBCs*

6.5.5.1.1 These requirements apply to metal IBCs intended for the carriage of solids and liquids. There are three categories of metal IBCs:

- (a) Those for solids which are filled or discharged by gravity (11A, 11B, 11N);

(b) Those for solids which are filled or discharged at a gauge pressure greater than 10 kPa (0.1 bar) (21A, 21B, 21N); and

(c) Those for liquids (31A, 31B, 31N).

6.5.5.1.2 Bodies shall be made of suitable ductile metal in which the weldability has been fully demonstrated. Welds shall be skilfully made and afford complete safety. Low-temperature performance of the material shall be taken into account when appropriate.

6.5.5.1.3 Care shall be taken to avoid damage by galvanic action due to the juxtaposition of dissimilar metals.

6.5.5.1.4 Aluminium IBCs intended for the carriage of flammable liquids shall have no movable parts, such as covers, closures, etc., made of unprotected steel liable to rust, which might cause a dangerous reaction by coming into frictional or percussive contact with the aluminium.

6.5.5.1.5 Metal IBCs shall be made of metals which meet the following requirements:

(a) for steel the elongation at fracture, in %, shall not be less than $\frac{10000}{R_m}$ with an absolute minimum of 20%;

where R_m = guaranteed minimum tensile strength of the steel to be used, in N/mm²;

(b) for aluminium and its alloy the elongation at fracture, in %, shall not be less than $\frac{10000}{6R_m}$ with an absolute minimum of 8%.

Specimens used to determine the elongation at fracture shall be taken transversely to the direction of rolling and be so secured that:

$$L_0 = 5d \quad \text{or}$$

$$L_0 = 5.65\sqrt{A}$$

where: L_0 = gauge length of the specimen before the test

d = diameter

A = cross-sectional area of test specimen.

6.5.5.1.6 *Minimum wall thickness:*

(a) for a reference steel having a product of $R_m \times A_0 = 10\,000$, the wall thickness shall not be less than:

Capacity (C) in litres	Wall thickness (T) in mm			
	Types 11A, 11B, 11N		Types 21A, 21B, 21N, 31A, 31B, 31N	
	Unprotected	Protected	Unprotected	Protected
$C \leq 1000$	2.0	1.5	2.5	2.0
$1000 < C \leq 2000$	$T = C/2000 + 1.5$	$T = C/2000 + 1.0$	$T = C/2000 + 2.0$	$T = C/2000 + 1.5$
$2000 < C \leq 3000$	$T = C/2000 + 1.5$	$T = C/2000 + 1.0$	$T = C/1000 + 1.0$	$T = C/2000 + 1.5$

where: A_o = minimum elongation (as a percentage) of the reference steel to be used on fracture under tensile stress (see 6.5.5.1.5);

- (b) for metals other than the reference steel described in (a), the minimum wall thickness is given by the following equivalence formula:

$$e_1 = \frac{21.4 \times e_0}{\sqrt[3]{Rm_1 \times A_1}}$$

where: e_1 = required equivalent wall thickness of the metal to be used (in mm);

e_0 = required minimum wall thickness for the reference steel (in mm);

Rm_1 = guaranteed minimum tensile strength of the metal to be used (in N/mm²) (see (c));

A_1 = minimum elongation (as a percentage) of the metal to be used on fracture under tensile stress (see 6.5.5.1.5).

However, in no case shall the wall thickness be less than 1.5 mm.

- (c) For purposes of the calculation described in (b), the guaranteed minimum tensile strength of the metal to be used (Rm_1) shall be the minimum value according to national or international material standards. However, for austenitic steels, the specified value for Rm according to the material standards may be increased by up to 15% when a greater value is attested in the material inspection certificate. When no material standard exists for the material in question, the value of Rm shall be the minimum value attested in the material inspection certificate.

6.5.5.1.7 Pressure-relief requirements: IBCs for liquids shall be capable of releasing a sufficient amount of vapour in the event of fire engulfment to ensure that no rupture of the body will occur. This can be achieved by conventional pressure relief devices or by other constructional means. The start-to-discharge pressure shall not be higher than 65 kPa (0.65 bar) and no lower than the total gauge pressure experienced in the IBC (i.e. the vapour pressure of the filling substance plus the partial pressure of the air or other inert gases, minus 100 kPa (1 bar)) at 55 °C, determined on the basis of a maximum degree of filling as defined in 4.1.1.4. The required relief devices shall be fitted in the vapour space.

6.5.5.2 *Specific requirements for flexible IBCs*

6.5.5.2.1 These requirements apply to flexible IBCs of the following types:

13H1	woven plastics without coating or liner
13H2	woven plastics, coated
13H3	woven plastics with liner
13H4	woven plastics, coated and with liner
13H5	plastics film
13L1	textile without coating or liner
13L2	textile, coated
13L3	textile with liner
13L4	textile, coated and with liner
13M1	paper, multiwall
13M2	paper, multiwall, water resistant

Flexible IBCs are intended for the carriage of solids only.

6.5.5.2.2 Bodies shall be manufactured from suitable materials. The strength of the material and the construction of the flexible IBC shall be appropriate to its capacity and its intended use.

6.5.5.2.3 All materials used in the construction of flexible IBCs of types 13M1 and 13M2 shall, after complete immersion in water for not less than 24 hours, retain at least 85% of the tensile strength as measured originally on the material conditioned to equilibrium at 67% relative humidity or less.

- 6.5.5.2.4 Seams shall be formed by stitching, heat sealing, gluing or any equivalent method. All stitched seam-ends shall be secured.
- 6.5.5.2.5 Flexible IBCs shall provide adequate resistance to ageing and to degradation caused by ultraviolet radiation or the climatic conditions, or by the substance contained, thereby rendering them appropriate to their intended use.
- 6.5.5.2.6 For flexible plastics IBCs where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the body. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.5.5.2.7 Additives may be incorporated into the material of the body to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.
- 6.5.5.2.8 No material recovered from used receptacles shall be used in the manufacture of IBC bodies. Production residues or scrap from the same manufacturing process may, however, be used. Component parts such as fittings and pallet bases may also be used provided such components have not in any way been damaged in previous use.
- 6.5.5.2.9 When filled, the ratio of height to width shall be not more than 2:1.
- 6.5.5.2.10 The liner shall be made of a suitable material. The strength of the material used and the construction of the liner shall be appropriate to the capacity of the IBC and the intended use. Joins and closures shall be siftproof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and carriage.
- 6.5.5.3 *Specific requirements for rigid plastics IBCs***
- 6.5.5.3.1 These requirements apply to rigid plastics IBCs for the carriage of solids or liquids. Rigid plastics IBCs are of the following types:
- | | |
|------|---|
| 11H1 | fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for solids which are filled or discharged by gravity |
| 11H2 | freestanding, for solids which are filled or discharged by gravity |
| 21H1 | fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for solids which are filled or discharged under pressure |
| 21H2 | freestanding, for solids which are filled or discharged under pressure |
| 31H1 | fitted with structural equipment designed to withstand the whole load when IBCs are stacked, for liquids |
| 31H2 | freestanding, for liquids. |
- 6.5.5.3.2 The body shall be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. The material shall be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance shall be taken into account when appropriate. Any permeation of the substance contained shall not constitute a danger under normal conditions of carriage.
- 6.5.5.3.3 Where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the body. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.5.5.3.4 Additives may be incorporated in the material of the body to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.

6.5.5.3.5 No used material other than production residues or regrind from the same manufacturing process may be used in the manufacture of rigid plastics IBCs.

6.5.5.4 *Specific requirements for composite IBCs with plastics inner receptacles*

6.5.5.4.1 These requirements apply to composite IBCs for the carriage of solids and liquids of the following types:

- 11HZ1 Composite IBCs with a rigid plastics inner receptacle, for solids filled or discharged by gravity
- 11HZ2 Composite IBCs with a flexible plastics inner receptacle, for solids filled or discharged by gravity
- 21HZ1 Composite IBCs with a rigid plastics inner receptacle, for solids filled or discharged under pressure
- 21HZ2 Composite IBCs with a flexible plastics inner receptacle, for solids filled or discharged under pressure
- 31HZ1 Composite IBCs with a rigid plastics inner receptacle, for liquids
- 31HZ2 Composite IBCs with a flexible plastics inner receptacle, for liquids.

This code shall be completed by replacing the letter Z by a capital letter in accordance with 6.5.1.4.1 (b) to indicate the nature of the material used for the outer casing.

6.5.5.4.2 The inner receptacle is not intended to perform a containment function without its outer casing. A "rigid" inner receptacle is a receptacle which retains its general shape when empty without closures in place and without benefit of the outer casing. Any inner receptacle that is not "rigid" is considered to be "flexible".

6.5.5.4.3 The outer casing normally consists of rigid material formed so as to protect the inner receptacle from physical damage during handling and carriage but is not intended to perform the containment function. It includes the base pallet where appropriate.

6.5.5.4.4 A composite IBC with a fully enclosing outer casing shall be so designed that the integrity of the inner receptacle may be readily assessed following the leakproofness and hydraulic pressure tests.

6.5.5.4.5 IBCs of type 31HZ2 shall be limited to a capacity of not more than 1 250 litres.

6.5.5.4.6 The inner receptacle shall be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. The material shall be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance shall be taken into account when appropriate. Any permeation of the substance contained shall not constitute a danger under normal conditions of carriage.

6.5.5.4.7 Where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the inner receptacle. Where use is made of carbon black, pigments or inhibitors, other than those used in the manufacture of the tested design type, retesting may be waived if changes in carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.

6.5.5.4.8 Additives may be incorporated in the material of the inner receptacle to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.

6.5.5.4.9 No used material other than production residues or regrind from the same manufacturing process may be used in the manufacture of inner receptacles.

6.5.5.4.10 The inner receptacle of IBCs type 31HZ2 shall consist of at least three plies of film.

6.5.5.4.11 The strength of the material and the construction of the outer casing shall be appropriate to the capacity of the composite IBC and its intended use.

6.5.5.4.12 The outer casing shall be free of any projection that might damage the inner receptacle.

- 6.5.5.4.13 Metal outer casings shall be constructed of a suitable metal of adequate thickness.
- 6.5.5.4.14 Outer casings of natural wood shall be of well seasoned wood, commercially dry and free from defects that would materially lessen the strength of any part of the casing. The tops and bottoms may be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type.
- 6.5.5.4.15 Outer casings of plywood shall be made of well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the casing. All adjacent plies shall be glued with water resistant adhesive. Other suitable materials may be used with plywood for the construction of casings. Casings shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.5.5.4.16 The walls of outer casings of reconstituted wood shall be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type. Other parts of the casings may be made of other suitable material.
- 6.5.5.4.17 For fibreboard outer casings, strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) shall be used appropriate to the capacity of the casing and to its intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m² (see ISO 535:1991). It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting of corrugated fibreboard shall be firmly glued to the facings.
- 6.5.5.4.18 The ends of fibreboard outer casings may have a wooden frame or be entirely of wood. Reinforcements of wooden battens may be used.
- 6.5.5.4.19 Manufacturing joints in the fibreboard outer casing shall be taped, lapped and glued, or lapped and stitched with metal staples. Lapped joints shall have an appropriate overlap. Where closing is effected by gluing or taping, a water resistant adhesive shall be used.
- 6.5.5.4.20 Where the outer casing is of plastics material, the relevant requirements of 6.5.5.4.6 to 6.5.5.4.9 apply, on the understanding that, in this case, the requirements applicable to the inner receptacle are applicable to the outer casing of composite IBCs.
- 6.5.5.4.21 The outer casing of an IBC type 31HZ2 shall enclose the inner receptacle on all sides.
- 6.5.5.4.22 Any integral pallet base forming part of an IBC or any detachable pallet shall be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.4.23 The pallet or integral base shall be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.4.24 The outer casing shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the IBC.
- 6.5.5.4.25 Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the inner receptacle.
- 6.5.5.4.26 Where IBCs are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner. Such IBCs shall be designed so that the load is not supported by the inner receptacle.
- 6.5.5.5** *Specific requirements for fibreboard IBCs*
- 6.5.5.5.1 These requirements apply to fibreboard IBCs for the carriage of solids which are filled or discharged by gravity. Fibreboard IBCs are of the following type: 11G.
- 6.5.5.5.2 Fibreboard IBCs shall not incorporate top lifting devices.

- 6.5.5.5.3 The body shall be made of strong and good quality solid or double-faced corrugated fibreboard (single or multiwall), appropriate to the capacity of the IBC and to its intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m² (see ISO 535:1991). It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting or corrugated fibreboard shall be firmly glued to the facings.
- 6.5.5.5.4 The walls, including top and bottom, shall have a minimum puncture resistance of 15 J measured according to ISO 3036:1975.
- 6.5.5.5.5 Manufacturing joins in the body of IBCs shall be made with an appropriate overlap and shall be taped, glued, stitched with metal staples or fastened by other means at least equally effective. Where joins are effected by gluing or taping, a water resistant adhesive shall be used. Metal staples shall pass completely through all pieces to be fastened and be formed or protected so that any inner liner cannot be abraded or punctured by them.
- 6.5.5.5.6 The liner shall be made of a suitable material. The strength of the material used and the construction of the liner shall be appropriate to the capacity of the IBC and the intended use. Joins and closures shall be siftproof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and carriage.
- 6.5.5.5.7 Any integral pallet base forming part of an IBC or any detachable pallet shall be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.5.8 The pallet or integral base shall be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.5.9 The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the IBC.
- 6.5.5.5.10 Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.
- 6.5.5.5.11 Where IBCs are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.
- 6.5.5.6** *Specific requirements for wooden IBCs*
- 6.5.5.6.1 These requirements apply to wooden IBCs for the carriage of solids which are filled or discharged by gravity. Wooden IBCs are of the following types:
- | | |
|-----|--------------------------------------|
| 11C | Natural wood with inner liner |
| 11D | Plywood with inner liner |
| 11F | Reconstituted wood with inner liner. |
- 6.5.5.6.2 Wooden IBCs shall not incorporate top lifting devices.
- 6.5.5.6.3 The strength of the materials used and the method of construction of the body shall be appropriate to the capacity and intended use of the IBC.
- 6.5.5.6.4 Natural wood shall be well seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the IBC. Each part of the IBC shall consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when a suitable method of glued assembly is used (as for instance Lindermann joint, tongue and groove joint, ship lap or rabbet joint); or butt joint with at least two corrugated metal fasteners at each joint, or when other methods at least equally effective are used.

- 6.5.5.6.5 Bodies of plywood shall be at least 3-ply. They shall be made of well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the body. All adjacent plies shall be glued with water resistant adhesive. Other suitable materials may be used with plywood for the construction of the body.
- 6.5.5.6.6 Bodies of reconstituted wood shall be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type.
- 6.5.5.6.7 IBCs shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.5.5.6.8 The liner shall be made of a suitable material. The strength of the material used and the construction of the liner shall be appropriate to the capacity of the IBC and the intended use. Joins and closures shall be siftproof and capable of withstanding pressures and impacts liable to occur under normal conditions of handling and carriage.
- 6.5.5.6.9 Any integral pallet base forming part of an IBC or any detachable pallet shall be suitable for mechanical handling with the IBC filled to its maximum permissible gross mass.
- 6.5.5.6.10 The pallet or integral base shall be designed so as to avoid any protrusion of the base of the IBC that might be liable to damage in handling.
- 6.5.5.6.11 The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the IBC.
- 6.5.5.6.12 Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.
- 6.5.5.6.13 Where IBCs are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.

6.5.6 Test requirements for IBCs

6.5.6.1 *Performance and frequency of tests*

- 6.5.6.1.1 Each IBC design type shall successfully pass the tests prescribed in this Chapter before being used and being approved by the competent authority allowing the allocation of the mark. An IBC design type is defined by the design, size, material and thickness, manner of construction and means of filling and discharging but may include various surface treatments. It also includes IBCs which differ from the design type only in their lesser external dimensions.
- 6.5.6.1.2 Tests shall be carried out on IBCs prepared for carriage. IBCs shall be filled as indicated in the relevant sections. The substances to be carried in the IBCs may be replaced by other substances except where this would invalidate the results of the tests. For solids, when another substance is used it shall have the same physical characteristics (mass, grain size, etc.) as the substance to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

6.5.6.2 *Design type tests*

- 6.5.6.2.1 One IBC of each design type, size, wall thickness and manner of construction shall be submitted to the tests listed in the order shown in 6.5.6.3.7 and as set out in 6.5.6.4 to 6.5.6.13. These design type tests shall be carried out as required by the competent authority.
- 6.5.6.2.2 To prove sufficient chemical compatibility with the contained goods or standard liquids in accordance with 6.5.6.3.3 or 6.5.6.3.5 for rigid plastics IBCs of type 31H2 and for composite IBCs of types 31HH1 and 31HH2, a second IBC can be used when the IBCs are designed to be stacked. In such case both IBCs shall be subjected to a preliminary storage.
- 6.5.6.2.3 The competent authority may permit the selective testing of IBCs which differ only in minor respects from a tested type, e.g. with small reductions in external dimensions.

- 6.5.6.2.4 If detachable pallets are used in the tests, the test report issued in accordance with 6.5.6.14 shall include a technical description of the pallets used.

6.5.6.3 *Preparation of IBCs for testing*

- 6.5.6.3.1 Paper and fibreboard IBCs and composite IBCs with fibreboard outer casings shall be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h.). There are three options, one of which shall be chosen. The preferred atmosphere is 23 ± 2 °C and $50\% \pm 2\%$ r.h. The two other options are 20 ± 2 °C and $65\% \pm 2\%$ r.h.; or 27 ± 2 °C and $65\% \pm 2\%$ r.h.

NOTE: Average values shall fall within these limits. Short-term fluctuations and measurement limitations may cause individual measurements to vary by up to $\pm 5\%$ relative humidity without significant impairment of test reproducibility.

- 6.5.6.3.2 Additional steps shall be taken to ascertain that the plastics material used in the manufacture of rigid plastics IBCs (types 31H1 and 31H2) and composite IBCs (types 31HZ1 and 31HZ2) complies respectively with the requirements in 6.5.5.3.2 to 6.5.5.3.4 and 6.5.5.4.6 to 6.5.5.4.9.

- 6.5.6.3.3 To prove there is sufficient chemical compatibility with the contained goods, the sample IBC shall be subjected to a preliminary storage for six months, during which the samples shall remain filled with the substances they are intended to contain or with substances which are known to have at least as severe a stress-cracking, weakening or molecular degradation influence on the plastics materials in question, and after which the samples shall be submitted to the applicable tests listed in the table in 6.5.6.3.7.

- 6.5.6.3.4 Where the satisfactory behaviour of the plastics material has been established by other means, the above compatibility test may be dispensed with. Such procedures shall be at least equivalent to the above compatibility test and recognized by the competent authority.

- 6.5.6.3.5 For polyethylene rigid plastics IBCs (types 31H1 and 31H2) in accordance with 6.5.5.3 and composite IBCs with polyethylene inner receptacle (types 31HZ1 and 31HZ2) in accordance with 6.5.5.4, chemical compatibility with filling liquids assimilated in accordance with 4.1.1.21 may be verified as follows with standard liquids (see 6.1.6).

The standard liquids are representative for the processes of deterioration on polyethylene, as there are softening through swelling, cracking under stress, molecular degradation and combinations thereof.

The sufficient chemical compatibility of the IBCs may be verified by storage of the required test samples for three weeks at 40 °C with the appropriate standard liquid(s); where this standard liquid is water, storage in accordance with this procedure is not required. Storage is not required either for test samples which are used for the stacking test in case of the standard liquids wetting solution and acetic acid. After this storage, the test samples shall undergo the tests prescribed in 6.5.6.4 to 6.5.6.9.

The compatibility test for tert-Butyl hydroperoxide with more than 40% peroxide content and peroxyacetic acids of Class 5.2 shall not be carried out using standard liquids. For these substances, sufficient chemical compatibility of the test samples shall be verified during a storage period of six months at ambient temperature with the substances they are intended to carry.

Results of the procedure in accordance with this paragraph from polyethylene IBCs can be approved for an equal design type, the internal surface of which is fluorinated.

- 6.5.6.3.6 For IBC design types, made of polyethylene, as specified in 6.5.6.3.5, which have passed the test in 6.5.6.3.5, the chemical compatibility with filling substances may also be verified by laboratory tests proving that the effect of such filling substances on the test specimens is less than that of the appropriate standard liquid(s) taking into account the relevant processes of deterioration. The same conditions as those set out in 4.1.1.21.2 shall apply with respect to relative density and vapour pressure.

6.5.6.3.7 *Design type tests required and sequential order*

Type of IBC	Vibration ^f	Bottom lift	Top lift ^a	Stacking ^b	Leak-proofness	Hydraulic pressure	Drop	Tear	Topple	Righting ^c
Metal:										
11A, 11B, 11N	-	1st ^a	2nd	3rd	-	-	4th ^e	-	-	-
21A, 21B, 21N	-	1st ^a	2nd	3rd	4th	5th	6th ^e	-	-	-
31A, 31B, 31N	1st	2nd ^a	3rd	4th	5th	6th	7th ^e	-	-	-

^a When IBCs are designed for this method of handling.

^b When IBCs are designed to be stacked.

^c When IBCs are designed to be lifted from the top or the side.

^d Required test indicated by x; an IBC which has passed one test may be used for other tests, in any order.

^e Another IBC of the same design may be used for the drop test.

^f Another IBC of the same design may be used for the vibration test.

^g The second IBC in accordance with 6.5.6.2.2 can be used out of the sequential order direct after the preliminary storage.

6.5.6.4 Bottom lift test6.5.6.4.1 *Applicability*

For all fibreboard and wooden IBCs, and for all types of IBC which are fitted with means of lifting from the base, as a design type test.

6.5.6.4.2 *Preparation of the IBC for test*

The IBC shall be filled. A load shall be added and evenly distributed. The mass of the filled IBC and the load shall be 1.25 times the maximum permissible gross mass.

6.5.6.4.3 *Method of testing*

The IBC shall be raised and lowered twice by a lift truck with the forks centrally positioned and spaced at three quarters of the dimension of the side of entry (unless the points of entry are fixed). The forks shall penetrate to three quarters of the direction of entry. The test shall be repeated from each possible direction of entry.

6.5.6.4.4 *Criteria for passing the test*

No permanent deformation which renders the IBC, including the base pallet, if any, unsafe for carriage and no loss of contents.

6.5.6.5 Top lift test6.5.6.5.1 *Applicability*

For all types of IBC which are designed to be lifted from the top and for flexible IBCs designed to be lifted from the top or the side, as a design type test.

6.5.6.5.2 *Preparation of the IBC for test*

Metal, rigid plastics and composite IBCs shall be filled. A load shall be added and evenly distributed. The mass of the filled IBC and the load shall be twice the maximum permissible gross mass. Flexible IBCs shall be filled with a representative material and then shall be loaded to six times their maximum permissible gross mass, the load being evenly distributed.

6.5.6.5.3 *Methods of testing*

Metal and flexible IBCs shall be lifted in the manner for which they are designed until clear of the floor and maintained in that position for a period of five minutes.

Rigid plastics and composite IBCs shall be lifted:

- (a) by each pair of diagonally opposite lifting devices, so that the hoisting forces are applied vertically, for a period of five minutes; and
- (b) by each pair of diagonally opposite lifting devices, so that the hoisting forces are applied toward the centre at 45° to the vertical, for a period of five minutes.

6.5.6.5.4 Other methods of top lift testing and preparation at least equally effective may be used for flexible IBCs.**6.5.6.5.5** *Criteria for passing the test*

- (a) Metal, rigid plastics and composite IBCs: the IBC remains safe for normal conditions of carriage, there is no observable permanent deformation of the IBC, including the base pallet, if any, and no loss of contents;
- (b) Flexible IBCs: no damage to the IBC or its lifting devices which renders the IBC unsafe for carriage or handling and no loss of contents.

6.5.6.6 *Stacking test***6.5.6.6.1** *Applicability*

For all types of IBC which are designed to be stacked on each other, as a design type test.

6.5.6.6.2 *Preparation of the IBC for test*

The IBC shall be filled to its maximum permissible gross mass. If the specific gravity of the product being used for testing makes this impracticable, the IBC shall additionally be loaded so that it is tested at its maximum permissible gross mass the load being evenly distributed.

6.5.6.6.3 *Method of testing*

- (a) The IBC shall be placed on its base on level hard ground and subjected to a uniformly distributed superimposed test load (see 6.5.6.6.4). For rigid plastics IBCs of type 31H2 and composite IBCs of types 31HH1 and 31HH2, a stacking test shall be carried out with the original filling substance or a standard liquid (see 6.1.6) in accordance with 6.5.6.3.3 or 6.5.6.3.5 using the second IBC in accordance with 6.5.6.2.2 after the preliminary storage. IBCs shall be subjected to the test load for a period of at least:
 - (i) 5 minutes, for metal IBCs;
 - (ii) 28 days at 40 °C, for rigid plastics IBCs of types 11H2, 21H2 and 31H2 and for composite IBCs with outer casings of plastics material which bear the stacking load (i.e., types 11HH1, 11HH2, 21HH1, 21HH2, 31HH1 and 31HH2);
 - (iii) 24 hours, for all other types of IBCs;

(b) The load shall be applied by one of the following methods:

- (i) one or more IBCs of the same type filled to the maximum permissible gross mass stacked on the test IBC;
- (ii) appropriate weights loaded on to either a flat plate or a reproduction of the base of the IBC, which is stacked on the test IBC.

6.5.6.6.4 *Calculation of superimposed test load*

The load to be placed on the IBC shall be 1.8 times the combined maximum permissible gross mass of the number of similar IBCs that may be stacked on top of the IBC during carriage.

6.5.6.6.5 *Criteria for passing the test*

- (a) All types of IBCs other than flexible IBCs: no permanent deformation which renders the IBC including the base pallet, if any, unsafe for carriage and no loss of contents;
- (b) Flexible IBCs: no deterioration of the body which renders the IBC unsafe for carriage and no loss of contents.

6.5.6.7 ***Leakproofness test***

6.5.6.7.1 *Applicability*

For those types of IBC used for liquids or for solids filled or discharged under pressure, as a design type test and periodic test.

6.5.6.7.2 *Preparation of the IBC for test*

The test shall be carried out before the fitting of any thermal insulation equipment. Vented closures shall either be replaced by similar non-vented closures or the vent shall be sealed.

6.5.6.7.3 *Method of testing and pressure to be applied*

The test shall be carried out for a period of at least 10 minutes using air at a gauge pressure of not less than 20 kPa (0.2 bar). The air tightness of the IBC shall be determined by a suitable method such as by air-pressure differential test or by immersing the IBC in water or, for metal IBCs, by coating the seams and joints with a soap solution. In the case of immersing a correction factor shall be applied for the hydrostatic pressure.

6.5.6.7.4 *Criterion for passing the test*

No leakage of air.

6.5.6.8 ***Internal pressure (hydraulic) test***

6.5.6.8.1 *Applicability*

For those types of IBCs used for liquids or for solids filled or discharged under pressure, as a design type test.

6.5.6.8.2 *Preparation of the IBC for test*

The test shall be carried out before the fitting of any thermal insulation equipment. Pressure-relief devices shall be removed and their apertures plugged, or shall be rendered inoperative.

6.5.6.8.3 *Method of testing*

The test shall be carried out for a period of at least 10 minutes applying a hydraulic pressure not less than that indicated in 6.5.6.8.4. The IBCs shall not be mechanically restrained during the test.

6.5.6.8.4 *Pressures to be applied***6.5.6.8.4.1** Metal IBCs:

- (a) For IBCs of types 21A, 21B and 21N, for packing group I solids, a 250 kPa (2.5 bar) gauge pressure;
- (b) For IBCs of types 21A, 21B, 21N, 31A, 31B and 31N, for packing groups II or III substances, a 200 kPa (2 bar) gauge pressure;
- (c) In addition, for IBCs of types 31A, 31B and 31N, a 65kPa (0.65 bar) gauge pressure. This test shall be performed before the 200 kPa (2 bar) test.

6.5.6.8.4.2 Rigid plastics and composite IBCs:

- (a) For IBCs of types 21H1, 21H2, 21HZ1 and 21HZ2: 75 kPa (0.75 bar) (gauge);
- (b) For IBCs of types 31H1, 31H2, 31HZ1 and 31HZ2: whichever is the greater of two values, the first as determined by one of the following methods:
 - (i) the total gauge pressure measured in the IBC (i.e. the vapour pressure of the filling substance and the partial pressure of the air or other inert gases, minus 100 kPa) at 55 °C multiplied by a safety factor of 1.5; this total gauge pressure shall be determined on the basis of a maximum degree of filling in accordance with 4.1.1.4 and a filling temperature of 15 °C;
 - (ii) 1.75 times the vapour pressure at 50 °C of the substance to be carried minus 100 kPa, but with a minimum test pressure of 100 kPa;
 - (iii) 1.5 times the vapour pressure at 55 °C of the substance to be carried minus 100 kPa, but with a minimum test pressure of 100 kPa;

and the second as determined by the following method:

- (iv) twice the static pressure of the substance to be carried, with a minimum of twice the static pressure of water;

6.5.6.8.5 *Criteria for passing the test(s):*

- (a) For IBCs of types 21A, 21B, 21N, 31A, 31B and 31N, when subjected to the test pressure specified in 6.5.6.8.4.1 (a) or (b): no leakage;
- (b) For IBCs of types 31A, 31B and 31N, when subjected to the test pressure specified in 6.5.6.8.4.1 (c): no permanent deformation which renders the IBC unsafe for carriage and no leakage;
- (c) For rigid plastics and composite IBCs: no permanent deformation which would render the IBC unsafe for carriage and no leakage.

6.5.6.9 *Drop test***6.5.6.9.1** *Applicability*

For all types of IBCs, as a design type test.

6.5.6.9.2 *Preparation of the IBC for test*

- (a) Metal IBCs: the IBC shall be filled to not less than 95% of its maximum capacity for solids or 98% of its maximum capacity for liquids. Pressure-relief devices shall be removed and their apertures plugged, or shall be rendered inoperative;
- (b) Flexible IBCs: the IBC shall be filled to the maximum permissible gross mass, the contents being evenly distributed;

- (c) Rigid plastics and composite IBCs: the IBC shall be filled to not less than 95% of its maximum capacity for solids or 98% of its maximum capacity for liquids. Arrangements provided for pressure relief may be removed and plugged or rendered inoperative. Testing of IBCs shall be carried out when the temperature of the test sample and its contents has been reduced to minus 18 °C or lower. Where test samples of composite IBCs are prepared in this way the conditioning specified in 6.5.6.3.1 may be waived. Test liquids shall be kept in the liquid state, if necessary by the addition of anti-freeze. This conditioning may be disregarded if the materials in question are of sufficient ductility and tensile strength at low temperatures;
- (d) Fibreboard and wooden IBCs: The IBC shall be filled to not less than 95% of its maximum capacity.

6.5.6.9.3 *Method of testing*

The IBC shall be dropped on its base onto a non-resilient, horizontal, flat, massive and rigid surface in conformity with the requirements of 6.1.5.3.4, in such a manner as to ensure that the point of impact is that part of the base of the IBC considered to be the most vulnerable. IBCs of 0.45 m³ or less capacity shall also be dropped:

- (a) Metal IBCs: on the most vulnerable part other than the part of the base tested in the first drop;
- (b) Flexible IBCs: on the most vulnerable side;
- (c) Rigid plastics, composite, fibreboard and wooden IBCs: flat on a side, flat on the top and on a corner.

The same or different IBCs may be used for each drop.

6.5.6.9.4 *Drop height*

For solids and liquids, if the test is performed with the solid or liquid to be carried or with another substance having essentially the same physical characteristics:

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

For liquids if the test is performed with water:

- (a) Where the substances to be carried have a relative density not exceeding 1.2:

Packing group II	Packing group III
1.2 m	0.8 m

- (b) Where the substances to be carried have a relative density exceeding 1.2, the drop heights shall be calculated on the basis of the relative density (d) of the substance to be carried rounded up to the first decimal as follows:

Packing group II	Packing group III
$d \times 1.0$ m	$d \times 0.67$ m

6.5.6.9.5 *Criteria for passing the test(s):*

- (a) Metal IBCs: no loss of contents;
- (b) Flexible IBCs: no loss of contents. A slight discharge, e.g. from closures or stitch holes, upon impact shall not be considered to be a failure of the IBC provided that no further leakage occurs after the IBC has been raised clear of the ground;
- (c) Rigid plastics, composite, fibreboard and wooden IBCs: no loss of contents. A slight discharge from a closure upon impact shall not be considered to be a failure of the IBC provided that no further leakage occurs;

- (d) All IBCs: no damage which renders the IBC unsafe to be carried for salvage or for disposal, and no loss of contents. In addition, the IBC shall be capable of being lifted by an appropriate means until clear of the floor for five minutes.

NOTE: The criteria in (d) apply to design types for IBCs manufactured as from 1 January 2011.

6.5.6.10 *Tear test*

6.5.6.10.1 *Applicability*

For all types of flexible IBCs, as a design type test.

6.5.6.10.2 *Preparation of the IBC for test*

The IBC shall be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

6.5.6.10.3 *Method of testing*

Once the IBC is placed on the ground, a 100 mm knife score, completely penetrating the wall of a wide face, is made at a 45° angle to the principal axis of the IBC, halfway between the bottom surface and the top level of the contents. The IBC shall then be subjected to a uniformly distributed superimposed load equivalent to twice the maximum permissible gross mass. The load shall be applied for at least five minutes. An IBC which is designed to be lifted from the top or the side shall then, after removal of the superimposed load, be lifted clear of the floor and maintained in that position for a period of five minutes.

6.5.6.10.4 *Criteria for passing the test*

The cut shall not propagate more than 25% of its original length.

6.5.6.11 *Topple test*

6.5.6.11.1 *Applicability*

For all types of flexible IBC, as a design type test.

6.5.6.11.2 *Preparation of the IBC for test*

The IBC shall be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

6.5.6.11.3 *Method of testing*

The IBC shall be caused to topple on to any part of its top on to a rigid, non-resilient, smooth, flat and horizontal surface.

6.5.6.11.4 *Topple height*

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

6.5.6.11.5 *Criteria for passing the test*

No loss of contents. A slight discharge, e.g. from closures or stitch holes, upon impact shall not be considered to be a failure of the IBC provided that no further leakage occurs.

6.5.6.12 *Righting test***6.5.6.12.1 *Applicability***

For all flexible IBCs designed to be lifted from the top or side, as a design type test.

6.5.6.12.2 *Preparation of the IBC for test*

The IBC shall be filled to not less than 95% of its capacity and to its maximum permissible gross mass, the contents being evenly distributed.

6.5.6.12.3 *Method of testing*

The IBC, lying on its side, shall be lifted at a speed of at least 0.1 m/s to upright position, clear of the floor, by one lifting device or by two lifting devices when four are provided.

6.5.6.12.4 *Criteria for passing the test*

No damage to the IBC or its lifting devices which renders the IBC unsafe for carriage or handling.

6.5.6.13 *Vibration test***6.5.6.13.1 *Applicability***

For all IBCs used for liquids, as a design type test.

NOTE: This test applies to design types for IBCs manufactured after 31 December 2010 (see also 1.6.1.14).

6.5.6.13.2 *Preparation of the IBC for test*

A sample IBC shall be selected at random and shall be fitted and closed as for carriage. The IBC shall be filled with water to not less than 98% of its maximum capacity.

6.5.6.13.3 *Test method and duration***6.5.6.13.3.1 *The IBC shall be placed in the center of the test machine platform with a vertical sinusoidal, double amplitude (peak-to peak displacement) of 25 mm ± 5%. If necessary, restraining devices shall be attached to the platform to prevent the specimen from moving horizontally off the platform without restricting vertical movement.*****6.5.6.13.3.2 *The test shall be conducted for one hour at a frequency that causes part of the base of the IBC to be momentarily raised from the vibrating platform for part of each cycle to such a degree that a metal shim can be completely inserted intermittently at, at least, one point between the base of the IBC and the test platform. The frequency may need to be adjusted after the initial set point to prevent the packaging from going into resonance. Nevertheless, the test frequency shall continue to allow placement of the metal shim under the IBC as described in this paragraph. The continuing ability to insert the metal shim is essential to passing the test. The metal shim used for this test shall be at least 1.6 mm thick, 50 mm wide, and be of sufficient length to be inserted between the IBC and the test platform a minimum of 100 mm to perform the test.*****6.5.6.13.4 *Criteria for passing the test***

No leakage or rupture shall be observed. In addition, no breakage or failure of structural components, such as broken welds or failed fastenings, shall be observed.

6.5.6.14 *Test report*

6.5.6.14.1 A test report containing at least the following particulars shall be drawn up and shall be made available to the users of the IBC:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test report;
5. Manufacturer of the IBC;
6. Description of the IBC design type (e.g. dimensions, materials, closures, thickness, etc.) including method of manufacture (e.g. blow moulding) and which may include drawing(s) and/or photograph(s);
7. Maximum capacity;
8. Characteristics of test contents, e.g. viscosity and relative density for liquids and particle size for solids;
9. Test descriptions and results;
10. The test report shall be signed with the name and status of the signatory.

6.5.6.14.2 The test report shall contain statements that the IBC prepared as for carriage was tested in accordance with the appropriate requirements of this Chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

CHAPTER 6.6

REQUIREMENTS FOR THE CONSTRUCTION AND TESTING OF LARGE PACKAGINGS

6.6.1 General

6.6.1.1 The requirements of this Chapter do not apply to:

- packagings for Class 2, except large packagings for articles, including aerosols;
- packagings for Class 6.2, except large packagings for clinical waste of UN No. 3291;
- Class 7 packages containing radioactive material.

6.6.1.2 Large packagings shall be manufactured, tested and remanufactured under a quality assurance programme which satisfies the competent authority in order to ensure that each manufactured or remanufactured large packaging meets the requirements of this Chapter.

NOTE: ISO 16106:2006 "Packaging – Transport packages for dangerous goods – Dangerous goods packagings, intermediate bulk containers (IBCs) and large packagings – Guidelines for the application of ISO 9001" provides acceptable guidance on procedures which may be followed.

6.6.1.3 The specific requirements for large packagings in 6.6.4 are based on large packagings currently used. In order to take into account progress in science and technology, there is no objection to the use of large packagings having specifications different from those in 6.6.4 provided they are equally effective, acceptable to the competent authority and able successfully to withstand the tests described in 6.6.5. Methods of testing other than those described in ADR are acceptable provided they are equivalent and are recognized by the competent authority.

6.6.1.4 Manufacturers and subsequent distributors of packagings shall provide information regarding procedures to be followed and a description of the types and dimensions of closures (including required gaskets) and any other components needed to ensure that packages as presented for carriage are capable of passing the applicable performance tests of this Chapter.

6.6.2 Code for designating types of large packagings

6.6.2.1 The code used for large packagings consist of:

(a) Two Arabic numerals:

50 for rigid large packagings; or
51 for flexible large packagings; and

(b) A capital letter in Latin character indicating the nature of the material, e.g. wood, steel etc. The capital letters used shall be those shown in 6.1.2.6.

6.6.2.2 The letters "T" or "W" may follow the Large Packaging code. The letter "T" signifies a large salvage packaging conforming to the requirements of 6.6.5.1.9. The letter "W" signifies that the large packaging, although of the same type indicated by the code, is manufactured to a specification different from those in 6.6.4 and is considered equivalent in accordance with the requirements in 6.6.1.3.

6.6.3 Marking**6.6.3.1 Primary marking**

Each large packaging manufactured and intended for use in accordance with the provisions of ADR shall bear markings which are durable, legible and placed in a location so as to be readily visible. Letters, numerals and symbols shall be at least 12 mm high and shall show:

- (a) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7¹. For metal large packagings on which the marking is stamped or embossed, the capital letters "UN" may be applied instead of the symbol;

- (b) The number "50" designating a large rigid packaging or "51" for flexible large packagings, followed by the material type in accordance with 6.5.1.4.1 (b);
- (c) A capital letter designating the packing group(s) for which the design type has been approved:
- X for packing groups I, II and III
Y for packing groups II and III
Z for packing group III only;
- (d) The month and year (last two digits) of manufacture;
- (e) The State authorizing the allocation of the mark; indicated by the distinguishing sign for motor vehicles in international traffic²;
- (f) The name or symbol of the manufacturer and other identification of the large packagings as specified by the competent authority;
- (g) The stacking test load in kg. For large packagings not designed for stacking the figure "0" shall be shown;
- (h) The maximum permissible gross mass in kilograms.

The primary marking required above shall be applied in the sequence of the sub-paragraphs.

Each element of the marking applied in accordance with (a) to (h) shall be clearly separated, e.g. by a slash or space, so as to be easily identifiable.

¹ This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

² Distinguishing sign for motor vehicles in international traffic prescribed in the Vienna Convention on Road Traffic (1968).

6.6.3.2

Examples of the marking:

50A/X/05 01/N/PQRS
2500/1000

For a large steel packaging suitable for stacking;
stacking load: 2 500 kg; maximum gross mass: 1 000 kg.

50H/Y/04 02/D/ABCD 987
0/800

For a large plastics packaging not suitable for stacking;
maximum gross mass: 800 kg.

51H/Z/06 01/S/1999
0/500

For a large flexible packaging not suitable for stacking;
maximum gross mass: 500 kg.

50AT/Y/05/01/B/PQRS
2500/1000

For a large steel salvage packaging suitable for stacking;
stacking load: 2 500 kg; maximum gross mass: 1 000 kg.

6.6.3.3

The maximum permitted stacking load applicable when the large packaging is in use shall be displayed on a symbol as shown in Figure 6.6.3.3.1 or Figure 6.6.3.3.2. The symbol shall be durable and clearly visible.

Figure 6.6.3.3.1

Large packagings capable
of being stacked

Figure 6.6.3.3.2

Large packagings NOT
capable of being stacked

The minimum dimensions shall be 100 mm x 100 mm. The letters and numbers indicating the mass shall be at least 12 mm high. The area within the printer's marks indicated by the dimensional arrows shall be square. Where dimensions are not specified, all features shall be in approximate proportion to those shown. The mass marked above the symbol shall not exceed the load imposed during the design type test (see 6.6.5.3.3.4) divided by 1.8.

6.6.4

Specific requirements for large packagings

6.6.4.1

Specific requirements for metal large packagings

50A steel
50B aluminium
50N metal (other than steel or aluminium)

6.6.4.1.1

The large packaging shall be made of suitable ductile metal in which the weldability has been fully demonstrated. Welds shall be skilfully made and afford complete safety. Low-temperature performance shall be taken into account when appropriate.

6.6.4.1.2

Care shall be taken to avoid damage by galvanic action due to the juxtaposition of dissimilar metals.

6.6.4.2

Specific requirements for flexible material large packagings

51H flexible plastics
51M flexible paper

- 6.6.4.2.1 The large packaging shall be manufactured from suitable materials. The strength of the material and the construction of the flexible large packagings shall be appropriate to its capacity and its intended use.
- 6.6.4.2.2 All materials used in the construction of flexible large packagings of types 51M shall, after complete immersion in water for not less than 24 hours, retain at least 85% of the tensile strength as measured originally on the material conditioned to equilibrium at 67% relative humidity or less.
- 6.6.4.2.3 Seams shall be formed by stitching, heat sealing, glueing or any equivalent method. All stitched seam-ends shall be secured.
- 6.6.4.2.4 Flexible large packagings shall provide adequate resistance to ageing and to degradation caused by ultraviolet radiation or the climatic conditions, or by the substance contained, thereby rendering them appropriate to their intended use.
- 6.6.4.2.5 For plastics flexible large packagings where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the large packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.6.4.2.6 Additives may be incorporated into the material of the large packaging to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.
- 6.6.4.2.7 When filled, the ratio of height to width shall be not more than 2:1.

6.6.4.3 *Specific requirements for plastics large packagings*

50H rigid plastics

- 6.6.4.3.1 The large packaging shall be manufactured from suitable plastics material of known specifications and be of adequate strength in relation to its capacity and its intended use. The material shall be adequately resistant to ageing and to degradation caused by the substance contained or, where relevant, by ultraviolet radiation. Low temperature performance shall be taken into account when appropriate. Any permeation of the substance contained shall not constitute a danger under normal conditions of carriage.
- 6.6.4.3.2 Where protection against ultraviolet radiation is required, it shall be provided by the addition of carbon black or other suitable pigments or inhibitors. These additives shall be compatible with the contents and remain effective throughout the life of the outer packaging. Where use is made of carbon black, pigments or inhibitors other than those used in the manufacture of the tested design type, re-testing may be waived if changes in the carbon black content, the pigment content or the inhibitor content do not adversely affect the physical properties of the material of construction.
- 6.6.4.3.3 Additives may be incorporated in the material of the large packaging to improve the resistance to ageing or to serve other purposes, provided that these do not adversely affect the physical or chemical properties of the material.

6.6.4.4 *Specific requirements for fibreboard large packagings*

50G rigid fibreboard

- 6.6.4.4.1 Strong and good quality solid or double-faced corrugated fibreboard (single or multiwall) shall be used, appropriate to the capacity of the large packagings and to their intended use. The water resistance of the outer surface shall be such that the increase in mass, as determined in a test carried out over a period of 30 minutes by the Cobb method of determining water absorption, is not greater than 155 g/m² - see ISO 535:1991. It shall have proper bending qualities. Fibreboard shall be cut, creased without scoring, and slotted so as to permit assembly without cracking, surface breaks or undue bending. The fluting or corrugated fibreboard shall be firmly glued to the facings.

- 6.6.4.4.2 The walls, including top and bottom, shall have a minimum puncture resistance of 15 J measured according to ISO 3036:1975.
- 6.6.4.4.3 Manufacturing joins in the outer packaging of large packagings shall be made with an appropriate overlap and shall be taped, glued, stitched with metal staples or fastened by other means at least equally effective. Where joins are effected by gluing or taping, a water resistant adhesive shall be used. Metal staples shall pass completely through all pieces to be fastened and be formed or protected so that any inner liner cannot be abraded or punctured by them.
- 6.6.4.4.4 Any integral pallet base forming part of a large packaging or any detachable pallet shall be suitable for mechanical handling with the large packaging filled to its maximum permissible gross mass.
- 6.6.4.4.5 The pallet or integral base shall be designed so as to avoid any protrusion of the base of the large packaging that might be liable to damage in handling.
- 6.6.4.4.6 The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the large packaging.
- 6.6.4.4.7 Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.
- 6.6.4.4.8 Where large packagings are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.
- 6.6.4.5** *Specific requirements for wooden large packagings*
- 50C natural wood
50D plywood
50F reconstituted wood
- 6.6.4.5.1 The strength of the materials used and the method of construction shall be appropriate to the capacity and intended use of the large packagings.
- 6.6.4.5.2 Natural wood shall be well seasoned, commercially dry and free from defects that would materially lessen the strength of any part of the large packagings. Each part of the large packagings shall consist of one piece or be equivalent thereto. Parts are considered equivalent to one piece when a suitable method of glued assembly is used as for instance Lindermann joint, tongue and groove joint, ship lap or rabbet joint; or butt joint with at least two corrugated metal fasteners at each joint, or when other methods at least equally effective are used.
- 6.6.4.5.3 Large packagings of plywood shall be at least 3-ply. They shall be made of well seasoned rotary cut, sliced or sawn veneer, commercially dry and free from defects that would materially lessen the strength of the large packaging. All adjacent plies shall be glued with water resistant adhesive. Other suitable materials may be used with plywood for the construction of the large packaging.
- 6.6.4.5.4 Large packagings of reconstituted wood shall be made of water resistant reconstituted wood such as hardboard, particle board or other suitable type.
- 6.6.4.5.5 Large packagings shall be firmly nailed or secured to corner posts or ends or be assembled by equally suitable devices.
- 6.6.4.5.6 Any integral pallet base forming part of a large packaging or any detachable pallet shall be suitable for mechanical handling with the large packaging filled to its maximum permissible gross mass.
- 6.6.4.5.7 The pallet or integral base shall be designed so as to avoid any protrusion of the base of the large packaging that might be liable to damage in handling.
- 6.6.4.5.8 The body shall be secured to any detachable pallet to ensure stability in handling and carriage. Where a detachable pallet is used, its top surface shall be free from sharp protrusions that might damage the large packaging.

6.6.4.5.9 Strengthening devices such as timber supports to increase stacking performance may be used but shall be external to the liner.

6.6.4.5.10 Where large packagings are intended for stacking, the bearing surface shall be such as to distribute the load in a safe manner.

6.6.5 Test requirements for large packagings

6.6.5.1 Performance and frequency of test

6.6.5.1.1 The design type of each large packaging shall be tested as provided in 6.6.5.3 in accordance with procedures established by the competent authority allowing the allocation of the mark and shall be approved by this competent authority.

6.6.5.1.2 Each large packaging design type shall successfully pass the tests prescribed in this Chapter before being used. A large packaging design type is defined by the design, size, material and thickness, manner of construction and packing, but may include various surface treatments. It also includes large packagings which differ from the design type only in their lesser design height.

6.6.5.1.3 Tests shall be repeated on production samples at intervals established by the competent authority. For such tests on fibreboard large packagings, preparation at ambient conditions is considered equivalent to the provisions of 6.6.5.2.4.

6.6.5.1.4 Tests shall also be repeated after each modification which alters the design, material or manner of construction of large packagings.

6.6.5.1.5 The competent authority may permit the selective testing of large packagings that differ only in minor respects from a tested type, e.g. smaller sizes of inner packagings or inner packagings of lower net mass; and large packagings which are produced with small reductions in external dimension(s).

6.6.5.1.6 *(Reserved)*

NOTE: For the conditions for assembling different inner packagings in a large packaging and permissible variations in inner packagings, see 4.1.1.5.1.

6.6.5.1.7 The competent authority may at any time require proof, by tests in accordance with this section, that serially-produced large packagings meet the requirements of the design type tests.

6.6.5.1.8 Provided the validity of the test results is not affected and with the approval of the competent authority, several tests may be made on one sample.

6.6.5.1.9 Large salvage packagings

Large salvage packagings shall be tested and marked in accordance with the provisions applicable to packing group II large packagings intended for the carriage of solids or inner packagings, except as follows:

- (a) The test substance used in performing the tests shall be water, and the large salvage packagings shall be filled to not less than 98% of their maximum capacity. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass so long as they are placed so that the test results are not affected. Alternatively, in performing the drop test, the drop height may be varied in accordance with 6.6.5.3.4.4.2 (b);
- (b) Large salvage packagings shall, in addition, have been successfully subjected to the leakproofness test at 30 kPa, with the results of this test reflected in the test report required by 6.6.5.4; and
- (c) Large salvage packagings shall be marked with the letter "T" as described in 6.6.2.2.

6.6.5.2 *Preparation for testing*

6.6.5.2.1 Tests shall be carried out on large packagings prepared as for carriage including the inner packagings or articles used. Inner packagings shall be filled to not less than 98% of their maximum capacity for liquids or 95% for solids. For large packagings where the inner packagings are designed to carry liquids and solids, separate testing is required for both liquid and solid contents. The substances in the inner packagings or the articles to be carried in the large packagings may be replaced by other material or articles except where this would invalidate the results of the tests. When other inner packagings or articles are used they shall have the same physical characteristics (mass, etc) as the inner packagings or articles to be carried. It is permissible to use additives, such as bags of lead shot, to achieve the requisite total package mass, so long as they are placed so that the test results are not affected.

6.6.5.2.2 In the drop tests for liquids, when another substance is used, it shall be of similar relative density and viscosity to those of the substance being carried. Water may also be used for the liquid drop test under the conditions in 6.6.5.3.4.4.

6.6.5.2.3 Large packagings made of plastics materials and large packagings containing inner packagings of plastic materials - other than bags intended to contain solids or articles - shall be drop tested when the temperature of the test sample and its contents has been reduced to -18 °C or lower. This conditioning may be disregarded if the materials in question are of sufficient ductility and tensile strength at low temperatures. Where test sample are prepared in this way, the conditioning in 6.6.5.2.4 may be waived. Test liquids shall be kept in the liquid state by the addition of anti-freeze if necessary.

6.6.5.2.4 Large packagings of fibreboard shall be conditioned for at least 24 hours in an atmosphere having a controlled temperature and relative humidity (r.h.). There are three options, one of which shall be chosen.

The preferred atmosphere is 23 °C ± 2 °C and 50% ± 2% r.h. The two other options are: 20 °C ± 2 °C and 65% ± 2% r.h.; or 27 °C ± 2 °C and 65% ± 2% r.h.

NOTE: Average values shall fall within these limits. Short term fluctuations and measurement limitations may cause individual measurements to vary by up to ±5% relative humidity without significant impairment of test reproducibility.

6.6.5.3 *Test requirements***6.6.5.3.1** *Bottom lift test***6.6.5.3.1.1** *Applicability*

For all types of large packagings which are fitted with means of lifting from the base, as a design type test.

6.6.5.3.1.2 *Preparation of large packaging for test*

The large packaging shall be loaded to 1.25 times its maximum permissible gross mass, the load being evenly distributed.

6.6.5.3.1.3 *Method of testing*

The large packaging shall be raised and lowered twice by a lift truck with the forks centrally positioned and spaced at three quarters of the dimension of the side of entry (unless the points of entry are fixed). The forks shall penetrate to three quarters of the direction of entry. The test shall be repeated from each possible direction of entry.

6.6.5.3.1.4 *Criteria for passing the test*

No permanent deformation which renders the large packaging unsafe for carriage and no loss of contents.

6.6.5.3.2 *Top lift test*

6.6.5.3.2.1 Applicability

For types of large packagings which are intended to be lifted from the top and fitted with means of lifting, as a design type test.

6.6.5.3.2.2 Preparation of large packaging for test

The large packaging shall be loaded to twice its maximum permissible gross mass. A flexible large packaging shall be loaded to six times its maximum permissible gross mass, the load being evenly distributed.

6.6.5.3.2.3 Method of testing

The large packaging shall be lifted in the manner for which it is designed until clear of the floor and maintained in that position for a period of five minutes.

6.6.5.3.2.4 *Criteria for passing the test*

- (a) Metal and rigid plastics large packagings: no permanent deformation which renders the large packaging, including the base pallet, if any, unsafe for carriage and no loss of contents;
- (b) Flexible large packagings: no damage to the large packaging or its lifting devices which renders the large packaging unsafe for carriage or handling and no loss of contents.

6.6.5.3.3 *Stacking test*

6.6.5.3.3.1 Applicability

For all types of large packagings which are designed to be stacked on each other, as a design type test.

6.6.5.3.3.2 Preparation of large packaging for test

The large packaging shall be filled to its maximum permissible gross mass.

6.6.5.3.3.3 Method of testing

The large packaging shall be placed on its base on level hard ground and subjected to a uniformly distributed superimposed test load (see 6.6.5.3.3.4) for a period of at least five minutes, large packagings of wood, fibreboard and plastics materials for a period of 24 h.

6.6.5.3.3.4 Calculation of superimposed test load

The load to be placed on the large packagings shall be 1.8 times the combined maximum permissible gross mass of the number of similar large packagings that may be stacked on top of the large packagings during carriage.

6.6.5.3.3.5 *Criteria for passing the test*

- (a) All types of large packagings other than flexible large packagings: no permanent deformation which renders the large packaging including the base pallet, if any, unsafe for carriage and no loss of contents;
- (b) Flexible large packagings: no deterioration of the body which renders the large packaging unsafe for carriage and no loss of contents.

6.6.5.3.4 *Drop test*

6.6.5.3.4.1 Applicability

For all types of large packagings as a design type test.

6.6.5.3.4.2 Preparation of large packaging for testing

The large packaging shall be filled in accordance with 6.6.5.2.1

6.6.5.3.4.3 Method of testing

The large packaging shall be dropped onto a non resilient, horizontal, flat, massive and rigid surface in conformity with the requirements of 6.1.5.3.4, in such a manner as to ensure that the point of impact is that part of the base of the large packaging considered to be the most vulnerable.

6.6.5.3.4.4 Drop height

NOTE: Large packagings for substances and articles of Class 1 shall be tested at the packing group II performance level.

6.6.5.3.4.4.1 For inner packagings containing solid or liquid substances or articles, if the test is performed with the solid, liquid or articles to be carried, or with another substance or article having essentially the same characteristics:

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

6.6.5.3.4.4.2 For inner packagings containing liquids if the test is performed with water:

(a) Where the substances to be carried have a relative density not exceeding 1.2:

Packing group I	Packing group II	Packing group III
1.8 m	1.2 m	0.8 m

(b) Where the substances to be carried have a relative density exceeding 1.2, the drop height shall be calculated on the basis of the relative density (d) of the substance to be carried, rounded up to the first decimal, as follows:

Packing group I	Packing group II	Packing group III
$d \times 1.5$ (m)	$d \times 1.0$ (m)	$d \times 0.67$ (m)

6.6.5.3.4.5 Criteria for passing the test

6.6.5.3.4.5.1 The large packaging shall not exhibit any damage liable to affect safety during carriage. There shall be no leakage of the filling substance from inner packaging(s) or article(s).

6.6.5.3.4.5.2 No rupture is permitted in large packagings for articles of Class 1 which would permit the spillage of loose explosive substances or articles from the large packaging.

6.6.5.3.4.5.3 Where a large packaging undergoes a drop test, the sample passes the test if the entire contents are retained even if the closure is no longer sift-proof.

6.6.5.4 Certification and test report

6.6.5.4.1 In respect of each design type of large packaging a certificate and mark (as in 6.6.3) shall be issued attesting that the design type including its equipment meets the test requirements.

6.6.5.4.2 A test report containing at least the following particulars shall be drawn up and shall be made available to the users of the large packaging:

1. Name and address of the test facility;
2. Name and address of applicant (where appropriate);
3. A unique test report identification;
4. Date of the test report;
5. Manufacturer of the large packaging;
6. Description of the large packaging design type (e.g. dimensions, materials, closures, thickness, etc) and/or photograph(s);
7. Maximum capacity/maximum permissible gross mass;
8. Characteristics of test contents, e.g. types and descriptions of inner packagings or articles used;
9. Test descriptions and results;
10. The test report shall be signed with the name and status of the signatory.

6.6.5.4.3 The test report shall contain statements that the large packaging prepared as for carriage was tested in accordance with the appropriate provisions of this Chapter and that the use of other packaging methods or components may render it invalid. A copy of the test report shall be available to the competent authority.

CHAPTER 6.7

REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF PORTABLE TANKS AND UN MULTIPLE-ELEMENT GAS CONTAINERS (MEGCs)

NOTE: *For fixed tanks (tank-vehicles), demountable tanks and tank-containers and tank swap bodies, with shells made of metallic materials, and battery-vehicles and multiple element gas containers (MEGCs) other than UN MEGCs, see Chapter 6.8; for fibre-reinforced plastics tanks, see Chapter 6.9; for vacuum operated waste tanks, see Chapter 6.10.*

6.7.1 Application and general requirements

6.7.1.1 The requirements of this Chapter apply to portable tanks intended for the carriage of dangerous goods, and to MEGCs intended for the carriage of non-refrigerated gases of Class 2, by all modes of carriage. In addition to the requirements of this Chapter, unless otherwise specified, the applicable requirements of the International Convention for Safe Containers (CSC) 1972, as amended, shall be fulfilled by any multimodal portable tank or MEGC which meets the definition of a "container" within the terms of that Convention. Additional requirements may apply to offshore portable tanks or MEGCs that are handled in open seas.

6.7.1.2 In recognition of scientific and technological advances, the technical requirements of this Chapter may be varied by alternative arrangements. These alternative arrangements shall offer a level of safety not less than that given by the requirements of this Chapter with respect to the compatibility with substances carried and the ability of the portable tank or MEGC to withstand impact, loading and fire conditions. For international carriage, alternative arrangement portable tanks or MEGCs shall be approved by the applicable competent authorities.

6.7.1.3 When a substance is not assigned a portable tank instruction (T1 to T23, T50 or T75) in Column (10) of Table A of in Chapter 3.2, interim approval for carriage may be issued by the competent authority of the country of origin. The approval shall be included in the documentation of the consignment and contain as a minimum the information normally provided in the portable tank instructions and the conditions under which the substance shall be carried.

6.7.2 Requirements for the design, construction, inspection and testing of portable tanks intended for the carriage of substances of Class 1 and Classes 3 to 9

6.7.2.1 Definitions

For the purposes of this section:

Alternative arrangement means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter:

Portable tank means a multimodal tank used for the carriage of substances of Class 1 and Classes 3 to 9. The portable tank includes a shell fitted with service equipment and structural equipment necessary for the carriage of dangerous substances. The portable tank shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the shell, and shall be capable of being lifted when full. It shall be designed primarily to be loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to facilitate mechanical handling. Tank-vehicles, tank-wagons, non-metallic tanks and intermediate bulk containers (IBCs) are not considered to fall within the definition for portable tanks;

Shell means the part of the portable tank which retains the substance intended for carriage (tank proper), including openings and their closures, but does not include service equipment or external structural equipment;

Service equipment means measuring instruments and filling, discharge, venting, safety, heating, cooling and insulating devices;

Structural equipment means the reinforcing, fastening, protective and stabilizing members external to the shell;

Maximum allowable working pressure (MAWP) means a pressure that shall be not less than the highest of the following pressures measured at the top of the shell while in operating position:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The maximum effective gauge pressure to which the shell is designed which shall be not less than the sum of:
 - (i) the absolute vapour pressure (in bar) of the substance at 65 °C, minus 1 bar; and
 - (ii) the partial pressure (in bar) of air or other gases in the ullage space being determined by a maximum ullage temperature of 65 °C and a liquid expansion due to an increase in mean bulk temperature of $t_r - t_f$ (t_f = filling temperature, usually 15 °C; t_r = maximum mean bulk temperature, 50 °C);

Design pressure means the pressure to be used in calculations required by a recognized pressure vessel code. The design pressure shall be not less than the highest of the following pressures:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The sum of:
 - (i) the absolute vapour pressure (in bar) of the substance at 65 °C, minus 1 bar;
 - (ii) the partial pressure (in bar) of air or other gases in the ullage space being determined by a maximum ullage temperature of 65 °C and a liquid expansion due to an increase in mean bulk temperature of $t_r - t_f$ (t_f = filling temperature usually 15 °C; t_r = maximum mean bulk temperature, 50 °C); and
 - (iii) a head pressure determined on the basis of the static forces specified in 6.7.2.2.12, but not less than 0.35 bar; or
- (c) Two thirds of the minimum test pressure specified in the applicable portable tank instruction in 4.2.5.2.6;

Test pressure means the maximum gauge pressure at the top of the shell during the hydraulic pressure test equal to not less than 1.5 times the design pressure. The minimum test pressure for portable tanks intended for specific substances is specified in the applicable portable tank instruction in 4.2.5.2.6;

Leakproofness test means a test using gas subjecting the shell and its service equipment to an effective internal pressure of not less than 25% of the MAWP;

Maximum permissible gross mass (MPGM) means the sum of the tare mass of the portable tank and the heaviest load authorized for carriage;

Reference steel means a steel with a tensile strength of 370 N/mm² and an elongation at fracture of 27%;

Mild steel means a steel with a guaranteed minimum tensile strength of 360 N/mm² to 440 N/mm² and a guaranteed minimum elongation at fracture conforming to 6.7.2.3.3.3;

Design temperature range for the shell shall be -40 °C to 50 °C for substances carried under ambient conditions. For the other substances handled under elevated temperature conditions the design temperature shall be not less than the maximum temperature of the substance during filling, discharge or carriage. More severe design temperatures shall be considered for portable tanks subjected to severe climatic conditions;

Fine grain steel means steel which has a ferritic grain size of 6 or finer when determined in accordance with ASTM E 112-96 or as defined in EN 10028-3, Part 3;

Fusible element means a non-reclosable pressure relief device that is thermally actuated;

Offshore portable tank means a portable tank specially designed for repeated use for carriage to, from and between offshore facilities. An offshore portable tank is designed and constructed in accordance with the guidelines for the approval of containers handled in open seas specified by the International Maritime Organization in document MSC/Circ.860.

6.7.2.2 General design and construction requirements

- 6.7.2.2.1 Shells shall be designed and constructed in accordance with the requirements of a pressure vessel code recognized by the competent authority. Shells shall be made of metallic materials suitable for forming. The materials shall in principle conform to national or international material standards. For welded shells only a material whose weldability has been fully demonstrated shall be used. Welds shall be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shells shall be suitably heat-treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material, the design temperature range shall be taken into account with respect to risk of brittle fracture, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength shall be not more than 460 N/mm² and the guaranteed value of the upper limit of the tensile strength shall be not more than 725 N/mm² according to the material specification. Aluminium may only be used as a construction material when indicated in a portable tank special provision assigned to a specific substance in Column (11) of Table A of Chapter 3.2 or when approved by the competent authority. When aluminium is authorized, it shall be insulated to prevent significant loss of physical properties when subjected to a heat load of 110 kW/m² for a period of not less than 30 minutes. The insulation shall remain effective at all temperatures less than 649 °C and shall be jacketed with a material with a melting point of not less than 700 °C. Portable tank materials shall be suitable for the external environment in which they may be carried.
- 6.7.2.2.2 Portable tank shells, fittings, and pipework shall be constructed from materials which are:
- (a) Substantially immune to attack by the substance(s) intended to be carried; or
 - (b) Properly passivated or neutralized by chemical reaction; or
 - (c) Lined with corrosion-resistant material directly bonded to the shell or attached by equivalent means.
- 6.7.2.2.3 Gaskets shall be made of materials not subject to attack by the substance(s) intended to be carried.
- 6.7.2.2.4 When shells are lined, the lining shall be substantially immune to attack by the substance(s) intended to be carried, homogeneous, non porous, free from perforations, sufficiently elastic and compatible with the thermal expansion characteristics of the shell. The lining of every shell, shell fittings and piping shall be continuous, and shall extend around the face of any flange. Where external fittings are welded to the tank, the lining shall be continuous through the fitting and around the face of external flanges.
- 6.7.2.2.5 Joints and seams in the lining shall be made by fusing the material together or by other equally effective means.
- 6.7.2.2.6 Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.
- 6.7.2.2.7 The materials of the portable tank, including any devices, gaskets, linings and accessories, shall not adversely affect the substance(s) intended to be carried in the portable tank.
- 6.7.2.2.8 Portable tanks shall be designed and constructed with supports to provide a secure base during carriage and with suitable lifting and tie-down attachments.

- 6.7.2.2.9 Portable tanks shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.
- 6.7.2.2.9.1 For portable tanks that are intended for use offshore, the dynamic stresses imposed by handling in open seas shall be taken into account.
- 6.7.2.2.10 A shell which is to be equipped with a vacuum-relief device shall be designed to withstand, without permanent deformation, an external pressure of not less than 0.21 bar above the internal pressure. The vacuum-relief device shall be set to relieve at a vacuum setting not greater than minus (-) 0.21 bar unless the shell is designed for a higher external over pressure, in which case the vacuum-relief pressure of the device to be fitted shall be not greater than the tank design vacuum pressure. A shell used for the carriage of solid substances (powdery or granular) of packing groups II or III only, which do not liquefy during carriage, may be designed for a lower external pressure, subject to the approval of the competent authority. In this case, the vacuum valve shall be set to relieve at this lower pressure. A shell that is not to be fitted with a vacuum-relief device shall be designed to withstand, without permanent deformation an external pressure of not less than 0.4 bar above the internal pressure.
- 6.7.2.2.11 Vacuum-relief devices used on portable tanks intended for the carriage of substances meeting the flash-point criteria of Class 3, including elevated temperature substances carried at or above their flash-point, shall prevent the immediate passage of flame into the shell, or the portable tank shall have a shell capable of withstanding, without leakage an internal explosion resulting from the passage of flame into the shell.
- 6.7.2.2.12 Portable tanks and their fastenings shall, under the maximum permissible load, be capable of absorbing the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity (g)¹;
 - (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity (g)¹;
 - (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity (g)¹; and
 - (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity (g)¹.
- 6.7.2.2.13 Under each of the forces in 6.7.2.2.12, the safety factor to be observed shall be as follows:
- (a) For metals having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
 - (b) For metals with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.
- 6.7.2.2.14 The values of yield strength or proof strength shall be the values according to national or international material standards. When austenitic steels are used, the specified minimum values of yield strength or proof strength according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the value of yield strength or proof strength used shall be approved by the competent authority.
- 6.7.2.2.15 Portable tanks shall be capable of being electrically earthed when intended for the carriage of substances meeting the flash-point criteria of Class 3 including elevated temperature substances carried at or above their flash-point. Measures shall be taken to prevent dangerous electrostatic discharge.

¹ For calculation purposes $g = 9.81 \text{ m/s}^2$.

6.7.2.2.16 When required for certain substances by the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3, portable tanks shall be provided with additional protection, which may take the form of additional shell thickness or a higher test pressure, the additional shell thickness or higher test pressure being determined in the light of the inherent risks associated with the carriage of the substances concerned.

6.7.2.2.17 Thermal insulation directly in contact with the shell intended for substances carried at elevated temperature shall have an ignition temperature at least 50 °C higher than the maximum design temperature of the tank.

6.7.2.3 *Design criteria*

6.7.2.3.1 Shells shall be of a design capable of being stress-analysed mathematically or experimentally by resistance strain gauges, or by other methods approved by the competent authority.

6.7.2.3.2 Shells shall be designed and constructed to withstand a hydraulic test pressure not less than 1.5 times the design pressure. Specific requirements are laid down for certain substances in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3. Attention is drawn to the minimum shell thickness requirements specified in 6.7.2.4.1 to 6.7.2.4.10.

6.7.2.3.3 For metals exhibiting a clearly defined yield point or characterized by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress σ (sigma) in the shell shall not exceed 0.75 Re or 0.50 Rm, whichever is lower, at the test pressure, where:

Re = yield strength in N/mm², or 0.2% proof strength or, for austenitic steels, 1% proof strength;

Rm = minimum tensile strength in N/mm².

6.7.2.3.3.1 The values of Re and Rm to be used shall be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for Re and Rm according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the values of Re and Rm used shall be approved by the competent authority or its authorized body.

6.7.2.3.3.2 Steels which have a Re/Rm ratio of more than 0.85 are not allowed for the construction of welded shells. The values of Re and Rm to be used in determining this ratio shall be the values specified in the material inspection certificate.

6.7.2.3.3.3 Steels used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/Rm with an absolute minimum of 16% for fine grain steels and 20% for other steels. Aluminium and aluminium alloys used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/6Rm with an absolute minimum of 12%.

6.7.2.3.3.4 For the purpose of determining actual values for materials, it shall be noted that for sheet metal, the axis of the tensile test specimen shall be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture shall be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1998 using a 50 mm gauge length.

6.7.2.4 *Minimum shell thickness*

6.7.2.4.1 The minimum shell thickness shall be the greater thickness based on:

(a) The minimum thickness determined in accordance with the requirements of 6.7.2.4.2 to 6.7.2.4.10;

(b) The minimum thickness determined in accordance with the recognized pressure vessel code including the requirements in 6.7.2.3; and

- (c) The minimum thickness specified in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3.

- 6.7.2.4.2 The cylindrical portions, ends (heads) and manhole covers of shells not more than 1.80 m in diameter shall be not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells more than 1.80 m in diameter shall be not less than 6 mm thick in the reference steel or of equivalent thickness in the metal to be used, except that for powdered or granular solid substances of packing group II or III the minimum thickness requirement may be reduced to not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.2.4.3 When additional protection against shell damage is provided, portable tanks with test pressures less than 2.65 bar may have the minimum shell thickness reduced, in proportion to the protection provided, as approved by the competent authority. However, shells not more than 1.80 m in diameter shall be not less than 3 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells more than 1.80 m in diameter shall be not less than 4 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.2.4.4 The cylindrical portions, ends (heads) and manhole covers of all shells shall be not less than 3 mm thick regardless of the material of construction.
- 6.7.2.4.5 The additional protection referred to in 6.7.2.4.3 may be provided by overall external structural protection, such as suitable "sandwich" construction with the outer sheathing (jacket) secured to the shell, double wall construction or by enclosing the shell in a complete framework with longitudinal and transverse structural members.
- 6.7.2.4.6 The equivalent thickness of a metal other than the thickness prescribed for the reference steel in 6.7.2.4.2 shall be determined using the following formula:

$$e_1 = \frac{21.4e_0}{\sqrt[3]{Rm_1 \times A_1}}$$

where:

- e_1 = required equivalent thickness (in mm) of the metal to be used;
- e_0 = minimum thickness (in mm) of the reference steel specified in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3;
- Rm_1 = guaranteed minimum tensile strength (in N/mm²) of the metal to be used (see 6.7.2.3.3);
- A_1 = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.

- 6.7.2.4.7 When in the applicable portable tank instruction in 4.2.5.2.6, a minimum thickness of 8 mm or 10 mm is specified, it shall be noted that these thicknesses are based on the properties of the reference steel and a shell diameter of 1.80 m. When a metal other than mild steel (see 6.7.2.1) is used or the shell has a diameter of more than 1.80 m, the thickness shall be determined using the following formula:

$$e_1 = \frac{21.4e_0 d_1}{1.8 \sqrt[3]{Rm_1 \times A_1}}$$

where:

- e_1 = required equivalent thickness (in mm) of the metal to be used;
- e_0 = minimum thickness (in mm) of the reference steel specified in the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 or by a portable tank special provision indicated in Column (11) of Table A of Chapter 3.2 and described in 4.2.5.3;
- d_1 = diameter of the shell (in m), but not less than 1.80 m;
- Rm_1 = guaranteed minimum tensile strength (in N/mm²) of the metal to be used (see 6.7.2.3.3);

A_1 = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.

6.7.2.4.8 In no case shall the wall thickness be less than that prescribed in 6.7.2.4.2, 6.7.2.4.3 and 6.7.2.4.4. All parts of the shell shall have a minimum thickness as determined by 6.7.2.4.2 to 6.7.2.4.4. This thickness shall be exclusive of any corrosion allowance.

6.7.2.4.9 When mild steel is used (see 6.7.2.1), calculation using the formula in 6.7.2.4.6 is not required.

6.7.2.4.10 There shall be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.

6.7.2.5 Service equipment

6.7.2.5.1 Service equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during handling and carriage. When the connection between the frame and the shell allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the internal stop-valve and its seating shall be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.

6.7.2.5.2 All openings in the shell, intended for filling or discharging the portable tank shall be fitted with a manually operated stop-valve located as close to the shell as reasonably practicable. Other openings, except for openings leading to venting or pressure-relief devices, shall be equipped with either a stop-valve or another suitable means of closure located as close to the shell as reasonably practicable.

6.7.2.5.3 All portable tanks shall be fitted with a manhole or other inspection openings of a suitable size to allow for internal inspection and adequate access for maintenance and repair of the interior. Compartmented portable tanks shall have a manhole or other inspection openings for each compartment.

6.7.2.5.4 As far as reasonably practicable, external fittings shall be grouped together. For insulated portable tanks, top fittings shall be surrounded by a spill collection reservoir with suitable drains.

6.7.2.5.5 Each connection to a portable tank shall be clearly marked to indicate its function.

6.7.2.5.6 Each stop-valve or other means of closure shall be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperatures expected during carriage. All stop-valves with screwed spindles shall close by a clockwise motion of the handwheel. For other stop-valves the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed to prevent unintentional opening.

6.7.2.5.7 No moving parts, such as covers, components of closures, etc., shall be made of unprotected corrodible steel when they are liable to come into frictional or percussive contact with aluminium portable tanks intended for the carriage of substances meeting the flash-point criteria of Class 3 including elevated temperature substances carried at or above their flash-point.

6.7.2.5.8 Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of a suitable metallic material. Welded pipe joints shall be used wherever possible.

6.7.2.5.9 Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The joints shall not decrease the strength of the tubing as may happen when cutting threads.

6.7.2.5.10 The burst pressure of all piping and pipe fittings shall be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).

6.7.2.5.11 Ductile metals shall be used in the construction of valves and accessories.

- 6.7.2.5.12 The heating system shall be designed or controlled so that a substance cannot reach a temperature at which the pressure in the tank exceeds its MAWP or causes other hazards (e.g. dangerous thermal decomposition).
- 6.7.2.5.13 The heating system shall be designed or controlled so that power for internal heating elements shall not be available unless the heating elements are completely submerged. The temperature at the surface of the heating elements for internal heating equipment, or the temperature at the shell for external heating equipment shall, in no case, exceed 80% of the autoignition temperature (in °C) of the substance carried.
- 6.7.2.5.14 If an electrical heating system is installed inside the tank, it shall be equipped with an earth leakage circuit breaker with a releasing current of less than 100 mA.
- 6.7.2.5.15 Electrical switch cabinets mounted to tanks shall not have a direct connection to the tank interior and shall provide protection of at least the equivalent of type IP56 according to IEC 144 or IEC 529.

6.7.2.6 Bottom openings

- 6.7.2.6.1 Certain substances shall not be carried in portable tanks with bottom openings. When the applicable portable tank instruction identified in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6 indicates that bottom openings are prohibited there shall be no openings below the liquid level of the shell when it is filled to its maximum permissible filling limit. When an existing opening is closed it shall be accomplished by internally and externally welding one plate to the shell.
- 6.7.2.6.2 Bottom discharge outlets for portable tanks carrying certain solid, crystallizable or highly viscous substances shall be equipped with not less than two serially fitted and mutually independent shut-off devices. The design of the equipment shall be to the satisfaction of the competent authority or its authorized body and shall include:
- (a) An external stop-valve, fitted as close to the shell as reasonably practicable, and so designed as to prevent any unintended opening through impact or other inadvertent act; and
 - (b) A liquid tight closure at the end of the discharge pipe, which may be a bolted blank flange or a screw cap.
- 6.7.2.6.3 Every bottom discharge outlet, except as provided in 6.7.2.6.2, shall be equipped with three serially fitted and mutually independent shut-off devices. The design of the equipment shall be to the satisfaction of the competent authority or its authorized body and include:
- (a) A self-closing internal stop-valve, that is a stop-valve within the shell or within a welded flange or its companion flange, such that:
 - (i) The control devices for the operation of the valve are designed so as to prevent any unintended opening through impact or other inadvertent act;
 - (ii) The valve may be operable from above or below;
 - (iii) If possible, the setting of the valve (open or closed) shall be capable of being verified from the ground;
 - (iv) Except for portable tanks having a capacity of not more than 1 000 litres, it shall be possible to close the valve from an accessible position of the portable tank that is remote from the valve itself; and
 - (v) The valve shall continue to be effective in the event of damage to the external device for controlling the operation of the valve;
 - (b) An external stop-valve fitted as close to the shell as reasonably practicable; and
 - (c) A liquid tight closure at the end of the discharge pipe, which may be a bolted blank flange or a screw cap.
- 6.7.2.6.4 For a lined shell, the internal stop-valve required by 6.7.2.6.3 (a) may be replaced by an additional external stop-valve. The manufacturer shall satisfy the requirements of the competent authority or its authorized body.

6.7.2.7 *Safety-relief devices*

6.7.2.7.1 All portable tanks shall be fitted with at least one pressure-relief device. All relief devices shall be designed, constructed and marked to the satisfaction of the competent authority or its authorized body.

6.7.2.8 *Pressure-relief devices*

6.7.2.8.1 Every portable tank with a capacity not less than 1 900 litres and every independent compartment of a portable tank with a similar capacity, shall be provided with one or more pressure-relief devices of the spring-loaded type and may in addition have a frangible disc or fusible element in parallel with the spring-loaded devices except when prohibited by reference to 6.7.2.8.3 in the applicable portable tank instruction in 4.2.5.2.6. The pressure-relief devices shall have sufficient capacity to prevent rupture of the shell due to over pressurization or vacuum resulting from filling, discharging, or from heating of the contents.

6.7.2.8.2 Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of liquid and the development of any dangerous excess pressure.

6.7.2.8.3 When required for certain substances by the applicable portable tank instruction indicated in Column (10) of Table A of Chapter 3.2 and described in 4.2.5.2.6, portable tanks shall have a pressure-relief device approved by the competent authority. Unless a portable tank in dedicated service is fitted with an approved relief device constructed of materials compatible with the substance carried, the relief device shall comprise a frangible disc preceding a spring-loaded pressure-relief device. When a frangible disc is inserted in series with the required pressure-relief device, the space between the frangible disc and the pressure-relief device shall be provided with a pressure gauge or suitable tell-tale indicator for the detection of disc rupture, pinholing, or leakage which could cause a malfunction of the pressure-relief system. The frangible disc shall rupture at a nominal pressure 10% above the start to discharge pressure of the relief device.

6.7.2.8.4 Every portable tank with a capacity less than 1 900 litres shall be fitted with a pressure-relief device which may be a frangible disc when this disc complies with the requirements of 6.7.2.11.1. When no spring-loaded pressure-relief device is used, the frangible disc shall be set to rupture at a nominal pressure equal to the test pressure. In addition, fusible elements conforming to 6.7.2.10.1 may also be used.

6.7.2.8.5 When the shell is fitted for pressure discharge, the inlet line shall be provided with a suitable pressure-relief device set to operate at a pressure not higher than the MAWP of the shell, and a stop-valve shall be fitted as close to the shell as reasonably practicable.

6.7.2.9 *Setting of pressure-relief devices*

6.7.2.9.1 It shall be noted that the pressure-relief devices shall operate only in conditions of excessive rise in temperature, since the shell shall not be subject to undue fluctuations of pressure during normal conditions of carriage (see 6.7.2.12.2).

6.7.2.9.2 The required pressure-relief device shall be set to start-to-discharge at a nominal pressure of five-sixths of the test pressure for shells having a test pressure of not more than 4.5 bar and 110% of two-thirds of the test pressure for shells having a test pressure of more than 4.5 bar. After discharge the device shall close at a pressure not more than 10% below the pressure at which the discharge starts. The device shall remain closed at all lower pressures. This requirement does not prevent the use of vacuum-relief or combination pressure-relief and vacuum-relief devices.

6.7.2.10 *Fusible elements*

6.7.2.10.1 Fusible elements shall operate at a temperature between 100 °C and 149 °C on condition that the pressure in the shell at the fusing temperature will be not more than the test pressure. They shall be placed at the top of the shell with their inlets in the vapour space and when used for transport safety purposes, they shall not be shielded from external heat. Fusible elements shall not be used on portable tanks with a test pressure which exceeds 2.65 bar unless specified by special provision TP36 in Column (11) of Table A of Chapter 3.2. Fusible elements used on portable tanks intended for the carriage of elevated temperature substances shall be designed to operate at a temperature higher than the maximum temperature that will be experienced during carriage and shall be to the satisfaction of the competent authority or its authorized body.

6.7.2.11 *Frangible discs*

6.7.2.11.1 Except as specified in 6.7.2.8.3, frangible discs shall be set to rupture at a nominal pressure equal to the test pressure throughout the design temperature range. Particular attention shall be given to the requirements of 6.7.2.5.1 and 6.7.2.8.3 if frangible discs are used.

6.7.2.11.2 Frangible discs shall be appropriate for the vacuum pressures which may be produced in the portable tank.

6.7.2.12 *Capacity of pressure-relief devices*

6.7.2.12.1 The spring-loaded pressure-relief device required by 6.7.2.8.1 shall have a minimum cross sectional flow area equivalent to an orifice of 31.75 mm diameter. Vacuum-relief devices, when used, shall have a cross sectional flow area not less than 284 mm².

6.7.2.12.2 The combined delivery capacity of the pressure relief system (taking into account the reduction of the flow when the portable tank is fitted with frangible-discs preceding spring-loaded pressure-relief devices or when the spring-loaded pressure-relief devices are provided with a device to prevent the passage of the flame), in condition of complete fire engulfment of the portable tank shall be sufficient to limit the pressure in the shell to 20% above the start-to-discharge pressure of the pressure limiting device. Emergency pressure-relief devices may be used to achieve the full relief capacity prescribed. These devices may be fusible, spring loaded or frangible disc components, or a combination of spring-loaded and frangible disc devices. The total required capacity of the relief devices may be determined using the formula in 6.7.2.12.2.1 or the table in 6.7.2.12.2.3.

6.7.2.12.2.1 To determine the total required capacity of the relief devices, which shall be regarded as being the sum of the individual capacities of all the contributing devices, the following formula shall be used:

$$Q = 12.4 \frac{FA^{0.82}}{LC} \sqrt{\frac{ZT}{M}}$$

where:

Q = minimum required rate of discharge in cubic metres of air per second (m³/s) at standard conditions: 1 bar and 0 °C (273 K);

F = is a coefficient with the following value:

for uninsulated shells: F = 1;

for insulated shells: F = U(649 - t)/13.6 but in no case is less than 0.25

where:

U = thermal conductance of the insulation, in kW.m⁻². K⁻¹, at 38 °C;

t = actual temperature of the substance during filling (in °C); when this temperature is unknown, let t = 15 °C;

The value of F given above for insulated shells may be taken provided that the insulation is in accordance with 6.7.2.12.2.4;

A = total external surface area of shell in m²;

Z = the gas compressibility factor in the accumulating condition (when this factor is unknown, let Z = 1.0);

T = absolute temperature in Kelvin (°C + 273) above the pressure-relief devices in the accumulating condition;

L = the latent heat of vaporization of the liquid, in kJ/kg, in the accumulating condition;

M = molecular mass of the discharged gas;

C = a constant which is derived from one of the following formulae as a function of the ratio k of specific heats:

$$k = \frac{c_p}{c_v}$$

where:

c_p is the specific heat at constant pressure; and
 c_v is the specific heat at constant volume.

When $k > 1$:

$$C = \sqrt[k]{k \left(\frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

When $k = 1$ or k is unknown:

$$C = \frac{1}{\sqrt{e}} = 0.607$$

where e is the mathematical constant 2.7183

C may also be taken from the following table:

k	C	k	C	k	C
1.00	0.607	1.26	0.660	1.52	0.704
1.02	0.611	1.28	0.664	1.54	0.707
1.04	0.615	1.30	0.667	1.56	0.710
1.06	0.620	1.32	0.671	1.58	0.713
1.08	0.624	1.34	0.674	1.60	0.716
1.10	0.628	1.36	0.678	1.62	0.719
1.12	0.633	1.38	0.681	1.64	0.722
1.14	0.637	1.40	0.685	1.66	0.725
1.16	0.641	1.42	0.688	1.68	0.728
1.18	0.645	1.44	0.691	1.70	0.731
1.20	0.649	1.46	0.695	2.00	0.770
1.22	0.652	1.48	0.698	2.20	0.793
1.24	0.656	1.50	0.701		

6.7.2.12.2.2 As an alternative to the formula above, shells designed for the carriage of liquids may have their relief devices sized in accordance with the table in 6.7.2.12.2.3. This table assumes an insulation value of $F = 1$ and shall be adjusted accordingly when the shell is insulated. Other values used in determining this table are:

M	=	86.7	T	=	394 K
L	=	334.94 kJ/kg	C	=	0.607
Z	=	1			

6.7.2.12.2.3 Minimum required rate of discharge, Q , in cubic metres per air per second at 1 bar and 0 °C (273 K)

A Exposed area (square metres)	Q (cubic metres of air per second)	A Exposed area (square metres)	Q (cubic metres of air per second)
2	0.230	37.5	2.539
3	0.320	40	2.677
4	0.405	42.5	2.814
5	0.487	45	2.949
6	0.565	47.5	3.082
7	0.641	50	3.215
8	0.715	52.5	3.346
9	0.788	55	3.476
10	0.859	57.5	3.605

A Exposed area (square metres)	Q (cubic metres of air per second)	A Exposed area (square metres)	Q (cubic metres of air per second)
12	0.998	60	3.733
14	1.132	62.5	3.860
16	1.263	65	3.987
18	1.391	67.5	4.112
20	1.517	70	4.236
22.5	1.670	75	4.483
25	1.821	80	4.726
27.5	1.969	85	4.967
30	2.115	90	5.206
32.5	2.258	95	5.442
35	2.400	100	5.676

6.7.2.12.2.4 Insulation systems, used for the purpose of reducing venting capacity, shall be approved by the competent authority or its authorized body. In all cases, insulation systems approved for this purpose shall:

- (a) Remain effective at all temperatures up to 649 °C; and
- (b) Be jacketed with a material having a melting point of 700 °C or greater.

6.7.2.13 *Marking of pressure-relief devices*

6.7.2.13.1 Every pressure-relief device shall be clearly and permanently marked with the following particulars:

- (a) The pressure (in bar or kPa) or temperature (in °C) at which it is set to discharge;
- (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
- (c) The reference temperature corresponding to the rated pressure for frangible discs;
- (d) The allowable temperature tolerance for fusible elements; and
- (e) The rated flow capacity of the spring-loaded pressure relief devices, frangible discs or fusible elements in standard cubic metres of air per second (m³/s);
- (f) The cross sectional flow areas of the spring loaded pressure-relief devices, frangible discs and fusible elements in mm².

When practicable, the following information shall also be shown:

- (g) The manufacturer's name and relevant catalogue number of the device.

6.7.2.13.2 The rated flow capacity marked on the spring-loaded pressure-relief devices shall be determined according to ISO 4126-1:2004 and ISO 4126-7:2004.

6.7.2.14 *Connections to pressure-relief devices*

6.7.2.14.1 Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve shall be installed between the shell and the pressure-relief devices except where duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that at least one of the duplicate devices is always in use. There shall be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Vents or pipes from the pressure-relief device outlets, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving devices.

6.7.2.15 *Siting of pressure-relief devices*

6.7.2.15.1 Each pressure-relief device inlet shall be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure-relief device inlets shall under maximum filling conditions be situated in the vapour space of the shell and the devices shall be so arranged as to ensure the escaping vapour is discharged unrestrictedly. For flammable substances, the escaping vapour shall be directed away from the shell in such a manner that it cannot impinge upon the shell. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

6.7.2.15.2 Arrangements shall be made to prevent access to the pressure-relief devices by unauthorized persons and to protect the devices from damage caused by the portable tank overturning.

6.7.2.16 *Gauging devices*

6.7.2.16.1 Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the tank shall not be used.

6.7.2.17 *Portable tank supports, frameworks, lifting and tie-down attachments*

6.7.2.17.1 Portable tanks shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.2.2.12 and the safety factor specified in 6.7.2.2.13 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

6.7.2.17.2 The combined stresses caused by portable tank mountings (e.g. cradles, framework, etc.) and portable tank lifting and tie-down attachments shall not cause excessive stress in any portion of the shell. Permanent lifting and tie-down attachments shall be fitted to all portable tanks. Preferably they shall be fitted to the portable tank supports but may be secured to reinforcing plates located on the shell at the points of support.

6.7.2.17.3 In the design of supports and frameworks the effects of environmental corrosion shall be taken into account.

6.7.2.17.4 Forklift pockets shall be capable of being closed off. The means of closing forklift pockets shall be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:

- (a) The shell including all the fittings are well protected from being hit by the forklift blades; and
- (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.

6.7.2.17.5 When portable tanks are not protected during carriage, according to 4.2.1.2, the shells and service equipment shall be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:

- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
- (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) Protection against rear impact which may consist of a bumper or frame;
- (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995.

6.7.2.18 *Design approval*

- 6.7.2.18.1 The competent authority or its authorized body shall issue a design approval certificate for any new design of a portable tank. This certificate shall attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter and where appropriate, the provisions for substances provided in Chapter 4.2 and in Table A of Chapter 3.2. When a series of portable tanks are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the substances or group of substances allowed to be carried, the materials of construction of the shell and lining (when applicable) and an approval number. The approval number shall consist of the distinguishing sign or mark of the State in whose territory the approval was granted, i.e. the distinguishing sign for use in international traffic as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.
- 6.7.2.18.2 The prototype test report for the design approval shall include at least the following:
- (a) The results of the applicable framework test specified in ISO 1496-3:1995;
 - (b) The results of the initial inspection and test according to 6.7.2.19.3; and
 - (c) The results of the impact test in 6.7.2.19.1, when applicable.

6.7.2.19 *Inspection and testing*

- 6.7.2.19.1 Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.
- 6.7.2.19.2 The shell and items of equipment of each portable tank shall be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test shall be performed regardless of the date of the last periodic inspection and test when necessary according to 6.7.2.19.7.
- 6.7.2.19.3 The initial inspection and test of a portable tank shall include a check of the design characteristics, an internal and external examination of the portable tank and its fittings with due regard to the substances to be carried, and a pressure test. Before the portable tank is placed into service, a leakproofness test and a check of the satisfactory operation of all service equipment shall also be performed. When the shell and its fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.
- 6.7.2.19.4 The 5-year periodic inspection and test shall include an internal and external examination and, as a general rule, a hydraulic pressure test. For tanks only used for the carriage of solid substances, other than toxic or corrosive substances that do not liquefy during carriage, the hydraulic pressure test may be replaced by a suitable pressure test at 1.5 times the MAWP, subject to competent authority approval. Sheathing, thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. When the shell and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.
- 6.7.2.19.5 The intermediate 2.5 year periodic inspection and test shall at least include an internal and external examination of the portable tank and its fittings with due regard to the substances intended to be carried, a leakproofness test and a check of the satisfactory operation of all service equipment. Sheathing, thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. For portable tanks intended for the carriage of a single substance, the 2.5 year internal examination may be waived or substituted by other test methods or inspection procedures specified by the competent authority or its authorized body.

- 6.7.2.19.6 A portable tank may not be filled and offered for carriage after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.2.19.2. However, a portable tank filled prior to the date of expiry of the last periodic inspection and test may be carried for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be carried after the date of expiry of the last periodic test and inspection:
- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
 - (b) Unless otherwise approved by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption shall be mentioned in the transport document.
- 6.7.2.19.7 The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, or leakage, or other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the portable tank. It shall include at least the 2.5 year inspection and test according to 6.7.2.19.5.
- 6.7.2.19.8 The internal and external examinations shall ensure that:
- (a) The shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the portable tank unsafe for carriage;
 - (b) The piping, valves, heating/cooling system, and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or carriage;
 - (c) Devices for tightening manhole covers are operative and there is no leakage at manhole covers or gaskets;
 - (d) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
 - (e) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
 - (f) Linings, if any, are inspected in accordance with criteria outlined by the lining manufacturer;
 - (g) Required markings on the portable tank are legible and in accordance with the applicable requirements; and
 - (h) The framework, supports and arrangements for lifting the portable tank are in a satisfactory condition.
- 6.7.2.19.9 The inspections and tests in 6.7.2.19.1, 6.7.2.19.3, 6.7.2.19.4, 6.7.2.19.5 and 6.7.2.19.7 shall be performed or witnessed by an expert approved by the competent authority or its authorized body. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the portable tank. While under pressure, the portable tank shall be inspected for any leaks in the shell, piping or equipment.
- 6.7.2.19.10 In all cases when cutting, burning or welding operations on the shell have been effected, that work shall be to the approval of the competent authority or its authorized body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure shall be performed after the work is completed.
- 6.7.2.19.11 When evidence of any unsafe condition is discovered, the portable tank shall not be returned to service until it has been corrected and the test is repeated and passed. .

6.7.2.20 Marking

6.7.2.20.1 Every portable tank shall be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements the plate cannot be permanently attached to the shell, the shell shall be marked with at least the information required by the pressure vessel code. As a minimum, at least the following information shall be marked on the plate by stamping or by any other similar method:

- (a) Owner information
 - (i) Owner's registration number;
- (b) Manufacturing information
 - (i) Country of manufacture;
 - (ii) Year of manufacture;
 - (iii) Manufacturer's name or mark;
 - (iv) Manufacturer's serial number;
- (c) Approval information

- (i) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7²;

- (ii) Approval country;
- (iii) Authorized body for the design approval;
- (iv) Design approval number;
- (v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);
- (vi) Pressure vessel code to which the shell is designed;
- (d) Pressures
 - (i) MAWP (in bar gauge or kPa gauge)³;
 - (ii) Test pressure (in bar gauge or kPa gauge)³;
 - (iii) Initial pressure test date (month and year);
 - (iv) Identification mark of the initial pressure test witness;
 - (v) External design pressure⁴ (in bar gauge or kPa gauge)³;
 - (vi) MAWP for heating/cooling system (in bar gauge or kPa gauge)³ (when applicable);
- (e) Temperatures
 - (i) Design temperature range (in °C)³;
- (f) Materials
 - (i) Shell material(s) and material standard reference(s);
 - (ii) Equivalent thickness in reference steel (in mm)³;
 - (iii) Lining material (when applicable);
- (g) Capacity

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ The unit used shall be indicated.

⁴ See 6.7.2.2.10.

- (i) Tank water capacity at 20 °C (in litres)³;
This indication is to be followed by the symbol "S" when the shell is divided by surge plates into sections of not more than 7 500 litres capacity;
- (ii) Water capacity of each compartment at 20 °C (in litres)³ (when applicable, for multi-compartment tanks).
This indication is to be followed by the symbol "S" when the compartment is divided by surge plates into sections of not more than 7 500 litres capacity;
- (h) Periodic inspections and tests
- (i) Type of the most recent periodic test (2.5-year, 5-year or exceptional);
- (ii) Date of the most recent periodic test (month and year);
- (iii) Test pressure (in bar gauge or kPa gauge)³ of the most recent periodic test (if applicable);
- (iv) Identification mark of the authorized body who performed or witnessed the most recent test.

- 6.7.2.20.2 The following particulars shall be durably marked either on the portable tank itself or on a metal plate firmly secured to the portable tank:

Name of the operator

Maximum permissible gross mass (MPGM) _____ kg

Unladen (tare) mass _____ kg

Portable tank instruction in accordance with 4.2.5.2.6

NOTE: For the identification of the substances being carried, see also Part 5.

- 6.7.2.20.3 If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" shall be marked on the identification plate.

6.7.3 Requirements for the design, construction, inspection and testing of portable tanks intended for the carriage of non-refrigerated liquefied gases

NOTE: These requirements also apply to portable tanks intended for the carriage of chemicals under pressure (UN Nos. 3500, 3501, 3502, 3503, 3504 and 3505).

6.7.3.1 Definitions

For the purposes of this section:

Alternative arrangement means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter;

Portable tank means a multimodal tank having a capacity of more than 450 litres used for the carriage of non-refrigerated liquefied gases of Class 2. The portable tank includes a shell fitted with service equipment and structural equipment necessary for the carriage of gases. The portable tank shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the shell, and shall be capable of being lifted when full. It shall be designed primarily to be loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to facilitate mechanical handling. Tank-vehicles, tank-wagons, non-metallic tanks, intermediate bulk containers (IBCs), gas cylinders and large receptacles are not considered to fall within the definition for portable tanks;

Shell means the part of the portable tank which retains the non-refrigerated liquefied gas intended for carriage (tank proper), including openings and their closures, but does not include service equipment or external structural equipment;

Service equipment means measuring instruments and filling, discharge, venting, safety and insulating devices;

Structural equipment means the reinforcing, fastening, protective and stabilizing members external to the shell;

Maximum allowable working pressure (MAWP) means a pressure that shall be not less than the highest of the following pressures measured at the top of the shell while in operating position, but in no case less than 7 bar:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The maximum effective gauge pressure to which the shell is designed, which shall be:
 - (i) for a non-refrigerated liquefied gas listed in the portable tank instruction T50 in 4.2.5.2.6, the MAWP (in bar) given in T50 portable tank instruction for that gas;

- (ii) for other non-refrigerated liquefied gases, not less than the sum of:
 - the absolute vapour pressure (in bar) of the non-refrigerated liquefied gas at the design reference temperature minus 1 bar; and
 - the partial pressure (in bar) of air or other gases in the ullage space being determined by the design reference temperature and the liquid phase expansion due to an increase of the mean bulk temperature of t_r - t_f (t_f = filling temperature, usually 15 °C, t_r = maximum mean bulk temperature, 50 °C);
- (iii) for chemicals under pressure, the MAWP (in bar) given in T50 portable tank instruction for the liquefied gas portion of the propellants listed in T50 in 4.2.5.2.6;

Design pressure means the pressure to be used in calculations required by a recognized pressure vessel code. The design pressure shall be not less than the highest of the following pressures:

- (a) The maximum effective gauge pressure allowed in the shell during filling or discharge; or
- (b) The sum of:
 - (i) the maximum effective gauge pressure to which the shell is designed as defined in (b) of the MAWP definition (see above); and
 - (ii) a head pressure determined on the basis of the static forces specified in 6.7.3.2.9, but not less than 0.35 bar;

Test pressure means the maximum gauge pressure at the top of the shell during the pressure test;

Leakproofness test means a test using gas subjecting the shell and its service equipment to an effective internal pressure of not less than 25% of the MAWP;

Maximum permissible gross mass (MPGM) means the sum of the tare mass of the portable tank and the heaviest load authorized for carriage;

Reference steel means a steel with a tensile strength of 370 N/mm² and an elongation at fracture of 27%;

Mild steel means a steel with a guaranteed minimum tensile strength of 360 N/mm² to 440 N/mm² and a guaranteed minimum elongation at fracture conforming to 6.7.3.3.3;

Design temperature range for the shell shall be -40 °C to 50 °C for non-refrigerated liquefied gases carried under ambient conditions. More severe design temperatures shall be considered for portable tanks subjected to severe climatic conditions;

Design reference temperature means the temperature at which the vapour pressure of the contents is determined for the purpose of calculating the MAWP. The design reference temperature shall be less than the critical temperature of the non-refrigerated liquefied gas or liquefied gas propellants of chemicals under pressure intended to be carried to ensure that the gas at all times is liquefied. This value for each portable tank type is as follows:

- (a) Shell with a diameter of 1.5 metres or less: 65 °C;
- (b) Shell with a diameter of more than 1.5 metres:
 - (i) without insulation or sun shield: 60 °C;
 - (ii) with sun shield (see 6.7.3.2.12): 55 °C; and
 - (iii) with insulation (see 6.7.3.2.12) : 50 °C;

Filling density means the average mass of non-refrigerated liquefied gas per litre of shell capacity (kg/l). The filling density is given in portable tank instruction T50 in 4.2.5.2.6.

6.7.3.2 *General design and construction requirements*

- 6.7.3.2.1 Shells shall be designed and constructed in accordance with the requirements of a pressure vessel code recognized by the competent authority. Shells shall be made of steel suitable for forming. The materials shall in principle conform to national or international material standards. For welded shells, only a material whose weldability has been fully demonstrated shall be used. Welds shall be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shells shall be suitably heat-treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material the design temperature range shall be taken into account with respect to risk of brittle fracture, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength shall be not more than 460 N/mm² and the guaranteed value of the upper limit of the tensile strength shall be not more than 725 N/mm² according to the material specification. Portable tank materials shall be suitable for the external environment in which they may be carried.
- 6.7.3.2.2 Portable tank shells, fittings and pipework shall be constructed of materials which are:
- (a) Substantially immune to attack by the non-refrigerated liquefied gas(es) intended to be carried; or
 - (b) Properly passivated or neutralized by chemical reaction.
- 6.7.3.2.3 Gaskets shall be made of materials compatible with the non-refrigerated liquefied gas(es) intended to be carried.
- 6.7.3.2.4 Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.
- 6.7.3.2.5 The materials of the portable tank, including any devices, gaskets, and accessories, shall not adversely affect the non-refrigerated liquefied gas(es) intended for carriage in the portable tank.
- 6.7.3.2.6 Portable tanks shall be designed and constructed with supports to provide a secure base during carriage and with suitable lifting and tie-down attachments.
- 6.7.3.2.7 Portable tanks shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.
- 6.7.3.2.8 Shells shall be designed to withstand an external pressure of at least 0.4 bar (gauge pressure) above the internal pressure without permanent deformation. When the shell is to be subjected to a significant vacuum before filling or during discharge it shall be designed to withstand an external pressure of at least 0.9 bar (gauge pressure) above the internal pressure and shall be proven at that pressure.
- 6.7.3.2.9 Portable tanks and their fastenings shall, under the maximum permissible load, be capable of absorbing the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity (g)¹;
 - (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity (g)¹;
 - (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity (g)¹; and
 - (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity (g)¹.

¹ For calculation purposes $g = 9.81 \text{ m/s}^2$.

- 6.7.3.2.10 Under each of the forces in 6.7.3.2.9, the safety factor to be observed shall be as follows:
- (a) For steels having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
 - (b) For steels with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.
- 6.7.3.2.11 The values of yield strength or proof strength shall be the values according to national or international material standards. When austenitic steels are used, the specified minimum values of yield strength and proof strength according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the steel in question, the value of yield strength or proof strength used shall be approved by the competent authority.
- 6.7.3.2.12 When the shells intended for the carriage of non-refrigerated liquefied gases are equipped with thermal insulation, the thermal insulation systems shall satisfy the following requirements:
- (a) It shall consist of a shield covering not less than the upper third but not more than the upper half of the surface of the shell and separated from the shell by an air space about 40 mm across;
 - (b) It shall consist of a complete cladding of adequate thickness of insulating materials protected so as to prevent the ingress of moisture and damage under normal conditions of carriage and so as to provide a thermal conductance of not more than $0.67 \text{ (W.m}^{-2}.\text{K}^{-1}\text{)}$;
 - (c) When the protective covering is so closed as to be gas-tight, a device shall be provided to prevent any dangerous pressure from developing in the insulating layer in the event of inadequate gas tightness of the shell or of its items of equipment; and
 - (d) The thermal insulation shall not inhibit access to the fittings and discharge devices.
- 6.7.3.2.13 Portable tanks intended for the carriage of flammable non-refrigerated liquefied gases shall be capable of being electrically earthed.

6.7.3.3 *Design criteria*

- 6.7.3.3.1 Shells shall be of a circular cross-section.
- 6.7.3.3.2 Shells shall be designed and constructed to withstand a test pressure not less than 1.3 times the design pressure. The shell design shall take into account the minimum MAWP values provided in portable tank instruction T50 in 4.2.5.2.6 for each non-refrigerated liquefied gas intended for carriage. Attention is drawn to the minimum shell thickness requirements for these shells specified in 6.7.3.4.
- 6.7.3.3.3 For steels exhibiting a clearly defined yield point or characterized by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress σ (sigma) in the shell shall not exceed 0.75 Re or 0.50 Rm, whichever is lower, at the test pressure, where:
- Re = yield strength in N/mm^2 , or 0.2% proof strength or, for austenitic steels, 1% proof stress;
- Rm = minimum tensile strength in N/mm^2 .
- 6.7.3.3.3.1 The values of Re and Rm to be used shall be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for Re and Rm according to the material standards may be increased by up to 15% when these greater values are attested in the material inspection certificate. When no material standard exists for the steel in question, the values of Re and Rm used shall be approved by the competent authority or its authorized body.
- 6.7.3.3.3.2 Steels which have a Re/Rm ratio of more than 0.85 are not allowed for the construction of welded shells. The values of Re and Rm to be used in determining this ratio shall be the values specified in the material inspection certificate.

6.7.3.3.3 Steels used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/Rm with an absolute minimum of 16% for fine grain steels and 20% for other steels.

6.7.3.3.4 For the purpose of determining actual values for materials, it shall be noted that for sheet metal, the axis of the tensile test specimen shall be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture shall be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1998 using a 50 mm gauge length.

6.7.3.4 *Minimum shell thickness*

6.7.3.4.1 The minimum shell thickness shall be the greater thickness based on:

- (a) The minimum thickness determined in accordance with the requirements in 6.7.3.4; and
- (b) The minimum thickness determined in accordance with the recognized pressure vessel code including the requirements in 6.7.3.3.

6.7.3.4.2 The cylindrical portions, ends (heads) and manhole covers of shells of not more than 1.80 m in diameter shall be not less than 5 mm thick in the reference steel or of equivalent thickness in the steel to be used. Shells of more than 1.80 m in diameter shall be not less than 6 mm thick in the reference steel or of equivalent thickness in the steel to be used.

6.7.3.4.3 The cylindrical portions, ends (heads) and manhole covers of all shells shall be not less than 4 mm thick regardless of the material of construction.

6.7.3.4.4 The equivalent thickness of a steel other than the thickness prescribed for the reference steel in 6.7.3.4.2 shall be determined using the following formula:

$$e_1 = \frac{21,4e_0}{\sqrt[3]{Rm_1 \times A_1}}$$

where:

- e_1 = required equivalent thickness (in mm) of the steel to be used;
- e_0 = minimum thickness (in mm) for the reference steel specified in 6.7.3.4.2;
- Rm_1 = guaranteed minimum tensile strength (in N/mm²) of the steel to be used (see 6.7.3.3.3);
- A_1 = guaranteed minimum elongation at fracture (in %) of the steel to be used according to national or international standards.

6.7.3.4.5 In no case shall the wall thickness be less than that prescribed in 6.7.3.4.1 to 6.7.3.4.3. All parts of the shell shall have a minimum thickness as determined by 6.7.3.4.1 to 6.7.3.4.3. This thickness shall be exclusive of any corrosion allowance.

6.7.3.4.6 When mild steel is used (see 6.7.3.1), calculation using the formula in 6.7.3.4.4 is not required.

6.7.3.4.7 There shall be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.

6.7.3.5 *Service equipment*

6.7.3.5.1 Service equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during handling and carriage. When the connection between the frame and the shell allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the internal stop-valve and its seating shall be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.

- 6.7.3.5.2 All openings with a diameter of more than 1.5 mm in shells of portable tanks, except openings for pressure-relief devices, inspection openings and closed bleed holes, shall be fitted with at least three mutually independent shut-off devices in series, the first being an internal stop-valve, excess flow valve or equivalent device, the second being an external stop-valve and the third being a blank flange or equivalent device.
- 6.7.3.5.2.1 When a portable tank is fitted with an excess flow valve, the excess flow valve shall be so fitted that its seating is inside the shell or inside a welded flange or, when fitted externally, its mountings shall be designed so that in the event of impact its effectiveness shall be maintained. The excess flow valves shall be selected and fitted so as to close automatically when the rated flow specified by the manufacturer is reached. Connections and accessories leading to or from such a valve shall have a capacity for a flow more than the rated flow of the excess flow valve.
- 6.7.3.5.3 For filling and discharge openings, the first shut-off device shall be an internal stop-valve and the second shall be a stop-valve placed in an accessible position on each discharge and filling pipe.
- 6.7.3.5.4 For filling and discharge bottom openings of portable tanks intended for the carriage of flammable and/or toxic non-refrigerated liquefied gases or chemicals under pressure the internal stop-valve shall be a quick closing safety device which closes automatically in the event of unintended movement of the portable tank during filling or discharge or fire engulfment. Except for portable tanks having a capacity of not more than 1 000 litres, it shall be possible to operate this device by remote control.
- 6.7.3.5.5 In addition to filling, discharge and gas pressure equalizing orifices, shells may have openings in which gauges, thermometers and manometers can be fitted. Connections for such instruments shall be made by suitable welded nozzles or pockets and not be screwed connections through the shell.
- 6.7.3.5.6 All portable tanks shall be fitted with manholes or other inspection openings of suitable size to allow for internal inspection and adequate access for maintenance and repair of the interior.
- 6.7.3.5.7 External fittings shall be grouped together so far as reasonably practicable.
- 6.7.3.5.8 Each connection on a portable tank shall be clearly marked to indicate its function.
- 6.7.3.5.9 Each stop-valve or other means of closure shall be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperatures expected during carriage. All stop-valves with a screwed spindle shall close by a clockwise motion of the handwheel. For other stop-valves the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed to prevent unintentional opening.
- 6.7.3.5.10 Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of suitable metallic material. Welded pipe joints shall be used wherever possible.
- 6.7.3.5.11 Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The joints shall not decrease the strength of tubing as may happen when cutting threads.
- 6.7.3.5.12 The burst pressure of all piping and pipe fittings shall be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).
- 6.7.3.5.13 Ductile metals shall be used in the construction of valves and accessories.
- 6.7.3.6 *Bottom openings***
- 6.7.3.6.1 Certain non-refrigerated liquefied gases shall not be carried in portable tanks with bottom openings when portable tank instruction T50 in 4.2.5.2.6 indicates that bottom openings are not allowed. There shall be no openings below the liquid level of the shell when it is filled to its maximum permissible filling limit.

6.7.3.7 Pressure-relief devices

- 6.7.3.7.1 Portable tanks shall be provided with one or more spring-loaded pressure-relief devices. The pressure-relief devices shall open automatically at a pressure not less than the MAWP and be fully open at a pressure equal to 110% of the MAWP. These devices shall, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and shall remain closed at all lower pressures. The pressure-relief devices shall be of a type that will resist dynamic forces including liquid surge. Frangible discs not in series with a spring-loaded pressure-relief device are not permitted.
- 6.7.3.7.2 Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.
- 6.7.3.7.3 Portable tanks intended for the carriage of certain non-refrigerated liquefied gases identified in portable tank instruction T50 in 4.2.5.2.6 shall have a pressure-relief device approved by the competent authority. Unless a portable tank in dedicated service is fitted with an approved relief device constructed of materials compatible with the load, such device shall comprise a frangible disc preceding a spring-loaded device. The space between the frangible disc and the device shall be provided with a pressure gauge or a suitable tell-tale indicator. This arrangement permits the detection of disc rupture, pinholing or leakage which could cause a malfunction of the pressure-relief device. The frangible discs shall rupture at a nominal pressure 10% above the start-to-discharge pressure of the relief device.
- 6.7.3.7.4 In the case of multi-purpose portable tanks, the pressure-relief devices shall open at a pressure indicated in 6.7.3.7.1 for the gas having the highest maximum allowable pressure of the gases allowed to be carried in the portable tank.

6.7.3.8 Capacity of relief devices

- 6.7.3.8.1 The combined delivery capacity of the relief devices shall be sufficient that, in the event of total fire engulfment, the pressure (including accumulation) inside the shell does not exceed 120% of the MAWP. Spring-loaded relief devices shall be used to achieve the full relief capacity prescribed. In the case of multi-purpose tanks, the combined delivery capacity of the pressure-relief devices shall be taken for the gas which requires the highest delivery capacity of the gases allowed to be carried in portable tanks.
- 6.7.3.8.1.1 To determine the total required capacity of the relief devices, which shall be regarded as being the sum of the individual capacities of the several devices, the following formula⁵ shall be used:

$$Q = 12.4 \frac{FA^{0.82}}{LC} \sqrt{\frac{ZT}{M}}$$

where:

Q = minimum required rate of discharge in cubic metres of air per second (m³/s) at standard conditions: 1 bar and 0 °C (273 K);

F = is a coefficient with the following value:

for uninsulated shells: F = 1;

for insulated shells: F = U(649-t)/13.6 but in no case is less than 0.25

where:

U = thermal conductance of the insulation, in Kw.m⁻².K⁻¹, at 38 °C;

⁵ This formula applies only to non-refrigerated liquefied gases which have critical temperatures well above the temperature at the accumulating condition. For gases which have critical temperatures near or below the temperature at the accumulating condition, the calculation of the pressure-relief device delivery capacity shall consider further thermodynamic properties of the gas (see for example CGA S-1.2-2003 "Pressure Relief Device Standards - Part 2 - Cargo and Portable Tanks for Compressed Gases").

t = actual temperature of the non-refrigerated liquefied gas during filling (°C); when this temperature is unknown, let $t=15$ °C;

The value of F given above for insulated shells may be taken provided that the insulation is in accordance with 6.7.3.8.1.2;

where:

A = total external surface area of shell in square metres;

Z = the gas compressibility factor in the accumulating condition (when this factor is unknown, let $Z=1.0$);

T = absolute temperature in Kelvin (°C + 273) above the pressure relief devices in the accumulating condition;

L = the latent heat of vaporization of the liquid, in kJ/kg, in the accumulating condition;

M = molecular mass of the discharged gas;

C = a constant which is derived from one of the following formulae as a function of the ratio k of specific heats

$$k = \frac{c_p}{c_v}$$

where

c_p is the specific heat at constant pressure; and

c_v is the specific heat at constant volume.

when $k > 1$:

$$C = \sqrt{k \left(\frac{2}{k+1} \right)^{\frac{k+1}{k-1}}}$$

when $k = 1$ or k is unknown:

$$C = \frac{1}{\sqrt{e}} = 0.607$$

where e is the mathematical constant 2.7183

C may also be taken from the following table:

k	C	k	C	k	C
1.00	0.607	1.26	0.660	1.52	0.704
1.02	0.611	1.28	0.664	1.54	0.707
1.04	0.615	1.30	0.667	1.56	0.710
1.06	0.620	1.32	0.671	1.58	0.713
1.08	0.624	1.34	0.674	1.60	0.716
1.10	0.628	1.36	0.678	1.62	0.719
1.12	0.633	1.38	0.681	1.64	0.722
1.14	0.637	1.40	0.685	1.66	0.725
1.16	0.641	1.42	0.688	1.68	0.728
1.18	0.645	1.44	0.691	1.70	0.731
1.20	0.649	1.46	0.695	2.00	0.770
1.22	0.652	1.48	0.698	2.20	0.793
1.24	0.656	1.50	0.701		

6.7.3.8.1.2 Insulation systems, used for the purpose of reducing the venting capacity, shall be approved by the competent authority or its authorized body. In all cases, insulation systems approved for this purpose shall:

- (a) Remain effective at all temperatures up to 649 °C; and
- (b) Be jacketed with a material having a melting point of 700 °C or greater.

6.7.3.9 *Marking of pressure-relief devices*

6.7.3.9.1 Every pressure-relief device shall be plainly and permanently marked with the following particulars:

- (a) The pressure (in bar or kPa) at which it is set to discharge;
- (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
- (c) The reference temperature corresponding to the rated pressure for frangible discs;
- (d) The rated flow capacity of the device in standard cubic metres of air per second (m³/s); and
- (e) The cross sectional flow areas of the spring loaded pressure-relief devices and frangible discs in mm².

When practicable, the following information shall also be shown:

- (f) The manufacturer's name and relevant catalogue number of the device.

6.7.3.9.2 The rated flow capacity marked on the pressure-relief devices shall be determined according to ISO 4126-1:2004 and ISO 4126-7:2004.

6.7.3.10 *Connections to pressure-relief devices*

6.7.3.10.1 Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve shall be installed between the shell and the pressure-relief devices except when duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that at least one of the duplicate devices is always operable and capable of meeting the requirements of 6.7.3.8. There shall be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Vents from the pressure-relief devices, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.

6.7.3.11 *Siting of pressure-relief devices*

6.7.3.11.1 Each pressure-relief device inlet shall be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure relief device inlets shall under maximum filling conditions be situated in the vapour space of the shell and the devices shall be so arranged as to ensure that the escaping vapour is discharged unrestrictedly. For flammable non-refrigerated liquefied gases, the escaping vapour shall be directed away from the shell in such a manner that it cannot impinge upon the shell. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

6.7.3.11.2 Arrangements shall be made to prevent access to the pressure-relief devices by unauthorized persons and to protect the devices from damage caused by the portable tank overturning.

6.7.3.12 *Gauging devices*

6.7.3.12.1 Unless a portable tank is intended to be filled by weight it shall be equipped with one or more gauging devices. Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the shell shall not be used.

6.7.3.13 *Portable tank supports, frameworks, lifting and tie-down attachments*

6.7.3.13.1 Portable tanks shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.3.2.9 and the safety factor specified in 6.7.3.2.10 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

6.7.3.13.2 The combined stresses caused by portable tank mountings (e.g. cradles, frameworks, etc.) and portable tank lifting and tie-down attachments shall not cause excessive stress in any portion of the shell. Permanent lifting and tie-down attachments shall be fitted to all portable tanks. Preferably they shall be fitted to the portable tank supports but may be secured to reinforcing plates located on the shell at the points of support.

6.7.3.13.3 In the design of supports and frameworks the effects of environmental corrosion shall be taken into account.

6.7.3.13.4 Forklift pockets shall be capable of being closed off. The means of closing forklift pockets shall be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:

- (a) The shell and all the fittings are well protected from being hit by the forklift blades; and
- (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.

6.7.3.13.5 When portable tanks are not protected during carriage, according to 4.2.2.3, the shells and service equipment shall be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:

- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
- (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) Protection against rear impact which may consist of a bumper or frame;
- (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995.

6.7.3.14 *Design approval*

6.7.3.14.1 The competent authority or its authorized body shall issue a design approval certificate for any new design of a portable tank. This certificate shall attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter and where appropriate the provisions for gases provided in portable tank instruction T50 in 4.2.5.2.6. When a series of portable tanks are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the gases allowed to be carried, the materials of construction of the shell and an approval number. The approval number shall consist of the distinguishing sign or mark of the State in whose territory the approval was granted, i.e. the distinguishing sign for use in international traffic, as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

6.7.3.14.2 The prototype test report for the design approval shall include at least the following:

- (a) The results of the applicable framework test specified in ISO 1496-3:1995;
- (b) The results of the initial inspection and test in 6.7.3.15.3; and
- (c) The results of the impact test in 6.7.3.15.1, when applicable.

6.7.3.15 *Inspection and testing*

6.7.3.15.1 Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.

6.7.3.15.2 The shell and items of equipment of each portable tank shall be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test shall be performed regardless of the last periodic inspection and test when necessary according to 6.7.3.15.7.

6.7.3.15.3 The initial inspection and test of a portable tank shall include a check of the design characteristics, an internal and external examination of the portable tank and its fittings with due regard to the non-refrigerated liquefied gases to be carried, and a pressure test referring to the test pressures according to 6.7.3.3.2. The pressure test may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorized body. Before the portable tank is placed into service, a leakproofness test and a test of the satisfactory operation of all service equipment shall also be performed. When the shell and its fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test. All welds subject to full stress level in the shell shall be inspected during the initial test by radiographic, ultrasonic, or another suitable non-destructive test method. This does not apply to the jacket.

6.7.3.15.4 The 5 year periodic inspection and test shall include an internal and external examination and, as a general rule, a hydraulic pressure test. Sheathing, thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. When the shell and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

- 6.7.3.15.5 The intermediate 2.5 year periodic inspection and test shall at least include an internal and external examination of the portable tank and its fittings with due regard to the non-refrigerated liquefied gases intended to be carried, a leakproofness test and a check of the satisfactory operation of all service equipment. Sheathing thermal insulation and the like shall be removed only to the extent required for reliable appraisal of the condition of the portable tank. For portable tanks intended for the carriage of a single non-refrigerated liquefied gas, the 2.5 year internal examination may be waived or substituted by other test methods or inspection procedures specified by the competent authority or its authorized body.
- 6.7.3.15.6 A portable tank may not be filled and offered for carriage after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.3.15.2. However a portable tank filled prior to the date of expiry of the last periodic inspection and test may be carried for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be carried after the date of expiry of the last periodic test and inspection:
- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
 - (b) Unless otherwise approved by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption shall be mentioned in the transport document.
- 6.7.3.15.7 The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, or leakage, or other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the portable tank. It shall include at least the 2.5 year inspection and test according to 6.7.3.15.5.
- 6.7.3.15.8 The internal and external examinations shall ensure that:
- (a) The shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the portable tank unsafe for carriage;
 - (b) The piping, valves, and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or carriage;
 - (c) Devices for tightening manhole covers are operative and there is no leakage at manhole covers or gaskets;
 - (d) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
 - (e) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
 - (f) Required markings on the portable tank are legible and in accordance with the applicable requirements; and
 - (g) The framework, the supports and the arrangements for lifting the portable tank are in satisfactory condition.
- 6.7.3.15.9 The inspections and tests in 6.7.3.15.1, 6.7.3.15.3, 6.7.3.15.4, 6.7.3.15.5 and 6.7.3.15.7 shall be performed or witnessed by an expert approved by the competent authority or its authorized body. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the portable tank. While under pressure, the portable tank shall be inspected for any leaks in the shell, piping or equipment.

6.7.3.15.10 In all cases when cutting, burning or welding operations on the shell have been effected, that work shall be to the approval of the competent authority or its authorized body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure shall be performed after the work is completed.

6.7.3.15.11 When evidence of any unsafe condition is discovered, the portable tank shall not be returned to service until it has been corrected and the pressure test is repeated and passed.

6.7.3.16 **Marking**

6.7.3.16.1 Every portable tank shall be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements the plate cannot be permanently attached to the shell, the shell shall be marked with at least the information required by the pressure vessel code. As a minimum, at least the following information shall be marked on the plate by stamping or by any other similar method:

- (a) Owner information
 - (i) Owner's registration number;
- (b) Manufacturing information
 - (i) Country of manufacture;
 - (ii) Year of manufacture;
 - (iii) Manufacturer's name or mark;
 - (iv) Manufacturer's serial number;
- (c) Approval information
 - (i) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7²;

- (ii) Approval country;
- (iii) Authorized body for the design approval;
- (iv) Design approval number;
- (v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);
- (vi) Pressure vessel code to which the shell is designed;
- (d) Pressures
 - (i) MAWP (in bar gauge or kPa gauge)³;
 - (ii) Test pressure (in bar gauge or kPa gauge)³;
 - (iii) Initial pressure test date (month and year);
 - (iv) Identification mark of the initial pressure test witness;
 - (v) External design pressure⁶ (in bar gauge or kPa gauge)³;
- (e) Temperatures
 - (i) Design temperature range (in °C)³;
 - (ii) Design reference temperature (in °C)³;

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ The unit used shall be indicated.

⁶ See 6.7.3.2.8.

- (f) Materials
 - (i) Shell material(s) and material standard reference(s);
 - (ii) Equivalent thickness in reference steel (in mm)³;
- (g) Capacity
 - (i) Tank water capacity at 20 °C (in litres)³;
- (h) Periodic inspections and tests
 - (i) Type of the most recent periodic test (2.5-year, 5-year or exceptional);
 - (ii) Date of the most recent periodic test (month and year);
 - (iii) Test pressure (in bar gauge or kPa gauge)³ of the most recent periodic test (if applicable);
 - (iv) Identification mark of the authorized body who performed or witnessed the most recent test.

- 6.7.3.16.2 The following information shall be durably marked either on the portable tank itself or on a metal plate firmly secured to the portable tank:

Name of the operator

Name of non-refrigerated liquefied gas(es) permitted for carriage

Maximum permissible load mass for each non-refrigerated liquefied gas permitted _____ kg

Maximum permissible gross mass (MPGM) _____ kg

Unladen (tare) mass _____ kg

Portable tank instruction in accordance with 4.2.5.2.6

NOTE: For the identification of the non-refrigerated liquefied gases being carried, see also Part 5.

- 6.7.3.16.3 If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" shall be marked on the identification plate.

6.7.4 Requirements for the design, construction, inspection and testing of portable tanks intended for the carriage of refrigerated liquefied gases

6.7.4.1 Definitions

For the purposes of this section:

Alternative arrangement means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter;

Portable tank means a thermally insulated multimodal tank having a capacity of more than 450 litres fitted with service equipment and structural equipment necessary for the carriage of refrigerated liquefied gases. The portable tank shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the tank, and shall be capable of being lifted when full. It shall be designed primarily to be loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to facilitate mechanical handling. Tank-vehicles, tank-wagons, non-metallic tanks, intermediate bulk containers (IBCs), gas cylinders and large receptacles are not considered to fall within the definition for portable tanks;

Tank means a construction which normally consists of either :

- (a) A jacket and one or more inner shells where the space between the shell(s) and the jacket is exhausted of air (vacuum insulation) and may incorporate a thermal insulation system; or
- (b) A jacket and an inner shell with an intermediate layer of solid thermally insulating material (e.g. solid foam);

Shell means the part of the portable tank which retains the refrigerated liquefied gas intended for carriage, including openings and their closures, but does not include service equipment or external structural equipment;

Jacket means the outer insulation cover or cladding which may be part of the insulation system;

Service equipment means measuring instruments and filling, discharge, venting, safety, pressurizing, cooling and thermal insulation devices;

Structural equipment means the reinforcing, fastening, protective and stabilizing members external to the shell;

Maximum allowable working pressure (MAWP) means the maximum effective gauge pressure permissible at the top of the shell of a loaded portable tank in its operating position including the highest effective pressure during filling and discharge;

Test pressure means the maximum gauge pressure at the top of the shell during the pressure test;

Leakproofness test means a test using gas subjecting the shell and its service equipment, to an effective internal pressure not less than 90% of the MAWP;

Maximum permissible gross mass (MPGM) means the sum of the tare mass of the portable tank and the heaviest load authorized for carriage;

Holding time means the time that will elapse from the establishment of the initial filling condition until the pressure has risen due to heat influx to the lowest set pressure of the pressure limiting device(s);

Reference steel means a steel with a tensile strength of 370 N/mm² and an elongation at fracture of 27%;

Minimum design temperature means the temperature which is used for the design and construction of the shell not higher than the lowest (coldest) temperature (service temperature) of the contents during normal conditions of filling, discharge and carriage.

6.7.4.2 General design and construction requirements

- 6.7.4.2.1 Shells shall be designed and constructed in accordance with the requirements of a pressure vessel code recognized by the competent authority. Shells and jackets shall be made of metallic materials suitable for forming. Jackets shall be made of steel. Non-metallic materials may be used for the attachments and supports between the shell and jacket, provided their material properties at the minimum design temperature are proven to be sufficient. The materials shall in principle conform to national or international material standards. For welded shells and jackets only materials whose weldability has been fully demonstrated shall be used. Welds shall be skilfully made and afford complete safety. When the manufacturing process or the materials make it necessary, the shell shall be suitably heat treated to guarantee adequate toughness in the weld and in the heat affected zones. In choosing the material, the minimum design temperature shall be taken into account with respect to risk of brittle fracture, to hydrogen embrittlement, to stress corrosion cracking and to resistance to impact. When fine grain steel is used, the guaranteed value of the yield strength shall be not more than 460 N/mm² and the guaranteed value of the upper limit of the tensile strength shall be not more than 725 N/mm² in accordance with the material specifications. Portable tank materials shall be suitable for the external environment in which they may be carried.
- 6.7.4.2.2 Any part of a portable tank, including fittings, gaskets and pipe-work, which can be expected normally to come into contact with the refrigerated liquefied gas carried shall be compatible with that refrigerated liquefied gas.
- 6.7.4.2.3 Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.
- 6.7.4.2.4 The thermal insulation system shall include a complete covering of the shell(s) with effective insulating materials. External insulation shall be protected by a jacket so as to prevent the ingress of moisture and other damage under normal carriage conditions.
- 6.7.4.2.5 When a jacket is so closed as to be gas-tight, a device shall be provided to prevent any dangerous pressure from developing in the insulation space.
- 6.7.4.2.6 Portable tanks intended for the carriage of refrigerated liquefied gases having a boiling point below minus (-) 182 °C at atmospheric pressure shall not include materials which may react with oxygen or oxygen enriched atmospheres in a dangerous manner, when located in parts of the thermal insulation when there is a risk of contact with oxygen or with oxygen enriched fluid.
- 6.7.4.2.7 Insulating materials shall not deteriorate unduly in service.
- 6.7.4.2.8 A reference holding time shall be determined for each refrigerated liquefied gas intended for carriage in a portable tank.
- 6.7.4.2.8.1 The reference holding time shall be determined by a method recognized by the competent authority on the basis of the following:
- (a) The effectiveness of the insulation system, determined in accordance with 6.7.4.2.8.2;
 - (b) The lowest set pressure of the pressure limiting device(s);

- (c) The initial filling conditions;
- (d) An assumed ambient temperature of 30 °C;
- (e) The physical properties of the individual refrigerated liquefied gas intended to be carried.

6.7.4.2.8.2 The effectiveness of the insulation system (heat influx in watts) shall be determined by type testing the portable tank in accordance with a procedure recognized by the competent authority. This test shall consist of either:

- (a) A constant pressure test (for example at atmospheric pressure) when the loss of refrigerated liquefied gas is measured over a period of time; or
- (b) A closed system test when the rise in pressure in the shell is measured over a period of time.

When performing the constant pressure test, variations in atmospheric pressure shall be taken into account. When performing either tests corrections shall be made for any variation of the ambient temperature from the assumed ambient temperature reference value of 30 °C.

NOTE: For the determination of the actual holding time before each journey, refer to 4.2.3.7.

6.7.4.2.9 The jacket of a vacuum-insulated double-wall tank shall have either an external design pressure not less than 100 kPa (1 bar) (gauge pressure) calculated in accordance with a recognized technical code or a calculated critical collapsing pressure of not less than 200 kPa (2 bar) (gauge pressure). Internal and external reinforcements may be included in calculating the ability of the jacket to resist the external pressure.

6.7.4.2.10 Portable tanks shall be designed and constructed with supports to provide a secure base during carriage and with suitable lifting and tie-down attachments.

6.7.4.2.11 Portable tanks shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the portable tank, have been taken into account.

6.7.4.2.12 Portable tanks and their fastenings under the maximum permissible load shall be capable of absorbing the following separately applied static forces:

- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity (g)¹;
- (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity (g)¹;
- (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity (g)¹; and
- (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity (g)¹.

6.7.4.2.13 Under each of the forces in 6.7.4.2.12, the safety factor to be observed shall be as follows:

- (a) For materials having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; and
- (b) For materials with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength or, in case of austenitic steels, the 1% proof strength.

¹ For calculation purposes $g = 9.81 \text{ m/s}^2$.

6.7.4.2.14 The values of yield strength or proof strength shall be the values according to national or international material standards. When austenitic steels are used, the specified minimum values according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, or when non-metallic materials are used the values of yield strength or proof strength shall be approved by the competent authority.

6.7.4.2.15 Portable tanks intended for the carriage of flammable refrigerated liquefied gases shall be capable of being electrically earthed.

6.7.4.3 *Design criteria*

6.7.4.3.1 Shells shall be of a circular cross section.

6.7.4.3.2 Shells shall be designed and constructed to withstand a test pressure not less than 1.3 times the MAWP. For shells with vacuum insulation the test pressure shall not be less than 1.3 times the sum of the MAWP and 100 kPa (1 bar). In no case shall the test pressure be less than 300 kPa (3 bar) (gauge pressure). Attention is drawn to the minimum shell thickness requirements, specified in 6.7.4.4.2 to 6.7.4.4.7.

6.7.4.3.3 For metals exhibiting a clearly defined yield point or characterized by a guaranteed proof strength (0.2% proof strength, generally, or 1% proof strength for austenitic steels) the primary membrane stress σ (sigma) in the shell shall not exceed 0.75 Re or 0.50 Rm, whichever is lower, at the test pressure, where:

Re = yield strength in N/mm², or 0.2% proof strength or, for austenitic steels, 1% proof strength;

Rm = minimum tensile strength in N/mm².

6.7.4.3.3.1 The values of Re and Rm to be used shall be the specified minimum values according to national or international material standards. When austenitic steels are used, the specified minimum values for Re and Rm according to the material standards may be increased by up to 15% when greater values are attested in the material inspection certificate. When no material standard exists for the metal in question, the values of Re and Rm used shall be approved by the competent authority or its authorized body.

6.7.4.3.3.2 Steels which have a Re/Rm ratio of more than 0.85 are not allowed for the construction of welded shells. The values of Re and Rm to be used in determining this ratio shall be the values specified in the material inspection certificate.

6.7.4.3.3.3 Steels used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/Rm with an absolute minimum of 16% for fine grain steels and 20% for other steels. Aluminium and aluminium alloys used in the construction of shells shall have an elongation at fracture, in %, of not less than 10 000/6Rm with an absolute minimum of 12%.

6.7.4.3.3.4 For the purpose of determining actual values for materials, it shall be noted that for sheet metal, the axis of the tensile test specimen shall be at right angles (transversely) to the direction of rolling. The permanent elongation at fracture shall be measured on test specimens of rectangular cross sections in accordance with ISO 6892:1988 using a 50 mm gauge length.

6.7.4.4 *Minimum shell thickness*

6.7.4.4.1 The minimum shell thickness shall be the greater thickness based on:

(a) The minimum thickness determined in accordance with the requirements in 6.7.4.4.2 to 6.7.4.4.7; or

(b) The minimum thickness determined in accordance with the recognized pressure vessel code including the requirements in 6.7.4.3.

- 6.7.4.4.2 Shells of not more than 1.80 m in diameter shall be not less than 5 mm thick in the reference steel or of equivalent thickness in the metal to be used. Shells of more than 1.80 m in diameter shall be not less than 6 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.4.4.3 Shells of vacuum-insulated tanks of not more than 1.80 m in diameter shall be not less than 3 mm thick in the reference steel or of equivalent thickness in the metal to be used. Such shells of more than 1.80 m in diameter shall be not less than 4 mm thick in the reference steel or of equivalent thickness in the metal to be used.
- 6.7.4.4.4 For vacuum-insulated tanks, the aggregate thickness of the jacket and the shell shall correspond to the minimum thickness prescribed in 6.7.4.4.2, the thickness of the shell itself being not less than the minimum thickness prescribed in 6.7.4.4.3.
- 6.7.4.4.5 Shells shall be not less than 3 mm thick regardless of the material of construction.
- 6.7.4.4.6 The equivalent thickness of a metal other than the thickness prescribed for the reference steel in 6.7.4.4.2 and 6.7.4.4.3 shall be determined using the following formula:

$$e_1 = \frac{21.4e_0}{\sqrt[3]{Rm_1 \times A_1}}$$

where:

- e_1 = required equivalent thickness (in mm) of the metal to be used;
- e_0 = minimum thickness (in mm) of the reference steel specified in 6.7.4.4.2 and 6.7.4.4.3;
- Rm_1 = guaranteed minimum tensile strength (in N/mm²) of the metal to be used (see 6.7.4.3.3);
- A_1 = guaranteed minimum elongation at fracture (in %) of the metal to be used according to national or international standards.

- 6.7.4.4.7 In no case shall the wall thickness be less than that prescribed in 6.7.4.4.1 to 6.7.4.4.5. All parts of the shell shall have a minimum thickness as determined by 6.7.4.4.1 to 6.7.4.4.6. This thickness shall be exclusive of any corrosion allowance.
- 6.7.4.4.8 There shall be no sudden change of plate thickness at the attachment of the ends (heads) to the cylindrical portion of the shell.

6.7.4.5 Service equipment

- 6.7.4.5.1 Service equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during handling and carriage. When the connection between the frame and the tank or the jacket and the shell allows relative movement, the equipment shall be so fastened as to permit such movement without risk of damage to working parts. The external discharge fittings (pipe sockets, shut-off devices), the stop-valve and its seating shall be protected against the danger of being wrenched off by external forces (for example using shear sections). The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.
- 6.7.4.5.2 Each filling and discharge opening in portable tanks used for the carriage of flammable refrigerated liquefied gases shall be fitted with at least three mutually independent shut-off devices in series, the first being a stop-valve situated as close as reasonably practicable to the jacket, the second being a stop-valve and the third being a blank flange or equivalent device. The shut-off device closest to the jacket shall be a quick closing device, which closes automatically in the event of unintended movement of the portable tank during filling or discharge or fire engulfment. This device shall also be possible to operate by remote control.
- 6.7.4.5.3 Each filling and discharge opening in portable tanks used for the carriage of non-flammable refrigerated liquefied gases shall be fitted with at least two mutually independent shut-off devices in series, the first being a stop-valve situated as close as reasonably practicable to the jacket, the second a blank flange or equivalent device.

- 6.7.4.5.4 For sections of piping which can be closed at both ends and where liquid product can be trapped, a method of automatic pressure relief shall be provided to prevent excess pressure build-up within the piping.
- 6.7.4.5.5 Vacuum insulated tanks need not have an opening for inspection.
- 6.7.4.5.6 External fittings shall be grouped together so far as reasonably practicable.
- 6.7.4.5.7 Each connection on a portable tank shall be clearly marked to indicate its function.
- 6.7.4.5.8 Each stop-valve or other means of closure shall be designed and constructed to a rated pressure not less than the MAWP of the shell taking into account the temperature expected during carriage. All stop-valves with a screwed spindle shall be closed by a clockwise motion of the handwheel. In the case of other stop-valves the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed to prevent unintentional opening.
- 6.7.4.5.9 When pressure-building units are used, the liquid and vapour connections to that unit shall be provided with a valve as close to the jacket as reasonably practicable to prevent the loss of contents in case of damage to the pressure-building unit.
- 6.7.4.5.10 Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of a suitable material. To prevent leakage due to fire, only steel piping and welded joints shall be used between the jacket and the connection to the first closure of any outlet. The method of attaching the closure to this connection shall be to the satisfaction of the competent authority or its authorized body. Elsewhere pipe joints shall be welded when necessary.
- 6.7.4.5.11 Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The joints shall not decrease the strength of the tubing as may happen when cutting threads.
- 6.7.4.5.12 The materials of construction of valves and accessories shall have satisfactory properties at the lowest operating temperature of the portable tank.
- 6.7.4.5.13 The burst pressure of all piping and pipe fittings shall be not less than the highest of four times the MAWP of the shell or four times the pressure to which it may be subjected in service by the action of a pump or other device (except pressure-relief devices).
- 6.7.4.6 *Pressure-relief devices***
- 6.7.4.6.1 Every shell shall be provided with not less than two independent spring-loaded pressure-relief devices. The pressure-relief devices shall open automatically at a pressure not less than the MAWP and be fully open at a pressure equal to 110% of the MAWP. These devices shall, after discharge, close at a pressure not lower than 10% below the pressure at which discharge starts and shall remain closed at all lower pressures. The pressure-relief devices shall be of the type that will resist dynamic forces including surge.
- 6.7.4.6.2 Shells for non-flammable refrigerated liquefied gases and hydrogen may in addition have frangible discs in parallel with the spring-loaded devices as specified in 6.7.4.7.2 and 6.7.4.7.3.
- 6.7.4.6.3 Pressure-relief devices shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.
- 6.7.4.6.4 Pressure-relief devices shall be approved by the competent authority or its authorized body.
- 6.7.4.7 *Capacity and setting of pressure-relief devices***
- 6.7.4.7.1 In the case of the loss of vacuum in a vacuum-insulated tank or of loss of 20% of the insulation of a tank insulated with solid materials, the combined capacity of all pressure-relief devices installed shall be sufficient so that the pressure (including accumulation) inside the shell does not exceed 120% of the MAWP.

6.7.4.7.2 For non-flammable refrigerated liquefied gases (except oxygen) and hydrogen, this capacity may be achieved by the use of frangible discs in parallel with the required safety-relief devices. Frangible discs shall rupture at nominal pressure equal to the test pressure of the shell.

6.7.4.7.3 Under the circumstances described in 6.7.4.7.1 and 6.7.4.7.2 together with complete fire engulfment the combined capacity of all pressure-relief devices installed shall be sufficient to limit the pressure in the shell to the test pressure.

6.7.4.7.4 The required capacity of the relief devices shall be calculated in accordance with a well-established technical code recognized by the competent authority⁷.

6.7.4.8 *Marking of pressure-relief devices*

6.7.4.8.1 Every pressure-relief device shall be plainly and permanently marked with the following particulars:

- (a) The pressure (in bar or kPa) at which it is set to discharge;
- (b) The allowable tolerance at the discharge pressure for spring-loaded devices;
- (c) The reference temperature corresponding to the rated pressure for frangible discs;
- (d) The rated flow capacity of the device in standard cubic meters of air per second (m³/s); and
- (e) The cross sectional flow areas of the spring loaded pressure-relief devices and frangible discs in mm².

When practicable, the following information shall also be shown:

- (f) The manufacturer's name and relevant catalogue number of the device.

6.7.4.8.2 The rated flow capacity marked on the pressure-relief devices shall be determined according to ISO 4126-1:2004 and ISO 4126-7:2004.

6.7.4.9 *Connections to pressure-relief devices*

6.7.4.9.1 Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the safety device. No stop-valve shall be installed between the shell and the pressure-relief devices except when duplicate devices are provided for maintenance or other reasons and the stop-valves serving the devices actually in use are locked open or the stop-valves are interlocked so that the requirements of 6.7.4.7 are always fulfilled. There shall be no obstruction in an opening leading to a vent or pressure-relief device which might restrict or cut-off the flow from the shell to that device. Pipework to vent the vapour or liquid from the outlet of the pressure-relief devices, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.

6.7.4.10 *Siting of pressure-relief devices*

6.7.4.10.1 Each pressure-relief device inlet shall be situated on top of the shell in a position as near the longitudinal and transverse centre of the shell as reasonably practicable. All pressure-relief device inlets shall under maximum filling conditions be situated in the vapour space of the shell and the devices shall be so arranged as to ensure that the escaping vapour is discharged unrestrictedly. For refrigerated liquefied gases, the escaping vapour shall be directed away from the tank and in such a manner that it cannot impinge upon the tank. Protective devices which deflect the flow of vapour are permissible provided the required relief-device capacity is not reduced.

6.7.4.10.2 Arrangements shall be made to prevent access to the devices by unauthorized persons and to protect the devices from damage caused by the portable tank overturning.

⁷ See for example CGA S-1.2-2003 "Pressure Relief Device Standards - Part 2 - Cargo and Portable Tanks for Compressed Gases".

6.7.4.11 *Gauging devices*

6.7.4.11.1 Unless a portable tank is intended to be filled by weight, it shall be equipped with one or more gauging devices. Glass level-gauges and gauges made of other fragile material, which are in direct communication with the contents of the shell shall not be used.

6.7.4.11.2 A connection for a vacuum gauge shall be provided in the jacket of a vacuum-insulated portable tank.

6.7.4.12 *Portable tank supports, frameworks, lifting and tie-down attachments*

6.7.4.12.1 Portable tanks shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.4.2.12 and the safety factor specified in 6.7.4.2.13 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

6.7.4.12.2 The combined stresses caused by portable tank mountings (e.g. cradles, frameworks, etc.) and portable tank lifting and tie-down attachments shall not cause excessive stress in any portion of the tank. Permanent lifting and tie-down attachments shall be fitted to all portable tanks. Preferably they shall be fitted to the portable tank supports but may be secured to reinforcing plates located on the tank at the points of support.

6.7.4.12.3 In the design of supports and frameworks the effects of environmental corrosion shall be taken into account.

6.7.4.12.4 Forklift pockets shall be capable of being closed off. The means of closing forklift pockets shall be a permanent part of the framework or permanently attached to the framework. Single compartment portable tanks with a length less than 3.65 m need not have closed off forklift pockets provided that:

- (a) The tank and all the fittings are well protected from being hit by the forklift blades; and
- (b) The distance between the centres of the forklift pockets is at least half of the maximum length of the portable tank.

6.7.4.12.5 When portable tanks are not protected during carriage, according to 4.2.3.3, the shells and service equipment shall be protected against damage to the shell and service equipment resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the shell contents upon impact or overturning of the portable tank on its fittings. Examples of protection include:

- (a) Protection against lateral impact which may consist of longitudinal bars protecting the shell on both sides at the level of the median line;
- (b) Protection of the portable tank against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) Protection against rear impact which may consist of a bumper or frame;
- (d) Protection of the shell against damage from impact or overturning by use of an ISO frame in accordance with ISO 1496-3:1995;
- (e) Protection of the portable tank from impact or overturning by a vacuum insulation jacket.

6.7.4.13 *Design approval*

6.7.4.13.1 The competent authority or its authorized body shall issue a design approval certificate for any new design of a portable tank. This certificate shall attest that a portable tank has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter. When a series of portable tanks are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the refrigerated liquefied gases allowed to be carried, the materials of construction of the shell and jacket and an approval number. The approval number shall consist of the distinguishing sign or mark of the State in whose territory the approval was granted, i.e. the distinguishing sign for use in international traffic, as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any

alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller portable tanks made of materials of the same kind and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

6.7.4.13.2 The prototype test report for the design approval shall include at least the following:

- (a) The results of the applicable frame-work test specified in ISO 1496-3:1995;
- (b) The results of the initial inspection and test in 6.7.4.14.3; and
- (c) The results of the impact test in 6.7.4.14.1, when applicable.

6.7.4.14 *Inspection and testing*

6.7.4.14.1 Portable tanks meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.

6.7.4.14.2 The tank and items of equipment of each portable tank shall be inspected and tested before being put into service for the first time (initial inspection and test) and thereafter at not more than five-year intervals (5 year periodic inspection and test) with an intermediate periodic inspection and test (2.5 year periodic inspection and test) midway between the 5 year periodic inspections and tests. The 2.5 year inspection and test may be performed within 3 months of the specified date. An exceptional inspection and test shall be performed regardless of the last periodic inspection and test when necessary according to 6.7.4.14.7.

6.7.4.14.3 The initial inspection and test of a portable tank shall include a check of the design characteristics, an internal and external examination of the portable tank shell and its fittings with due regard to the refrigerated liquefied gases to be carried, and a pressure test referring to the test pressures according to 6.7.4.3.2. The pressure test may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorized body. Before the portable tank is placed into service, a leakproofness test and a check of the satisfactory operation of all service equipment shall also be performed. When the shell and its fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test. All welds subject to full stress level shall be inspected during the initial test by radiographic, ultrasonic, or another suitable non-destructive test method. This does not apply to the jacket.

6.7.4.14.4 The 5 and 2.5 year periodic inspections and tests shall include an external examination of the portable tank and its fittings with due regard to the refrigerated liquefied gases carried, a leakproofness test, a check of the satisfactory operation of all service equipment and a vacuum reading, when applicable. In the case of non-vacuum insulated tanks, the jacket and insulation shall be removed during the 2.5 year and the 5 year periodic inspections and tests but only to the extent necessary for a reliable appraisal.

6.7.4.14.5 *(Deleted)*

6.7.4.14.6 A portable tank may not be filled and offered for carriage after the date of expiry of the last 5 year or 2.5 year periodic inspection and test as required by 6.7.4.14.2. However a portable tank filled prior to the date of expiry of the last periodic inspection and test may be carried for a period not to exceed three months beyond the date of expiry of the last periodic test or inspection. In addition, a portable tank may be carried after the date of expiry of the last periodic test and inspection:

- (a) After emptying but before cleaning, for purposes of performing the next required test or inspection prior to refilling; and
- (b) Unless otherwise approved by the competent authority, for a period not to exceed six months beyond the date of expiry of the last periodic test or inspection, in order to allow the return of dangerous goods for proper disposal or recycling. Reference to this exemption shall be mentioned in the transport document.

- 6.7.4.14.7 The exceptional inspection and test is necessary when the portable tank shows evidence of damaged or corroded areas, leakage, or any other conditions that indicate a deficiency that could affect the integrity of the portable tank. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the portable tank. It shall include at least the 2.5 year inspection and test according to 6.7.4.14.4.
- 6.7.4.14.8 The internal examination during the initial inspection and test shall ensure that the shell is inspected for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, that might render the portable tank unsafe for carriage.
- 6.7.4.14.9 The external examination shall ensure that:
- (a) The external piping, valves, pressurizing/cooling systems when applicable and gaskets are inspected for corroded areas, defects, or any other conditions, including leakage, that might render the portable tank unsafe for filling, discharge or carriage;
 - (b) There is no leakage at any manhole covers or gaskets;
 - (c) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
 - (d) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
 - (e) Required markings on the portable tank are legible and in accordance with the applicable requirements; and
 - (f) The framework, the supports and the arrangements for lifting the portable tank are in satisfactory condition.
- 6.7.4.14.10 The inspections and tests in 6.7.4.14.1, 6.7.4.14.3, 6.7.4.14.4, 6.7.4.14.5 and 6.7.4.14.7 shall be performed or witnessed by an expert approved by the competent authority or its authorized body. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the portable tank. While under pressure, the portable tank shall be inspected for any leaks in the shell, piping or equipment.
- 6.7.4.14.11 In all cases when cutting, burning or welding operations on the shell of a portable tank have been effected, that work shall be to the approval of the competent authority or its authorized body taking into account the pressure vessel code used for the construction of the shell. A pressure test to the original test pressure shall be performed after the work is completed.
- 6.7.4.14.12 When evidence of any unsafe condition is discovered, the portable tank shall not be returned to service until it has been corrected and the test is repeated and passed.
- 6.7.4.15 *Marking***
- 6.7.4.15.1 Every portable tank shall be fitted with a corrosion resistant metal plate permanently attached to the portable tank in a conspicuous place readily accessible for inspection. When for reasons of portable tank arrangements the plate cannot be permanently attached to the shell, the shell shall be marked with at least the information required by the pressure vessel code. As a minimum, at least the following information shall be marked on the plate by stamping or by any other similar method:

- (a) Owner information
 - (i) Owner's registration number;
- (b) Manufacturing information
 - (i) Country of manufacture;
 - (ii) Year of manufacture;
 - (iii) Manufacturer's name or mark;
 - (iv) Manufacturer's serial number;

(c) Approval information

(i) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7²;

(ii) Approval country;

(iii) Authorized body for the design approval;

(iv) Design approval number;

(v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);

(vi) Pressure vessel code to which the shell is designed;

(d) Pressures

(i) MAWP (in bar gauge or kPa gauge)³;(ii) Test pressure (in bar gauge or kPa gauge)³;

(iii) Initial pressure test date (month and year);

(iv) Identification mark of the initial pressure test witness;

(e) Temperatures

(i) Minimum design temperature (in °C)³;

(f) Materials

(i) Shell material(s) and material standard reference(s);

(ii) Equivalent thickness in reference steel (in mm)³;

(g) Capacity

(i) Tank water capacity at 20 °C (in litres)³;

(h) Insulation

(i) Either "Thermally insulated" or "Vacuum insulated" (as applicable);

(ii) Effectiveness of the insulation system (heat influx) (in Watts)³;

(i) Holding times – for each refrigerated liquefied gas permitted to be carried in the portable tank

(i) Name, in full, of the refrigerated liquefied gas;

(ii) Reference holding time (in days or hours)³;(iii) Initial pressure (in bar gauge or kPa gauge)³;(iv) Degree of filling (in kg)³;

(j) Periodic inspections and tests

(i) Type of the most recent periodic test (2.5-year, 5-year or exceptional);

(ii) Date of the most recent periodic test (month and year);

(iii) Identification mark of the authorized body who performed or witnessed the most recent test.

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ The unit used shall be indicated.

- 6.7.4.15.2 The following particulars shall be durably marked either on the portable tank itself or on a metal plate firmly secured to the portable tank.

Name of the owner and the operator
 Name of the refrigerated liquefied gas being carried (and minimum mean bulk temperature)
 Maximum permissible gross mass (MPGM) _____ kg
 Unladen (tare) mass _____ kg
 Actual holding time for gas being carried _____ days (or hours)
 Portable tank instruction in accordance with 4.2.5.2.6

NOTE: For the identification of the refrigerated liquefied gas(es) being carried, see also Part 5.

- 6.7.4.15.3 If a portable tank is designed and approved for handling in open seas, the words "OFFSHORE PORTABLE TANK" shall be marked on the identification plate.

6.7.5 Requirements for the design, construction, inspection and testing of UN multiple-element gas containers (MEGCs) intended for the carriage of non-refrigerated gases

6.7.5.1 Definitions

For the purposes of this section:

Alternative arrangement means an approval granted by the competent authority for a portable tank or MEGC that has been designed, constructed or tested to technical requirements or testing methods other than those specified in this Chapter;

Elements are cylinders, tubes or bundles of cylinders;

Leakproofness test means a test using gas subjecting the elements and the service equipment of the MEGC to an effective internal pressure of not less than 20% of the test pressure;

Manifold means an assembly of piping and valves connecting the filling and/or discharge openings of the elements;

Maximum permissible gross mass (MPGM) means the sum of the tare mass of the MEGC and the heaviest load authorized for carriage;

UN Multiple-element gas containers (MEGCs) are multimodal assemblies of cylinders, tubes and bundles of cylinders which are interconnected by a manifold and which are assembled within a framework. The MEGC includes service equipment and structural equipment necessary for the carriage of gases;

Service equipment means measuring instruments and filling, discharge, venting and safety devices;

Structural equipment means the reinforcing, fastening, protective and stabilizing members external to the elements.

6.7.5.2 General design and construction requirements

6.7.5.2.1 The MEGC shall be capable of being filled and discharged without the removal of its structural equipment. It shall possess stabilizing members external to the elements to provide structural integrity for handling and carriage. MEGCs shall be designed and constructed with supports to provide a secure base during carriage and with lifting and tie-down attachments which are adequate for lifting the MEGC including when filled to its maximum permissible gross mass. The MEGC shall be designed to be loaded onto a vehicle, wagon or sea-going or inland navigation vessel and shall be equipped with skids, mountings or accessories to facilitate mechanical handling.

6.7.5.2.2 MEGCs shall be designed, manufactured and equipped in such a way as to withstand all conditions to which they will be subjected during normal conditions of handling and carriage. The design shall take into account the effects of dynamic loading and fatigue.

6.7.5.2.3 Elements of an MEGC shall be made of seamless steel and be constructed and tested according to 6.2.1 and 6.2.2. All of the elements in an MEGC shall be of the same design type.

6.7.5.2.4 Elements of MEGCs, fittings and pipework shall be:

- (a) Compatible with the substances intended to be carried (see ISO 11114-1:2012 and ISO 11114-2:2000); or
- (b) Properly passivated or neutralized by chemical reaction.

6.7.5.2.5 Contact between dissimilar metals which could result in damage by galvanic action shall be avoided.

6.7.5.2.6 The materials of the MEGC, including any devices, gaskets, and accessories, shall not adversely affect the gas(es) intended for carriage in the MEGC.

- 6.7.5.2.7 MEGCs shall be designed to withstand, without loss of contents, at least the internal pressure due to the contents, and the static, dynamic and thermal loads during normal conditions of handling and carriage. The design shall demonstrate that the effects of fatigue, caused by repeated application of these loads through the expected life of the multiple-element gas container, have been taken into account.
- 6.7.5.2.8 MEGCs and their fastenings shall, under the maximum permissible load, be capable of withstanding the following separately applied static forces:
- (a) In the direction of travel: twice the MPGM multiplied by the acceleration due to gravity (g)¹;
 - (b) Horizontally at right angles to the direction of travel: the MPGM (when the direction of travel is not clearly determined, the forces shall be equal to twice the MPGM) multiplied by the acceleration due to gravity (g)¹;
 - (c) Vertically upwards: the MPGM multiplied by the acceleration due to gravity (g)¹; and
 - (d) Vertically downwards: twice the MPGM (total loading including the effect of gravity) multiplied by the acceleration due to gravity (g)¹.
- 6.7.5.2.9 Under the forces defined in 6.7.5.2.8, the stress at the most severely stressed point of the elements shall not exceed the values given in either the relevant standards of 6.2.2.1 or, if the elements are not designed, constructed and tested according to those standards, in the technical code or standard recognised or approved by the competent authority of the country of use (see 6.2.5).
- 6.7.5.2.10 Under each of the forces in 6.7.5.2.8, the safety factor for the framework and fastenings to be observed shall be as follows:
- (a) for steels having a clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed yield strength; or
 - (b) for steels with no clearly defined yield point, a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength and, for austenitic steels, the 1% proof strength.
- 6.7.5.2.11 MEGCs intended for the carriage of flammable gases shall be capable of being electrically earthed.
- 6.7.5.2.12 The elements shall be secured in a manner that prevents undesired movement in relation to the structure and the concentration of harmful localized stresses.

6.7.5.3 *Service equipment*

- 6.7.5.3.1 Service equipment shall be configured or designed to prevent damage that could result in the release of the pressure receptacle contents during normal conditions of handling and carriage. When the connection between the frame and the elements allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without damage to working parts. The manifolds, the discharge fittings (pipe sockets, shut-off devices), and the stop-valves shall be protected from being wrenched off by external forces. Manifold piping leading to shut-off valves shall be sufficiently flexible to protect the valves and the piping from shearing, or releasing the pressure receptacle contents. The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.
- 6.7.5.3.2 Each element intended for the carriage of toxic gases (gases of groups T, TF, TC, TO, TFC and TOC) shall be fitted with a valve. The manifold for liquefied toxic gases (gases of classification codes 2T, 2TF, 2TC, 2TO, 2TFC and 2TOC) shall be so designed that the elements can be filled separately and be kept isolated by a valve capable of being sealed. For the carriage of flammable gases (gases of group F), the elements shall be divided into groups of not more than 3 000 litres each isolated by a valve.
- 6.7.5.3.3 For filling and discharge openings of the MEGC, two valves in series shall be placed in an accessible position on each discharge and filling pipe. One of the valves may be a non-return valve. The filling

¹ For calculation purposes $g = 9.81 \text{ m/s}^2$.

and discharge devices may be fitted to a manifold. For sections of piping which can be closed at both ends and where a liquid product can be trapped, a pressure-relief valve shall be provided to prevent excessive pressure build-up. The main isolation valves on an MEGC shall be clearly marked to indicate their directions of closure. Each stop-valve or other means of closure shall be designed and constructed to withstand a pressure equal to or greater than 1.5 times the test pressure of the MEGC. All stop-valves with screwed spindles shall close by a clockwise motion of the handwheel. For other stop-valves, the position (open and closed) and direction of closure shall be clearly indicated. All stop-valves shall be designed and positioned to prevent unintentional opening. Ductile metals shall be used in the construction of valves or accessories.

- 6.7.5.3.4 Piping shall be designed, constructed and installed so as to avoid damage due to expansion and contraction, mechanical shock and vibration. Joints in tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525 °C. The rated pressure of the service equipment and of the manifold shall be not less than two thirds of the test pressure of the elements.

6.7.5.4 *Pressure-relief devices*

- 6.7.5.4.1 The elements of MEGCs used for the carriage of UN No. 1013 carbon dioxide and UN No. 1070 nitrous oxide shall be divided into groups of not more than 3 000 litres each isolated by a valve. Each group shall be fitted with one or more pressure relief devices. If so required by the competent authority of the country of use, MEGCs for other gases shall be fitted with pressure relief devices as specified by that competent authority.

- 6.7.5.4.2 When pressure relief devices are fitted, every element or group of elements of an MEGC that can be isolated shall then be fitted with one or more pressure relief devices. Pressure relief devices shall be of a type that will resist dynamic forces including liquid surge and shall be designed to prevent the entry of foreign matter, the leakage of gas and the development of any dangerous excess pressure.

- 6.7.5.4.3 MEGCs used for the carriage of certain non-refrigerated gases identified in portable tank instruction T50 in 4.2.5.2.6 may have a pressure-relief device as required by the competent authority of the country of use. Unless an MEGC in dedicated service is fitted with an approved pressure relief device constructed of materials compatible with the gas carried, such a device shall comprise a frangible disc preceding a spring-loaded device. The space between the frangible disc and the spring-loaded device may be equipped with a pressure gauge or a suitable telltale indicator. This arrangement permits the detection of disc rupture, pinholing or leakage which could cause a malfunction of the pressure relief device. The frangible disc shall rupture at a nominal pressure 10% above the start-to-discharge pressure of the spring-loaded device.

- 6.7.5.4.4 In the case of multi-purpose MEGCs used for the carriage of low-pressure liquefied gases, the pressure-relief devices shall open at a pressure as specified in 6.7.3.7.1 for the gas having the highest maximum allowable working pressure of the gases allowed to be carried in the MEGC.

6.7.5.5 *Capacity of pressure relief devices*

- 6.7.5.5.1 The combined delivery capacity of the pressure relief devices when fitted shall be sufficient that, in the event of total fire engulfment of the MEGC, the pressure (including accumulation) inside the elements does not exceed 120% of the set pressure of the pressure relief device. The formula provided in CGA S-1.2-2003 "Pressure Relief Device Standards - Part 2 - Cargo and Portable Tanks for Compressed Gases" shall be used to determine the minimum total flow capacity for the system of pressure relief devices. CGA S-1.1-2003 "Pressure Relief Device Standards - Part 1 - Cylinders for Compressed Gases" may be used to determine the relief capacity of individual elements. Spring-loaded pressure relief devices may be used to achieve the full relief capacity prescribed in the case of low pressure liquefied gases. In the case of multi-purpose MEGCs, the combined delivery capacity of the pressure-relief devices shall be taken for the gas which requires the highest delivery capacity of the gases allowed to be carried in the MEGC.

- 6.7.5.5.2 To determine the total required capacity of the pressure relief devices installed on the elements for the carriage of liquefied gases, the thermodynamic properties of the gas shall be considered (see, for example, CGA S-1.2-2003 "Pressure Relief Device Standards - Part 2 - Cargo and Portable Tanks for Compressed Gases" for low pressure liquefied gases and CGA S-1.1-2003 "Pressure Relief Device Standards - Part 1 - Cylinders for Compressed Gases" for high pressure liquefied gases).

6.7.5.6 ***Marking of pressure-relief devices***

6.7.5.6.1 Pressure relief devices shall be clearly and permanently marked with the following:

- (a) The manufacturer's name and relevant catalogue number;
- (b) The set pressure and/or the set temperature;
- (c) The date of the last test.
- (d) The cross sectional flow areas of the spring loaded pressure-relief devices and frangible discs in mm².

6.7.5.6.2 The rated flow capacity marked on spring loaded pressure relief devices for low pressure liquefied gases shall be determined according to ISO 4126-1:2004 and ISO 4126-7:2004.

6.7.5.7 ***Connections to pressure-relief devices***

6.7.5.7.1 Connections to pressure-relief devices shall be of sufficient size to enable the required discharge to pass unrestricted to the pressure relief device. No stop-valve shall be installed between the element and the pressure-relief devices, except when duplicate devices are provided for maintenance or other reasons, and the stop-valves serving the devices actually in use are locked open, or the stop-valves are interlocked so that at least one of the duplicate devices is always operable and capable of meeting the requirements of 6.7.5.5. There shall be no obstruction in an opening leading to or leaving from a vent or pressure-relief device which might restrict or cut-off the flow from the element to that device. The opening through all piping and fittings shall have at least the same flow area as the inlet of the pressure relief device to which it is connected. The nominal size of the discharge piping shall be at least as large as that of the pressure relief device outlet. Vents from the pressure-relief devices, when used, shall deliver the relieved vapour or liquid to the atmosphere in conditions of minimum back-pressure on the relieving device.

6.7.5.8 ***Siting of pressure-relief devices***

6.7.5.8.1 Each pressure relief device shall, under maximum filling conditions, be in communication with the vapour space of the elements for the carriage of liquefied gases. The devices, when fitted, shall be so arranged as to ensure that the escaping vapour is discharged upwards and unrestrictedly as to prevent any impingement of escaping gas or liquid upon the MEGC, its elements or personnel. For flammable, pyrophoric and oxidizing gases, the escaping gas shall be directed away from the element in such a manner that it cannot impinge upon the other elements. Heat resistant protective devices which deflect the flow of gas are permissible provided the required pressure relief device capacity is not reduced.

6.7.5.8.2 Arrangements shall be made to prevent access to the pressure-relief devices by unauthorized persons and to protect the devices from damage caused by the MEGC overturning.

6.7.5.9 ***Gauging devices***

6.7.5.9.1 When an MEGC is intended to be filled by mass, it shall be equipped with one or more gauging devices. Level-gauges made of glass or other fragile material shall not be used.

6.7.5.10 ***MEGC supports, frameworks, lifting and tie-down attachments***

6.7.5.10.1 MEGCs shall be designed and constructed with a support structure to provide a secure base during carriage. The forces specified in 6.7.5.2.8 and the safety factor specified in 6.7.5.2.10 shall be considered in this aspect of the design. Skids, frameworks, cradles or other similar structures are acceptable.

6.7.5.10.2 The combined stresses caused by element mountings (e.g. cradles, frameworks, etc.) and MEGC lifting and tie-down attachments shall not cause excessive stress in any element. Permanent lifting and tie-down attachments shall be fitted to all MEGCs. In no case shall mountings or attachments be welded onto the elements.

6.7.5.10.3 In the design of supports and frameworks, the effects of environmental corrosion shall be taken into account.

6.7.5.10.4 When MEGCs are not protected during carriage, according to 4.2.4.3, the elements and service equipment shall be protected against damage resulting from lateral or longitudinal impact or overturning. External fittings shall be protected so as to preclude the release of the elements' contents upon impact or overturning of the MEGC on its fittings. Particular attention shall be paid to the protection of the manifold. Examples of protection include:

- (a) Protection against lateral impact which may consist of longitudinal bars;
- (b) Protection against overturning which may consist of reinforcement rings or bars fixed across the frame;
- (c) Protection against rear impact which may consist of a bumper or frame;
- (d) Protection of the elements and service equipment against damage from impact or overturning by use of an ISO frame in accordance with the relevant provisions of ISO 1496-3:1995.

6.7.5.11 *Design approval*

6.7.5.11.1 The competent authority or its authorized body shall issue a design approval certificate for any new design of an MEGC. This certificate shall attest that the MEGC has been surveyed by that authority, is suitable for its intended purpose and meets the requirements of this Chapter, the applicable provisions for gases of Chapter 4.1 and of packing instruction P200. When a series of MEGCs are manufactured without change in the design, the certificate shall be valid for the entire series. The certificate shall refer to the prototype test report, the materials of construction of the manifold, the standards to which the elements are made and an approval number. The approval number shall consist of the distinguishing sign or mark of the country granting the approval, i.e. the distinguishing sign for use in international traffic, as prescribed by the Convention on Road Traffic, Vienna 1968, and a registration number. Any alternative arrangements according to 6.7.1.2 shall be indicated on the certificate. A design approval may serve for the approval of smaller MEGCs made of materials of the same type and thickness, by the same fabrication techniques and with identical supports, equivalent closures and other appurtenances.

6.7.5.11.2 The prototype test report for the design approval shall include at least the following:

- (a) The results of the applicable framework test specified in ISO1496-3:1995;
- (b) The results of the initial inspection and test specified in 6.7.5.12.3;
- (c) The results of the impact test specified in 6.7.5.12.1; and
- (d) Certification documents verifying that the cylinders and tubes comply with the applicable standards.

6.7.5.12 *Inspection and testing*

6.7.5.12.1 MEGCs meeting the definition of container in the International Convention for Safe Containers (CSC), 1972, as amended, shall not be used unless they are successfully qualified by subjecting a representative prototype of each design to the Dynamic, Longitudinal Impact Test prescribed in the Manual of Tests and Criteria, Part IV, Section 41.

6.7.5.12.2 The elements and items of equipment of each MEGC shall be inspected and tested before being put into service for the first time (initial inspection and test). Thereafter, MEGCs shall be inspected at no more than five-year intervals (5 year periodic inspection). An exceptional inspection and test shall be performed, regardless of the last periodic inspection and test, when necessary according to 6.7.5.12.5.

6.7.5.12.3 The initial inspection and test of an MEGC shall include a check of the design characteristics, an external examination of the MEGC and its fittings with due regard to the gases to be carried, and a pressure test performed at the test pressures according to packing instruction P200 of 4.1.4.1. The pressure test of the manifold may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorized body. Before the MEGC is placed into service, a leakproofness test and a test of the satisfactory operation of all service equipment shall also be performed. When the elements and their fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

- 6.7.5.12.4 The 5-year periodic inspection and test shall include an external examination of the structure, the elements and the service equipment in accordance with 6.7.5.12.6. The elements and the piping shall be tested at the periodicity specified in packing instruction P200 and in accordance with the provisions described in 6.2.1.6. When the elements and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.
- 6.7.5.12.5 An exceptional inspection and test is necessary when the MEGC shows evidence of damaged or corroded areas, leakage, or other conditions that indicate a deficiency that could affect the integrity of the MEGC. The extent of the exceptional inspection and test shall depend on the amount of damage or deterioration of the MEGC. It shall include at least the examinations required under 6.7.5.12.6.
- 6.7.5.12.6 The examinations shall ensure that:
- (a) The elements are inspected externally for pitting, corrosion, abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the MEGC unsafe for carriage;
 - (b) The piping, valves, and gaskets are inspected for corroded areas, defects, and other conditions, including leakage, that might render the MEGC unsafe for filling, discharge or carriage;
 - (c) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
 - (d) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
 - (e) Required markings on the MEGC are legible and in accordance with the applicable requirements; and
 - (f) The framework, the supports and the arrangements for lifting the MEGC are in satisfactory condition.
- 6.7.5.12.7 The inspections and tests in 6.7.5.12.1, 6.7.5.12.3, 6.7.5.12.4 and 6.7.5.12.5 shall be performed or witnessed by a body authorized by the competent authority. When the pressure test is a part of the inspection and test, the test pressure shall be the one indicated on the data plate of the MEGC. While under pressure, the MEGC shall be inspected for any leaks in the elements, piping or equipment.
- 6.7.5.12.8 When evidence of any unsafe condition is discovered, the MEGC shall not be returned to service until it has been corrected and the applicable tests and verifications are passed.

6.7.5.13 *Marking*

- 6.7.5.13.1 Every MEGC shall be fitted with a corrosion resistant metal plate permanently attached to the MEGC in a conspicuous place readily accessible for inspection. The metal plate shall not be affixed to the elements. The elements shall be marked in accordance with Chapter 6.2. As a minimum, at least the following information shall be marked on the plate by stamping or by any other similar method:
- (a) Owner information
 - (i) Owner's registration number;
 - (b) Manufacturing information
 - (i) Country of manufacture;
 - (ii) Year of manufacture;
 - (iii) Manufacturer's name or mark;
 - (iv) Manufacturer's serial number;

(c) Approval information

(i) The United Nations packaging symbol

;

This symbol shall not be used for any purpose other than certifying that a packaging, a portable tank or a MEGC complies with the relevant requirements in Chapter 6.1, 6.2, 6.3, 6.5, 6.6 or 6.7²;

(ii) Approval country;

(iii) Authorized body for the design approval;

(iv) Design approval number;

(v) Letters 'AA', if the design was approved under alternative arrangements (see 6.7.1.2);

(d) Pressures

(i) Test pressure (in bar gauge)³;

(ii) Initial pressure test date (month and year);

(iii) Identification mark of the initial pressure test witness;

(e) Temperatures

(i) Design temperature range (in °C)³;

(f) Elements / Capacity

(i) Number of elements;

(ii) Total water capacity (in litres)³;

(g) Periodic inspections and tests

(i) Type of the most recent periodic test (5-year or exceptional);

(ii) Date of the most recent periodic test (month and year);

(iii) Identification mark of the authorized body who performed or witnessed the most recent test.

² This symbol is also used to certify that flexible bulk containers authorized for other modes of transport comply with the requirements in Chapter 6.8 of the UN Model Regulations.

³ The unit used shall be indicated.

CHAPTER 6.8

REQUIREMENTS FOR THE CONSTRUCTION, EQUIPMENT, TYPE APPROVAL, INSPECTIONS AND TESTS, AND MARKING OF FIXED TANKS (TANK-VEHICLES), DEMOUNTABLE TANKS AND TANK-CONTAINERS AND TANK SWAP BODIES, WITH SHELLS MADE OF METALLIC MATERIALS, AND BATTERY-VEHICLES AND MULTIPLE ELEMENT GAS CONTAINERS (MEGCs)

NOTE 1: For portable tanks and UN multiple-element gas containers (MEGCs) see Chapter 6.7, for fibre-reinforced plastics tanks see Chapter 6.9, for vacuum operated waste tanks see Chapter 6.10.

NOTE 2: For fixed tanks (tank-vehicles) and demountable tanks with additive devices, see special provision 664 of Chapter 3.3.

6.8.1 Scope

6.8.1.1 The requirements across the whole width of the page apply both to fixed tanks (tank-vehicles), to demountable tanks and battery-vehicles, and to tank-containers, tank swap bodies and MEGCs. Those contained in a single column apply only:

- to fixed tanks (tank-vehicles), to demountable tanks and battery-vehicles (left hand column);
- to tank-containers, tank swap bodies and MEGCs (right hand column).

6.8.1.2 These requirements shall apply to

fixed tanks (tank-vehicles), demountable tanks and battery-vehicles	tank-containers, tank swap bodies and MEGCs
---	---

used for the carriage of gaseous, liquid, powdery or granular substances.

6.8.1.3 Section 6.8.2 sets out the requirements applicable to fixed tanks (tank-vehicles), to demountable tanks, tank-containers, tank swap bodies intended for the carriage of substances of all classes and battery-vehicles and MEGCs for gases of Class 2. Sections 6.8.3 to 6.8.5 contain special requirements supplementing or modifying the requirements of section 6.8.2.

6.8.1.4 For provisions concerning use of these tanks, see Chapter 4.3.

6.8.2 Requirements applicable to all classes

6.8.2.1 Construction

Basic principles

6.8.2.1.1 Shells, their attachments and their service and structural equipment shall be designed to withstand without loss of contents (other than quantities of gas escaping through any degassing vents):

- static and dynamic stresses in normal conditions of carriage as defined in 6.8.2.1.2 and 6.8.2.1.13;
- prescribed minimum stresses as defined in 6.8.2.1.15.

- | | | |
|-----------|--|--|
| 6.8.2.1.2 | <p>The tanks and their fastenings shall be capable of absorbing, under the maximum permissible load, the forces exerted by:</p> <ul style="list-style-type: none"> - in the direction of travel: twice the total mass; - at right angles to the direction of travel: the total mass; - vertically upwards: the total mass; - vertically downwards: twice the total mass. | <p>Tank-containers and their fastenings shall, under the maximum permissible load be capable of absorbing the forces equal to those exerted by:</p> <ul style="list-style-type: none"> - in the direction of travel: twice the total mass; - horizontally at right angles to the direction of travel: the total mass; (where the direction of travel is not clearly determined, twice the total mass in each direction); - vertically upwards: the total mass; - vertically downwards: twice the total mass. |
|-----------|--|--|
- 6.8.2.1.3 The walls of the shells shall have at least the thickness specified in
6.8.2.1.17 to 6.8.2.1.21 | 6.8.2.1.17 to 6.8.2.1.20.
- 6.8.2.1.4 Shells shall be designed and constructed in accordance with the requirements of standards listed in 6.8.2.6 or of a technical code recognized by the competent authority, in accordance with 6.8.2.7, in which the material is chosen and the shell thickness determined taking into account maximum and minimum filling and working temperatures, but the following minimum requirements of 6.8.2.1.6 to 6.8.2.1.26 shall be met.
- 6.8.2.1.5 Tanks intended to contain certain dangerous substances shall be provided with additional protection. This may take the form of additional thickness of the shell (increased calculation pressure) determined in the light of the dangers inherent in the substances concerned or of a protective device (see the special provisions of 6.8.4).
- 6.8.2.1.6 Welds shall be skilfully made and shall afford the fullest safety. The execution and checking of welds shall comply with the requirements of 6.8.2.1.23.
- 6.8.2.1.7 Measures shall be taken to protect shells against the risk of deformation as a result of a negative internal pressure. Shells, other than shells according to 6.8.2.2.6, designed to be equipped with vacuum valves shall be able to withstand, without permanent deformation, an external pressure of not less than 21 kPa (0.21 bar) above the internal pressure. Shells used for the carriage of solid substances (powdery or granular) of packing groups II or III only, which do not liquefy during carriage, may be designed for a lower external pressure but not less than 5 kPa (0.05 bar). The vacuum valves shall be set to relieve at a vacuum setting not greater than the tank's design vacuum pressure. Shells, which are not designed to be equipped with a vacuum valve shall be able to withstand, without permanent deformation an external pressure of not less than 40 kPa (0.4 bar) above the internal pressure.
- Materials for shells***
- 6.8.2.1.8 Shells shall be made of suitable metallic materials which, unless other temperature ranges are prescribed in the various classes, shall be resistant to brittle fracture and to stress corrosion cracking between -20 °C and +50 °C.
- 6.8.2.1.9 The materials of shells or of their protective linings which are in contact with the contents shall not contain substances liable to react dangerously (see "Dangerous reaction" in 1.2.1) with the contents, to form dangerous compounds, or substantially to weaken the material.
- If contact between the substance carried and the material used for the construction of the shell entails a progressive decrease in the shell thickness, this thickness shall be increased at manufacture by an appropriate amount. This additional thickness to allow for corrosion shall not be taken into consideration in calculating the shell thickness.

- 6.8.2.1.10 For welded shells only materials of faultless weldability whose adequate impact strength at an ambient temperature of $-20\text{ }^{\circ}\text{C}$ can be guaranteed, particularly in the weld seams and the zones adjacent thereto, shall be used.

If fine-grained steel is used, the guaranteed value of the yield strength R_e shall not exceed 460 N/mm^2 and the guaranteed value of the upper limit of tensile strength R_m shall not exceed 725 N/mm^2 , in accordance with the specifications of the material.

- 6.8.2.1.11 Ratios of R_e/R_m exceeding 0.85 are not allowed for steels used in the construction of welded tanks.

R_e = apparent yield strength for steels having a clearly-defined yield point or

guaranteed 0.2% proof strength for steels with no clearly-defined yield point (1% for austenitic steels)

R_m = tensile strength.

The values specified in the inspection certificate for the material shall be taken as a basis in determining this ratio in each case.

- 6.8.2.1.12 For steel, the elongation at fracture, in % shall be not less than

$$\frac{10\,000}{\text{determined tensile strength in N/mm}^2}$$

but in any case for fine-grained steels it shall be not less than 16% and not less than 20% for other steels.

For aluminium alloys the elongation at fracture shall be not less than 12%¹.

Calculation of the shell thickness

- 6.8.2.1.13 The pressure on which the shell thickness is based shall not be less than the calculation pressure, but the stresses referred to in 6.8.2.1.1 shall also be taken into account, and, if necessary, the following stresses:

In the case of vehicles in which the tank constitutes a stressed self-supporting member, the shell shall be designed to withstand the stresses thus imposed in addition to stresses from other sources.

Under these stresses, the stress at the most severely stressed point of the shell and its fastenings shall not exceed the value σ defined in 6.8.2.1.16.

Under each of these stresses the safety factors to be observed shall be the following:

- for metals having a clearly-defined yield point: a safety factor of 1.5 in relation to the apparent yield strength; or
- for metals with no clearly-defined yield point: a safety factor of 1.5 in relation to the guaranteed 0.2% proof strength (1% maximum elongation for austenitic steels).

¹ In the case of sheet metal the axis of the tensile test-piece shall be at right angles to the direction of rolling. The permanent elongation at fracture shall be measured on test-pieces of circular cross-section in which the gauge length l is equal to five times the diameter d ($l = 5d$); if test-pieces of rectangular section are used, the gauge length shall be calculated by the formula

$$l = 5,65 \sqrt{F_0} ,$$

where F_0 indicates the initial cross-section area of the test-piece.

- 6.8.2.1.14 The calculation pressure is in the second part of the code (see 4.3.4.1) according to Column (12) of Table A of Chapter 3.2.

When "G" appears, the following requirements shall apply:

- (a) Gravity-discharge shells intended for the carriage of substances having a vapour pressure not exceeding 110 kPa (1.1 bar) (absolute pressure) at 50 °C shall be designed for a calculation pressure of twice the static pressure of the substance to be carried but not less than twice the static pressure of water;
- (b) Pressure-filled or pressure-discharge shells intended for the carriage of substances having a vapour pressure not exceeding 110 kPa (1.1 bar) (absolute pressure) at 50 °C shall be designed for a calculation pressure equal to 1.3 times the filling or discharge pressure;

When the numerical value of the minimum calculation pressure is given (gauge pressure) the shell shall be designed for this pressure which shall not be less than 1.3 times the filling or discharge pressure. The following minimum requirements shall apply in these cases:

- (c) Shells intended for the carriage of substances having a vapour pressure of more than 110 kPa (1.1 bar) at 50 °C and a boiling point of more than 35 °C shall, whatever their filling or discharge system, be designed for a calculation pressure of not less than 150 kPa (1.5 bar) gauge pressure or 1.3 times the filling or discharge pressure, whichever is the higher;
- (d) Shells intended for the carriage of substances having a boiling point of not more than 35 °C shall, whatever their filling or discharge system, be designed for a calculation pressure equal to 1.3 times the filling or discharge pressure but not less than 0.4 MPa (4 bar) (gauge pressure).

- 6.8.2.1.15 At the test pressure, the stress σ at the most severely stressed point of the shell shall not exceed the material-dependent limits prescribed below. Allowance shall be made for any weakening due to the welds.

- 6.8.2.1.16 For all metals and alloys, the stress σ at the test pressure shall be lower than the smaller of the values given by the following formulae:

$$\sigma \leq 0.75 Re \text{ or } \sigma \leq 0.5 Rm$$

where

Re = apparent yield strength for steels having a clearly-defined yield point; or
guaranteed 0.2% proof strength for steels with no clearly-defined yield point (1% for austenitic steels)

Rm = tensile strength.

The values of Re and Rm to be used shall be specified minimum values according to material standards. If no material standard exists for the metal or alloy in question, the values of Re and Rm used shall be approved by the competent authority or by a body designated by that authority.

When austenitic steels are used, the specified minimum values according to the material standards may be exceeded by up to 15% if these higher values are attested in the inspection certificate. The minimum values shall, however, not be exceeded when the formula given in 6.8.2.1.18 is applied.

Minimum shell thickness

- 6.8.2.1.17 The shell thickness shall not be less than the greater of the values determined by the following formulae:

$$e = \frac{P_T D}{2 \sigma \lambda}$$

$$e = \frac{P_C D}{2 \sigma}$$

where:

e = minimum shell thickness in mm

P_T = test pressure in MPa

P_C = calculation pressure in MPa as specified in 6.8.2.1.14

D = internal diameter of shell in mm

σ = permissible stress, as defined in 6.8.2.1.16, in N/mm²

λ = a coefficient not exceeding 1, allowing for any weakening due to welds, and linked to the inspection methods defined in 6.8.2.1.23.

The thickness shall in no case be less than that defined in

6.8.2.1.18 to 6.8.2.1.21.

6.8.2.1.18 to 6.8.2.1.20.

6.8.2.1.18 Shells of circular cross-section² not more than 1.80 m in diameter other than those referred to in 6.8.2.1.21, shall not be less than 5 mm thick if of mild steel³, or of equivalent thickness if of another metal.

Shells shall be not less than 5 mm thick if of mild steel³ (in conformity with the requirements of 6.8.2.1.11 and 6.8.2.1.12) or of equivalent thickness if of another metal.

Where the diameter is more than 1.80 m, this thickness shall be increased to 6 mm except in the case of shells intended for the carriage of powdery or granular substances, if the shell is of mild steel³, or to an equivalent thickness if of another metal.

Where the diameter is more than 1.80 m, this thickness shall be increased to 6 mm except in the case of tanks intended for the carriage of powdery or granular substances, if the shell is of mild steel³ or to an equivalent thickness if of another metal.

Whatever the metal used, the shell thickness shall in no case be less than 3 mm.

"Equivalent thickness" means the thickness obtained by the following formula⁴:

$$e_1 = \frac{464e_0}{\sqrt[3]{(R_{m1}A_1)^2}}$$

² For shells not of a circular cross-section, for example box-shaped or elliptical shells, the indicated diameters shall correspond to those calculated on the basis of a circular cross-section of the same area. For such shapes of cross-section the radius of convexity of the shell wall shall not exceed 2 000 mm at the sides or 3 000 mm at the top and bottom.

³ For the definitions of "mild steel" and "reference steel" see 1.2.1. "Mild steel" in this case also covers a steel referred to in EN material standards as "mild steel", with a minimum tensile strength between 360 N/mm² and 490 N/mm² and a minimum elongation at fracture conforming to 6.8.2.1.12.

⁴ This formula is derived from the general formula:

$$e_1 = e_0 \sqrt[3]{\left(\frac{R_{m0}A_0}{R_{m1}A_1}\right)^2}$$

where

e_1 = minimum shell thickness for the metal chosen, in mm;

e_0 = minimum shell thickness for mild steel, in mm, according to 6.8.2.1.18 and 6.8.2.1.19;

R_{m0} = 370 (tensile strength for reference steel, see definition 1.2.1, in N/mm²);

A_0 = 27 (elongation at fracture for reference steel, in %);

R_{m1} = minimum tensile strength of the metal chosen, in N/mm²; and

A_1 = minimum elongation at fracture of the metal chosen under tensile stress, in %.

6.8.2.1.19

Where protection of the tank against damage through lateral impact or overturning is provided according to 6.8.2.1.20, the competent authority may allow the aforesaid minimum thicknesses to be reduced in proportion to the protection provided; however, the said thicknesses shall not be less than 3 mm in the case of mild steel³, or than an equivalent thickness in the case of other materials, for shells not more than 1.80 m in diameter. For shells with a diameter exceeding 1.80 m the aforesaid minimum thickness shall be increased to 4 mm in the case of mild steel³ and to an equivalent thickness in the case of other metals.

Equivalent thickness means the thickness given by the formula in 6.8.2.1.18.

Except in cases for which 6.8.2.1.21 provide, the thickness of shells with protection against damage in accordance with 6.8.2.1.20 (a) or (b) shall not be less than the values given in the table below.

Where protection of the tank against damage is provided according to 6.8.2.1.20, the competent authority may allow the aforesaid minimum thicknesses to be reduced in proportion to the protection provided; however, the said thicknesses shall be not less than 3 mm in the case of mild steel³, or than an equivalent thickness in the case of other materials, for shells not more than 1.80 m in diameter. For shells of a diameter exceeding 1.80 m this minimum thickness shall be increased to 4 mm in the case of mild steel³, and to an equivalent thickness in the case of other metals.

Equivalent thickness means the thickness given by the formula in 6.8.2.1.18.

The thickness of shells with protection against damage in accordance with 6.8.2.1.20 shall not be less than the values given in the table below.

	Diameter of shell	≤ 1.80 m	> 1.80 m
Minimum thickness of shells	Austenitic stainless steels	2.5 mm	3 mm
	Austenitic-ferritic stainless steels	3 mm	3.5 mm
	Other steels	3 mm	4 mm
	Aluminium alloys	4 mm	5 mm
	Pure aluminium of 99.80%	6 mm	8 mm

6.8.2.1.20

For tanks built after 1 January 1990, there is protection against damage as referred to in 6.8.2.1.19 when the following measures or equivalent⁵ measures are adopted:

- (a) For tanks intended for the carriage of powdery or granular substances, the protection against damage shall satisfy the competent authority.
- (b) For tanks intended for the carriage of other substances, there is protection against damage when:

1. For shells with a circular or elliptical cross-section having a maximum radius of curvature of 2 m, the shell is equipped with strengthening members comprising partitions, surge-plates or external or internal rings, so placed that at least one of the following conditions is met:

The protection referred to in 6.8.2.1.19 may consist of:

- overall external structural protection as in "sandwich" construction where the sheathing is secured to the shell; or
- a structure in which the shell is supported by a complete skeleton including longitudinal and transverse structural members; or
- double-wall construction.

Where the tanks are made with double walls, the space between being evacuated of air, the aggregate thickness of the outer metal wall and the shell wall shall correspond to the minimum wall thickness prescribed in 6.8.2.1.18, the thickness of the wall of the shell itself being not less than the minimum thickness prescribed in 6.8.2.1.19.

³ For the definitions of "mild steel" and "reference steel" see 1.2.1. "Mild steel" in this case also covers a steel referred to in EN material standards as "mild steel", with a minimum tensile strength between 360 N/mm² and 490 N/mm² and a minimum elongation at fracture conforming to 6.8.2.1.12.

⁵ Equivalent measures means measures given in standards referenced in 6.8.2.6.

- Distance between two adjacent strengthening elements of not more than 1.75 m.

- Volume contained between two partitions or surge-plates of not more than 7 500 l.

The vertical cross-section of a ring, with the associated coupling, shall have a section modulus of at least 10 cm³.

External rings shall not have projecting edges with a radius of less than 2.5 mm.

Partitions and surge-plates shall conform to the requirements of 6.8.2.1.22.

The thickness of the partitions and surge-plates shall in no case be less than that of the shell.

2. For tanks made with double walls, the space between being evacuated of air, the aggregate thickness of the outer metal wall and the shell wall corresponds to the wall thickness prescribed in 6.8.2.1.18, and the thickness of the wall of the shell itself is not less than the minimum thickness prescribed in 6.8.2.1.19.
3. For tanks made with double walls having an intermediate layer of solid materials at least 50 mm thick, the outer wall has a thickness of at least 0.5 mm of mild steel³ or at least 2 mm of a plastics material reinforced with glass fibre. Solid foam (with an impact absorption capacity like that, for example, of polyurethane foam) may be used as the intermediate layer of solid material.
4. Shells of forms other than in 1, especially box-shaped shells, are provided, all round the mid-point of their vertical height and over at least 30% of their height with a protection designed in such a way as to offer specific resilience at least equal to that of a shell constructed in mild steel³ of a thickness of 5 mm (for a shell diameter not exceeding 1.80 m) or 6 mm (for a shell diameter exceeding 1.80 m). The protection shall be applied in a durable manner to the shell.

This requirement shall be considered to have been met without further proof of the specific resilience when the

Where tanks are made with double walls with an intermediate layer of solid materials at least 50 mm thick, the outer wall shall have a thickness of not less than 0.5 mm if it is made of mild steel³ or at least 2 mm if it is made of a plastics material reinforced with glass fibre. Solid foam with an impact absorption capacity such as that, for example, of polyurethane foam, may be used as the intermediate layer of solid material.

³ For the definitions of "mild steel" and "reference steel" see 1.2.1. "Mild steel" in this case also covers a steel referred to in EN material standards as "mild steel", with a minimum tensile strength between 360 N/mm² and 490 N/mm² and a minimum elongation at fracture conforming to 6.8.2.1.12.

protection involves the welding of a plate of the same material as the shell to the area to be strengthened, so that the minimum wall thickness is in accordance with 6.8.2.1.18.

This protection is dependent upon the possible stresses exerted on mild steel³ shells in the event of an accident, where the ends and walls have a thickness of at least 5 mm for a diameter not exceeding 1.80 m or at least 6 mm for a diameter exceeding 1.80 m. If another metal is used, the equivalent thickness shall be obtained in accordance with the formula in 6.8.2.1.18.

For demountable tanks this protection is not required when they are protected on all sides by the drop sides of the carrying vehicle.

6.8.2.1.21

The thickness of shells designed in accordance with 6.8.2.1.14 (a) which either are of not more than 5 000 litres capacity or are divided into leakproof compartments of not more than 5 000 litres unit capacity may be adjusted to a level which, unless prescribed otherwise in 6.8.3 or 6.8.4, shall however not be less than the appropriate value shown in the following table:

Maximum radius of curvature of shell (m)	Capacity of shell or shell compartment (m ³)	Minimum thickness (mm)
		Mild steel
≤ 2	≤ 5.0	3
2 - 3	≤ 3.5	3
	> 3.5 but ≤ 5.0	4

Where a metal other than mild steel³ is used, the thickness shall be determined by the equivalence formula given in 6.8.2.1.18 and shall not be less than the values given in the following table:

³

For the definitions of "mild steel" and "reference steel" see 1.2.1. "Mild steel" in this case also covers a steel referred to in EN material standards as "mild steel", with a minimum tensile strength between 360 N/mm² and 490 N/mm² and a minimum elongation at fracture conforming to 6.8.2.1.12.

	Maximum radius of curvature of shell (m)	≤ 2	2-3	2-3
	Capacity of shell or shell compartment (m ³)	≤ 5.0	≤ 3.5	> 3.5 but ≤ 5.0
Minimum thickness of shell	Austenitic stainless steels	2.5 mm	2.5 mm	3 mm
	Other steels	3 mm	3 mm	4 mm
	Aluminium alloys	4 mm	4 mm	5 mm
	Pure aluminium at 99.80%	6 mm	6 mm	8 mm

6.8.2.1.22

The thickness of the partitions and surge-plates shall in no case be less than that of the shell. Surge-plates and partitions shall be dished, with a depth of dish of not less than 10 cm, or shall be corrugated, profiled or otherwise reinforced to give equivalent strength. The area of the surge plate shall be at least 70% of the cross-sectional area of the tank in which the surge-plate is fitted.

Welding and inspection of welds

6.8.2.1.23

The manufacturer's qualification for performing welding operations shall be one recognized by the competent authority. Welding shall be performed by skilled welders using a welding process whose effectiveness (including any heat treatments required) has been demonstrated by test. Non-destructive tests shall be carried out by radiography or by ultrasound and must confirm that the quality of the welding is appropriate to the stresses.

The following checks shall be carried out in accordance with the value of the coefficient λ used in determining the thickness of the shell in 6.8.2.1.17:

- $\lambda = 0.8$: the weld beads shall so far as possible be inspected visually on both faces and shall be subjected to a non-destructive spot check. All weld "Tee" junctions with the total length of weld examined to be not less than 10% of the sum of the length of all longitudinal, circumferential and radial (in the tank ends) welds shall be tested;
- $\lambda = 0.9$: all longitudinal beads throughout their length, all connections, 25% of circular beads, and welds for the assembly of large-diameter items of equipment shall be subjected to non-destructive checks. Beads shall be checked visually on both sides as far as possible;
- $\lambda = 1$: all beads shall be subjected to non-destructive checks and shall so far as possible be inspected visually on both sides. A weld test-piece shall be taken.

Where the competent authority has doubts regarding the quality of weld beads, it may require additional checks.

Other construction requirements

6.8.2.1.24

The protective lining shall be so designed that its leakproofness remains intact, whatever the deformation liable to occur in normal conditions of carriage (see 6.8.2.1.2).

6.8.2.1.25

The thermal insulation shall be so designed as not to hinder access to, or the operation of, filling and discharge devices and safety valves.

6.8.2.1.26 If shells intended for the carriage of flammable liquids having a flash-point of not more than 60 °C are fitted with non-metallic protective linings (inner layers), the shells and the protective linings shall be so designed that no danger of ignition from electrostatic charges can occur.

6.8.2.1.27 Shells intended for the carriage of liquids having a flash-point of not more than 60 °C or for the carriage of flammable gases, or of UN No.1361 carbon or UN No.1361 carbon black, packing group II, shall be linked to the chassis by means of at least one good electrical connection. Any metal contact capable of causing electrochemical corrosion shall be avoided. Shells shall be provided with at least one earth fitting clearly marked with the symbol "  ", capable of being electrically connected.

All parts of a tank-container intended for the carriage of liquids having a flash-point of not more than 60 °C, flammable gases, or UN No.1361 carbon or UN No.1361 carbon black, packing group II, shall be capable of being electrically earthed. Any metal contact capable of causing electrochemical corrosion shall be avoided.

6.8.2.1.28 *Protection of fittings mounted on the upper part of the tank*

The fittings and accessories mounted on the upper part of the tank shall be protected against damage caused by overturning. This protection may take the form of strengthening rings, protective canopies or transverse or longitudinal members so shaped that effective protection is given.

6.8.2.2 *Items of equipment*

6.8.2.2.1 Suitable non-metallic materials may be used to manufacture service and structural equipment.

The items of equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during carriage or handling. They shall exhibit a suitable degree of safety comparable to that of the shells themselves, and shall in particular:

- be compatible with the substances carried; and
- meet the requirements of 6.8.2.1.1.

Piping shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration.

As many operating parts as possible shall be served by the smallest possible number of openings in the shell. The leakproofness of the service equipment including the closure (cover) of the inspection openings shall be ensured even in the event of overturning of the tank, taking into account the forces generated by an impact (such as acceleration and dynamic pressure). Limited release of the tank contents due to a pressure peak during the impact is however allowed.

The leakproofness of the service equipment shall be ensured even in the event of the overturning of the tank-container.

The gaskets shall be made of a material compatible with the substance carried and shall be replaced as soon as their effectiveness is impaired, for example as a result of ageing.

Gaskets ensuring the leakproofness of fittings requiring manipulation during normal use of tanks shall be so designed and arranged that manipulation of the fittings incorporating them does not damage them.

- 6.8.2.2.3 Tanks that are not hermetically closed may be fitted with vacuum valves to avoid an unacceptable negative internal pressure; these vacuum-relief valves shall be set to relieve at a vacuum setting not greater than the vacuum pressure for which the tank has been designed (see 6.8.2.1.7). Hermetically closed tanks shall not be fitted with vacuum valves. However, tanks of the tank code SGAH, S4AH or L4BH, fitted with vacuum valves which open at a negative pressure of not less than 21 kPa (0.21 bar) shall be considered as being hermetically closed. For tanks intended for the carriage of solid substances (powdery or granular) of packing groups II or III only, which do not liquefy during transport, the negative pressure may be reduced to not less than 5 kPa (0.05 bar).

Vacuum valves and breather devices (see 6.8.2.2.6) used on tanks intended for the carriage of substances meeting the flash-point criteria of Class 3, shall prevent the immediate passage of flame into the shell by means of a suitable protective device, or the shell of the tank shall be explosion pressure shock resistant, which means being capable of withstanding without leakage, but allowing deformation, an explosion resulting from the passage of the flame.

If the protective device consists of a suitable flame trap or flame arrester, it shall be positioned as close as possible to the shell or the shell compartment. For multi-compartment tanks, each compartment shall be protected separately.

- 6.8.2.2.4 The shell or each of its compartments shall be provided with an opening large enough to permit inspection.

- 6.8.2.2.5 *(Reserved)*

- 6.8.2.2.6 Tanks intended for the carriage of liquids having a vapour pressure of not more than 110 kPa (1.1 bar) (absolute) at 50 °C shall have a breather device and a safety device to prevent the contents from spilling out if the tank overturns; otherwise they shall conform to 6.8.2.2.7 or 6.8.2.2.8.

- 6.8.2.2.7 Tanks intended for the carriage of liquids having a vapour pressure of more than 110 kPa (1.1 bar) at 50 °C and a boiling point of more than 35 °C shall have a safety valve set at not less than 150 kPa (1.5 bar) (gauge pressure) and which shall be fully open at a pressure not exceeding the test pressure; otherwise they shall conform to 6.8.2.2.8.

- 6.8.2.2.8 Tanks intended for the carriage of liquids having a boiling point of not more than 35 °C shall have a safety valve set at not less than 300 kPa (3 bar) gauge pressure and which shall be fully open at a pressure not exceeding the test pressure; otherwise they shall be hermetically closed⁷.

- 6.8.2.2.9 Movable parts such as covers, closures, etc., which are liable to come into frictional or percussive contact with aluminium shells intended for the carriage of flammable liquids having a flash-point of not more than 60 °C or for the carriage of flammable gases shall not be made of unprotected corrodible steel.

- 6.8.2.2.10 If tanks required to be hermetically closed are equipped with safety valves, these shall be preceded by a bursting disc and the following conditions shall be observed:

The arrangement of the bursting disc and safety valve shall be such as to satisfy the competent authority. A pressure gauge or another suitable indicator shall be provided in the space between the bursting disc and the safety valve, to enable detection of any rupture, perforation or leakage of the disc which may disrupt the action of the safety valve.

⁷ For the definition of "hermetically closed tank" see 1.2.1.

6.8.2.3 *Type approval*

6.8.2.3.1 The competent authority or a body designated by that authority shall issue in respect of each new type of tank-vehicle, demountable tank, tank-container, tank swap body, battery-vehicle or MEGC a certificate attesting that the type, including fastenings, which it has inspected is suitable for the purpose for which it is intended and meets the construction requirements of 6.8.2.1, the equipment requirements of 6.8.2.2 and the special conditions for the classes of substances carried.

The certificate shall show:

- the results of the test;
- an approval number for the type;

The approval number shall consist of the distinguishing sign⁸ of the State in whose territory the approval was granted and a registration number.

- the tank code in accordance with 4.3.3.1.1 or 4.3.4.1.1;
- the alphanumeric codes of special provisions of construction (TC), equipment (TE) and type approval (TA) of 6.8.4 which are shown in column (13) of Table A of Chapter 3.2 for those substances for the carriage of which the tank has been approved;
- if required, the substances and/or group of substances for the carriage of which the tank has been approved. These shall be shown with their chemical name or the corresponding collective entry (see 2.1.1.2), together with their classification (class, classification code and packing group). With the exception of substances of Class 2 and those listed in 4.3.4.1.3, the listing of approved substances may be dispensed with. In such cases, groups of substances permitted on the basis of the tank code shown in the rationalised approach in 4.3.4.1.2 shall be accepted for carriage taking into account any relevant special provision.

The substances referred to in the certificate or the groups of substances approved according to the rationalised approach shall, in general, be compatible with the characteristics of the tank. A reservation shall be included in the certificate if it was not possible to investigate this compatibility exhaustively when the type approval was issued.

A copy of the certificate shall be attached to the tank record of each tank, battery-vehicle or MEGC constructed (see 4.3.2.1.7).

The competent authority or a body designated by that authority shall at the request of the applicant carry out a separate type approval of valves and other service equipment for which a standard is listed in the table in 6.8.2.6.1, in accordance with that standard. This separate type approval shall be taken into account when issuing the certificate for the tank, if the test results are presented and the valves and other service equipment are fit for the intended use.

6.8.2.3.2 If the tanks, battery-vehicles or MEGCs are manufactured in series without modification this approval shall be valid for the tanks, battery-vehicles or MEGCs manufactured in series or according to the prototype.

A type approval may however serve for the approval of tanks with limited variations of the design that either reduce the loads and stresses on the tanks (e.g. reduced pressure, reduced mass, reduced volume) or increase the safety of the structure (e.g. increased shell thickness, more surge-plates, decreased diameter of openings). The limited variations shall be clearly described in the type approval certificate.

6.8.2.3.3 The following requirements apply to tanks for which special provision TA4 of 6.8.4 (and therefore 1.8.7.2.4) does not apply.

⁸ *Distinguishing sign for use in international traffic prescribed by the Convention on Road Traffic (Vienna, 1968).*

The type approval shall be valid for a maximum of ten years. If within that period the relevant technical requirements of ADR (including referenced standards) have changed so that the approved type is no longer in conformity with them, the competent authority or the body designated by that authority which issued the type approval shall withdraw it and inform the holder of the type approval.

NOTE: For the ultimate dates for withdrawal of existing type approvals, see column (5) of the tables in 6.8.2.6 or 6.8.3.6 as appropriate.

If a type approval has expired or has been withdrawn, the manufacture of the tanks, battery-vehicles or MEGCs according to that type approval is no longer authorised.

In such a case, the relevant provisions concerning the use, periodic inspection and intermediate inspection of tanks, battery-vehicles or MEGCs contained in the type approval which has expired or has been withdrawn shall continue to apply to these tanks, battery-vehicles or MEGCs constructed before the expiry or the withdrawal if they may continue to be used.

They may continue to be used as long as they remain in conformity with the requirements of ADR. If they are no longer in conformity with the requirements of ADR they may continue to be used only if such use is permitted by relevant transitional measures in Chapter 1.6.

Type approvals may be renewed by a complete review and assessment for conformity with the provisions of ADR applicable at the date of renewal. Renewal is not permitted after a type approval has been withdrawn. Interim amendments of an existing type approval not affecting conformity (see 6.8.2.3.2) do not extend or modify the original validity of the certificate.

NOTE: The review and assessment of conformity can be done by a body other than the one which issued the original type approval.

The issuing body shall keep all documents for the type approval for the whole period of validity including its renewals if granted.

If the designation of the issuing body is revoked or restricted, or when the body has ceased activity, the competent authority shall take appropriate steps to ensure that the files are either processed by another body or kept available.

6.8.2.3.4

In the case of a modification of a tank with a valid, expired or withdrawn type approval, the testing, inspection and approval are limited to the parts of the tank that have been modified. The modification shall meet the provisions of ADR applicable at the time of the modification. For all parts of the tank not affected by the modification, the documentation of the initial type approval remains valid.

A modification may apply to one or more tanks covered by a type approval.

A certificate approving the modification shall be issued by the competent authority of any Contracting Party to ADR or by a body designated by this authority and shall be kept as part of the tank record.

Each application for an approval certificate for a modification shall be lodged with a single competent authority or body designated by this authority.

6.8.2.4 Inspections and tests

6.8.2.4.1 Shells and their equipment shall either together or separately undergo an initial inspection before being put into service. This inspection shall include:

- a check of conformity to the approved type;
- a check of the design characteristics⁹
- an examination of the internal and external conditions;
- a hydraulic pressure test¹⁰ at the test pressure indicated on the plate prescribed in 6.8.2.5.1; and
- a leakproofness test and a check of satisfactory operation of the equipment.

Except in the case of Class 2, the test pressure for the hydraulic pressure test depends on the calculation pressure and shall be at least equal to the pressure indicated below:

Calculation pressure (bar)	Test pressure (bar)
G^{11}	G^{11}
1.5	1.5
2.65	2.65
4	4
10	4
15	4
21	10 (4 ¹²)

The minimum test pressures for Class 2 are given in the table of gases and gas mixtures in 4.3.3.2.5.

The hydraulic pressure test shall be carried out on the shell as a whole and separately on each compartment of compartmented shells.

The test shall be carried out on each compartment at a pressure at least equal to 1.3 times the maximum working pressure.

The hydraulic pressure test shall be carried out before the installation of a thermal insulation as may be necessary.

If the shells and their equipment are tested separately, they shall be jointly subjected to a leakproofness test after assembly in accordance with 6.8.2.4.3.

The leakproofness test shall be carried out separately on each compartment of compartmented shells.

6.8.2.4.2 Shells and their equipment shall undergo periodic inspections no later than every

six years. | five years.

These periodic inspections shall include:

- An external and internal examination;

⁹ The check of the design characteristics shall also include, for shells requiring a test pressure of 1 MPa (10 bar) or higher, the taking of weld test-pieces (work samples) in accordance with 6.8.2.1.23 and the tests prescribed in 6.8.5.

¹⁰ In special cases and with the agreement of the expert approved by the competent authority, the hydraulic pressure test may be replaced by a pressure test using another liquid or gas, where such an operation does not present any danger.

¹¹ G = minimum calculation pressure according to the general requirements of 6.8.2.1.14 (see 4.3.4.1).

¹² Minimum test pressure for UN No. 1744 bromine or UN No. 1744 bromine solution.

- A leakproofness test in accordance with 6.8.2.4.3 of the shell with its equipment and check of the satisfactory operation of all the equipment;
- As a general rule, a hydraulic pressure test¹⁰ (for the test pressure for the shells and compartments if applicable, see 6.8.2.4.1).

Sheathing for thermal or other insulation shall be removed only to the extent required for reliable appraisal of the characteristics of the shell.

In the case of tanks intended for the carriage of powdery or granular substances, and with the agreement of the expert approved by the competent authority, the periodic hydraulic pressure tests may be omitted and replaced by leakproofness tests in accordance with 6.8.2.4.3, at an effective internal pressure at least equal to the maximum working pressure.

6.8.2.4.3 Shells and their equipment shall undergo intermediate inspections at least every

three years | two and a half years

after the initial inspection and each periodic inspection. These intermediate inspections may be performed within three months before or after the specified date.

However, the intermediate inspection may be performed at any time before the specified date.

If an intermediate inspection is performed more than three months before the due date, another intermediate inspection shall be performed at the latest

three years | two and a half years

after this date.

These intermediate inspections shall include a leakproofness test of the shell with its equipment and check of the satisfactory operation of all the equipment. For this purpose the tank shall be subjected to an effective internal pressure at least equal to the maximum working pressure. For tanks intended for the carriage of liquids or solids in the granular or powdery state, when a gas is used for the leakproofness test it shall be carried out at a pressure at least equal to 25% of the maximum working pressure. In all cases, it shall not be less than 20 kPa (0.2 bar) (gauge pressure).

For tanks equipped with breather devices and a safety device to prevent the contents spilling out if the tank overturns, the pressure test shall be equal to the static pressure of the filling substance.

The leakproofness test shall be carried out separately on each compartment of compartmented shells.

6.8.2.4.4 When the safety of the tank or of its equipment may have been impaired as a result of repairs, alterations or accident, an exceptional check shall be carried out. If an exceptional check fulfilling the requirements of 6.8.2.4.2 has been performed, then the exceptional check may be considered to be a periodic inspection. If an exceptional check fulfilling the requirements of 6.8.2.4.3 has been performed then the exceptional check may be considered to be an intermediate inspection.

6.8.2.4.5 The tests, inspections and checks in accordance with 6.8.2.4.1 to 6.8.2.4.4 shall be carried out by the expert approved by the competent authority. Certificates shall be issued showing the results of these operations, even in the case of negative results. These certificates shall refer to the list of the substances permitted for carriage in this tank or to the tank code and the alphanumeric codes of special provisions in accordance with 6.8.2.3.

A copy of these certificates shall be attached to the tank record of each tank, battery-vehicle or MEGC tested (see 4.3.2.1.7).

¹⁰ *In special cases and with the agreement of the expert approved by the competent authority, the hydraulic pressure test may be replaced by a pressure test using another liquid or gas, where such an operation does not present any danger.*

6.8.2.5 Marking

6.8.2.5.1 Every tank shall be fitted with a corrosion-resistant metal plate permanently attached to the tank in a place readily accessible for inspection. The following particulars at least shall be marked on the plate by stamping or by any other similar method. These particulars may be engraved directly on the walls of the shell itself, if the walls are so reinforced that the strength of the shell is not impaired¹³:

- approval number;
- manufacturer's name or mark;
- manufacturer's serial number;
- year of manufacture;
- test pressure (gauge pressure);
- external design pressure (see 6.8.2.1.7);
- capacity of the shell – in the case of multiple-compartment shells, the capacity of each compartment –, followed by the symbol "S" when the shells or the compartments of more than 7 500 litres are divided by surge plates into sections of not more than 7 500 litres capacity;
- design temperature (only if above +50 °C or below -20 °C);
- date and type of the most recent test: "month, year" followed by a "P" when the test is the initial test or a periodic test in accordance with 6.8.2.4.1 and 6.8.2.4.2, or "month, year" followed by an "L" when the test is an intermediate leakproofness test in accordance with 6.8.2.4.3;
- stamp of the expert who carried out the tests;
- material of the shell and reference to materials standards, if available and, where appropriate, the protective lining;
- test pressure on the shell as a whole and test pressure by compartment in MPa or bar (gauge pressure) where the pressure by compartment is less than the pressure on the shell.

In addition, the maximum working pressure allowed shall be inscribed on pressure-filled or pressure-discharge tanks.

<p>6.8.2.5.2 The following particulars shall be inscribed on the tank-vehicle (on the tank itself or on plates)¹³:</p> <ul style="list-style-type: none"> - name of owner or operator; - unladen mass of the tank-vehicle; and - maximum permissible mass of the tank-vehicle. <p>The following particulars shall be inscribed on a demountable tank (on the tank itself or on plates)¹³:</p> <ul style="list-style-type: none"> - name of owner or operator; - "demountable tank"; - tare of the tank; - maximum permissible gross mass of the tank; - for the substances according to 4.3.4.1.3, the proper shipping name of the substance(s) 	<p>The following particulars shall be inscribed on the tank-container (on the tank itself or on plates)¹³:</p> <ul style="list-style-type: none"> - names of owner and of operator; - capacity of the shell; - tare; - maximum permissible gross mass; - for the substances according to 4.3.4.1.3, the proper shipping name of the substance(s) accepted for carriage; - tank code according to 4.3.4.1.1; and - for substances other than those according to 4.3.4.1.3, the alphanumeric codes of all special provisions TC and TE which are shown in column (13) of Table A of Chapter 3.2 for the substances to be carried in the tank.
---	---

¹³ Add the units of measurement after the numerical values.

- accepted for carriage;
- tank code according to 4.3.4.1.1; and
 - for substances other than those according to 4.3.4.1.3, the alphanumeric codes of all special provisions TC and TE which are shown in column (13) of Table A of Chapter 3.2 for the substances to be carried in the tank.

6.8.2.6 *Requirements for tanks which are designed, constructed and tested according to referenced standards*

NOTE: Persons or bodies identified in standards as having responsibilities in accordance with ADR shall meet the requirements of ADR.

6.8.2.6.1 *Design and construction*

The standards referenced in the table below shall be applied for the issue of type approvals as indicated in column (4) to meet the requirements of Chapter 6.8 referred to in column (3). The requirements of Chapter 6.8 referred to in column (3) shall prevail in all cases. Column (5) gives the latest date when existing type approvals shall be withdrawn according to 1.8.7.2.4 or 6.8.2.3.3; if no date is shown the type approval remains valid until it expires.

Since 1 January 2009 the use of the referenced standards has been mandatory. Exceptions are dealt with in 6.8.2.7 and 6.8.3.7.

If more than one standard is referenced for the application of the same requirements, only one of them shall be applied, but in full unless otherwise specified in the table below.

The scope of application of each standard is defined in the scope clause of the standard unless otherwise specified in the Table below.

6.8.2.6.2 *Inspection and test*

The standard referenced in the table below shall be applied for the inspection and test of tanks as indicated in column (4) to meet the requirements of Chapter 6.8 referred to in column (3) which shall prevail in all cases.

The use of a referenced standard is mandatory.

The scope of application of each standard is defined in the scope clause of the standard unless otherwise specified in the Table below.

Reference	Title of document	Applicable sub-sections and paragraphs	Applicable
(1)	(2)	(3)	(4)
EN 12972:2007	Tanks for transport of dangerous goods – Testing, inspection and marking of metallic tanks	6.8.2.4 6.8.3.4	Until further notice

6.8.2.7 *Requirements for tanks which are not designed, constructed and tested according to referenced standards*

To reflect scientific and technical progress or where no standard is referenced in 6.8.2.6 or to deal with specific aspects not addressed in a standard referenced in 6.8.2.6, the competent authority may recognize the use of a technical code providing the same level of safety. Tanks shall, however, comply with the minimum requirements of 6.8.2.

The competent authority shall transmit to the secretariat of UNECE a list of the technical codes that it recognises. The list should include the following details: name and date of the code, purpose of the code and details of where it may be obtained. The secretariat shall make this information publicly available on its website.

A standard which has been adopted for reference in a future edition of the ADR may be approved by the competent authority for use without notifying the UNECE secretariat.

For testing, inspection and marking, the applicable standard referenced in 6.8.2.6 may also be used.

6.8.3 *Special requirements applicable to Class 2*

6.8.3.1 *Construction of shells*

6.8.3.1.1 Shells intended for the carriage of compressed or liquefied gases or dissolved gases shall be made of steel. In the case of weldless shells, by derogation from 6.8.2.1.12 a minimum elongation at fracture of 14% and also a stress σ lower than or equal to limits hereafter given according to the material may be accepted:

- (a) When the ratio R_e/R_m (of the minimum guaranteed characteristics after heat treatment) is higher than 0.66 without exceeding 0.85:

$$\sigma \leq 0.75 R_e;$$

- (b) When the ratio R_e/R_m (of the minimum guaranteed characteristics after heat treatment) is higher than 0.85:

$$\sigma \leq 0.5 R_m.$$

6.8.3.1.2 The requirements of 6.8.5 apply to the materials and construction of welded shells.

6.8.3.1.3 *(Reserved)*

Construction of battery-vehicles and MEGCs

6.8.3.1.4 Cylinders, tubes, pressure drums and bundles of cylinders, as elements of a battery-vehicle or MEGC, shall be constructed in accordance with Chapter 6.2.

NOTE 1: *Bundles of cylinders which are not elements of a battery-vehicle or of a MEGC shall be subject to the requirements of Chapter 6.2.*

NOTE 2: *Tanks as elements of battery-vehicles and MEGCs shall be constructed in accordance with 6.8.2.1 and 6.8.3.1.*

NOTE 3: *Demountable tanks¹⁴ are not to be considered elements of battery-vehicles or MEGCs.*

¹⁴ For the definition of "demountable tank" see 1.2.1.

- 6.8.3.1.5 Elements and their fastenings shall be capable of absorbing under the maximum permissible load the forces defined in 6.8.2.1.2. Under each force the stress at the most severely stressed point of the element and its fastenings shall not exceed the value defined in 6.2.5.3 for cylinders, tubes, pressure drums and bundles of cylinders and for tanks the value of σ defined in 6.8.2.1.16.

6.8.3.2 *Items of equipment*

- 6.8.3.2.1 The discharge pipes of tanks shall be capable of being closed by blank flanges or some other equally reliable device. For tanks intended for the carriage of refrigerated liquefied gases, these blank flanges or other equally reliable devices may be fitted with pressure-release openings of a maximum diameter of 1.5 mm.

- 6.8.3.2.2 Shells intended for the carriage of liquefied gases may be provided with, in addition to the openings prescribed in 6.8.2.2.2 and 6.8.2.2.4, openings for the fitting of gauges, thermometers, manometers and with bleed holes, as required for their operation and safety.

- 6.8.3.2.3 The internal stop-valve of all filling and all discharge openings of tanks

| with a capacity greater than 1 m³

intended for the carriage of liquefied flammable or toxic gases shall be instant-closing and shall close automatically in the event of an unintended movement of the tank or in the event of fire. It shall also be possible to operate the internal stop-valve by remote control.

However on tanks intended for the carriage of liquefied non-toxic flammable gases, the internal stop-valve with remote control may be replaced by a non-return valve for filling openings into the vapour phase of the tank only. The non-return valve shall be positioned internally in the tank, be spring loaded so that the valve is closed if the pressure in the filling line is equal to or lower than the pressure in the tank and be equipped with appropriate sealing¹⁵.

- 6.8.3.2.4 All openings, other than those accommodating safety valves and closed bleed holes, of tanks intended for the carriage of liquefied flammable and/or toxic gases shall, if their nominal diameter is more than 1.5 mm, shall be equipped with an internal shut-off device.

- 6.8.3.2.5 Notwithstanding the requirements of 6.8.2.2.2, 6.8.3.2.3 and 6.8.3.2.4, tanks intended for the carriage of refrigerated liquefied gases may be equipped with external devices in place of internal devices if the external devices afford protection against external damage at least equivalent to that afforded by the wall of the shell.

- 6.8.3.2.6 If the tanks are equipped with gauges in direct contact with the substance carried, the gauges shall not be made of a transparent material. If there are thermometers, they shall not project directly into the gas or liquid through the shell.

- 6.8.3.2.7 Filling and discharge openings situated in the upper part of tanks shall be equipped with, in addition to what is prescribed in 6.8.3.2.3, a second, external, closing device. This device shall be capable of being closed by a blank flange or some other equally reliable device.

- 6.8.3.2.8 Safety valves shall meet the requirements of 6.8.3.2.9 to 6.8.3.2.12 below:

¹⁵ *The use of metal to metal sealing is not permitted.*

6.8.3.2.9 Tanks intended for the carriage of compressed or liquefied gases or dissolved gases, may be fitted with spring-loaded safety valves. These valves shall be capable of opening automatically under a pressure between 0.9 and 1.0 times the test pressure of the tank to which they are fitted. They shall be of such a type as to resist dynamic stresses, including liquid surge. The use of dead weight or counter weight valves is prohibited. The required capacity of the safety valves shall be calculated in accordance with the formula contained in 6.7.3.8.1.1.

6.8.3.2.10 Where tanks are intended for carriage by sea, the requirements of 6.8.3.2.9 shall not prohibit the fitting of safety valves conforming to the IMDG Code.

6.8.3.2.11 Tanks intended for the carriage of refrigerated liquefied gases shall be equipped with two or more independent safety valves capable of opening at the maximum working pressure indicated on the tank. Two of these safety valves shall be individually sized to allow the gases formed by evaporation during normal operation to escape from the tank in such a way that the pressure does not at any time exceed by more than 10% the working pressure indicated on the tank.

One of the safety valves may be replaced by a bursting disc which shall be such as to burst at the test pressure.

In the event of loss of the vacuum in a double-walled tank, or of destruction of 20% of the insulation of a single-walled tank, the combination of the pressure relief devices shall permit an outflow such that the pressure in the shell cannot exceed the test pressure. The provisions of 6.8.2.1.7 shall not apply to vacuum-insulated tanks.

6.8.3.2.12 These pressure relief devices of tanks intended for the carriage of refrigerated liquefied gases shall be so designed as to function faultlessly even at their lowest working temperature. The reliability of their operation at that temperature shall be established and checked either by testing each device or by testing a specimen device of each design-type.

6.8.3.2.13 The valves of demountable tanks that can be rolled shall be provided with protective caps.

Thermal insulation

6.8.3.2.14 If tanks intended for the carriage of liquefied gases are equipped with thermal insulation, such insulation shall consist of either:

- a sun shield covering not less than the upper third but not more than the upper half of the tank surface and separated from the shell by an air space at least 4 cm across; or
- a complete cladding, of adequate thickness, of insulating materials.

6.8.3.2.15 Tanks intended for the carriage of refrigerated liquefied gases shall be thermally insulated. Thermal insulation shall be ensured by means of a continuous sheathing. If the space between the shell and the sheathing is under vacuum (vacuum insulation), the protective sheathing shall be so designed as to withstand without deformation an external pressure of at least 100 kPa (1 bar) (gauge pressure). By derogation from the definition of "calculation pressure" in 1.2.1, external and internal reinforcing devices may be taken into account in the calculations. If the sheathing is so closed as to be gas-tight, a device shall be provided to prevent any dangerous pressure from developing in the insulating layer in the event of inadequate gas-tightness of the shell or of its items of equipment. The device shall prevent the infiltration of moisture into the heat-insulating sheath.

6.8.3.2.16 Tanks intended for the carriage of liquefied gases having a boiling point below -182° C at atmospheric pressure shall not include any combustible material either in the thermal insulation or in the means of attachment.

The means of attachment for vacuum insulated tanks may, with the approval of the competent authority, contain plastics substances between the shell and the sheathing.

6.8.3.2.17 By derogation from the requirements of 6.8.2.2.4 shells intended for the carriage of refrigerated liquefied gases need not have an inspection opening.

Items of equipment for battery-vehicles and MEGCs

- 6.8.3.2.18 Service and structural equipment shall be configured or designed to prevent damage that could result in the release of the pressure receptacle contents during normal conditions of handling and carriage. When the connection between the frame of the battery-vehicle or MEGC and the elements allows relative movement between the sub-assemblies, the equipment shall be so fastened as to permit such movement without damage to working parts. Manifold piping leading to shut-off valves shall be sufficiently flexible to protect the valves and the piping from shearing, or releasing the pressure receptacle contents. The filling and discharge devices (including flanges or threaded plugs) and any protective caps shall be capable of being secured against unintended opening.
- 6.8.3.2.19 In order to avoid any loss of content in the event of damage, the manifolds, the discharge fittings (pipe sockets, shut-off devices), and the stop-valves shall be protected or arranged from being wrenched off by external forces or designed to withstand them.
- 6.8.3.2.20 The manifold shall be designed for service in a temperature range of -20° C to +50° C.
- The manifold shall be designed, constructed and installed so as to avoid the risk of damage due to thermal expansion and contraction, mechanical shock and vibration. All piping shall be of suitable metallic material. Welded pipe joints shall be used wherever possible.
- Joints in copper tubing shall be brazed or have an equally strong metal union. The melting point of brazing materials shall be no lower than 525°C. The joints shall not decrease the strength of tubing as may happen when cutting threads.
- 6.8.3.2.21 Except for UN No.1001 acetylene, dissolved, the permissible maximum stress σ of the manifolding arrangement at the test pressure of the receptacles shall not exceed 75% of the guaranteed yield strength of the material.
- The necessary wall thickness of the manifolding arrangement for the carriage of UN No.1001 acetylene, dissolved shall be calculated according to an approved code of practice.
- NOTE:** For the yield strength, see 6.8.2.1.11.
- The basic requirements of this paragraph shall be deemed to have been complied with if the following standards are applied: (*Reserved*).
- 6.8.3.2.22 By derogation from the requirements of 6.8.3.2.3, 6.8.3.2.4 and 6.8.3.2.7, for cylinders, tubes, pressure drums and bundles of cylinders (frames) forming a battery-vehicle or MEGC, the required closing devices may be provided for within the manifolding arrangement.
- 6.8.3.2.23 If one of the elements is equipped with a safety valve and shut-off devices are provided between the elements, every element shall be so equipped.
- 6.8.3.2.24 The filling and discharge devices may be affixed to a manifold.
- 6.8.3.2.25 Each element, including each individual cylinder of a bundle, intended for the carriage of toxic gases, shall be capable of being isolated by a shut-off valve.
- 6.8.3.2.26 Battery-vehicles or MEGCs intended for the carriage of toxic gases shall not have safety valves, unless the safety valves are preceded by a bursting disc. In the latter case, the arrangement of the bursting disc and safety valve shall be satisfactory to the competent authority.
- 6.8.3.2.27 When battery-vehicles or MEGCs are intended for carriage by sea, the requirements of 6.8.3.2.26 shall not prohibit the fitting of safety valves conforming to the IMDG Code.
- 6.8.3.2.28 Receptacles which are elements of a battery-vehicle or MEGC intended for the carriage of flammable gases shall be combined in groups of not more than 5 000 litres which are capable of being isolated by a shut-off valve.

Each element of a battery-vehicle or MEGC intended for the carriage of flammable gases, when consisting of tanks conforming to this Chapter, shall be capable of being isolated by a shut-off valve.

6.8.3.3 *Type approval*

No special requirements.

6.8.3.4 *Inspections and tests*

6.8.3.4.1 The materials of every welded shell with the exception of cylinders, tubes, pressure drums and cylinders as part of bundles of cylinders which are elements of a battery-vehicle or of a MEGC shall be tested according to the method described in 6.8.5.

6.8.3.4.2 The basic requirements for the test pressure are given in 4.3.3.2.1 to 4.3.3.2.4 and the minimum test pressures are given in the table of gases and gas mixtures in 4.3.3.2.5.

6.8.3.4.3 The first hydraulic pressure test shall be carried out before thermal insulation is placed in position. When the shell, its fittings, piping and items of equipment have been tested separately, the tank shall be subjected to a leakproofness test after assembly.

6.8.3.4.4 The capacity of each shell intended for the carriage of compressed gases filled by mass, liquefied gases or dissolved gases shall be determined, under the supervision of an expert approved by the competent authority, by weighing or volumetric measurement of the quantity of water which fills the shell; the measurement of shell capacity shall be accurate to within 1%. Determination by a calculation based on the dimensions of the shell is not permitted. The maximum filling masses allowed in accordance with packing instruction P200 or P203 in 4.1.4.1 as well as 4.3.3.2.2 and 4.3.3.2.3 shall be prescribed by an approved expert.

6.8.3.4.5 Checking of the welds shall be carried out in accordance with the $\lambda=1$ requirements of 6.8.2.1.23.

6.8.3.4.6 By derogation from the requirements of 6.8.2.4.2, the periodic inspections shall take place:

at least after six years

at least after eight years

of service and thereafter at least every 12 years in the case of tanks intended for the carriage of refrigerated liquefied gases.

The intermediate inspections according to 6.8.2.4.3 shall be carried out at least six years after each periodic inspection.

A leakproofness test or an intermediate inspection according to 6.8.2.4.3 may be performed, at the request of the competent authority, between any two successive periodic inspections.

6.8.3.4.7 In the case of vacuum-insulated tanks, the hydraulic-pressure test and the check of the internal condition may, with the consent of the approved expert, be replaced by a leakproofness test and measurement of the vacuum.

6.8.3.4.8 If, at the time of periodic inspections, openings have been made in shells intended for the carriage of refrigerated liquefied gases, the method by which they are hermetically closed before the shells are returned to service shall be approved by the approved expert and shall ensure the integrity of the shell.

6.8.3.4.9 Leakproofness tests of tanks intended for the carriage of gases shall be performed at a pressure of not less than:

- For compressed gases, liquefied gases and dissolved gases: 20% of the test pressure;
- For refrigerated liquefied gases: 90% of the maximum working pressure.

Inspections and tests for battery-vehicles and MEGCs

6.8.3.4.10 The elements and items of equipment of each battery-vehicle or MEGC shall be inspected and tested either together or separately before being put into service for the first time (initial inspection and test). Thereafter battery-vehicles or MEGCs the elements of which are receptacles shall be inspected at not more than five-year intervals. Battery-vehicles and MEGCs the elements of which are tanks shall be inspected according to 6.8.3.4.6. An exceptional inspection and test shall be performed regardless of the last periodic inspection and test when necessary according to 6.8.3.4.14.

6.8.3.4.11 The initial inspection shall include:

- a check of conformity to the approved type;
- a check of the design characteristics;
- an examination of the internal and external conditions;
- a hydraulic pressure test¹⁰ at the test pressure indicated on the plate prescribed in 6.8.3.5.10;
- a leakproofness test at the maximum working pressure; and
- a check of satisfactory operation of the equipment.

When the elements and their fittings have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

6.8.3.4.12 Cylinders, tubes and pressure drums and cylinders as part of bundles of cylinders shall be tested according to packing instruction P200 or P203 in 4.1.4.1.

The test pressure of the manifold of the battery-vehicle or MEGC shall be the same as that of the elements of the battery-vehicle or MEGC. The pressure test of the manifold may be performed as a hydraulic test or by using another liquid or gas with the agreement of the competent authority or its authorised body. By derogation from this requirement, the test pressure for the manifold of battery-vehicle or MEGC shall not be less than 300 bar for UN No. 1001 acetylene, dissolved.

6.8.3.4.13 The periodic inspection shall include a leakproofness test at the maximum working pressure and an external examination of the structure, the elements and the service equipment without disassembling. The elements and the piping shall be tested at the periodicity defined in packing instruction P200 of 4.1.4.1 and in accordance with the requirements of 6.2.1.6 and 6.2.3.5 respectively. When the elements and equipment have been pressure-tested separately, they shall be subjected together after assembly to a leakproofness test.

6.8.3.4.14 An exceptional inspection and test is necessary when the battery-vehicle or MEGC shows evidence of damaged or corroded areas, or leakage, or any other conditions, that indicate a deficiency that could affect the integrity of the battery-vehicle or MEGC. The extent of the exceptional inspection and test and, if deemed necessary, the disassembling of elements shall depend on the amount of damage or deterioration of the battery-vehicle or MEGC. It shall include at least the examinations required under 6.8.3.4.15.

6.8.3.4.15 The examinations shall ensure that:

- (a) The elements are inspected externally for pitting, corrosion, or abrasions, dents, distortions, defects in welds or any other conditions, including leakage, that might render the battery-vehicles or MEGCs unsafe for transport;
- (b) The piping, valves, and gaskets are inspected for corroded areas, defects, and other conditions, including leakage, that might render battery-vehicles or MEGCs unsafe for filling, discharge or transport;

¹⁰ *In special cases and with the agreement of the expert approved by the competent authority, the hydraulic pressure test may be replaced by a pressure test using another liquid or gas, where such an operation does not present any danger.*

- (c) Missing or loose bolts or nuts on any flanged connection or blank flange are replaced or tightened;
- (d) All emergency devices and valves are free from corrosion, distortion and any damage or defect that could prevent their normal operation. Remote closure devices and self-closing stop-valves shall be operated to demonstrate proper operation;
- (e) Required markings on the battery-vehicles or MEGCs are legible and in accordance with the applicable requirements; and
- (f) Any framework, supports and arrangements for lifting the battery-vehicles or MEGCs are in satisfactory condition.

6.8.3.4.16 The tests, inspections and checks in accordance with 6.8.3.4.10 to 6.8.3.4.15 shall be carried out by the expert approved by the competent authority. Certificates shall be issued showing the results of these operations, even in the case of negative results.

These certificates shall refer to the list of the substances permitted for carriage in this battery-vehicle or MEGC in accordance with 6.8.2.3.1.

A copy of these certificates shall be attached to the tank record of each tank, battery-vehicle or MEGC tested (see 4.3.2.1.7).

6.8.3.5 **Marking**

6.8.3.5.1 The following additional particulars shall be marked by stamping or by any other similar method on the plate prescribed in 6.8.2.5.1, or directly on the walls of the shell itself if the walls are so reinforced that the strength of the tank is not impaired.

6.8.3.5.2 On tanks intended for the carriage of only one substance:

- the proper shipping name of the gas and, in addition for gases classified under an n.o.s. entry, the technical name¹⁶;

This indication shall be supplemented:

- in the case of tanks intended for the carriage of compressed gases filled by volume (pressure), by an indication of the maximum filling pressure at 15 °C permitted for the tank; and
- in the case of tanks intended for the carriage of compressed gases filled by mass, and of liquefied gases, refrigerated liquefied gases or dissolved gases by an indication of the maximum permissible load mass in kg and of the filling temperature if below -20 °C.

6.8.3.5.3 On multipurpose tanks:

- the proper shipping names of the gases and, in addition for gases classified under an n.o.s. entry, the technical name of the gases¹⁶ for whose carriage the tank is approved.

¹⁶ *Instead of the proper shipping name or, if applicable, of the proper shipping name of the n.o.s. entry followed by the technical name, the use of the following names is permitted:*

- *for UN No. 1078 refrigerant gas, n.o.s.: mixture F1, mixture F2, mixture F3;*
- *for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;*
- *for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.: mixture A, mixture A01, mixture A02, mixture A0, mixture A1, mixture B1, mixture B2, mixture B, mixture C. The names customary in the trade and mentioned in 2.2.2.3, Classification code 2F, UN No. 1965, Note 1 may be used only as a complement;*
- *for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.*

These particulars shall be supplemented by an indication of the maximum permissible load mass in kg for each gas.

6.8.3.5.4 On tanks intended for the carriage of refrigerated liquefied gases:

- the maximum working pressure allowed.

6.8.3.5.5 On tanks equipped with thermal insulation:

- the inscription "thermally insulated" or "thermally insulated by vacuum".

6.8.3.5.6 In addition to the particulars prescribed in 6.8.2.5.2, the following shall be inscribed on the tank-vehicle (on the tank itself or on plates)¹³: In addition to the particulars prescribed in 6.8.2.5.2, the following shall be inscribed on the tank-container (on the tank itself or on plates)¹³:

- (a) - the tank code according to the certificate (see 6.8.2.3.1) with the actual test pressure of the tank;
- the inscription: "minimum filling temperature allowed: ...";
- (b) where the tank is intended for the carriage of one substance only:
 - the proper shipping name of the gas and, in addition for gases classified under an n.o.s. entry, the technical name¹⁶;
 - for compressed gases which are filled by mass, and for liquefied gases, refrigerated liquefied gases or dissolved gases, the maximum permissible load mass in kg;
- (c) where the tank is a multipurpose tank:
 - the proper shipping name of the gas and, for gases classified under an n.o.s. entry, the technical name¹⁶ of all gases to whose carriage the tank is assigned with an indication of the maximum permissible load mass in kg for each of them;
- (d) where the shell is equipped with thermal insulation:
 - the inscription "thermally insulated" (or "thermally insulated by vacuum"), in an official language of the country of registration and also, if that language is not English, French or German, in English, French or German, unless any agreements concluded between the countries concerned in the transport operation provide otherwise.

6.8.3.5.7 (Reserved)

6.8.3.5.8 These particulars shall not be required in the case of a vehicle carrying demountable tanks.

6.8.3.5.9 (Reserved)

¹³ Add the units of measurement after the numerical values.

¹⁶ Instead of the proper shipping name or, if applicable, of the proper shipping name of the n.o.s. entry followed by the technical name, the use of the following names is permitted:

- for UN No. 1078 refrigerant gas, n.o.s.: mixture F1, mixture F2, mixture F3;
- for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;
- for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s.: mixture A, mixture A01, mixture A02, mixture A0, mixture A1, mixture B1, mixture B2, mixture B, mixture C. The names customary in the trade and mentioned in 2.2.2.3, Classification code 2F, UN No. 1965, Note 1 may be used only as a complement;
- for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.

Marking of battery-vehicles and MEGCs

6.8.3.5.10 Every battery-vehicle and every MEGC shall be fitted with a corrosion-resistant metal plate permanently attached in a place readily accessible for inspection. The following particulars at least shall be marked on the plate by stamping or by any other similar method¹³

- approval number;
- manufacturer's name or mark;
- manufacturer's serial number;
- year of manufacture;
- test pressure (gauge pressure)
- design temperature (only if above +50 °C or below -20 °C);
- date (month and year) of initial test and most recent periodic test in accordance with 6.8.3.4.10 to 6.8.3.4.13;
- stamp of the expert who carried out the tests.

6.8.3.5.11 The following particulars shall be inscribed on the battery-vehicle itself or on a plate¹³:

- names of owner or of operator;
 - number of elements;
 - total capacity of the elements;
- and for battery-vehicles filled by mass:
- unladen mass;
 - maximum permissible mass.

The following particulars shall be inscribed either on the MEGC itself or on a plate¹³:

- names of owner and of operator;
- number of elements;
- total capacity of the elements;
- maximum permissible laden mass;
- the tank code according to the certificate of approval (see 6.8.2.3.1) with the actual test pressure of the MEGC;
- the proper shipping name of the gases, and in addition, for gases classified under an n.o.s. entry, the technical name¹⁶ of the gases for whose carriage the MEGC is used;

and for MEGCs filled by mass:

- tare.

¹³ Add the units of measurement after the numerical values.

¹⁶ Instead of the proper shipping name or, if applicable, of the proper shipping name of the n.o.s. entry followed by the technical name, the use of the following names is permitted:

- for UN No. 1078 refrigerant gas, n.o.s: mixture F1, mixture F2, mixture F3;
- for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;
- for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s: mixture A, mixture A01, mixture A02, mixture A0, mixture A1, mixture B1, mixture B2, mixture B, mixture C. The names customary in the trade and mentioned in 2.2.2.3, Classification code 2F, UN No. 1965, Note 1 may be used only as a complement;
- for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.

- 6.8.3.5.12 The frame of a battery-vehicle or MEGC shall bear near the filling point a plate specifying:
- the maximum filling pressure¹³ at 15 °C allowed for elements intended for compressed gases;
 - the proper shipping name of the gas in accordance with Chapter 3.2 and, in addition for gases classified under an n.o.s. entry, the technical name¹⁶;
- and, in addition, in the case of liquefied gases:
- the permissible maximum load per element¹³.

6.8.3.5.13 Cylinders, tubes and pressure drums, and cylinders as part of bundles of cylinders, shall be marked according to 6.2.2.7. These receptacles need not be labelled individually with the danger labels as required in Chapter 5.2.

Battery-vehicles and MEGCs shall be placarded and marked according to Chapter 5.3.

6.8.3.6 *Requirements for battery-vehicles and MEGCs which are designed, constructed and tested according to referenced standards*

NOTE: *Persons or bodies identified in standards as having responsibilities in accordance with ADR shall meet the requirements of ADR.*

The standard referenced in the table below shall be applied for the issue of type approvals as indicated in column (4) to meet the requirements of Chapter 6.8 referred to in column (3). The requirements of Chapter 6.8 referred to in column (3) shall prevail in all cases. Column (5) gives the latest date when existing type approvals shall be withdrawn according to 1.8.7.2.4; if no date is shown the type approval remains valid until it expires.

Since 1 January 2009 the use of the referenced standards has been mandatory. Exceptions are dealt with in 6.8.3.7

If more than one standard is referenced for the application of the same requirements, only one of them shall be applied, but in full unless otherwise specified in the table below.

The scope of application of each standard is defined in the scope clause of the standard unless otherwise specified in the Table below.

¹³ Add the units of measurements after the numerical values.

¹⁶ Instead of the proper shipping name or, if applicable, of the proper shipping name of the n.o.s. entry followed by the technical name, the use of the following names is permitted:

- for UN No. 1078 refrigerant gas, n.o.s: mixture F1, mixture F2, mixture F3;
- for UN No. 1060 methylacetylene and propadiene mixtures, stabilized: mixture P1, mixture P2;
- for UN No. 1965 hydrocarbon gas mixture, liquefied, n.o.s: mixture A, mixture A01, mixture A02, mixture A0, mixture A1, mixture B1, mixture B2, mixture B, mixture C. The names customary in the trade and mentioned in 2.2.2.3, Classification code 2F, UN No. 1965, Note 1 may be used only as a complement;
- for UN No. 1010 Butadienes, stabilized: 1,2-Butadiene, stabilized, 1,3-Butadiene, stabilized.

Reference	Title of document	Applicable sub-sections and paragraphs	Applicable for new type approvals or for renewals	Latest date for withdrawal of existing type approvals
(1)	(2)	(3)	(4)	(5)
EN 13807:2003	Transportable gas cylinders – Battery vehicles – Design, manufacture, identification and testing	6.8.3.1.4 and 6.8.3.1.5, 6.8.3.2.18 to 6.8.3.2.26, 6.8.3.4.10 to 6.8.3.4.12 and 6.8.3.5.10 to 6.8.3.5.13	Until further notice	

6.8.3.7 *Requirements for battery-vehicles and MEGCs which are not designed, constructed and tested according to referenced standards*

To reflect scientific and technical progress or where no standard is referenced in 6.8.3.6 or to deal with specific aspects not addressed in a standard referenced in 6.8.3.6, the competent authority may recognize the use of a technical code providing the same level of safety. Battery-vehicles and MEGCs shall, however, comply with the minimum requirements of 6.8.3.

In the type approval the issuing body shall specify the procedure for periodic inspections if the standards referenced in 6.2.2, 6.2.4 or 6.8.2.6 are not applicable or shall not be applied.

The competent authority shall transmit to the secretariat of UNECE a list of the technical codes that it recognises. The list should include the following details: name and date of the code, purpose of the code and details of where it may be obtained. The secretariat shall make this information publicly available on its website.

A standard which has been adopted for reference in a future edition of the ADR may be approved by the competent authority for use without notifying the UNECE secretariat.

6.8.4 **Special provisions**

NOTE 1: For liquids having a flash-point of not more than 60 °C and for flammable gases, see also 6.8.2.1.26, 6.8.2.1.27 and 6.8.2.2.9.

NOTE 2: For requirements for tanks subjected to a pressure test of not less than 1 MPa (10 bar) or for tanks intended for the carriage of refrigerated liquefied gases, see 6.8.5.

When they are shown under an entry in Column (13) of Table A of Chapter 3.2, the following special provisions apply:

(a) **Construction (TC)**

TC1 The requirements of 6.8.5 are applicable to the materials and construction of these shells.

TC2 Shells, and their items of equipment, shall be made of aluminium not less than 99.5% pure or of suitable steel not liable to cause hydrogen peroxide to decompose. Where shells are made of aluminium not less than 99.5% pure, the wall thickness need not exceed 15 mm, even where calculation in accordance with 6.8.2.1.17 gives a higher value.

TC3 The shells shall be made of austenitic steel.

TC4 Shells shall be provided with an enamel or equivalent protective lining if the material of the shell is attacked by UN No. 3250 chloroacetic acid.

TC5 Shells shall be provided with a lead lining not less than 5 mm thick or an equivalent lining.

- TC6** Where the use of aluminium is necessary for tanks, such tanks shall be made of aluminium not less than 99.5% pure; the wall thickness need not exceed 15 mm even where calculation in accordance with 6.8.2.1.17 gives a higher value.
- TC7** The effective minimum thickness of the shell shall not be less than 3 mm.
- TC8** The shells shall be made of aluminium or aluminium alloy.
- (b) **Items of equipment (TE)**
- TE1** *(Deleted)*
- TE2** *(Deleted)*
- TE3** Tanks shall in addition meet the following requirements. The heating device shall not penetrate into, but shall be exterior to the shell. However, a pipe used for extracting the phosphorus may be equipped with a heating jacket. The device heating the jacket shall be so regulated as to prevent the temperature of the phosphorus from exceeding the filling temperature of the shell. Other piping shall enter the shell in its upper part; openings shall be situated above the highest permissible level of the phosphorus and be capable of being completely enclosed under lockable caps. The tank shall be equipped with a gauging system for verifying the level of the phosphorus and, if water is used as a protective agent, with a fixed gauge mark showing the highest permissible level of the water.
- TE4** Shells shall be equipped with thermal insulation made of materials which are not readily flammable.
- TE5** If shells are equipped with thermal insulation, such insulation shall be made of materials which are not readily flammable.
- TE6** Tanks may be equipped with a device of a design which precludes its obstruction by the substance carried and which prevents leakage and the build-up of excess overpressure or underpressure inside the shell.
- TE7** The shell-discharge system shall be equipped with two mutually independent shut-off devices mounted in series, the first taking the form of a quick-closing internal stop-valve of an approved type and the second that of an external stop-valve, one at each end of the discharge pipe. A blank flange, or another device providing the same measure of security, shall also be fitted at the outlet of each external stop-valve. The internal stop-valve shall be such that if the pipe is wrenched off the stop-valve will remain integral with the shell and in the closed position.
- TE8** The connections to the external pipe-sockets of tanks shall be made of materials not liable to cause decomposition of hydrogen peroxide.
- TE9** Tanks shall be fitted in their upper part with a shut-off device preventing any build-up of excess pressure inside the shell due to the decomposition of the substances carried, any leakage of liquid, and any entry of foreign matter into the shell.
- TE10** The shut-off devices of tanks shall be so designed as to preclude obstruction of the devices by the solidified substance during carriage. Where tanks are sheathed in thermally-insulating material, the material shall be of an inorganic nature and entirely free from combustible matter.
- TE11** Shells and their service equipment shall be so designed as to prevent the entry of foreign matter, leakage of liquid or any building up of dangerous excess pressure inside the shell due to the decomposition of the substances carried. A safety valve preventing the entry of foreign matter also fulfils this provision.
- TE12** Tanks shall be equipped with thermal insulation complying with the requirements of 6.8.3.2.14. If the SADT of the organic peroxide in the tank is 55 °C or less, or the tank is constructed of aluminium, the shell shall be completely insulated. The sun shield and any part of the tank not covered by it, or the outer sheathing of a complete lagging, shall be painted white or finished in bright metal. The paint shall be cleaned before each transport journey and

renewed in case of yellowing or deterioration. The thermal insulation shall be free from combustible matter. Tanks shall be fitted with temperature sensing devices.

Tanks shall be fitted with safety valves and emergency pressure-relief devices. Vacuum-relief devices may also be used. Emergency pressure-relief devices shall operate at pressures determined according to both the properties of the organic peroxide and the construction characteristics of the tank. Fusible elements shall not be permitted in the body of the shell.

Tanks shall be fitted with spring-loaded safety valves to prevent significant pressure build-up within the shell of the decomposition products and vapours released at a temperature of 50 °C. The capacity and start-to-discharge pressure of the safety-valve(s) shall be based on the results of the tests specified in special provision TA2. The start-to-discharge pressure shall however in no case be such that liquid could escape from the valve(s) if the tank were overturned.

The emergency-relief devices may be of the spring-loaded or frangible types designed to vent all the decomposition products and vapours evolved during a period of not less than one hour of complete fire-engulfment as calculated by the following formula:

$$q = 70961 \times F \times A^{0.82}$$

where:

q = heat absorption [W]

A = wetted area [m²]

F = insulation factor

F = 1 for non-insulated tanks, or

$$F = \frac{U (923 - T_{p0})}{47032} \text{ for insulated tanks}$$

where:

K = heat conductivity of insulation layer [W·m⁻¹·K⁻¹]

L = thickness of insulation layer [m]

U = K/L = heat transfer coefficient of the insulation [W·m⁻²·K⁻¹]

T_{p0} = temperature of peroxide at relieving conditions [K]

The start-to-discharge pressure of the emergency-relief device(s) shall be higher than that above specified and based on the results of the tests referred to in special provision TA2. The emergency-relief devices shall be dimensioned in such a way that the maximum pressure in the tank never exceeds the test pressure of the tank.

NOTE: An example of a method to determine the size of emergency-relief devices is given in Appendix 5 of the Manual of Tests and Criteria.

For tanks equipped with thermal insulation consisting of a complete cladding, the capacity and setting of the emergency-relief device(s) shall be determined assuming a loss of insulation from 1% of the surface area.

Vacuum-relief devices and spring-loaded safety valves of tanks shall be provided with flame arresters unless the substances to be carried and their decomposition products are non-combustible. Due attention shall be paid to the reduction of the relief capacity caused by the flame arrester.

TE13 Tanks shall be thermally insulated and fitted with a heating device on the outside.

TE14 Tanks shall be equipped with thermal insulation. The thermal insulation directly in contact with the shell shall have an ignition temperature at least 50 °C higher than the maximum temperature for which the tank was designed.

TE15 (Deleted)

TE16 (Reserved)

TE17 (Reserved)

TE18 Tanks intended for the carriage of substances filled at a temperature higher than 190 °C shall be equipped with deflectors placed at right angles to the upper filling openings, so as to avoid a sudden localized increase in wall temperature during filling.

TE19 Fittings and accessories mounted in the upper part of the tank shall be either:

- inserted in a recessed housing; or
- equipped with an internal safety valve; or
- shielded by a cap, or by transverse and/or longitudinal members, or by other equally effective devices, so profiled that in the event of overturning the fittings and accessories will not be damaged.

Fittings and accessories mounted in the lower part of the tank:

Pipe-sockets, lateral shut-off devices, and all discharge devices shall either be recessed by at least 200 mm from the extreme outer edge of the tank or be protected by a rail having a coefficient of inertia of not less than 20 cm³ transversally to the direction of travel; their ground clearance shall be not less than 300 mm with the tank full.

Fittings and accessories mounted on the rear face of the tank shall be protected by the bumper prescribed in 9.7.6. Their height above the ground shall be such that they are adequately protected by the bumper

TE20 Notwithstanding the other tank-codes which are permitted in the hierarchy of tanks of the rationalized approach in 4.3.4.1.2, tanks shall be equipped with a safety valve.

TE21 The closures shall be protected with lockable caps.

TE22 (Reserved)

TE23 Tanks shall be equipped with a device of a design which precludes its obstruction by the substance carried and which prevents leakage and the build-up of excess overpressure or underpressure inside the shell.

TE24 If tanks, intended for the carriage and handling of bitumen, are equipped with a spray bar at the end of the discharge pipe, the closing device, as required by 6.8.2.2.2, may be replaced by a shut-off valve, situated on the discharge pipe and preceding the spray bar.

TE25 (Reserved)

(c) Type approval (TA)

TA1 Tanks shall not be approved for the carriage of organic substances.

TA2 This substance may be carried in fixed or demountable tanks or tank-containers under the conditions laid down by the competent authority of the country of origin, if, on the basis of the tests mentioned below, the competent authority is satisfied that such a transport operation can be carried out safely. If the country of origin is not party to ADR, these conditions shall be recognized by the competent authority of the first ADR country reached by the consignment.

For the type approval tests shall be undertaken:

- to prove the compatibility of all materials normally in contact with the substance during carriage;
- to provide data to facilitate the design of the emergency pressure-relief devices and safety valves taking into account the design characteristics of the tank; and
- to establish any special requirements necessary for the safe carriage of the substance.

The test results shall be included in the report for the type approval.

TA3 This substance may be carried only in tanks with the tank code LGAV or SGAV; the hierarchy in 4.3.4.1.2 is not applicable.

TA4 The conformity assessment procedures of section 1.8.7 shall be applied by the competent authority, its delegate or inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited to EN ISO/IEC 17020:2012 (except clause 8.1.3) type A.

TA5 This substance may be carried only in tanks with the tank code S2.65AN(+); the hierarchy in 4.3.4.1.2 is not applicable.

(d) Tests (TT)

TT1 Tanks of pure aluminium need to be subjected to the initial and periodic hydraulic pressure tests at a pressure of only 250 kPa (2.5 bar) (gauge pressure).

TT2 The condition of the lining of shells shall be inspected every year by an expert approved by the competent authority, who shall inspect the inside of the shell.

TT3 By derogation from the requirements of 6.8.2.4.2, periodic inspections shall take place at least every eight years and shall include a thickness check using suitable instruments. For such tanks, the leakproofness test and check for which provision is made in 6.8.2.4.3 shall be carried out at least every four years.

TT4 (*Reserved*)

TT5 The hydraulic pressure tests shall take place at least every
3 years. | 2½ years.

TT6 The periodic tests, including the
hydraulic pressure test, shall be
carried out at least every 3 years. |

TT7 Notwithstanding the requirements of 6.8.2.4.2, the periodic internal inspection may be replaced by a programme approved by the competent authority.

TT8 Tanks on which the proper shipping name required for the entry UN 1005 AMMONIA, ANHYDROUS is marked in accordance with 6.8.3.5.1 to 6.8.3.5.3 and constructed of fine-grained steel with a yield strength of more than 400 N/mm² in accordance with the material standard, shall be subjected at each periodic test according to 6.8.2.4.2, to magnetic particle inspections to detect surface cracking.

For the lower part of each shell at least 20% of the length of each circumferential and longitudinal weld shall, together with all nozzle welds and any repair or ground areas, be inspected.

If the marking of the substance on the tank or tank plate is removed, a magnetic particle inspection shall be carried out and these actions recorded in the inspection certificate attached to the tank record.

Such magnetic particle inspections shall be carried out by a competent person qualified for this method according to EN ISO 9712:2012 (Non-destructive testing – Qualification and certification of NDT personnel – General principles).

TT9 For inspections and tests (including supervision of the manufacture) the procedures of section 1.8.7 shall be applied by the competent authority, its delegate or inspection body conforming to 1.8.6.2, 1.8.6.4, 1.8.6.5 and 1.8.6.8 and accredited according to EN ISO/IEC 17020:2012 (except clause 8.1.3) type A.

TT10 **The periodic inspections according to 6.8.2.4.2 shall take place:**

at least every three years.

at least every two and a half years.

TT11 For fixed tanks (tank-vehicles) and demountable tanks used exclusively for the carriage of LPG, with carbon steel shells and service equipment, the hydraulic pressure test, may, at the time of the periodic inspection and at the request of the applicant, be replaced by the non-destructive testing (NDT) techniques listed below. These techniques may be used either singularly or in combination as deemed suitable by the competent authority, its delegate or inspection body (see special provision TT9):

– EN ISO 17640:2010 – Non-destructive testing of welds – Ultrasonic testing – Techniques, testing levels and assessment,

– EN ISO 17638:2009 – Non-destructive testing of welds – Magnetic particle testing, with indications acceptance in accordance with EN ISO 23278:2009 – Magnetic particle testing of welds. Acceptance levels,

– EN 1711:2000 – Non-destructive testing of welds – Eddy current examination of welds by complex plane analysis,

– EN 14127:2011 – Non-destructive testing – Ultrasonic thickness measurement,

Personnel involved in NDT shall be qualified, certified and have the appropriate theoretical and practical

knowledge of the non-destructive tests they perform, specify, supervise, monitor or evaluate in accordance with:

–EN ISO 9712:2012 – Non-destructive testing – Qualification and certification of NDT personnel.

After direct application of heat such as welding or cutting to the pressure containing elements of the tank a hydraulic test shall be carried out in addition to any prescribed NDT.

NDT shall be performed on the areas of the shell and equipment listed in the table below:

Area of shell and equipment	NDT
Shell longitudinal butt welds	100% NDT, using one or more of the following techniques: ultrasonic, magnetic particle or eddy current testing
Shell circumferential butt welds	
Attachments, manway, nozzles and opening welds (internal) direct to the shell	
High stress areas of fastening doubling plates (over the end of the saddle horn, plus 400 mm down each side)	
Piping and other equipment welds	Ultrasonic thickness survey, from inside, on a 150 mm (maximum) spaced grid
Shell, areas that cannot be visually inspected from the outside	

Irrespective of the original design and construction standard or technical code used for the tank, the defect acceptance levels shall be in accordance with the requirements of the relevant parts of EN 14025:2013 (Tanks for the transport of dangerous goods – metallic pressure tanks – design and construction), EN 12493:2013 (LPG equipment and accessories – welded steel tanks for liquefied petroleum gas (LPG) – road tankers – design and manufacture), EN ISO 23278:2009 (Non-destructive testing of welds – magnetic particle testing of welds – acceptance levels) or the acceptance standard referenced in the applicable NDT standard.

If an unacceptable defect is found in the tank by NDT methods it shall be repaired and retested. It is not permitted to hydraulic test the tank without undertaking the required repairs.

The results of the NDT shall be recorded and retained for the lifetime of the tank.

(e) **Marking (TM)**

NOTE: *These particulars shall be in an official language of the country of approval, and also, if that language is not English, French or German, in English, French or German, unless any agreements concluded between the countries concerned in the transport operation provide otherwise.*

TM1 Tanks shall bear in addition to the particulars prescribed in 6.8.2.5.2, the words: "**Do not open during carriage. Liable to spontaneous combustion**" (see also the Note above).

TM2 Tanks shall bear in addition to the particulars prescribed in 6.8.2.5.2, the words: "**Do not open during carriage. Gives off flammable gases on contact with water**" (see also the Note above).

TM3 Tanks shall also bear, on the plate prescribed in 6.8.2.5.1, the proper shipping name and the maximum permissible load mass in kg for this substance.

TM4 For tanks the following additional particulars shall be marked by stamping or by any other similar method on the plate prescribed in 6.8.2.5.2 or directly on the shell itself, if the walls are so reinforced that the strength of the tank is not impaired: the chemical name with the approved concentration of the substance concerned.

TM5 Tanks shall bear, in addition to the particulars referred to in 6.8.2.5.1 the date (month, year) of the most recent inspection of the internal condition of the shell.

TM6 *(Reserved)*

TM7 The trefoil symbol, as described in 5.2.1.7.6, shall be marked by stamping or any other equivalent method on the plate described in 6.8.2.5.1. This trefoil may be engraved directly on the walls of the shell itself, if the walls are so reinforced that the strength of the shell is not impaired.

6.8.5 Requirements concerning the materials and construction of fixed welded tanks, demountable welded tanks, and welded shells of tank-containers for which a test pressure of not less than 1 MPa (10 bar) is required, and of fixed welded tanks, demountable welded tanks and welded shells of tank-containers intended for the carriage of refrigerated liquefied gases of Class 2

6.8.5.1 Materials and shells

6.8.5.1.1 (a) Shells intended for the carriage of:

- compressed, liquefied gases or dissolved gases of Class 2;
- UN Nos. 1380, 2845, 2870, 3194 and 3391 to 3394 of Class 4.2; and
- UN No. 1052 hydrogen fluoride, anhydrous and UN No.1790 hydrofluoric acid with more than 85% hydrogen fluoride of Class 8

shall be made of steel;

(b) Shells constructed of fine-grained steels for the carriage of:

- corrosive gases of Class 2 and UN No. 2073 ammonia solution; and
- UN No. 1052 hydrogen fluoride, anhydrous and UN No.1790 hydrofluoric acid with more than 85% hydrogen fluoride of Class 8

shall be heat-treated for thermal stress relief;

- (c) Shells intended for the carriage of refrigerated liquefied gases of Class 2, shall be made of steel, aluminium, aluminium alloy, copper or copper alloy (e.g. brass). However, shells made of copper or copper alloy shall be allowed only for gases containing no acetylene; ethylene, however, may contain not more than 0.005% acetylene;
- (d) Only materials appropriate to the lowest and highest working temperatures of the shells and of their fittings and accessories may be used.

6.8.5.1.2 The following materials shall be allowed for the manufacture of shells:

- (a) Steels not subject to brittle fracture at the lowest working temperature (see 6.8.5.2.1):
 - mild steels (except for refrigerated liquefied gases of Class 2);
 - fine-grained steels, down to a temperature of -60 °C;
 - nickel steels (with a nickel content of 0.5 to 9%), down to a temperature of -196 °C, depending on the nickel content;
 - austenitic chrome-nickel steels, down to a temperature of -270 °C;
- (b) Aluminium not less than 99.5% pure or aluminium alloys (see 6.8.5.2.2);
- (c) Deoxidized copper not less than 99.9% pure, or copper alloys having a copper content of over 56% (see 6.8.5.2.3).

6.8.5.1.3 (a) Shells made of steel, aluminium or aluminium alloys shall be either seamless or welded;

(b) Shells made of austenitic steel, copper or copper alloy may be hard-soldered.

6.8.5.1.4 The fittings and accessories may either be screwed to the shells or be secured thereto as follows:

- (a) Shells made of steel, aluminium or aluminium alloy: by welding;
- (b) Shells made of austenitic steel, of copper or of copper alloy: by welding or hard-soldering.

6.8.5.1.5 The construction of shells and their attachment to the vehicle, to the underframe or in the container frame shall be such as to preclude with certainty any such reduction in the temperature of the load-bearing components as would be likely to render them brittle. The means of attachment of shells shall themselves be so designed that even when the shell is at its lowest working temperature they still possess the necessary mechanical properties.

6.8.5.2 Test requirements

6.8.5.2.1 Steel shells

The materials used for the manufacture of shells and the weld beads shall, at their lowest working temperature, but at least at -20 °C, meet at least the following requirements as to impact strength:

- The tests shall be carried out with test-pieces having a V-shaped notch;
- The minimum impact strength (see 6.8.5.3.1 to 6.8.5.3.3) for test-pieces with the longitudinal axis at right angles to the direction of rolling and a V-shaped notch (conforming to ISO R 148) perpendicular to the plate surface, shall be 34 J/cm² for mild steel (which, because of existing ISO standards, may be tested with test-pieces having the longitudinal axis in the direction of rolling); fine-grained steel; ferritic alloy steel Ni < 5%, ferritic alloy steel 5% ≤ Ni ≤ 9%; or austenitic Cr - Ni steel;
- In the case of austenitic steels, only the weld bead need be subjected to an impact-strength test;
- For working temperatures below -196°C the impact-strength test is not performed at the lowest working temperature, but at -196 °C.

6.8.5.2.2 *Shells made of aluminium or aluminium alloy*

The seams of shells shall meet the requirements laid down by the competent authority.

6.8.5.2.3 *Shells made of copper or copper alloy*

It is not necessary to carry out tests to determine whether the impact strength is adequate.

6.8.5.3 *Impact-strength tests*

6.8.5.3.1 For sheets less than 10 mm but not less than 5 mm thick, test-pieces having a cross-section of 10 mm × e mm, where "e" represents the thickness of the sheet, shall be used. Machining to 7.5 mm or 5 mm is permitted if it is necessary. The minimum value of 34 J/cm² shall be required in every case.

NOTE: No impact-strength test shall be carried out on sheets less than 5 mm thick, or on their weld seams.

6.8.5.3.2 (a) For the purpose of testing sheets, the impact strength shall be determined on three test-pieces. Test-pieces shall be taken at right angles to the direction of rolling; however, for mild steel they may be taken in the direction of rolling.

(b) For testing weld seams the test-pieces shall be taken as follows:

when $e \leq 10$ mm:

three test-pieces with the notch at the centre of the weld;

three test-pieces with the notch in the centre of the heat affected zone (the V-notch to cross the fusion boundary at the centre of the specimen);

when $10 \text{ mm} < e \leq 20 \text{ mm}$:

three test-pieces from the centre of the weld;

three test-pieces from the heat affected zone (the V-notch to cross the fusion boundary at the centre of the specimen);

Center of the weld

Heat affected zone

when $e > 20 \text{ mm}$

two sets of three test-pieces, one set on the upper face, one set on the lower face at each of the points indicated below (the V-notch to cross the fusion boundary at the centre of the specimen for those taken from the heat affected zone)

Center of the weld

Heat affected zone

6.8.5.3.3

- (a) For sheets, the average of the three tests shall meet the minimum value of 34 J/cm^2 indicated in 6.8.5.2.1; not more than one of the individual values may be below the minimum value and then not below 24 J/cm^2 ;
- (b) For welds, the average value obtained from the three test-pieces taken at the centre of the weld shall not be below the minimum value of 34 J/cm^2 ; not more than one of the individual values may be below the minimum value and then not below 24 J/cm^2 ;

- (c) For the heat affected zone (the V-notch to cross the fusion boundary at the centre of the specimen) the value obtained from not more than one of the three test-pieces may be below the minimum value of 34 J/cm², though not below 24 J/cm².

6.8.5.3.4 If the requirements prescribed in 6.8.5.3.3 are not met, one retest only may be done if:

- (a) the average value of the first three tests is below the minimum value of 34 J/cm²; or
- (b) more than one of the individual values is less than the minimum value of 34 J/cm² but not below 24 J/cm².

6.8.5.3.5 In a repeated impact test on sheets or welds, none of the individual values may be below 34 J/cm². The average value of all the results of the original test and of the retest should be equal to or more than the minimum of 34 J/cm².

On a repeated impact strength test on the heat-affected zone, none of the individual values may be below 34 J/cm².

6.8.5.4 *Reference to standards*

The requirements of 6.8.5.2 and 6.8.5.3 shall be deemed to have been complied with if the following relevant standards have been applied:

EN 1252-1:1998 Cryogenic vessels - Materials - Part 1: Toughness requirements for temperature below - 80 °C.

EN 1252-2:2001 Cryogenic vessels - Materials - Part 2: Toughness requirements for temperature between - 80 °C and - 20 °C.

CHAPTER 6.9

REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, EQUIPMENT, TYPE APPROVAL, TESTING AND MARKING OF FIBRE-REINFORCED PLASTICS (FRP) FIXED TANKS (TANK-VEHICLES), DEMOUNTABLE TANKS, TANK-CONTAINERS AND TANK SWAP BODIES

NOTE: *For portable tanks and UN multiple-element gas containers (MEGCs) see Chapter 6.7; for fixed tanks (tank-vehicles), demountable tanks and tank-containers and tank swap bodies, with shells made of metallic materials, and battery-vehicles and multiple element gas containers (MEGCs) other than UN MEGCs see Chapter 6.8; for vacuum operated waste tanks see Chapter 6.10.*

6.9.1 General

- 6.9.1.1 FRP tanks shall be designed, manufactured and tested in accordance with a quality assurance programme recognized by the competent authority; in particular, lamination work and welding of thermoplastic liners shall only be carried out by qualified personnel in accordance with a procedure recognized by the competent authority.
- 6.9.1.2 For the design and testing of FRP tanks, the provisions of 6.8.2.1.1, 6.8.2.1.7, 6.8.2.1.13, 6.8.2.1.14 (a) and (b), 6.8.2.1.25, 6.8.2.1.27, 6.8.2.1.28 and 6.8.2.2.3 shall also apply.
- 6.9.1.3 Heating elements shall not be used for FRP tanks.
- 6.9.1.4 For the stability of tank-vehicles, the requirements of 9.7.5.1 shall apply.

6.9.2 Construction

- 6.9.2.1 Shells shall be made of suitable materials, which shall be compatible with the substances to be carried in a service temperature range of between -40°C and +50°C, unless temperature ranges are specified for specific climatic conditions by the competent authority of the country where the transport operation is performed.
- 6.9.2.2 Shells shall consist of the following three elements :
- internal liner,
 - structural layer,
 - external layer.
- 6.9.2.2.1 The internal liner is the inner shell wall zone designed as the primary barrier to provide for the long-term chemical resistance in relation to the substances to be carried, to prevent any dangerous reaction with the contents or the formation of dangerous compounds and any substantial weakening of the structural layer owing to the diffusion of products through the internal liner.
- The internal liner may either be a FRP liner or a thermoplastic liner.
- 6.9.2.2.2 FRP liners shall consist of:
- (a) surface layer ("gel-coat"): adequate resin rich surface layer, reinforced with a veil, compatible with the resin and contents. This layer shall have a fibre mass content of not more than 30% and have a thickness between 0.25 and 0.60 mm;
 - (b) strengthening layer(s): layer or several layers with a minimum thickness of 2 mm, containing a minimum of 900 g/m² of glass mat or chopped fibres with a mass content in glass of not less than 30% unless equivalent safety is demonstrated for a lower glass content.

- 6.9.2.2.3 Thermoplastic liners shall consist of thermoplastic sheet material as referred to in 6.9.2.3.4, welded together in the required shape, to which the structural layers are bonded. Durable bonding between liners and the structural layer shall be achieved by the use of an appropriate adhesive.

NOTE: For the carriage of flammable liquids the internal layer may require additional measures in accordance with 6.9.2.14, in order to prevent the accumulation of electrical charges.

- 6.9.2.2.4 The structural layer of the shell is the zone specially designed according to 6.9.2.4 to 6.9.2.6 to withstand the mechanical stresses. This part normally consists of several fibre reinforced layers in determined orientations.

- 6.9.2.2.5 The external layer is the part of the shell which is directly exposed to the atmosphere. It shall consist of a resin rich layer with a thickness of at least 0.2 mm. For a thickness larger than 0.5 mm, a mat shall be used. This layer shall have a mass content in glass of less than 30% and shall be capable of withstanding exterior conditions, in particular the occasional contact with the substance to be carried. The resin shall contain fillers or additives to provide protection against deterioration of the structural layer of the shell by ultra-violet radiation.

6.9.2.3 Raw materials

- 6.9.2.3.1 All materials used for the manufacture of FRP tanks shall be of known origin and specifications.

6.9.2.3.2 Resins

The processing of the resin mixture shall be carried out in strict compliance with the recommendations of the supplier. This concerns mainly the use of hardeners, initiators and accelerators. These resins can be:

- unsaturated polyester resins;
- vinyl ester resins;
- epoxy resins;
- phenolic resins.

The heat distortion temperature (HDT) of the resin, determined in accordance with EN ISO 75-1:2013 shall be at least 20°C higher than the maximum service temperature of the tank, but shall in any case not be lower than 70 °C.

6.9.2.3.3 Reinforcement fibres

The reinforcement material of the structural layers shall be a suitable grade of fibres such as glass fibres of type E or ECR according to ISO 2078:1993. For the internal surface liner, glass fibres of type C according to ISO 2078:1993 may be used. Thermoplastic veils may only be used for the internal liner when their compatibility with the intended contents has been demonstrated.

6.9.2.3.4 Thermoplastic liner material

Thermoplastic liners, such as unplasticized polyvinyl chloride (PVC-U), polypropylene (PP), polyvinylidene fluoride (PVDF), polytetrafluoroethylene (PTFE), etc. may be used as lining materials.

6.9.2.3.5 Additives

Additives necessary for the treatment of the resin, such as catalysts, accelerators, hardeners and thixotropic substances as well as materials used to improve the tank, such as fillers, colours, pigments etc. shall not cause weakening of the material, taking into account lifetime and temperature expectancy of the design.

- 6.9.2.4 Shells, their attachments and their service and structural equipment shall be designed to withstand without loss of contents (other than quantities of gas escaping through any degassing vents) during the design lifetime:

- the static and dynamic loads in normal conditions of carriage;
- the prescribed minimum loads as defined in 6.9.2.5 to 6.9.2.10.

6.9.2.5

At the pressures as indicated in 6.8.2.1.14 (a) and (b), and under the static gravity forces caused by the contents with maximum density specified for the design and at maximum filling degree, the design stress σ in longitudinal and circumferential direction of any layer of the shell shall not exceed the following value:

$$\sigma \leq \frac{R_m}{K}$$

where:

R_m = the value of tensile strength given by taking the mean value of the test results minus twice the standard deviation of the test results. The tests shall be carried out, in accordance with the requirements of EN ISO 527-4:1997 and EN ISO 527-5:2009, on not less than six samples representative of the design type and construction method;

K = $S \times K_0 \times K_1 \times K_2 \times K_3$

where

K shall have a minimum value of 4, and

S = the safety coefficient. For the general design, if the tanks are referred to in Column (12) of Table A of Chapter 3.2 by a tank code including the letter "G" in its second part (see 4.3.4.1.1), the value for S shall be equal to or more than 1.5. For tanks intended for the carriage of substances which require an increased safety level, i.e. if the tanks are referred to in Column (12) of Table A of Chapter 3.2 by a tank code including the number "4" in its second part (see 4.3.4.1.1), the value of S shall be multiplied by a factor of two, unless the shell is provided with protection against damage consisting of a complete metal skeleton including longitudinal and transverse structural members;

K_0 = a factor related to the deterioration in the material properties due to creep and ageing and as a result of the chemical action of the substances to be carried. It shall be determined by the formula:

$$K_0 = \frac{1}{\alpha\beta}$$

where " α " is the creep factor and " β " is the ageing factor determined in accordance with EN 978:1997 after performance of the test according to EN 977:1997. Alternatively, a conservative value of $K_0 = 2$ may be applied. In order to determine α and β the initial deflection shall correspond to 2σ ;

K_1 = a factor related to the service temperature and the thermal properties of the resin, determined by the following equation, with a minimum value of 1:

$$K_1 = 1.25 - 0.0125 (\text{HDT} - 70)$$

where HDT is the heat distortion temperature of the resin, in °C;

K_2 = a factor related to the fatigue of the material; the value of $K_2 = 1.75$ shall be used unless otherwise agreed with the competent authority. For the dynamic design as outlined in 6.9.2.6 the value of $K_2 = 1.1$ shall be used;

$K_3 =$ a factor related to curing and has the following values:

- 1.1 where curing is carried out in accordance with an approved and documented process;
- 1.5 in other cases.

6.9.2.6 At the dynamic stresses, as indicated in 6.8.2.1.2 the design stress shall not exceed the value specified in 6.9.2.5, divided by the factor α .

6.9.2.7 At any of the stresses as defined in 6.9.2.5 and 6.9.2.6, the resulting elongation in any direction shall not exceed 0.2% or one tenth of the elongation at fracture of the resin, whichever is lower.

6.9.2.8 At the specified test pressure, which shall not be less than the relevant calculation pressure as specified in 6.8.2.1.14 (a) and (b) the maximum strain in the shell shall not be greater than the elongation at fracture of the resin.

6.9.2.9 The shell shall be capable of withstanding the ball drop test according to 6.9.4.3.3 without any visible internal or external defects.

6.9.2.10 The overlay laminates used in the joints, including the end joints, the joints of the surge plates and the partitions with the shell shall be capable of withstanding the static and dynamic stresses mentioned above. In order to avoid concentrations of stresses in the overlay lamination, the applied taper shall not be steeper than 1:6.

The shear strength between the overlay laminate and the tank components to which it is bonded shall not be less than:

$$\tau = \frac{Q}{l} \leq \frac{\tau_R}{K}$$

where:

τ_R is the bending shear strength according to EN ISO 14125:1998 + AC:2002 + A1:2011 (three points method) with a minimum of $\tau_R = 10 \text{ N/mm}^2$, if no measured values are available;

Q is the load per unit width that the joint shall carry under the static and dynamic loads;

K is the factor calculated in accordance with 6.9.2.5 for the static and dynamic stresses;

l is the length of the overlay laminate.

6.9.2.11 Openings in the shell shall be reinforced to provide at least the same safety factors against the static and dynamic stresses as specified in 6.9.2.5 and 6.9.2.6 as that for the shell itself. The number of openings shall be minimized. The axis ratio of oval-shaped openings shall be not more than 2.

6.9.2.12 For the design of flanges and pipework attached to the shell, handling forces and the fastening of bolts shall also be taken into account.

6.9.2.13 The tank shall be designed to withstand, without significant leakage, the effects of a full engulfment in fire for 30 minutes as specified by the test requirements in 6.9.4.3.4. Testing may be waived with the agreement of the competent authority, where sufficient proof can be provided by tests with comparable tank designs.

6.9.2.14 *Special requirements for the carriage of substances with a flash-point of not more than 60 °C*

FRP tanks used for the carriage of substances with a flash-point of not more than 60°C shall be constructed so as to ensure the elimination of static electricity from the various component parts so as to avoid the accumulation of dangerous charges.

6.9.2.14.1 The electrical surface resistance of the inside and outside of the shell as established by measurements shall not be higher than 10^9 ohms. This may be achieved by the use of additives in the resin or interlaminar conducting sheets, such as metal or carbon network.

- 6.9.2.14.2 The discharge resistance to earth as established by measurements shall not be higher than 10^7 ohms.
- 6.9.2.14.3 All components of the shell shall be electrically connected to each other and to the metal parts of the service and structural equipment of the tank and to the vehicle. The electrical resistance between components and equipment in contact with each other shall not exceed 10 ohms.
- 6.9.2.14.4 The electrical surface-resistance and discharge resistance shall be measured initially on each manufactured tank or a specimen of the shell in accordance with a procedure recognized by the competent authority.
- 6.9.2.14.5 The discharge resistance to earth of each tank shall be measured as part of the periodic inspection in accordance with a procedure recognized by the competent authority.

6.9.3 Items of equipment

- 6.9.3.1 The requirements of 6.8.2.2.1, 6.8.2.2.2 and 6.8.2.2.4 to 6.8.2.2.8 shall apply.
- 6.9.3.2 In addition, when they are shown under an entry in Column (13) of Table A of Chapter 3.2, the special provisions of 6.8.4 (b) (TE) shall also apply.

6.9.4 Type testing and approval

- 6.9.4.1 For any design of a FRP tank type, its materials and a representative prototype shall be subjected to the design type testing as outlined below.

6.9.4.2 Material testing

- 6.9.4.2.1 The elongation at fracture according to EN ISO 527-4:1997 or EN ISO 527-5:2009 and the heat distortion temperature according to EN ISO 75-1:2013 shall be determined for the resins to be used.
- 6.9.4.2.2 The following characteristics shall be determined for samples cut out of the shell. Samples manufactured in parallel may only be used, if it is not possible to use cutouts from the shell. Prior to testing, any liner shall be removed.

The tests shall cover:

- Thickness of the laminates of the central shell wall and the ends;
 - Mass content and composition of glass, orientation and arrangement of reinforcement layers;
 - Tensile strength, elongation at fracture and modulus of elasticity according to EN ISO 527-4:1997 or EN ISO 527-5:2009 in the direction of stresses. In addition, the elongation at fracture of the resin shall be established by means of ultrasound;
 - Bending strength and deflection established by the bending creep test according to EN ISO 14125:1998 + AC:2002 + A1:2011 for a period of 1000 hours using a sample with a minimum width of 50 mm and a support distance of at least 20 times the wall thickness. In addition, the creep factor α and the ageing factor β shall be determined by this test and according to EN 978:1997.
- 6.9.4.2.3 The interlaminar shear strength of the joints shall be measured by testing representative samples in the tensile test according to EN ISO 14130:1997.
- 6.9.4.2.4 The chemical compatibility of the shell with the substances to be carried shall be demonstrated by one of the following methods with the agreement of the competent authority. This demonstration shall account for all aspects of the compatibility of the materials of the shell and its equipment with the substances to be carried, including chemical deterioration of the shell, initiation of critical reactions of the contents and dangerous reactions between both.
- In order to establish any deterioration of the shell, representative samples taken from the shell, including any internal liners with welds, shall be subjected to the chemical compatibility test according to EN 977:1997 for a period of 1 000 hours at 50°C. Compared with a virgin sample,

the loss of strength and elasticity modulus measured by the bending test according to EN 978:1997 shall not exceed 25%. Cracks, bubbles, pitting effects as well as separation of layers and liners and roughness shall not be acceptable.

- Certified and documented data of positive experiences on the compatibility of the filling substances in question with the materials of the shell with which they come into contact at given temperatures, times and any other relevant service conditions.
- Technical data published in relevant literature, standards or other sources, acceptable to the competent authority.

6.9.4.3 *Type testing*

A representative prototype tank shall be subjected to tests as specified below. For this purpose service equipment may be replaced by other items if necessary.

6.9.4.3.1 The prototype shall be inspected for compliance with the design type specification. This shall include an internal and external visual inspection and measurement of the main dimensions.

6.9.4.3.2 The prototype, equipped with strain gauges at all locations where a comparison with the design calculation is required, shall be subjected to the following loads and the strains shall be recorded:

- Filled with water to the maximum filling degree. The measuring results shall be used to calibrate the design calculation according to 6.9.2.5;
- Filled with water to the maximum filling degree and subjected to accelerations in all three directions by means of driving and braking exercises with the prototype attached to a vehicle. For comparison with the design calculation according to 6.9.2.6 the strains recorded shall be extrapolated in relation to the quotient of the accelerations required in 6.8.2.1.2 and measured;
- Filled with water and subjected to the specified test pressure. Under this load, the shell shall exhibit no visual damage or leakage.

6.9.4.3.3 The prototype shall be subjected to the ball drop test according to EN 976-1:1997, No. 6.6. No visible damage inside or outside the tank shall occur.

6.9.4.3.4 The prototype with its service and structural equipment in place and filled to 80% of its maximum capacity with water, shall be exposed to a full engulfment in fire for 30 minutes, caused by an open heating oil pool fire or any other type of fire with the same effect. The dimensions of the pool shall exceed those of the tank by at least 50 cm to each side and the distance between fuel level and tank shall be between 50 cm and 80 cm. The rest of the tank below liquid level, including openings and closures, shall remain leakproof except for drips.

6.9.4.4 *Type approval*

6.9.4.4.1 The competent authority or a body designated by that authority shall issue in respect of each new type of tank an approval attesting that the design is suitable for the purpose for which it is intended and meets the construction and equipment requirements of this chapter as well as the special provisions applicable to the substances to be carried.

6.9.4.4.2 The approval shall be based on the calculation and the test report, including all material and prototype test results and its comparison with the design calculation, and shall refer to the design type specification and the quality assurance programme.

6.9.4.4.3 The approval shall include the substances or group of substances for which compatibility with the shell is provided. Their chemical names or the corresponding collective entry (see 2.1.1.2), and their class and classification code shall be indicated.

6.9.4.4.4 In addition, it shall include design and threshold values (such as life-time, service temperature range, working and test pressures, material data) specified and all precautions to be taken for the manufacture, testing, type approval, marking and use of any tank, manufactured in accordance with the approved design type.

6.9.5 Inspections

6.9.5.1 For every tank, manufactured in conformity with the approved design, material tests and inspections shall be performed as specified below.

6.9.5.1.1 The material tests according to 6.9.4.2.2, except for the tensile test and for a reduction of the testing time for the bending creep test to 100 hours shall be performed with samples taken from the shell. Samples manufactured in parallel may only be used, if no cutouts from the shell are possible. The approved design values shall be met.

6.9.5.1.2 Shells and their equipment shall either together or separately undergo an initial inspection before being put into service. This inspection shall include:

- a check of conformity to the approved design;
- a check of the design characteristics;
- an internal and external examination;
- a hydraulic pressure test at the test pressure indicated on the plate prescribed in 6.8.2.5.1;
- a check of operation of the equipment;
- a leakproofness test, if the shell and its equipment have been pressure tested separately.

6.9.5.2 For the periodic inspection of tanks the requirements of 6.8.2.4.2 to 6.8.2.4.4 shall apply. In addition, the inspection in accordance with 6.8.2.4.3 shall include an examination of the internal condition of the shell.

6.9.5.3 The inspections and tests in accordance with 6.9.5.1 and 6.9.5.2 shall be carried out by the expert approved by the competent authority. Certificates shall be issued showing the results of these operations. These certificates shall refer to the list of the substances permitted for carriage in this shell in accordance with 6.9.4.4.

6.9.6 Marking

6.9.6.1 The requirements of 6.8.2.5 shall apply to the marking of FRP tanks, with the following amendments:

- the tank plate may also be laminated to the shell or be made of suitable plastics materials;
- the design temperature range shall always be marked.

6.9.6.2 In addition, when they are shown under an entry in Column (13) of Table A of Chapter 3.2, the special provisions of 6.8.4 (e) (TM) shall also apply.

CHAPTER 6.10

REQUIREMENTS FOR THE CONSTRUCTION, EQUIPMENT, TYPE APPROVAL, INSPECTION AND MARKING OF VACUUM-OPERATED WASTE TANKS

NOTE 1: For portable tanks and UN multiple-element gas containers (MEGCs) see Chapter 6.7; for fixed tanks (tank-vehicles), demountable tanks and tank containers and tank swap bodies, with shells made of metallic materials, and battery-vehicles and multiple element gas containers (MEGCs) other than UN MEGCs see Chapter 6.8; for fibre-reinforced plastic tanks see Chapter 6.9.

NOTE 2: This Chapter applies to fixed tanks, demountable tanks, tank-containers and tank swap bodies.

6.10.1 General

6.10.1.1 Definition

NOTE: A tank which fully complies with the requirements of Chapter 6.8 is not considered to be a "vacuum-operated waste tank".

6.10.1.1.1 The term "protected area" means the areas located as follows:

- (a) The lower part of the tank in a zone which extends over a 60° angle on either side of the lower generating line;
- (b) The top part of the tank in a zone which extends over a 30° angle on either side of the top generating line;
- (c) On the end front of the tank on motor vehicles;
- (d) On the rear end of the tank inside the protection volume formed by the device stipulated in 9.7.6.

6.10.1.2 Scope

6.10.1.2.1 The special requirements of 6.10.2 to 6.10.4 complete or modify Chapter 6.8 and are applied to vacuum-operated waste tanks.

Vacuum-operated waste tanks may be equipped with openable ends, if the requirements of Chapter 4.3 allow bottom discharge of the substances to be carried (indicated by letters "A" or "B" in Part 3 of the tank code given in Column (12) of Table A of Chapter 3.2, in accordance with 4.3.4.1.1).

Vacuum-operated waste tanks shall comply with all requirements of Chapter 6.8, with the exception of requirements overtaken by a special provision in this Chapter. However the requirements of 6.8.2.1.19, 6.8.2.1.20, and 6.8.2.1.21 shall not apply.

6.10.2 Construction

6.10.2.1 Tanks shall be designed for a calculation pressure equal to 1.3 times the filling or discharge pressure but not less than 400 kPa (4 bar) (gauge pressure). For the carriage of substances for which a higher calculation pressure of the tank is specified in Chapter 6.8, this higher pressure shall apply.

6.10.2.2 Tanks shall be designed to withstand a negative internal pressure of 100 kPa (1 bar).

6.10.3 Items of equipment

6.10.3.1 The items of equipment shall be so arranged as to be protected against the risk of being wrenched off or damaged during carriage or handling. This requirement can be fulfilled by placing the items of equipment in a so called "protected area" (see 6.10.1.1.1).

6.10.3.2 The bottom discharge of shells may be constituted by external piping with a stop-valve fitted as close to the shell as practicable and a second closure which may be a blank flange or other equivalent device.

6.10.3.3 The position and closing direction of the stop-valve(s) connected to the shell, or to any compartment in the case of compartmented shells, shall be unambiguous, and be able to be checked from the ground.

6.10.3.4 In order to avoid any loss of contents in the event of damage to the external filling and discharge fittings (pipes, lateral shut-off devices), the internal stop-valve, or the first external stop-valve (where applicable), and its seatings shall be protected against the danger of being wrenched off by external stresses or shall be so designed as to withstand them. The filling and discharge devices (including flanges or threaded plugs) and protective caps (if any) shall be capable of being secured against any unintended opening.

6.10.3.5 The tanks may be equipped with openable ends. Openable ends shall comply with the following conditions:

- (a) The ends shall be designed to be secured leaktight when closed;
- (b) Unintentional opening shall not be possible;
- (c) Where the opening mechanism is power operated the end shall remain securely closed in the event of a power failure;
- (d) A safety or breakseal device shall be incorporated to ensure that the openable end cannot be opened when there is still a residual over pressure in the tank. This requirement does not apply to openable ends which are power-operated, where the movement is positively controlled. In this case the controls shall be of the dead-man type and be so positioned that the operator can observe the movement of the openable end at all times and is not endangered during opening and closing of the openable end; and
- (e) Provisions shall be made to protect the openable end and prevent it from being forced open during a roll-over of the vehicle, tank-container or tank swap body.

6.10.3.6 Vacuum-operated waste tanks which are fitted with an internal piston to assist in the cleaning of the tank or discharging shall be provided with stop-devices to prevent the piston in every operational position being ejected from the tank when a force equivalent to the maximum working pressure of the tank is applied to the piston. The maximum working pressure for tanks or compartments with pneumatic operated piston shall not exceed 100 kPa (1.0 bar). The internal piston shall be constructed in a manner and of materials which will not cause an ignition source when the piston is moved.

The internal piston may be used as a compartment provided it is secured in position. Where any of the means by which the internal piston is secured is external to the tank, it shall be placed in a position not liable to accidental damage.

6.10.3.7 The tanks may be equipped with suction booms if:

- (a) The boom is fitted with an internal or external stop-valve fixed directly to the shell, or directly to a bend that is welded to the shell; a rotation crown wheel can be fitted between the shell or the bend and the external stop valve, if this rotation crown wheel is located in the protected area and the stop-valve control device is protected with a housing or cover against the danger of being wrenched off by external loads;
- (b) The stop-valve mentioned in (a) is so arranged that carriage with the valve in an open position is prevented; and

- (c) The boom is constructed in such a way that the tank will not leak as a result of accidental impact on the boom.

6.10.3.8 The tanks shall be fitted with the following additional service equipment:

- (a) The outlet of a pump/exhauster unit shall be so arranged as to ensure that any flammable or toxic vapours are diverted to a place where they will not cause a danger;
- (b) A device to prevent immediate passage of flame shall be fitted to all openings of a vacuum pump/exhauster unit which may provide a source of ignition and which is fitted on a tank used for the carriage of flammable wastes, or the tank shall be explosion pressure shock resistant, which means being capable of withstanding without leakage, but allowing deformation, an explosion resulting from the passage of the flame;
- (c) Pumps which can deliver a positive pressure shall have a safety device fitted in the pipework which can be pressurised. The safety device shall be set to discharge at a pressure not exceeding the maximum working pressure of the tank;
- (d) A stop-valve shall be fitted between the shell, or the outlet of the overfill prevention device fitted to the shell, and the pipework connecting the shell to the pump/exhauster unit;
- (e) The tank shall be fitted with a suitable pressure/vacuum manometer which shall be mounted in a position where it can be easily read by the person operating the pump/exhauster unit. A distinguishing line shall be marked on the scale to indicate the maximum working pressure of the tank;
- (f) The tank, or in case of compartmented tanks, every compartment, shall be equipped with a level indicating device. Sight glasses may be used as level indicating devices provided:
 - (i) they form a part of the tank wall and have a resistance to the pressure comparable to that of the tank; or they are fitted external to the tank;
 - (ii) the top and bottom connections to the tank are equipped with shut-off valves fixed directly to the shell and so arranged that carriage with the valves in an open position is prevented;
 - (iii) are suitable for operation at the maximum working pressure of the tank; and
 - (iv) are placed in a position where they will not be liable to accidental damage.

6.10.3.9 The shells of vacuum-operated waste tanks shall be fitted with a safety valve preceded by a bursting disc.

The valve shall be capable of opening automatically at a pressure between 0.9 and 1.0 times the test pressure of the tank to which it is fitted. The use of dead weight or counterweight valves is prohibited.

The bursting disc shall burst at the earliest when the initial opening pressure of the valve is reached and at the latest when this pressure reaches the test pressure of the tank to which it is fitted.

Safety devices shall be of such a type as to resist dynamic stresses, including liquid surge.

The space between the bursting disc and the safety valve shall be provided with a pressure gauge or suitable tell-tale indicator for the detection of disc rupture, pinholing or leakage which could cause a malfunction of the safety valve.

6.10.4 Inspection

Vacuum-operated waste tanks shall be subject every three years for fixed tanks or demountable tanks and at least every two and a half years for tank-containers and tank swap bodies to an examination of the internal condition, in addition to the tests according to 6.8.2.4.3.

CHAPTER 6.11

REQUIREMENTS FOR THE DESIGN, CONSTRUCTION, INSPECTION AND TESTING OF BULK CONTAINERS

6.11.1 (Reserved)

6.11.2 **Application and general requirements**

6.11.2.1 Bulk containers and their service and structural equipment shall be designed and constructed to withstand, without loss of contents, the internal pressure of the contents and the stresses of normal handling and carriage.

6.11.2.2 Where a discharge valve is fitted, it shall be capable of being made secure in the closed position and the whole discharge system shall be suitably protected from damage. Valves having lever closures shall be able to be secured against unintended opening and the open or closed position shall be readily apparent.

6.11.2.3 **Code for designating types of bulk container**

The following table indicates the codes to be used for designating types of bulk containers:

Types of bulk containers	Code
Sheeted bulk container	BK1
Closed bulk container	BK2

6.11.2.4 In order to take account of progress in science and technology, the use of alternative arrangements which offer at least equivalent safety as provided by the requirements of this chapter may be considered by the competent authority.

6.11.3 **Requirements for the design, construction, inspection and testing of containers conforming to the CSC used as BK1 or BK2 bulk containers**

6.11.3.1 **Design and construction requirements**

6.11.3.1.1 The general design and construction requirements of this sub-section are deemed to be met if the bulk container complies with the requirements of ISO 1496-4:1991 "Series 1 Freight containers- Specification and testing – Part 4: Non pressurized containers for dry bulk" and the container is siftproof.

6.11.3.1.2 Containers designed and tested in accordance with ISO 1496-1:1990 "Series 1 Freight containers- Specification and testing - Part 1: General cargo containers for general purposes" shall be equipped with operational equipment which is, including its connection to the container, designed to strengthen the end walls and to improve the longitudinal restraint as necessary to comply with the test requirements of ISO 1496-4:1991 as relevant.

6.11.3.1.3 Bulk containers shall be siftproof. Where a liner is used to make the container siftproof it shall be made of a suitable material. The strength of material used for, and the construction of, the liner shall be appropriate to the capacity of the container and its intended use. Joins and closures of the liner shall withstand pressures and impacts liable to occur under normal conditions of handling and carriage. For ventilated bulk containers any liner shall not impair the operation of ventilating devices.

6.11.3.1.4 The operational equipment of bulk containers designed to be emptied by tilting shall be capable of withstanding the total filling mass in the tilted orientation.

6.11.3.1.5 Any movable roof or side or end wall or roof section shall be fitted with locking devices with securing devices designed to show the locked state to an observer at ground level.

6.11.3.2 *Service equipment*

- 6.11.3.2.1 Filling and discharge devices shall be so constructed and arranged as to be protected against the risk of being wrenched off or damaged during carriage and handling. The filling and discharge devices shall be capable of being secured against unintended opening. The open and closed position and direction of closure shall be clearly indicated.
- 6.11.3.2.2 Seals of openings shall be so arranged as to avoid any damage by the operation, filling and emptying of the bulk container.
- 6.11.3.2.3 Where ventilation is required bulk containers shall be equipped with means of air exchange, either by natural convection, e.g. by openings, or active elements, e.g. fans. The ventilation shall be designed to prevent negative pressures in the container at all times. Ventilating elements of bulk containers for the carriage of flammable substances or substances emitting flammable gases or vapours shall be designed so as not to be a source of ignition.

6.11.3.3 *Inspection and testing*

- 6.11.3.3.1 Containers used, maintained and qualified as bulk containers in accordance with the requirements of this section shall be tested and approved in accordance with the CSC.
- 6.11.3.3.2 Containers used and qualified as bulk containers shall be inspected periodically according to the CSC.

6.11.3.4 *Marking*

- 6.11.3.4.1 Containers used as bulk containers shall be marked with a Safety Approval Plate in accordance with the CSC.

6.11.4 *Requirements for the design, construction and approval of BK1 or BK2 bulk containers other than containers conforming to the CSC*

NOTE: When containers conforming to the provisions of this section are used for the carriage of solids in bulk, the following statement shall be shown on the transport document:

"Bulk container BK(x) approved by the competent authority of". (see 5.4.1.1.17)".

- 6.11.4.1 Bulk containers covered in this section include skips, offshore bulk containers, bulk bins, swap bodies, trough shaped containers, roller containers, and load compartments of vehicles.

NOTE: These bulk containers also include containers conforming to the UIC leaflets 591, 592 and 592-2 to 592-4 as mentioned in 7.1.3 which do not conform to the CSC.

- 6.11.4.2 These bulk containers shall be designed and constructed so as to be strong enough to withstand the shocks and loadings normally encountered during carriage including, as applicable, transshipment between modes of transport.
- 6.11.4.3 (*Reserved*)
- 6.11.4.4 These bulk containers shall be approved by the competent authority and the approval shall include the code for designating types of bulk containers in accordance with 6.11.2.3 and the requirements for inspection and testing as appropriate.
- 6.11.4.5 Where it is necessary to use a liner in order to retain the dangerous goods it shall meet the provisions of 6.11.3.1.3.

CHAPTER 6.12**REQUIREMENTS FOR THE CONSTRUCTION, EQUIPMENT, TYPE APPROVAL, INSPECTIONS AND TESTS, AND MARKING OF TANKS, BULK CONTAINERS AND SPECIAL COMPARTMENTS FOR EXPLOSIVES OF MOBILE EXPLOSIVES MANUFACTURING UNITS (MEMUs)**

NOTE 1: *For portable tanks, see Chapter 6.7; for fixed tanks (tank-vehicles), demountable tanks, tank-containers and tank swap bodies, with shells made of metallic materials, see Chapter 6.8; for fibre-reinforced plastics tanks see Chapter 6.9; for vacuum operated waste tanks see Chapter 6.10; for bulk containers see Chapter 6.11.*

NOTE 2: *This Chapter applies to fixed tanks, demountable tanks, tank-containers, tank swap bodies, which do not comply with all requirements of the Chapters mentioned in Note 1 as well as bulk containers and special compartments for explosives.*

6.12.1 Scope

The requirements of this Chapter are applicable to tanks, bulk containers and special compartments intended for the carriage of dangerous goods on MEMUs.

6.12.2 General provisions

6.12.2.1 Tanks shall meet the requirements of Chapter 6.8, notwithstanding the minimum capacity defined in section 1.2.1 for fixed tanks, as modified by the special provisions of this Chapter.

6.12.2.2 Bulk containers intended for the carriage of dangerous goods on MEMUs shall comply with the requirements for bulk containers of type BK2.

6.12.2.3 Where a single tank or bulk container contains more than one substance each substance shall be separated by at least two walls with drained air space between.

6.12.3 Tanks**6.12.3.1 Tanks with a capacity of 1 000 litres or more**

6.12.3.1.1 These tanks shall meet the requirements of section 6.8.2.

6.12.3.1.2 For UN Nos. 1942 and 3375, the tank shall meet the requirements of Chapters 4.3 and 6.8 concerning breather devices and, in addition, shall have bursting discs or other suitable means of emergency pressure relief, approved by the competent authority of the country of use.

6.12.3.1.3 For shells not of a circular cross-section, for example box-shaped or elliptical shells, which cannot be calculated according to 6.8.2.1.4 and standards or technical code mentioned therein, the ability to withstand the permissible stress may be demonstrated by a pressure test specified by the competent authority.

These tanks shall meet the requirements of sub-section 6.8.2.1 other than 6.8.2.1.3, 6.8.2.1.4 and 6.8.2.1.13 to 6.8.2.1.22.

The thickness of these shells shall not be less than the values given in the table below:

Material	Minimum thickness
Stainless austenitic steels	2.5 mm
Other steels	3 mm
Aluminium alloys	4 mm
Pure aluminium of 99.80%	6 mm

Protection of the tank against damage through lateral impact or overturning shall be provided. Protection shall be provided according to 6.8.2.1.20 or the competent authority shall approve alternative protection measures.

- 6.12.3.1.4 By derogation from the requirements of 6.8.2.5.2 tanks do not need to be marked with the tank code and the special provisions, as applicable.

6.12.3.2 Tanks with a capacity of less than 1 000 litres

- 6.12.3.2.1 The construction of these tanks shall meet the requirements of sub-section 6.8.2.1 other than 6.8.2.1.3, 6.8.2.1.4, 6.8.2.1.6, 6.8.2.1.10 to 6.8.2.1.23 and 6.8.2.1.28.

- 6.12.3.2.2 The equipment of these tanks shall meet the requirements of 6.8.2.2.1. For UN Nos. 1942 and 3375, the tank shall meet the requirements of Chapters 4.3 and 6.8 concerning breather devices and, in addition, shall have bursting discs or other suitable means of emergency pressure relief, approved by the competent authority of the country of use.

- 6.12.3.2.3 The thickness of these shells shall not be less than the values given in the table below:

Material	Minimum thickness
Stainless austenitic steels	2.5 mm
Other steels	3 mm
Aluminium alloys	4 mm
Pure aluminium of 99.80%	6 mm

- 6.12.3.2.4 Tanks may have constructional parts that are without a radius of convexity. Alternative supportive measures may be curved walls, corrugated walls or ribs. In at least one direction the distance between parallel supports on each side of the tank shall not be greater than 100 times the wall thickness.

- 6.12.3.2.5 Welds shall be skilfully made and shall afford the fullest safety. Welding shall be performed by skilled welders using a welding process whose effectiveness (including any heat treatments required) has been demonstrated by test.

- 6.12.3.2.6 The requirements of 6.8.2.4 do not apply. However, the initial and periodic inspections of these tanks shall be carried out under the responsibility of the user or owner of the MEMU. Shells and their equipment shall be subject to visual examination of their external and internal condition and a leakproofness test to the satisfaction of the competent authority at least every three years.

- 6.12.3.2.7 The requirements for type approval of 6.8.2.3 and for marking of 6.8.2.5 do not apply.

6.12.4 Items of equipment

- 6.12.4.1 Tanks with bottom discharge for UN 1942 and UN 3375 shall have at least two closures. One of these closures may be the product mixing or discharge pump or auger.
- 6.12.4.2 Any piping after the first closure shall be of a fusible material (i.e. rubber hose) or have fusible elements.
- 6.12.4.3 In order to avoid any loss of contents in the event of damage to the external pumps and discharge fittings (pipes), the first closure and its seatings shall be protected against the danger of being wrenched off by external stresses or shall be so designed as to withstand them. The filling and discharge devices (including flanges or threaded plugs) and protective caps (if any) shall be capable of being secured against any unintended opening.
- 6.12.4.4 Breather devices in accordance with 6.8.2.2.6 on tanks for UN 3375 may be substituted by "goose necks". Such equipment shall be protected against the danger of being wrenched off by external stresses or shall be so designed as to withstand them.

6.12.5 Special compartments for explosives

Compartments for packages of explosives containing detonators and/or detonator assemblies and those containing substances or articles of compatibility group D shall be designed to provide effective segregation such that there is no danger of transmission of detonation from the detonators and/or detonator assemblies to the substances or articles of compatibility group D. Segregation shall be achieved by the use of separate compartments or by placing one of the two types of explosive in a special containment system. Either method of segregation shall be approved by the competent authority. If the material used for the compartment is metal, the complete inside of the compartment shall be covered with materials providing suitable fire resistance. The explosives compartments shall be located where they are protected from impact and from damage on rough terrain and dangerous interaction with other dangerous goods on board and from ignition sources on the vehicle e.g. exhausts etc.

NOTE: Materials classified as class B-s3-d2 according to standard EN 13501-1:2007 + A1:2009 are deemed to fulfil the fire resistance requirement.

PART 7

Provisions concerning the conditions of carriage, loading, unloading and handling

CHAPTER 7.1

GENERAL PROVISIONS

- 7.1.1 The carriage of dangerous goods is subject to the mandatory use of a particular type of transport equipment in accordance with the provisions of this Chapter and Chapter 7.2 for carriage in packages, Chapter 7.3 for carriage in bulk and Chapter 7.4 for carriage in tanks. In addition, the provisions of Chapter 7.5 concerning loading, unloading and handling shall be observed.

Columns (16), (17) and (18) of Table A of Chapter 3.2 show the particular provisions of this Part that apply to specific dangerous goods.

- 7.1.2 In addition to the provisions of this Part, vehicles used for the carriage of dangerous goods shall, as regards their design, construction and, if appropriate, their approval, conform to the relevant requirements of Part 9.

- 7.1.3 Large containers, portable tanks and tank-containers which meet the definition of "container" given in the CSC (1972), as amended, or in UIC leaflets 591 (status at 01.10.2007, 3rd edition), 592 (status at 01.10.2013, 2nd edition), 592-2 (status at 01.10.2004, 6th edition), 592-3 (status at 01.01.1998, 2nd edition) and 592-4 (status at 01.05.2007, 3rd edition) may not be used to carry dangerous goods unless the large container or the frame of the portable tank or tank-container satisfies the provisions of the CSC or of UIC leaflets 591, 592 and 592-2 to 592-4.

- 7.1.4 A large container may be presented for carriage only if it is structurally serviceable.

"Structurally serviceable" means that the container is free from major defects in its structural components, e.g. top and bottom side rails, doorsill and header, floor cross members, corner posts, and corner fittings. "Major defects" are dents or bends in structural members greater than 19 mm in depth, regardless of length; cracks or breaks in structural members; more than one splice or an improper splice (e.g. a lapped splice) in top or bottom end rails or door headers or more than two splices in any one top or bottom side rail or any splice in a door sill or corner post; door hinges and hardware that are seized, twisted, broken, missing or otherwise inoperative; non-closing gaskets and seals; any distortion of the overall configuration sufficient to prevent proper alignment of handling equipment, mounting and securing on a chassis or vehicle.

In addition, deterioration in any component of the container, such as rusted metal in side walls or disintegrated fibreglass is unacceptable, regardless of the material of construction. Normal wear, including oxidization (rust), slight dents and scratches and other damage that do not affect serviceability or weather-tightness are, however, acceptable.

Prior to loading the container shall also be checked to ensure that it is free from any residue of a previous load and that the interior floor and walls are free from protrusions.

- 7.1.5 Large containers shall meet the requirements concerning the body of the vehicle laid down in this Part and, if appropriate, those laid down in Part 9 for the load in question; the body of the vehicle need not then satisfy those provisions.

However, large containers carried on vehicles whose platforms have insulation and heat-resistant qualities which satisfy those requirements need not then satisfy the said requirements.

This provision also applies to small containers for the carriage of explosive substances and articles of Class 1.

- 7.1.6 Subject to the provisions of the last part of the first sentence of 7.1.5, the fact that dangerous goods are contained in one or more containers shall not affect the conditions to be met by the vehicle by reason of the nature and quantities of the dangerous goods carried.

CHAPTER 7.2**PROVISIONS CONCERNING CARRIAGE IN PACKAGES**

7.2.1 Unless otherwise provided in 7.2.2 to 7.2.4, packages may be loaded:

- (a) in closed vehicles or in closed containers; or
- (b) in sheeted vehicles or in sheeted containers; or
- (c) in open vehicles or in open containers.

7.2.2 Packages comprising packagings made of materials sensitive to moisture shall be loaded on to closed or on to sheeted vehicles or into closed or sheeted containers.

7.2.3 *(Reserved)*

7.2.4 When they are shown under an entry in Column (16) of Table A of Chapter 3.2, the following special provisions apply:

- V1 Packages shall be loaded on to closed or sheeted vehicles or into closed or sheeted containers.
- V2 (1) Packages shall only be loaded on to EX/II or EX/III vehicles which satisfy the relevant requirements of Part 9. The choice of vehicle depends on the quantity to be carried, which is limited per transport unit in accordance with the provisions concerning loading (see 7.5.5.2).
- (2) Trailers, except semi-trailers, which satisfy the requirements for EX/II or EX/III vehicles may be drawn by motor vehicles which do not satisfy those requirements.

For carriage in containers, see also 7.1.3 to 7.1.6.

Where substances or articles of Class 1 in quantities requiring a transport unit made up of EX/III vehicle(s) are being carried in containers to or from harbour areas, rail terminals or airports of arrival or departure as part of a multimodal journey, a transport unit made up of EX/II vehicle(s) may be used instead, provided that the containers being carried comply with the appropriate requirements of the IMDG Code, the RID or the ICAO Technical Instructions.

V3 For free-flowing powdery substances and for fireworks the floor of a container shall have a non-metallic surface or covering.

V4 *(Reserved)*

V5 Packages may not be carried in small containers.

V6 Flexible IBCs shall be carried in closed vehicles or in closed containers, in sheeted vehicles or in sheeted containers. The sheet shall be of an impermeable and non-combustible material.

V7 *(Reserved)*

V8 (1) Substances stabilized by temperature control shall be forwarded in such manner that the control temperatures indicated in 2.2.41.1.17 and 2.2.41.4 or in 2.2.52.1.16 and 2.2.52.4, as appropriate, are never exceeded.

- (2) The means of temperature control chosen for the transport operation depends on a number of factors such as:
- the control temperature(s) of the substance(s) to be carried;
 - the difference between the control temperature and the expected ambient temperature;
 - the effectiveness of the thermal insulation;
 - the duration of the transport operation; and
 - the safety margin to be allowed for delays en route.
- (3) Suitable methods to prevent the control temperature from being exceeded are listed below, in ascending order of effectiveness:
- R1 Thermal insulation, provided that the initial temperature of the substance(s) is sufficiently below the control temperature;
- R2 Thermal insulation and coolant system, provided that:
- an adequate quantity of non-flammable coolant (e.g. liquid nitrogen or solid carbon dioxide), allowing a reasonable margin for possible delay, is carried or a means of replenishment is assured;
 - liquid oxygen or air is not used as coolant;
 - there is a uniform cooling effect even when most of the coolant has been consumed; and
 - the need to ventilate the transport unit before entering is clearly indicated by a warning on the door(s);
- R3 Thermal insulation and single mechanical refrigeration, provided that for substances with a flash-point lower than the sum of the emergency temperature plus 5 °C explosion-proof electrical fittings, EEx IIB T3, are used within the cooling compartment to prevent ignition of flammable vapours from the substances;
- R4 Thermal insulation and combined mechanical refrigeration system and coolant system, provided that:
- the two systems are independent of one another; and
 - the requirements of methods R2 and R3 above are met;
- R5 Thermal insulation and dual mechanical refrigeration system, provided that:
- apart from the integral power supply unit, the two systems are independent of one another;
 - each system alone is capable of maintaining adequate temperature control; and
 - for substances with a flash-point lower than the sum of the emergency temperature plus 5 °C explosion-proof electrical fittings, EEx IIB T3, are used within the cooling compartment to prevent ignition of flammable vapours from the substances.
- (4) Methods R4 and R5 may be used for all organic peroxides and self-reactive substances.

Method R3 may be used for organic peroxides and self-reactive substances of Types C, D, E and F and, when the maximum ambient temperature to be expected during carriage does not exceed the control temperature by more than 10 °C, for organic peroxides and self-reactive substances of Type B.

Method R2 may be used for organic peroxides and self-reactive substances of Types C, D, E and F when the maximum ambient temperature to be expected during carriage does not exceed the control temperature by more than 30 °C.

Method R1 may be used for organic peroxides and self-reactive substances of Types C, D, E and F when the maximum ambient temperature to be expected during carriage is at least 10 °C below the control temperature.

- (5) Where substances are required to be carried in insulated, refrigerated or mechanically-refrigerated vehicles or containers, these vehicles or containers shall satisfy the requirements of Chapter 9.6.
- (6) If substances are contained in protective packagings filled with a coolant, they shall be loaded in closed or sheeted vehicles or closed or sheeted containers. If the vehicles or containers used are closed they shall be adequately ventilated. Sheeted vehicles and containers shall be fitted with sideboards and a tailboard. The sheets of these vehicles and containers shall be of an impermeable and non-combustible material.
- (7) Any control and temperature sensing devices in the refrigeration system shall be readily accessible and all electrical connections shall be weatherproof. The temperature of the air inside the transport unit shall be measured by two independent sensors and the output shall be recorded so that any change in temperature is readily detectable. When substances having a control temperature of less than +25 °C are carried, the transport unit shall be equipped with visible and audible alarms, powered independently of the refrigeration system and set to operate at or below the control temperature.
- (8) A back-up refrigeration system or spare parts shall be available.

NOTE: This provision V8 does not apply to substances referred to in 3.1.2.6 when substances are stabilized by the addition of chemical inhibitors such that the SADT is greater than 50 °C. In this latter case, temperature control may be required under conditions of carriage where the temperature may exceed 55 °C.

V9 (Reserved)

V10 IBCs shall be carried in closed or sheeted vehicles or closed or sheeted containers.

V11 IBCs other than metal or rigid plastics IBCs shall be carried in closed or sheeted vehicles or closed or sheeted containers.

V12 IBCs of type 31HZ2 (31HA2, 31HB2, 31HN2, 31HD2 and 31HH2) shall be carried in closed vehicles or containers.

V13 When packed in 5H1, 5L1 or 5 M1 bags, shall be carried in closed vehicles or containers.

V14 Aerosols carried for the purposes of reprocessing or disposal under special provision 327 in Chapter 3.3 shall only be carried in ventilated or open vehicles or containers.

CHAPTER 7.3

PROVISIONS CONCERNING CARRIAGE IN BULK

7.3.1 General provisions

7.3.1.1 Goods may not be carried in bulk in bulk containers, containers or vehicles unless:

- (a) either a special provision, identified by the code "BK" or a reference to a specific paragraph, explicitly authorizing this mode of carriage is indicated in column (10) of Table A of Chapter 3.2 and the relevant conditions of 7.3.2 are satisfied in addition to those of this section; or
- (b) a special provision, identified by the code "VC" or a reference to a specific paragraph, explicitly authorizing this mode of carriage is indicated in column (17) of Table A of Chapter 3.2 and the conditions of this special provision, together with any additional provision identified with the code(s) "AP", as laid down in 7.3.3 are satisfied in addition to those of this section.

Nevertheless, empty packagings, uncleaned, may be carried in bulk if this mode of carriage is not explicitly prohibited by other provisions of ADR.

NOTE: For carriage in tanks, see Chapters 4.2 and 4.3.

7.3.1.2 Substances which may become liquid at temperatures likely to be encountered during carriage, are not permitted for carriage in bulk.

7.3.1.3 Bulk containers, containers or bodies of vehicles shall be siftproof and shall be so closed that none of the contents can escape under normal conditions of carriage including the effect of vibration, or by changes of temperature, humidity or pressure.

7.3.1.4 Substances shall be loaded and evenly distributed in a manner that minimises movement that could result in damage to the bulk container, container or vehicle or leakage of the dangerous goods.

7.3.1.5 Where venting devices are fitted they shall be kept clear and operable.

7.3.1.6 Substances shall not react dangerously with the material of the bulk container, container, vehicle, gaskets, equipment including lids and tarpaulins and with protective coatings which are in contact with the contents or significantly weaken them. Bulk containers, containers or vehicles shall be so constructed or adapted that the goods cannot penetrate between wooden floor coverings or come into contact with those parts of the bulk container, container or vehicle that may be affected by the materials or residues thereof.

7.3.1.7 Before being filled and handed over for carriage, each bulk container, container or vehicle shall be inspected and cleaned to ensure that it does not contain any residue on the interior or exterior of the bulk container, container or vehicle that could:

- cause a dangerous reaction with the substance intended for carriage;
- detrimentally affect the structural integrity of the bulk container, container or vehicle; or
- affect the dangerous goods retention capabilities of the bulk container, container or vehicle.

7.3.1.8 During carriage, no dangerous residues shall adhere to the outer surfaces of bulk containers, containers or of the bodies of vehicles.

7.3.1.9 If several closure systems are fitted in series, the system which is located nearest to the substance to be carried shall be closed first before filling.

7.3.1.10 Empty bulk containers, containers or vehicles which have carried a dangerous solid substance in bulk shall be treated in the same manner as is required by ADR for a filled bulk container, container or vehicle, unless adequate measures have been taken to nullify any hazard.

7.3.1.11 If bulk containers, containers or vehicles are used for the carriage in bulk of goods liable to cause a dust explosion, or evolve flammable vapours (e. g. for certain wastes) measures shall be taken to exclude sources of ignition and prevent dangerous electrostatic discharge during carriage, filling or discharge of the substance.

7.3.1.12 Substances, for example wastes, which may react dangerously with one another and substances of different classes and goods not subject to ADR, which are liable to react dangerously with one another shall not be mixed together in the same bulk container, container or vehicle. Dangerous reactions are:

- (a) Combustion and/or evolution of considerable heat;
- (b) Emission of flammable and/or toxic gases;
- (c) Formation of corrosive liquids; or
- (d) Formation of unstable substances.

7.3.1.13 Before a bulk container, container or vehicle is filled it shall be visually examined to ensure it is structurally serviceable, its interior walls, ceiling and floors are free from protrusions or damage and that any inner liners or substance retaining equipment are free from rips, tears or any damage that would compromise its cargo retention capabilities. Structurally serviceable means the bulk container, container or vehicle does not have major defects in its structural components, such as top and bottom side rails, top and bottom end rails, door sill and header, floor cross members, corner posts, and corner fittings in a bulk container or container. Major defects include:

- (a) Bends, cracks or breaks in the structural or supporting members that affect the integrity of the bulk container, container or of the body of the vehicle;
- (b) More than one splice or an improper splice (such as a lapped splice) in top or bottom end rails or door headers;
- (c) More than two splices in any one top or bottom side rail;
- (d) Any splice in a door sill or corner post;
- (e) Door hinges and hardware that are seized, twisted, broken, missing, or otherwise inoperative;
- (f) Gaskets and seals that do not seal;
- (g) Any distortion of the overall configuration of a bulk container or container great enough to prevent proper alignment of handling equipment, mounting and securing on a chassis or vehicle;
- (h) Any damage to lifting attachments or handling equipment interface features; or
- (i) Any damage to service or operational equipment.

7.3.2 Provisions for the carriage in bulk when the provisions of 7.3.1.1 (a) are applied

7.3.2.1 In addition to the general provisions of section 7.3.1, the provisions of this section are applicable. The codes BK1 and BK2 in column (10) of Table A of Chapter 3.2 have the following meanings:

- BK1: Carriage in bulk in sheeted bulk containers is permitted;
BK2: Carriage in bulk in closed bulk containers is permitted.

7.3.2.2 The bulk container used shall conform to the requirements of Chapter 6.11.

7.3.2.3 Goods of Class 4.2

The total mass carried in a bulk container shall be such that its spontaneous ignition temperature is greater than 55 °C.

7.3.2.4 *Goods of Class 4.3*

These goods shall be carried in bulk containers which are waterproof.

7.3.2.5 *Goods of Class 5.1*

Bulk containers shall be so constructed or adapted that the goods cannot come into contact with wood or any other incompatible material.

7.3.2.6 *Goods of Class 6.2*

7.3.2.6.1 Animal material containing infectious substances (UN Nos. 2814, 2900 and 3373) is authorized for carriage in bulk containers provided the following conditions are met:

- (a) Sheeted bulk containers BK1 are permitted provided that they are not filled to maximum capacity to avoid substances coming into contact with the sheeting. Closed bulk containers BK2 are also permitted;
- (b) Closed and sheeted bulk containers, and their openings, shall be leak-proof by design or by the fitting of a suitable liner;
- (c) The animal material shall be thoroughly treated with an appropriate disinfectant before loading prior to carriage;
- (d) Sheeted bulk containers shall be covered by an additional top liner weighted down by absorbent material treated with an appropriate disinfectant;
- (e) Closed or sheeted bulk containers shall not be re-used until after they have been thoroughly cleaned and disinfected.

NOTE: Additional provisions may be required by appropriate national health authorities.

7.3.2.6.2 *Wastes of Class 6.2 (UN 3291)*

- (a) *(Reserved)*;
- (b) Closed bulk containers and their openings shall be leakproof by design. These bulk containers shall have non porous interior surfaces and shall be free from cracks or other features which could damage packagings inside, impede disinfection or permit inadvertent release;
- (c) Wastes of UN No. 3291 shall be contained within the closed bulk container in UN type tested and approved sealed leakproof plastics bags tested for solids of packing group II and marked in accordance with 6.1.3.1. Such plastics bags shall be capable of passing the tests for tear and impact resistance according to ISO 7765-1:1988 "Plastics film and sheeting - Determination of impact resistance by the free-falling dart method - Part 1: Staircase methods" and ISO 6383-2:1983 "Plastics - Film and sheeting - Determination of tear resistance. Part 2: Elmendorf method". Each bag shall have an impact resistance of at least 165 g and a tear resistance of at least 480 g in both parallel and perpendicular planes with respect to the length of the bag. The maximum net mass of each plastics bag shall be 30 kg;
- (d) Single articles exceeding 30 kg such as soiled mattresses may be carried without the need for a plastics bag when authorized by the competent authority;
- (e) Wastes of UN No. 3291 which contain liquids shall only be carried in plastics bags containing sufficient absorbent material to absorb the entire amount of liquid without it spilling in the bulk container;
- (f) Wastes of UN No. 3291 containing sharp objects shall only be carried in UN type tested and approved rigid packagings meeting the provisions of packing instructions P621, IBC620 or LP621;
- (g) Rigid packagings specified in packing instructions P621, IBC620 or LP621 may also be used. They shall be properly secured to prevent damage during normal conditions of carriage.

Wastes carried in rigid packagings and plastics bags together in the same closed bulk container shall be adequately segregated from each other, e.g. by suitable rigid barriers or dividers, mesh nets or otherwise securing, such that they prevent damage to the packagings during normal conditions of carriage;

- (h) Wastes of UN No. 3291 in plastics bags shall not be compressed in a closed bulk container in such a way that bags may be rendered no longer leakproof;
- (i) The closed bulk container shall be inspected for leakage or spillage after each journey. If any wastes of UN No. 3291 have leaked or been spilled in the closed bulk container, it shall not be re-used until after it has been thoroughly cleaned and, if necessary, disinfected or decontaminated with an appropriate agent. No other goods shall be carried together with UN No. 3291 other than medical or veterinary wastes. Any such other wastes carried in the same closed bulk container shall be inspected for possible contamination.

7.3.2.7 *Material of Class 7*

For the carriage of unpackaged radioactive material, see 4.1.9.2.4.

7.3.2.8 *Goods of Class 8*

These goods shall be carried in bulk containers which are watertight.

7.3.2.9 *Goods of Class 9*

- 7.3.2.9.1 For UN 3509, only closed bulk containers (code BK2) may be used. Bulk containers shall be made leak tight or fitted with a leak tight and puncture resistant sealed liner or bag, and shall have a means of retaining any free liquid that might escape during carriage, e.g. absorbent material. Packagings, discarded, empty, uncleaned with residues of Class 5.1 shall be carried in bulk containers which have been so constructed or adapted that the goods cannot come into contact with wood or any other combustible material.

7.3.3 **Provisions for carriage in bulk when the provisions of 7.3.1.1 (b) are applied**

- 7.3.3.1 In addition to the general provisions of section 7.3.1, the provisions of this section are applicable, when they are shown under an entry in column (17) of Table A of Chapter 3.2. Sheeted or closed vehicles or sheeted or closed containers used under this section need not be in conformity with the requirements of Chapter 6.11. The codes VC1, VC2 and VC3 in column (17) of Table A of Chapter 3.2 have the following meanings:

- VC1 Carriage in bulk in sheeted vehicles, sheeted containers or sheeted bulk containers is permitted;
- VC2 Carriage in bulk in closed vehicles, closed containers or closed bulk containers is permitted;
- VC3 Carriage in bulk is permitted in specially equipped vehicles or containers in accordance with standards specified by the competent authority of the country of origin. If the country of origin is not a Contracting Party to ADR, the conditions laid down shall be recognized by the competent authority of the first country Contracting Party to ADR reached by the consignment.

- 7.3.3.2 When the VC bulk codes are used, the following additional provisions shown in column (17) of Table A of Chapter 3.2 shall apply:

7.3.3.2.1 *Goods of Class 4.1*

- AP1 Vehicles and containers shall have a metal body and where fitted the sheet shall be non-combustible.
- AP2 Vehicles and containers shall have adequate ventilation.

7.3.3.2.2 *Goods of Class 4.2*

- AP1 Vehicles and containers shall have a metal body and where fitted the sheet shall be non-combustible.

7.3.3.2.3 *Goods of Class 4.3*

- AP2 Vehicles and containers shall have adequate ventilation.
- AP3 Sheeted vehicles and sheeted containers shall be used only when the substance is in pieces (not in powder, granular, dust or ashes form).
- AP4 Closed vehicles and closed containers shall be equipped with hermetically closed openings used for loading and unloading to prevent the exit of gas and exclude the ingress of moisture.
- AP5 The cargo doors of the closed vehicles or closed containers shall be marked with the following in letters not less than 25 mm high:

"WARNING
NO VENTILATION
OPEN WITH CAUTION"

This shall be in a language considered appropriate by the consignor.

7.3.3.2.4 *Goods of Class 5.1*

- AP6 If the vehicle or container is made of wood or other combustible material, an impermeable surfacing resistant to combustion or a coating of sodium silicate or similar substance shall be provided. Sheeting shall also be impermeable and non-combustible.
- AP7 Carriage in bulk shall only be as a full load.

7.3.3.2.5 *Goods of Class 6.1*

- AP7 Carriage in bulk shall only be as a full load.

7.3.3.2.6 *Goods of Class 8*

- AP7 Carriage in bulk shall only be as a full load.
- AP8 The design of the load compartment of vehicles or containers shall take account of any residual currents and impacts from the batteries.

The load compartments of vehicles or containers shall be of steel resistant to the corrosive substances contained in the batteries. Less resistant steels may be used when there is a sufficiently great wall thickness or a plastics lining/layer resistant to the corrosive substances.

NOTE: *Steel exhibiting a maximum rate of progressive reduction of 0.1 mm per year under the effects of the corrosive substances may be considered as resistant.*

The load compartments of vehicles or containers shall not be loaded above the top of their walls.

Carriage is also permitted in small plastics containers which shall be capable of withstanding, when fully loaded, a drop from a height of 0.8 m onto a hard surface at -18 °C, without breakage.

7.3.3.2.7

Goods of Class 9

- AP2 Vehicles and containers shall have adequate ventilation.
- AP9 Carriage in bulk is permitted for solids (substances or mixtures, such as preparations or wastes) containing on average not more than 1 000 mg/kg of substance to which this UN number is assigned. At no point of the load shall the concentration of this substance or these substances be higher than 10 000 mg/kg.
- AP10 Vehicles and containers shall be made leak tight or fitted with a leak tight and puncture resistant sealed liner or bag, and shall have a means of retaining any free liquid that might escape during carriage, e.g. absorbent material. Packagings, discarded, empty, uncleaned with residues of Class 5.1 shall be carried in vehicles and containers which have been so constructed or adapted that the goods cannot come into contact with wood or any other combustible material.

CHAPTER 7.4**PROVISIONS CONCERNING CARRIAGE IN TANKS**

7.4.1 Dangerous goods may not be carried in tanks unless a code is indicated in Columns (10) or (12) of Table A of Chapter 3.2 or unless a competent authority approval is granted as detailed in 6.7.1.3. The carriage shall be in accordance with the provisions of Chapters 4.2, 4.3, 4.4 or 4.5 as applicable. The vehicles, whether they be rigid vehicles, drawing vehicles, trailers or semi-trailers, shall satisfy the relevant requirements of Chapters 9.1, 9.2 and 9.7.2 concerning the vehicle to be used, as indicated in Column (14) of Table A in Chapter 3.2.

7.4.2 The vehicles designated by the codes EX/III, FL, OX or AT in 9.1.1.2 shall be used as follows:

- Where an EX/III vehicle is prescribed, only an EX/III vehicle may be used;
- Where a FL vehicle is prescribed, only an FL vehicle may be used;
- Where a OX vehicle is prescribed, only an OX vehicle may be used;
- Where a AT vehicle is prescribed, AT, FL and OX vehicles may be used.

CHAPTER 7.5

PROVISIONS CONCERNING LOADING, UNLOADING AND HANDLING

7.5.1 General provisions concerning loading, unloading and handling

NOTE: Within the meaning of this section, placing a container, bulk-container, tank-container or portable tank onto a vehicle is considered as loading, and removing it is considered as unloading.

7.5.1.1 The vehicle and its driver, as well as the large container(s), bulk-container(s), tank-container(s) or portable tank(s) if any, shall comply with the regulatory provisions (especially those concerning safety, security, cleanliness and satisfactory operation of the equipment used in loading and unloading) upon arrival at the loading and unloading sites, which include container terminals.

7.5.1.2 Unless otherwise specified in ADR, the loading shall not be carried out if:

- (a) an examination of the documents; or
- (b) a visual inspection of the vehicle or of the large container(s), bulk-container(s), tank-container(s) or portable tank(s) if any, as well as of their equipment used in loading and unloading,

shows that the vehicle, the driver, a large container, a bulk-container, a tank-container, a portable tank or their equipment do not comply with the regulatory provisions. The interior and exterior of a vehicle or container shall be inspected prior to loading to ensure that there is no damage that could affect its integrity or that of the packages to be loaded in it.

7.5.1.3 Unless otherwise specified in ADR, the unloading shall not be carried out, if the above-mentioned inspections reveal deficiencies that might affect the safety or the security of the unloading.

7.5.1.4 In accordance with the special provisions of 7.3.3 or 7.5.11, in conformity with Columns (17) and (18) of Table A of Chapter 3.2, certain dangerous goods shall only be forwarded as a "full load" (see definition in 1.2.1). In such a case, the competent authorities may require the vehicle or large container used for such carriage to be loaded at only one point and unloaded at only one point.

7.5.1.5 When orientation arrows are required packages and overpacks shall be oriented in accordance with such markings.

NOTE: Liquid dangerous goods shall be loaded below dry dangerous goods whenever practicable.

7.5.1.6 All means of containment shall be loaded and unloaded in conformity with a handling method for which they have been designed and, where required, tested.

7.5.2 Mixed loading prohibition

7.5.2.1 Packages bearing different danger labels shall not be loaded together in the same vehicle or container unless mixed loading is permitted according to the following Table based on the danger labels they bear.

NOTE: In accordance with 5.4.1.4.2, separate transport documents shall be drawn up for consignments that cannot be loaded together in the same vehicle or container.

Labels Nos.	1	1.4	1.5	1.6	2.1, 2.2, 2.3	3	4.1	4.1 + 1	4.2	4.3	5.1	5.2	5.2 + 1	6.1	6.2	7 A, B, C	8	9

X Mixed loading permitted.

a Mixed loading permitted with 1.4S substances and articles.

b Mixed loading permitted between goods of Class 1 and life-saving appliances of Class 9 (UN Nos. 2990, 3072 and 3268).

c Mixed loading permitted between safety devices, pyrotechnic of Division 1.4, compatibility group G, (UN No. 0503) and safety devices, electrically initiated of Class 9 (UN No. 3268).

d Mixed loading permitted between blasting explosives (except UN No. 0083 explosive, blasting, type C) and ammonium nitrate (UN Nos. 1942 and 2067) and alkali metal nitrates and alkaline earth metal nitrates provided the aggregate is treated as blasting explosives under Class 1 for the purposes of placarding, segregation, stowage and maximum permissible load. Alkali metal nitrates include caesium nitrate (UN 1451), lithium nitrate (UN 2722), potassium nitrate (UN 1486), rubidium nitrate (UN 1477) and sodium nitrate (UN 1498). Alkaline earth metal nitrates include barium nitrate (UN 1446), beryllium nitrate (UN 2464), calcium nitrate (UN 1454), magnesium nitrate (UN 1474) and strontium nitrate (UN 1507).

7.5.2.2

Packages containing substances or articles of Class 1, bearing a label conforming to models Nos. 1, 1.4, 1.5 or 1.6 which are assigned to different compatibility groups shall not be loaded together in the same vehicle or container, unless mixed loading is permitted in accordance with the following Table for the corresponding compatibility groups.

Compatibility Group	A	B	C	D	E	F	G	H	J	L	N	S
A	X											
B		X		^a								X
C			X	X	X		X				^{b c}	X
D		^a	X	X	X		X				^{b c}	X
E			X	X	X		X				^{b c}	X
F						X						X
G			X	X	X		X					X
H								X				X
J									X			X
L										^d		
N			^{b c}	^{b c}	^{b c}						^b	X
S		X	X	X	X	X	X	X	X		X	X

X Mixed loading permitted.

- ^a Packages containing articles of compatibility group B and those containing substances or articles of compatibility group D may be loaded together on one vehicle or in one container provided they are effectively segregated such that there is no danger of transmission of detonation from the articles of compatibility group B to the substances or articles of compatibility group D. Segregation shall be achieved by the use of separate compartments or by placing one of the two types of explosive in a special containment system. Either method of segregation shall be approved by the competent authority.
- ^b Different types of articles of division 1.6, compatibility group N, may be carried together as articles of division 1.6, compatibility group N, only when it is proven by testing or analogy that there is no additional risk of sympathetic detonation between the articles. Otherwise they should be treated as hazard division 1.1.
- ^c When articles of compatibility group N are carried with substances or articles of compatibility groups C, D or E, the articles of compatibility group N should be considered as having the characteristics of compatibility group D.
- ^d Packages containing substances and articles of Compatibility Group L may be loaded together on one vehicle or in one container with packages containing the same type of substances and articles of that compatibility group.

7.5.2.3 For the purpose of the application of the prohibitions of mixed loading on one vehicle, no account shall be taken of substances contained in closed containers with complete sides. Nevertheless, the mixed loading prohibitions laid down in 7.5.2.1 concerning mixed loading of packages bearing labels conforming to models Nos. 1, 1.4, 1.5 or 1.6 with other packages, and in 7.5.2.2 concerning mixed loading of explosives of different compatibility groups shall also apply between dangerous goods contained in a container and the other dangerous goods loaded on the same vehicle, whether or not the latter goods are enclosed in one or more other containers.

7.5.2.4 Mixed loading of dangerous goods packed in limited quantities with any type of explosive substances and articles, except those of Division 1.4 and UN Nos. 0161 and 0499, is prohibited.

7.5.3 *(Reserved)*

7.5.4 **Precautions with respect to foodstuffs, other articles of consumption and animal feeds**

If special provision CV28 is indicated for a substance or article in Column (18) of Table A of Chapter 3.2, precautions with respect to foodstuffs, other articles of consumption and animal feeds shall be taken as follows.

Packages as well as uncleaned empty packagings, including large packagings and intermediate bulk containers (IBCs), bearing labels conforming to models Nos. 6.1 or 6.2 and those bearing labels conforming to model No. 9 containing goods of UN Nos. 2212, 2315, 2590, 3151, 3152 or 3245, shall not be stacked on or loaded in immediate proximity to packages known to contain foodstuffs, other articles of consumption or animal feeds in vehicles, in containers and at places of loading, unloading or transhipment.

When these packages, bearing the said labels, are loaded in immediate proximity of packages known to contain foodstuffs, other articles of consumption or animal feeds, they shall be kept apart from the latter:

- (a) By complete partitions which should be as high as the packages bearing the said labels;
- (b) By packages not bearing labels conforming to models Nos. 6.1, 6.2 or 9 or packages bearing labels conforming to model No.9 but not containing goods of UN Nos. 2212, 2315, 2590, 3151, 3152 or 3245; or
- (c) By a space of at least 0.8 m;

unless the packages bearing the said labels are provided with an additional packaging or are completely covered (e.g. by a sheeting, a fibreboard cover or other measures).

7.5.5 **Limitation of the quantities carried**

7.5.5.1 If the provisions below, or the additional provisions of 7.5.11 to be applied according to Column (18) of Table A of Chapter 3.2 require a limitation of the quantity of specific goods that can be carried, the fact that dangerous goods are contained in one or more containers shall not affect the mass limitations per transport unit laid down by these provisions.

7.5.5.2 ***Limitations with respect to explosive substances and articles***

7.5.5.2.1 ***Substances and quantities carried***

The total net mass in kg of explosive substance (or in the case of explosive articles, the total net mass of explosive substance contained in all the articles combined) which may be carried on one transport unit shall be limited as indicated in the table below (see also 7.5.2.2 as regards the prohibition of mixed loading):

Maximum permissible net mass in kg of explosive in Class 1 goods per transport unit

Transport Unit	Division	1.1		1.2	1.3	1.4		1.5 and 1.6	Empty uncleaned packagings
	Compatibility group	1.1A	Other than 1.1A			Other than 1.4S	1.4S		
EX/II ^a		6.25	1 000	3 000	5 000	15 000	Unlimited	5 000	Unlimited
EX/III ^a		18.75	16 000	16 000	16 000	16 000	Unlimited	16 000	Unlimited

^a For the description of EX/II and EX/III vehicles see Part 9.

7.5.5.2.2 Where substances and articles of different divisions of Class 1 are loaded on one transport unit in conformity with the prohibitions of mixed loading contained in 7.5.2.2, the load as a whole shall be treated as if it belonged to the most dangerous division (in the order 1.1, 1.5, 1.2, 1.3, 1.6, 1.4). However, the net mass of explosives of compatibility group S shall not count towards the limitation of quantities carried.

Where substances classified as 1.5D are carried on one transport unit together with substances or articles of division 1.2, the entire load shall be treated for carriage as if it belonged to division 1.1.

7.5.5.2.3 Carriage of explosives on MEMUs

Carriage of explosives on MEMUs is only permitted subject to the following conditions:

- The competent authority shall authorize the transport operation within its territory;
- The type and quantity of packaged explosives carried shall be limited to those necessary for the quantity of material to be manufactured on the MEMU, and in any case shall not exceed:
 - 200 kg of explosives of compatibility group D; and
 - a total of 400 units of detonators or detonator assemblies, or a mixture of both,
 unless otherwise approved by the competent authority;
- Packaged explosives shall only be carried in compartments that meet the requirements of 6.12.5;
- No other dangerous goods may be carried in the same compartment as the packaged explosives;
- Packaged explosives shall only be loaded onto the MEMU once the loading of other dangerous goods has been completed and immediately prior to carriage;
- When mixed loading is permitted between explosives and substances of Class 5.1 (UN 1942 and UN 3375) the aggregate is treated as blasting explosives under Class 1 for the purposes of segregation, stowage and maximum permissible load.

7.5.5.3 The maximum quantity of organic peroxides of Class 5.2 and self-reactive substances of Class 4.1 of Types B, C, D, E or F is limited to 20 000 kg per transport unit.

7.5.6 (Reserved)

7.5.7 Handling and stowage

- 7.5.7.1 Where appropriate the vehicle or container shall be fitted with devices to facilitate securing and handling of the dangerous goods. Packages containing dangerous substances and unpackaged dangerous articles shall be secured by suitable means capable of restraining the goods (such as fastening straps, sliding slatboards, adjustable brackets) in the vehicle or container in a manner that will prevent any movement during carriage which would change the orientation of the packages or cause them to be damaged. When dangerous goods are carried with other goods (e.g. heavy machinery or crates), all goods shall be securely fixed or packed in the vehicles or containers so as to prevent the release of dangerous goods. Movement of packages may also be prevented by filling any voids by the use of dunnage or by blocking and bracing. Where restraints such as banding or straps are used, these shall not be over-tightened to cause damage or deformation of the package¹. The requirements of this paragraph are deemed to be complied with if the cargo is secured in accordance with standard EN 12195-1:2010.
- 7.5.7.2 Packages shall not be stacked unless designed for that purpose. Where different design types of packages that have been designed for stacking are to be loaded together, consideration shall be given to their compatibility for stacking with each other. Where necessary, stacked packages shall be prevented from damaging the package below by the use of load-bearing devices.
- 7.5.7.3 During loading and unloading, packages containing dangerous goods shall be protected from being damaged.
- NOTE:** Particular attention shall be paid to the handling of packages during their preparation for carriage, the type of vehicle or container on which they are to be carried and to the method of loading or unloading, so that accidental damage is not caused through dragging or mishandling the packages.*
- 7.5.7.4 The provisions of 7.5.7.1 also apply to the loading, stowage and unloading of containers, tank-containers, portable tanks and MEGCs on to and from vehicles.
- 7.5.7.5 Members of the vehicle crew may not open a package containing dangerous goods.

¹ Guidance on the stowage of dangerous goods can be found in the European Best Practice Guidelines on Cargo Securing for Road Transport published by the European Commission. Other guidance is also available from competent authorities and industry bodies.

7.5.8 Cleaning after unloading

7.5.8.1 If, when a vehicle or container which has contained packaged dangerous goods is unloaded, some of the contents are found to have escaped, the vehicle or container shall be cleaned as soon as possible and in any case before reloading.

If it is not possible to do the cleaning locally, the vehicle or container shall be carried, with due regard to adequate safety, to the nearest suitable place where cleaning can be carried out.

Carriage is adequately safe if suitable measures have been taken to prevent the uncontrolled release of the dangerous goods that have escaped.

7.5.8.2 Vehicles or containers which have been loaded with dangerous goods in bulk shall be properly cleaned before reloading unless the new load consists of the same dangerous goods as the preceding load.

7.5.9 Prohibition of smoking

Smoking shall be prohibited during handling operations in the vicinity of vehicles or containers and inside the vehicles or containers. This prohibition of smoking is also applicable to the use of electronic cigarettes and similar devices.

7.5.10 Precautions against electrostatic charges

In the case of flammable gases, or liquids with a flash-point of 60 °C or below, or UN No. 1361, carbon or carbon black, packing group II, a good electrical connection from the chassis of the vehicle, the portable tank or the tank-container to earth shall be established before tanks are filled or emptied. In addition, the rate of filling shall be limited.

7.5.11 Additional provisions applicable to certain classes or specific goods

In addition to the provisions of sections 7.5.1 to 7.5.10, the following provisions shall apply when they are shown under an entry indicated in Column (18) of Table A of Chapter 3.2.

- CV1 (1) The following operations are prohibited:
- (a) Loading or unloading goods in a public place in a built-up area without special permission from the competent authorities;
 - (b) Loading or unloading goods in a public place elsewhere than in a built-up area without prior notice thereof having been given to the competent authorities, unless these operations are urgently necessary for reasons of safety.
- (2) If, for any reason, handling operations have to be carried out in a public place, then substances and articles of different kinds shall be separated according to the labels.
- CV2 (1) Before loading, the loading surface of the vehicle or container shall be thoroughly cleaned.
- (2) The use of fire or naked flame shall be prohibited on vehicles and containers carrying goods, in their vicinity and during the loading and unloading of these goods.
- CV3 See 7.5.5.2.
- CV4 Substances and articles of compatibility group L shall only be carried as a full load.
- CV5 to CV8 *(Reserved)*
- CV9 Packages shall not be thrown or subjected to impact.
Receptacles shall be so stowed in the vehicle or container that they cannot overturn or fall.

CV10 Cylinders as defined in 1.2.1, shall be laid parallel to or at right angles to the longitudinal axis of the vehicle or container; however, those situated near the forward transverse wall shall be laid at right angles to the said axis.

Short cylinders of large diameter (about 30 cm and over) may be stowed longitudinally with their valve-protecting devices directed towards the middle of the vehicle or container.

Cylinders which are sufficiently stable or are carried in suitable devices effectively preventing them from overturning may be placed upright.

Cylinders which are laid flat shall be securely and appropriately wedged, attached or secured so that they cannot shift.

CV11 Receptacles shall always be placed in the position for which they were designed and be protected against any possibility of being damaged by other packages.

CV12 When pallets loaded with articles are stacked, each tier of pallets shall be evenly distributed over the lower tier, if necessary by the interposition of a material of adequate strength.

CV13 If any substances have leaked and been spilled in a vehicle or container, it may not be re-used until after it has been thoroughly cleaned and, if necessary, disinfected or decontaminated. Any other goods and articles carried in the same vehicle or container shall be examined for possible contamination.

CV14 Goods shall be shielded from direct sunlight and heat during carriage.

Packages shall be stored only in cool, well-ventilated places away from heat sources.

CV15 See 7.5.5.3.

CV16 to CV19 (*Reserved*)

CV20 The provisions of Chapter 5.3 and special provisions V1 and V8(5) and (6) of Chapter 7.2 shall not apply provided that the substance is packaged in accordance with packing method OP1 or OP2 of packing instruction P520 in 4.1.4.1, as required, and the total quantity of substances to which this derogation applies per transport unit is limited to 10 kg.

CV21 The transport unit shall be thoroughly inspected prior to loading.

Before carriage, the carrier shall be informed:

- about the operation of the refrigeration system, including a list of the suppliers of coolant available en route;
- procedures to be followed in the event of loss of temperature control.

In the case of temperature control in accordance with methods R2 or R4 of special provision V8(3) of Chapter 7.2, a sufficient quantity of non-flammable refrigerant (e.g. liquid nitrogen or dry ice), including a reasonable margin for possible delays, shall be carried unless a means of replenishment is assured.

Packages shall be so stowed as to be readily accessible.

The specified control temperature shall be maintained during the whole transport operation, including loading and unloading, as well as any intermediate stops.

CV22 Packages shall be loaded so that a free circulation of air within the loading space provides a uniform temperature of the load. If the contents of one vehicle or large container exceed 5 000 kg of flammable solids and/or organic peroxides, the load shall be divided into stacks of not more than 5 000 kg separated by air spaces of at least 0.05 m.

CV23 When handling packages, special measures shall be taken to ensure that they do not come into contact with water.

CV24 Before loading, vehicles and containers shall be thoroughly cleaned and in particular be free of any combustible debris (straw, hay, paper, etc.).

The use of readily flammable materials for stowing packages is prohibited.

CV25 (1) Packages shall be so stowed that they are readily accessible.

(2) When packages are to be carried at an ambient temperature of not more than 15 °C or refrigerated, the temperature shall be maintained when unloading or during storage.

(3) Packages shall be stored only in cool places away from sources of heat.

CV26 The wooden parts of a vehicle or container which have come into contact with these substances shall be removed and burnt.

CV27 (1) Packages shall be so stowed that they are readily accessible.

(2) When packages are to be carried refrigerated, the functioning of the cooling chain shall be ensured when unloading or during storage.

(3) Packages shall only be stored in cool places away from sources of heat.

CV28 See 7.5.4.

CV29 to CV32 (Reserved)

CV33 **NOTE 1:** "Critical group" means a group of members of the public which is reasonably homogeneous with respect to its exposure for a given radiation source and given exposure pathway and is typical of individual receiving the highest effective dose by the given exposure pathway from the given source.

NOTE 2: "Members of the public" means in a general sense, any individuals in the population except when subject to occupational or medical exposure.

NOTE 3: "Workers" are any persons who work, whether full time, part-time or temporarily, for an employer and who have recognised rights and duties in relation to occupational radiation protection.

(1) Segregation

(1.1) Packages, overpacks, containers and tanks containing radioactive material and unpacked radioactive material shall be segregated during carriage:

(a) from workers in regularly occupied working areas:

(i) in accordance with Table A below; or

(ii) by distances calculated using a dose criterion of 5 mSv in a year and conservative model parameters;

NOTE: Workers subject to individual monitoring for the purposes of radiation protection shall not be considered for the purposes of segregation.

(b) from members of the public, in areas where the public has regular access:

(i) in accordance with Table A below; or

(ii) by distances calculated using a dose criterion of 1 mSv in a year and conservative model parameters;

(c) from undeveloped photographic film and mailbags:

(i) in accordance with Table B below; or

(ii) by distances calculated using a radiation exposure criterion for undeveloped photographic film due to the transport of radioactive material for 0.1 mSv per consignment of such film; and

NOTE: Mailbags shall be assumed to contain undeveloped film and plates and therefore be separated from radioactive material in the same way.

(d) from other dangerous goods in accordance with 7.5.2.

Table A: Minimum distances between packages of category II-YELLOW or of category III-YELLOW and persons

Sum of transport indexes not more than	Exposure time per year (hours)			
	Areas where members of the public have regular access		Regularly occupied working areas	
	50	250	50	250
	Segregation distance in metres, no shielding material intervening, from:			
2	1	3	0.5	1
4	1.5	4	0.5	1.5
8	2.5	6	1.0	2.5
12	3	7.5	1.0	3
20	4	9.5	1.5	4
30	5	12	2	5
40	5.5	13.5	2.5	5.5
50	6.5	15.5	3	6.5

Table B: Minimum distances between packages of category II-YELLOW or of category III-YELLOW and packages bearing the word "FOTO", or mailbags

Total number of packages not more than		Sum of transport indexes not more than	Journey or storage duration, in hours								
Category			1	2	4	10	24	48	120	240	
III-yellow	II-yellow		Minimum distances in metres								
		0.2	0.5	0.5	0.5	0.5	1	1	2	3	
		0.5	0.5	0.5	0.5	1	1	2	3	5	
	1	1	0.5	0.5	1	1	2	3	5	7	
	2	2	0.5	1	1	1.5	3	4	7	9	
	4	4	1	1	1.5	3	4	6	9	13	
	8	8	1	1.5	2	4	6	8	13	18	
1	10	10	1	2	3	4	7	9	14	20	
2	20	20	1.5	3	4	6	9	13	20	30	
3	30	30	2	3	5	7	11	16	25	35	
4	40	40	3	4	5	8	13	18	30	40	
5	50	50	3	4	6	9	14	20	32	45	

(1.2) Category II-YELLOW or III-YELLOW packages or overpacks shall not be carried in compartments occupied by passengers, except those exclusively reserved for couriers specially authorized to accompany such packages or overpacks.

- (1.3) No persons other than members of the vehicle crew shall be permitted in vehicles carrying packages, overpacks or containers bearing category II-YELLOW or III-YELLOW labels.

(2) *Activity limits*

The total activity in a vehicle, for carriage of LSA material or SCO in Industrial Packages Type 1 (Type IP-1), Type 2 (Type IP-2), Type 3 (Type IP-3) or unpackaged, shall not exceed the limits shown in Table C below.

Table C: Vehicle activity limits for LSA material and SCO in industrial packages or unpackaged

Nature of material or object	Activity limit for vehicle
LSA-I	No limit
LSA-II and LSA-III non-combustible solids	No limit
LSA-II and LSA-III combustible solids, and all liquids and gases	100 A ₂
SCO	100 A ₂

(3) *Stowage during carriage and storage in transit*

- (3.1) Consignments shall be securely stowed.
- (3.2) Provided that its average surface heat flux does not exceed 15 W/m² and that the immediately surrounding cargo is not in bags, a package or overpack may be carried or stored among packaged general cargo without any special stowage provisions except as may be specifically required by the competent authority in an applicable certificate of approval.
- (3.3) Loading of containers and accumulation of packages, overpacks and containers shall be controlled as follows:
- (a) Except under the condition of exclusive use, and for consignments of LSA-I material, the total number of packages, overpacks and containers aboard a single vehicle shall be so limited that the total sum of the transport indexes aboard the vehicle does not exceed the values shown in Table D below;
 - (b) The radiation level under routine conditions of carriage shall not exceed 2 mSv/h at any point on, and 0.1 mSv/h at 2 m from, the external surface of the vehicle, except for consignments carried under exclusive use, for which the radiation limits around the vehicle are set forth in (3.5) (b) and (c);
 - (c) The total sum of the criticality safety indexes in a container and aboard a vehicle shall not exceed the values shown in Table E below.

Table D: Transport Index limits for containers and vehicles not under exclusive use

Type of container or vehicle	Limit on total sum of transport indexes in a container or aboard a vehicle
Small container	50
Large container	50
Vehicle	50

Table E: Criticality Safety Index for containers and vehicles containing fissile material

Type of container or vehicle	Limit on total sum of criticality safety indexes	
	Not under exclusive use	Under exclusive use
Small container	50	n.a.
Large container	50	100
Vehicle	50	100

(3.4) Any package or overpack having either a transport index greater than 10, or any consignment having a criticality safety index greater than 50, shall be carried only under exclusive use.

(3.5) For consignments under exclusive use, the radiation level shall not exceed:

- (a) 10 mSv/h at any point on the external surface of any package or overpack, and may only exceed 2 mSv/h provided that:
 - (i) the vehicle is equipped with an enclosure which, during routine conditions of carriage, prevents the access of unauthorized persons to the interior of the enclosure;
 - (ii) provisions are made to secure the package or overpack so that its position within the vehicle enclosure remains fixed during routine conditions of carriage, and
 - (iii) there is no loading or unloading during the shipment;
- (b) 2 mSv/h at any point on the outer surfaces of the vehicle, including the upper and lower surfaces, or, in the case of an open vehicle, at any point on the vertical planes projected from the outer edges of the vehicle, on the upper surface of the load, and on the lower external surface of the vehicle; and
- (c) 0.1 mSv/h at any point 2 m from the vertical planes represented by the outer lateral surfaces of the vehicle, or, if the load is carried in an open vehicle, at any point 2 m from the vertical planes projected from the outer edges of the vehicle.

(4) *Additional requirements relating to carriage and storage in transit of fissile material*

- (4.1) Any group of packages, overpacks, and containers containing fissile material stored in transit in any one storage area shall be so limited that the total sum of the CSIs in the group does not exceed 50. Each group shall be stored so as to maintain a spacing of at least 6 m from other such groups.

- (4.2) Where the total sum of the criticality safety indexes on board a vehicle or in a container exceeds 50, as permitted in Table E above, storage shall be such as to maintain a spacing of at least 6 m from other groups of packages, overpacks or containers containing fissile material or other vehicles carrying radioactive material.
- (4.3) Fissile material meeting one of the provisions (a) to (f) of 2.2.7.2.3.5 shall meet the following requirements:
 - (a) Only one of the provisions (a) to (f) of 2.2.7.2.3.5 is allowed per consignment;
 - (b) Only one approved fissile material in packages classified in accordance with 2.2.7.2.3.5 (f) is allowed per consignment unless multiple materials are authorized in the certificate of approval;
 - (c) Fissile material in packages classified in accordance with 2.2.7.2.3.5 (c) shall be carried in a consignment with no more than 45 g of fissile nuclides;
 - (d) Fissile material in packages classified in accordance with 2.2.7.2.3.5 (d) shall be carried in a consignment with no more than 15 g of fissile nuclides;
 - (e) Unpackaged or packaged fissile material classified in accordance with 2.2.7.2.3.5 (e) shall be carried under exclusive use on a vehicle with no more than 45 g of fissile nuclides.
- (5) *Damaged or leaking packages, contaminated packagings*
 - (5.1) If it is evident that a package is damaged or leaking, or if it is suspected that the package may have leaked or been damaged, access to the package shall be restricted and a qualified person shall, as soon as possible, assess the extent of contamination and the resultant radiation level of the package. The scope of the assessment shall include the package, the vehicle, the adjacent loading and unloading areas, and, if necessary, all other material which has been carried in the vehicle. When necessary, additional steps for the protection of persons property and the environment, in accordance with provisions established by the competent authority, shall be taken to overcome and minimize the consequences of such leakage or damage.
 - (5.2) Packages damaged or leaking radioactive contents in excess of allowable limits for normal conditions of carriage may be removed to an acceptable interim location under supervision, but shall not be forwarded until repaired or reconditioned and decontaminated.
 - (5.3) A vehicle and equipment used regularly for the carriage of radioactive material shall be periodically checked to determine the level of contamination. The frequency of such checks shall be related to the likelihood of contamination and the extent to which radioactive material is carried.

(5.4) Except as provided in paragraph (5.5), any vehicle, or equipment or part thereof which has become contaminated above the limits specified in 4.1.9.1.2 in the course of carriage of radioactive material, or which shows a radiation level in excess of 5 $\mu\text{Sv/h}$ at the surface, shall be decontaminated as soon as possible by a qualified person and shall not be re-used unless the following conditions are fulfilled:

- (a) the non-fixed contamination shall not exceed the limits specified in 4.1.9.1.2;
- (b) the radiation level resulting from the fixed contamination shall not exceed 5 $\mu\text{Sv/h}$ at the surface.

(5.5) A container, tank, intermediate bulk container or vehicle dedicated to the carriage of unpackaged radioactive material under exclusive use shall be excepted from the requirements of the previous paragraph (5.4) and in 4.1.9.1.4 solely with regard to its internal surfaces and only for as long as it remains under that specific exclusive use.

(6) *Other provisions*

Where a consignment is undeliverable, the consignment shall be placed in a safe location and the competent authority shall be informed as soon as possible and a request made for instructions on further action.

CV34 Prior to carriage of pressure receptacles it shall be ensured that the pressure has not risen due to potential hydrogen generation.

CV35 If bags are used as single packagings, they shall be adequately separated to allow for the dissipation of heat.

CV36 Packages shall preferably be loaded in open or ventilated vehicles or open or ventilated containers. If this is not feasible and packages are carried in other closed vehicles or containers, the cargo doors of the vehicles or containers shall be marked with the following in letters not less than 25 mm high:

"WARNING
NO VENTILATION
OPEN WITH CAUTION"

This shall be in a language considered appropriate by the consignor.

CV37 Before carriage, aluminium smelting by-products or aluminium remelting by-products shall be cooled to ambient temperature prior to loading. Sheeted vehicles and sheeted containers shall be waterproof. The cargo doors of the closed vehicles and closed containers shall be marked with the following in letters not less than 25 mm high:

"WARNING
CLOSED MEANS OF CONTAINMENT
OPEN WITH CAUTION"

This shall be in a language considered appropriate by the consignor.

ANNEX B

PROVISIONS CONCERNING TRANSPORT EQUIPMENT AND TRANSPORT OPERATIONS

PART 8

Requirements for vehicle crews, equipment, operation and documentation

CHAPTER 8.1

GENERAL REQUIREMENTS CONCERNING TRANSPORT UNITS AND EQUIPMENT ON BOARD

8.1.1 Transport units

A transport unit loaded with dangerous goods may in no case include more than one trailer (or semi-trailer).

8.1.2 Documents to be carried on the transport unit

8.1.2.1 In addition to the documents required under other regulations, the following documents shall be carried on the transport unit:

- (a) The transport documents prescribed in 5.4.1, covering all the dangerous goods carried and, when appropriate, the large container or vehicle packing certificate prescribed in 5.4.2;
- (b) The instructions in writing prescribed in 5.4.3;
- (c) *(Reserved)*;
- (d) Means of identification, which include a photograph, for each member of the vehicle crew, in accordance with 1.10.1.4.

8.1.2.2 Where the provisions of ADR require the following documents to be drawn up, they shall likewise be carried on the transport unit:

- (a) The certificate of approval referred to in 9.1.3 for each transport unit or element thereof;
- (b) The driver's training certificate prescribed in 8.2.1;
- (c) A copy of the competent authority approval, when required in 5.4.1.2.1 (c) or (d) or 5.4.1.2.3.3.

8.1.2.3 The instructions in writing prescribed in 5.4.3 shall be kept readily available.

8.1.2.4 *(Deleted)*

8.1.3 Placarding and marking

Transport units carrying dangerous goods shall be placarded and marked in conformity with Chapter 5.3.

8.1.4 Fire-fighting equipment

8.1.4.1 The following table shows the minimum provisions for portable fire extinguishers for the inflammability Classes¹ A, B and C that apply to transport units carrying dangerous goods except for those referred to in 8.1.4.2:

¹ For the definition of the inflammability classes, see Standard EN 2:1992 + A1:2004 Classification of fires.

(1) Transport unit maximum permissible mass	(2) Minimum number of fire extinguishers	(3) Minimum total capacity per transport unit	(4) Extinguisher suitable for engine or cab fire. At least one with a minimum capacity of:	(5) Additional extinguisher(s) requirement. At least one extinguisher shall have a minimum capacity of:
≤ 3.5 tonnes	2	4 kg	2 kg	2 kg
> 3.5 tonnes ≤ 7.5 tonnes	2	8 kg	2 kg	6 kg
> 7.5 tonnes	2	12 kg	2 kg	6 kg
The capacities are for dry powder devices (or an equivalent capacity for any other suitable extinguishing agent).				

8.1.4.2 Transport units carrying dangerous goods in accordance with 1.1.3.6 shall be equipped with one portable fire extinguisher for the inflammability classes¹ A, B and C, with a minimum capacity of 2 kg dry powder (or an equivalent capacity for any other suitable extinguishing agent).

8.1.4.3 The portable fire extinguishers shall be suitable for use on a vehicle and shall comply with the relevant requirements of EN 3 Portable fire extinguishers, Part 7 (EN 3-7:2004 + A1:2007).

If the vehicle is equipped with a fixed fire extinguisher, automatic or easily brought into action for fighting a fire in the engine, the portable extinguisher need not be suitable for fighting a fire in the engine. The extinguishing agents shall be such that they are not liable to release toxic gases into the driver's cab or under the influence of the heat of the fire.

8.1.4.4 The portable fire extinguishers conforming to the provisions of 8.1.4.1 or 8.1.4.2 shall be fitted with a seal which allows verifying that they have not been used.

The fire extinguishers shall be subjected to inspections in accordance with authorized national standards in order to guarantee their functional safety. They shall bear a mark of compliance with a standard recognized by a competent authority and a marking indicating the date (month, year) of the next inspection or of the maximum permissible period of use, as applicable.

8.1.4.5 The fire extinguishers shall be installed on the transport units in a way that they are easily accessible to the vehicle crew. The installation shall be carried out in such a way that the fire extinguishers shall be protected against effects of the weather so that their operational safety is not affected. During carriage, the date required in 8.1.4.4 shall not have expired.

8.1.5 Miscellaneous equipment and equipment for personal protection

8.1.5.1 Each transport unit carrying dangerous goods shall be provided with items of equipment for general and personal protection in accordance with 8.1.5.2. The items of equipment shall be selected in accordance with the danger label number of the goods loaded. The label numbers can be identified through the transport document.

8.1.5.2 The following equipment shall be carried on board the transport unit:

- For each vehicle, a wheel chock of a size suited to the maximum mass of the vehicle and to the diameter of the wheel;
- Two self-standing warning signs;
- Eye rinsing liquid²; and

for each member of the vehicle crew

¹ For the definition of the inflammability classes, see Standard EN 2:1992 + A1:2004 Classification of fires.

² Not required for danger label numbers 1, 1.4, 1.5, 1.6, 2.1, 2.2 and 2.3.

- A warning vest (e.g. as described in the EN 471:2003 + A1:2007 standard);
- Portable lighting apparatus conforming to the provisions of 8.3.4;
- A pair of protective gloves; and
- Eye protection (e.g. protective goggles).

8.1.5.3 Additional equipment required for certain classes:

- An emergency escape mask³ for each member of the vehicle crew shall be carried on board the vehicle for danger label numbers 2.3 or 6.1;
- A shovel⁴;
- A drain seal⁴;
- A collecting container⁴.

³ For example an emergency escape mask with a combined gas/dust filter of the A1B1E1K1-P1 or A2B2E2K2-P2 type which is similar to that described in the EN 141 standard.

⁴ Only required for solids and liquids with danger label numbers 3, 4.1, 4.3, 8 or 9.

CHAPTER 8.2

REQUIREMENTS CONCERNING THE TRAINING OF THE VEHICLE CREW

8.2.1 Scope and general requirements concerning the training of drivers

- 8.2.1.1 Drivers of vehicles carrying dangerous goods shall hold a certificate issued by the competent authority stating that they have participated in a training course and passed an examination on the particular requirements that have to be met during carriage of dangerous goods.
- 8.2.1.2 Drivers of vehicles carrying dangerous goods shall attend a basic training course. Training shall be given in the form of a course approved by the competent authority. Its main objectives are to make drivers aware of hazards arising in the carriage of dangerous goods and to give them basic information indispensable for minimizing the likelihood of an incident taking place and, if it does, to enable them to take measures which may prove necessary for their own safety and that of the public and the environment, for limiting the effects of an incident. This training, which shall include individual practical exercises, shall act as the basis of training for all categories of drivers covering at least the subjects defined in 8.2.2.3.2. The competent authority may approve basic training courses limited to specific dangerous goods or to a specific class or classes. These restricted basic training courses shall not confer the right to attend the training courses referred to in 8.2.1.4.
- 8.2.1.3 Drivers of vehicles or MEMUs carrying dangerous goods in fixed tanks or demountable tanks with a capacity exceeding 1 m³, drivers of battery-vehicles with a total capacity exceeding 1 m³ and drivers of vehicles or MEMUs carrying dangerous goods in tank-containers, portable tanks or MEGCs with an individual capacity exceeding 3 m³ on a transport unit, shall attend a specialization training course for carriage in tanks covering at least the subjects defined in 8.2.2.3.3. The competent authority may approve tank specialization training courses limited to specific dangerous goods or to a specific class or classes. These restricted tank specialization training courses shall not confer the right to attend the training courses referred to in 8.2.1.4.
- 8.2.1.4 Drivers of vehicles carrying dangerous goods of Class 1, other than substances and articles of Division 1.4, compatibility group S, or Class 7 shall attend specialization training courses covering at least the subjects defined in 8.2.2.3.4 or 8.2.2.3.5, as applicable.
- 8.2.1.5 All training courses, practical exercises, examinations and the role of competent authorities shall comply with the provisions of 8.2.2.
- 8.2.1.6 All training certificates conforming to the requirements of this section and issued in accordance with 8.2.2.8 by the competent authority of a Contracting Party shall be accepted during their period of validity by the competent authorities of other Contracting Parties.

8.2.2 Special requirements concerning the training of drivers

- 8.2.2.1 The necessary knowledge and skills shall be imparted by training covering theoretical courses and practical exercises. The knowledge shall be tested in an examination.
- 8.2.2.2 The training body shall ensure that the training instructors have a good knowledge of, and take into consideration, recent developments in regulations and training requirements relating to the carriage of dangerous goods. The training shall be practice-related. The training programme shall conform with the approval referred to in 8.2.2.6, on the subjects set out in 8.2.2.3.2 to 8.2.2.3.5. The training shall also include individual practical exercises (see 8.2.2.3.8).

8.2.2.3 Structure of training

- 8.2.2.3.1 Training shall be given in the form of a basic training course and, when applicable, specialization training courses. Basic training courses and specialization training courses may be given in the form of comprehensive training courses, conducted integrally, on the same occasion and by the same training body.

- 8.2.2.3.2 Subjects to be covered by the basic training course shall be, at least:
- (a) General requirements governing the carriage of dangerous goods;
 - (b) Main types of hazard;
 - (c) Information on environmental protection in the control of the transfer of wastes;
 - (d) Preventive and safety measures appropriate to the various types of hazard;
 - (e) What to do after an accident (first aid, road safety, basic knowledge about the use of protective equipment, instructions in writing, etc.);
 - (f) Marking, labelling, placarding and orange-coloured plate marking;
 - (g) What a driver should and should not do during the carriage of dangerous goods;
 - (h) Purpose and the method of operation of technical equipment on vehicles;
 - (i) Prohibitions on mixed loading in the same vehicle or container;
 - (j) Precautions to be taken during loading and unloading of dangerous goods;
 - (k) General information concerning civil liability;
 - (l) Information on multimodal transport operations;
 - (m) Handling and stowage of packages;
 - (n) Traffic restrictions in tunnels and instructions on behaviour in tunnels (prevention of incidents, safety, action in the event of fire or other emergencies, etc.);
 - (o) Security awareness.
- 8.2.2.3.3 Subjects to be covered by the specialization training course for carriage in tanks shall be, at least:
- (a) Behaviour of vehicles on the road, including movements of the load;
 - (b) Specific requirements of the vehicles;
 - (c) General theoretical knowledge of the various and different filling and discharge systems;
 - (d) Specific additional provisions applicable to the use of those vehicles (certificates of approval, approval marking, placarding and orange-coloured plate marking, etc.).
- 8.2.2.3.4 Subjects to be covered by the specialization training course for the carriage of substances and articles of Class 1 shall be, at least:
- (a) Specific hazards related to explosive and pyrotechnical substances and articles;
 - (b) Specific requirements concerning mixed loading of substances and articles of Class 1.
- 8.2.2.3.5 Subjects to be covered by the specialization training course for the carriage of radioactive material of Class 7 shall be, at least:
- (a) Specific hazards related to ionizing radiation;
 - (b) Specific requirements concerning packing, handling, mixed loading and stowage of radioactive material;
 - (c) Special measures to be taken in the event of an accident involving radioactive material.
- 8.2.2.3.6 Teaching units are intended to last 45 minutes.

8.2.2.3.7 Normally, not more than eight teaching units are permitted on each training day.

8.2.2.3.8 The individual practical exercises shall take place in connection with the theoretical training, and shall at least cover first aid, fire-fighting and what to do in case of an incident or accident.

8.2.2.4 Initial training programme

8.2.2.4.1 The minimum duration of the theoretical element of each initial training course or part of the comprehensive training course shall be as follows:

Basic training course	18 teaching units
Specialization training course for carriage in tanks	12 teaching units
Specialization training course for carriage of substances and articles of Class 1	8 teaching units
Specialization training course for carriage of radioactive material of Class 7	8 teaching units

For the basic training course and the specialization training course for carriage in tanks, additional teaching units are required for practical exercises referred to in 8.2.2.3.8 which will vary depending on the number of drivers under instruction.

8.2.2.4.2 The total duration of the comprehensive training course may be determined by the competent authority, who shall maintain the duration of the basic training course and the specialization training course for tanks, but may supplement it with shortened specialization training courses for Classes 1 and 7.

8.2.2.5 Refresher training programme

8.2.2.5.1 Refresher training undertaken at regular intervals serves the purpose of bringing the drivers' knowledge up to date; it shall cover new technical, legal and substance-related developments.

8.2.2.5.2 The duration of the refresher training including individual practical exercises shall be of at least two days for comprehensive training courses, or at least one half the duration allocated to the corresponding initial basic or initial specialization training courses as specified in 8.2.2.4.1 for individual training courses.

8.2.2.5.3 A driver may replace a refresher training course and examination with the corresponding initial training course and examination.

8.2.2.6 Approval of training

8.2.2.6.1 The training courses shall be subject to approval by the competent authority.

8.2.2.6.2 Approval shall only be given with regard to applications submitted in writing.

8.2.2.6.3 The following documents shall be attached to the application for approval:

- (a) A detailed training programme specifying the subjects taught and indicating the time schedule and planned teaching methods;
- (b) Qualifications and fields of activities of the teaching personnel;
- (c) Information on the premises where the courses take place and on the teaching materials as well as on the facilities for the practical exercises;
- (d) Conditions of participation in the courses, such as number of participants.

8.2.2.6.4 The competent authority shall organize the supervision of training and examinations.

- 8.2.2.6.5 Approval shall be granted in writing by the competent authority subject to the following conditions:
- (a) The training shall be given in conformity with the application documents;
 - (b) The competent authority shall be granted the right to send authorized persons to be present at the training courses and examinations;
 - (c) The competent authority shall be advised in time of the dates and the places of the individual training courses;
 - (d) The approval may be withdrawn if the conditions of approval are not complied with.
- 8.2.2.6.6 The approval document shall indicate whether the courses concerned are basic or specialization training courses, initial or refresher training courses, and whether they are limited to specific dangerous goods or a specific class or classes.
- 8.2.2.6.7 If the training body, after a training course has been given approval, intends to make any alterations with respect to such details as were relevant to the approval, it shall seek permission in advance from the competent authority. This applies in particular to changes concerning the training programme.
- 8.2.2.7 Examinations**
- 8.2.2.7.1 *Examinations for the basic training course*
- 8.2.2.7.1.1 After completion of the basic training, including the practical exercises, an examination shall be held on the corresponding basic training course.
- 8.2.2.7.1.2 In the examination, the candidate has to prove that he has the knowledge, insight and skill for the practice of professional driver of vehicles carrying dangerous goods as provided in the basic training course.
- 8.2.2.7.1.3 For this purpose the competent authority shall prepare a catalogue of questions which refer to the items summarized in 8.2.2.3.2. Questions in the examination shall be drawn from this catalogue. The candidates shall not have any knowledge of the questions selected from the catalogue prior to the examination.
- 8.2.2.7.1.4 A single examination for comprehensive training courses may be held.
- 8.2.2.7.1.5 Each competent authority shall supervise the modalities of the examination.
- 8.2.2.7.1.6 The examination shall take the form of a written examination or a combination of a written and oral examination. Each candidate shall be asked at least 25 written questions for the basic training course. If the examination follows a refresher training course, at least 15 written questions shall be asked. The duration of these examinations shall be at least 45 and 30 minutes respectively. The questions may be of a varying degree of difficulty and be allocated a different weighting.
- 8.2.2.7.2 *Examinations for specialization training courses for carriage in tanks or carriage of substances and articles of Class 1 or radioactive material of Class 7*
- 8.2.2.7.2.1 After having sat the examination on the basic training course and after having attended the specialization training course for carriage in tanks or carriage of substances and articles of Class 1 or radioactive material of Class 7, the candidate shall be allowed to take part in the examination corresponding to the training.
- 8.2.2.7.2.2 This examination shall be held and supervised on the same basis as in 8.2.2.7.1. The catalogue of questions shall refer to the items summarized in 8.2.2.3.3, 8.2.2.3.4 or 8.2.2.3.5, as appropriate.
- 8.2.2.7.2.3 With respect to each specialization training examination, at least 15 written questions shall be asked. If the examination follows a refresher training course, at least 10 written questions shall be asked. The duration of these examinations shall be at least 30 and 20 minutes respectively.
- 8.2.2.7.2.4 If an examination is based on a restricted basic training course, this limits the examination of the specialization training course to the same scope.

8.2.2.8 *Certificate of driver's training*

8.2.2.8.1 The certificate referred to in 8.2.1.1 shall be issued:

- (a) After completion of a basic training course, provided the candidate has successfully passed the examination in accordance with 8.2.2.7.1;
- (b) If applicable, after completion of a specialization training course for carriage in tanks or carriage of substances and articles of Class 1 or radioactive material of Class 7, or after having acquired the knowledge referred to in special provisions S1 and S11 in Chapter 8.5, provided the candidate has successfully passed an examination in accordance with 8.2.2.7.2;
- (c) If applicable, after completion of a restricted basic or restricted tank specialization training course, provided the candidate has successfully passed the examination in accordance with 8.2.2.7.1 or 8.2.2.7.2. The certificate issued shall clearly indicate its limited scope of validity to the relevant dangerous goods or class(es).

8.2.2.8.2 The date of validity of a driver training certificate shall be five years from the date the driver passes an initial basic or initial comprehensive training examination.

The certificate shall be renewed if the driver furnishes proof of participation in refresher training in accordance with 8.2.2.5 and has passed an examination in accordance with 8.2.2.7 in the following cases:

- (a) In the twelve months before the date of expiry of the certificate. The competent authority shall issue a new certificate, valid for five years, the period of validity of which shall begin with the date of expiry of the previous certificate;
- (b) Prior to the twelve months before the date of expiry of the certificate. The competent authority shall issue a new certificate, valid for five years, the period of validity of which shall begin from the date on which the refresher examination was passed.

Where a driver extends the scope of his certificate during its period of validity, by meeting the requirements of 8.2.2.8.1 (b) and (c), the period of validity of a new certificate shall remain that of the previous certificate. When a driver has passed a specialization training examination, the specialization shall be valid until the date of expiry of the certificate.

8.2.2.8.3 The certificate shall have the layout of the model shown in 8.2.2.8.5. Its dimensions shall be in accordance with ISO 7810:2003 ID-1 and it shall be made of plastic. The colour shall be white with black lettering. It shall include an additional security feature such as a hologram, UV printing or guilloche patterns.

8.2.2.8.4 The certificate shall be prepared in the language(s) or one of the languages of the country of the competent authority which issued the certificate. If none of these languages is English, French or German, the title of the certificate, the title of item 8 and the titles on the back shall also be drawn up in English, French or German.

8.2.2.8.5 *Model for the training certificate for drivers of vehicles carrying dangerous goods*

Front	<p style="text-align: center;">ADR DRIVER TRAINING CERTIFICATE</p> <p style="text-align: center;">**</p> <div style="display: flex; justify-content: space-between;"> <div style="width: 30%;"> <p>(Insert driver photograph) *</p> </div> <div style="width: 65%;"> <p>1. ** Distinguishing sign used on vehicles in international traffic (for Parties to the 1968 Convention on Road Traffic or the 1949 Convention on Road Traffic, as notified to the Secretary General of the United Nations in accordance with respectively article 45(4) or annex 4 of these conventions).

8.2.2.8.6 Contracting Parties shall provide the UNECE secretariat with an example of the national model for any certificate intended for issue in accordance with this section, along with examples of models for certificates which are still valid. A Contracting Party may additionally provide explanatory notes. The UNECE secretariat shall make the information received available to all Contracting Parties.

8.2.3 Training of persons other than the drivers holding a certificate in accordance with 8.2.1, involved in the carriage of dangerous goods by road

Persons whose duties concern the carriage of dangerous goods by road shall have received training in the requirements governing the carriage of such goods appropriate to their responsibilities and duties according to Chapter 1.3. This requirement shall apply to individuals such as personnel who are employed by the road vehicle operator or the consignor, personnel who load or unload dangerous goods, personnel in freight forwarding or shipping agencies and drivers of vehicles other than drivers holding a certificate in accordance with 8.2.1, involved in the carriage of dangerous goods by road.

CHAPTER 8.3**MISCELLANEOUS REQUIREMENTS TO BE COMPLIED
WITH BY THE VEHICLE CREW****8.3.1 Passengers**

Apart from members of the vehicle crew, no passengers may be carried in transport units carrying dangerous goods.

8.3.2 Use of fire-fighting appliances

Members of the vehicle crew shall know how to use the fire-fighting appliances.

8.3.3 Prohibition on opening packages

A driver or a driver's assistant may not open a package containing dangerous goods.

8.3.4 Portable lighting apparatus

The portable lighting apparatus used shall not exhibit any metal surface liable to produce sparks.

8.3.5 Prohibition on smoking

Smoking shall be prohibited during handling operations in the vicinity of vehicles and inside the vehicles. This prohibition of smoking is also applicable to the use of electronic cigarettes and similar devices.

8.3.6 Running the engine during loading or unloading

Except where the engine has to be used to drive the pumps or other appliances for loading or unloading the vehicle and the laws of the country in which the vehicle is operating permit such use, the engine shall be shut off during loading and unloading operations.

8.3.7 Use of the parking brakes and wheel chocks

No vehicles carrying dangerous goods may be parked without the parking brakes being applied. Trailers without braking devices shall be restrained from moving by applying at least one wheel chock as described in 8.1.5.2.

8.3.8 Use of cables

In the case of a transport unit equipped with an anti-lock braking system, consisting of a motor vehicle and a trailer with a maximum mass exceeding 3.5 tonnes, the connections referred to in paragraph 9.2.2.6.3 shall be connecting the towing vehicle and the trailer at all times during carriage.

CHAPTER 8.4**REQUIREMENTS CONCERNING THE SUPERVISION OF VEHICLES**

8.4.1 Vehicles carrying dangerous goods in the quantities shown in special provisions S1 (6) and S14 to S24 of Chapter 8.5 for a given substance according to Column (19) of Table A of Chapter 3.2 shall be supervised or alternatively may be parked, unsupervised, in a secure depot or secure factory premises. If such facilities are not available, the vehicle, after having been properly secured, may be parked in an isolated position meeting the requirements of (a), (b) or (c) below:

- (a) A vehicle park supervised by an attendant who has been notified of the nature of the load and the whereabouts of the driver;
- (b) A public or private vehicle park where the vehicle is not likely to suffer damage from other vehicles; or
- (c) A suitable open space separated from the public highway and from dwellings, where the public does not normally pass or assemble.

The parking facilities permitted in (b) shall be used only if those described in (a) are not available, and those described in (c) may be used only if facilities described in (a) and (b) are not available.

8.4.2 Loaded MEMUs shall be supervised or alternatively may be parked, unsupervised, in a secure depot or secure factory premises. Empty uncleaned MEMUs are exempted from this requirement.

CHAPTER 8.5

ADDITIONAL REQUIREMENTS RELATING TO PARTICULAR CLASSES OR SUBSTANCES

In addition to the requirements of Chapters 8.1 to 8.4, when reference is made to them in Column (19) of Table A of Chapter 3.2, the following requirements shall apply to the carriage of the substances or articles concerned. In the event of conflict with the requirements of Chapters 8.1 to 8.4, the requirements of this Chapter shall take precedence.

S1: Requirements concerning the carriage of explosive substances and articles (Class 1)

(1) *Special training of drivers*

If, according to other regulations applicable in the country of a Contracting Party, a driver has followed equivalent training under a different regime or for a different purpose, covering the subjects defined in 8.2.2.3.4, the specialization training course may be totally or partially dispensed with.

(2) *Approved official*

If the national regulations so provide, the competent authority of a country contracting party to ADR may require an approved official to be carried in the vehicle at the carrier's expense.

(3) *Prohibition of smoking, fire and naked flame*

Smoking, the use of fire or of naked flames shall be prohibited on vehicles carrying substances and articles of Class 1, in their vicinity and during the loading and unloading of these substances and articles. This prohibition of smoking is also applicable to the use of electronic cigarettes and similar devices.

(4) *Places of loading and unloading*

- (a) Loading or unloading of substances and articles of Class 1 shall not take place in a public place in a built-up area without special permission from the competent authorities;
- (b) Loading or unloading of substances and articles of Class 1 in a public space elsewhere than in a built-up area without prior notice thereof having been given to the competent authorities shall be prohibited, unless operations are urgently necessary for reasons of safety;
- (c) If, for any reason, handling operations have to be carried out in a public place, then substances and articles of different kinds shall be separated according to the labels;
- (d) When vehicles carrying substances and articles of Class 1 are obliged to stop for loading or unloading operations in a public place, a distance of at least 50 m shall be maintained between the stationary vehicles. This distance shall not apply to vehicles belonging to the same transport unit.

(5) *Convoys*

- (a) When vehicles carrying substances and articles of Class 1 travel in convoy, a distance of not less than 50 m shall be maintained between each transport unit and the next;
- (b) The competent authority may lay down rules for the order or composition of convoys.

(6) Supervision of vehicles

The requirements of Chapter 8.4 shall be applicable only when substances and articles of Class 1 having a total net mass of explosive substance above the limits set below are carried in a vehicle:

Division 1.1:	0 kg
Division 1.2:	0 kg
Division 1.3, compatibility group C:	0 kg
Division 1.3, other than compatibility group C:	50 kg
Division 1.4, other than those listed below:	50 kg
Division 1.5:	0 kg
Division 1.6:	50 kg
Substances and articles of Division 1.4 belonging to UN numbers 0104, 0237, 0255, 0267, 0289, 0361, 0365, 0366, 0440, 0441, 0455, 0456 and 0500:	0 kg

For mixed loads the lowest limit applicable to any of the substances or articles carried shall be used for the load as a whole.

In addition, these substances and articles shall be supervised at all times in order to prevent any malicious act and to alert the driver and the competent authorities in the event of loss or fire.

Empty uncleaned packagings are exempted.

(7) Locking of vehicles

Doors and rigid covers in the load compartments of EX/II vehicles and all openings in the load compartments of EX/III vehicles carrying substances and articles of Class 1 shall be locked during transport, except for the periods of loading and unloading.

S2: Additional requirements concerning the carriage of flammable liquids or gases**(1) Portable lighting apparatus**

The load compartment of closed vehicles carrying liquids having a flash-point of not more than 60 °C or flammable substances or articles of Class 2, shall not be entered by persons carrying portable lighting apparatus other than those so designed and constructed that they cannot ignite any flammable vapours or gases which may have penetrated into the interior of the vehicle.

(2) Operation of combustion heaters during loading or unloading

The operation of combustion heaters of vehicles of type FL (see Part 9) is forbidden during loading and unloading and at loading sites.

(3) Precautions against electrostatic charges

In the case of vehicles of type FL (see Part 9), a good electrical connection from the vehicle chassis to earth shall be established before tanks are filled or emptied. In addition, the rate of filling shall be limited.

S3: Special provisions concerning the carriage of infectious substances

The requirements of the table columns (2), (3) and (5) in 8.1.4.1 and 8.3.4 shall not apply.

S4: Additional requirements concerning carriage under controlled temperatures

Maintenance of the prescribed temperature is essential for safe carriage. In general, there shall be:

- thorough inspection of the transport unit prior to loading;
- instructions to the carrier about the operation of the refrigeration system, including a list of the suppliers of coolant available en route;

- procedures to be followed in the event of loss of control;
- regular monitoring of operating temperatures; and
- availability of a back-up refrigeration system or spare parts.

The temperature of the air space within the transport unit shall be measured by two independent sensors and the output shall be so recorded that temperature changes are readily detectable.

The temperature shall be checked every four to six hours and logged.

If the control temperature is exceeded during carriage, an alert procedure shall be initiated involving any necessary repairs to the refrigeration equipment or an increase in the cooling capacity (e.g. by adding liquid or solid coolant). There shall also be frequent checking of the temperature and preparations for implementation of the emergency procedures. If the emergency temperature (see also 2.2.41.1.17 and 2.2.52.1.15 to 2.2.52.1.18) is reached, the emergency procedures shall be set in operation.

NOTE: This provision S4 does not apply to substances referred to in 3.1.2.6 when substances are stabilized by the addition of chemical inhibitors such that the SADT is greater than 50 °C. In this latter case, temperature control may be required under conditions of carriage where the temperature may exceed 55 °C.

S5: Special provisions common to the carriage of radioactive material of Class 7 in excepted packages (UN Nos. 2908, 2909, 2910 and 2911) only

The requirements of the instructions in writing of 8.1.2.1 (b) and of 8.2.1, 8.3.1 and 8.3.4 shall not apply.

S6: Special provisions common to the carriage of radioactive material of Class 7 other than in excepted packages

The provisions of 8.3.1 shall not apply to vehicles carrying only packages, overpacks or containers bearing category I-WHITE labels.

The provisions of 8.3.4 shall not apply provided there is no subsidiary risk.

Other additional requirements or special provisions

S7: *(Deleted)*

S8: When a transport unit is loaded with more than 2 000 kg of these substances, stops for service requirements shall as far as possible not be made near inhabited places or frequented places. A longer stop near such places is permissible only with the consent of the competent authorities.

S9: During the carriage of these substances, stops for service requirements shall as far as possible not be made near inhabited places or frequented places. A longer stop near such places is permissible only with the consent of the competent authorities.

S10: During the period April to October, when a vehicle is stationary, the packages shall, if the legislation of the country in which the vehicle is halted so requires, be effectively protected against the action of the sun, e.g. by means of sheets placed not less than 20 cm above the load.

S11: If, according to other regulations applicable in the country of a Contracting Party, a driver has followed equivalent training under a different regime or for a different purpose covering the subjects defined in 8.2.2.3.5, the specialization training course may be totally or partially dispensed with.

- S12:** If the total number of packages containing radioactive material carried in the transport unit does not exceed 10, the sum of the transport indexes does not exceed 3 and there are no subsidiary risks, the requirements in 8.2.1 concerning the training of drivers need not be applied. However, drivers shall then receive appropriate training in the requirements governing the carriage of radioactive material, commensurate with their duties. This training shall provide them with an awareness of the radiation hazards involved in the carriage of radioactive material. Such awareness training shall be confirmed by a certificate provided by their employer. See also 8.2.3.
- S13:** *(Deleted)*
- S14:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply for vehicles carrying any amount of these substances.
- S15:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply for vehicles carrying any amount of these substances. However, the provisions of Chapter 8.4 need not be applied when the loaded compartment is locked or the packages carried are otherwise protected against any illicit unloading.
- S16:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass of these substances in the vehicle exceeds 500 kg.
- In addition, vehicles carrying more than 500 kg of these substances shall be subject at all times to supervision to prevent any malicious act and to alert the driver and competent authorities in the event of loss or fire.
- S17:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass of these substances in the vehicle exceeds 1 000 kg.
- S18:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass of such substances in the vehicle exceeds 2 000 kg.
- S19:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass of such substances in the vehicle exceeds 5 000 kg.
- S20:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass or volume of these substances in the vehicle exceeds 10 000 kg as packaged goods or 3 000 litres in tanks.
- S21:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply to all material, in whatever mass. In addition, these goods shall be subject at all times to supervision to prevent any malicious act and to alert the driver and the competent authorities in the event of loss or fire. However, the provisions of Chapter 8.4 need not be applied where:
- (a) The loaded compartment is locked or the packages carried are otherwise protected against illicit unloading; and
 - (b) The dose rate does not exceed 5µSv/h at any accessible point on the outer surface of the vehicle.
- S22:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass or volume of these substances in the vehicle exceeds 5 000 kg as packaged goods or 3 000 litres in tanks.
- S23:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when this substance is carried in bulk or in tanks and when the total mass or volume in the vehicle exceeds 3 000 kg or 3 000 litres, as applicable.
- S24:** The provisions of Chapter 8.4 concerning the supervision of vehicles shall apply when the total mass of these substances in the vehicle exceeds 100 kg.

CHAPTER 8.6

ROAD TUNNEL RESTRICTIONS FOR THE PASSAGE OF VEHICLES CARRYING DANGEROUS GOODS

8.6.1 General provisions

The provisions of this Chapter apply when the passage of vehicles through road tunnels is restricted in accordance with 1.9.5.

8.6.2 Road signs or signals governing the passage of vehicles carrying dangerous goods

The tunnel category, assigned in accordance with 1.9.5.1 by the competent authority to a given road tunnel for the purpose of restricting the passage of transport units carrying dangerous goods, shall be indicated as follows by means of road signs and signals:

Sign and signal	Tunnel category
No sign	Tunnel category A
Sign with an additional panel bearing a letter B	Tunnel category B
Sign with an additional panel bearing a letter C	Tunnel category C
Sign with an additional panel bearing a letter D	Tunnel category D
Sign with an additional panel bearing a letter E	Tunnel category E

8.6.3 Tunnel restriction codes

8.6.3.1 The restrictions for the transport of specific dangerous goods through tunnels are based on the tunnel restriction code of these goods, indicated in Column (15) of Table A of Chapter 3.2. The tunnel restriction codes are put between brackets at the bottom of the cell. When '(—)' is indicated instead of one of the tunnel restriction codes, the dangerous goods are not subject to any tunnel restriction; for the dangerous goods assigned to UN Nos. 2919 and 3331, restrictions to the passage through tunnels may, however, be part of the special arrangement approved by the competent authority(ies) on the basis of 1.7.4.2.

8.6.3.2 When a transport unit contains dangerous goods to which different tunnel restriction codes have been assigned, the most restrictive of these tunnel restriction codes shall be assigned to the whole load.

8.6.3.3 Dangerous goods carried in accordance with 1.1.3 are not subject to the tunnel restrictions and shall not be taken into account when determining the tunnel restriction code to be assigned to the whole load of a transport unit, except if the transport unit is required to be marked in accordance with 3.4.13 subject to 3.4.14¹

8.6.4 Restrictions for the passage of transport units carrying dangerous goods through tunnels

The restrictions for passage through tunnels shall apply:

- to transport units for which marking is required by 3.4.13 subject to 3.4.14¹, through tunnels of category E; and
- to transport units for which an orange-coloured plate marking is required according to 5.3.2, in accordance with the table below once the tunnel restriction code to be assigned to the whole load of the transport unit has been determined.

¹ or in accordance with 3.4.10 subject to 3.4.11 of ADR as applicable until 31 December 2010 if the transitional measures of 1.6.1.20 are applied.

Tunnel restriction code of the whole load	Restriction
B	Passage forbidden through tunnels of category B, C, D and E
B1000C	Carriage where the total net explosive mass per transport unit <ul style="list-style-type: none"> - exceeds 1000 kg: Passage forbidden through tunnels of category B, C, D and E; - does not exceed 1000 kg: Passage forbidden through tunnels of category C, D and E
B/D	Tank carriage: Passage forbidden through tunnels of category B, C, D and E; Other carriage: Passage forbidden through tunnels of category D and E
B/E	Tank carriage: Passage forbidden through tunnels of category B, C, D and E; Other carriage: Passage forbidden through tunnels of category E
C	Passage forbidden through tunnels of category C, D and E
C5000D	Carriage where the total net explosive mass per transport unit <ul style="list-style-type: none"> - exceeds 5000 kg: Passage forbidden through tunnels of category C, D and E; - does not exceed 5000 kg: Passage forbidden through tunnels of category D and E
C/D	Tank carriage: Passage forbidden through tunnels of category C, D and E; Other carriage: Passage forbidden through tunnels of category D and E
C/E	Tank carriage: Passage forbidden through tunnels of category C, D and E; Other carriage: Passage forbidden through tunnels of category E
D	Passage forbidden through tunnels of category D and E
D/E	Bulk or tank carriage: Passage forbidden through tunnels of category D and E; Other carriage: Passage forbidden through tunnels of category E
E	Passage forbidden through tunnels of category E
-	Passage allowed through all tunnels (For UN Nos. 2919 and 3331, see also 8.6.3.1).

NOTE 1: For example, the passage of a transport unit carrying UN 0161, powder, smokeless, classification code 1.3C, tunnel restriction code C5000D, in a quantity representing a total net explosive mass of 3000 kg is forbidden in tunnels of categories D and E.

NOTE 2: Dangerous goods packed in limited quantities carried in containers or transport units marked in accordance with the IMDG Code are not subject to the restrictions for passage through tunnels of category E when the total gross mass of the packages containing dangerous goods packed in limited quantities does not exceed 8 tonnes per transport unit.

PART 9

Requirements concerning the construction and approval of vehicles

CHAPTER 9.1

SCOPE, DEFINITIONS AND REQUIREMENTS FOR THE APPROVAL OF VEHICLES

9.1.1 Scope and definitions

9.1.1.1 Scope

The requirements of Part 9 shall apply to vehicles of categories N and O, as defined in Annex 7 of the Consolidated Resolution on the Construction of Vehicles (R.E.3)¹, intended for the carriage of dangerous goods.

These requirements refer to vehicles, as regards their construction, type approval, ADR approval and annual technical inspection.

9.1.1.2 Definitions

For the purposes of Part 9:

"Vehicle" means any vehicle, whether complete, incomplete or completed, intended for the carriage of dangerous goods by road;

"EX/II vehicle" or "EX/III vehicle" means a vehicle intended for the carriage of explosive substances and articles (Class 1);

"FL vehicle" means:

- (a) A vehicle intended for the carriage of liquids having a flash-point of not more than 60°C (with the exception of diesel fuel complying with standard EN 590:2009 + A1:2010, gas oil, and heating oil (light) - UN No. 1202 - with a flash-point as specified in standard EN 590:2009 + A1:2010) in fixed tanks or demountable tanks with a capacity exceeding 1 m³ or in tank-containers or portable tanks with an individual capacity exceeding 3 m³; or
- (b) A vehicle intended for the carriage of flammable gases in fixed tanks or demountable tanks with a capacity exceeding 1 m³ or in tank-containers, portable tanks or MEGCs with an individual capacity exceeding 3 m³; or,
- (c) A battery-vehicle with a total capacity exceeding 1 m³ intended for the carriage of flammable gases;

"OX vehicle" means a vehicle intended for the carriage of hydrogen peroxide, stabilized or hydrogen peroxide, aqueous solution stabilized with more than 60% hydrogen peroxide (Class 5.1, UN No. 2015) in fixed tanks or demountable tanks with a capacity exceeding 1 m³ or in tank-containers or portable tanks with an individual capacity exceeding 3 m³;

"AT vehicle" means:

- (a) A vehicle, other than EX/III, FL or OX vehicle or than a MEMU, intended for the carriage of dangerous goods in fixed tanks or demountable tanks with a capacity exceeding 1 m³ or in tank-containers, portable tanks or MEGCs with an individual capacity exceeding 3 m³; or
- (b) A battery-vehicle with a total capacity exceeding 1 m³ other than a FL vehicle;

"MEMU" means a vehicle meeting the definition of mobile explosives manufacturing unit in 1.2.1.

"Complete vehicle" means any vehicle which does not need any further completion (e.g. one stage built vans, lorries, tractors, trailers);

¹ United Nations document ECE/TRANS/WP.29/78/Rev.3

"Incomplete vehicle" means any vehicle which still needs completion in at least one further stage (e.g. chassis-cab, trailer chassis);

"Completed vehicle" means any vehicle which is the result of a multi-stage process (e.g. chassis or chassis-cab fitted with a bodywork);

"Type-approved vehicle" means any vehicle which has been approved in accordance with ECE Regulation No. 105²;

"ADR approval" means certification by a competent authority of a Contracting Party that a single vehicle intended for the carriage of dangerous goods satisfies the relevant technical requirements of this Part as an EX/II, EX/III, FL, OX, or AT vehicle or as a MEMU.

9.1.2 Approval of EX/II, EX/III, FL, OX and AT vehicles and MEMUs

NOTE: *No special certificates of approval shall be required for vehicles other than EX/II, EX/III, FL, OX and AT vehicles and MEMUs, apart from those required by the general safety regulations normally applicable to vehicles in the country of origin.*

9.1.2.1 General

EX/II, EX/III, FL, OX and AT vehicles and MEMUs shall comply with the relevant requirements of this Part.

Every complete or completed vehicle shall be subjected to a first inspection by the competent authority in accordance with the administrative requirements of this Chapter to verify conformity with the relevant technical requirements of Chapters 9.2 to 9.8.

The competent authority may waive the first inspection for a tractor for a semi trailer type-approved in accordance with 9.1.2.2 for which the manufacturer, his duly accredited representative or a body recognised by the competent authority has issued a declaration of conformity with the requirements of Chapter 9.2.

The conformity of the vehicle shall be certified by the issue of a certificate of approval in accordance with 9.1.3.

When vehicles are required to be fitted with an endurance braking system, the manufacturer of the vehicle or his duly accredited representative shall issue a declaration of conformity with the relevant prescriptions of Annex 5 of ECE Regulation No. 13³. This declaration shall be presented at the first technical inspection.

9.1.2.2 Requirements for type-approved vehicles

At the request of the vehicle manufacturer or his duly accredited representative, vehicles subject to ADR approval according to 9.1.2.1 may be type-approved by a competent authority. The relevant technical requirements of Chapter 9.2 shall be considered to be fulfilled if a type approval certificate has been issued by a competent authority in accordance with ECE Regulation No. 105² provided that the technical requirements of the said Regulation correspond to those of Chapter 9.2 of this Part and provided that no modification of the vehicle alters its validity. In the case of MEMUs, the type approval mark affixed in accordance with ECE Regulation No. 105 may identify the vehicle as either MEMU or EX/III. MEMUs need only be identified as such on the certificate of approval issued in accordance with 9.1.3.

This type approval, granted by one Contracting Party, shall be accepted by the other Contracting Parties as ensuring the conformity of the vehicle when the single vehicle is submitted for inspection for ADR approval.

² ECE Regulation No. 105 (Uniform provisions concerning the approval of vehicles intended for the carriage of dangerous goods with regard to their specific constructional features).

³ ECE Regulation No. 13 (Uniform provisions concerning the approval of vehicles of categories M, N and O with regards to braking).

At the inspection for ADR approval, only those parts of the type-approved incomplete vehicle which have been added or modified in the process of completion shall be inspected for compliance with the applicable requirements of Chapter 9.2.

9.1.2.3 *Annual technical inspection*

EX/II, EX/III, FL, OX and AT vehicles and MEMUs shall be subject to an annual technical inspection in their country of registration to make sure that they conform to the relevant requirements of this Part, and to the general safety regulations (concerning brakes, lighting, etc.) in force in their country of registration.

The conformity of the vehicle shall be certified either by the extension of validity of the certificate of approval or by the issue of a new certificate of approval in accordance with 9.1.3.

9.1.3 *Certificate of approval*

9.1.3.1 Conformity of EX/II, EX/III, FL, OX and AT vehicles and MEMUs with the requirements of this Part is subject to a certificate of approval (certificate of ADR approval) issued by the competent authority of the country of registration for each vehicle whose inspection yields satisfactory results or has resulted in the issue of a declaration of conformity with the requirements of Chapter 9.2 in accordance with 9.1.2.1.

9.1.3.2 A certificate of approval issued by the competent authority of one Contracting Party for a vehicle registered in the territory of that Contracting Party shall be accepted, so long as its validity continues, by the competent authorities of the other Contracting Parties.

9.1.3.3 The certificate of approval shall have the same layout as the model shown in 9.1.3.5. Its dimensions shall be 210 mm × 297 mm (format A4). Both front and back may be used. The colour shall be white, with a pink diagonal stripe.

It shall be drawn up in the language or one of the languages of the country issuing it. If that language is not English, French or German, the title of the certificate of approval and any remarks under No. 11 shall also be drawn up in English, French or German.

The certificate of approval for a vacuum-operated waste tank-vehicle shall bear the following remark: "vacuum-operated waste tank-vehicle".

9.1.3.4 The validity of a certificate of approval shall expire not later than one year after the date of the technical inspection of the vehicle preceding the issue of the certificate. The next approval term shall, however, be related to the last nominal expiry date, if the technical inspection is performed within one month before or after that date.

However, in the case of tanks subject to compulsory periodic inspection this provision shall not mean that tightness (leakproofness) tests, hydraulic pressure tests or internal inspections of tanks have to be carried out at intervals shorter than those laid down in Chapters 6.8 and 6.9.

9.1.3.5 Model for certificate of approval for vehicles carrying certain dangerous goods

CERTIFICATE OF APPROVAL FOR VEHICLES CARRYING CERTAIN DANGEROUS GOODS			
This certificate testifies that the vehicle specified below fulfils the conditions prescribed by the European Agreement concerning the International Carriage of Dangerous Goods by Road (ADR).			
1. Certificate No.:	2. Vehicle manufacturer:	3. Vehicle Identification No.:	4. Registration number (if any):
5. Name and business address of carrier, operator or owner:			
6. Description of vehicle: ¹			
7. Vehicle designation(s) according to 9.1.1.2 of ADR: ² EX/II EX/III FL OX AT MEMU			
8. Endurance braking system: ³ <input type="checkbox"/> Not applicable <input type="checkbox"/> The effectiveness according to 9.2.3.1.2 of ADR is sufficient for a total mass of the transport unit of ____ t ⁴			
9. Description of the fixed tank(s)/battery-vehicle (if any): 9.1 Manufacturer of the tank: 9.2 Approval number of the tank/battery-vehicle: 9.3 Tank manufacturer's serial number/Identification of elements of battery-vehicle: 9.4 Year of manufacture: 9.5 Tank code according to 4.3.3.1 or 4.3.4.1 of ADR: 9.6 Special provisions TC and TE according to 6.8.4 of ADR (if applicable) ⁶ :			
10. Dangerous goods authorised for carriage: The vehicle fulfils the conditions required for the carriage of dangerous goods assigned to the vehicle designation(s) in No. 7. 10.1 In the case of an EX/II <input type="checkbox"/> goods of Class 1 including compatibility group J or EX/III vehicle ³ <input type="checkbox"/> goods of Class 1 excluding compatibility group J 10.2 In the case of a tank-vehicle/battery-vehicle ³ <input type="checkbox"/> only the substances permitted under the tank code and any special provisions specified in No. 9 may be carried ⁵ or <input type="checkbox"/> only the following substances (Class, UN number, and if necessary packing group and proper shipping name) may be carried: Only substances which are not liable to react dangerously with the materials of the shell, gaskets, equipment and protective linings (if applicable) may be carried.			
11. Remarks:			
12. Valid until:		Stamp of issuing service	
		Place, Date, Signature	

¹ According to the definitions for power-driven vehicles and for trailers of categories N and O as defined in Annex 7 of the Consolidated Resolution on the Construction of Vehicles (R.E.3) or in Directive 2007/46/EC.

² Strike out what is not appropriate.

³ Mark the appropriate.

⁴ Enter appropriate value. A value of 44t will not limit the "registration / in-service maximum permissible mass" indicated in the registration document(s).

⁵ Substances assigned to the tank code specified in No. 9 or to another tank code permitted under the hierarchy in 4.3.3.1.2 or 4.3.4.1.2, taking account of the special provision(s), if any.

⁶ Not required when the authorized substances are listed in No. 10.2.

13. Extensions of validity	
Validity extended until	Stamp of issuing service, place, date, signature:

NOTE: This certificate shall be returned to the issuing service when the vehicle is taken out of service; if the vehicle is transferred to another carrier, operator or owner, as specified in No. 5; on expiry of the validity of the certificate; and if there is a material change in one or more essential characteristics of the vehicle.

CHAPTER 9.2

REQUIREMENTS CONCERNING THE CONSTRUCTION OF VEHICLES

9.2.1 Compliance with the requirements of this Chapter

9.2.1.1 EX/II, EX/III, FL, OX and AT vehicles shall comply with the requirements of this Chapter, according to the table below.

For vehicles other than of EX/II, EX/III, FL, OX and AT:

- the requirements of 9.2.3.1.1 (Braking equipment in accordance with ECE Regulation No. 13 or Directive 71/320/EEC) are applicable to all vehicles first registered (or which entered into service if the registration is not mandatory) after 30 June 1997;
- the requirements of 9.2.5 (Speed limitation device in accordance with ECE Regulation No. 89 or Directive 92/24/EEC) are applicable to all motor vehicles with a maximum mass exceeding 12 tonnes first registered after 31 December 1987 and all motor vehicles with a maximum mass exceeding 3.5 tonnes but not more than 12 tonnes first registered after 31 December 2007.

9.2.6	COUPLING DEVICE OF TRAILERS	X	X				

9.2.1.2 MEMUs shall comply with the requirements of this Chapter applicable to EX/III-vehicles.

9.2.2 Electrical equipment

9.2.2.1 General provisions

The electrical installation as a whole shall meet the provisions of 9.2.2.2 to 9.2.2.6 in accordance with the table of 9.2.1.

9.2.2.2 Wiring

9.2.2.2.1 The size of conductors shall be large enough to avoid overheating. Conductors shall be adequately insulated. All circuits shall be protected by fuses or automatic circuit breakers, except for the following:

- from the battery to the cold start and stopping systems of the engine;
- from the battery to the alternator;
- from the alternator to the fuse or circuit breaker box;
- from the battery to the starter motor;
- from the battery to the power control housing of the endurance braking system (see 9.2.3.1.2), if this system is electrical or electromagnetic;
- from the battery to the electrical lifting mechanism for lifting the bogie axle.

The above unprotected circuits shall be as short as possible.

9.2.2.2.2 Cables shall be securely fastened and positioned in such a way that the conductors are adequately protected against mechanical and thermal stresses.

9.2.2.3 Battery master switch

9.2.2.3.1 A switch for breaking the electrical circuits shall be placed as close to the battery as practicable. If a single pole switch is used it shall be placed in the supply lead and not in the earth lead.

9.2.2.3.2 A control device to facilitate the disconnecting and reconnecting functions of the switch shall be installed in the driver's cab. It shall be readily accessible to the driver and be distinctively marked. It shall be protected against inadvertent operation by either adding a protective cover, by using a dual movement control device or by other suitable means. Additional control devices may be installed provided they are distinctively marked and protected against inadvertent operation. If the control device(s) are electrically operated, the circuits of the control device(s) are subject to the requirements of 9.2.2.5.

9.2.2.3.3 The switch shall have a casing with protection degree IP 65 in accordance with IEC Standard 60529.

9.2.2.3.4 The cable connections on the switch shall have protection degree IP 54. However, this does not apply if these connections are contained in a housing which may be the battery box. In this case it is sufficient to insulate the connections against short circuits, for example with a rubber cap.

9.2.2.4 Batteries

The battery terminals shall be electrically insulated or covered by an insulating battery box cover. If the batteries are not located under the engine bonnet, they shall be fitted in a vented box.

9.2.2.5 *Permanently energized circuits*

9.2.2.5.1 (a) Those parts of the electrical installation including the leads which shall remain energized when the battery master switch is open, shall be suitable for use in hazardous areas. Such equipment shall meet the general requirements of IEC 60079, parts 0 and 14¹ and the additional requirements applicable from IEC 60079, parts 1, 2, 5, 6, 7, 11, 15 or 18;

(b) For the application of IEC 60079 part 14¹, the following classification shall be used:

Permanently energized electrical equipment including the leads which is not subject to 9.2.2.3 and 9.2.2.4 shall meet the requirements for Zone 1 for electrical equipment in general or meet the requirements for Zone 2 for electrical equipment situated in the driver's cab. The requirements for explosion group IIC, temperature class T6 shall be met.

However, for permanently energized electrical equipment installed in an environment where the temperature caused by non-electrical equipment situated in that environment exceeds the T6 temperature limit, the temperature classification of the permanently energized electrical equipment shall be at least that of the T4 temperature class.

(c) The supply leads for permanently energised equipment shall either comply with the provisions of IEC 60079, part 7 ("Increased safety") and be protected by a fuse or automatic circuit breaker placed as close to the source of power as practicable or, in the case of "intrinsically safe equipment", they shall be protected by a safety barrier placed as close to the source of power as practicable.

9.2.2.5.2 Bypass connections to the battery master switch for electrical equipment which must remain energized when the battery master switch is open shall be protected against overheating by suitable means, such as a fuse, a circuit breaker or a safety barrier (current limiter).

9.2.2.6 *Provisions concerning that part of the electrical installation situated to the rear of the driver's cab*

The whole installation shall be so designed, constructed and protected such that it cannot provoke any ignition or short-circuit under normal conditions of use of vehicles and that these risks can be minimized in the event of an impact or deformation. In particular:

9.2.2.6.1 *Wiring*

The wiring located to the rear of the driver's cab shall be protected against impact, abrasion and chafing during normal vehicle operation. Examples of appropriate protection are given in figures 1, 2, 3 and 4 below. However, the sensor cables of anti-lock braking devices do not need additional protection.

¹ The requirements of IEC 60079 part 14 do not take precedence over the requirement of this Part.

Figure N°1

Figure N°2

Figure N°3

Figure N°4

9.2.2.6.2 *Lighting*

Lamp with a screw cap shall not be used.

9.2.2.6.3 *Electrical connections*

Electrical connections between motor vehicles and trailers shall have a protection degree IP54 in accordance with IEC 60529 and be designed to prevent accidental disconnection. Connectors shall be in conformity with ISO 25981:2008², ISO 12098:2004², ISO 7638:2003² and EN 15207:2006 as appropriate.

9.2.3 **Braking equipment****9.2.3.1** *General provisions*

9.2.3.1.1 Motor vehicles and trailers intended for use as transport units for dangerous goods shall fulfil all relevant technical requirements of ECE Regulation No.13³ or Directive 71/320/EEC³, as amended, in accordance with the dates of application specified therein.

9.2.3.1.2 EX/III, FL, OX and AT vehicles shall fulfil the requirements of ECE Regulation No.13³, Annex 5.

9.2.3.2 *(Deleted)*

9.2.4 **Prevention of fire risks****9.2.4.1** *General provisions*

The following technical provisions shall apply in accordance with the table of 9.2.1.

9.2.4.2 *Vehicle cab*

Unless the driver's cab is made of materials which are not readily flammable, a shield made of metal or other suitable material of the same width as the tank shall be fitted at the rear of the cab. Any windows in the rear of the cab or in the shield shall be hermetically closed and made of fire-resistant safety glass with fire-resistant frames. Furthermore, there shall be a clear space of not less than 15 cm between the tank and the cab or the shield.

9.2.4.3 *Fuel tanks*

The fuel tanks for supplying the engine of the vehicle shall meet the following requirements:

- (a) In the event of any leakage, the fuel shall drain to the ground without coming into contact with hot parts of the vehicle or the load;
- (b) Fuel tanks containing petrol shall be equipped with an effective flame trap at the filler opening or with a closure enabling the opening to be kept hermetically sealed.

9.2.4.4 *Engine*

The engine propelling the vehicle shall be so equipped and situated to avoid any danger to the load through heating or ignition. In the case of EX/II and EX/III vehicles the engine shall be of compression-ignition construction.

² *ISO 4009, referred to in this standard, need not be applied.*

³ *ECE Regulation No. 13 (Uniform provisions concerning the approval of vehicles of categories M, N and O with regard to braking).*

9.2.4.5 Exhaust system

The exhaust system (including the exhaust pipes) shall be so directed or protected to avoid any danger to the load through heating or ignition. Parts of the exhaust system situated directly below the fuel tank (diesel) shall have a clearance of at least 100 mm or be protected by a thermal shield.

9.2.4.6 Vehicle endurance braking

Vehicles equipped with endurance braking systems emitting high temperatures placed behind the rear wall of the driver's cab shall be equipped with a thermal shield securely fixed and located between this system and the tank or load so as to avoid any heating, even local, of the tank wall or the load.

In addition, the thermal shield shall protect the braking system against any outflow or leakage, even accidental, of the load. For instance, a protection including a twin-shell shield shall be considered satisfactory.

9.2.4.7 Combustion heaters

9.2.4.7.1 Combustion heaters shall comply with the relevant technical requirements of ECE Regulation No. 122⁴, as amended, in accordance with the dates of application specified therein and the provisions of 9.2.4.7.2 to 9.2.4.7.6 applicable according to the table in 9.2.1.

9.2.4.7.2 The combustion heaters and their exhaust gas routing shall be designed, located, protected or covered so as to prevent any unacceptable risk of heating or ignition of the load. This requirement shall be considered as fulfilled if the fuel tank and the exhaust system of the appliance conform to provisions similar to those prescribed for fuel tanks and exhaust systems of vehicles in 9.2.4.3 and 9.2.4.5 respectively.

9.2.4.7.3 The combustion heaters shall be put out of operation by at least the following methods:

- (a) Intentional manual switching off from the driver's cab;
- (b) Stopping of the vehicle engine; in this case the heating device may be restarted manually by the driver;
- (c) Start up of a feed pump on the motor vehicle for the dangerous goods carried.

9.2.4.7.4 Afterrunning is permitted after the combustion heaters have been put out of operation. For the methods of 9.2.4.7.3 (b) and (c) the supply of combustion air shall be interrupted by suitable measures after an afterrunning cycle of not more than 40 seconds. Only heaters shall be used for which proof has been furnished that the heat exchanger is resistant to the reduced afterrunning cycle of 40 seconds for the time of their normal use.

9.2.4.7.5 The combustion heater shall be switched on manually. Programming devices shall be prohibited.

9.2.4.7.6 Combustion heaters with gaseous fuels are not permitted.

9.2.5 Speed limitation device

Motor vehicles (rigid vehicles and tractors for semi-trailers) with a maximum mass exceeding 3.5 tonnes, shall be equipped with a speed limitation device according to the technical requirements of ECE Regulation No. 89⁵, as amended. The device shall be set in such a way that the speed cannot exceed 90 km/h, bearing in mind the technological tolerance of the device.

⁴ ECE Regulation No. 122 (Regulation with regard the type approval of a heating system and of a vehicle with regard to its heating system).

⁵ ECE Regulation No. 89: uniform provisions concerning the approval of:

- I. Vehicles with regard to limitation of their maximum speed;
- II. Vehicles with regard to the installation of a speed limitation device (SLD) of an approved type;
- III. Speed limitation devices (SLD).

9.2.6**Coupling devices of trailers**

Coupling devices of trailers shall comply with the technical requirements of ECE Regulation No. 55⁶ as amended, in accordance with the dates of application specified therein.

⁶ *ECE Regulation No. 55 (Uniform provisions concerning the approval of mechanical coupling components of combinations of vehicles).*

CHAPTER 9.3

ADDITIONAL REQUIREMENTS CONCERNING COMPLETE OR COMPLETED EX/II OR EX/III VEHICLES INTENDED FOR THE CARRIAGE OF EXPLOSIVE SUBSTANCES AND ARTICLES (CLASS 1) IN PACKAGES

9.3.1 Materials to be used in the construction of vehicle bodies

No materials likely to form dangerous compounds with the explosive substances carried shall be used in the construction of the body.

9.3.2 Combustion heaters

9.3.2.1 Combustion heaters may only be installed on EX/II and EX/III vehicles for heating of the driver's cab or the engine.

9.3.2.2 Combustion heaters shall meet the requirements of 9.2.4.7.1, 9.2.4.7.2, 9.2.4.7.5 and 9.2.4.7.6.

9.3.2.3 The switch of the combustion heater may be installed outside the driver's cab.

It is not necessary to prove that the heat exchanger is resistant to the reduced afterrunning cycle.

9.3.2.4 No combustion heaters or fuel tanks, power sources, combustion air or heating air intakes as well as exhaust tube outlets required for the operation of the combustion heater shall be installed in the load compartment.

9.3.3 EX/II vehicles

The vehicles shall be designed, constructed and equipped so that the explosives are protected from external hazards and the weather. They shall be either closed or sheeted. Sheeting shall be resistant to tearing and be of impermeable material, not readily flammable¹. It shall be tautened so as to cover the loading area on all sides.

All openings in the load compartment of closed vehicles shall have lockable, close-fitting doors or rigid covers. The driver's compartment shall be separated from the load compartment by a continuous wall.

9.3.4 EX/III vehicles

9.3.4.1 The vehicles shall be designed, constructed and equipped so that the explosives are protected from external hazards and the weather. These vehicles shall be closed. The driver's compartment shall be separated from the load compartment by a continuous wall. The loading surface shall be continuous. Load restraint anchorage points may be installed. All joints shall be sealed. All openings shall be capable of being locked. They shall be so constructed and placed as to overlap at the joints.

9.3.4.2 The body shall be made from heat and flame resistant materials with a minimum thickness of 10 mm. Materials classified as Class B-s3-d2 according to standard EN 13501-1:2007 + A1:2009 are deemed to fulfil this requirement.

If the material used for the body is metal, the complete inside of the body shall be covered with materials fulfilling the same requirement.

¹ In the case of flammability, this requirement will be deemed to be met if, in accordance with the procedure specified in ISO standard 3795:1989 'Road vehicles, and tractors and machinery for agriculture and forestry - Determination of burning behaviour of interior materials', samples of the sheeting have a burn rate not exceeding 100 mm/min.

9.3.5 Engine and load compartment

The engine propelling an EX/II or EX/III vehicle shall be placed forward of the front wall of the load compartment; it may nevertheless be placed under the load compartment, provided this is done in such a way that any excess heat does not constitute a hazard to the load by raising the temperature on the inner surface of the load compartment above 80 °C.

9.3.6 External heat sources and load compartment

The exhaust system of EX/II and EX/III vehicles or others parts of these complete or completed vehicles shall be so constructed and situated that any excess heat shall not constitute a hazard to the load by raising the temperature on the inner surface of the load compartment above 80 °C.

9.3.7 Electrical equipment

9.3.7.1 The rated voltage of the electrical system shall not exceed 24V.

9.3.7.2 Any lighting in the load compartment of EX/II vehicles shall be on the ceiling and covered, i.e. with no exposed wiring or bulb.

In the case of Compatibility Group J, the electrical installation shall be at least IP65 (e.g. flame-proof Eex d). Any electrical equipment accessible from the inside of the load compartment shall be sufficiently protected from mechanical impact from the inside.

9.3.7.3 The electrical installation on EX/III vehicles shall meet the relevant requirements of 9.2.2.2, 9.2.2.3, 9.2.2.4, 9.2.2.5.2 and 9.2.2.6.

The electrical installation in the load compartment shall be dust-protected (at least IP54 or equivalent) or, in the case of Compatibility Group J, at least IP65 (e.g. flame-proof Eex d).

CHAPTER 9.4**ADDITIONAL REQUIREMENTS CONCERNING THE CONSTRUCTION OF THE BODIES OF COMPLETE OR COMPLETED VEHICLES INTENDED FOR THE CARRIAGE OF DANGEROUS GOODS IN PACKAGES (OTHER THAN EX/II AND EX/III VEHICLES)**

- 9.4.1 Combustion heaters shall meet the following requirements:
- (a) The switch may be installed outside the driver's cab;
 - (b) The device may be switched off from outside the load compartment; and
 - (c) It is not necessary to prove that the heat exchanger is resistant to the reduced afterrunning cycle.
- 9.4.2 If the vehicle is intended for the carriage of dangerous goods for which a label conforming to models Nos. 1, 1.4, 1.5, 1.6, 3, 4.1, 4.3, 5.1 or 5.2 is prescribed, no fuel tanks, power sources, combustion air or heating air intakes as well as exhaust tube outlets required for the operation of the combustion heater shall be installed in the load compartment. It shall be ensured that the heating air outlet cannot be blocked by cargo. The temperature to which packages are heated shall not exceed 50° C. Heating devices installed inside the load compartments shall be designed so as to prevent the ignition of an explosive atmosphere under operating conditions.
- 9.4.3 Additional requirements concerning the construction of the bodies of vehicles intended for the carriage of given dangerous goods or specific packagings may be included in Part 7, Chapter 7.2 in accordance with the indications in Column (16) of Table A of Chapter 3.2, for a given substance.

CHAPTER 9.5**ADDITIONAL REQUIREMENTS CONCERNING THE CONSTRUCTION OF
THE BODIES OF COMPLETE OR COMPLETED VEHICLES INTENDED
FOR THE CARRIAGE OF DANGEROUS SOLIDS IN BULK**

- 9.5.1 Combustion heaters shall meet the following requirements:
- (a) The switch may be installed outside the driver's cab;
 - (b) The device may be switched off from outside the load compartment; and
 - (c) It is not necessary to prove that the heat exchanger is resistant to the reduced afterrunning cycle.
- 9.5.2 If the vehicle is intended for the carriage of dangerous goods for which a label conforming to models Nos. 4.1, 4.3 or 5.1 is prescribed, no fuel tanks, power sources, combustion air or heating air intakes as well as exhaust tube outlets required for the operation of the combustion heater shall be installed in the load compartment. It shall be ensured that the heating air outlet cannot be blocked by cargo. The temperature to which the load is heated shall not exceed 50 °C. Heating devices installed inside the load compartments shall be designed so as to prevent the ignition of an explosive atmosphere under operating conditions.
- 9.5.3 The bodies of vehicles intended for the carriage of dangerous solids in bulk shall meet the requirements of Chapter 6.11 and 7.3, as appropriate, including those of 7.3.2 or 7.3.3 which may be applicable in accordance with the indications in columns (10) or (17) respectively of Table A of Chapter 3.2 for a given substance.

CHAPTER 9.6**ADDITIONAL REQUIREMENTS CONCERNING COMPLETE OR
COMPLETED VEHICLES INTENDED FOR THE CARRIAGE OF TEMPERATURE
CONTROLLED SUBSTANCES**

- 9.6.1 Insulated, refrigerated and mechanically-refrigerated vehicles intended for the carriage of temperature controlled substances shall conform to the following conditions:
- (a) the vehicle shall be such and so equipped as regards its insulation and means of refrigeration, that the control temperature prescribed in 2.2.41.1.17 and 2.2.52.1.16 and in 2.2.41.4 and 2.2.52.4 for the substance to be carried is not exceeded. The overall heat transfer coefficient shall be not more than $0.4 \text{ W/m}^2\text{K}$;
 - (b) the vehicle shall be so equipped that vapours from the substances or the coolant carried cannot penetrate into the driver's cab;
 - (c) a suitable device shall be provided enabling the temperature prevailing in the loading space to be determined at any time from the cab;
 - (d) the loading space shall be provided with vents or ventilating valves if there is any risk of a dangerous excess pressure arising therein. Care shall be taken where necessary to ensure that refrigeration is not impaired by the vents or ventilating valves;
 - (e) the refrigerant shall not be flammable; and
 - (f) the refrigerating appliance of a mechanically refrigerated vehicle shall be capable of operating independently of the engine used to propel the vehicle.
- 9.6.2 Suitable methods (see V8(3)) to prevent the control temperature from being exceeded are listed in Chapter 7.2 (R1 to R5). Depending on the method used, additional provisions concerning the construction of vehicle bodies may be included in Chapter 7.2.

CHAPTER 9.7

ADDITIONAL REQUIREMENTS CONCERNING FIXED TANKS (TANK-VEHICLES), BATTERY-VEHICLES AND COMPLETE OR COMPLETED VEHICLES USED FOR THE CARRIAGE OF DANGEROUS GOODS IN DEMOUNTABLE TANKS WITH A CAPACITY GREATER THAN 1 M³ OR IN TANK-CONTAINERS, PORTABLE TANKS OR MEGCs OF A CAPACITY GREATER THAN 3 M³ (EX/III, FL, OX AND AT VEHICLES)

9.7.1 General provisions

- 9.7.1.1 In addition to the vehicle proper, or the units of running gear used in its stead, a tank-vehicle comprises one or more shells, their items of equipment and the fittings for attaching them to the vehicle or to the running-gear units.
- 9.7.1.2 Once the demountable tank has been attached to the carrier vehicle, the entire unit shall meet the requirements prescribed for tank-vehicles.

9.7.2 Requirements concerning tanks

- 9.7.2.1 Fixed tanks or demountable tanks made of metal shall meet the relevant requirements of Chapter 6.8.
- 9.7.2.2 Elements of battery-vehicles and of MEGCs shall meet the relevant requirements of Chapter 6.2 in the case of cylinders, tubes, pressure drums and bundles of cylinders and the requirements of Chapter 6.8 in the case of tanks.
- 9.7.2.3 Tank-containers made of metal shall meet the requirements of Chapter 6.8, portable tanks shall meet the requirements of Chapter 6.7 or, if applicable, those of the IMDG Code (see 1.1.4.2).
- 9.7.2.4 Tanks made of fibre-reinforced plastics material shall meet the requirements of Chapter 6.9.
- 9.7.2.5 Vacuum-operated waste tanks shall meet the requirements of Chapter 6.10.

9.7.3 Fastenings

Fastenings shall be designed to withstand static and dynamic stresses in normal conditions of carriage, and minimum stresses as defined in 6.8.2.1.2, 6.8.2.1.11 to 6.8.2.1.15 and 6.8.2.1.16 in the case of tank-vehicles, battery-vehicles, and vehicles carrying demountable tanks.

9.7.4 Earthing of FL vehicles

Tanks made of metal or of fibre-reinforced plastics material of FL tank-vehicles and battery elements of FL battery-vehicles shall be linked to the chassis by means of at least one good electrical connection. Any metal contact capable of causing electrochemical corrosion shall be avoided.

NOTE: See also 6.9.1.2 and 6.9.2.14.3.

9.7.5 Stability of tank-vehicles

- 9.7.5.1 The overall width of the ground-level bearing surface (distance between the outer points of contact with the ground of the right-hand tyre and the left-hand tyre of the same axle) shall be at least equal to 90% of the height of the centre of gravity of the laden tank-vehicle. In an articulated vehicle the mass on the axles of the load-carrying unit of the laden semi-trailer shall not exceed 60% of the nominal total laden mass of the complete articulated vehicle.

- 9.7.5.2 In addition, tank-vehicles with fixed tanks with a capacity of more than 3 m³ intended for the carriage of dangerous goods in the liquid or molten state tested with a pressure of less than 4 bar, shall comply with the technical requirements of ECE Regulation No. 111¹ for lateral stability, as amended, in accordance with the dates of application specified therein. The requirements are applicable to tank-vehicles which are first registered as from 1 July 2003.

9.7.6 Rear protection of vehicles

A bumper sufficiently resistant to rear impact shall be fitted over the full width of the tank at the rear of the vehicle. There shall be a clearance of at least 100 mm between the rear wall of the tank and the rear of the bumper (this clearance being measured from the rearmost point of the tank wall or from projecting fittings or accessories in contact with the substance being carried). Vehicles with a tilting shell for the carriage of powdery or granular substances and a vacuum-operated waste tank with a tilting shell with rear discharge do not require a bumper if the rear fittings of the shell are provided with a means of protection which protects the shell in the same way as a bumper.

NOTE 1: This provision does not apply to vehicles used for the carriage of dangerous goods in tank-containers, MEGCs or portable tanks.

NOTE 2: For the protection of tanks against damage by lateral impact or overturning, see 6.8.2.1.20 and 6.8.2.1.21 or, for portable tanks, 6.7.2.4.3 and 6.7.2.4.5.

9.7.7 Combustion heaters

- 9.7.7.1 Combustion heaters shall meet the requirements of 9.2.4.7.1, 9.2.4.7.2, 9.2.4.7.5 and the following:

- (a) The switch may be installed outside the driver's cab;
- (b) The device may be switched off from outside the load compartment; and
- (c) It is not necessary to prove that the heat exchanger is resistant to the reduced afterrunning cycle.

In addition for FL vehicles, they shall meet the requirements of 9.2.4.7.3 and 9.2.4.7.4.

- 9.7.7.2 If the vehicle is intended for the carriage of dangerous goods for which a label conforming to models Nos. 1.5, 3, 4.1, 4.3, 5.1 or 5.2 is prescribed, no fuel tanks, power sources, combustion air or heating air intakes as well as exhaust tube outlets required for the operation of the combustion heater shall be installed in the load compartment. It shall be ensured that the heating air outlet cannot be blocked by cargo. The temperature to which the load is heated shall not exceed 50 °C. Heating devices installed inside the load compartments shall be designed so as to prevent the ignition of an explosive atmosphere under operating conditions.

9.7.8 Electrical equipment

- 9.7.8.1 The electrical installation on FL vehicles shall meet the relevant requirements of 9.2.2.2, 9.2.2.3, 9.2.2.4, 9.2.2.5.1 and 9.2.2.6.

However additions to or modifications of the electrical installations of the vehicle shall meet the requirements for the electrical apparatus of the relevant group and temperature class according to the substances to be carried.

NOTE: For transitional provisions, see also 1.6.5.

¹ ECE Regulation No. 111: Uniform provisions concerning the approval of tank-vehicles of categories N and O with regard to rollover stability.

- 9.7.8.2 Electrical equipment on FL vehicles, situated in areas where an explosive atmosphere is, or may be expected to be, present in such quantities as to require special precautions, shall be suitable for use in a hazardous area. Such equipment shall meet the general requirements of IEC 60079 parts 0 and 14 and the additional requirements applicable from IEC 60079 parts 1, 2, 5, 6, 7, 11 or 18. The requirements for the electrical apparatus of the relevant group and temperature class according to the substances to be carried shall be met.

For the application of IEC 60079 part 14, the following classification shall be used:

ZONE 0

Inside tank compartments, fittings for filling and discharge and vapour recovery lines.

ZONE 1

Inside cabinets for equipment used for filling and discharge and within 0.5 m of venting devices and pressure relief safety valves.

- 9.7.8.3 Permanently energized electrical equipment, including the leads, which is situated outside Zones 0 and 1 shall meet the requirements for Zone 1 for electrical equipment in general or meet the requirements for Zone 2 according to IEC 60079 part 14 for electrical equipment situated in the driver's cab. The requirements for the relevant group of electrical apparatus according to the substances to be carried shall be met.

9.7.9 Additional safety requirements concerning EX/III vehicles

- 9.7.9.1 EX/III vehicles shall be equipped with automatic fire extinguisher systems for the engine compartment.
- 9.7.9.2 Protection of the load by metal thermal shields against tyre fire shall be provided.

CHAPTER 9.8

ADDITIONAL REQUIREMENTS CONCERNING COMPLETE AND COMPLETED MEMUs

9.8.1 General provisions

In addition to the vehicle proper, or the units of running gear used in its stead, a MEMU comprises one or more tanks and bulk containers, their items of equipment and the fittings for attaching them to the vehicle or to the running-gear units.

9.8.2 Requirements concerning tanks and bulk containers

Tanks, bulk containers and special compartments for packages of explosives of MEMUs shall meet the requirements of Chapter 6.12.

9.8.3 Earthing of MEMUs

Tanks, bulk containers and special compartments for packages of explosives made of metal or of fibre-reinforced plastics material shall be linked to the chassis by means of at least one good electrical connection. Any metal contact capable of causing electro-chemical corrosion or reacting with the dangerous goods carried in the tanks and bulk containers shall be avoided.

9.8.4 Stability of MEMUs

The overall width of the ground-level bearing surface (distance between the outer points of contact with the ground of the right-hand tyre and the left-hand tyre of the same axle) shall be at least equal to 90% of the height of the centre of gravity of the laden vehicle. In an articulated vehicle the mass on the axles of the load-carrying unit of the laden semi-trailer shall not exceed 60% of the nominal total laden mass of the complete articulated vehicle.

9.8.5 Rear protection of MEMUs

A bumper sufficiently resistant to rear impact shall be fitted over the full width of the tank at the rear of the vehicle. There shall be a clearance of at least 100 mm between the rear wall of the tank and the rear of the bumper (this clearance being measured from the rearmost point of the tank wall or from protecting fittings or accessories in contact with the substance being carried). Vehicles with a tilting shell with rear discharge do not require a bumper if the rear fittings of the shell are provided with a means of protection which protects the shell in the same way as a bumper.

NOTE: This provision does not apply to MEMUs where the tanks are protected adequately against rear impact by other means, e.g. machinery or piping not containing dangerous goods.

9.8.6 Combustion heaters

9.8.6.1 Combustion heaters shall meet the requirements of 9.2.4.7.1, 9.2.4.7.2, 9.2.4.7.5, 9.2.4.7.6 and the following:

- (a) the switch may be installed outside the driver's cab;
- (b) the device shall be switched off from outside the MEMU compartment; and
- (c) it is not necessary to prove that the heat exchanger is resistant to the reduced afterrunning cycle.

- 9.8.6.2 No fuel tanks, power sources, combustion air or heating air intakes as well as exhaust tube outlets required for the operation of the combustion heater shall be installed in the load compartments containing tanks. It shall be ensured that the heating air outlet cannot be blocked. The temperature to which any equipment is heated shall not exceed 50 °C. Heating devices installed inside the compartments shall be designed so as to prevent the ignition of any explosive atmosphere under operating conditions.

9.8.7 Additional safety requirements

- 9.8.7.1 MEMUs shall be equipped with automatic fire extinguisher systems for the engine compartment.
- 9.8.7.2 Protection of the load by metal thermal shields against tyre fire shall be provided.

9.8.8 Additional security requirements

Process equipment and special compartments in MEMUs shall be fitted with locks.

- 1.10.2 Školení o obecné bezpečnosti
- 1.10.3 Ustanovení pro vysoce rizikové nebezpečné věci

Část 2

Klasifikace

Kapitola 2.1 Všeobecná ustanovení

- 2.1.1 Úvod
- 2.1.2 Zásady klasifikace
- 2.1.3 Klasifikace jmenovitě neuvedených látek, včetně roztoků a směsí (jako přípravky a odpady)
- 2.1.4 Klasifikace zkušebních vzorků
- 2.1.5 Klasifikace obalů, vyřazených, prázdných, nevyčištěných

Kapitola 2.2 Zvláštní ustanovení pro jednotlivé třídy

- 2.2.1 Třída 1 Výbušné látky a předměty
- 2.2.2 Třída 2 Plyny

- 2.2.3 Třída 3 Hořlavé kapaliny
- 2.2.41 Třída 4.1 Hořlavé tuhé látky, samovolně se rozkládající látky a znečlivěné tuhé výbušné látky
- 2.2.42 Třída 4.2 Samozápalné látky
- 2.2.43 Třída 4.3 Látky, které ve styku s vodou vyvíjejí hořlavé plyny
- 2.2.51 Třída 5.1 Látky podporující hoření
- 2.2.52 Třída 5.2 Organické peroxidy
- 2.2.61 Třída 6.1 Toxické látky
- 2.2.62 Třída 6.2 Infekční látky
- 2.2.7 Třída 7 Radioaktivní látky
- 2.2.8 Třída 8 Žiravé látky
- 2.2.9 Třída 9 Jiné nebezpečné látky a předměty

Kapitola**2.3 Zkušební postupy**

- 2.3.0 Všeobecně
- 2.3.1 Zkouška na výpotek pro trhavinu typu A
- 2.3.2 Zkoušky týkající se nitrovaných směsí celulózy třídy 4.1
- 2.3.3 Zkoušky hořlavých kapalných látek tříd 3, 6.1 a 8
- 2.3.4 Zkouška ke stanovení tekutosti
- 2.3.5 Klasifikace organokovových látek do tříd 4.2 a 4.3

Část 3 **Vyjmenování nebezpečných věcí, zvláštní ustanovení a vynětí z platnosti pro omezená a vyňatá množství****Kapitola 3.1. Všeobecné**

3.1.1 Úvod

3.1.2 Oficiální pojmenování pro přepravu

3.1.3 Roztoky nebo směsi

Kapitola 3.2 Seznam nebezpečných věcí

3.2.1 Tabulka A: Seznam nebezpečných věcí

3.2.2 Tabulka B: Abecední seznam látek a předmětů ADR

Kapitola 3.3 Zvláštní ustanovení pro určité látky nebo předměty**Kapitola 3.4 Nebezpečné věci balené v omezených množstvích****Kapitola 3.5 Nebezpečné věci balené ve vyňatých množstvích**

3.5.1 Vyňatá množství

3.5.2 Obaly

3.5.3 Zkoušky pro kusy

3.5.4 Značení kusů

3.5.5 Maximální počet kusů ve vozidle nebo kontejneru

3.5.6 Dokumentace

Část 4 **Ustanovení o používání obalů a cisteren****Kapitola 4.1 Použití obalů, včetně IBC a velkých obalů**

4.1.1 Všeobecná ustanovení pro balení nebezpečných věcí do obalů včetně IBC a velkých obalů

- 4.1.2 Dodatečná všeobecná ustanovení pro používání IBC
- 4.1.3 Všeobecná ustanovení týkající se pokynů pro balení
- 4.1.4 Přehled pokynů pro balení
- 4.1.5 Zvláštní ustanovení pro balení věcí třídy 1
- 4.1.6 Zvláštní ustanovení pro balení věcí třídy 2 a věcí jiných tříd přiřazených k pokynu pro balení P200
- 4.1.7 Zvláštní ustanovení pro balení organických peroxidů třídy 5.2 a samovolně se rozkládajících látek třídy 4.1
- 4.1.8 Zvláštní ustanovení pro balení infekčních látek (třída 6.2)
- 4.1.9 Zvláštní ustanovení pro balení radioaktivních látek
- 4.1.10 Zvláštní ustanovení pro společné balení

Kapitola 4.2 Používání přemístitelných cisteren a UN vícečláňkových kontejnerů na plyn (MEGC)

- 4.2.1 Všeobecná ustanovení pro používání přemístitelných cisteren pro přepravu látek třídy 1 a tříd 3 až 9
- 4.2.2 Všeobecná ustanovení pro používání přemístitelných cisteren pro přepravu nezchlazených zkapalněných plynů a chemických látek pod tlakem
- 4.2.3 Všeobecná ustanovení pro používání přemístitelných cisteren pro přepravu hluboce zchlazených zkapalněných plynů
- 4.2.4 Všeobecná ustanovení pro používání UN vícečláňkových kontejnerů na plyn (MEGC)

	4.2.5	Pokyny a zvláštní ustanovení pro přemístitelné cisterny
Kapitola	4.3	Používání nesnímatelných cisteren (cisternových vozidel), snímatelných cisteren, cisternových kontejnerů a cisternových výměnných nástaveb, jejichž nádrže jsou vyrobeny z kovových materiálů, a bateriových vozidel a vícečlankových kontejnerů na plyn (MEGC)
	4.3.1	Rozsah použití
	4.3.2	Ustanovení vztahující se na všechny třídy
	4.3.3	Zvláštní ustanovení pro třídu 2
	4.3.4	Zvláštní ustanovení pro třídy 1a 3 až 9
	4.3.5	Zvláštní ustanovení
Kapitola	4.4	Používání nesnímatelných cisteren (cisternových vozidel), snímatelných cisteren, cisternových kontejnerů a cisternových výměnných nástaveb z vyztužených plastů (FRP)
	4.4.1	Všeobecná ustanovení
	4.4.2	Provoz
Kapitola	4.5	Používání cisteren pro podtlakové vyčerpávání odpadů
	4.5.1	Používání
	4.4.2	Provoz
Kapitola	4.6	(Vyhrazeno)
Kapitola	4.7	Používání mobilních jednotek přepravujících výbušniny (MEMU)
	4.7.1	Používání
	4.7.2	Provoz
Část 5	Postupy při odeslání	
Kapitola	5.1	Všeobecná ustanovení
	5.1.1	Rozsah použití a všeobecná ustanovení
	5.1.2	Použití přepravních obalových souborů

- 5.1.3 Prázdné nevyčištěné obaly (včetně IBC a velkých obalů), cisterny, MEMU; vozidla a kontejnery pro přepravu ve volně loženém stavu
- 5.1.4 Společné balení
- 5.1.5 Všeobecná ustanovení pro třídu 7
- Kapitola 5.2 Nápis a bezpečnostní značky**
 - 5.2.1 Značení kusů
 - 5.2.2 Označování kusů
- Kapitola 5.3 Označování kontejnerů, MEGC, MEMU; cisternových kontejnerů, přemístitelných cisteren a vozidel velkými bezpečnostními značkami, oranžovými tabulkami a nápisy**
 - 5.3.1 Označování velkými bezpečnostními značkami
 - 5.3.2 Označování oranžovými tabulkami
 - 5.3.3 Značka pro zahřáté látky
 - 5.3.4 (Vyhrazeno)
 - 5.3.5 (Vyhrazeno)
 - 5.3.6 Značka pro látky ohrožující životní prostředí
- Kapitola 5.4 Průvodní doklady**
 - 5.4.1 Přepravní doklad pro nebezpečné věci a předepsané údaje
 - 5.4.2 Osvědčení o naložení velkého kontejneru nebo vozidla
 - 5.4.3 Písemné pokyny
 - 5.4.4 Uchovávání informací o přepravě nebezpečných věcí
 - 5.4.5 Příklad formuláře pro multimodální přepravu nebezpečných věcí
- Kapitola 5.5 Zvláštní ustanovení**
 - 5.5.1 (Vypuštěno)

- 5.5.2 Zvláštní ustanovení pro zaplynované nákladní dopravní (přepravní) jednotky (UN 3359)
- 5.5.3 Zvláštní ustanovení platná pro kusy a vozidla a kontejnery obsahující látky představující riziko udušení, jsou-li používány pro účely chlazení nebo kondicionování (jako jsou suchý led (UN 1845), nebo dusík, hluboce zchlazený, kapalný (UN 1977) nebo argon, hluboce zchlazený, kapalný (UN 1951))

Část 6**Požadavky na konstrukci a zkoušení obalů, velkých nádob pro volně ložené látky (IBC), velkých obalů a cisteren**

Kapitola	6.1	Požadavky na konstrukci a zkoušení obalů
	6.1.1	Všeobecně
	6.1.2	Kódování konstrukčních typů obalů
	6.1.3	Značení
	6.1.4	Požadavky na obaly
	6.1.5	Požadavky na zkoušky obalů
	6.1.6	Standardní kapaliny pro důkaz chemické snášenlivosti obalů a IBC z polyetylenu podle 6.1.5.2.6, popřípadě 6.5.6.3.5
Kapitola	6.2	Požadavky na konstrukci a zkoušení tlakových nádob, aerosolových rozprašovačů, malých nádobek obsahujících plyn (plynových kartuši) a zásobníků do palivových článků obsahujících zkapalněný hořlavý plyn
	6.2.1	Všeobecné požadavky
	6.2.2	Požadavky na UN tlakové nádoby
	6.2.3	Všeobecné požadavky na tlakové nádoby neodpovídající UN
	6.2.4	Požadavky na tlakové láhve neodpovídající UN, zkonstruované, vyrobené a odzkoušené podle norem
	6.2.5	Požadavky na tlakové nádoby neodpovídající

UN, které nejsou zkonstruovány, vyrobeny
a odzkoušeny podle norem

- 6.2.6 Všeobecné požadavky na aerosolové
rozprašovače, malé nádoby obsahující plyn
(plynové kartuše) a zásobníky do palivových
článků obsahující zkapalněný hořlavý plyn

**Kapitola 6.3 Požadavky na konstrukci a zkoušení obalů
pro infekční látky kategorie A třídy 6.2**

- 6.3.1 Obecné
- 6.3.2 Požadavky na balení
- 6.3.3 Kód pro určení typu obalů
- 6.3.4 Značení
- 6.3.5 Požadavky na zkoušení obalů

**Kapitola 6.4 Požadavky na konstrukci, zkoušení
a schvalování kusů a látek třídy 7**

- 6.4.1 (Vyhrazeno)
- 6.4.2 Všeobecné požadavky
- 6.4.3 (Vyhrazeno)
- 6.4.4 Požadavky na kusy vyňaté z platnosti
- 6.4.5 Požadavky na průmyslové kusy
- 6.4.6 Požadavky na kusy obsahující hexafluorid
uranu
- 6.4.7 Požadavky na kusy typu A
- 6.4.8 Požadavky na kusy typu B(U)
- 6.4.9 Požadavky na kusy typu B(M)
- 6.4.10 Požadavky na kusy typu C
- 6.4.11 Požadavky na kusy obsahující štěpné látky
- 6.4.12 Zkušební postupy a důkaz shodnosti
- 6.4.13 Zkoušení celistvosti kontejmentového systému
a stínění a zhodnocení podkritičnosti

- 6.4.14 Terč pro zkoušky pádem
- 6.4.15 Zkoušky pro prokázání schopnosti odolat normálním podmínkám přepravy
- 6.4.16 Dodatečné zkoušky kusů typu A konstruované pro kapaliny a plyny
- 6.4.17 Zkoušky pro prokázání schopnosti odolat nehodovým podmínkám při přepravě
- 6.4.18 Rozšířená zkouška ponořením do vody pro kusy typu B(U) a typu B(M) obsahující výše než 10^5 A₂ a typu C
- 6.4.19 Zkouška úniku vody pro kus obsahující štěpnou látku
- 6.4.20 Zkoušky pro kusy typu C
- 6.4.21 Prohlídky obalů konstruovaných pro obsah 0,1kg nebo více hexafluoridu uranu
- 6.4.22 Typové schválení kusu a materiálů
- 6.4.23 Žádosti a povolování přepravy radioaktivní látky

Kapitola 6.5 Požadavky na konstrukci a zkoušení velkých nádob pro volně ložené látky (IBC)

- 6.5.1 Obecné požadavky
- 6.5.2 Značení UN kódem
- 6.5.3 Požadavky na konstrukci
- 6.5.4 Zkoušení, certifikace a inspekce
- 6.5.5 Zvláštní požadavky na IBC
- 6.5.6 Požadavky na zkoušky IBC

Kapitola 6.6 Požadavky na konstrukci a zkoušení velkých obalů

- 6.6.1 Všeobecné
- 6.6.2 Kód pro označení typu velkých obalů
- 6.6.3 Značení

- 6.6.4 Zvláštní požadavky na velké obaly
- 6.6.5 Zkušební požadavky na velké obaly
- Kapitola 6.7 Požadavky na konstrukci, výrobu, inspekce a zkoušení přemístitelných cisteren a UN vícečlánekových kontejnerů na plyn (MEGC)**
 - 6.7.1 Platnost a všeobecné požadavky
 - 6.7.2 Požadavky na konstrukci, výrobu, inspekce a zkoušení přemístitelných cisteren určených pro přepravu látek třídy 1 a tříd 3 až 9
 - 6.7.3 Požadavky na konstrukci, výrobu, inspekce a zkoušení přemístitelných cisteren určených pro přepravu nezchlazených zkapalněných plynů
 - 6.7.4 Požadavky na konstrukci, výrobu, inspekce a zkoušení přemístitelných cisteren určených pro přepravu hluboce zchlazených zkapalněných plynů
 - 6.7.5 Požadavky na konstrukci, výrobu, inspekce a zkoušení UN vícečlánekových kontejnerů na plyn (MEGC) určených pro přepravu nezchlazených plynů
- Kapitola 6.8 Požadavky na konstrukci, výstroj, schvalování typu, inspekce a zkoušení a značení nesnímatelných cisteren, (cisternových vozidel), snímatelných cisteren a cisternových kontejnerů a cisternových výměnných nástaveb s nádržemi vyrobenými z kovových materiálů a bateriových vozidel a vícečlánekových kontejnerů na plyn (MEGC)**
 - 6.8.1 Rozsah použití
 - 6.8.2 Požadavky vztahující se na všechny třídy
 - 6.8.3 Zvláštní požadavky vztahující se na třídu 2
 - 6.8.4 Zvláštní ustanovení
 - 6.8.5 Požadavky na materiály a konstrukci svařovaných nesnímatelných cisteren, svařovaných snímatelných cisteren a svařovaných nádrží cisternových kontejnerů, pro které je požadován zkušební tlak nejméně

1 MPa (10 bar) a svařovaných nesnímatelných cisteren, svařovaných snímatelných cisteren a svařovaných nádrží cisternových kontejnerů určených pro přepravu hluboce zchlazených zkapalněných plynů třídy 2

Kapitola 6.9 Požadavky na konstrukci, výrobu, výstroj, schválování typu, zkoušení a značení cisteren nesnímatelných cisteren, (cisternových vozidel), snímatelných cisteren, cisternových kontejnerů a výměnných cisternových nástaveb z vyztužených plastů (FRP)

- 6.9.1 Všeobecně
- 6.9.2 Konstrukce
- 6.9.3 Části výstroje
- 6.9.4 Zkoušení a schválení typu
- 6.9.5 Inspekce
- 6.9.6 Značení

Kapitola 6.10 Požadavky na konstrukci, výstroj, schvalování typu, inspekci a značení cisteren pro podtlakové vyčerpávání odpadů

- 6.10.1 Všeobecně
- 6.10.2 Konstrukce
- 6.10.3 Části výstroje
- 6.10.4 Inspekce

Kapitola 6.11 Požadavky na konstrukci, výrobu, inspekce a zkoušení kontejnerů pro volně ložené látky

- 6.11.1 Vyhrazeno
- 6.11.2 Platnost a všeobecné požadavky
- 6.11.3 Požadavky na konstrukci, výrobu, inspekce a zkoušení kontejnerů odpovídajících KBK používaných jako kontejnery pro volně ložené

látky

- 6.11.4 Požadavky na konstrukci, výrobu a schválení kontejnerů pro volně ložené látky jiných než kontejnerů odpovídajících KBK

Kapitola 6.12 Požadavky na výrobu, výstroj, schvalování typu, inspekce a zkoušení a značení cisteren, kontejnerů pro volně ložené látky a zvláštních komor pro výbušniny mobilních jednotek připravujících výbušniny (MEMU)

- 6.12.1 Rozsah použití
- 6.12.2 Všeobecná ustanovení
- 6.12.3 Cisterny
- 6.12.4 Části výstroje
- 6.12.5 Zvláštní komory pro výbušniny

Část 7 Ustanovení o podmínkách přepravy, nakládky, vykládky a manipulace

Kapitola 7.1 Všeobecná ustanovení

Kapitola 7.2 Ustanovení o přepravě v kusech

Kapitola 7.3 Ustanovení o přepravě ve volně loženém stavu

- 7.3.1 Všeobecná ustanovení
- 7.3.2 Dodatečná ustanovení pro přepravu ve volně loženém stavu, použijí-li se ustanovení pododdílu 7.3.1.1 (a)
- 7.3.3 Zvláštní ustanovení pro přepravu ve volně loženém stavu, použijí-li se ustanovení pododdílu 7.3.1.1 (b)

Kapitola 7.4 Ustanovení o přepravě v cisternách

Kapitola 7.5 Ustanovení o nakládce, vykládce a manipulaci

- 7.5.1 Všeobecná ustanovení o nakládce, vykládce a manipulaci
- 7.5.2 Zákaz společné nakládky
- 7.5.3 (Vyhrazeno)
- 7.5.4 Preventivní opatření se zřetelem na potraviny, poživatiny a krmiva
- 7.5.5 Omezení přepravovaných množství
- 7.5.6 (Vyhrazeno)
- 7.5.7 Manipulace a ukládání
- 7.5.8 Čištění po vykládce
- 7.5.9 Zákaz kouření
- 7.5.10 Preventivní opatření proti elektrickým nábojům
- 7.5.11 Dodatečná ustanovení vztahující se na určité třídy nebo věci

PŘÍLOHA B USTANOVENÍ O DOPRAVNÍCH PROSTŘEDCÍCH A O PŘEPRAVĚ

Část 8 Požadavky na osádky vozidel, jejich výbavu, provoz a průvodní doklady

- | | | |
|-----------------|------------|---|
| Kapitola | 8.1 | Všeobecné požadavky na dopravní jednotky a jejich vybavení |
| | 8.1.1 | Dopravní jednotky |
| | 8.1.2 | Průvodní doklady |
| | 8.1.3 | Označování |
| | 8.1.4 | Hasicí přístroje |
| | 8.1.5 | Další výbava a výbava pro osobní ochranu |
| Kapitola | 8.2 | Požadavky na školení a osádky vozidla |
| | 8.2.1 | Všeobecné požadavky na školení řidičů |
| | 8.2.2 | Zvláštní požadavky na školení řidičů |

- 8.2.3 Školení všech osob, kromě řidičů majících osvědčení podle oddílu 8.2.1, podílejících se na silniční přepravě nebezpečných věcí

Kapitola 8.3 Další požadavky, které musí plnit osádka vozidla

- 8.3.1 Osoby
- 8.3.2 Používání hasicích přístrojů
- 8.3.3 Zákaz otevírání kusů
- 8.3.4 Přenosná osvětlovací zařízení
- 8.3.5 Zákaz kouření
- 8.3.6 Běh motoru při nakládce nebo vykládce
- 8.3.7 Používání parkovacích brzd a zakládacích klínů
- 8.3.8 Použití kabelových spojů

Kapitola 8.4 Požadavky na dozor nad vozidly

Kapitola 8.5 Dodatečné požadavky na jednotlivé třídy nebo látky

Kapitola 8.6 Omezení průjezdu vozidel přepravujících nebezpečné věci silničními tunely

- 8.6.1 Všeobecná ustanovení
- 8.6.2 Silniční dopravní značky a signály upravující průjezd vozidel přepravujících nebezpečné věci
- 8.6.3 Kódy omezení průjezdu tunelem
- 8.6.4 Omezení průjezdu dopravních jednotek přepravujících nebezpečné věci tunely

Část 9 Požadavky na konstrukci a schvalování vozidel

Kapitola 9.1 Rozsah platnosti, definice a požadavky na schvalování vozidel

	9.1.1	Rozsah platnosti a definice
	9.1.2	Schvalování vozidel EX/II, EX/III, FL, OX a AT a MEMU
	9.1.3	Osvědčení o schválení
Kapitola	9.2	Požadavky na konstrukci vozidel
	9.2.1	Shoda s požadavky této kapitoly
	9.2.2	Elektrické vedení
	9.2.3	Brzdový systém
	9.2.4	Prevence nebezpečí požáru
	9.2.5	Omezovač rychlosti
	9.2.6	Spojovací zařízení přípojných vozidel
Kapitola	9.3	Dodatečné požadavky na kompletní nebo zkompleťovaná vozidla EX/II nebo EX/III
	9.3.1	Materiály používané pro konstrukci nástaveb vozidel
	9.3.2	Vytápěcí systémy s vnitřním spalováním
	9.3.3	Vozidla EX/II
	9.3.4	Vozidla EX/III
	9.3.5	Motor a ložný prostor
	9.3.6	Vnější zdroje tepla a ložný prostor
	9.3.7	Elektrické příslušenství
Kapitola	9.4	Dodatečné požadavky na konstrukci Nástaveb kompletních nebo zkompleťovaných vozidel určených pro přepravu nebezpečných věcí v kusech (kromě vozidel EX/II a EX III)
Kapitola	9.5	Dodatečné požadavky na konstrukci nástaveb kompletních nebo zkompleťovaných vozidel určených pro přepravu volně ložených tuhých nebezpečných látek

Kapitola	9.6	Dodatečné požadavky na kompletní nebo zkompleťovaná vozidla určená pro přepravu látek při řízené teplotě
Kapitola	9.7	Dodatečné požadavky na nesnímatelné cisterny (cisterny), bateriová vozidla a kompletní nebo zkompleťovaná vozidla používaná pro přepravu nebezpečných věcí ve snímatelných cisternách s vnitřním objemem větším než 1 m³ nebo v cisternových kontejnerech, přemístitelných cisternách nebo MEGC s vnitřním objemem větším než 3 m³ (vozidla FL, OX a AT)
	9.7.1	Všeobecná ustanovení
	9.7.2	Požadavky na cisterny
	9.7.3	Upevňovací prvky
	9.7.4	Uzemnění vozidel FL
	9.7.5	Stabilita cisternových vozidel
	9.7.6	Ochrana vozidel proti nárazu zezadu
	9.7.7	Vytápěcí systémy s vnitřním spalováním
	9.7.8	Elektrické příslušenství
	9.7.9	Dodatečné bezpečnostní požadavky na vozidla EX/III
Kapitola	9.8	Dodatečné požadavky na kompletní a zkompleťované MEMU
	9.8.1	Všeobecná ustanovení
	9.8.2	Požadavky na cisterny a kontejnery pro volně ložené látky
	9.8.3	Uzemnění MEMU
	9.8.4	Stabilita MEMU
	9.8.5	Ochrana MEMU proti nárazu zezadu
	9.8.6	Vytápěcí systémy s vnitřním spalováním

9.8.7 Dodatečné bezpečnostní požadavky

9.8.8 Dodatečné další bezpečnostní požadavky

PŘÍLOHA A

**VŠEOBECNÁ USTANOVENÍ A USTANOVENÍ TÝKAJÍCÍ SE
NEBEZPEČNÝCH LÁTEK
A PŘEDMĚTŮ**

ČÁST 1
VŠEOBECNÁ USTANOVENÍ

KAPITOLA 1.1

ROZSAH A POUŽITÍ

1.1.1 Struktura

Přílohy A a B jsou rozděleny do devíti částí. Přílohu A tvoří části 1 až 7 a přílohu B tvoří části 8 a 9. Každá část se dělí do kapitol a každá kapitola do oddílů a pododdílů. Uvnitř každé části je číslo části zahrnuto do čísel kapitol, oddílů a pododdílů, např. část 4, kapitola 2, oddíl 1, je očíslována „4.2.1“.

1.1.2 Rozsah platnosti

1.1.2.1 Pro účely článku 2 dohody ADR příloha A uvádí:

- (a) nebezpečné věci, které jsou z mezinárodní přepravy vyloučeny;
- (b) nebezpečné věci, jejichž mezinárodní přeprava je přípustná a požadavky, které musí být při této přepravě splněny (včetně vynětí z platnosti), zejména:
 - klasifikace věcí, včetně klasifikačních kritérií a příslušných zkušebních metod;
 - používání obalů (včetně společného balení);
 - používání cisteren (včetně jejich plnění);
 - postupy před odesláním (včetně nápisů a bezpečnostních značek na kusech, označování dopravních a přepravních prostředků, jakož i doklady a požadované informace);
 - ustanovení o konstrukci, zkoušení a schvalování obalů a cisteren;
 - používání dopravních prostředků (včetně nakládky, společné nakládky a vykládky).

1.1.2.2 Příloha A obsahuje rovněž určitá ustanovení, která se podle článku 2 dohody ADR týkají přílohy B nebo obou příloh A a B:

- 1.1.1 Struktura
- 1.1.2.3 (Rozsah platnosti přílohy B)
- 1.1.2.4
- 1.1.3.1 Vynětí z platnosti vztahující se k druhu přepravy
- 1.1.3.6 Vynětí z platnosti pro množství přepravovaná jednou dopravní jednotkou
- 1.1.4 Použitelnost jiných předpisů
- 1.1.4.5 Přeprava jinou dopravou než silniční
- Kapitola 1.2 Definice a měrové jednotky
- Kapitola 1.3 Školení osob podílejících se na přepravě nebezpečných věcí
- Kapitola 1.4 Povinnosti účastníků přepravy z hlediska bezpečnosti
- Kapitola 1.5 Odchytky
- Kapitola 1.6 Přechodná ustanovení
- Kapitola 1.8 Kontroly a jiná podpůrná opatření pro zajištění plnění bezpečnostních požadavků
- Kapitola 1.9 Dopravní omezení stanovená příslušnými orgány
- Kapitola 1.10 Bezpečnostní předpisy
- Kapitola 3.1 Všeobecně
- Kapitola 3.2 sloupce (1), (2), (14), (15) a (19) (použití ustanovení částí 8 a 9 pro jednotlivé látky nebo předměty)

1.1.2.3 Pro účely článku 2 dohody ADR příloha B uvádí požadavky na konstrukci, výbavu a provoz vozidel schválených pro přepravu nebezpečných věcí, a to:

- požadavky na osádky vozidel, jejich výbavu, provoz a doklady;
- požadavky na konstrukci a schvalování vozidel.

1.1.2.4 Pojem „vozidlo“ v článku 1(c) dohody ADR se nevztahuje nutně jen na jedno a totéž vozidlo. Mezinárodní přeprava může být prováděna několika různými vozidly, pokud se tato přeprava provádí po území nejméně dvou smluvních států dohody ADR mezi odesílatelem a příjemcem uvedenými v přepravním dokladu.

1.1.3 Vynětí z platnosti

1.1.3.1 Vynětí z platnosti vztahující se k druhu přepravy

Ustanovení dohody ADR se nevztahují na:

- (a) přepravu nebezpečných věcí soukromými osobami, pokud jsou dotyčné věci baleny pro maloobchodní prodej a jsou určeny pro jejich osobní nebo domácí použití nebo pro jejich aktivity ve volném čase nebo pro sportovní činnost, pokud byla učiněna opatření k zamezení úniku obsahu za normálních přepravních podmínek. Pokud jsou tyto věci hořlavými kapalinami přepravovanými v opakovaně plnitelných nádobách naplněných soukromými osobami nebo pro tyto osoby, nesmí celkové množství překročit 60 litrů na nádobu a 240 litrů na dopravní jednotku. Nebezpečné věci ve velkých nádobách IBC, velkých obalech nebo cisternách se nepovažují za věci balené pro maloobchodní prodej;
- (b) přepravu strojů nebo zařízení nevymenovaných v této příloze, které mohou obsahovat nebezpečné věci ve své konstrukci nebo provozní výbavě, pokud byla učiněna opatření k zamezení úniku obsahu za normálních podmínek přepravy;
- (c) přepravu prováděnou podniky jako vedlejší činnost k jejich hlavní činnosti, jako je zásobování staveníšť pozemních nebo inženýrských staveb nebo zpětné jízdy z nich, nebo přepravy související s měřičskými, opravářskými a údržbářskými pracemi, v množstvích nejvýše 450 litrů v jednom obalu, včetně IBC a velkých obalů, a nepřekračujících nejvyšší celková množství uvedená v 1.1.3.6. Musí být učiněna opatření k zamezení úniku obsahu za normálních podmínek přepravy. Tato vynětí se nevztahují na třídu 7.

Přepravy prováděné takovými podniky pro jejich zásobování nebo vnější nebo vnitřní distribuci však nespádají do rozsahu tohoto vynětí;

- (d) přepravu prováděnou příslušnými orgány v rámci nouzových opatření nebo pod jejich dozorem, pokud je taková přeprava nutná ve vztahu k nouzovým opatřením, zejména přepravu prováděnou:
 - odtahovými vozidly přepravujícími vozidla, která byla účastníky dopravní nehody nebo měla poruchu a obsahují nebezpečné věci; nebo
 - za účelem sběru nebezpečných věcí, které byly účastny mimořádné události nebo nehody, a jejich přemístění na nejbližší vhodné bezpečné místo.
- (e) nouzové přepravy určené pro záchranu lidských životů nebo ochranu životního prostředí, za podmínky, že byla učiněna všechna opatření zajišťující plnou bezpečnost takové přepravy.
- (f) přepravu nevyčištěných prázdných stabilních nebo skladovacích nádob, které obsahovaly plyny třídy 2, skupin A, O nebo F, látky třídy 3 nebo třídy 9 spadající pod obalovou skupinu II nebo III, nebo pesticidy třídy 6.1 spadající pod obalovou skupinu II nebo III, za dodržení následujících podmínek:
 - všechny otvory, s výjimkou zařízení pro vyrovnávání tlaku (pokud jsou), jsou hermeticky uzavřeny;
 - byla učiněna opatření k zamezení jakéhokoli úniku obsahu za normálních podmínek přepravy; a

- náklad je upevněn v lůžkách nebo latěních nebo jiných manipulačních prostředcích nebo ve vozidle nebo kontejneru takovým způsobem, aby se nemohl uvolnit ani posunout za normálních podmínek přepravy.

Toto vynětí se nevztahuje na stabilní nebo skladovací nádoby a cisterny, které obsahovaly znečištěné výbušné látky nebo látky, jejichž přeprava je podle ADR zakázána.

POZNÁMKA: K radioaktivním látkám viz také 1.7.1.4.

1.1.3.2

Vynětí z platnosti pro přepravu plynů

Ustanovení dohody ADR se nevztahují na přepravu:

- (a) plynů obsažených v nádržích vozidel provádějících přepravu, které slouží pro jejich pohon nebo provoz jejich zvláštních zařízení (např. chladicí zařízení);
- (b) plynů obsažených v palivových nádržích přepravovaných vozidel. Palivový kohout mezi plynovou nádrží a motorem musí být uzavřen a elektrické spojení přerušeno;
- (c) plynů skupin A a O (podle pododdílu 2.2.2.1), jestliže tlak plynu v nádobě nebo cisterně při teplotě 20 °C nepřevyšuje 200 kPa (2 bary) a jestliže plyn není zkapalněným nebo hluboce zchlazeným zkapalněným plynem. To platí pro všechny druhy nádob nebo cisteren, např. rovněž pro různé části strojů a přístrojů;

POZNÁMKA: Toto vynětí se nevztahuje na lampy. K lampám viz 1.1.3.10.

- (d) plynů obsažených v zařízeních používaných pro provoz vozidla (např. v hasicích přístrojích), včetně náhradních dílů (např. nahuštěných pneumatik); toto vynětí z platnosti se vztahuje rovněž na nahuštěné pneumatiky přepravované jako náklad;
- (e) plynů obsažených ve zvláštním zařízení vozidel a nezbytných pro provoz těchto zvláštních zařízení během přepravy (chladicí systémy, nádrže na ryby, ohříváče atd.), jakož i náhradních nádob pro taková zařízení nebo prázdných nevyčištěných výměnných nádob, přepravovaných v téže dopravní jednotce;
- (f) plynů obsažených v potravinách (kromě UN 1950), včetně sycených nápojů;
- (g) plynů obsažených v míčích určených pro použití ve sportech; a
- (h) (Vypuštěno)

1.1.3.3

Vynětí z platnosti pro přepravu kapalných pohonných látek

Ustanovení dohody ADR se nevztahují na přepravu:

- (a) pohonných látek obsažených v palivových nádržích vozidel provádějících přepravu, určených pro jejich pohon nebo pro provoz jakýchkoli jejich zařízení používaných nebo určených k použití během přepravy.

Pohonné látky smí být přepravovány v pevných palivových nádržích, přímo propojených s motorem nebo přídavným zařízením vozidla, které splňují příslušné právní předpisy, nebo mohou být přepravovány v přenosných nádobách na pohonné látky (jako jsou kanystry).

Celkový vnitřní objem pevných palivových nádrží nesmí překročit 1500 litrů na jednu dopravní jednotku a vnitřní objem palivové nádrže připevněné na přípojně vozidlo nesmí překročit 500 litrů. V přenosných nádobách na pohonné látky smí být přepravováno nejvýše 60 litrů na jednu dopravní jednotku. Tato omezení se nevztahují na vozidla zásahových služeb;

- (b) pohonné látky v palivových nádržích vozidel nebo jiných dopravních prostředků (jako jsou lodě), které jsou přepravovány jako náklad, pokud jsou určeny pro jejich pohon nebo pro provoz jakýchkoli jejich zařízení. Všechny palivové kohouty mezi motorem nebo zařízením a palivovou nádrží musí být během přepravy uzavřeny, vyjma případu, kdy je pro zachování operativnosti zařízení nezbytné, aby zůstaly otevřené. Pokud je to možné, musí být vozidla nebo jiné dopravní prostředky uloženy na stojato a zajištěny proti spadnutí.

- (c) pohonných látek obsažených v nádržích po silnici nepojízdného strojního zařízení¹, které je přepravováno jako náklad, pokud jsou určeny k jeho pohonu nebo k provozu některého z jeho příslušenství. Pohonné hmoty smějí být přepravovány v pevně zabudovaných palivových nádržích spojených přímo s motorem vozidla a/nebo s pomocným příslušenstvím, a které splňují právní předpisy. Pokud je to vhodné, musí být toto strojního zařízení naloženo nastojato a zajištěno proti pádu.

1.1.3.4 Vynětí z platnosti podle zvláštních ustanovení a pro nebezpečné věci balené v omezených nebo vyňatých množstvích

POZNÁMKA: K radioaktivním látkám viz také 1.7.1.4

- 1.1.3.4.1 Některá zvláštní ustanovení kapitoly 3.3 vyjímají částečně nebo úplně přepravu určitých nebezpečných věcí z platnosti ustanovení ADR. Toto vynětí z platnosti platí pouze tehdy, pokud jsou ve sloupci (6) tabulky A kapitoly 3.2 uvedena zvláštní ustanovení u příslušné položky nebezpečných věcí.
- 1.1.3.4.2 Některé nebezpečné věci mohou podléhat vynětí z platnosti, pokud jsou splněny podmínky uvedené v kapitole 3.4.
- 1.1.3.4.3 Některé nebezpečné věci mohou podléhat vynětím z platnosti, pokud jsou splněny podmínky kapitoly 3.5.

1.1.3.5 Vynětí z platnosti pro prázdné nevyčištěné obaly

Prázdné nevyčištěné obaly (včetně IBC a velkých obalů), které obsahovaly látky tříd 2, 3, 4.1, 5.1, 6.1, 8 a 9, nepodléhají ustanovením ADR, jestliže byla provedena přiměřená opatření vylučující jakékoli nebezpečí. Nebezpečí jsou vyloučena, jestliže byla provedena opatření vylučující všechna nebezpečí tříd 1 až 9.

1.1.3.6 Vynětí z platnosti pro množství přepravovaná jednou dopravní jednotkou

- 1.1.3.6.1 Nebezpečné věci jsou pro účely tohoto pododdílu zařazeny do přepravních kategorií 0, 1, 2, 3 nebo 4, jak je uvedeno ve sloupci (15) tabulky A kapitoly 3.2. Prázdné nevyčištěné obaly, které obsahovaly látky zařazené do přepravní kategorie „0“, jsou též zařazené do kategorie „0“. Prázdné nevyčištěné obaly, které obsahovaly látky zařazené do přepravní kategorie jiné než „0“, jsou zařazené do přepravní kategorie „4“.
- 1.1.3.6.2 Pokud množství nebezpečných věcí přepravovaných jednou dopravní jednotkou nepřevyšuje hodnoty uvedené ve sloupci (3) tabulky uvedené v 1.1.3.6.3 pro danou přepravní kategorii (pokud nebezpečné věci přepravované v jedné dopravní jednotce patří do téže přepravní kategorie) nebo hodnotu vypočtenou podle 1.1.3.6.4 (pokud nebezpečné věci přepravované v jedné dopravní jednotce patří do různých přepravních kategorií), mohou být přepravovány v kusech v téže dopravní jednotce, aniž se použijí tato ustanovení:

¹ K definici po silnici nepojízdného strojního zařízení viz odstavec 2.7 Konsolidované rezoluce o konstrukci vozidel (R.E.3) (dokument Spojených národů ECE/TRANS/WP.29/78/Rev.3) nebo článek 2 Směrnice 97/68/ES Evropského parlamentu a Rady z 16. prosince 1997 o sblížení právních a správních předpisů členských států týkajících se opatření proti emisím plyných a prachových škodlivin z motorů s vnitřním spalováním určených pro po silnici nepojízdného strojního zařízení (Úřední věstník Evropských společenství č. L 059 z 27. února 1998).

- Kapitola 1.10, kromě výbušnin třídy 1, UN čísel 0029, 0030, 0059, 0065, 0073, 0104, 0237, 0255, 0267, 0288, 0289, 0290, 0360, 0361, 0364, 0365, 0366, 0439, 0440, 0441, 0455, 0456 a 0500 a kromě vyjmutých kusů třídy 7, UN čísel 2910 a 2911, jestliže úroveň aktivity překračuje hodnotu A2;
- Kapitola 5.3;
- Oddíl 5.4.3;
- Kapitola 7.2, kromě zvláštních ustanovení V5 a V8 oddílu 7.2.4;
- CV1 oddílu 7.5.11;
- Část 8, kromě
 - 8.1.2.1 (a),
 - 8.1.4.2 až 8.1.4.5,
 - 8.2.3,
 - 8.3.3,
 - 8.3.4,
 - 8.3.5,
 - kapitoly 8.4,
 - S1(3) a (6),
 - S2(1),
 - S4, S5
 - S14 až S21 a
 - S24 kapitoly 8.5;
- Část 9.

1.1.3.6.3 Pokud nebezpečné věci přepravované v jedné dopravní jednotce patří do stejné přepravní kategorie, je největší celkové množství na jednu dopravní jednotku uvedeno ve sloupci (3) následující tabulky.

Přepravní kategorie (1)	Látky nebo předměty obalová skupina nebo klasifikační kód /skupina nebo UN číslo (2)	Nejvyšší celkové množství na jednu dopravní jednotku (3)
0	<p>Třída 1: 1.1A/1.1L/1.2L/1.3L a UN 0190</p> <p>Třída 3: UN 3343</p> <p>Třída 4.2: Látky patřící k obalové skupině I</p> <p>Třída 4.3: UN 1183, 1242, 1295, 1340, 1390, 1403, 1928, 2813, 2965, 2968, 2988, 3129, 3130, 3131, 3134, 3148, 3396, 3398 a 3399</p> <p>Třída 5.1: UN 2426</p> <p>Třída 6.1: UN 1051, 1600, 1613, 1614, 2312, 3250 a 3294</p> <p>Třída 6.2: UN 2814 a 2900</p> <p>Třída 7: UN 2912 až 2919, 2977, 2978 a 3321 až 3333</p> <p>Třída 8: UN 2215 (MALEINANHYDRID, ROZTAVENÝ)</p> <p>Třída 9: UN 2315, 3151, 3152 a 3432 a zařízení obsahující takové látky nebo směsi</p> <p>a prázdné nevyčištěné obaly, kromě obalů zařazených pod UN číslo 2908, které obsahovaly látky zařazené do této přepravní kategorie</p>	0
1	<p>Látky a předměty patřící k obalové skupině I a nezařazené do přepravní kategorie 0 a látky a předměty následujících tříd:</p> <p>Třída 1: 1.1B až 1.1J^a/1.2B až 1.2J/1.3C/1.3G/1.3H/1.3J/1.5D^a</p> <p>Třída 2: skupiny T, TC^a, TO, TF, TOC^a a TFC; aerosoly: skupiny C, CO, FC, T, TF, TC, TO, TFC a TOC</p> <p>chemické látky pod tlakem: UN 3502, 3503, 3504 a 3505</p> <p>Třída 4.1: UN 3221 až 3224 a 3231 až 3240</p> <p>Třída 5.2: UN 3101 až 3104 a 3111 až 3120</p>	20
2	<p>Látky a předměty patřící k obalové skupině II a nezařazené do přepravních kategorií 0, 2 nebo 4 a látky a předměty následujících tříd:</p> <p>Třída 1: 1.4B až 1.4G a 1.6N</p> <p>Třída 2: skupina F; aerosoly: skupina F</p> <p>chemické látky pod tlakem: UN 3501</p> <p>Třída 4.1: UN 3225 až 3230</p> <p>Třída 5.2: UN 3105 až 3110</p> <p>Třída 6.1: látky a předměty patřící k obalové skupině III</p> <p>Třída 9: UN 3245</p>	333
3	<p>Látky a předměty patřící k obalové skupině III a nezařazené do přepravních kategorií 0, 2 nebo 4 a látky a předměty následujících tříd:</p> <p>Třída 2: skupiny A a O; aerosoly: skupiny A a O</p> <p>chemické látky pod tlakem: UN 3500</p> <p>Třída 3: UN 3473</p> <p>Třída 4.3: UN 3476</p> <p>Třída 8: UN 2794, 2795, 2800, 3028 a 3477</p> <p>Třída 9: UN 2990 a 3072</p>	1 000
4	<p>Třída 1: 1.4S</p> <p>Třída 4.1: UN 1331, 1345, 1944, 1945, 2254 a 2623</p> <p>Třída 4.2: UN 1361 a 1362 obalová skupina III</p> <p>Třída 7: UN 2908 až 2911</p> <p>Třída 9: UN 3268, 3499 a 3509</p> <p>a prázdné nevyčištěné obaly, které obsahovaly nebezpečné věci, kromě věcí zařazených do přepravní kategorie 0</p>	bez omezení

^a Pro UN 0081, 0082, 0084, 0241, 0331, 0332, 0482, 1005 a 1017 je nejvyšší celkové množství na dopravní jednotku 50 kg.

Ve výše uvedené tabulce se „nejvyšším celkovým množstvím na dopravní jednotku“ rozumí:

- pro předměty celková (bto) hmotnost v kilogramech (pro předměty třídy 1 čistá (netto) hmotnost výbušné látky v kilogramech); pro nebezpečné věci ve strojích a zařízeních vyjmenovaných v této příloze celkové množství nebezpečných věcí v nich obsažených v kilogramech nebo litrech, jak je to vhodné;
- pro tuhé látky, zkapalněné plyny, hluboce zchlazené zkapalněné plyny a rozpuštěné plyny čistá (netto) hmotnost v kilogramech;
- pro kapaliny celkové množství obsažených nebezpečných látek v litrech;
- pro stlačené plyny, adsorbované plyny a chemické látky pod tlakem hydraulický vnitřní objem nádoby v litrech.

1.1.3.6.4 Pokud jsou v jedné dopravní jednotce přepravovány nebezpečné věci různých přepravních kategorií, pak součet

- množství látek a předmětů přepravní kategorie 1 vynásobený „50“;
- množství látek a předmětů přepravní kategorie 1 uvedených v poznámce a) k tabulce v 1.1.3.6.3 vynásobený „20“;
- množství látek a předmětů přepravní kategorie 2 vynásobený „3“; a
- množství látek a předmětů přepravní kategorie 3

nesmí překročit číslo „1 000“.

1.1.3.6.5 Pro účely tohoto pododdílu se nebezpečné věci, které jsou vyňaty podle pododdílů 1.1.3.1 (a), (b) a (d) až (f), 1.1.3.2 až 1.1.3.5, 1.1.3.7 a 1.1.3.9 a 1.1.3.10, neberou v úvahu.

1.1.3.7 ***Vynětí z platnosti pro přepravu systémů akumulace a výroby elektrické energie***

Ustanovení uvedená v ADR se nevztahují na systémy akumulace a výroby elektrické energie (např. lithiové baterie, elektrické kondenzátory, asymetrické kondenzátory, zásobníkové systémy s hydridem kovu a palivové články):

- (a) instalované ve vozidle provádějícím přepravu a určené pro jeho pohon nebo pro provoz kteréhokoli z jeho zařízení;
- (b) obsažené ve výbavě pro provoz tohoto zařízení, používané nebo určené k použití během přepravy (např. laptop).

1.1.3.8 (Vyhrazeno)

1.1.3.9 ***Vynětí z platnosti vztahující se na nebezpečné věci používané pro chlazení nebo kondicionování během přepravy***

Jsou-li ve vozidlech nebo kontejnerech používány pro účely chlazení nebo kondicionování nebezpečné věci, které jsou jen dusivé (které ředí nebo nahrazují kyslík normálně v ovzduší), podléhají pouze ustanovením oddílu 5.5.3.

1.1.3.10 ***Vynětí z platnosti vztahující se na přepravu lamp a žárovek obsahujících nebezpečné věci***

Následující lampy a žárovky nepodléhají ADR, pokud neobsahují radioaktivní látku a neobsahují rtuť v množstvích větších, než jsou množství uvedená ve zvláštním ustanovení 366 kapitoly 3.3:

- (a) Lampy a žárovky, které jsou sesbírány přímo od jednotlivců nebo z domácností, jsou-li přepravovány do sběrného nebo recyklačního objektu;

POZNÁMKA: Toto zahrnuje také lampy a žárovky přinesené nebo přivezené jednotlivci do prvního sběrného místa a poté přepravované do jiného sběrného místa, mezizpracovatelského nebo recyklačního objektu.

- (b) Lamy a žárovky, každá z nich obsahující nejvýše 1 gram nebezpečných věcí, a zabalené tak, že je nejvýše 30 gramů nebezpečných věcí v jednom kusu, za podmínky, že

- (i) lampy a žárovky jsou vyrobeny v souladu s certifikovaným systémem řízení kvality;

POZNÁMKA: ISO 9001:2008 smí být použita k tomuto účelu.

a

- (ii) lampy nebo žárovky jsou buď jednotlivě zabaleny ve vnitřních obalech a odděleny přepážkami, nebo každá obklopena fixačním materiálem, aby byly chráněny, a poté zabaleny do pevných vnějších obalů splňujících všeobecná ustanovení uvedená v 4.1.1.1 a schopných vyhovět při zkoušce volným pádem z výšky 1,2 m;
- (c) Použité, poškozené nebo vadné lampy a žárovky, každá z nich obsahující nejvýše 1 g nebezpečných věcí s nejvýše 30 g nebezpečných věcí na kus, jsou-li přepravovány ze sběrného nebo recyklačního objektu. Lamy a žárovky musí být zabaleny do pevných vnějších obalů, dostačujících k zamezení úniku obsahu za normálních podmínek přepravy, splňujících všeobecná ustanovení uvedená v 4.1.1.1 a které jsou schopné vyhovět zkoušce volným pádem z výšky nejméně 1,2 m;
- (d) Lamy a žárovky obsahující jen plyny skupin A a O (podle 2.2.2.1), za podmínky, že jsou zabaleny tak, aby účinky rozletu při jakémkoli prasknutí lampy nebo žárovky byly omezeny na vnitřek kusu.

POZNÁMKA: Lamy a žárovky obsahující radioaktivní látky jsou popsány v 2.2.7.2.2.2. (b).

1.1.4 Použitelnost jiných předpisů

1.1.4.1 (Vyhrazeno)

1.1.4.2 Přeprava v přepravním řetězci zahrnujícím námořní nebo leteckou dopravu

1.1.4.2.1 Kusy, kontejnery, přemístitelné cisterny, cisternové kontejnery a MEGC, které neodpovídají plně ustanovením ADR pro balení, společné balení, označení a bezpečnostní značky na kusech nebo označení velkými bezpečnostními značkami a oranžovými výstražnými tabulkami, ale odpovídají ustanovením IMDG Code (pro námořní dopravu) nebo ICAO Technical Instructions (pro leteckou dopravu) musí být připuštěny k přepravě v přepravním řetězci zahrnujícím námořní nebo leteckou dopravu, pokud splňují následující podmínky:

- (a) pokud kusy nejsou opatřeny nápisy a bezpečnostními značkami podle dohody ADR, musí být označeny nápisy a bezpečnostními značkami podle IMDG Code pro námořní nebo podle ICAO Technical Instructions pro leteckou přepravu;
- (b) pro společné balení v jednom kusu platí předpisy IMDG Code nebo ICAO Technical Instructions;
- (c) jestliže kontejnery, přemístitelné cisterny, cisternové kontejnery nebo MEGC nejsou pro přepravu v dopravním řetězci zahrnujícím námořní přepravu označeny velkými bezpečnostními značkami a výstražnými oranžovými tabulkami podle kapitoly 5.3 této přílohy, musí být opatřeny velkými bezpečnostními značkami a označením podle kapitoly 5.3 IMDG Code. V tomto případě se vztahuje na označení vozidla samého pouze ustanovení uvedené v 5.3.2.1.1 této přílohy. Toto ustanovení se vztahuje i na prázdné nevyčištěné přemístitelné cisterny, cisternové kontejnery a MEGC a též na jejich následnou přepravu do čistící stanice.

Tato odchylka se nevztahuje na věci, které jsou zařazeny jako nebezpečné věci tříd 1 až 9 ADR a nejsou považovány za nebezpečné podle příslušných ustanovení IMDG Code nebo ICAO Technical Instructions.

1.1.4.2.2 Dopravní jednotky složené z vozidla nebo vozidel jiných než těch, která přepravují kontejnery, přemístitelné cisterny, cisternové kontejnery nebo MEGC, jak je stanoveno v 1.1.4.2.1 (c), které nejsou označeny velkými bezpečnostními značkami podle ustanovení 5.3.1 ADR, avšak které jsou označeny podle kapitoly 5.3 IMDG Code, jsou připuštěny k přepravě v dopravním řetězci zahrnujícím námořní dopravu za podmínky, že jsou dodržena ustanovení o označení oranžovými tabulkami v 5.3.2 ADR.

1.1.4.2.3 Pro přepravu v dopravním řetězci zahrnujícím námořní nebo leteckou přepravu směji být informace vyžadované podle oddílů 5.4.1 a 5.4.2 a podle kteréhokoli zvláštního ustanovení kapitoly 3.3 nahrazeny přepravním dokladem a informacemi vyžadovanými podle IMDG Code, popřípadě podle ICAO Technical Instructions, za předpokladu, že některé dodatečné informace vyžadovány podle ADR jsou také uvedeny.

POZNÁMKA: K přepravě podle 1.1.4.2.1 viz též 5.4.1.1.7. K přepravě v kontejnerech viz též 5.4.2.

1.1.4.3 **Používání přemístitelných cisteren typu IMO schválených pro námořní dopravu**

Přemístitelné cisterny typu IMO (typy 1,2,5 a 7), které neodpovídají předpisům kapitol 6.7 nebo 6.8, ale které byly vyrobeny a schváleny před 1. lednem 2003 podle ustanovení IMDG Code (Změna29-98), směji být dále používány za podmínky, že odpovídají příslušným ustanovením IMDG Code o periodických inspekcích a zkouškách.² Kromě toho musí splňovat ustanovení odpovídající pokynům uvedeným ve sloupcích (10) a (11) tabulky A kapitoly 3.2 a ustanovením kapitoly 4.2 ADR. Viz též 4.2.0.1 IMDG Code.

1.1.4.4 (Vyhrazeno)

1.1.4.5 **Přeprava jinou dopravou než silniční**

1.1.4.5.1 Jestliže vozidlo, jímž se provádí přeprava, na kterou se vztahují předpisy ADR, je přepravováno v části dopravní cesty jiným druhem dopravy než silniční dopravou, platí pro tuto část cesty výhradně vnitrostátní nebo mezinárodní předpisy, jimiž se řídí v této části dopravní cesty přeprava nebezpečných věcí tím druhem dopravy, jehož bylo použito k přepravě silničního vozidla.

1.1.4.5.2 V případech výše uvedených v 1.1.4.5.1 se dotčené smluvní strany ADR mohou dohodnout, že dodatečně uplatní, pokud to považují za nezbytné, předpisy ADR na tu část dopravní cesty, po které je vozidlo přepravováno jinou dopravou než silniční, pokud takové dohody mezi dotčenými smluvními stranami ADR neodporují ustanovením mezinárodních úmluv upravujících přepravu nebezpečných věcí druhem dopravy použitým pro přepravu silničního vozidla v dané části dopravní cesty, např. Mezinárodní úmluvě o bezpečnosti života na moři – International Convention for the Safety of Life at Sea (SOLAS), jichž jsou tyto dotčené smluvní strany ADR též smluvními stranami.

Tyto dohody musí zaslat smluvní strana, jež byla jejich iniciátorem, Sekretariátu Evropské hospodářské komise Organizace spojených národů, který s nimi seznámí všechny smluvní strany ADR.

1.1.4.5.3 Jestliže pro přepravu, na niž se vztahují ustanovení ADR, platí pro celou silniční dopravní cestu nebo její část rovněž ustanovení mezinárodní úmluvy upravující přepravu nebezpečných věcí jiným druhem dopravy než silniční dopravou, podle ustanovení uvedené smlouvy, která rozšiřují její platnost na některé přepravy silničními motorovými vozidly, pak ustanovení této mezinárodní úmluvy platí pro tuto dopravní cestu současně s ustanoveními ADR, které jim neodporují; ostatní ustanovení ADR se pro dotčnou dopravní cestu nepoužijí.

² Mezinárodní námořní organizace (IMO) vydala oběžníkem DSC.1/Circ.12 a korigendem „Směrnici pro další používání existujících přemístitelných cisteren a silničních cisternových vozidel typu IMO pro přepravu nebezpečných věcí“. Text směrnice je možno nalézt na webových stránkách IMO: www.imo.org.

1.1.5**Použití norem**

Pokud se vyžaduje použití normy a existuje rozpor mezi touto normou a ustanoveními ADR, mají ustanovení ADR přednost. Požadavky normy, které nejsou v rozporu s ADR, se použijí tak, jak je stanoveno, včetně požadavků jakékoli jiné normy nebo části normy, na něž tato norma odkazuje jako na normativní.

KAPITOLA 1.2

DEFINICE A MĚROVÉ JEDNOTKY

1.2.1

Definice

POZNÁMKA: Tento oddíl obsahuje všechny všeobecné a zvláštní definice.

Pro účely ADR se pod následujícími pojmy rozumějí:

A

„**ADN**“ Evropská dohoda o mezinárodní přepravě nebezpečných věcí po vnitrozemských vodních cestách;

„**Aerosol**“ nebo „**Aerosolový rozprašovač**“ nádoba pro jedno použití splňující ustanovení oddílu 6.2.6, vyrobená z kovu, skla nebo plastu a obsahující plyn, stlačený, zkapalněný nebo rozpuštěný pod tlakem, s kapalinou nebo bez kapaliny, pastu nebo prášek, a vybavená rozprašovacím zařízením umožňujícím rozprášení obsahu ve formě tuhých nebo kapalných částic ve směsi s plynem ve formě pěny, pasty nebo prášku nebo v kapalném nebo plynném stavu;

„**ASTM**“ American Society for Testing and Materials (Americká společnost pro zkoušení a materiály) (ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA, 19428-2959, USA);

B

„**Balič**“ podnik, který balí nebezpečné věci do obalů, včetně velkých obalů a IBC, a, pokud je to nutné, připravuje kusy k přepravě;

„**Bateriové vozidlo**“ vozidlo se souborem článků vzájemně propojených sběrným potrubím, stabilně upevněných na tomto vozidle. Následující články jsou považovány za články bateriového vozidla: láhve, trubkové nádoby, svazky lahví (označované také jako rámy), tlakové sudy, jakož i cisterny určené pro přepravu plynů, jak jsou definovány v 2.2.2.1.1, s vnitřním objemem větším než 450 litrů;

„**Bedna**“ pravoúhlý nebo mnohoúhelníkový plnostěnný obal z kovu, dřeva, překližky, rekonstituovaného dřeva, lepenky, plastu nebo jiného vhodného materiálu. Malé otvory pro usnadnění manipulace nebo otevírání nebo pro splnění klasifikačních požadavků jsou dovoleny, pokud nejsou v rozporu s požadavkem neporušenosti obalu během přepravy;

„**Běžná údržba flexibilních IBC**“ viz „**IBC**“;

„**Běžná údržba tuhých IBC**“ viz „**IBC**“;

„**Bod vzplanutí**“ nejnižší teplota kapaliny, při které její páry tvoří se vzduchem hořlavou směs;

C

„**CGA**“ Compressed Gas Association (Sdružení pro stlačené plyny) (CGA, 4221 Walney Road, 5th Floor, Chantilly VA 20151-2923, USA);

„**CIM**“ Jednotné právní předpisy pro smlouvu o mezinárodní železniční přepravě zboží (Přípojek B Úmluvy o mezinárodní železniční přepravě (COTIF)), se změnami;

„**Cisterna**“ nádrž včetně své provozní a konstrukční výstroje. Pokud je používán tento pojem samostatně, označuje cisternový kontejner, přemístitelnou cisternu, snímatelnou cisternu nebo nesnímatelnou cisternu, jak jsou definovány v tomto oddílu, včetně cisteren tvořících články bateriových vozidel nebo MEGC;

POZNÁMKA: K přemístitelným cisternám viz 6.7.4.1.

„Cisterna nesnímatelná“ cisterna s vnitřním objemem větším než 1000 litrů, která je konstrukčně trvale připevněna k vozidlu (které se tím stává cisternovým vozidlem) nebo tvoří nedílnou část rámu takového vozidla;

„Cisterna pro podtlakové vyčerpávání odpadů“ nesnímatelná cisterna, snímatelná cisterna, cisternový kontejner nebo cisternová výměnná nástavba používané zejména pro přepravu nebezpečných odpadů, se zvláštními konstrukčními vlastnostmi a/nebo zařízením usnadňujícím nakládku (plnění) a vykládku (vyprazdňování) odpadů, jak je uvedeno v kapitole 6.10. Cisterna, která plně odpovídá požadavkům kapitol 6.7 nebo 6.8 se nepovažuje za cisternu pro podtlakové vyčerpávání odpadů;

„Cisterna přemístitelná“ multimodální cisterna mající, je-li použita pro přepravu plynů, jak jsou definovány v 2.2.2.1.1, vnitřní objem větší než 450 litrů v souladu s definicemi v kapitole 6.7 nebo v IMDG Code a uvedená pokynem pro přemístitelné cisterny (T-kódem) ve sloupci (10) tabulky A kapitoly 3.2;

„Cisterna snímatelná“ cisterna, kromě nesnímatelné cisterny, přemístitelné cisterny, cisternového kontejneru nebo článku bateriového vozidla nebo MEGC, která má vnitřní objem větší než 450 litrů, není konstruována pro přepravu věcí beze změny nákladu a může s ní být normálně manipulováno pouze, když je prázdná;

„Cisternová výměnná nástavba“ se považuje za cisternový kontejner;

„Cisternové vozidlo“ vozidlo určené pro přepravu kapalin, plynů nebo práškových nebo zrnitých látek a zahrnující jednu nebo více nesnímatelných cisteren. Kromě vlastního vozidla nebo je nahrazujících částí podvozku cisternové vozidlo zahrnuje jednu nebo více nádrží, jejich výstroj a upevňovací prvky pro jejich připevnění na vozidlo nebo na části podvozku;

„Cisternový kontejner“ přepravní prostředek odpovídající definici kontejneru a zahrnující nádrž a její výstroj včetně zařízení umožňujícího přemístění cisternového kontejneru bez významné změny rovnovážné polohy, používaný pro přepravu plynů, kapalin, práškových nebo zrnitých látek a, je-li použit pro přepravu plynů, jak jsou definovány v 2.2.2.1.1, mající vnitřní objem větší než 0,45 m³ (450 litrů);

POZNÁMKA: Velké nádoby pro volně ložené látky (IBC), které odpovídají požadavkům kapitoly 6.5, se nepovažují za cisternové kontejnery.

„Cívka“ (třída 1) zařízení vyrobené z plastu, dřeva, lepenky, kovu nebo jiného vhodného materiálu tvořené centrálním vřetenem s nebo bez postranních stěn na každém konci vřeten. Předměty a látky mohou být navinuty na vřeteno a mohou být zadržovány postranními stěnami;

„CMR“ Úmluva o přepravní smlouvě v mezinárodní silniční nákladní dopravě (Ženeva, 19. května 1956), se změnami;

„CSC“ (International Convention for Safe Containers, Ženeva 1972) viz „**KBK**“

Č

„Čistá hmotnost výbušniny (NEM)“ celková hmotnost výbušných látek, bez obalů, pouzder atd. (Čisté množství výbušniny (NEQ), čistý obsah výbušniny (NEC), čistá váha výbušniny (NEW) nebo čistá hmotnost výbušného obsahu se často používají ke sdělení stejného významu);

„Člen osádky vozidla“ řidič nebo jakákoli jiná osoba doprovázející řidiče z bezpečnostních, zabezpečovacích, výcvikových nebo provozních důvodů;

D

„Dávkový příkon“ pro přepravu radioaktivních látek je odpovídající velikost dávky vyjádřená milisievertch za hodinu nebo mikrosievertch za hodinu;

„Detektor neutronového záření“ je přístroj, který zjišťuje neutronové záření. V takovém přístroji může být v hermeticky uzavřeném elektronkovém měniči obsažen plyn, který přemění neutronové záření na měřitelný elektrický signál;

„Dokumentace cisterny“ složka obsahující všechny důležité technické informace týkající se cisterny, bateriového vozidla nebo MEGC, jako jsou osvědčení zmíněná v 6.8.2.3, 6.8.2.4 a 6.8.3.4;

„Dopravce“ podnik, který provádí přepravu podle nebo bez přepravní smlouvy;

„Dopravní jednotka“ motorové vozidlo bez přípojného vozidla nebo jízdní souprava tvořená motorovým a přípojným vozidlem;

„Dopravní prostředek“ pro přepravu po silnici nebo po železnici vozidlo nebo železniční vůz;

„Dřevěná IBC“ viz „**IBC dřevěná**“

„Dřevěný sud“ obal vyrobený z přírodního dřeva, kruhového průřezu, mající vypouklé stěny, tvořený dužinami a víky a opatřený obručemi;

E

„EN“ (norma) evropská norma uveřejněná Evropským výborem pro normalizaci (CEN) (CEN, Avenue Marnix 17, B-1000 Brusel);

F

„Fixační podložka“ (třída 1) plát kovu, plastu, lepenky nebo jiného vhodného materiálu, který je uložen ve vnitřním obalu, meziobalu nebo vnějším obalu a dosahuje těsného uložení v takovém obalu. Povrch takové fixační podložky může být vytvarován tak, že obaly nebo předměty mohou být vloženy dovnitř, zajištěny a odděleny od sebe navzájem;

„Flexibilní IBC“ viz „**IBC flexibilní**“

G

„GHS“ (Globally Harmonized System of Classification and Labelling of Chemicals) Páté revidované vydání Globálního harmonizovaného systému klasifikace a označování chemických látek, uveřejněného Spojenými národy jako dokument ST/SG/AC.10/30/Rev.5;

H

„Hermeticky uzavřená cisterna“ cisterna, určená pro přepravu kapalin, s výpočtovým tlakem nejméně 4 bary, nebo cisterna určená pro přepravu tuhých látek (práškových nebo zrnitých) bez ohledu na její výpočtový tlak, jejíž otvory jsou hermeticky uzavřeny a která:

- není vybavena pojistnými ventily, průtržnými kotouči, jinými podobnými bezpečnostními zařízeními ani podtlakovými ventily; nebo
- není vybavena pojistnými ventily, průtržnými kotouči, jinými podobnými bezpečnostními zařízeními, ale je vybavena podtlakovými ventily, podle požadavků v 6.8.2.2.3
- je vybavena pojistnými ventily s předřazeným průtržným kotoučem podle 6.8.2.2.10, ale není vybavena podtlakovými ventily; nebo
- je vybavena pojistnými ventily s předřazeným průtržným kotoučem podle 6.8.2.2.10 a podtlakovými ventily, podle požadavků v 6.8.2.2.3.

„Hmotnost kusu“ Pokud není stanoveno jinak, je to celková (brutto) hmotnost kusu. Hmotnost kontejnerů a cisteren používaných pro přepravu věcí se do celkové hmotnosti nezahrnuje;

„Hořlavá složka“ (pro aerosoly) hořlavé kapaliny, hořlavé tuhé látky nebo hořlavé plyny a směsi plynů, jak jsou definovány v poznámkách 1 až 3 pododdílu 31.1.3 části III Příručky zkoušek a kritérií. Tento pojem nezahrnuje pyroforní látky, látky schopné samoohřevu ani látky reagující s vodou. Chemické spalné teplo se určí jednou z následujících metod ASTM D 240, ISO/FDIS 13943: 1999 (E/F) 86.1 až 86.3 nebo NFPA 30B;

„Hromadná položka“ položka pro definovanou skupinu látek nebo předmětů (viz pododdíl 2.1.1.2, B, C a D);

CH

„Chráněná IBC“ viz „IBC chráněná“

I

„IAEA“ (International Atomic Energy Agency) Mezinárodní agentura pro atomovou energii (IAEA), (IAEA, P.O. Box 100 – A-1400 Vídeň);

„IBC“ (Intermediate bulk container) tuhý nebo flexibilní přepravní obalový prostředek, který není uveden v kapitole 6.1 a který:

- (a) má vnitřní objem:
 - (i) nejvýše 3 m³ pro tuhé a kapalné látky obalových skupin II a III;
 - (ii) nejvýše 1,5 m³ pro tuhé látky obalové skupiny I, jestliže jsou baleny ve flexibilních IBC, v IBC z tuhého plastu, v kompozitních, lepenkových nebo dřevěných IBC;
 - (iii) nejvýše 3 m³ pro tuhé látky obalové skupiny I, jestliže jsou baleny v kovových IBC;
 - (iv) nejvýše 3 m³ pro radioaktivní látky třídy 7;
- (b) je zkonstruován pro mechanickou manipulaci;
- (c) odolává namáháním při manipulaci a přepravě ověřovacími zkouškami uvedenými v kapitole 6.5;

POZNÁMKA 1: Přemístitelné cisterny nebo cisternové kontejnery splňující požadavky kapitoly 6.7 nebo 6.8 se nepovažují za velké nádoby pro volně ložené látky (IBC).

POZNÁMKA 2: Velké nádoby pro volně ložené látky (IBC) splňující požadavky kapitoly 6.5 se nepovažují za kontejnery pro účely ADR.

„IBC dřevěná“ tuhé nebo skládací dřevěné těleso společně s vnitřní vložkou (avšak nikoli s vnitřním obalem) a příslušnou provozní a konstrukční výstrojí;

„IBC flexibilní“ těleso nádoby tvořené fólií, tkaninou nebo jiným flexibilním materiálem nebo kombinací těchto materiálů, a v nezbytném případě vnitřním povlakem nebo vložkou, spolu s příslušnou provozní výstrojí a manipulačním zařízením;

„IBC flexibilní - běžná údržba“ běžné provádění pracovních úkonů na plastových nebo textilních IBC, jako jsou:

- (a) čištění; nebo
- (b) náhrada neintegrálních součástí, jako jsou neintegrální vložky a uzavěrové pásky, součástmi podle původních specifikací výrobce,

za podmínky, že tyto úkony nepříznivě neovlivní zádržnou funkci flexibilní IBC ani nezmění konstrukční typ;

„IBC chráněná“ (pro kovové IBC) IBC vybavená dodatečnou ochranou proti nárazu mající formu např. vícevrstvé (sendvičové) konstrukce nebo konstrukce s dvojitou stěnou nebo rámu s kovovým mřížovým opláštěním;

„IBC kompozitní s vnitřní nádobou z plastu“ IBC sestávající z konstrukční výstroje tvořené tuhým vnějším pláštěm obklopujícím vnitřní plastovou nádobu s jakoukoliv provozní výstrojí nebo další konstrukční výstrojí. Je provedena tak, že vnitřní nádoba a vnější plášť tvoří po sestavení nedělitelnou jednotku, která se jako taková plní, skladuje, přepravuje nebo vyprazdňuje.

POZNÁMKA: „Plast“, pokud je použit ve spojení s vnitřními nádobami pro kompozitní IBC, zahrnuje jiné polymerní materiály, takové jako je guma.

„IBC kovová“ kovové těleso společně s příslušnou provozní a konstrukční výstrojí;

„IBC lepenková“ lepenkový plášť s nebo bez oddělených horních a dolních vík, popřípadě s vnitřní vložkou (avšak bez vnitřního obalu), a s příslušnou provozní výstrojí a konstrukční výstavou;

„IBC opravená“ kovová IBC, IBC z tuhého plastu nebo kompozitní IBC, která je v důsledku nárazu nebo jakékoli jiné příčiny (např. koroze, zkrěnutí nebo jiného projevu snížené pevnosti ve srovnání s konstrukčním typem) obnovena tak, aby odpovídala konstrukčnímu typu a byla schopna odolávat zkouškám konstrukčního typu. Pro účely ADR se náhrada tuhé vnitřní nádoby kompozitní IBC nádobou, odpovídající původnímu konstrukčnímu typu téhož výrobce, považuje za opravu. Avšak běžné opravy a údržba tuhých IBC se nepovažují za opravu. Tělesa IBC z tuhého plastu ani vnitřní nádoby kompozitních IBC nejsou opravitelné. Flexibilní IBC nejsou opravitelné, ledaže by to schválil příslušný orgán;

„IBC z tuhého plastu“ tuhé těleso z plastu, které může mít konstrukční výstroj společně s příslušnou provozní výstrojí;

„IBC tuhé - běžná údržba“ běžné provádění pracovních úkonů na kovových IBC, IBC z tuhého plastu a na kompozitních IBC, jako jsou:

- (a) čištění;
- (b) demontáž a nová montáž nebo výměna uzávěrů tělesa (včetně jejich těsnění) nebo provozní výstroje podle původních specifikací výrobce, za podmínky, že se ověří těsnost IBC; nebo
- (c) obnova konstrukční výstroje, která nemá přímou zádržnou funkci vzhledem k nebezpečným věcem a vyprazdňovacímu tlaku, tak, aby odpovídala konstrukčnímu typu (např. zesílení noh nebo úchytů pro zvedání), za podmínky, že nebude ovlivněna zádržná funkce IBC;

„IBC rekonstruovaná“ kovová IBC, IBC z tuhého plastu nebo kompozitní IBC, která

- (a) je vyrobena jako typ UN z typu jiného než typ UN;
- (b) je přestavěna z jednoho konstrukčního typu UN na jiný konstrukční typ UN.

Na rekonstruované IBC se vztahují stejné předpisy ADR jako na nové IBC téhož typu (viz definici konstrukčního typu v 6.5.6.1.1);

„ICAO“ (International Civil Aviation Organization) Mezinárodní organizace pro civilní letectví (ICAO, 999 University Street, Montreal, Quebec H3C 5H7, Canada);

„ICAO Technické pokyny“ (Technical Instructions for the Safe Transport of Dangerous Goods by Air), které doplňují Přílohu 18 Chicagské úmluvy o mezinárodním civilním letectví (Chicago 1944), uveřejněné Mezinárodní organizací pro civilní letectví (ICAO) v Montrealu;

„IMDG Code“ (International Maritime Dangerous Goods Code) předpisy pro mezinárodní námořní přepravu nebezpečných věcí naplňující kapitulu VII, část A Mezinárodní úmluvy o bezpečnosti života na moři – International Convention for the Safety of Life at Sea (SOLAS), vydané Mezinárodní námořní organizací (IMO), Londýn;

„**IMO**“ (International Maritime Organization) Mezinárodní námořní organizace (IMO, 4 Albert Embankment, London SE1 7SR, United Kingdom);

„**Index kritické bezpečnosti (CSI)**“ přidělený kusu, přepravnímu obalovému souboru nebo kontejneru se štěpnými látkami pro přepravu radioaktivních látek je číslo, pomocí kterého se omezuje nahromadění kusů, přepravních obalových souborů nebo kontejnerů obsahujících štěpné látky;

„**Inspekční organizace**“ nezávislá inspekční a zkušební organizace schválená příslušným orgánem;

„**ISO**“ (norma) mezinárodní norma uveřejněná Mezinárodní organizací pro standardizaci (ISO) (ISO - 1, rue de Varembe, CH-1204 Ženeva 20);

J

„**J.N. položka (jinde nejmenovaná položka)**“ hromadná položka, k níž mohou být látky, směsi, roztoky nebo předměty přiřazeny, jestliže:

- (a) nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2; a
- (b) vykazují chemické, fyzikální a/nebo nebezpečné vlastnosti odpovídající třídě, klasifikačnímu kódu, obalové skupině a pojmenování a popisu položky j.n.;

K

„**Kanistr**“ obal z kovu nebo plastu, pravoúhelníkového nebo mnohoúhelníkového průřezu s jedním nebo více otvory;

„**Kapalina**“ látka mající při 50 °C tenzi par nejvýše 300 kPa (3 bary), která není kompletně v plynném stavu při 20 °C a 101,3 kPa a která

- (a) má bod tání nebo bod počátku tání nejvýše 20 °C při tlaku 101,3 kPa nebo
- (b) je kapalná podle zkušební metody ASTM D 4359-90 nebo
- (c) není kašovitá podle kritérií vztahujících se na zkoušku pro stanovení tekutosti (penetrometrická zkouška) popsanou v 2.3.4;

POZNÁMKA: „Přepravou v kapalném stavu“ ve smyslu požadavků na cisterny se rozumí:

- přeprava kapalin podle výše uvedené definice, nebo
- přeprava tuhých látek podaných k přepravě v roztaveném stavu.

„**KBK**“ (International Convention for Safe Containers) Mezinárodní úmluva o bezpečných kontejnerech (Ženeva, 1972) se změnami, uveřejněná Mezinárodní námořní organizací (International Maritime Organization – IMO), Londýn;

„**Kompozitní IBC s vnitřní nádobou z plastu**“ viz „**IBC kompozitní s vnitřní nádobou z plastu**“

„**Kompozitní obal**“ viz „**Obal kompozitní**“

„**Konstrukční výstroj**“ znamená:

- (a) pro cisterny cisternového vozidla nebo snímatelnou cisternu vnější nebo vnitřní výztužné, upevňovací, ochranné a stabilizační prvky nádrže;
- (b) pro cisterny cisternového kontejneru vnější nebo vnitřní výztužné, upevňovací, ochranné a stabilizační prvky nádrže;
- (c) pro články bateriového vozidla nebo MEGC vnější nebo vnitřní výztužné, upevňovací, ochranné a stabilizační prvky nádrže nebo nádoby;
- (d) pro IBC, kromě flexibilních IBC, výztužné, upevňovací, manipulační, ochranné a stabilizační prvky tělesa (včetně základní palety pro kompozitní IBC s vnitřní nádobou z plastu);

POZNÁMKA: K přemístitelným cisternám viz kapitolu 6.7.

„Kontejner“ přepravní prostředek (výměnná skříň nebo jiná podobná konstrukce):

- určený ke stálému používání a dostatečně dimenzovaný pro opakované použití;
- speciálně zkonstruovaný pro usnadnění přepravy věcí jedním nebo více druhy dopravy beze změny nákladu;
- opatřený zařízením pro usnadnění manipulace, zvláště při jeho překládce z jednoho dopravního prostředku na jiný;
- zkonstruovaný tak, aby mohl být lehce naplněn a vyprázdněn;
- mající vnitřní objem nejméně 1 m³, s výjimkou kontejnerů pro přepravu radioaktivních látek.

Výměnná nástavba je kontejner, který má podle Evropské normy EN 283 (vydání 1991) následující charakteristiky:

- z hlediska mechanického namáhání je zkonstruován pouze pro pozemní přepravu na železničním voze nebo silničním vozidle nebo na lodi v systému roll-on roll-off;
- nemůže být stohován;
- může být přemístěn ze silničního vozidla na podpěry a naložen zpět pomocí zařízení vozidla

POZNÁMKA: Pojem „kontejner“ nezahrnuje obvyklé obaly, IBC, cisternové kontejnery ani vozidla. Kontejner však smí být použit jako obal pro přepravu radioaktivních látek.

„Kontejner malý“ kontejner, který má vnitřní objem nejvýše 3 m³.

POZNÁMKA: (Vypuštěno)

„Kontejner MEGC“ viz „Vícečlánekový kontejner na plyn (MEGC)“;

„Kontejner nekrytý“ kontejner beze střechy nebo plošinový kontejner;

„Kontejner pro volně ložené látky“ přepravní prostředek (včetně všech vložek nebo vyložení) určený pro přepravu tuhých látek, které jsou v přímém styku s tímto přepravním prostředkem. Tento pojem nezahrnuje obaly, IBC, velké obaly ani cisterny;

Kontejner pro volně ložené látky je:

- trvalé povahy a dostatečně pevný, aby byl vhodný pro opakované používání;
- speciálně zkonstruovaný pro usnadnění přepravy věcí jedním nebo více dopravními prostředky bez překládky nákladu;
- opatřený prostředky dovolujícími jejich snadnou manipulaci;
- o vnitřním objemu nejméně 1,0 m³.

Příklady kontejnerů pro volně ložené látky jsou kontejnery, kontejnery pro přepravu volně ložených látek v systému off shore, skipové nádoby, zásobníky na volně ložené látky, výměnné nástavby, násypné kontejnery, valivé kontejnery, ložné komory vozidel.

POZNÁMKA: Tato definice platí jen pro kontejnery pro volně ložené látky splňující požadavky kapitoly 6.11.

„Kontejner s plachtou pro volně ložené látky“ nezakrytý kontejner pro volně ložené látky s pevnou podlahou (včetně výsypného dna), s pevnými bočními stěnami a pevnými koncovými stěnami a pružným zakrytím.

„Uzavřený kontejner pro volně ložené látky“ plně uzavřený kontejner s pevnou střechou, pevnými bočními stěnami, pevnými koncovými stěnami a pevnou podlahou (včetně výsypných den). Tento pojem zahrnuje kontejner pro volně ložené látky s otevíratelnou střechou, boční stěnou nebo koncovou stěnou, která může být/je během přepravy uzavřena. Kontejnery pro volně ložené látky mohou mít otvory dovolující výměnu par a plynů za vzduch a které zabraňují za normálních podmínek přepravy úniku tuhých obsahů, jakož i pronikání deště a rozstřikované vody.

„Kontejner pro přepravu volně ložených látek v systému off shore“ kontejner pro přepravu volně ložených látek, speciálně zkonstruovaný pro opakované použití k přepravě z přibřežních zařízení, do těchto zařízení a mezi nimi navzájem. Kontejner pro přepravu volně ložených látek je zkonstruován a vyroben podle předpisů pro schvalování kontejnerů manipulovaných na širých mořích vypracovaných Mezinárodní námořní organizací (IMO) v dokumentu MSC/Circ.860;

„Kontejner s plachtou“ nekrytý kontejner opatřený plachtou pro ochranu nákladu;

„Kontejner s plachtou pro volně ložené látky“ viz **„Kontejner pro volně ložené látky“**

„Kontejner uzavřený“ plně uzavřený kontejner s pevnou střechou, pevnými bočními stěnami, pevnými koncovými stěnami a podlahou. Tento pojem zahrnuje kontejner s otevíratelnou střechou, pokud je během přepravy uzavřena;

„Kontejner velký“

- (a) kontejner, který nesplňuje definici malého kontejneru;
- (b) ve smyslu dohody KBK (CSC) kontejner s takovými rozměry, že ložná plocha mezi čtyřmi vnějšími dolními rohy je buď;
 - (i) nejméně 14 m² (150 čtverečných stop) nebo
 - (ii) nejméně 7 m² (75 čtverečných stop), pokud je vybaven horními rohovými prvky;

„Kontejmentový systém“ pro přepravu radioaktivních látek je soubor částí obalu specifikovaný konstruktérem, který má zabránit unikání radioaktivních látek během přepravy;

„Koš“ vnější obal s neplnými stěnami;

„Kovová IBC“ viz **„IBC kovová“**

„Kritická teplota“ teplota, nad níž se nemůže látka vyskytovat v kapalném stavu;

„Kryogenní nádoba“ viz **„Nádoba kryogenní“**

„Kus“ konečný produkt balení sestávající z obalu nebo velkého obalu nebo IBC a z jejich obsahu, připravený k přepravě. Pojem zahrnuje nádoby na plyny, jak jsou definovány v tomto oddílu, jakož i předměty, které vzhledem k jejich rozměrům, hmotnosti nebo tvaru mohou být přepravovány bez obalu nebo v lůžkách, latěních nebo manipulačních přípravcích. S výjimkou přepravy radioaktivních látek se tento pojem nevztahuje na věci, které se přepravují volně ložené, ani na látky přepravované v cisternách.

POZNÁMKA: K radioaktivním látkám viz 2.2.7.2, 4.1.9.1.1 a 6.4.

L

„**Láhev**“ přemístitelná tlaková nádoba s hydraulickým vnitřním objemem nejvýše 150 litrů (viz též „Svazek lahví“).

„**Latění**“ vnější obal s neplnými stěnami;

„**Lepenková IBC**“ viz „**IBC lepenková**“

M

„**Malá nádoba obsahující plyn (plynová kartuše)**“ nádoba pro jedno použití, s hydraulickým vnitřním objemem nepřesahujícím 1 000 ml pro nádoby vyrobené z kovu a nepřesahujícím 500 ml pro nádoby vyrobené ze syntetického materiálu nebo ze skla, obsahující plyn nebo směs plynů pod tlakem. Může být vybavena ventilem.

„**Malý kontejner**“ viz „**Kontejner malý**“

„**Manipulační prvky**“ (pro flexibilní IBC) nosné pásy, popruhy, oka, poutka nebo rámy, které jsou připevněny k tělesu nádoby IBC nebo vytvořeny z materiálu tělesa nádoby;

„**Materiál živočišného původu**“ jsou mrtvá těla zvířat (kadávery), části zvířecích těl nebo krmiva pro zvířata;

„**MEGC**“ viz „**Vícečlánkový kontejner na plyn**“;

„**Měkká ocel**“ ocel s nejnižší pevností v tahu mezi 360 N/mm² a 440 N/mm²;

POZNÁMKA: K přemístitelným cisternám viz kapitulu 6.7.

„**MEMU**“, viz „**Mobilní jednotka připravující výbušniny**“

„**Mobilní jednotka připravující výbušniny**“ jednotka, nebo vozidlo smontované s jednotkou, pro přípravu a nabíjení výbušnin z nebezpečných věcí, které nejsou výbušninami. Jednotka sestává z různých cisteren a kontejnerů pro volně ložené látky a provozní výstroje, jakož i čerpadel a příslušného zařízení. MEMU může mít zvláštní komory pro balené výbušniny;

POZNÁMKA: I když definice MEMU zahrnuje výraz „příprava a nabíjení výbušnin“ vztahují se požadavky na MEMU pouze na přepravu a nikoli na přípravu a nabíjení výbušnin.“

„**Motor na palivové články**“ prostředek používaný k pohonu zařízení, který sestává z palivového článku a jeho zásoby paliva, ať už je tato zásoba paliva s palivovým článkem integrována, nebo je od něj oddělena, a zahrnuje veškeré příslušenství nutné k plnění své funkce;

„**Meziobal**“ obal umístěný mezi vnitřními obaly nebo předměty a vnějším obalem;

N

„**Nádoba**“ prostředek pro naplnění a udržení látek nebo předmětů, včetně všech uzávěrů. Tato definice se nevztahuje na nádrže cisteren;

„**Nádoba**“ (třída 1) zahrnuje bedny, láhve, plechovky, sudy, konve nebo pouzdra, včetně jakýchkoli uzávěrů, používané jako vnitřní obal nebo meziobal;

„**Nádoba kryogenní**“ přemístitelná tepelně izolovaná tlaková nádoba pro hluboce zchlazené zkapalněné plyny s hydraulickým vnitřním objemem nejvýše 1 000 litrů „(viz též „**Nádoba kryogenní, otevřená**“);

„**Nádoba kryogenní, otevřená**“ přepravitelná tepelně izolovaná nádoba na hluboce zchlazené zkapalněné plyny udržovaná při atmosférickém tlaku průběžným odvětráváním hluboce zchlazeného zkapalněného plynu;

„**Nádoba tlaková**“ společný název, který zahrnuje láhve, trubkové nádoby, tlakové sudy, uzavřené kryogenní nádoby, zásobníkové systémy s hydridem kovu, svazky lahví a záchranné tlakové nádoby;

„**Nádoba trubková**“ (třída 2) přepravitelná bezešvá tlaková nádoba s hydraulickým vnitřním objemem větším než 150 litrů, nejvýše však 3 000 litrů;

„**Nádoba tuhá vnitřní**“ (pro kompozitní IBC) nádoba, která zachovává svůj původní tvar, když je prázdná, bez svých uzávěrů a bez podpory vnějšího pouzdra. Jakákoli vnitřní nádoba, která není „tuhá“, je považována za „flexibilní“;

„**Nádoba vnitřní**“ nádoba vyžadující vnější obal, aby mohla plnit svoji obalovou funkci;

„**Nádrž**“ (pro cisterny) část cisterny, která obsahuje látku určenou k přepravě, včetně otvorů a jejich uzávěrů, nezahmující však provozní výstroj ani vnější konstrukční výstroj;

POZNÁMKA: K přemístitelným cisternám viz kapitola 6.7.“

„**Nakládce**“ podnik, který

- (a) nakládá balené nebezpečné věci, malé kontejnery nebo přemístitelné cisterny do vozidla nebo na vozidlo, nebo do kontejneru; nebo
- (b) nakládá kontejner, kontejner pro volně ložené látky, MEGC, cisternový kontejner nebo přemístitelnou cisternu na vozidlo.

„**Nákladní dopravní (přepravní) jednotka**“ vozidlo, kontejner, cisternový kontejner, přemístitelná cisterna nebo MEGC;

POZNÁMKA: Tato definice se vztahuje pouze na aplikaci zvláštního ustanovení 302 kapitoly 3.3 a kapitoly 5.5.2.

„**Nebezpečné reakce**“ jsou

- hoření nebo vývin značného tepla;
- vývin hořlavých, dusivých, hoření podporujících nebo toxických plynů;
- tvoření žiravých látek;
- tvoření nestabilních látek; nebo
- nebezpečné zvýšení tlaku (pouze pro cisterny);

„**Nebezpečné věci**“ látky a předměty, jejichž přeprava je podle dohody ADR vyloučena, nebo připuštěna pouze za podmínek v ní stanovených;

„**Nejvyšší čistá (netto) hmotnost**“ nejvyšší čistá hmotnost obsahu v samostatném obalu nebo nejvyšší součtová hmotnost vnitřních obalů a jejich obsahu vyjádřená v kilogramech;

„**Nejvyšší dovolená celková hmotnost**“

- (a) (pro IBC) hmotnost IBC a její provozní a konstrukční výstroje a nejvyšší čistá (netto) hmotnost;
- (b) (pro cisterny) vlastní hmotnost cisterny a nejvyšší dovolená užitečná hmotnost;

POZNÁMKA: K přemístitelným cisternám viz kapitulu 6.7.

„**Nejvyšší normální provozní tlak**“ pro přepravu radioaktivních látek je nejvyšší přetlak při průměrné výšce nad hladinou moře, který může vzniknout v kontejnmentovém systému v průběhu jednoho roku za teplotních podmínek a slunečního záření odpovídajících okolním podmínkám, bez odvětrávání, vnějšího chlazení pomocným systémem nebo provozních kontrol během přepravy;

„**Nejvyšší provozní tlak (přetlak)**“ nejvyšší z následujících tří hodnot:

- (a) nejvyšší účinný tlak dovolený v cisterně během jejího plnění (nejvyšší dovolený plnicí tlak);
- (b) nejvyšší účinný tlak dovolený v cisterně během jejího vyprazdňování (nejvyšší dovolený vyprazdňovací tlak); a
- (c) účinný přetlak, kterému je cisterna vystavena svým obsahem (včetně cizích plynů, které může obsahovat) při nejvyšší provozní teplotě.

Pokud zvláštní požadavky předepsané v kapitole 4.3 nestanoví jinak, číselná hodnota tohoto provozního tlaku (přetlaku) nesmí být nižší než tenze par (absolutní tlak) plnicí látky při 50 °C.

Pro cisterny vybavené pojistnými ventily (s nebo bez průtržného kotouče) se však nejvyšší provozní tlak (přetlak) musí rovnat předepsanému otevíracímu tlaku takových pojistných ventilů. Tento požadavek se nevztahuje na cisterny pro přepravu stlačených, zkapalněných nebo rozpuštěných plynů třídy 2;

POZNÁMKA 1: *K přemístitelným cisternám viz kapitolu 6.7.*

POZNÁMKA 2: *K uzavřeným kryogenním nádobám viz poznámku k 6.2.1.3.6.5.*

„Nejvyšší vnitřní objem“ nejvyšší vnitřní objem nádob nebo obalů včetně IBC a velkých obalů, vyjádřený v krychlových metrech nebo litrech;

„Nekryté vozidlo“ vozidlo, jehož ložná plocha je tvořena jen plošinou nebo je opatřena pouze bočnicemi a zadním čelem;

„Nekrytý kontejner“ viz „Kontejner nekrytý“

„Nesnímatelná cisterna“ viz „Cisterna nesnímatelná“

O

„Obal“ jedna nebo více nádob a všechny jiné součásti nebo materiály nezbytné k tomu, aby nádoby mohly plnit svou obalovou funkci a jiné bezpečnostní funkce (viz také „Obal kompozitní“, „Obal obnovený (rekondiciovaný obal)“, „Obal opakovaně použitelný“, „Obal prachotěsný“, „Obal rekonstruovaný“, „Obal skupinový“, „Obal velký, opakovaně použitelný“, „Obal velký, rekonstruovaný“, „Obal vnější“, „Obal vnitřní“, „Obal z jemného plechu“, „Obal záchranný“, „Obal záchranný velký“);

„Obal kompozitní“ je obal sestávající z vnějšího obalu a z vnitřní nádoby a zkonstruovaný tak, že vnitřní nádoba a vnější obal tvoří jeden integrální obal. Po sestavení zůstává nadále jednou nedělitelnou jednotkou a jako takový je plněn, skladován, přepravován a vyprazdňován;

POZNÁMKA: Pojem „vnitřní nádoba“ používaný pro kompozitní obaly nesmí být zaměňován s pojmem „vnitřní obal“ používaným pro skupinové obaly. Například vnitřní část kompozitního obalu (plast) 6HA1 je takovou vnitřní nádobou, neboť není normálně konstruována tak, aby plnila obalovou funkci bez svého vnějšího obalu a není tedy vnitřním obalem.

Tam, kde je za pojem „kompozitní obal“ uveden v závorkách materiál, vztahuje se na vnitřní nádobu.

„Obal obnovený (rekondiciovaný obal)“ znamená zejména

- (a) kovové sudy, které jsou:
 - (i) vyčištěny až na původní materiál jejich konstrukce, zbaveny všech svých předchozích obsahů, vnější a vnitřní koroze a je z nich odstraněn vnější nátěr a bezpečnostní značky;
 - (ii) obnoveny do původního tvaru a obrysů, s přehyby, pokud jsou, vyrovnanými a utěsněnými a s vyměněnými všemi porušenými těsněními, která nejsou nedílnou součástí obalu; a
 - (iii) zkontrolovány po vyčištění, avšak před opětovným nátěrem, s vyřazením obalů, které jsou viditelně poškozeny, mají značně zmenšenou tloušťku materiálu, jeví únavu materiálu, mají poškozené závitky nebo uzávěry nebo jiné závažné závady.

- (b) plastové sudy nebo kanystry, které:
 - (i) jsou vyčištěny až na původní materiál jejich konstrukce, zbaveny všech svých předchozích obsahů a je z nich odstraněn vnější nátěr a bezpečnostní značky;
 - (ii) mají vyměněna všechna porušená těsnění, která nejsou nedílnou součástí obalu; a
 - (iii) jsou zkontrolovány po vyčištění s vyřazením obalů s viditelným poškozením, jako trhlinami, průhyby nebo prasklinami, nebo poškozenými závity nebo uzávěry nebo jinými závažnými závadami;

„Obal opakovaně použitelný“ obal, který byl prohlédnut a shledán bez závad, které by mohly ovlivnit jeho schopnost podrobit se funkčním zkouškám. Tento pojem zahrnuje zejména ty obaly, které se znovu naplňují stejným nebo podobným snášelivým obsahem a jsou přepravovány v distribučním řetězci řízeném odesilatelem produktu;

„Obal prachotěsný“ nepropustný obal pro udržení suchého obsahu včetně jemné tuhé látky (prášku) vznikající během přepravy.

„Obal rekonstruovaný“ znamená zejména

- (a) kovové sudy, které jsou:
 - (i) vyrobeny jako typ UN odpovídající požadavkům kapitoly 6.1 z typu jiného než typ UN;
 - (ii) rekonstruovány z jednoho typu UN odpovídajícího požadavkům kapitoly 6.1 na jiný typ UN; nebo
 - (iii) podrobeny výměně komponentů, které jsou jejich nedílnou konstrukční součástí (takových jako jsou neodnímatelná víka);
- (b) plastové sudy, které jsou:
 - (i) rekonstruovány z jednoho typu UN na jiný typ UN (např. 1H1 na 1H2); nebo
 - (ii) podrobeny výměně komponentů, které jsou jejich nedílnou konstrukční součástí.

Na rekonstruované sudy se vztahují požadavky kapitoly 6.1, které se vztahují na nové sudy téhož typu.

„Obal skupinový“ kombinace obalů vytvořená pro účely přepravy, sestávající z jednoho nebo více vnitřních obalů, které jsou vloženy do jednoho vnějšího obalu podle pododdílu 4.1.1.5;

POZNÁMKA: Pojem „vnitřní obal“ používaný pro skupinové obaly nesmí být zaměňován s pojmem „vnitřní nádoba“ používaným pro kompozitní obaly.

„Obal velký“ obal tvořený vnějším obalem, který obsahuje předměty nebo vnitřní obaly a který

- (a) je zkonstruován pro mechanickou manipulaci;
- (b) převyšuje 400 kg čisté (netto) hmotnosti nebo 450 litrů vnitřního objemu, ale má objem nejvýše 3 m³;

„Obal velký, opakovaně použitelný“ velký obal k opakovanému plnění, který byl prohlédnut a shledán bez závad, které by mohly ovlivnit jeho schopnost vyhovět provozním zkouškám; tento pojem zahrnuje zejména ty velké obaly, které se znovu plní stejným nebo podobným snášelivým obsahem a jsou přepravovány v distribučním řetězci řízeném odesilatelem produktu;

„Obal velký, rekonstruovaný“ velký obal z kovu nebo z tuhého plastu, který:

- (a) je vyroben jako typ UN z typu jiného než typu UN; nebo
- (b) je rekonstruován z jednoho konstrukčního typu UN na jiný konstrukční typ UN.

Na rekonstruované velké obaly se vztahují tytéž požadavky ADR, které se vztahují na nové velké obaly téhož typu (viz též definici konstrukčního typu v 6.6.5.1.2);

„**Obal vnější**“ vnější ochrana kompozitního nebo skupinového obalu včetně absorpčních a fixačních materiálů a všech ostatních součástí, které jsou nutné, aby obklopily a chránily vnitřní nádoby nebo vnitřní obaly;

„**Obal vnitřní**“ obal, pro jehož přepravu se vyžaduje vnější obal;

„**Obal z jemného plechu**“ obal s kruhovým, elipsovým, pravoúhlým nebo mnohoúhelníkovým průřezem (také kónický), jakož i obal s hrdlem kuželového tvaru nebo obal kelímkovitého tvaru z jemného plechu o tloušťce stěny menší než 0,5 mm (např. pocínovaného), s plochým nebo vypouklým dnem, s jedním nebo více otvory, který nespadá pod definici sudu nebo kanystru;

„**Obal záchranný**“ zvláštní obal, do kterého se ukládají poškozené, vadné nebo netěsnící kusy nebo kusy neodpovídající předpisům obsahující nebezpečné věci, nebo nebezpečné věci, které se rozsypaly nebo unikly, za účelem jejich přepravy k obnově nebo likvidaci;

„**Obal záchranný velký**“ speciální obal, který:

- (a) je zkonstruován pro mechanickou manipulaci; a
- (b) překračuje 400 kg čisté (netto) hmotnosti nebo 450 litrů vnitřního objemu, ale má objem nejvýše 3 m³;

do něhož se ukládají poškozené, vadné nebo netěsné kusy s nebezpečnými věcmi, nebo nebezpečné věci, které se vysypaly nebo vytekly, za účelem jejich přepravy k regeneraci nebo likvidaci.

„**Obalová skupina**“ skupina, ke které mohou být pro účely balení přiřazeny určité látky podle jejich stupně nebezpečnosti. Obalové skupiny mají následující významy, které jsou podrobně vysvětleny v části 2:

Obalová skupina I: látky velmi nebezpečné;

Obalová skupina II: látky středně nebezpečné;

Obalová skupina III: látky málo nebezpečné.

POZNÁMKA: Určité předměty obsahující nebezpečné věci jsou rovněž přiřazeny k obalové skupině.

„**Obnovený obal**“ viz „**Obal obnovený**“

„**Odesílatel**“ podnik, který odesílá nebezpečné věci buď pro sebe, nebo pro třetí stranu. Pokud je přeprava prováděna na základě přepravní smlouvy, odesílatelem je odesílatel uvedený v této smlouvě;

„**Odpady**“ látky, roztoky, směsi nebo předměty, které nemohou být používány jako takové, které se však přepravují pro další zpracování, uložení na skládce nebo likvidaci spaláním nebo jinými dostupnými metodami;

„**Opakovaně použitelný obal**“ viz „**Obal opakovaně použitelný**“

„**Opravená IBC**“ viz „**IBC opravená**“

P

„Palivový článek“ elektrochemický prostředek, který přeměňuje chemickou energii paliva na elektrickou energii, teplo a produkty reakce;

„Plastová tkanina“ (pro flexibilní IBC) materiál vyrobený z pásků nebo vláken vhodného plastu;

„Plnicí tlak“ nejvyšší tlak skutečně vyvinutý v cisterně při jejím plnění pod tlakem;

„Plnič“ jakýkoliv podnik, který nakládá (plní) nebezpečné věci do cisterny (cisternového vozidla, snímatelné cisterny, přemístitelné cisterny nebo cisternového kontejneru) a/nebo do vozidla, velkého kontejneru nebo malého kontejneru pro volně ložené látky, nebo do bateriového vozidla nebo MEGC;

„Plyn“ látka, která:

- (a) při 50 °C má tenzi par větší než 300 kPa (3 bary); nebo
- (b) je kompletně v plynném stavu při 20 °C při normálním tlaku 101,3 kPa;

„Plynová kartuše“ viz „**Malá nádobka obsahující plyn**“;

„Podnik“ jakákoli fyzická nebo právnická osoba, ať již zisková nebo nezisková, sdružení nebo skupina osob bez právní subjektivity, ať již ziskové nebo neziskové, nebo instituce s vlastní právní subjektivitou nebo závislá na správním orgánu, který má právní subjektivitu;

„Podtlakový ventil“ pružinové zařízení, které je uváděno automaticky v činnost tlakem a jehož účelem je ochrana cisterny proti nežádoucímu vnitřnímu podtlaku;

„Pojistný ventil“ pružinové zařízení automaticky ovládané tlakem, jehož účelem je chránit cisternu proti nežádoucímu zvýšení vnitřního tlaku;

„Posuzování shody“ je proces ověřování shody výrobku podle ustanovení oddílů 1.8.6 a 1.8.7 vztahujících se na schvalování konstrukčního typu, dohled nad výrobou a na první inspekci a zkoušení;

„Prachotěsný obal“ viz „**Obal prachotěsný**“

„Provozní tlak“ stabilizovaný tlak stlačeného plynu při vztažné teplotě 15 °C v naplněné tlakové nádobě;

POZNÁMKA: K cisternám viz „**Nejvyšší provozní tlak** „

„Provozní výstroj“

- (a) cisteren znamená plnicí a vyprazdňovací, odvodušňovací, bezpečnostní, ohřívací, tepelně izolační a přídavná zařízení a měřicí přístroje;
- (b) článků bateriového vozidla nebo MEGC znamená plnicí a vyprazdňovací zařízení, včetně propojovacího potrubí, bezpečnostní zařízení a měřicí přístroje;
- (c) IBC znamená plnicí a vyprazdňovací zařízení a jakékoli tlak vyrovnávající nebo větrací, bezpečnostní, ohřívací a tepelně izolační zařízení a měřicí přístroje;

POZNÁMKA: K přemístitelným cisternám viz kapitola 6.7.

„Provozovatel cisternového kontejneru nebo přemístitelné cisterny“ podnik, na jehož jméno je registrován nebo připuštěn k provozu cisternový kontejner nebo přemístitelná cisterna;

„Předpis EHK“ předpis tvořící přílohu k dohodě o přijetí jednotných podmínek pro homologaci (ověřování shodnosti) a vzájemné uznávání homologace výstroje a součástí motorových vozidel (Dohoda 1958, v úplném znění, jak vyplývá z pozdějších změn a doplnění);

„Přemístitelná cisterna“ viz „**Cisterna přemístitelná**“

„Přeprava“ přemístění nebezpečných věcí, včetně zastávek nezbytných vzhledem k dopravním podmínkám a včetně všech dob, po které jsou nebezpečné věci uloženy ve vozidlech, cisternách nebo v kontejnerech a které jsou nezbytné vzhledem k provozním podmínkám před, během a po přemístění.

Tato definice zahrnuje též krátké dočasné skladování nebezpečných věcí za účelem změny druhu dopravního prostředku (překládku). Tato definice se vztahuje na překládku, pokud jsou přepravní doklady, v nichž je uvedeno místo odeslání a místo určení, předloženy na požádání a pokud kusy a cisterny nejsou otevírány během krátkodobého skladování, kromě kontroly provedené příslušnými orgány;

„Přeprava ve volně loženém stavu“ přeprava tuhých látek nebo předmětů bez obalů ve vozidlech, kontejnerech nebo kontejnerech pro volně ložené látky. Tento pojem se nevztahuje na věci, které se přepravují jako kusy, ani na látky přepravované v cisternách;

„Přepravní index (TI)“ přidělený kusu, přepravnímu obalovému souboru nebo kontejneru, nebo nezabalené látce LSA-I nebo nezabalenému předmětu SCO-I pro přepravu radioaktivních látek je číslo, kterého se používá ke kontrole expozice záření;

„Přepravní obalový soubor“ vnější obalový prostředek používaný (jedním odesílatelem v případě radioaktivních látek) obsahující jeden nebo více kusů pevně spojených do jedné manipulační jednotky pro usnadnění manipulace a uložení při přepravě;

Příklady přepravních obalových souborů:

- (a) úložná plošina, jako je paleta, na které jsou uloženy nebo navrstveny jeden nebo více kusů a zajištěny plastovou stahovací páskou, smršťovací nebo průtažnou fólií nebo jinými vhodnými prostředky; nebo
- (b) vnější ochranný obal jako bedna nebo latění;

„Přes nebo do“ pro přepravu radioaktivních látek znamená přes zemi nebo do zemí, v níž nebo do nichž je zásilka přepravována, ale výslovně vylučuje země, „nad“ nimiž je zásilka přepravována letecky, pokud nejsou v těchto zemích podle letového řádu žádné zastávky;

„Příjemce“ příjemce uvedený v přepravní smlouvě. Jestliže příjemce určí třetí osobu v souladu s ustanoveními platnými pro přepravní smlouvu, je tato osoba považována za příjemce ve smyslu ADR. Pokud je přeprava prováděna bez přepravní smlouvy, podnik, který přebírá nebezpečné věci po příjezdu, se považuje za příjemce;

„Příručka zkoušek a kritérií“ páté revidované vydání „United Nations Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria, publikované Organizací spojených národů (ST/SG/AC.10/11/Rev.5 se změnami uvedenými v dokumentech ST/SG/AC.10/11/Rev.5/Amend.1 a ST/SG/AC.10/11/Rev.5/Amend.2);

„Příslušný orgán“ úřad nebo jiné instituce určené v každém státě a pro každý jednotlivý případ v souladu s jeho vnitrostátním právním řádem;

„Pytel“ poddajný obal z papíru, plastové fólie, textilu, tkaniny nebo jiných vhodných materiálů;

R

„Radioaktivní obsah“ pro přepravu radioaktivních látek jsou radioaktivní látky spolu se všemi kontaminovanými nebo aktivovanými tuhými látkami, kapalinami a plyny uvnitř obalu;

„Recyklovaný plast“ materiál získaný z použitých průmyslových obalů, který byl vyčištěn a připraven pro výrobu nových obalů;

„Referenční ocel“ ocel s mezí pevnosti 370 N/mm² a prodloužením při přetržení o 27 %;

„Rekonstruovaná IBC“ viz „IBC rekonstruovaná“

„Rekonstruovaný obal“ viz „**Obal rekonstruovaný**“

„RID“ Řád pro mezinárodní železniční přepravu nebezpečných věcí [příloha 1 k přípojkou B (Jednotné právní předpisy pro Smlouvu o mezinárodní železniční přepravě zboží - CIM) Úmluvy o mezinárodní železniční přepravě - COTIF];

Ř

„Řízená teplota“ nejvyšší teplota, při které může být bezpečně přepravován organický peroxid nebo samovolně se rozkládající látka;

S

„SADT“ viz „**Teplota samourychlujícího se rozkladu**“;

„Schválení“

„Vícestranné schválení“ pro přepravu radioaktivních látek je schválení, které bylo uděleno příslušným orgánem buď země původu vzoru, nebo země odeslání, podle toho, co je relevantní, a také příslušným orgánem každého státu, přes který nebo do kterého má být příslušná zásilka přepravena.

„Jednostranné schválení“ pro přepravu radioaktivních látek je schválení vzoru, které uděluje jen příslušný orgán země původu vzoru. Není-li země původu smluvním státem ADR, musí být toto schválení uznáno příslušným orgánem prvního členského státu ADR, který přijde se zásilkou do styku (viz 6.4.22.8).

„Skupinový obal“ viz „**Obal skupinový**“

„Směrnice ES“ rozhodnutí příslušných orgánů Evropského společenství, která jsou závazná, pokud se týče dosažených výsledků, pro všechny členské státy, jimž jsou adresována, avšak volba formy a metod je ponechána národním orgánům;

„Snímatelná cisterna“ viz „**Cisterna snímatelná**“

„Stabilizovaný tlak“ tlak obsahu tlakové nádoby v tepelné a difúzní rovnováze;

„Stupeň plnění“ poměr hmotnosti plynu k hmotnosti vody při 15 °C, která by zcela naplnila tlakovou nádobu připravenou pro použití;

„Sud“ válcovitý obal z kovu, lepenky, plastu, překližky nebo jiných vhodných materiálů s plochými nebo oblými víky a dny (základnami). Pod tento pojem patří též obaly jiných tvarů, např. oblé obaly s hrdlem kuželovitého tvaru nebo obaly kelímkovitého tvaru. Pod tento pojem nepatří dřevěné sudy a kanystry.

„Svazek lahví“ soubor lahví, které jsou navzájem pevně spojeny a propojeny sběrným potrubím a jsou přepravovány jako jeden celek. Celkový hydraulický vnitřní objem nesmí přesáhnout 3 000 litrů, u svazku lahví určených pro přepravu toxických plynů třídy 2 (skupin začínajících písmenem T podle 2.2.2.1.3) je tento hydraulický vnitřní objem omezen na 1 000 litrů;

„Systém měření radiace“ je přístroj, který obsahuje detektory záření, jako své součásti;

„Systém řízení“ pro přepravu radioaktivních látek je soustava vzájemně propojených nebo vzájemně působících prvků (systém) pro stanovení strategie a cílů a umožňující, aby cílů bylo dosaženo vhodným a účinným způsobem;

T

„**Technický název**“ uznávaný chemický, popřípadě biologický název nebo jiný název běžně používaný ve vědeckých a technických příručkách, časopisech a textech (viz 3.1.2.8.1.1);

„**Těleso nádoby**“ (pro všechny druhy IBC kromě kompozitních IBC) vlastní nádoba, včetně otvorů a jejich uzávěrů, avšak bez provozní výstroje;

„**Teplota samourychlujícího se rozkladu**“ (SADT) nejnižší teplota, při níž může nastat samourychlující se rozklad látky v obalu použitém při přepravě. Ustanovení pro určení SADT a účinků zahřátí pod uzavřením jsou uvedeny v části II Příručky zkoušek a kritérií (Manual of Tests and Criteria);

„**Tlaková nádoba**“ viz „**Nádoba tlaková**“

„**Tlakový sud**“ svařovaná přemístitelná tlaková nádoba s hydraulickým vnitřním objemem větším než 150 litrů, nejvýše však 1 000 litrů (např. válcová nádoba vybavená obručemi pro válení a nádoba na ližinách nebo v rámu);

„**Trubková nádoba**“ viz „**Nádoba trubková**“

„**Tuhá látka**“

- (a) látka s bodem tání nebo bodem počátku tání vyšším než 20 °C při tlaku 101,3 kPa; nebo
- (b) látka, která není kapalná podle zkušební metody ASTM D 4359-90 nebo která je pastovitá podle kritérií vztahujících se na zkoušku tekutosti (penetrometrická zkouška) popsanou v oddílu 2.3.4.;

„**Tuhá vnitřní nádoba**“ viz „**Nádoba tuhá vnitřní**“

U

„**UIC**“ International Union of Railways (Mezinárodní železniční unie) (UIC, 16 rue Jean Rey, F-75015 Paris, France);

„**UN číslo**“ čtyřmístné identifikační číslo látky nebo předmětu převzaté ze Vzorových předpisů OSN;

„**UNECE**“ (United Nations Economic Commission for Europe) Evropská hospodářská komise OSN - EHK OSN (UNECE, Palais des Nations, 8-14 avenue de la Paix, CH-1211 Geneve 10, Suisse);

„**Uzávěr**“ zařízení uzavírající otvor v nádobě;

„**Uzavírací systém**“ pro přepravu radioaktivních látek je konstruktérem specifikovaný a příslušným orgánem uznaný soubor štěpných látek a částí obalů, který je určen pro udržení kritické bezpečnosti;

„**Uzavřené vozidlo**“ vozidlo s uzavíratelnou nástavbou;

„**Uzavřený kontejner**“ viz „**Kontejner uzavřený**“

„**Uzavřený kontejner pro volně ložené látky**“ viz „**Kontejner pro volně ložené látky**“

V

„**Velká nádoba pro volně ložené látky (IBC)**“ viz „**IBC**“

„**Velký obal**“ viz „**Obal velký**“

„**Velký kontejner**“ viz „**Kontejner velký**“

„**Vícečláňkový kontejner na plyn**“ (MEGC) přepravní prostředek obsahující články, které jsou navzájem propojeny spojovacím potrubím a namontovány na rámu. Následující články se považují za

články vícečlánkového kontejneru na plyn: láhve, trubkové nádoby, tlakové sudy a svazky lahví, jakož i cisterny pro přepravu plynů, jak jsou definovány v 2.2.2.1.1, s vnitřním objemem větším než 450 litrů;

POZNÁMKA: K UN MEGC viz kapitola 6.7.

„**Vložka**“ hadice nebo pytel vložený do obalu, včetně velkých obalů nebo IBC, které však netvoří jeho nedílnou součást, včetně uzávěrů jeho otvorů;

„**Vnější obal**“ viz „**Obal vnější**“

„**Vnitřní nádoba**“ viz „**Nádoba vnitřní**“

„**Vnitřní obal**“ viz „**Obal vnitřní**“

„**Vnitřní objem nádrže nebo komory nádrže**“ cisterny je celkový vnitřní objem nádrže nebo komory nádrže vyjádřený v litrech nebo kubických metrech. Není-li možno nádrž nebo komoru nádrže z důvodů jejího tvaru nebo konstrukce zcela naplnit, musí se pro určení stupně plnění a pro značení cisterny použít tento snížený vnitřní objem;

„**Vozidlo s plachtou**“ nekryté vozidlo opatřené plachtou pro ochranu nákladu;

„**Vozidlo**“ viz „**Bateriové vozidlo**“, „**Uzavřené vozidlo**“, „**Nekryté vozidlo**“, „**Vozidlo s plachtou**“ a „**Cisternové vozidlo**“;

„**Vozová zásilka**“ každá zásilka od jednoho odesílatele, pro kterou je výlučně vyhrazeno použití vozidla nebo velkého kontejneru, přičemž všechny úkony spojené s nakládkou a vykládkou se vykonávají podle příkazů odesílatele nebo příjemce;

POZNÁMKA: Odpovídající pojem pro radioaktivní látky je „výlučné použití“.

„**Vykládce**“ podnik, který:

- (a) snímá kontejner, kontejner pro volně ložené látky, MEGC, cisternový kontejner nebo přemístitelnou cisternu z vozidla; nebo
- (b) vykládá balené nebezpečné věci, malé kontejnery nebo přemístitelné cisterny z vozidla nebo kontejneru; nebo
- (c) vyprazdňuje nebezpečné věci z cisterny (cisternového vozidla, snímatelné cisterny, přemístitelné cisterny nebo cisternového kontejneru) nebo z bateriového vozidla, MEMU nebo MEGC nebo z vozidla, velkého kontejneru nebo malého kontejneru pro přepravu ve volně loženém stavu nebo z kontejneru pro volně ložené látky;

„**Výlučné použití**“ pro přepravu radioaktivních látek je výhradní použití vozidla nebo velkého kontejneru jediným odesílatelem, přičemž všechny postupy nakládky a vykládky a expedice před přepravou, během přepravy a po přepravě jsou prováděny podle pokynů odesílatele nebo příjemce, kde je to ustanoveními ADR vyžadováno.

„**Výměnná nástavba**“ viz „**Kontejner**“;

„**Výpočtový tlak**“ teoretický tlak rovný nejméně zkušebnímu tlaku, který může více nebo méně překročit provozní tlak podle stupně nebezpečnosti představovaného přepravovanou látkou. Slouží výhradně pro určení tloušťky stěn nádrže, nezávisle na jakémkoli vnitřním nebo vnějším výztužném zařízení;

POZNÁMKA: K přemístitelným cisternám viz kapitulu 6.7.

„**Vyprazdňovací tlak**“ nejvyšší tlak skutečně vyvinutý v cisterně při jejím vyprazdňování pod tlakem;

„**Vytápěcí systém s vnitřním spalováním**“ zařízení používající přímo kapalné nebo plynné palivo a nepoužívající odpadní teplo z hnacího motoru vozidla;

„**Vzor**“ pro přepravu radioaktivních látek je popis štěpné látky vyjmuté podle 2.2.7.2.3.5 (f), radioaktivní látky zvláštní formy, nízkodisperzní radioaktivní látky, kusu nebo obalu, který umožňuje jejich úplnou identifikaci. Popis může obsahovat specifikace, konstrukční výkresy, zprávy, ze kterých je zřejmý soulad s právními předpisy, a jinou relevantní dokumentaci;

„**Vzorové předpisy OSN**“ vzorové předpisy v příloze k osmnáctému revidovanému vydání Doporučení pro přepravu nebezpečných věcí OSN, vydaného Organizací spojených národů (ST/SG/AC.10/1/Rev.18);

Z

„**Záchranná tlaková nádoba**“ tlaková nádoba s hydraulickým vnitřním objemem nejvýše 1000 litrů, do které se ukládají poškozené, vadné nebo netěsnící tlakové nádoby nebo tlakové nádoby neodpovídající předpisům pro jejich přepravu, např. za účelem jejich obnovy nebo likvidace;

„**Záchranný obal**“ viz „**Obal záchranný**“

„**Zajištění kvality**“ systematický program inspekci a kontrol uplatňovaný jakoukoli organizací nebo institucí, jehož cílem je poskytnout přiměřenou záruku, že bezpečnostní požadavky ADR jsou v praxi plněny;

„**Zásobníkový systém s hydridem kovu**“ samostatný kompletní systém pro akumulaci vodíku, včetně nádob, hydridu kovu, zařízení pro vyrovnávání tlaku, uzavíracího ventilu, provozní výstroje a vnitřních komponentů, používaný pouze pro přepravu vodíku;

„**Záruka plnění předpisů**“ (radioaktivní látky) systematický program opatření uplatňovaných příslušným orgánem, jehož cílem je zajistit plnění požadavků ADR v praxi;

„**Zásilka**“ jakýkoli kus nebo více kusů, nebo náklad nebezpečných věcí předaný odesílatelem k přepravě;

„**Zkapalněný ropný plyn (LPG)**“ nízkotlaký zkapalněný plyn složený z jednoho nebo více lehkých uhlovodíků, které jsou přiřazeny jen k UN číslům 1011, 1075, 1965, 1969 nebo 1978 a které sestávají hlavně z propanu, propenu, butanu, izomerů butanu, butenu se stopami jiných uhlovodíkových plynů;

POZNÁMKA 1: Hořlavé plyny přiřazené k jiným UN číslům se nepovažují za LPG.

POZNÁMKA 2: K UN 1075 viz POZNÁMKU 2 pod 2F, UN 1965, v tabulce pro zkapalněné plyny ve 2.2.2.3.

„**Zkouška těsnosti**“ zkouška pro ověření těsnosti cisterny, obalu nebo IBC, jakož i výstroje a uzávěrů;

POZNÁMKA: K přemístitelným cisternám viz kapitulu 6.7.

„**Zkušební tlak**“ tlak, který se musí použít během první a periodické tlakové zkoušky.;

POZNÁMKA: K přemístitelným cisternám viz kapitulu 6.7.

Ž

„**Žadatel**“ je v případě posuzování shody výrobce nebo jeho oprávněný zástupce ve státě smluvní strany. V případě periodických inspekci, meziperiodických inspekci a mimořádných kontrol se žadatelem rozumí zkušebna, provozovatel nebo jejich oprávněný zástupce ve státě smluvní strany.

POZNÁMKA: Výjimečně smí o posouzení shody požádat třetí strana (např. provozovatel cisternového kontejneru podle definice v oddílu 1.2.1).

1.2.2 Měrové jednotky

1.2.2.1 V dohodě ADR se používá těchto měrových jednotek^a

Veličina	Jednotka SI	Přípustná doplňková (vedlejší) jednotka	Vztah mezi jednotkami
Délka	m (metr)	-	-
Plošný obsah	m ² (čtverečný metr)	-	-
Objem	m ³ (krychlový metr)	l c (litr)	1 l = 10 ⁻³ m ³
Čas	s (sekunda)	min (minuta)	1 min = 60 s
		h (hodina)	1 h = 3 600 s
		d (den)	1 d = 86 400 s
Hmotnost	kg (kilogram)	g (gram)	1 g = 10 ⁻³ kg
		t (tuna)	1 t = 10 ³ kg
Hustota	kg/m ³	kg/l	1 kg/l = 10 ³ kg/m ³
Teplota	K (kelvin)	°C (stupeň Celsia)	0 °C = 273,15 K
Teplotní rozdíl	K (kelvin)	°C (stupeň Celsia)	1 °C = 1 K
Síla	N (newton)	-	1 N = 1 kg.m/s ²
Tlak	Pa (pascal)	-	1 Pa = 1 N/m ²
		bar (bar)	1 bar = 10 ⁵ Pa
Mechanické napětí	N/m ²	N/mm ²	1 N/mm ² = 1 MPa
Práce	J (joule)	kWh (kilowatthodina)	1 kWh = 3,6 MJ
Energie	J (joule)	-	1 J = 1 N.m = 1 W.s
Teplo	J (joule)	eV (elektronvolt)	1 eV = 0,1602 . 10 ⁻¹⁸ J
Výkon	W (watt)	-	1 W = 1 J/s = 1 N.m/s
Viskozita kinematická	m ² /s	mm ² /s	1 mm ² /s = 10 ⁻⁶ m ² /s
Viskozita dynamická	Pa.s	mPa.s	1 mPa.s = 10 ⁻³ Pa.s
Aktivita	Bq (bequerel)	-	-
Ekvivalent dávkového příkonu	Sv (sievert)	-	-

^a Pro přepočet dosud používaných jednotek na jednotky SI platí následující zaokrouhlené hodnoty:

Síla

$$\begin{aligned}
 1 \text{ kg} &= 9,807 \text{ N} & \text{Napětí} \\
 1 \text{ N} &= 0,102 \text{ kg} & 1 \text{ kg/mm}^2 &= 9,807 \text{ N/mm}^2 \\
 & & 1 \text{ N/mm}^2 &= 0,102 \text{ kg/mm}^2
 \end{aligned}$$

Tlak

$$\begin{aligned}
 1 \text{ Pa} &= 1 \text{ N/m}^2 & &= 10^{-5} \text{ bar} & &= 1,02 \times 10^{-5} \text{ kg/cm}^2 & &= 0,75 \times 10^{-2} \text{ torr} \\
 1 \text{ bar} &= 10^5 \text{ Pa} & &= 1,02 \text{ kg/cm}^2 & &= 750 \text{ torr} \\
 1 \text{ kg/cm}^2 &= 9,807 \times 10^4 \text{ Pa} & &= 0,9807 \text{ bar} & &= 736 \text{ torr} \\
 1 \text{ torr} &= 1,33 \times 10^2 \text{ Pa} & &= 1,33 \times 10^{-3} \text{ bar} & &= 1,36 \times 10^{-3} \text{ kg/cm}^2
 \end{aligned}$$

Práce, energie, teplo

$$\begin{aligned}
 1 \text{ J} &= 1 \text{ N.m} & &= 0,278 \times 10^{-6} \text{ kWh} & &= 0,102 \text{ kgm} & &= 0,239 \times 10^{-3} \text{ kcal} \\
 1 \text{ kWh} &= 3,6 \times 10^6 \text{ J} & &= 367 \times 10^3 \text{ kgm} & &= 860 \text{ kcal} \\
 1 \text{ kgm} &= 9,807 \text{ J} & &= 2,72 \times 10^{-6} \text{ kWh} & &= 2,34 \times 10^{-3} \text{ kcal} \\
 1 \text{ kcal} &= 4,19 \times 10^3 \text{ J} & &= 1,16 \times 10^{-3} \text{ kWh} & &= 427 \text{ kgm}
 \end{aligned}$$

Výkon

$$\begin{aligned}
 1 \text{ W} &= 0,102 \text{ kgm/s} & &= 0,86 \text{ kcal/h} \\
 1 \text{ kgm/s} &= 9,807 \text{ W} & &= 8,43 \text{ kcal/h} \\
 1 \text{ kcal/h} &= 1,16 \text{ W} & &= 0,119 \text{ kgm/s}
 \end{aligned}$$

Kinematická viskozita

$$\begin{aligned}
 1 \text{ m}^2/\text{s} &= 10^4 \text{ St (stoků)} \\
 1 \text{ St} &= 10^{-4} \text{ m}^2/\text{s}
 \end{aligned}$$

Dynamická viskozita

$$\begin{aligned}
 1 \text{ Pa.s} &= 1 \text{ N.s/m}^2 & &= 10 \text{ P (poise)} & &= 0,102 \text{ kg.s/m}^2 \\
 1 \text{ P} &= 0,1 \text{ Pa.s} & &= 0,1 \text{ N.s/m}^2 & &= 1,02 \times 10^{-2} \text{ kg.s/m}^2 \\
 1 \text{ kg.s/m}^2 &= 9,807 \text{ Pa.s} & &= 9,807 \text{ N.s/m}^2 & &= 98,07 \text{ P}
 \end{aligned}$$

^b Mezinárodní soustava měrových jednotek SI je výsledkem usnesení Generální konference pro míry a váhy (Adresa: Pavillon de Breteuil, Parc de St-Cloud, F-92 310 Sèvres).

^c Namísto zkratky „l“ pro litr při použití psacího stroje, u něhož není rozdíl mezi písmenem „l“ a číslicí „1“, je dovoleno používat zkratky „L“.

Desetinné násobky a díly jednotky mohou být tvořeny těmito předponami nebo značkami umístěnými před názvem nebo před značkou jednotky:

Činitel			Předpona	Značka
1 000 000 000 000 000 000	= 10^{18}	trilion	exa	E
1 000 000 000 000 000	= 10^{15}	biliarda	peta	P
1 000 000 000 000	= 10^{12}	bilion	tera	T
1 000 000 000	= 10^9	miliarda	giga	G
1 000 000	= 10^6	milion	mega	M
1 000	= 10^3	tisíc	kilo	K
100	= 10^2	sto	hekto	H
10	= 10^1	deset	deka	da
0.1	= 10^{-1}	desetina	deci	d
0.01	= 10^{-2}	setina	centi	c
0.001	= 10^{-3}	tisícina	milli	m
0.000 001	= 10^{-6}	miliónčina	mikro	μ
0.000 000 001	= 10^{-9}	miliardtina	nano	n
0.000 000 000 001	= 10^{-12}	bilióntina	piko	p
0.000 000 000 000 001	= 10^{-15}	biliardtina	femto	f
0.000 000 000 000 000 001	= 10^{-18}	trilióntina	atto	a

POZNÁMKA: $10^9 = 1$ billion je použití násobku měrových jednotek Spojenými národy v angličtině. Analogicky je pak $10^{-9} = 1$ biliontina.

1.2.2.2 Není-li výslovně stanoveno jinak, značí znaménko „%“ v ADR:

- (a) u směsí tuhých nebo kapalných látek, jakož i u roztoků a u tuhých látek zvlhčených kapalinou, část hmotnosti z celkové hmotnosti směsi, roztoku nebo zvlhčené látky vyjádřená v procentech;
- (b) u směsí stlačených plynů, jsou-li plněny tlakově, část objemu z celkového objemu plynné směsi vyjádřená v procentech, nebo, jsou-li plněny podle hmotnosti, část hmotnosti z celkové hmotnosti plynné směsi vyjádřená v procentech;
- (c) u směsí zkapalněných plynů a rozpuštěných plynů část hmotnosti z celkové hmotnosti směsi vyjádřená v procentech.

1.2.2.3 Tlaky všeho druhu, týkající se nádob (např. zkušební tlak, vnitřní tlak, tlak, při němž se otevírá pojistný ventil) jsou vždy udány jako přetlak (tlak převyšující atmosférický tlak); naproti tomu tenze par je vždy vyjádřena jako absolutní tlak.

1.2.2.4 Pokud ADR stanoví stupeň plnění nádob, vztahuje se tento stupeň vždy na základní teplotu látek 15 °C, není-li udána jiná teplota.

KAPITOLA 1.3

ŠKOLENÍ OSOB PODÍLEJÍCÍCH SE NA PŘEPRAVĚ NEBEZPEČNÝCH VĚCÍ

1.3.1 Rozsah a uplatnění

Osoby, které jsou zaměstnanci účastníků přepravy nebezpečných věcí uvedených v kapitole 1.4 a jejichž pracovní povinnosti se týkají přepravy nebezpečných věcí, musí být vyškoleny o předpisech pro dopravu takových věcí podle své odpovědnosti a pracovní náplně. Před převzetím odpovědnosti musí být zaměstnanci vyškoleni podle 1.3.2 a činnosti, pro které, dosud neabsolvovali vyžadované školení, smějí vykonávat pouze pod přímým dohledem vyškolené osoby. Školení se musí zaměřit také na specifická ustanovení vztahující se na bezpečnost při přepravě nebezpečných věcí, uvedená v kapitole 1.10.

POZNÁMKA 1: O školení bezpečnostního poradce viz 1.8.3 namísto tohoto oddílu.

POZNÁMKA 2: O školení osádky vozidla viz kapitolu 8.2 namísto tohoto oddílu.

POZNÁMKA 3: O školení ke třídě 7, viz též 1.7.2.5.

1.3.2 Forma školení

Školení musí mít následující obsah odpovídající odpovědnosti a pracovní činnosti dotyčné osoby.

1.3.2.1 Všeobecné bezpečnostní školení

Personál musí být seznámen se všeobecnými ustanoveními předpisů o přepravě nebezpečných věcí.

1.3.2.2 Specifické školení

Personál musí být vyškolen přiměřeně ke svým povinnostem a odpovědnostem o ustanoveních předpisů týkajících se dopravy nebezpečných věcí.

Pokud je přeprava nebezpečných věcí prováděna kombinovanou (multimodální) dopravou, personál musí být seznámen s předpisy ostatních druhů dopravy zúčastněných na přepravním procesu.

1.3.2.3 Bezpečnostní školení

Personál musí být proškolen o rizicích a nebezpečích, které představují nebezpečné věci, přiměřeně stupni rizika zranění nebo ozáření při nehodě při přepravě těchto věcí, včetně jejich nakládky a vykládky.

Školení musí být provedeno tak, aby se personál seznámil s bezpečnou manipulací a nouzovými postupy.

1.3.2.4 Školení musí být periodicky doplňováno obnovovacím školením s ohledem na změny předpisů.

1.3.3 Dokumentace

Záznamy o školeních absolvovaných podle této kapitoly musí být uchovávány zaměstnavatelem a musí být na požádání k dispozici zaměstnanci nebo příslušnému orgánu. Záznamy musí být zaměstnavatelem uchovávány po dobu stanovenou příslušným orgánem. Záznamy o školeních musí být zkontrolovány při nástupu do nového zaměstnání.

KAPITOLA 1.4

POVINNOSTI ÚČASTNÍKŮ PŘEPRAVY Z HLEDISKA BEZPEČNOSTI

1.4.1 Všeobecná bezpečnostní opatření

- 1.4.1.1 Účastníci přepravy nebezpečných věcí musí učinit přiměřená opatření podle povahy a rozsahu předvídatelných nebezpečí tak, aby se zabránilo vzniku škod nebo zranění a, popřípadě, aby se minimalizovaly jejich následky. Musí však ve všech případech splnit požadavky ADR vztahující se na jejich činnost.
- 1.4.1.2 Pokud se vyskytuje bezprostřední riziko, že může být přímo ohrožena bezpečnost veřejnosti, účastníci přepravy musí neprodleně uvědomit zásahové jednotky a musí jim sdělit všechny informace potřebné pro jejich činnost.
- 1.4.1.3 ADR může stanovit určité povinnosti různých účastníků.

Jestliže smluvní strana usoudí, že to nezpůsobí zhoršení bezpečnosti, může ve své vnitrostátní legislativě přesunout povinnosti týkající se jednoho uvedeného účastníka na jednoho nebo několik jiných účastníků, pokud jsou splněny povinnosti uvedené v oddílech 1.4.2 a 1.4.3. Tyto odchylky musí být sděleny smluvní stranou sekretariátu Evropské hospodářské komise Organizace spojených národů, který je dá na vědomí smluvním stranám.

Ustanovení oddílů 1.2.1, 1.4.2 a 1.4.3 týkající se definic účastníků a jejich příslušných povinností se nedotýkají ustanovení vnitrostátních předpisů týkajících se právních důsledků (trestnost, odpovědnost atd.) vznikajících ze skutečnosti, že dotýčný účastník je např. právnická osoba, samostatně výdělečná osoba, zaměstnavatel nebo zaměstnanec.

1.4.2 Povinnosti hlavních účastníků

POZNÁMKA 1: Někteří účastníci, kterým jsou v této kapitole ukládány bezpečnostní povinnosti, mohou být jedním a tímž podnikem. Činnosti a odpovídající bezpečnostní povinnosti účastníka mohou být převzaty více podniky.

POZNÁMKA 2: K radioaktivním látkám viz též 1.7.6.

1.4.2.1 Odesílatel

- 1.4.2.1.1 Odesílatel nebezpečných věcí je povinen předat k přepravě jen zásilky, které odpovídají požadavkům ADR. V rámci oddílu 1.4.1 musí zejména:
- (a) přesvědčit se, že nebezpečné věci jsou zařazeny a připuštěny k přepravě podle ADR;
 - (b) předat dopravci ve sledovatelné formě informace a údaje a popřípadě požadované přepravní a průvodní doklady (povolení, schválení, oznámení, osvědčení atd.), zejména s ohledem na ustanovení kapitoly 5.4 a tabulek v části 3;
 - (c) použít pouze obaly, velké obaly, velké nádoby pro volně ložené látky (IBC) a cisterny (cisternová vozidla, snímatelné cisterny, bateriová vozidla, MEGC, přemístitelné cisterny a cisternové kontejnery) schválené a vhodné pro přepravu dotýčných látek a označené podle ADR;
 - (d) splnit požadavky týkající se způsobu odeslání a omezení přepravy;
 - (e) zajistit aby i prázdné nevyčištěné a neodplyněné cisterny (cisternová vozidla, snímatelné cisterny, bateriová vozidla, MEGC, přemístitelné cisterny a cisternové kontejnery) nebo prázdná nevyčištěná vozidla a prázdné nevyčištěné velké nebo malé kontejnery pro volně ložené látky byly příslušně označeny a opatřeny bezpečnostními značkami a aby prázdné nevyčištěné cisterny byly uzavřeny a poskytovaly stejné záruky těsnosti, jako kdyby byly plné.

1.4.2.1.2 Jestliže odesílatel používá služeb jiných účastníků (balič, nakládky, plnič atd.), musí učinit přiměřená opatření, aby bylo zajištěno, že zásilka splňuje předpisy ADR. Může se však v případech uvedených v 1.4.2.1.1 a), b), c) a e) spolehnout na informace a údaje poskytnuté mu jinými účastníky.

1.4.2.1.3 Pokud odesílatel jedná z pověření třetí osoby, pak tato musí odesílatele písemně upozornit, že se jedná o nebezpečné věci a poskytnout mu všechny informace a doklady potřebné ke splnění jeho povinností.

1.4.2.2 **Dopravce**

1.4.2.2.1 V souvislosti s oddílem 1.4.1, kde je to vhodné, dopravce musí zejména:

- (a) ověřit si, že nebezpečné věci, které se mají přepravovat, je dovoleno přepravovat podle ADR;
- (b) přesvědčit se, že všechny informace předepsané v ADR ve vztahu k nebezpečným věcem, které se mají přepravovat, byly před přepravou odesílatelem poskytnuty, že je v dopravní jednotce předepsaná dokumentace, nebo pokud je namísto papírové dokumentace používán systém elektronického zpracování dat (EDP) nebo systém elektronické výměny dat (EDI), že jsou během přepravy k dispozici údaje způsobem, který je alespoň rovnocenný papírové dokumentaci;
- (c) vizuálně se přesvědčit, že vozidla a náklad jsou bez viditelných závad, netěsností nebo trhlin, že nechybí výbava atd.;
- (d) přesvědčit se, že neprošel termín příští zkoušky cisternových vozidel, bateriových vozidel, snímatelných cisteren, přemístitelných cisteren, cisternových kontejnerů a MEGC;

POZNÁMKA: Cisterny, bateriová vozidla a MEGC však smí být přepravovány po uplynutí tohoto termínu za podmínek uvedených v 4.1.6.10 (v případě bateriových vozidel a MEGC obsahujících jako články tlakové nádoby), 4.2.4.4, 4.3.2.4.4, 6.7.2.19.6, 6.7.3.15.6 nebo 6.7.4.14.6.

- (e) přesvědčit se, že vozidla nejsou přetížena;
- (f) přesvědčit se, že byly připevněny velké bezpečnostní značky a označení předepsaná pro vozidla;
- (g) přesvědčit se, že je ve vozidle výbava předepsaná v písemných pokynech pro řidiče.

Pokud je to vhodné, toto všechno musí být provedeno na základě přepravních dokladů a průvodních dokladů vizuální prohlídkou vozidla nebo kontejnerů a popřípadě nákladu.

1.4.2.2.2 Dopravce však se může v případech uvedených v 1.4.2.2.1 a), b), e), a f) spolehnout na informace a údaje poskytnuté mu jinými účastníky.

1.4.2.2.3 Pokud dopravce zjistí podle 1.4.2.2.1 porušení předpisů ADR, nesmí přepravit zásilku, pokud nedošlo k odstranění nedostatků.

1.4.2.2.4 Pokud je během cesty zjištěna závada, která by mohla ohrozit bezpečnost přepravy, pak se musí zásilka pokud možno co nejrychleji zadržet s ohledem na požadavky bezpečnosti silničního provozu, bezpečného odstavení zásilky a bezpečnosti veřejnosti. V přepravě se může pokračovat až tehdy, až zásilka splňuje platné předpisy. Příslušný(é) orgán(y) může (mohou) pro zbytek cesty vydat povolení pro pokračování přepravy.

Pokud nemůže být dosaženo splnění předpisů a není vydáno povolení pro zbytek cesty, příslušný(é) orgán(y) musí dopravci poskytnout nezbytnou administrativní podporu. Totéž se vztahuje i na případ, kdy dopravce informuje tento/tyto příslušný(é) orgán(y), že nebezpečná povaha přepravovaných věcí mu nebyla odesílatelem oznámena, a že by si přál v souladu s právním předpisem vztahujícím se zejména na přepravní smlouvu tyto věci vyložit, zničit nebo je učinit neškodnými.

1.4.2.2.5 (Vyhrazeno)

1.4.2.3 Příjemce

- 1.4.2.3.1 Příjemce má povinnost nezdržovat bez pádných důvodů převzetí věci a po vykládce ověřit, že jsou dodrženy předpisy ADR, které se ho týkají.
- 1.4.2.3.2 Pokud se při kontrole u kontejneru zjistí porušení předpisů ADR, příjemce nesmí vrátit kontejner dopravci, dokud zjištěné závady nebyly odstraněny.
- 1.4.2.3.3 Jestliže příjemce používá služby jiných účastníků (provádějících vykládku, čištění, dekontaminaci atd.), musí provést náležitá opatření k tomu, aby byly dodrženy požadavky uvedené v 1.4.2.3.1 a 1.4.2.3.2 ADR.

1.4.3 Povinnosti ostatních účastníků

Nevyčerpávající seznam ostatních účastníků a jejich příslušných povinností je uveden dále. Povinnosti těchto ostatních účastníků vyplývají z oddílu 1.4.1 uvedeného výše, pokud vědí nebo by měli vědět, že jejich činnost tvoří část přepravního procesu podléhajícího ADR.

1.4.3.1 Nakládce

- 1.4.3.1.1 V souvislosti s oddílem 1.4.1 nakládce má zejména následující povinnosti:
- (a) smí předat nebezpečné věci dopravci pouze tehdy, je-li jejich přeprava podle ADR dovolena;
 - (b) musí, pokud předává k přepravě balené nebezpečné věci nebo nevyčištěné prázdné obaly, zkontrolovat, zda obal není poškozen. Nesmí předat k přepravě kus, jehož obal je poškozen, zejména není-li těsný, a jsou úniky nebo možnost úniku nebezpečných látek, dokud závada není odstraněna; tato povinnost se vztahuje též na prázdné nevyčištěné obaly;
 - (c) musí, pokud nakládá nebezpečné věci do vozidla nebo velkého nebo malého kontejneru, splnit zvláštní předpisy pro nakládku a manipulaci.
 - (d) musí po nakládce nebezpečných věcí do kontejneru splnit předpisy týkající se označení nebezpečnosti podle kapitoly 5.3;
 - (e) musí při nakládce kusů dodržet zákazy společné nakládky rovněž s přihlédnutím k nebezpečným věcem, které jsou již ve vozidle nebo velkém kontejneru, jakož i předpisy týkající se oddělení potravin, poživatin a krmiv.
- 1.4.3.1.2 Nakládce se však může v případech uvedených v 1.4.3.1.1 a), d) a e) spolehnout na informace a údaje poskytnuté mu jinými účastníky.

1.4.3.2 Balič

V souvislosti s oddílem 1.4.1 balič musí splnit zejména:

- (a) předpisy týkající se podmínek balení nebo podmínek společného balení, a
- (b) pokud připravuje kusy pro přepravu, předpisy týkající se nápisů a bezpečnostních značek na kusech.

1.4.3.3 Plnič

V souvislosti s oddílem 1.4.1 plnič musí splnit zejména následující povinnosti:

- (a) musí ověřit před plněním cisteren, že tyto cisterny a jejich výstroj jsou v dobrém technickém stavu;
- (b) musí se přesvědčit, že neprošlo datum příští zkoušky cisternových vozidel, bateriových vozidel, snímatelných cisteren, přemístitelných cisteren, cisternových kontejnerů a MEGC;
- (c) smí plnit cisterny pouze nebezpečnými věcmi, které je dovoleno v těchto cisternách přepravovat;

- (d) musí při plnění cisterny dodržet ustanovení týkající se nebezpečných věcí v sousedních komorách;
- (e) musí během plnění cisterny dodržet nejvyšší dovolený stupeň plnění nebo nejvyšší dovolenou hmotnost obsahu na litr jejího vnitřního objemu pro plněnou látku;
- (f) musí po naplnění cisterny zajistit, aby všechny uzávěry byly v uzavřené poloze a nedocházelo k žádnému úniku;
- (g) musí zajistit, aby žádné nebezpečné zbytky naplněné látky neulpívaly na vnějším povrchu jím naplněných cisteren;
- (h) musí při přípravě nebezpečných věcí k přepravě zajistit, aby předepsané oranžové tabulky, bezpečnostní značky, jakož i značky pro zahřáté látky a značky pro látky ohrožující životní prostředí byly připevněny na cisterny, na vozidla a na velké a malé kontejnery pro volně ložené látky v souladu s příslušnými předpisy.
- (i) (Vyhrazeno)
- (j) musí se při plnění vozidel nebo kontejnerů volně loženými nebezpečnými věcmi ujistit, že jsou dodržena příslušná ustanovení kapitoly 7.3.

1.4.3.4 **Provozovatel cisternového kontejneru nebo přemístitelné cisterny**

V souvislosti s oddílem 1.4.1 provozovatel cisternového kontejneru nebo přemístitelné cisterny musí zejména:

- (a) zajistit dodržení předpisů pro konstrukci, výstroj, zkoušky a značení;
- (b) zajistit, aby údržba nádrží a jejich výstroje byla prováděna způsobem, který zaručí, že cisternový kontejner nebo přemístitelná cisterna bude za normálních provozních podmínek odpovídat předpisům ADR až do své příští inspekce;
- (c) zajistit provedení mimořádné kontroly, jestliže může být bezpečnost nádrže nebo její výstroje snížena opravou, změnou nebo nehodou.

1.4.3.5 (Vyhrazeno)

1.4.3.6 (Vyhrazeno)

1.4.3.7 **Vykládce**

POZNÁMKA: *Vykládka v tomto pododdílu zahrnuje snímání, vykládku a vyprazdňování, jak je uvedeno v definici vykládce v 1.2.1.*

1.4.3.7.1 V souvislosti s oddílem 1.4.1 vykládce musí zejména:

- (a) přesvědčit se, že jsou vykládány správné věci srovnáním příslušných informací v přepravním dokladu s informacemi na kusu, kontejneru, cisterně, MEMU, MEGC nebo vozidle;
- (b) před vykládkou a během ní přezkontrolovat, zda obaly, cisterna, vozidlo nebo kontejner nejsou poškozeny do té míry, že by to ohrozilo vykládku. V tomto případě zajistit, aby vykládka nebyla provedena, dokud nebudou učiněna náležitá opatření;
- (c) dodržet všechny příslušné předpisy týkající se vykládky;
- (d) ihned po vykládce cisterny, vozidla nebo kontejneru:
 - (i) odstranit všechny nebezpečné zbytky, které ulpěly na vnější straně cisterny, vozidla nebo kontejneru během vykládky; a
 - (ii) zajistit uzavření ventilů a kontrolních otvorů;
- (e) zajistit, aby bylo provedeno předepsané vyčištění a dekontaminace vozidel nebo kontejnerů; a
- (f) zajistit, aby kontejnery po jejich úplném vyložení, vyčištění a dekontaminaci už nebyly označeny podle kapitoly 5.3.

- 1.4.3.7.2 Jestliže vykládce používá služeb jiných účastníků (provádějících čištění, dekontaminaci atd.), musí provést náležitá opatření k tomu, aby byly dodrženy předpisy ADR.

KAPITOLA 1.5

ODCHYLKY

1.5.1 Dočasné odchylky

- 1.5.1.1 Podle článku 4, odstavce 3 ADR se mohou příslušné orgány smluvních stran dohodnout přímo mezi sebou, že určité přepravy po jejich území se budou dočasně provádět odchylně od předpisů ADR, za podmínky, že tím není snížena bezpečnost. Orgán, který byl iniciátorem této dočasné odchylky, musí takové odchylky oznámit sekretariátu Evropské hospodářské komise Organizace spojených národů, který je dá na vědomí smluvním stranám¹.

POZNÁMKA: „Zvláštní ujednání“ podle oddílu 1.7.4 se nepovažuje za dočasnou odchylku podle tohoto oddílu.

- 1.5.1.2 Doba platnosti dočasné odchylky nesmí být delší než pět let od data jejího vstupu v platnost. Dočasná odchylka automaticky pozbývá platnosti datem vstupu v platnost příslušné změny ADR.
- 1.5.1.3 Přepravy na základě dočasných odchylek jsou přepravami podle ADR.
- 1.5.2 (Vyhrazeno)

¹ Poznámka Sekretariátu: Odchylky dohodnuté podle tohoto pododdílu jsou k nahlédnutí na webové stránce UNECE: <http://www.unece.org/trans/danger/danger.htm>

KAPITOLA 1.6

PŘECHODNÁ USTANOVENÍ

1.6.1 Všeobecná ustanovení

- 1.6.1.1 Pokud není stanoveno jinak, směji být látky a předměty ADR přepravovány až do 30. června 2015 podle předpisů ADR platných do 31. prosince 2014.
- 1.6.1.2 (Vypuštěno)
- 1.6.1.3 Látky a předměty třídy 1 patřící ozbrojeným silám smluvní strany, které byly zabaleny před 1. lednem 1990 podle předpisů ADR platných v této době, mohou být přepravovány po 31. prosinci 1989, pokud jsou obaly nepoškozeny a jsou uvedeny v přepravním dokladu jako vojenské věci zabalené před 1. lednem 1990. Ostatní ustanovení platná od 1. ledna 1990 pro tuto třídu musí být dodržena.
- 1.6.1.4 Látky a předměty třídy 1, které byly zabaleny mezi 1. lednem 1990 a 31. prosincem 1996 podle předpisů ADR platných v této době, mohou být přepravovány po 31. prosinci 1996, pokud jsou obaly nepoškozeny a jsou uvedeny v přepravním dokladu jako věci třídy 1 zabalené mezi 1. lednem 1990 a 31. prosincem 1996.
- 1.6.1.5 (Vyhrazeno)
- 1.6.1.6 Velké nádoby pro volně ložené látky (IBC) vyrobené před 1. lednem 2003 podle předpisů bodu 3612 (1) platných do 30. června 2001, které však nesplňují předpisy týkající se výšky písmen, číslic a symbolů v 6.5.2.1.1 platné od 1. července 2001, směji být dále používány.
- 1.6.1.7 Typová schválení pro sudy, kanystry a kompozitní obaly vyrobené z polyetylénu o vysoké nebo střední molekulární hmotnosti vydaná před 1. červencem 2005 podle ustanovení 6.1.5.2.6 platných do 31. prosince 2004, které však nesplňují ustanovení pododdílu 4.1.1.21, budou dále platná až do 31. prosince 2009. Každý takový obal vyrobený a označený na základě těchto typových schválení může být používán až do konce své dovolené doby používání stanovené v pododdílu 4.1.1.15.
- 1.6.1.8 Stávající oranžové tabulky, které splňují požadavky pododdílu 5.3.2.2 platné do 31. prosince 2004, směji být dále používány, pokud jsou splněny požadavky uvedené v 5.3.2.2.1 a 5.3.2.2.2, že tabulka, čísla a písmena musí zůstat upevněny bez ohledu na orientaci vozidla.
- 1.6.1.9 (Vypuštěno)
- 1.6.1.10 (Vypuštěno)
- 1.6.1.11 Schválení typu pro sudy, kanystry a kompozitní obaly vyrobené z polyetylénu o vysoké nebo střední molekulární hmotnosti a pro IBC z polyetylénu o vysoké molekulární hmotnosti, vydaná před 1. červencem 2007 podle požadavků v oddílu 6.1.6.1 (a) platných do 31. prosince 2006, které však neodpovídají požadavkům v oddílu 6.1.6.1 (a) platným od 1. ledna 2007, jsou nadále platná.
- 1.6.1.12 (Vypuštěno)
- 1.6.1.13 (Vypuštěno)
- 1.6.1.14 IBC vyrobené před 1. lednem 2011 a odpovídající konstrukčnímu typu, který neprošel vibrační zkouškou podle 6.5.6.13, nebo který nemusel splňovat kritéria odstavce 6.5.6.9.5 (d) v době, kdy byl podroben zkoušce volným pádem, mohou být dále používány.
- 1.6.1.15 IBC vyrobené, rekonstruované nebo opravené před 1. lednem 2011 nemusí být označeny nejvyšším dovoleným stohovacím zatížením podle 6.5.2.2.2. Takové IBC, které nejsou označeny podle 6.5.2.2.2, směji být dále používány po 31. prosinci 2010, avšak musí být označeny podle 6.5.2.2.2, jsou-li rekonstruovány nebo opraveny po tomto datu. IBC vyrobené, rekonstruované nebo opravené mezi

1. lednem 2011 a 31. prosincem 2016 a označené nejvyšším dovoleným stohovacím zatížením podle ustanovení v 6.5.2.2.2 platných do 31. prosince 2014 směji být dále používány.

1.6.1.16 (Vypuštěno)

1.6.1.17 (Vypuštěno)

1.6.1.18 (Vypuštěno)

1.6.1.19 (Vypuštěno)

1.6.1.20 Bez ohledu na předpisy kapitoly 3.4 platné od 1. ledna 2011, nebezpečné věci balené v omezených množstvích, jiné než ty, jimž je ve sloupci (7a) tabulky A kapitoly 3.2 přiřazena číslice „0“, směji být dále přepravovány až do 30. června 2015 podle předpisů kapitoly 3.4 platných do 31. prosince 2010. Avšak v takovém případě směji být ustanovení v 3.4.12 až 3.4.15 platná od 1. ledna 2011 používána od 1. ledna 2011. Pro účely použití poslední věty v 3.4.13 (b), je-li přepravovaný kontejner označen značkou vyžadovanou v oddílu 3.4.12 platném do 31. prosince 2010, smí být dopravní jednotka označena značkou vyžadovanou v oddílu 3.4.15 platném od 1. ledna 2011.

1.6.1.21 Osvědčení o školení pro řidiče odpovídající vzoru platnému do 31. prosince 2010, vydaná smluvními stranami do 31. prosince 2012 namísto osvědčení odpovídajících požadavkům odstavce 8.2.2.8.5, se směji dále používat až do konce své pětileté platnosti.

1.6.1.22 Vnitřní nádoby kompozitních IBC vyrobené před 1. červencem 2011 a značené podle předpisů v 6.5.2.4 platných do 31. prosince 2010 mohou být dále používány.

1.6.1.23 Hasicí přístroje vyrobené před 1. červencem 2011 v souladu s požadavky pododdílu 8.1.4.3 platných do 31. prosince 2010 mohou být dále používány.

1.6.1.24 (Vypuštěno)

1.6.1.25 Kusy a přepravní obalové soubory označené UN číslem podle ustanovení ADR platných do 31. prosince 2012 a které neodpovídají požadavkům uvedeným v 5.2.1.1, pokud jde o velikost UN čísla a písmen „UN“, platným od 1. ledna 2013, směji být dále používány až do 31. prosince 2013, a pokud jde o láhve s hydraulickým vnitřním objemem nejvýše 60 litrů, až do příští periodické inspekce, nejdéle však do 30. června 2018.

1.6.1.26 Velké obaly vyrobené nebo rekonstruované před 1. lednem 2014 a které neodpovídají požadavkům uvedeným v 6.6.3.1, pokud jde o velikost písmen, číslic a symbolů, platným od 1. ledna 2013, směji být dále používány. Velké obaly vyrobené nebo rekonstruované před 1. lednem 2015 nemusí být označeny nejvyšší dovolenou stohovací zátěží podle 6.6.3.3. Takové velké obaly, které nejsou označeny podle 6.6.3.3, směji být používány i po 31. prosinci 2014, ale musí být označeny podle 6.6.3.3, pokud byly rekonstruovány po tomto datu. Velké obaly vyrobené nebo rekonstruované mezi 1. lednem 2011 a 31. prosincem 2016 a označené nejvyšším dovoleným stohovacím zatížením podle ustanovení v 6.6.3.3 platných do 31. prosince 2014 směji být dále používány.

1.6.1.27 Nádrže jako integrální součásti zařízení nebo strojů, obsahující kapalná paliva UN čísel 1202, 1203, 1223, 1268, 1863 a 3475, vyrobené před 1. červencem 2013, které neodpovídají požadavkům odstavce (a) zvláštního ustanovení 363 kapitoly 3.3 platným od 1. ledna 2013, směji být dále používány.

1.6.1.28 Odchylkou od ustanovení v 1.6.1.1 nebudou akreditace podle normy EN ISO/IEC 17020:2004 pro účely uvedené v 1.8.6.8, 6.2.2.11, 6.2.3.6.1 a ve zvláštních ustanoveních TA4 a TT9 oddílu 6.8.4 uznávány po 28. únoru 2015.

1.6.1.29 Lithiové články a baterie vyrobené podle konstrukčního typu splňujícího požadavky pododdílu 38.3 Příručky zkoušek a kritérií, revize 3, změny 1 nebo jakékoli následné revize a změny platné k datu zkoušky konstrukčního typu směji být dále přepravovány, pokud není v ADR stanoveno jinak.

Lithiové články a baterie vyrobené před 1. červencem 2003 a splňující požadavky Příručky zkoušek a kritérií, revize 3 směji být dále přepravovány, pokud jsou dodržena všechna ostatní příslušná ustanovení.

- 1.6.1.30 Bezpečnostní značky, velké bezpečnostní značky a značky, které splňují požadavky uvedené v 3.4.7, 3.4.8, 3.5.4.2, 5.2.1.8.3, 5.2.2.2.1.1, 5.3.1.7.1, 5.3.3, 5.3.6, 5.5.2.3.2 a 5.5.3.6.2 platné do 31. prosince 2014, směji být používány až do 31. prosince 2016.
- 1.6.1.31 Přepravní obalové soubory označené nápisem „PŘEPRAVNÍ OBALOVÝ SOUBOR“ podle ustanovení ADR platných do 31. prosince 2014 a které neodpovídají požadavkům v 5.1.2.1 (a) týkajícím se velikosti písmen, platným od 1. ledna 2015, směji být dále používány až do 31. prosince 2015.
- 1.6.1.32 Záchranné obaly a záchranné tlakové nádoby označené slovem „ZÁCHRANNÝ“ podle ustanovení ADR platných do 31. prosince 2014 a které neodpovídají požadavkům v 5.2.1.3 týkajícím se velikosti písmen, platným od 1. ledna 2015, směji být dále používány až do 31. prosince 2015.
- 1.6.1.33 Elektrické dvouvrstvé kondenzátory UN čísla 3499 vyrobené před 1. lednem 2014 nemusí mít vyznačenu svou kapacitu akumulace energie ve Wh, jak je vyžadováno v pododstavci (e) zvláštního ustanovení 361 kapitoly 3.3.
- 1.6.1.34 Asymetrické kondenzátory UN čísla 3508 vyrobené před 1. lednem 2016 nemusí mít vyznačenu svou kapacitu akumulace energie ve Wh, jak je vyžadováno v pododstavci (c) zvláštního ustanovení 372 kapitoly 3.3.
- 1.6.1.35 Písemné pokyny podle ustanovení ADR platných do 31. prosince 2014, které však neodpovídají požadavkům v 5.4.3 platným od 1. ledna 2015, směji být dále používány až do 30. června 2017.
- 1.6.1.36 Osvědčení o školení řidiče vydaná před 1. lednem 2014, která neodpovídají požadavkům v 8.2.2.8.5 platným od 1. ledna 2013, pokud jde o pořadí údajů pod čísly 4. a 8., barvu (bílá s černými písmeny a číslicemi) a použití čísel 9. a 10. na zadní straně osvědčení k uvedení příslušných seznamů tříd, pro které osvědčení platí, směji být dále používána až do data skončení jejich platnosti.

1.6.2 Tlakové nádoby a nádoby pro třídu 2

- 1.6.2.1 Nádoby vyrobené před 1. lednem 1997, které neodpovídají předpisům ADR platným od 1. ledna 1997, ale jejichž přeprava byla povolena podle předpisů ADR platných do 31. prosince 1996, mohou být používány i po tomto datu, jestliže splňují předpisy pro periodické zkoušky podle pokynů pro balení P200 a P203.
- 1.6.2.2 (Vypuštěno)
- 1.6.2.3 Nádoby určené pro přepravu látek třídy 2, vyrobené před 1. lednem 2003, směji být nadále opatřeny, po 1. lednu 2003, značením podle předpisů platných do 31. prosince 2002.
- 1.6.2.4 Tlakové nádoby zkonstruované a vyrobené podle technických předpisů, které již nejsou uznávány podle 6.2.5, mohou být dále používány.
- 1.6.2.5 Tlakové nádoby a jejich uzávěry zkonstruované a vyrobené podle norem platných v době jejich výroby, (viz. 6.2.4) podle ustanovení ADR, která platila v té době, mohou být dále používány, pokud to není omezeno zvláštním přechodným ustanovením.
- 1.6.2.6 Tlakové nádoby pro jiné látky, než jsou látky třídy 2, vyrobené před 1. červencem 2009 podle ustanovení pododdílu 4.1.4.4 platných do 31. prosince 2008, které však neodpovídají ustanovením pododdílu 4.1.3.6 platným od 1. ledna 2009, směji být dále používány, pokud jsou dodržena ustanovení pododdílu 4.1.4.4 platná do 31. prosince 2008.
- 1.6.2.7 (Vypuštěno)
- 1.6.2.8 (Vypuštěno)

- 1.6.2.9 Ustanovení pokynu pro balení P200 (10), zvláštního ustanovení pro balení (v) ve 4.1.4.1 platná do 31. prosince 2010 smějí být smluvními stranami ADR používána pro láhve vyrobené před 1. lednem 2015.
- 1.6.2.10 Opakovaně plnitelné svařované ocelové láhve pro přepravu plynů UN čísel 1011, 1075, 1965, 1969 nebo 1978, kterým byl podle pokynu pro balení P200 (10), zvláštního ustanovení pro balení (v) ve 4.1.4.1 platného do 31. prosince 2010 příslušným orgánem státu (států) přepravy povolen interval mezi periodickými inspekcemi 15 let, smějí být dále podrobovány periodickým inspekcím podle těchto ustanovení.
- 1.6.2.11 Plynové kartuše vyrobené a připravené k přepravě před 1. lednem 2013, pro které nebyly použity předpisy uvedené v 1.8.6, 1.8.7 nebo 1.8.8 pro posuzování shody plynových kartuší, smějí být dále přepravovány po tomto datu, pokud jsou dodržena všechna ostatní příslušná ustanovení ADR.
- 1.6.2.12 Záchranné tlakové nádoby smějí být dále vyráběny a schvalovány podle vnitrostátních předpisů až do 31. prosince 2013. Záchranné tlakové nádoby vyrobené a schválené podle vnitrostátních předpisů před 1. lednem 2014 smějí být dále používány se schválením příslušných orgánů zemí používání.
- 1.6.2.13 Svazky lahví vyrobené před 1. červencem 2013, které nejsou označeny podle ustanovení v 6.2.3.9.7.2 a 6.2.3.9.7.3 platných od 1. ledna 2013 nebo v 6.2.3.9.7.2 platných od 1. ledna 2015, smějí být používány až do příští periodické inspekce po 1. červenci 2015.
- 1.6.2.14 Láhve vyrobené před 1. lednem 2016 podle 6.2.3 a podle specifikace schválené příslušnými orgány zemí přepravy a použití, které však neodpovídají normě ISO 11513:2011 nebo normě ISO 9809-1:2010, jak je vyžadováno v 4.1.4.1, pokynu pro balení P208 (1), smějí být používány pro přepravu adsorbovaných plynů, za podmínky, že jsou dodrženy všeobecné předpisy pro balení uvedené v 4.1.6.1.
- 1.6.2.15 Svazky lahví podrobené periodické inspekci před 1. červencem 2015, které nejsou označeny podle ustanovení v 6.2.3.9.7.3 platných od 1. ledna 2015, smějí být používány až do příští periodické inspekce po 1. červenci 2015.

1.6.3 Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla

- 1.6.3.1 Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla vyrobené před vstupem v platnost předpisů platných od 1. října 1978, smějí být dále používány, jestliže výstroj nádrží odpovídá požadavkům kapitoly 6.8. Tloušťka stěny nádrží, kromě nádrží určených pro přepravu hluboce zchlazených zkapalněných plynů třídy 2, musí odpovídat výpočtovému tlaku nejméně 0,4 MPa (4 bary) (přetlak) v případě měkké oceli, nebo nejméně 200 kPa (2 bary) (přetlak) v případě hliníku nebo hliníkových slitin. Pro cisterny s jiným než kruhovým průřezem se musí vzít za základ výpočtu průměr, z něhož vypočtený plošný obsah kruhu je roven skutečnému plošnému obsahu průřezu cisterny.
- 1.6.3.2 Periodické zkoušky nesnímatelných cisteren (cisternových vozidel), snímatelných cisteren a bateriových vozidel ponechaných v provozu podle těchto přechodných ustanovení musí být prováděny podle požadavků uvedených v pododdílech 6.8.2.4 a 6.8.3.4 a podle zvláštních požadavků pro jednotlivé třídy. Pokud dřívější ustanovení nepředepisovala vyšší zkušební tlak, pak je pro nádrže z hliníku a hliníkových slitin postačující zkušební tlak 200 kPa (2 bary) (přetlak).
- 1.6.3.3 Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla, které splňují přechodná ustanovení uvedená v pododdílech 1.6.3.1 a 1.6.3.2, mohou být používány až do 30. září 1993 pro přepravu nebezpečných věcí, pro které byly schváleny. Toto přechodné období se nevztahuje na nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla určené pro přepravu látek třídy 2, ani na nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla, jejichž tloušťka stěny a části výstroje splňují požadavky kapitoly 6.8.

- 1.6.3.4 (a) Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla vyrobené před 1. květnem 1985 podle předpisů ADR platných od 1. října 1978 do 30. dubna 1985, avšak nesplňující ustanovení platná od 1. května 1985, smějí být dále používány po tomto datu.
- (b) Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla vyrobené mezi 1. květnem 1985 a datem vstupu v platnost ustanovení platných od 1. ledna 1988, které tato ustanovení nesplňují, ale byly vyrobeny podle ustanovení ADR platných do tohoto data, smějí být dále používány ještě po tomto datu.
- 1.6.3.5 Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla vyrobené před 1. lednem 1993 podle předpisů platných do 31. prosince 1992, které však nesplňují předpisy platné od 1. ledna 1993, smějí být dále používány.
- 1.6.3.6 (a) Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla vyrobené mezi 1. lednem 1978 a 31. prosincem 1984 musí, pokud budou používány po 31. prosinci 2004, splňovat ustanovení bodu 211 127 (5) platná od 1. ledna 1990 týkající se tloušťky nádrží a ochrany proti poškození;
- (b) Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla vyrobené mezi 1. lednem 1985 a 31. prosincem 1989 musí, pokud budou používány po 31. prosinci 2010, splňovat ustanovení bodu 211 127 (5) platná od 1. ledna 1990 týkající se tloušťky nádrží a ochrany proti poškození.
- 1.6.3.7 Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla vyrobené před 1. lednem 1999 podle předpisů platných do 31. prosince 1998, které však nesplňují předpisy platné od 1. ledna 1999, smějí být dále používány.
- 1.6.3.8 Jestliže byla v důsledku změn ADR některá oficiální pojmenování plynů pozměněna, není nutno měnit pojmenování na štítku nebo na vlastní nádrži (viz 6.8.3.5.2 nebo 6.8.3.5.3), pokud se pojmenování plynů na nesnímatelných cisternách (cisternových vozidlech), snímatelných cisternách a bateriových vozidlech nebo na štítcích /viz 6.8.3.5.6 (b) nebo (c)/ upraví při nejbližší periodické zkoušce.
- 1.6.3.9 a 1.6.3.10 (Vyhrazeno)
- 1.6.3.11 Nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny vyrobené před 1. lednem 1997 podle předpisů platných do 31. prosince 1996, které však nesplňují požadavky bodů 211 332 a 211 333 platné od 1. ledna 1997, smějí být dále používány.
- 1.6.3.12 (Vyhrazeno)
- 1.6.3.13 (Vypuštěno)
- 1.6.3.14 (Vyhrazeno)
- 1.6.3.15 (Vypuštěno)
- 1.6.3.16 Pro nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla vyrobené před 1. červencem 2007, které nesplňují ustanovení oddílu 4.3.2, jakož i pododdílů, 6.8.2.4 a 6.8.3.4, co se týče složky dokladů k cisterně, musí být uchovávání dokladů pro složku dokladů k cisterně zahájeno nejpozději při příští periodické inspekci.
- 1.6.3.17 Nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny určené pro přepravu látek třídy 3, obalové skupiny I s tenzí par při 50 °C nejvýše 175 kPa (1,75 baru) (absolutní), vyrobené před 1. červencem 2007 podle předpisů platných do 31. prosince 2006, kterým byl přiřazen kód cisterny L1,5BN podle předpisů platných do 31. prosince 2006, smějí být dále používány pro přepravu výše uvedených látek až do 31. prosince 2018.

- 1.6.3.18 Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla vyrobené před 1. lednem 2003 podle předpisů platných do 30. června 2001, které však nesplňují předpisy platné od 1. července 2001, smějí být dále používány, pokud bylo provedeno přiřazení k příslušnému kódu cisterny.
- 1.6.3.19 Nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny vyrobené před 1. lednem 2003 podle ustanovení uvedených v 6.8.2.1.21 platných do 31. prosince 2002, které však nesplňují předpisy platné od 1. ledna 2003, smějí být dále používány.
- 1.6.3.20 Nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny vyrobené před 1. červencem 2003 podle předpisů platných do 31. prosince 2002, které však nesplňují požadavky 6.8.2.1.7, platné od 1. ledna 2003 a zvláštní ustanovení TE15 oddílu 6.8.4 (b) platné od 1. ledna 2003 do 31. prosince 2006, mohou být dále používány.
- 1.6.3.21 (Vypuštěno)
- 1.6.3.22 až 1.6.3.24 (Vyhrazeno)
- 1.6.3.25 (Vypuštěno)
- 1.6.3.26 Nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny vyrobené před 1. lednem 2007 podle předpisů platných do 31. prosince 2006, které však nesplňují předpisy platné od 1. ledna 2007 týkající se vyznačení vnějšího výpočtového tlaku podle 6.8.2.5.1, mohou být dále používány.
- 1.6.3.27 až 1.6.3.29 (Vyhrazeno)
- 1.6.3.30 Nesnímatelné cisterny (cisternová vozidla) pro podtlakové vyčerpávání odpadů a snímatelné cisterny vyrobené před 1. červencem 2005 podle ustanovení platných do 31. prosince 2004, které však nevyhovují ustanovením pododdílu 6.10.3.9 platným od 1. ledna 2005, smějí být dále používány.
- 1.6.3.31 Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a cisterny tvořící prvky bateriových vozidel zkonstruované a vyrobené podle technických předpisů, které byly uznávány v době jejich výroby podle ustanovení 6.8.2.7, která platila v té době, smějí být dále používány.
- 1.6.3.32 Nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny vyrobené před 1. červencem 2007 podle předpisů platných do 31. prosince 2006, vybavené víky průlezů podle ustanovení normy EN 13317:2002, zmíněné v tabulce odstavce 6.8.2.6 platného do 31. prosince 2006, včetně ustanovení obrázku a tabulky B.2 přílohy B uvedené normy, která již nejsou od 1. ledna 2007 akceptována, nebo jejichž materiál nesplňuje požadavky normy EN 13094:2004, odstavce 5.2, smějí být dále používány.
- 1.6.3.33 Pokud byla nádrž nesnímatelné cisterny (cisternového vozidla) nebo snímatelné cisterny již před 1. lednem 2009 rozdělena přepážkami nebo peřejníky na oddíly o vnitřním objemu nejvýše 7 500 litrů, nemusí být vnitřní objem nádrže doplněn symbolem „S“ v údajích vyžadovaných odstavcem 6.8.2.5.1 až do provedení příští periodické inspekce podle 6.8.2.4.2.
- 1.6.3.34 Bez ohledu na ustanovení odstavce 4.3.2.2.4, nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny určené pro přepravu zkapalněných plynů nebo hluboce zchlazených zkapalněných plynů, které splňují platné konstrukční požadavky ADR, ale byly před 1. červencem 2009 rozděleny přepážkami nebo peřejníky na oddíly o vnitřním objemu větším než 7 500 litrů, smějí být dále plněny do více než 20 % a méně než 80 % svého vnitřního objemu.
- 1.6.3.35 (Vypuštěno)
- 1.6.3.36 Nesnímatelné cisterny (cisternová vozidla) určené pro přepravu zkapalněných netoxických hořlavých plynů a vyrobené před 1. červencem 2011, které jsou vybaveny zpětnými ventily namísto vnitřních uzavíracích ventilů a které neodpovídají požadavkům uvedeným v 6.8.3.2.3, smějí být dále používány.
- 1.6.3.37 (Vypuštěno)

- 1.6.3.38 Nesnímatelné cisterny (cisternová vozidla), snímatelné cisterny a bateriová vozidla zkonstruované a vyrobené podle norem platných v době jejich výroby (viz 6.8.2.6 a 6.8.3.6) podle ustanovení ADR, která platila v té době, smějí být dále používány, pokud to není omezeno zvláštním přechodným ustanovením.
- 1.6.3.39 Nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny vyrobené před 1. červencem 2011 podle požadavků uvedených v 6.8.2.2.3, platných do 31. prosince 2010, které však neodpovídají požadavkům uvedeným v 6.8.2.2.3, třetí odstavec, týkajícím se umístění vhodné pojistky proti prošlehnutí plamene nebo ochrany proti prošlehnutí plamene, smějí být dále používány.
- 1.6.3.40 Pro látky toxické při vdechování UN čísel 1092, 1238, 1239, 1244, 1251, 1510, 1580, 1810, 1834, 1838, 2474, 2486, 2668, 3381, 3383, 3385, 3387 a 3389 smí být kód cisteren uvedený ve sloupci (12) tabulky A kapitoly 3.2, platný do 31. prosince 2010, dále používán až do 31. prosince 2016 pro nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny vyrobené před 1. červencem 2011.
- 1.6.3.41 Nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny vyrobené před 1. červencem 2013 podle předpisů platných do 31. prosince 2012, které však neodpovídají požadavkům na značení uvedeným v 6.8.2.5.2 nebo 6.8.3.5.6 platným od 1. ledna 2013, smějí být dále označeny podle předpisů platných do 31. prosince 2012 až do příští periodické inspekce po 1. červenci 2013.
- 1.6.3.42 Pro UN 2381 smí být kód cisteren udaný ve sloupci (12) tabulky A kapitoly 3.2, platný do 31. prosince 2012, dále používán až do 31. prosince 2018 pro nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny vyrobené před 1. červencem 2013.
- 1.6.3.43 Nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny vyrobené před 1. lednem 2012 podle předpisů platných do 31. prosince 2012, které však neodpovídají požadavkům uvedeným v 6.8.2.6, týkajícím se norem EN 14432:2006 a EN 14433:2006, platným od 1. ledna 2011, smějí být dále používány.
- 1.6.3.44 Nesnímatelné cisterny (cisternová vozidla) a snímatelné cisterny určené pro přepravu látek UN čísel 1202, 1203, 1223, 3475 nebo leteckého paliva zařazeného pod UN čísla 1268 nebo 1863, vybavené aditivačními zařízeními zkonstruovanými a vyrobenými před 1. červencem 2015 podle ustanovení vnitrostátních předpisů, které však neodpovídají požadavkům na konstrukci, schvalování a zkoušení zvláštního ustanovení 664 kapitoly 3.3 platným od 1. ledna 2015, smějí být dále používány až do své první meziperiodické nebo periodické inspekce po 31. prosinci 2015. Po tomto datu smějí být používány jen se schválením příslušných orgánů zemí používání.
- 1.6.3.45 až 1.6.3.49 (Vyhrazeno)

1.6.3.50 Cisterny z vyztužených plastů (FRP)

Cisterny z vyztužených plastů (FRP) vyrobené před 1. červencem 2002 podle konstrukčního typu schváleného před 1. červencem 2001 podle předpisů dodatku B.1c, které byly v platnosti do 30. června 2001, mohou být dále používány až ukončení jejich životnosti, pokud všechny předpisy platné do 30. června 2001 byly a jsou nadále plněny.

Avšak od 1. července 2001 nebude moci být již žádný nový konstrukční typ schválen podle předpisů platných do 30. června 2001.

1.6.4 Cisternové kontejnery, přemístitelné cisterny a MEGC

- 1.6.4.1 Cisternové kontejnery vyrobené před 1. lednem 1988 podle předpisů platných do 31. prosince 1987, které však nesplňují předpisy platné od 1. ledna 1988, mohou být dále používány.
- 1.6.4.2 Cisternové kontejnery vyrobené před 1. lednem 1993 podle předpisů platných do 31. prosince 1992, které však nesplňují předpisy platné od 1. ledna 1993, mohou být dále používány.
- 1.6.4.3 Cisternové kontejnery vyrobené před 1. lednem 1999 podle předpisů platných do 31. prosince 1998, které však nesplňují předpisy platné od 1. ledna 1999, mohou být dále používány.

- 1.6.4.4 (Vyhrazeno)
- 1.6.4.5 Jestliže byla v důsledku změn ADR některá oficiální pojmenování plynů pozměněna, není nutno měnit pojmenování na štítku nebo na vlastní nádrži (viz 6.8.3.5.2 nebo 6.8.3.5.3), pokud se pojmenování plynů na cisternových kontejnerech a MEGC nebo na štítcích /viz 6.8.3.5.6 (b) nebo (c)/ upraví při nejbližší periodické zkoušce.
- 1.6.4.6 Cisternové kontejnery vyrobené před 1. lednem 2007 podle předpisů platných do 31. prosince 2006, které však nesplňují předpisy platné od 1. ledna 2007, které se týkají vyznačení vnějšího výpočtového tlaku podle 6.8.2.5.1, mohou být dále používány.
- 1.6.4.7 Cisternové kontejnery vyrobené před 1. lednem 1997 podle předpisů platných do 31. prosince 1996, které však nesplňují požadavky bodů 212 332 a 212 333 platné od 1. ledna 1997, smějí být dále používány.
- 1.6.4.8 (Vyhrazeno)
- 1.6.4.9 Cisternové kontejnery a MEGC zkonstruované a vyrobené podle technických předpisů, které byly uznávány v době jejich výroby podle ustanovení 6.8.2.7, která platila v té době, smějí být dále používány.
- 1.6.4.10 (Vypuštěno)
- 1.6.4.11 (Vyhrazeno)
- 1.6.4.12 Cisternové kontejnery a MEGC vyrobené před 1. lednem 2003 podle předpisů platných do 30.června 2001, které však nesplňují předpisy platné od 1. července 2001, smějí být dále používány.
- Avšak musí být označeny příslušným kódem cisterny, a, pokud je to náležité, příslušnými alfanumerickými kódy zvláštních ustanovení TC a TE podle 6.8.4.
- 1.6.4.13 Cisternové kontejnery vyrobené před 1. červencem 2003 podle předpisů platných do 31. prosince 2002, které však nesplňují požadavky 6.8.2.1.7, platné od 1. ledna 2003 a zvláštní ustanovení TE15 oddílu 6.8.4 (b) platné od 1. ledna 2003 do 31. prosince 2006, smějí být dále používány.
- 1.6.4.14 (Vyhrazeno)
- 1.6.4.15 Druh zkoušky („P“ nebo „L“) vyžadovaný podle 6.8.2.5.1 je třeba doplnit na štítek cisterny teprve při první předepsané zkoušce po 1. lednu 2007.
- 1.6.4.16 (Vypuštěno)
- 1.6.4.17 (Vypuštěno)
- 1.6.4.18 Pro cisternové kontejnery a MEGC vyrobené před 1. lednem 2007, které nesplňují ustanovení oddílu 4.3.2, jakož i pododdílů 6.8.2.4 a 6.8.3.4 co se týče složky dokladů k cisterně, musí být uchovávání dokladů pro složku dokladů k cisterně zahájeno nejpozději při příští periodické inspekci.
- 1.6.4.19 Cisternové kontejnery určené pro přepravu látek třídy 3, obalové skupiny I s tenzí par při 50 °C nejvýše 175 kPa (1,75 baru) (absolutní), vyrobené před 1. červencem 2007 podle předpisů platných do 31. prosince 2006, kterým byl přiřazen kód cisterny L1,5BN podle předpisů platných do 31. prosince 2006, smějí být dále používány pro přepravu výše uvedených látek až do 31. prosince 2016.
- 1.6.4.20 Cisternové kontejnery pro podtlakové vyčerpávání odpadů vyrobené před 1. červencem 2005 podle požadavků platných do 31. prosince 2004, které však neodpovídají požadavkům pododdílu 6.10.3.9 platným od 1. ledna 2005, smějí být dále používány.
- 1.6.4.21 až 1.6.4.29 (Vyhrazeno)

- 1.6.4.30 Přemístitelné cisterny a UN MEGC, které nesplňují konstrukční požadavky platné od 1. ledna 2007, ale které byly vyrobeny podle osvědčení o schválení typu, které bylo vydáno před 1. lednem 2008, smějí být dále používány.
- 1.6.4.31 (Vypuštěno)
- 1.6.4.32 Pokud byla nádrž cisternového kontejneru již před 1. lednem 2009 rozdělena přepážkami nebo peřejníky na oddíly o vnitřním objemu nejvýše 7.500 litrů, nemusí být vnitřní objem nádrže doplněn symbolem „S“ v údajích vyžadovaných odstavcem 6.8.2.5.1 až do provedení příští periodické inspekce podle odstavce 6.8.2.4.2.
- 1.6.4.33 Bez ohledu na ustanovení odstavce 4.3.2.2.4, cisternové kontejnery určené pro přepravu zkapalněných plynů nebo hluboce zchlazených zkapalněných plynů, které splňují platné konstrukční požadavky ADR, ale byly před 1. červencem 2009 rozděleny přepážkami nebo peřejníky na oddíly o vnitřním objemu větším než 7 500 litrů, smějí být dále plněny do více než 20 % a méně než 80 % svého vnitřního objemu.
- 1.6.4.34 (Vypuštěno)
- 1.6.4.35 (Vypuštěno)
- 1.6.4.36 Pro látky, u nichž je ve sloupci (11) tabulky A kapitoly 3.2 uvedeno TP37, smí být pokyn pro přemístitelné cisterny předepsaný v ADR platné do 31. prosince 2010 dále používán až do 31. prosince 2016.
- 1.6.4.37 Přemístitelné cisterny a MEGC vyrobené před 1. lednem 2012, které vyhovují požadavkům na značení v 6.7.2.20.1, 6.7.3.16.1, 6.7.4.15.1 nebo 6.7.5.13.1 platným do 31. prosince 2010, jak je to náležité, smějí být dále používány, jestliže splňují všechny ostatní příslušné požadavky ADR platné od 1. ledna 2011, včetně, pokud je to aplikovatelné, požadavku uvedeného v 6.7.2.20.1 (g) na značení symbolem „S“ na štítku, pokud je nádrž nebo komora rozdělena peřejníky na oddíly o vnitřním objemu nejvýše 7 500 litrů. Pokud byla nádrž nebo komora rozdělena peřejníky na oddíly o vnitřním objemu nejvýše 7 500 litrů již před 1. lednem 2012, nemusí být vnitřní objem nádrže nebo popřípadě komory doplněn symbolem „S“ až do provedení příští periodické inspekce nebo zkoušky podle 6.7.2.19.5.
- 1.6.4.38 Přemístitelné cisterny vyrobené před 1. lednem 2014 nemusí být označeny pokynem pro přemístitelné cisterny, jak je vyžadováno v 6.7.2.20.2, 6.7.3.16.2 a 6.7.4.15.2, až do příští periodické inspekce a zkoušky.
- 1.6.4.39 Cisternové kontejnery a MEGC zkonstruované a vyrobené podle norem platných v době jejich výroby (viz 6.8.2.6 a 6.8.3.6) podle ustanovení ADR, která platila v té době, smějí být dále používány, pokud to není omezeno zvláštním přechodným ustanovením.
- 1.6.4.40 Cisternové kontejnery vyrobené před 1. červencem 2011 podle požadavků uvedených v 6.8.2.2.3, platných do 31. prosince 2010, které však neodpovídají požadavkům uvedeným v 6.8.2.2.3, třetí odstavce, týkající se umístění pojistky proti prošlehnutí plamene nebo ochrany proti prošlehnutí plamene, smějí být dále používány.
- 1.6.4.41 Pro látky toxické při vdechování UN čísel 1092, 1238, 1239, 1244, 1251, 1510, 1580, 1810, 1834, 1838, 2474, 2486, 2668, 3381, 3383, 3385, 3387 a 3389 smí být kód cisteren uvedený ve sloupci (12) tabulky A kapitoly 3.2, platný do 31. prosince 2010, dále používán až do 31. prosince 2016 pro cisternové kontejnery vyrobené před 1. červencem 2011.
- 1.6.4.42 Cisternové kontejnery vyrobené před 1. červencem 2013 podle předpisů platných do 31. prosince 2012, které však neodpovídají požadavkům na značení uvedeným v 6.8.2.5.2 nebo 6.8.3.5.6 platným od 1. ledna 2013, smějí být dále označeny podle předpisů platných do 31. prosince 2012 až do příští periodické inspekce po 1. červenci 2013.

- 1.6.4.43 Přemístitelné cisterny a MEGC vyrobené před 1. lednem 2014 nemusí vyhovovat požadavkům uvedeným v 6.7.2.13.1 (f), 6.7.3.9.1 (e), 6.7.4.8.1 (e) a 6.7.5.6.1 (d) týkajícím se značení zařízení pro vyrovnávání tlaku.
- 1.6.4.44 Pro látky, u nichž je ve sloupci (11) tabulky A kapitoly 3.2 uvedeno TP38 nebo TP39, smí být pokyn pro přemístitelné cisterny předepsaný v ADR platné do 31. prosince 2012 dále používán až do 31. prosince 2018.
- 1.6.4.45 Pro UN 2381 smí být kód cisteren udaný ve sloupci (12) tabulky A kapitoly 3.2, platný do 31. prosince 2012, dále používán až do 31. prosince 2018 pro cisternové kontejnery vyrobené před 1. červencem 2013.
- 1.6.4.46 Cisternové kontejnery vyrobené před 1. lednem 2012 podle předpisů platných do 31. prosince 2012, které však neodpovídají požadavkům uvedeným v 6.8.2.6, týkajícím se norem EN 14432:2006 a EN 14433:2006, platným od 1. ledna 2011, smějí být dále používány.

1.6.5 Vozidla

- 1.6.5.1 až 1.6.5.2 (Vyhrazeno)
- 1.6.5.3 (Vypuštěno)
- 1.6.5.4 Pokud jde o konstrukci vozidel EX/II, EX/III, FL, OX a AT, smějí být předpisy části 9 platné do 31. prosince 2014 používány až do 31. března 2016.
- 1.6.5.5 Vozidla registrovaná nebo uvedená do provozu před 1. lednem 2003, jejichž elektrické příslušenství nesplňuje požadavky oddílů 9.2.2, 9.3.7 nebo 9.7.8, avšak splňuje předpisy platné do 30. června 2001, mohou být dále používána.
- 1.6.5.6 (Vypuštěno)
- 1.6.5.7 Kompletní nebo zkompletovaná vozidla, která byla typově schválena před 31. prosincem 2002 podle Předpisu EHK č. 105¹ pozměněného sérií změn 01, nebo podle příslušných ustanovení Směrnice 98/91/ES² a která nesplňují požadavky kapitoly 9.2, ale splňují požadavky na konstrukci základních vozidel (body 220 100 až 220 540 dodatku B.2) platné do 30. června 2001, mohou být dále schvalována a používána, za podmínky, že byla poprvé registrována nebo uvedena do provozu před 1. červencem 2003.
- 1.6.5.8 Vozidla EX/II a EX/III, která byla poprvé schválena před 1. červencem 2005 a která splňují požadavky části 9 platné do 31. prosince 2004, ale nesplňují požadavky platné od 1. ledna 2005, mohou být dále používána.
- 1.6.5.9 Cisternová vozidla s nesnímatelnými cisternami o vnitřním objemu větším než 3 m³, určená pro přepravu nebezpečných látek v kapalném nebo roztaveném stavu, zkoušená tlakem nižším než 4 bary, která nesplňují požadavky pododdílu 9.7.5.2 a byla poprvé registrována nebo uvedena do provozu, není-li registrace povinná před 1. červencem 2004, mohou být dále používána.
- 1.6.5.10 Osvědčení o schválení, která odpovídají vzoru uvedenému v 9.1.3.5, platnému do 31. prosince 2006 a osvědčení o schválení, která odpovídají vzoru uvedenému v 9.1.3.5, platnému od 1. ledna 2007 do

¹ Předpis č. 105 (Jednotná ustanovení pro schvalování vozidel určených pro přepravu nebezpečných věcí s ohledem na jejich specifické konstrukční vlastnosti).

² Směrnice 98/91/ES Evropského parlamentu a Rady ze dne 14. prosince 1998 o motorových vozidlech a jejich přípojných vozidlech určených pro silniční přepravu nebezpečných věcí, pozměňující Směrnici 70/156/EES o schválení typu motorových vozidel a jejich přípojných vozidel (Official Journal of the European Communities No. L 011 ze dne 16.1.1999, str. 0025 – 0036).

31. prosince 2008, mohou být dále používána. Osvědčení o schválení, která odpovídají vzoru uvedenému v 9.1.3.5, platnému od 1. ledna 2009 do 31. prosince 2014, mohou být dále používána.

- 1.6.5.11 MEMU, které byly vyrobeny a schváleny před 1. lednem 2009 podle ustanovení vnitrostátních právních předpisů, které však neodpovídají konstrukčním a schvalovacím předpisům platným od 1. ledna 2009, smějí být používány se schválením příslušných orgánů v zemích, v nichž se používají.
- 1.6.5.12 Vozidla EX/III a FL registrovaná nebo uvedená do provozu před 1. dubnem 2012, jejichž elektrická spojení nesplňují požadavky v 9.2.2.6.3, ale splňují požadavky platné do 31. prosince 2010, smějí být dále používána.
- 1.6.5.13 Přípojná vozidla poprvé registrovaná (nebo která byla uvedena do provozu, jestliže registrace nebyla povinná) před 1. červencem 1995, vybavená antiblokovacím brzdovým systémem vyhovujícím Předpisu EHK č. 13, sérii změn 06, který však nesplňuje technické požadavky na antiblokovací brzdový systém kategorie A, smějí být dále používána.
- 1.6.5.14 MEMU, která byla schválena před 1. červencem 2013 podle ustanovení ADR platných do 31. prosince 2012, která však neodpovídají požadavkům uvedeným v 6.12.3.1.2 nebo 6.12.3.2.2 platným od 1. ledna 2013, smějí být dále používána.
- 1.6.5.15 Pokud jde o aplikaci ustanovení části 9, vozidla, která byla poprvé registrována nebo uvedena do provozu před 1. listopadem 2014 a která byla schválena podle ustanovení směrnic zrušených Nařízením (ES) č. 661/2009³, smějí být dále používána.

1.6.6 Třída 7

1.6.6.1 ***Kusy nevyžadující schválení konstrukce příslušným orgánem podle vydání z let 1985 a 1985 (se změnami 1990) předpisů IAEA Safety Series No. 6***

Kusy, které nevyžadují schválení konstrukce příslušným orgánem (vyjmuté kusy, kusy typu IP-1, typu IP-2, typu IP-3 a typu A), musí zcela splňovat předpisy ADR, s výjimkou toho, že kusy, které splňují předpisy vydání z roku 1985 nebo 1985 (se změnami 1990) Pravidel pro bezpečnou přepravu radioaktivních látek Mezinárodní agentury pro atomovou energii (série č. 6) /IAEA Regulations for the Transport of Radioactive Material (IAEA Safety Series No. 6):

- (a) smějí být nadále přepravovány, pokud byly připraveny k přepravě před 31. prosincem 2003 a za dodržení požadavků uvedených v 1.6.6.3, jsou-li relevantní;
- (b) smějí být nadále používány, za podmínky, že:
 - (i) nebyly zkonstruovány k tomu, aby obsahovaly hexafluorid uranu;
 - (ii) příslušné požadavky uvedené v 1.7.3 jsou splněny;
 - (iii) meze aktivity a klasifikace uvedené v 2.2.7 jsou dodrženy;
 - (iv) požadavky a kontroly pro přepravu v částech 1, 3, 4, 5 a 7 jsou splněny;
 - (v) obal nebyl vyroben ani modifikován po 31. prosinci 2003.

1.6.6.2 ***Kusy schválené podle vydání z let 1973, 1973 (se změnami), 1985 a 1985 (se změnami 1990) IAEA Safety Series No. 6***

- 1.6.6.2.1 Kusy, které vyžadují schválení konstrukce příslušným orgánem, musí zcela splňovat předpisy ADR, ledaže jsou splněny následující podmínky:

³ Nařízení (ES) č. 661/2009 z 13. července 2009 o požadavcích pro schvalování typu motorových vozidel, jejich přípojných vozidel a systémů, konstrukčních částí a samostatných technických celků určených pro tato vozidla z hlediska obecné bezpečnosti (Úřední věstník L 200 z 31.7.2009, p. 1).

- (a) Obaly byly vyrobeny podle konstrukčního vzoru kusu schváleného příslušným orgánem podle ustanovení vydání z roku 1973 nebo 1973 (se změnami) nebo 1985 nebo 1985 (se změnami 1990) předpisu IAEA Safety Series No. 6;
- (b) Konstrukční vzor kusu podléhá vícestrannému schválení;
- (c) Příslušné požadavky uvedené v 1.7.3 jsou splněny;
- (d) Meze aktivity a klasifikace uvedené v 2.2.7 jsou dodrženy;
- (e) Požadavky a kontroly pro přepravu v částech 1, 3, 4, 5 a 7 jsou splněny;
- (f) (Vyhrazeno)
- (g) Pro kusy, které splňují ustanovení vydání z roku 1973 nebo 1973 (se změnami 1990) předpisu IAEA Safety Series No. 6:
 - (i) Kusy mají dostatečné stínění, aby bylo zajištěno, že dávkový příkon ve vzdálenosti 1 m od povrchu kusu nepřekročí 10 mSv/h v nehodových podmínkách přepravy, definovaných v revidovaném vydání z roku 1973 nebo revidovaném vydání z roku 1973 (se změnami) předpisu IAEA Safety Series No. 6, s maximálním radioaktivním obsahem, který je pro kus dovolen;
 - (ii) Kusy nepoužívají kontinuální ventilaci;
 - (iii) Sériové číslo podle ustanovení uvedených v 5.2.1.7.5 je přiděleno a vyznačeno na vnější straně každého obalu.

1.6.6.2 Žádnou novou výrobu obalů podle konstrukčního vzoru kusu splňujícího ustanovení vydání z roku 1973, 1973 (se změnami), 1985 a 1985 (se změnami 1990) předpisu IAEA Safety Series No. 6 není dovoleno zahájit. 1.6.6.3 Kusy vyjmuté z předpisů pro štěpné látky podle vydání ADR 2011 a 2013 (vydání 2009 předpisu IAEA Safety Standard Series No. TS-R-1)

1.6.6.3 *Kusy vyjmuté z předpisů pro štěpné látky podle vydání ADR 2011 a 2013 (vydání 2009 předpisu IAEA Safety Standard Series No. TS-R-1)*

Kusy obsahující štěpné látky, které jsou vyjmuty z klasifikace látky jako „ŠTĚPNÁ“ podle 2.2.7.2.3.5 (a) (i) nebo (iii) vydání ADR 2011 a 2013 (odst. 417 (a) (i) nebo (iii) vydání 2009 předpisu IAEA Pravidla pro bezpečnou přepravu radioaktivních látek), připravené k přepravě před 31. prosincem 2014, smějí být nadále přepravovány a smějí být nadále klasifikovány jako neštěpné nebo štěpné vyjmuté, s výjimkou toho, že se hmotnostní meze na dodávku (zásilku) uvedené v tabulce 2.2.7.2.3.5 těchto vydání vztáhnou na vozidlo. Zásilka musí být přepravována za výlučného použití.

1.6.6.4 *Radioaktivní látky zvláštní formy schválené podle vydání z let 1973, 1973 (se změnami), 1985 a 1985 (se změnami 1990) IAEA Safety Series No. 6*

Radioaktivní látky zvláštní formy vyrobené podle konstrukčního vzoru, který byl jednostranně schválen příslušným orgánem podle vydání 1973, 1973 (se změnami), 1985 a 1985 (se změnami 1990) IAEA Safety Series No. 6 mohou být dále používány, pokud jsou v souladu s povinným systémem řízení podle příslušných předpisů uvedených v oddílu 1.7.3. Žádnou novou výrobu takových radioaktivních látek zvláštní formy není dovoleno zahájit.

KAPITOLA 1.7

VŠEOBECNÉ PŘEDPISY PRO RADIOAKTIVNÍ LÁTKY

1.7.1 Rozsah a použití

POZNÁMKA 1: V případě nehod nebo událostí v průběhu přepravy radioaktivních látek, musí být plněna nouzová opatření k ochraně osob, majetku a životního prostředí tak jak je stanoveno relevantními národními a/nebo mezinárodními organizacemi. Příslušné směrnice jsou obsaženy v dokumentu „Plánování a příprava havarijní odezvy při nehodách zahrnující radioaktivní látky“, bezpečnostní norma Safety Standard Series N. TS-G-1.2 (ST-3), vydaná IAEA, Vídeň (2002).

POZNÁMKA 2: Bezpečnostní postupy musí zahrnovat možnost přítomnosti jiných nebezpečných látek, které mohou ovlivnit reakci mezi obsahem zásilky a životním prostředím v případě nehody.

1.7.1.1 ADR stanoví normy bezpečnosti, které obsahují přijatelnou úroveň kontroly zařízení, kritického stavu a tepelného ohrožení osob, majetku a životního prostředí, spojených s přepravou radioaktivních látek. Tyto normy jsou založeny na dokumentu „IAEA Regulations for the Safe Transport of Radioactive material, vydání 2012 Edition, IAEA Safety Standards Series No. SSR-6, IAEA, Vienna (2012)“. Vysvětlující materiál je možno nalézt v „Advisory Material for the IAEA Regulations for the Safe Transport of Radioactive Material (2012 Edition)“, IAEA Safety Standards Series No. SSG-26, IAEA, Vienna (2014).

1.7.1.2 Cílem ADR je stanovit požadavky, které musí být splněny, aby se zajistila bezpečnost a ochrana osob, majetku a životního prostředí před účinky záření při přepravě radioaktivních látek. Tato ochrana je dosažena vyžadováním:

- (a) uzavření radioaktivního obsahu;
- (b) kontrolou vnějších dávkových příkonů;
- (c) zabránění kritickému stavu; a
- (d) zamezení škodám způsobeným teplem.

Tyto požadavky se uspokojují za prvé uplatňováním odstupňovaného přístupu k limitům obsahu pro kusy a vozidla a uplatněním norem týkajících se konstrukce kusu v závislosti na riziku, které představuje radioaktivní obsah. Za druhé se uspokojují uplatňováním předpisů pro konstrukci a používání kusů a pro údržbu obalů s přihlédnutím k povaze radioaktivního obsahu. Dále jsou uspokojovány vyžadováním administrativních kontrol a popřípadě schválením příslušnými orgány.

1.7.1.3 ADR se vztahuje na silniční přepravu radioaktivních látek včetně přepravy, která souvisí s používáním radioaktivních látek. Přeprava zahrnuje všechny činnosti a podmínky spojené a vyvolané přemísťováním radioaktivních látek; ty pak zahrnují konstrukci, výrobu, údržbu a opravy obalů a přípravu, odeslání, nakládku, přepravu včetně tranzitního skladování, vykládku a příjem v konečném místě určení nákladů radioaktivních látek a kusů. Aplikuje se odstupňovaný přístup ke stanovení požadavků v ADR, které jsou charakterizovány třemi všeobecnými stupni přísnosti:

- (a) Běžné podmínky přepravy (bez nehod);
- (b) Normální podmínky přepravy (drobné nehody);
- (c) Nehodové podmínky přepravy.

1.7.1.4 Ustanovení předepsaná v ADR se nevztahují na následující případy:

- (a) Radioaktivní látky, které jsou integrální součástí dopravních prostředků;

- (b) Radioaktivní látky, které jsou přepravovány uvnitř podniku, kde podléhají příslušným bezpečnostním předpisům platným v tomto podniku a kde přeprava neprobíhá po veřejných komunikacích nebo kolejových cestách;
- (c) Radioaktivní látky, které jsou implantovány nebo vloženy do organismu osob nebo živých zvířat pro diagnostické nebo terapeutické účely;
- (d) Radioaktivní látky, které byly náhodně nebo úmyslně vpraveny do těla osoby nebo kterými byla osoba kontaminována a má být z tohoto důvodu přepravována k lékařskému ošetření.
- (e) Radioaktivní látky ve výrobcích určených ke spotřebě, které obdržely příslušné schválení příslušného orgánu, pokud následuje jejich prodej koncovému uživateli;
- (f) Přírodní látky a rudy obsahující radionuklidy, které se v přírodě vyskytují (které mohou být zpracovány pro použití těchto radionuklidů), za předpokladu, že specifická aktivita těchto látek nepřekročí desetinásobek hodnot udaných v tabulce 2.2.7.2.2.1, nebo vypočítaných v souladu s 2.2.7.2.2.2 (a) a od 2.2.7.2.2.3 do 2.2.7.2.2.6. Pro přírodní látky a rudy obsahující radionuklidy, které se v přírodě vyskytují a které nejsou v trvalé rovnováze, musí být výpočet specifické aktivity proveden v souladu s 2.2.7.2.2.4;
- (g) neradioaktivní tuhé předměty s radioaktivními látkami přítomnými na jakémkoli povrchu v množstvích nepřevyšujícím mezní hodnotu stanovenou v definici „kontaminace“ v 2.2.7.1.2.

1.7.1.5 Zvláštní ustanovení pro přepravu vyjmutých kusů

1.7.1.5.1 Vyjmuté kusy, které smějí obsahovat radioaktivní látky v omezených množstvích, přístroje, výrobky, nebo prázdné obaly, jak jsou specifikovány v 2.2.7.2.4.1, podléhají pouze následujícím ustanovením částí 5 až 7:

- (a) relevantní z ustanovení uvedených v 5.1.2.1, 5.1.3.2, 5.1.5.2.2, 5.1.5.2.3, 5.1.5.4, 5.2.1.9, 7.5.11 CV33 (3.1), (5.1) to (5.4) and (6); a
- (b) požadavky na vyjmuté kusy, specifikované v ustanovení 6.4.4.,

s výjimkou radioaktivních látek vykazujících další nebezpečné vlastnosti a které proto musí být klasifikovány v jiné třídě, než je třída 7 podle zvláštních ustanovení 290 nebo 369 kapitoly 3.3, kdy ustanovení (a) a (b) uvedená výše jsou aplikována pouze přiměřeně navíc k těm, vztahujícím se k hlavní třídě.

1.7.1.5.2 Vyjmuté kusy podléhají příslušným ustanovením všech ostatních částí ADR. Obsahuje - li vyjmutá zásilka štěpnou látku na základě jedné z výjimek, které poskytuje 2.2.7.2.3.5, musí být splněny požadavky 7.5.11 CV33 (4.3).

1.7.2 Program ochrany proti záření

1.7.2.1 Přeprava radioaktivních látek musí probíhat podle programu ochrany proti záření, který obsahuje systematický soubor ustanovení zaměřených na provádění přiměřených ochranných opatření proti záření.

1.7.2.2 Osobní dávky musí být nižší, než jsou příslušné dávkové limity. Ochrana a bezpečnost musí být optimalizovány tak, aby velikost individuálních dávek, počet osob vystavených záření a pravděpodobnost zdraví škodlivého záření byly udrženy tak nízké, jak je to jen rozumně dosažitelné s přihlédnutím k ekonomickým a sociálním faktorům kromě toho, že individuálně obdržené dávky budou omezeny dávkovými limity. Musí být zvolen strukturalizovaný systematický postup na vztahy mezi přepravou a ostatními činnostmi.

1.7.2.3 Povaha a rozsah měření použité v programu se musí vztahovat k závažnosti a pravděpodobnosti radiačního ozáření. Program musí zahrnovat požadavky uvedené v 1.7.2.2., 1.7.2.4, 1.7.2.5 a 7.5.11 CV33 (1.1). Programové dokumenty musí být k dispozici, na požadavek, pro inspekci relevantního příslušného orgánu

1.7.2.4 Pro profesní vystavení záření vznikající při dopravních činnostech, kde se odhaduje, že efektivní dávka:

- (a) bude pravděpodobně mezi 1 mSv a 6 mSv za 1 rok, musí být prováděn program vyhodnocování dávek monitorováním pracovního místa nebo individuálním monitorováním;
- (b) pravděpodobně překročí 6 mSv za 1 rok, musí být prováděno individuální monitorování.

Pokud je prováděno monitorování pracovního místa nebo individuální monitorování, příslušné záznamy musí být uchovávány.

POZNÁMKA: Pro profesní expozici vyplývající z přepravních aktivit, kde se předpokládá, že efektivní dávka pravděpodobně nepřekročí 1 mSv za rok, není požadováno vypracovávání zvláštních pracovních postupů, podrobné monitorování, programy ohodnocování dávek nebo uchovávání individuálních záznamů.

1.7.2.5 Pracovníci (viz 7.5.11, CV 33 Poznámka 3) musí být náležitě vyškoleni v radiační ochraně včetně monitorovacích opatření za účelem omezení jejich pracovního ozáření a ozáření jiných osob, které by mohly být dotčeny jejich činností.“

1.7.3 Systém řízení

Aby bylo zajištěno dodržování relevantních ustanovení ADR, musí být zaveden a využíván pro všechny činnosti v rámci ADR, jak jsou popsány v 1.7.1.3, systém řízení založený na mezinárodních, vnitrostátních, nebo jiných normách, přijatelných pro příslušný orgán. Potvrzení, že specifikace konstrukce byly v plném rozsahu dodrženy, musí být tomuto orgánu k dispozici. Výrobce, odesílatel nebo uživatel musí být připraven:

- (a) poskytnout zařízení pro inspekci během výroby a užívání; a
- (b) prokázat dodržování ADR příslušnému orgánu.

Jestliže se požaduje schválení příslušného orgánu, musí toto schválení přihlížet k přiměřenosti programu zajištění kvality a musí být na něm závislé.

1.7.4 Zvláštní ujednání

1.7.4.1 Zvláštním ujednáním se rozumí taková ustanovení schválená příslušným orgánem, podle nichž mohou být přepravovány, které nesplňují všechny požadavky ADR aplikovatelné na radioaktivní látky.

POZNÁMKA: Zvláštní ujednání se nepovažuje za dočasnou odchylku podle oddílu 1.5.1.

1.7.4.2 Zásilkly, pro které je prakticky neproveditelné vyhovět ustanovením vztahujícím se na radioaktivní látky, nesmějí být přepravovány jinak, než podle zvláštního ustanovení. Pokud je příslušný orgán přesvědčen, že soulad s ustanoveními ADR pro radioaktivní látky je prakticky neproveditelný a že splnění nezbytných bezpečnostních norem předepsaných ADR bylo prokázáno alternativními prostředky, příslušný orgán může schválit zvláštní ustanovení o přepravách pro jednotlivou zásilku nebo plánovanou sérii více zásilek. Celková úroveň bezpečnosti přepravy musí být nejméně rovnocenná úrovni, které by bylo dosaženo při dodržení všech příslušných předpisů. Pro mezinárodní zásilkly tohoto typu se požaduje vícestanné schválení.

1.7.5 Radioaktivní látky s dalšími nebezpečnými vlastnostmi

Kromě radioaktivních a štěpných vlastností musí být brány v úvahu v dokladech, při balení, označování bezpečnostními značkami a nápisy, tranzitním skladování, oddělování a přepravě všechna další vedlejší nebezpečí obsahu kusu, jako je výbušnost, hořlavost, samozápalnost, chemická toxicita a žíravost, aby odpovídaly všem příslušným ustanovením pro nebezpečné věci podle ADR.

1.7.6 Nedodržení limitů

1.7.6.1 V případě nedodržení jakéhokoli limitu v ADR platného pro dávkový příkon nebo kontaminaci

- (a) Odesílatel, příjemce, dopravce a kterákoliv z organizací zapojených do dopravy, která by mohla být dotčena, musí být informována o nedodržení limitů:
 - (i) dopravcem, pokud se nedodržení zjistí během přepravy; nebo
 - (ii) příjemcem, pokud se nedodržení zjistí při příjmu;
- (b) dopravce, odesílatel, popřípadě příjemce musí:
 - (i) učinit okamžitá opatření ke zmírnění následků nedodržení;
 - (ii) vyšetřit nedodržení a jeho příčiny, okolnosti a následky;
 - (iii) učinit vhodná opatření k odstranění příčin a okolností, které vedly nedodržení a zamezit opakování podobných okolností, které vedly k nedodržení; a
 - (iv) sdělit příslušnému orgánu (příslušným orgánům) příčiny nedodržení a nápravná nebo preventivní opatření, která byla nebo mají být učiněna;
- (c) informování odesílatele, popřípadě příslušného orgánu (příslušných orgánů) musí být provedeno bezodkladně, a musí být okamžité, jestliže se vyvinula nebo vyvíjí situace kritického ozáření.

KAPITOLA 1.8

KONTROLY A JINÁ PODPŮRNÁ OPATŘENÍ PRO ZAJIŠTĚNÍ PLNĚNÍ BEZPEČNOSTNÍCH POŽADAVKŮ

1.8.1 Kontroly nebezpečných věcí

1.8.1.1 Příslušné orgány smluvních stran mohou kdykoli na svém území provádět namátkové kontroly pro ověření, zda jsou dodržovány předpisy pro přepravu nebezpečných věcí včetně požadavků pododdílu 1.10.1.5.

Tyto kontroly však musí být prováděny bez ohrožení osob, majetku nebo životního prostředí a bez nepřiměřeného narušení silničního provozu.

1.8.1.2 Účastníci přepravy nebezpečných věcí (kapitola 1.4) musí bezodkladně v rámci svých příslušných povinností poskytnout příslušným orgánům a jejich pověřeným zástupcům informace nezbytné pro provedení kontrol.

1.8.1.3 Příslušné orgány mohou též v objektech podniků zúčastněných na přepravě nebezpečných věcí (kapitola 1.4) za účelem kontroly provádět inspekce, prozkoumat nezbytné doklady a odebrat vzorky nebezpečných věcí nebo obalů pro zkoušku, pokud tím není ohrožena bezpečnost. Účastníci přepravy nebezpečných věcí (kapitola 1.4) musí též zpřístupnit vozidla nebo jejich části a zařízení a vybavení pro účely kontrol, pokud je to možné a zdůvodněné. Mohou též, pokud se jim to jeví nezbytným, určit osobu z podniku pro doprovod zástupce příslušného orgánu.

1.8.1.4 Pokud příslušné orgány zjistí, že předpisy ADR nejsou dodrženy, mohou zakázat odeslání zásilkou nebo přerušit přepravu, dokud zjištěné nedostatky nejsou odstraněny, nebo mohou předepsat jiná vhodná opatření. Přerušování přepravy může být provedeno na místě nebo na jiném místě určeném příslušným orgánem z bezpečnostních důvodů. Tato opatření nesmějí způsobit nepřiměřené narušení silničního provozu.

1.8.2 Vzájemná úřední podpora

1.8.2.1 Smluvní strany se mohou dohodnout na vzájemné úřední podpoře při uplatňování ADR.

1.8.2.2 Pokud jedna smluvní strana zjistí, že bezpečnost přepravy nebezpečných věcí po jejím území je ohrožena následkem velmi vážných nebo opakovaných porušení předpisů ze strany podniku, který má své sídlo na území jiné smluvní strany, musí takové přestupky oznámit příslušným orgánům této smluvní strany. Příslušné orgány smluvní strany, na jejímž území byly zjištěny velmi vážné nebo opakované přestupky, mohou požádat příslušné orgány smluvní strany, na jejímž území má podnik své sídlo, aby přijaly vhodná opatření proti viníkům. Předání údajů osobního charakteru není dovoleno, ledaže je to nezbytné pro postihy velmi vážných nebo opakovaných přestupků.

1.8.2.3 Takto informované orgány musí sdělit příslušným orgánům smluvní strany, na jejímž území byly předpisy porušeny, jaká opatření, pokud to bylo nezbytné, byla učiněna vůči tomuto podniku.

1.8.3 Bezpečnostní poradce

1.8.3.1 Každý podnik, jehož činnosti zahrnují silniční přepravu nebezpečných věcí nebo s touto přepravou související operace balení, nakládky, plnění nebo vykládky nebezpečných věcí, musí jmenovat jednoho nebo více bezpečnostních poradců, dále nazývaných „poradci“ pro přepravu nebezpečných věcí, odpovědných za pomoc při zabránění rizikům při těchto činnostech s ohledem na osoby, majetek a životní prostředí.

- 1.8.3.2 Příslušné orgány smluvních stran mohou stanovit, že se tyto předpisy nevztahují na podniky:
- (a) jejichž činnosti se týkají množství, která jsou v každé dopravní jednotce menší než meze (limity) uvedené v 1.1.3.6 a 1.7.1.4, jakož i v kapitolách 3.3, 3.4 a 3.5, nebo
 - (b) jejichž hlavní nebo vedlejší činnosti nejsou přeprava nebo související nakládka nebo vykládka nebezpečných věcí, ale které se příležitostně zabývají vnitrostátní přepravou nebo související nakládkou nebo vykládkou nebezpečných věcí představujících jen velmi malé nebezpečí nebo riziko znečištění.

- 1.8.3.3 Hlavním úkolem poradce, při zachování odpovědnosti vedoucího podniku, je snažit se všemi vhodnými prostředky a opatřeními v mezích příslušných činností výše uvedeného podniku usnadnit provádění těchto činností v souladu s platnými předpisy a co nejbezpečnějším způsobem.

S přihlédnutím k činnostem podniku má poradce zejména tyto povinnosti:

- dohlížet na dodržování předpisů pro přepravu nebezpečných věcí;
- radit svému podniku při operacích souvisejících s přepravou nebezpečných věcí;
- připravit výroční zprávu pro vedení svého podniku nebo popřípadě pro místní orgán veřejné správy, o činnostech podniku týkajících se přepravy nebezpečných věcí. Takové výroční zprávy musí být uchovávány po dobu pěti let a musí být k dispozici národním orgánům na jejich žádost.

Poradce má rovněž za povinnost sledovat zejména tyto činnosti a postupy vztahující se k dotčeným činnostem podniku:

- postupy pro dodržování předpisů upravujících zařazování nebezpečných věcí určených k přepravě;
- postup podniku při pořízování dopravních prostředků s ohledem na respektování všech zvláštních požadavků souvisejících s přepravou nebezpečných věcí;
- postupy kontrol zařízení užívaného při přepravě, nakládce nebo vykládce nebezpečných věcí;
- vlastní školení zaměstnanců podniku, včetně školení o změnách předpisů, a vedení záznamů o takovém školení;
- uplatňování vhodných nouzových postupů v případě jakékoli nehody nebo mimořádné události, která může nepříznivě ovlivnit bezpečnost přepravy, nakládky nebo vykládky nebezpečných věcí;
- analýzy a, pokud je to potřebné, vypracovávání zpráv týkajících se vážných nehod, mimořádných událostí nebo závažných porušení předpisů zjištěných během přepravy, nakládky nebo vykládky nebezpečných věcí;
- uplatňování vhodných opatření k zamezení opakování nehod, mimořádných událostí nebo závažných porušení předpisů;
- dodržování právních předpisů a zvláštních požadavků spojených s přepravou nebezpečných věcí, týkajících se volby a využití subdodavatelů nebo jiných třetích osob;
- ověřování, že zaměstnanci účastníci se přepravy, nakládky nebo vykládky nebezpečných věcí mají k dispozici podrobné pracovní postupy a pokyny;
- zavádění opatření ke zvýšení informovanosti o nebezpečích spojených s přepravou, nakládkou a vykládkou nebezpečných věcí;
- uplatňování kontrolních postupů s cílem zajistit, aby v dopravních prostředcích byly k dispozici doklady a bezpečnostní výbava, které musí doprovázet přepravu, a aby tyto doklady a výbava byly v souladu s předpisy;

- uplatňování kontrolních postupů s cílem zajistit dodržování předpisů pro nakládku a vykládku;
 - existenci bezpečnostního plánu uvedeného v pododdílu 1.10.3.2.
- 1.8.3.4 Poradcem může být též vedoucí podniku, osoba s jinými povinnostmi v podniku nebo osoba, která výše uvedeným podnikem není přímo zaměstnána, pokud je tato osoba odborně způsobilá pro vykonávání povinností poradce.
- 1.8.3.5 Každý dotčený podnik musí na požádání informovat o totožnosti svého poradce příslušný orgán nebo instituci pověřenou pro tento účel každou smluvní stranou.
- 1.8.3.6 Kdykoli během přepravy, nakládky nebo vykládky prováděné dotčeným podnikem postihne nehoda osoby, majetek nebo životní prostředí, zajistí poradce po shromáždění všech potřebných informací vypracování zprávy o nehodě pro vedení podniku nebo popřípadě pro místní orgán veřejné správy. Tato zpráva nesmí nahrazovat žádnou zprávu vypracovanou vedením podniku, která by mohla být požadována jinými mezinárodními nebo vnitrostátními předpisy.
- 1.8.3.7 Poradce musí být držitelem osvědčení o odborné způsobilosti bezpečnostního poradce pro přepravu nebezpečných věcí po silnici. Toto osvědčení musí být vydáno příslušným orgánem nebo organizací pověřenou pro tento účel každou smluvní stranou.
- 1.8.3.8 K získání osvědčení se musí uchazeč podrobit školení a úspěšně složit zkoušku schválenou příslušným orgánem smluvní strany.
- 1.8.3.9 Hlavním účelem školení je poskytnout uchazečům dostatečné znalosti o nebezpečích při přepravě nebezpečných věcí, dostatečné znalosti platných právních a správních ustanovení, jakož i dostatečné znalosti povinností uvedených v pododdílu 1.8.3.3.
- 1.8.3.10 Zkouška musí být organizována příslušným orgánem nebo jím pověřenou zkušební organizací.
- Zkušební organizace nesmí být školícím zařízením.
- Pověření zkušební organizace musí být provedeno písemnou formou. Toto schválení může být časově omezeno a musí být založeno na následujících kritériích:
- způsobilost zkušební organizace;
 - specifikace forem zkoušek navržené zkušební organizací;
 - opatření určená pro zajištění nestrannosti zkoušek;
 - nezávislost zkušební organizace na všech fyzických nebo právnických osobách zaměstnávajících poradce.
- 1.8.3.11 Hlavním účelem zkoušky je zjistit, zda uchazeči mají potřebnou úroveň znalostí potřebných pro výkon funkce bezpečnostního poradce, jak je uvedeno v pododdílu 1.8.3.3, pro získání osvědčení předepsaného v pododdílu 1.8.3.7 a musí zahrnovat nejméně následující témata:
- (a) Znalost druhů následků, které mohou být způsobeny při nehodě s nebezpečnými věcmi a znalost hlavních příčin nehody;
 - (b) Ustanovení vnitrostátních předpisů, mezinárodních úmluv a dohod, zejména pokud jde o:
 - klasifikaci nebezpečných věcí (postup při klasifikaci roztoků a směsí, struktura seznamu látek, třídy nebezpečných věcí a zásady jejich klasifikace, povaha přepravovaných nebezpečných věcí, fyzikální, chemické a toxikologické vlastnosti nebezpečných věcí);
 - všeobecná ustanovení o obalech, cisternách a cisternových kontejnerech (druhy, kódování, značení, konstrukce, první a periodické inspekce a zkoušky);

- nápisy a bezpečnostní značky, označení oranžovými tabulkami (nápisy a bezpečnostní značky na kusech, umístování a odstraňování velkých bezpečnostních značek a oranžových tabulek);
- údaje v přepravních dokladech (požadované informace);
- způsob odesílání a omezení při odesílání (vozová zásilka, přeprava ve volně loženém stavu, přeprava v IBC, přeprava v kontejnerech, přeprava v nesnímatelných nebo snímatelných cisternách);
- přepravu osob;
- zákazy a bezpečnostní opatření týkající se společné nakládky;
- vzájemné oddělování věcí;
- limity přepravovaných množství a množství vyňatá z platnosti předpisů;
- manipulaci a uložení (nakládka a vykládka, stupně plnění, uložení ve vozidle a vzájemné oddělování);
- čištění nebo odplyňování před nakládkou a po vykládce;
- osádku a odborné školení;
- doklady vozidla (přepravní doklady, písemné pokyny, osvědčení o schválení vozidla, osvědčení o školení řidiče, kopie všech odchylek, jiné doklady);
- písemné pokyny pro řidiče (používání pokynů a ochranné prostředky pro osádku);
- požadavky na dozor nad vozidly (parkování);
- pravidla a omezení silničního provozu;
- únik znečišťujících látek během provozu a při nehodách;
- předpisy týkající se dopravních prostředků.

1.8.3.12 **Zkoušky**

1.8.3.12.1 Zkouška sestává z písemného testu, který může být doplněn ústní zkouškou.

1.8.3.12.2 Při písemných testech není dovoleno použití žádných jiných dokumentů kromě mezinárodních nebo vnitrostátních předpisů.

1.8.3.12.3 Elektronická media smějí být použita jen tehdy, pokud byla poskytnuta zkušební organizací. Kandidát nesmí mít žádnou možnost pořizovat jiná data do poskytnutého elektronického media; kandidát smí odpovídat pouze na položené otázky.

1.8.3.12.4 Písemný test musí mít dvě části:

- (a) Uchazeč obdrží dotazník. Ten musí obsahovat nejméně dvacet otevřených otázek zahrnujících nejméně témata uvedená v seznamu v pododdílu 1.8.3.11. Mohou však být použity také otázky s uvedením několika možných odpovědí, z nichž pouze jedna je správná. V tomto případě se takové dvě otázky počítají za jednu otevřenou otázku. Zvláštní pozornost musí být věnována těmto tématům:
- všeobecná preventivní a bezpečnostní opatření;
 - klasifikace nebezpečných věcí;
 - všeobecná ustanovení o balení, včetně cisteren, cisternových kontejnerů, cisternových vozidel atd.;

- nápisy k označení nebezpečí a bezpečnostní značky;
- údaje v přepravním dokladu;
- manipulace a uložení;
- odborné školení osádky;
- doklady vozidla a osvědčení;
- písemné pokyny pro řidiče;
- předpisy týkající se dopravních prostředků.

- (b) Uchazeči musí vypracovat případovou studii podle povinností poradce uvedených v pododdílu 1.8.3.3, aby prokázali, že mají nezbytnou kvalifikaci pro plnění funkce poradce.

1.8.3.13 Smluvní strany mohou rozhodnout, že uchazeči, kteří hodlají pracovat pro podniky specializované na přepravu určitých druhů nebezpečných věcí mohou být zkoušeni pouze z témat, které jsou spojeny s jejich činnostmi. Tyto druhy věcí jsou:

- třída 1,
- třída 2,
- třída 7,
- třídy 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 6.2, 8 a 9.
- UN čísla 1202, 1203, 1223, 3475 a letecké palivo zařazené pod UN čísla 1268 nebo 1863.

Osvědčení předepsané v pododdílu 1.8.3.7 musí zřetelně uvádět, že je platné pouze pro druhy nebezpečných věcí uvedených v tomto pododdíle a pro které byl poradce zkoušen podle podmínek uvedených v pododdíle 1.8.3.12.

1.8.3.14 Příslušný orgán nebo zkušební organizace musí uchovávat seznam zkušebních otázek, které byly použity při zkoušce.

1.8.3.15 Osvědčení předepsané v pododdílu 1.8.3.7 musí mít formu podle vzoru uvedeného v pododdílu 1.8.3.18 a musí být uznáváno všemi smluvními stranami.

1.8.3.16 *Platnost a prodloužení platnosti osvědčení*

1.8.3.16.1 Osvědčení je platné po dobu pěti let. Doba platnosti osvědčení se prodlouží o pět let od data uplynutí jeho platnosti, pokud jeho držitel během posledního roku před uplynutím doby jeho platnosti složil zkoušku. Zkouška musí být schválena příslušným orgánem.

1.8.3.16.2 Účelem zkoušky je ověřit, zda má držitel potřebné znalosti k vykonávání povinností uvedených v pododdílu 1.8.3.3. Vyžadované znalosti jsou uvedeny v pododdíle 1.8.3.11 (b) a musí zahrnovat změny předpisů, k nimž došlo od získání posledního osvědčení. Zkouška musí být organizována a dozorována na stejném základě, jak je uvedeno v pododdílech 1.8.3.10 a 1.8.3.12 až 1.8.3.14. Držitel osvědčení však nemusí vypracovat případovou studii podle ustanovení pododdílu 1.8.3.12.4 (b).

1.8.3.17 (Vypuštěno)

1.8.4 Seznam příslušných orgánů a jimi pověřených organizací

Smluvní strany oznámí Sekretariátu Evropské hospodářské komise Organizace spojených národů adresy příslušných orgánů a jimi pověřených organizací, které jsou kompetentní podle vnitrostátních předpisů pro uplatňování ADR, přičemž uvedou pro každý případ příslušné ustanovení ADR, jakož i adresy, na které je třeba zasílat příslušné žádosti.

Sekretariát Evropské hospodářské komise Organizace spojených národů pořídí na základě obdržení informací seznam a udržuje jej v aktuálním stavu. Oznamuje tento seznam a jeho změny smluvním stranám.

1.8.5 Hlášení o nehodách a mimořádných událostech při přepravě nebezpečných věcí

1.8.5.1 Dojde-li během nakládky, plnění, přepravy nebo vykládky nebezpečných věcí na území smluvní strany k závažné nehodě nebo mimořádné události, je nakládce, plnič, dopravce nebo příjemce povinen zajistit, aby byla pro příslušný orgán dotýčnej smluvní strany vypracována a předložena zpráva podle vzoru předepsaného v pododdíle 1.8.5.4 nejpozději jeden měsíc po této události.

1.8.5.2 Tato smluvní strana musí, je-li to žádoucí, zaslat zprávu Sekretariátu Evropské hospodářské komise Organizace spojených národů za účelem informování ostatních smluvních stran.

1.8.5.3 Událostí, která podléhá povinnosti vypracování zprávy podle pododdílu 1.8.5.1, je událost, při níž došlo k úniku nebezpečných věcí nebo hrozilo bezprostřední riziko úniku látky, došlo-li ke zranění osob, k hmotným škodám nebo ke škodám na životním prostředí, nebo pokud byly zapojeny orgány (úřady) a je-li splněno alespoň jedno z následujících kritérií:

Zranění osob znamená událost, při níž došlo k usmrcení nebo zranění v přímém vztahu k přepravovaným nebezpečným věcem, přičemž zranění

- (a) vyžaduje intenzivní lékařskou péči,
- (b) vyžaduje nejméně jednodenní pobyt v nemocnici, nebo
- (c) má za následek pracovní neschopnost v trvání nejméně tří po sobě jdoucích dnů.

Únik látky znamená uniknutí nebezpečných věcí

- (a) přepravní kategorie 0 nebo 1 v množství větším než 50 kg / 50 litrů,
- (b) přepravní kategorie 2 v množství větším než 333 kg / 333 litrů, nebo
- (c) přepravní kategorie 3 nebo 4 v množství větším než 1000 kg / 1000 litrů.

Kritérium úniku látky platí také v případě bezprostředního rizika úniku látky ve výše uvedených množstvích. Zpravidla se toto riziko musí předpokládat, jestliže z důvodu poškození své konstrukce již dopravní nebo přepravní prostředky nejsou způsobilé pro další přepravu nebo jestliže z nějakého jiného důvodu již nemůže být zajištěna dostatečná úroveň bezpečnosti (např. z důvodu deformace cisterny nebo kontejneru, převrácení cisterny nebo požáru v bezprostřední blízkosti).

Dojde-li k nehodě nebo mimořádné události při přepravě nebezpečných věcí třídy 6.2, předkládá se zpráva o nehodě vždy, bez ohledu na množství uniklé látky.

Dojde-li k nehodě nebo mimořádné události při přepravě radioaktivních látek jsou kritéria pro únik látky následující:

- (a) jakýkoli únik radioaktivních látek z kusů;
- (b) expozice vedoucí k překročení mezních hodnot stanovených v předpisech pro ochranu pracovníků a veřejnosti proti ionizujícímu záření (Schedule II of IAEA Safety Series No. 115 – „International Basic Safety Standards for Protection Against Ionizing Radiation and for Safety Radiation Sources“); nebo

- (c) je-li důvod předpokládat, že došlo k významnému zhoršení bezpečnostní funkce kusu (kontejnment, stínění, tepelná ochrana nebo kritičnost), které může učinit kus nezpůsobilým pro pokračování přepravy bez dodatečných bezpečnostních opatření.

POZNÁMKA: Viz ustanovení pro nedoručitelné zásilky oddílu 7.5.11 (6), dodatečné ustanovení CV33.

Hmotné škody nebo škody na životním prostředí nastanou při uvolnění nebezpečných věcí, bez ohledu na jejich množství, kdy odhadovaná částka škody překročí 50 000 euro. Škoda na přímo zúčastněných dopravních prostředcích obsahujících nebezpečné věci ani na dopravní infrastrukturu se pro tento účel nebere v úvahu.

Účast orgánů (úřadů) znamená přímé zapojení úřadů nebo nouzových zásahových jednotek během události s nebezpečnými věcmi a evakuaci osob nebo uzavření veřejných dopravních komunikací (silnic/železničních tratí) na nejméně tři hodiny z důvodu nebezpečí vytvářeného nebezpečnými věcmi.

Pokud je to potřebné, může si příslušný orgán vyžádat další relevantní informace.

1.8.5.4 *Vzor zprávy o nehodě nebo mimořádné události během přepravy nebezpečných věcí*

**Zpráva o nehodě nebo mimořádné události při přepravě nebezpečných věcí
podle oddílu 1.8.5 RID/ADR**

1.8.6 Administrativní dozor nad prováděním posuzování shody, periodických inspekcí, meziperiodických inspekcí a mimořádných kontrol popsaných v 1.8.7

1.8.6.1 Schvalování inspekčních organizací

Příslušný orgán může schválit inspekční organizace pro posuzování shody, periodické inspekce, meziperiodické inspekce, mimořádné kontroly a dohled nad vlastní inspekční službou, jak je uveden v oddílu 1.8.7.

1.8.6.2 Pracovní povinnosti příslušného orgánu, jeho zástupce nebo inspekční organizace

1.8.6.2.1 Příslušný orgán, jeho zástupce nebo inspekční organizace musí provádět posuzování shody, periodické inspekce, meziperiodické inspekce a mimořádné kontroly přiměřeným způsobem, bez zbytečných nákladů. Příslušný orgán, jeho zástupce nebo inspekční organizace musí vykonávat své činnosti s přihlédnutím k velikosti, odvětví a struktuře dotčených podniků, k relativní složitosti technologie a sériovému charakteru výroby.

1.8.6.2.2 Avšak příslušný orgán, jeho zástupce nebo inspekční organizace musí respektovat stupeň přísnosti a úroveň ochrany vyžadované k tomu, aby přepravitelná tlaková zařízení vyhovovala příslušným ustanovením částí 4 a 6.

1.8.6.2.3 Pokud příslušný orgán, jeho zástupce nebo inspekční organizace zjistí, že požadavky stanovené v částech 4 nebo 6 nebyly výrobcem dodrženy, požádá výrobce, aby učinil náležitá nápravná opatření, a nevydá žádné osvědčení o schválení konstrukčního typu ani osvědčení o shodě.

1.8.6.3 Informační povinnost

Smluvní strany ADR musí zveřejnit své vnitrostátní postupy pro posuzování, pověřování a monitorování inspekčních organizací a všechny změny těchto informací.

1.8.6.4 Delegování inspekčních činností

POZNÁMKA: *Vlastních inspekčních služeb podle 1.8.7.6 se pododdíl 1.8.6.4 netýká.*

1.8.6.4.1 Pokud inspekční organizace využívá služeb jakékoli jiné organizační jednotky (např. subdodavatel, pobočka) k vykonávání specifických činností spojených s posuzováním shody, periodickou inspekci, meziperiodickou inspekci nebo mimořádnými kontrolami, musí být tato organizační jednotka zahrnuta do akreditace inspekční organizace, nebo musí být akreditována odděleně. V případě oddělené akreditace musí být tato jednotka patřičně akreditována podle normy EN ISO/IEC 17025:2005 a musí být uznána inspekční organizací jako nezávislá a nestranná zkušební laboratoř k provádění zkušebních úkolů ve shodě se svou akreditací, nebo musí být akreditována podle normy EN ISO/IEC 17020:2012 (kromě klauzule 8.1.3). Inspekční organizace se musí ujistit, že tato organizační jednotka splňuje požadavky stanovené pro činnosti, které jsou jí předány, se stejnou úrovní kompetentnosti a bezpečnosti, jaká je stanovena pro inspekční organizace (viz 1.8.6.8) a inspekční organizace to musí monitorovat. Inspekční organizace musí informovat příslušný orgán o výše uvedených opatřeních.

1.8.6.4.2 Inspekční organizace přebírá plnou odpovědnost za činnosti vykonávané takovými organizačními jednotkami, bez ohledu na místo, kde tyto činnosti vykonávají.

1.8.6.4.3 Inspekční organizace nesmí převést celou činnost posuzování shody, periodické inspekce, meziperiodické inspekce nebo mimořádných kontrol. V každém případě posuzování a vydávání osvědčení musí být prováděno vlastní inspekční organizací.

1.8.6.4.4 Činnosti nesmějí být převáděny bez souhlasu žadatele.

1.8.6.4.5 Inspekční organizace musí uchovávat k dispozici příslušného orgánu příslušné doklady týkající se posuzování kvalifikací a prací provedených výše zmíněnými organizačními jednotkami.

1.8.6.5 Informační povinnosti inspekčních organizací

Každá inspekční organizace musí informovat příslušný orgán, který ji schválil, o následujících skutečnostech. Jsou to:

- (a) s výjimkou aplikace ustanovení uvedených v 1.8.7.2.4, každé zamítnutí, omezení, pozastavení platnosti nebo odebrání osvědčení o schválení konstrukčního typu;
- (b) každá okolnost nebo okolnosti ovlivňující rozsah a podmínky pro schválení, jak bylo uděleno příslušným orgánem;
- (c) každá žádost o informace o vykonávaných činnostech při posuzování shody, kterou obdržela od příslušných orgánů monitorujících dodržování ustanovení uvedených v 1.8.1 nebo 1.8.6.6;
- (d) na vyžádání, činnosti vykonávané při posuzování shody v rámci rozsahu jejich schválení a jiné vykonávané činnosti, včetně převádění činností.

1.8.6.6 Příslušný orgán musí zajistit monitorování inspekčních organizací a musí zrušit nebo omezit platnost uděleného schválení, pokud zjistí, že schválená organizace již neplní podmínky schválení a požadavky pododdílu 1.8.6.8 nebo nedodržuje postupy uvedené v ustanoveních ADR.

1.8.6.7 Je-li platnost schválení inspekční organizace zrušena nebo omezena, nebo pokud inspekční organizace zastavila svou činnost, musí příslušný orgán učinit příslušné kroky k tomu, aby se zajistilo, že její dokumentace bude buď zpracována jinou inspekční organizací, nebo bude k dispozici.

1.8.6.8 Inspekční organizace musí:

- (a) mít k dispozici personál s organizační strukturou, který je schopný, vyškolený, kompetentní a způsobilý vykonávat uspokojivě své technické funkce;
- (b) mít přístup ke vhodným a přiměřeným technickým prostředkům a vybavení;
- (c) pracovat nestranně a bez jakéhokoli vlivu, který by mohl takové činnosti bránit;
- (d) zajistit důvěrnost obchodních a vlastnických aktivit výrobce a jiných organizací;
- (e) udržovat jasný odstup mezi vlastními činnostmi inspekční organizace a ostatními činnostmi, které k nim nemají vztah;
- (f) mít dokumentovaný systém kvality;
- (g) zajistit, aby byly prováděny zkoušky a inspekce specifikované v příslušné normě a v ADR; a
- (h) udržovat účinný a přiměřený dokumentační a záznamový systém podle 1.8.7 a 1.8.8

Inspekční organizace musí být kromě toho akreditována podle normy EN ISO/IEC 17020:2012 (kromě klauzule 8.1.3), jak je specifikováno v 6.2.2.11 a 6.2.3.6 a TA4 a TT9 oddílu 6.8.4.

Inspekční organizace, která zahajuje novou činnost, smí být schválena prozatímně. Před prozatímním schválením musí příslušný orgán zajistit, aby inspekční organizace splňovala požadavky normy EN ISO/IEC 17020:2012 (kromě klauzule 8.1.3). Inspekční organizace musí být akreditována v prvním roce své činnosti, aby byla schopna pokračovat v této nové činnosti.

1.8.7 Postupy pro posuzování shody a periodickou inspekci

POZNÁMKA: V tomto oddílu „příslušná organizace“ znamená organizaci určenou v pododdíle 6.2.2.11 k certifikaci UN tlakových nádob, v pododdílu 6.2.3.6 ke schvalování jiných tlakových nádob, než jsou UN tlakové nádoby, a ve zvláštních ustanoveních TA4 a TT9 oddílu 6.8.4.

1.8.7.1 Všeobecná ustanovení

1.8.7.1.1 Postupy v 1.8.7 se musí použít podle 6.2.3.6 při schvalování jiných tlakových nádob, než jsou UN tlakové nádoby, a podle zvláštních ustanovení TA4 a TT9 oddílu 6.8.4 při schvalování cisteren, bateriových vozidel a MEGC.

Postupy v oddílu 1.8.7 se mohou použít podle tabulky v 6.2.2.11 při certifikaci UN tlakových nádob.

1.8.7.1.2 Každá žádost o:

- (a) schválení konstrukčního typu podle 1.8.7.2; nebo
- (b) dohled nad výrobou podle 1.8.7.3 a první inspekci a zkoušku podle 1.8.7.4; nebo
- (c) periodickou, meziperiodickou inspekci a mimořádné kontroly podle 1.8.7.5

musí být podána žadatelem u jediného příslušného orgánu, jeho zástupce nebo schválené inspekční organizace podle jeho vlastní volby.

1.8.7.1.3 Žádost musí obsahovat:

- (a) jméno a adresu žadatele;
- (b) v případě posuzování shody, není-li žadatel výrobcem, jméno a adresu výrobce;
- (c) písemné prohlášení, že stejná žádost nebyla podána u jiného příslušného orgánu, jeho zástupce nebo inspekční organizace;
- (d) příslušnou technickou dokumentaci uvedenou v 1.8.7.7;
- (e) prohlášení dovolující příslušnému orgánu, jeho zástupci nebo inspekční organizaci z inspekčních důvodů vstup do objektů výroby, inspekce, zkoušení a skladování a poskytující jim všechny potřebné informace.

1.8.7.1.4 Pokud může žadatel prokázat ke spokojenosti příslušného orgánu nebo jej zastupující inspekční organizace splnění podmínek pododdílu 1.8.7.6, smí si žadatel zřídit vlastní inspekční službu, která smí provádět část nebo všechny inspekce a zkoušky, je-li to uvedeno v 6.2.2.11 nebo 6.2.3.6.

1.8.7.1.5 Osvědčení o schválení konstrukčního typu a osvědčení o shodě – včetně technické dokumentace – musí být uchovávána výrobcem, nebo žadatelem o typové schválení, pokud tento není výrobcem, a inspekční organizací, která osvědčení vydala, po dobu nejméně 20 let od posledního data výroby výrobků téhož typu.

1.8.7.1.6 Pokud výrobce nebo vlastník zamýšlí zastavit činnost, musí zaslat dokumentaci příslušnému orgánu. Příslušný orgán poté uchová dokumentaci po zbytek doby stanovené v 1.8.7.1.5.

1.8.7.2 Schválení konstrukčního typu

Typová schválení povolují výrobu tlakových nádob, cisteren, bateriových vozidel nebo MEGC po dobu platnosti tohoto schválení.

1.8.7.2.1 Žadatel musí:

- (a) v případě tlakových nádob dát k dispozici příslušné organizaci reprezentativní vzorky zamýšlené výroby. Příslušná organizace si může vyžádat další vzorky, vyžaduje-li si to zkušební program;
- (b) v případě cisteren, bateriových vozidel nebo MEGC umožnit přístup k prototypu pro zkoušení konstrukčního typu.

1.8.7.2.2 Příslušná organizace musí:

- (a) prozkoumat technickou dokumentaci uvedenou v 1.8.7.7.1 a ověřit, zda konstrukce odpovídá příslušným ustanovením ADR a že prototyp nebo prototypová série byl(y) vyrobeny ve shodě s technickou dokumentací a je (jsou) typovou konstrukcí;
- (b) provést prohlídky a dohlížet na zkoušky předepsané ADR, aby se zjistilo, zda byly použity a dodrženy předpisy a zda postupy použité výrobcem odpovídají předpisům;
- (c) zkontrolovat certifikát(y) vystavený(é) výrobcem (výrobci) materiálů vzhledem k platným ustanovením ADR;
- (d) pokud je to aplikovatelné, schválit postupy pro trvalá spojení konstrukčních částí nebo zkontrolovat, zda byly předem schváleny, a ověřit si, že personál provádějící trvalé spojení konstrukčních částí a nedestruktivní zkoušky je kvalifikovaný nebo schválený;
- (e) dohodnout se žadatelem místo a zkušební laboratoře, kde se mají provést prohlídky a potřebné zkoušky.

Příslušná organizace vydá žadateli protokol o posouzení konstrukčního typu.

- 1.8.7.2.3 Pokud konstrukční typ vyhovuje všem platným ustanovením, vydá příslušný orgán, jeho zástupce nebo inspekční organizace žadateli osvědčení o schválení konstrukčního typu.

Toto osvědčení musí obsahovat:

- (a) název a adresu vydávající instituce;
- (b) název a adresu výrobce a žadatele, pokud žadatel není výrobcem;
- (c) odvolávku na vydání ADR a normy použité pro posouzení konstrukčního typu;
- (d) jakékoli požadavky vyplývající z posouzení;
- (e) údaje nezbytné pro identifikaci konstrukčního typu a modifikace, jak je definováno příslušnou normou;
- (f) odvolávku na protokol(y) o posouzení konstrukčního typu; a
- (g) maximální dobu platnosti typového schválení.

K osvědčení musí být přiložen seznam příslušných částí technické dokumentace (viz 1.8.7.7.1).

- 1.8.7.2.4 Typové schválení je platné na dobu nejvýše 10 let. Jestliže se v průběhu této doby změní příslušné technické požadavky ADR (včetně referenčních norem), takže schválený typ jim už nevyhovuje, příslušná organizace, která typové schválení vydala, toto schválení zruší a informuje o tom držitele typového schválení.

POZNÁMKA: K nejzazším termínům pro zrušení platnosti existujících typových schválení viz sloupec (5) tabulek v 6.2.4 a 6.8.2.6 nebo 6.8.3.6, jak je to náležité.

Jestliže platnost typového schválení vypršela nebo bylo zrušeno, není již výroba tlakových nádob, cisteren, bateriových vozidel a MEGC podle tohoto typového schválení dovolena.

V takovém případě příslušná ustanovení týkající se používání, periodické inspekce a meziperiodické inspekce tlakových nádob, cisteren, bateriových vozidel nebo MEGC obsažená v typovém schválení, jehož platnost vypršela nebo bylo zrušeno, budou nadále platit pro tyto tlakové nádoby, cisterny, bateriová vozidla nebo MEGC vyrobené před vypršením platnosti nebo zrušením platnosti typového schválení, jestliže směji být dále používány.

Tyto směji být dále používány, dokud zůstávají ve shodě s požadavky ADR. Jestliže již nejsou ve shodě s požadavky ADR, směji být dále používány pouze tehdy, je-li takové používání povoleno příslušnými přechodnými ustanoveními v kapitole 1.6.

Typová schválení směji být obnovena po úplné revizi a posouzení shody s ustanoveními ADR platnými k datu obnovy. Obnova není dovolena poté, co bylo zrušeno typové schválení. Modifikace existujícího

typového schválení, které se objevily během doby jeho platnosti (např. pro tlakové nádoby menší změny, jako je doplnění dalších velikostí a objemů, které neovlivňují shodu s předpisy, nebo pro cisterny viz 6.8.2.3.2) neprodlužují ani nemění původní platnost osvědčení.

POZNÁMKA: *Revize a posouzení shody s ustanoveními ADR mohou být provedeny jinou organizací, než je organizace, která vydala původní typové schválení.*

Vydávající organizace musí uchovávat všechny dokumenty pro typové schválení (viz 1.8.7.7.1) po celou dobu platnosti včetně jeho obnov, pokud byly povoleny.

- 1.8.7.2.5 V případě modifikace tlakové nádoby, cisterny, bateriového vozidla nebo MEGC s platným, propadlým nebo zrušeným typovým schválením jsou zkoušky, inspekce a schválení omezeny na ty součásti tlakové nádoby, cisterny, bateriového vozidla nebo MEGC, které byly modifikovány. Modifikace musí splňovat ustanovení ADR platná v době modifikace. Pro všechny součásti tlakové nádoby, cisterny, bateriového vozidla nebo MEGC, jichž se modifikace nedotkla, zůstává v platnosti dokumentace původního typového schválení.

Modifikace se může týkat jedné nebo více tlakových nádob, cisteren, bateriových vozidel nebo MEGC, pro které platí typové schválení.

Osvědčení o schválení modifikace musí být vydáno žadateli příslušným orgánem kterékoli smluvní strany ADR nebo organizací pověřenou tímto orgánem. Pro cisterny, bateriová vozidla nebo MEGC musí být kopie tohoto osvědčení součástí dokumentace cisterny.

Každá žádost o vydání schvalovacího osvědčení pro modifikaci musí být žadatelem podána u jednoho příslušného orgánu nebo organizace pověřené tímto orgánem.

1.8.7.3 **Dohled nad výrobou**

- 1.8.7.3.1 Výrobní proces musí být podroben ze strany příslušné organizace dohledu, aby se zajistilo, že je výrobek vyráběn ve shodě s ustanoveními schválení konstrukčního typu.

- 1.8.7.3.2 Žadatel musí učinit všechna potřebná opatření, aby zajistil, že výrobní proces vyhovuje platným ustanovením ADR a osvědčení o schválení konstrukčního typu a jeho přílohám.

- 1.8.7.3.3 Příslušná organizace musí:

- (a) ověřit shodu s technickou dokumentací uvedenou v 1.8.7.7.2;
- (b) ověřit si, že výrobní proces produkuje výrobky, které odpovídají předpisům a dokumentací, která se jich týká;
- (c) ověřit zpětnou zjištělnost materiálů a zkontrolovat certifikát(y) materiálů vzhledem ke specifikacím;
- (d) pokud je to aplikovatelné, ověřit si, že personál provádějící trvalé spojení konstrukčních částí a nedestruktivní zkoušky je kvalifikovaný nebo schválený;
- (e) dohodnout se žadatelem na místě, kde se mají provést prohlídky a potřebné zkoušky; a
- (f) zaznamenat výsledky svého dohledu.

1.8.7.4 **První inspekce a zkoušky**

- 1.8.7.4.1 Žadatel musí:

- (a) umístit značky uvedené v ADR; a
- (b) dodat příslušné organizaci technickou dokumentaci uvedenou v 1.8.7.7.

1.8.7.4.2 Příslušná organizace musí:

- (a) provést potřebné prohlídky a zkoušky za účelem ověření, že výrobek je vyráběn v souladu se schválením konstrukčního typu a příslušnými předpisy;
- (b) zkontrolovat certifikáty dodané výrobcí provozní výstroje vůči provozní výstroji;
- (c) vydat žadateli protokol o první inspekci a zkoušce týkající se provedených detailních zkoušek a ověření a ověřenou technickou dokumentaci;
- (d) vystavit písemné osvědčení o shodě výroby a umístit svou registrační značku, pokud výroba vyhovuje předpisům; a
- (e) zkontrolovat, zda typové schválení zůstává platné poté, co se změnila ustanovení ADR (včetně referenčních norem) platná pro toto typové schválení.

Osvědčení pod písmenem (d) a protokol pod písmenem (c) mohou být společné pro více jednotek téhož konstrukčního typu (skupinové osvědčení nebo skupinový protokol).

1.8.7.4.3 Osvědčení musí obsahovat alespoň:

- (a) název a adresu příslušné organizace;
- (b) název a adresu výrobce a název a adresu žadatele, pokud není výrobcem;
- (c) odvolávku na vydání ADR a normy použité pro první inspekce a zkoušky;
- (d) (výsledky inspekce a zkoušek;
- (e) údaje pro identifikaci zkontrolovaného (zkontrolovaných) výrobku(ů), alespoň sériové číslo, nebo pro láhve, které nejsou opakovaně plnitelné, číslo výrobní série; a
- (f) číslo schválení konstrukčního typu.

1.8.7.5 *Periodická, meziperiodická inspekce a mimořádné kontroly*

1.8.7.5.1 Příslušná organizace musí:

- (a) provést identifikaci a ověřit shodu s dokumentací;
- (b) provést inspekce a dohlížet na zkoušky, aby zkontrolovala, zda jsou dodrženy předpisy;
- (c) vydat protokoly o výsledcích inspekce a zkoušek, které mohou být společné pro více jednotek; a
- (d) zajistit, aby byly umístěny vyžadované značky.

1.8.7.5.2 Protokoly o periodických inspekcích a zkouškách tlakových nádob musí být žadatelem uchovávány alespoň do příští periodické inspekce.

POZNÁMKA: K cisternám viz ustanovení o dokumentaci cisterny v 4.3.2.1.7.

1.8.7.6 *Dohled nad vlastní inspekční službou žadatele*

1.8.7.6.1 Žadatel musí:

- (a) realizovat vlastní inspekční službu se systémem kvality pro inspekce a zkoušky dokumentovanou podle 1.8.7.7.5 a podléhající dohledu;
- (b) plnit povinnosti vyplývající ze systému kvality, jak byl schválen, a zajistit, aby zůstal uspokojivý a účinný;
- (c) přidělit k provádění vlastní inspekční služby vyškolený a kompetentní personál; a
- (d) umístit registrační značku inspekční organizace, kde je to náležité.

- 1.8.7.6.2 Inspekční organizace musí provést první audit. Je-li uspokojivý, vydá inspekční organizace pověření na období nejdéle tří let. Musí být splněna tato ustanovení:
- (a) tento audit musí potvrdit, že inspekce a zkoušky provedené na výrobku jsou v souladu s předpisy ADR;
 - (b) inspekční organizace může pověřit vlastní inspekční službu žadatele, aby umístila registrační značku inspekční organizace na každý schválený výrobek;
 - (c) pověření může být prodlouženo po uspokojivém auditu v posledním roce před skončením jeho platnosti. Nová doba platnosti započne od data skončení platnosti pověření; a
 - (d) auditóři inspekční organizace musí být schopni provést posouzení shody výrobku spadajícího pod systém kvality.
- 1.8.7.6.3 Inspekční organizace musí provést během trvání platnosti pověření periodické audity, aby se ubezpečila, že žadatel udržuje a používá systém kvality. Musí být splněna tato ustanovení:
- (a) v období 12 měsíců musí být provedeny nejméně dva audity;
 - (b) inspekční organizace může vyžadovat dodatečné kontroly, školení, technické změny, modifikace systému kvality, může omezit nebo zakázat inspekce a zkoušky, které má dělat žadatel;
 - (c) inspekční organizace musí posoudit jakékoli změny v systému kvality a rozhodnout, zda pozměněný systém kvality ještě vyhovuje požadavkům prvního auditu, nebo zda se vyžaduje jeho zcela nové posouzení;
 - (d) auditóři inspekční organizace musí být schopni provést posouzení shody výrobku spadajícího pod systém kvality; a
 - (e) inspekční organizace musí žadateli poskytnout kontrolní nebo auditorskou zprávu, a pokud byla provedena zkouška, zkušební protokol.
- 1.8.7.6.4 V případech nesouladu s platnými předpisy musí inspekční organizace zabezpečit, že budou učiněna nápravná opatření. Nejsou-li nápravná opatření učiněna v náležité lhůtě, inspekční organizace dočasně pozastaví platnost oprávnění nebo odejme oprávnění vlastní inspekční službě provádět její činnosti. Oznámení o dočasném pozastavení platnosti nebo odejmutí oprávnění musí být zasláno příslušnému orgánu. Žadatel musí obdržet zprávu obsahující podrobné důvody pro rozhodnutí učiněná inspekční organizací.
- 1.8.7.7 Dokumentace**
- Technická dokumentace musí umožnit posouzení, zda jsou dodrženy příslušné předpisy.
- 1.8.7.7.1 Dokumenty pro schválení konstrukčního typu**
- Žadatel musí poskytnout, jak je to náležité:
- (a) seznam norem použitých pro konstrukci a výrobu;
 - (b) popis konstrukčního typu včetně všech modifikací;
 - (c) pokyny podle příslušného sloupce tabulky A kapitoly 3.2, nebo seznam nebezpečných věcí, které se mají přepravovat, pro dotyčné výrobky;
 - (d) výkres nebo výkresy celkové sestavy;
 - (e) detailní výkresy, včetně rozměrů použitých pro výpočty, výrobku, provozní výstroje, konstrukční výstroje, značení a/nebo označení bezpečnostními značkami nezbytné pro ověření shody;
 - (f) poznámky k výpočtům, výsledky a závěry;
 - (g) seznam provozní výstroje s příslušnými technickými údaji a informacemi k pojistným zařízením včetně výpočtu odlehčovací kapacity, pokud je to relevantní;

- (h) seznam materiálu vyžadovaného v normě pro výrobu, použitého pro každou část, podskupinu, vnitřní povlak, provozní a konstrukční výstroj a odpovídající specifikace materiálů nebo odpovídající prohlášení o souladu s ADR;
- (i) schválenou kvalifikaci procesu trvalých spojení;
- (j) popis procesu(ů) tepelného zpracování; a
- (k) postupy, popisy a záznamy o všech příslušných zkouškách uvedených v normách nebo ADR pro schválení konstrukčního typu a pro výrobu.

1.8.7.7.2 **Dokumenty pro dohled nad výrobou**

Žadatel musí dát k dispozici, jak je to náležité:

- (a) dokumenty uvedené v 1.8.7.7.1;
- (b) kopii osvědčení o schválení konstrukčního typu;
- (c) výrobní postupy včetně zkušebních postupů;
- (d) výrobní záznamy;
- (e) schválené kvalifikace pracovníků provádějících trvalá spojení;
- (f) schválené kvalifikace pracovníků provádějících nedestruktivní zkoušky;
- (g) protokoly o destruktivních a nedestruktivních zkouškách;
- (h) záznamy o tepelném zpracování; a
- (i) kalibrační záznamy.

1.8.7.7.3 **Dokumenty pro první inspekci a zkoušky**

Žadatel musí dát k dispozici, jak je to náležité:

- (a) dokumenty uvedené v 1.8.7.7.1 a 1.8.7.7.2;
- (b) certifikáty materiálu výrobku a všech podskupin;
- (c) prohlášení o shodě a certifikáty materiálu provozní výstroje; a
- (d) prohlášení o shodě včetně popisu výrobku a všech modifikací odvozených ze schválení konstrukčního typu.

1.8.7.7.4 **Dokumenty pro periodické, meziperiodické inspekce a mimořádné kontroly**

Žadatel musí dát k dispozici, jak je to náležité:

- (a) pro tlakové nádoby dokumenty obsahující zvláštní požadavky, pokud to normy pro výrobu a pro periodické inspekce a zkoušky vyžadují;
- (b) pro cisterny:
 - (i) dokumentaci cisterny (pasport); a
 - (ii) jeden nebo více dokumentů uvedených v 1.8.7.7.1 až 1.8.7.7.3.

1.8.7.7.5 **Dokumenty pro hodnocení vlastní inspekční služby**

Žadatel o vlastní inspekční službu musí dát k dispozici dokumentaci k systému kvality, jak je to náležité:

- (a) organizační strukturu a odpovědnosti;
- (b) příslušné pokyny pro inspekci a zkoušku, kontrolu kvality, zajištění kvality a operační postupy a systematické činnosti, které budou prováděny;

- (c) záznamy o kvalitě, jako jsou inspekční zprávy, testovací data, kalibrační údaje a certifikáty;
- (d) výsledky auditů k zajištění účinného fungování systému kvality vyplývající z auditů podle 1.8.7.6;
- (e) postup popisující, jak jsou plněny požadavky zákazníka a předpisů;
- (f) postup pro kontrolu dokumentů a jejich revizi;
- (g) postupy pro nevyhovující výrobky; a
- (h) školicí programy a kvalifikační postupy pro příslušný personál.

1.8.7.8 **Výrobky vyrobené, schválené, prohlížené a zkoušené podle norem**

Požadavky pododdílu 1.8.7.7 se považují za splněné, použijí-li se dále uvedené relevantní normy:

Příslušné ustanovení	Odkazy	Název dokumentu
1.8.7.7.1 až 1.8.7.7.4	EN 12972:2007	Cisterny pro přepravu nebezpečných věcí – Zkoušení, inspekce a značení kovových cisteren

1.8.8 **Postupy pro posuzování shody plynových kartuší**

Při posuzování shody plynových kartuší se použije jeden z následujících postupů:

- (a) postup v oddílu 1.8.7 pro tlakové nádoby neodpovídající UN, s výjimkou pododdílu 1.8.7.5; nebo
- (b) postup v pododdílech 1.8.8.1 až 1.8.8.7.

1.8.8.1 **Všeobecná ustanovení**

1.8.8.1.1 Dohled nad výrobou musí být prováděn organizací Xa a zkoušky vyžadované v 6.2.6 musí být prováděny buď organizací Xa, nebo organizací IS schválenou touto organizací Xa; k definici organizací Xa a IS viz definice v 6.2.3.6.1. Posuzování shody musí být prováděno příslušným orgánem, jeho zástupcem nebo jeho schválenou inspekční organizací smluvní strany ADR.

1.8.8.1.2 Při použití ustanovení v 1.8.8 musí žadatel prokázat, zajistit a deklarovat na svou výlučnou odpovědnost shodu plynových kartuší s ustanoveními uvedenými v 6.2.6 a se všemi dalšími platnými ustanoveními ADR.

1.8.8.1.3 Žadatel musí:

- (a) provést posouzení konstrukčního typu každého typu plynových kartuší (včetně použitých materiálů a modifikací tohoto typu, např. objemy, tlaky, výrobní výkresy a uzavírací a výpustná zařízení) podle 1.8.8.2;
- (b) používat schválený systém kvality pro konstrukci, výrobu, inspekci a zkoušení podle 1.8.8.3;
- (c) používat schválený zkušební režim podle 1.8.8.4 pro zkoušky vyžadované v 6.2.6;
- (d) požádat o schválení svého systému kvality pro dohled nad výrobou a pro zkoušení jednu organizaci Xa podle své volby smluvní strany; jestliže žadatel nemá své sídlo ve smluvní straně, musí požádat jednu organizaci Xa ze smluvní strany před první přepravou do smluvní strany;
- (e) je-li plynová kartuše v konečné fázi kompletována z dílů vyrobených žadatelem jedním nebo více jinými podniky, vypracovat písemné pokyny, jak kompletovat a plnit plynové kartuše, aby splnily ustanovení jeho osvědčení o posouzení konstrukčního typu.

1.8.8.1.4 Pokud žadatel a podniky kompletující nebo plnící plynové kartuše podle pokynů žadatele mohou prokázat ke spokojenosti organizace Xa shodu s ustanoveními pododdílu 1.8.7.6, kromě 1.8.7.6.1 (d) a 1.8.7.6.2 (b), smějí si zřídit vlastní inspekční službu, která smí vykonávat část nebo všechny inspekce a zkoušky uvedené v 6.2.6.

1.8.8.2 *Posuzování konstrukčního typu*

- 1.8.8.2.1 Žadatel musí vypracovat technickou dokumentaci pro každý typ plynových kartuší včetně použité technické normy (norem). Jestliže se rozhodne použít normu, na kterou není odkaz v 6.2.6, musí doplnit použitou normu do dokumentace.
- 1.8.8.2.2 Žadatel musí uchovávat technickou dokumentaci spolu se vzorky tohoto typu k dispozici organizaci Xa během výroby a poté po dobu nejméně pěti let od posledního data výroby plynových kartuší podle osvědčení o posouzení konstrukčního typu.
- 1.8.8.2.3 Žadatel vydá po pečlivém posouzení osvědčení pro konstrukční typ, které platí na maximální dobu deseti let; toto osvědčení musí doplnit do dokumentace. Toto osvědčení ho opravňuje vyrábět plynové kartuše tohoto typu po tuto dobu.
- 1.8.8.2.4 Jestliže se v průběhu této doby změni příslušné technické požadavky ADR (včetně referenčních norem), takže konstrukční typ jim už nevyhovuje, musí žadatel zrušit své osvědčení o posouzení konstrukčního typu a informovat o tom organizaci Xa.
- 1.8.8.2.5 Žadatel smí po pečlivém a úplném přezkoumání vydat znovu osvědčení s platností na další období maximálně deseti let.

1.8.8.3 *Dohled nad výrobou*

- 1.8.8.3.1 Postup při posuzování konstrukčního typu, jakož i výrobní proces musí být podrobeny kontrole ze strany organizace Xa, aby se zajistilo, že konstrukční typ certifikovaný žadatelem a výrobek, jak je vyráběn, jsou ve shodě s ustanoveními osvědčení pro konstrukční typ a s platnými ustanoveními ADR. Při použití odstavce 1.8.8.1.3 (c) musí být do tohoto postupu zahrnuty rovněž podniky pověřené kompletací a plněním.
- 1.8.8.3.2 Žadatel musí učinit všechna potřebná opatření, aby zajistil, že výrobní proces splňuje platná ustanovení ADR a jeho osvědčení pro konstrukční typ a jeho příloh. Při použití odstavce 1.8.8.1.3 (c) musí být do tohoto postupu zahrnuty rovněž podniky pověřené kompletací a plněním.
- 1.8.8.3.3 Organizace Xa musí:
- (a) ověřit shodu posouzení konstrukčního typu žadatele a shodu typu plynových kartuší s technickou dokumentací uvedenou v 1.8.8.2;
 - (b) ověřit, zda výrobní proces vyrábí výrobky ve shodě s předpisy a dokumentací, které se na něj vztahují; je-li plynová kartuše v konečné fázi kompletována z dílů vyrobených žadatelem jedním nebo více jinými podniky, musí organizace Xa rovněž ověřit, zda jsou plynové kartuše v plné shodě s platnými předpisy po finální kompletaci a naplnění a že jsou pokyny žadatele správně používány;
 - (c) ověřit, zda je personál provádějící trvalá spojení dílů a zkoušky kvalifikovaný nebo schválený;
 - (d) zaznamenat výsledky svých kontrol.
- 1.8.8.3.4 Jestliže nálezy organizace Xa ukáží neshodu osvědčení pro konstrukční typ žadatele nebo výrobního procesu, musí tato organizace vyžadovat náležitá opravná opatření nebo zrušení platnosti osvědčení vydaného žadatelem.

1.8.8.4 Zkouška těsnosti

1.8.8.4.1 Žadatel a podniky v konečné fázi kompletující a plnicí plynové kartuše podle pokynů žadatele musí:

- (a) provést zkoušky vyžadované v 6.2.6;
- (b) zaznamenat výsledky zkoušek;
- (c) vydat osvědčení o shodě pouze pro plynové kartuše, které plně vyhovují ustanovením svého posouzení konstrukčního typu a platným ustanovením ADR a které s úspěchem prošly zkouškami vyžadovanými v 6.2.6;
- (d) uchovávat dokumentaci uvedenou v 1.8.8.7 během výroby a poté po dobu nejméně pěti let od posledního data výroby plynových kartuší náležejících k jednomu typovému schválení pro inspekci prováděnou organizací Xa v namátkově zvolených intervalech;
- (e) připevnit odolnou a čitelnou značku identifikující typ plynové kartuše, žadatele a datum výroby nebo číslo výrobní série; tam, kde vzhledem k omezené disponibilní ploše nemůže být tato značka umístěna na těleso plynové kartuše, musí připevnit odolnou visačku s těmito informacemi k plynové kartuši nebo ji vložit s plynovou kartuší do vnitřního obalu.

1.8.8.4.2 Organizace Xa musí:

- (a) provádět potřebné prohlídky a zkoušky v namátkově zvolených intervalech, ale alespoň krátce po zahájení výroby určitého typu plynových kartuší a poté alespoň jednou za tři roky za účelem ověření, že postup pro posouzení konstrukčního typu žadatele, jakož i výroba a zkoušení výrobku jsou prováděny v souladu s osvědčením pro konstrukční typ a s příslušnými předpisy;
- (b) zkontrolovat osvědčení dodaná žadatelem;
- (c) provádět zkoušky vyžadované v 6.2.6 nebo schválit program zkoušek a vlastní inspekční službu k provádění zkoušek.

1.8.8.4.3 Osvědčení musí obsahovat alespoň:

- (a) název a adresu žadatele a, není-li finální kompletace prováděna žadatelem, nýbrž podnikem nebo podniky podle písemných pokynů žadatele, název (názvy) a adresu (adresy) těchto podniků;
- (b) odvolávku na vydání ADR a normu (normy) použité pro výrobu a zkoušky;
- (c) výsledky inspekce a zkoušek;
- (d) údaje pro značení, jak jsou vyžadovány v 1.8.8.4.1 (c).

1.8.8.5 (Vyhrazeno)

1.8.8.6 Dohled nad vlastní inspekční službou

Pokud si žadatel nebo podnik kompletující nebo plnicí plynové kartuše zřídil vlastní inspekční službu, použijí se ustanovení uvedená v 1.8.7.6, kromě 1.8.7.6.1 (d) a 1.8.7.6.2 (b). Podnik kompletující nebo plnicí plynové kartuše musí splňovat ustanovení platná pro žadatele.

1.8.8.7 Dokumentace

Použijí se ustanovení uvedená v 1.8.7.7.1, 1.8.7.7.2, 1.8.7.7.3 a 1.8.7.7.5.

KAPITOLA 1.9

DOPRAVNÍ OMEZENÍ STANOVENÁ PŘÍSLUŠNÝMI ORGÁNY

- 1.9.1 Podle článku 4, odstavce 1 dohody ADR může být vstup nebezpečných věcí na území smluvních stran předmětem pravidel nebo zákazů stanovených z jiných důvodů, než je bezpečnost během přepravy. Taková pravidla nebo zákazy musí být uveřejněny vhodnou formou.
- 1.9.2 Smluvní strany mohou uplatňovat vůči vozidlům provádějícím mezinárodní silniční přepravu nebezpečných věcí na svém území určitá dodatečná ustanovení v rámci výčtu uvedeného v následujícím oddílu 1.9.3, která nejsou obsažena v ADR, pokud tato ustanovení nejsou v rozporu s článkem 2, odstavcem 2 Dohody a pokud jsou obsažena v jejich vnitrostátních právních předpisech a vztahují se rovnocenně rovněž na vozidla provádějící vnitrostátní silniční přepravu nebezpečných věcí na území této smluvní strany.
- 1.9.3 Dodatečná ustanovení, která mohou být uplatňována podle výše uvedeného oddílu 1.9.2, jsou tato:
- (a) Dodatečné bezpečnostní požadavky nebo omezení týkající se vozidel užívaných určitou infrastrukturou, jako jsou mosty, vozidel přepravovaných prostředky kombinované dopravy, jako jsou trajekty nebo vlaky, nebo vozidel vjíždějících nebo vyjíždějících z přístavů nebo jiných dopravních terminálů;
 - (b) Požadavky na jízdu vozidel po předepsaných dopravních trasách, které se vyhýbají obchodním nebo obytným územím, územím citlivým z hlediska ochrany životního prostředí, průmyslovým zónám s rizikovými zařízeními nebo silnicím s vážnými fyzikálními riziky;
 - (c) Výjimečné požadavky týkající se dopravní trasy nebo podmínek parkování vozidel přepravujících nebezpečné věci, které vyplývají z extrémních povětrnostních podmínek, zemětřesení, nehody, odborářských akcí, občanských nepokojů nebo vojenských konfliktů;
 - (d) Omezení silničního provozu vozidel přepravujících nebezpečné věci v určitých dnech týdne nebo roku.
- 1.9.4 Příslušný orgán smluvní strany uplatňující na svém území jakákoli dodatečná ustanovení uvedená v odstavcích (a) a (d) předchozího oddílu 1.9.3 musí o tom informovat Sekretariát Evropské hospodářské komise Organizace spojených národů, který o nich uvědomí smluvní strany¹.

1.9.5 Omezení průjezdu tunely

POZNÁMKA: Ustanovení o omezeních průjezdu vozidel silničními tunely jsou též uvedeny v kapitole 8.6.

1.9.5.1 Všeobecná ustanovení

Při aplikaci omezení průjezdu vozidel přepravujících nebezpečné věci tunely musí příslušný orgán označit silniční tunel jednou z kategorií tunelů definovaných v 1.9.5.2.2. Musí být vzaty v úvahu charakteristiky tunelu, odhad rizika, včetně možnosti a vhodnosti alternativních tras a způsobů a řízení provozu. Tentýž tunel může být označen více než jednou kategorií tunelu, např. závisející na denních hodinách nebo na dnech týdne atd.

¹ Do Všeobecného návodu pro výpočet rizik při silniční přepravě nebezpečných věcí (A Guideline for the Calculation of Risks in the Transport of Dangerous Goods by Road) je možno nahlédnout na webové stránce sekretariátu Evropské hospodářské komise OSN (<http://www.unece.org/trans/danger/danger.htm>).

1.9.5.2 Kategorizace

1.9.5.2.1 Kategorizace musí vycházet z předpokladu, že v tunelech existují tři hlavní nebezpečí, které mohou způsobit početné oběti nebo vážné poškození infrastruktury tunelu:

- (a) Výbuchy;
- (b) Únik toxického plynu nebo těkavé toxické kapaliny;
- (c) Požáry.

1.9.5.2.2 Pět kategorií jsou dále uvedené:

Kategorie tunelu A

Žádná omezení pro přepravu nebezpečných věcí;

Kategorie tunelu B

Omezení pro přepravu nebezpečných věcí, které mohou vést k velmi silnému výbuchu;

Dále uvedené nebezpečné věci jsou považovány za splňující tato kritéria²:

Třída 1:	Skupiny snášenlivosti A a L;
Třída 3:	Klasifikační kód D (UN 1204, 2059, 3064, 3343, 3357 a 3379);
Třída 4.1:	Klasifikační kódy D a DT; a Samovolně se rozkládající látky, typ B (UN 3221, 3222, 3231 a 3232);
Třída 5.2:	Organické peroxidy, typ B (UN 3101, 3102, 3111 a 3112).
Pokud celková čistá hmotnost výbušné látky v dopravní jednotce je větší než 1000 kg:	
Třída 1:	Podtřídy 1.1, 1.2 a 1.5 (kromě skupin snášenlivosti A a L).
Pokud jsou přepravovány v cisternách:	
Třída 2:	Klasifikační kódy F, TF a TFC;
Třída 4.2:	Obalová skupina I;
Třída 4.3:	Obalová skupina I;
Třída 5.1:	Obalová skupina I.
Třída 6.1:	UN 1510

Kategorie tunelu C

Omezení pro přepravu nebezpečných věcí, které mohou vést k velmi silnému výbuchu, silnému výbuchu nebo velkému úniku toxické látky;

Dále uvedené nebezpečné věci jsou považovány za splňující tato kritéria² nahoře:

- nebezpečné věci omezené v tunelu kategorie B, a
- následující nebezpečné věci:

² Odhad vychází ze skutečných nebezpečných vlastností věcí, typu ochrany a přepravovaného množství.

Třída 1:	Podtřída 1.1, 1.2 a 1.5 (kromě skupin snášenlivosti A a L); a
Třída 7:	Podtřída 1.3 (skupiny snášenlivosti H a J); UN 2977 a 2978.
Pokud celková čistá hmotnost výbušné látky v dopravní jednotce je větší než 5000 kg:	
Třída 1:	Podtřída 1.3 (skupiny snášenlivosti C a G).
Pokud jsou přepravovány v cisternách:	
Třída 2:	Klasifikační kódy 2A, 2O, 3A a 3O, jakož i klasifikační kódy obsahující jen písmeno T nebo skupiny písmen TC, TO a TOC;
Třída 3:	Obalová skupina I pro klasifikační kódy FC, FT1, FT2 a FTC;
Třída 6.1:	Obalová skupina I; kromě UN 1510
Třída 8:	Obalová skupin I pro klasifikační kód CT1, CFT a COT.

Kategorie tunelu D:

Omezení pro přepravu nebezpečných věcí, které mohou vést k velmi silnému výbuchu, silnému výbuchu, velkému úniku toxické látky nebo velkému požáru;

Dále uvedené nebezpečné věci jsou považovány za splňující tato kritéria2:

- nebezpečné věci omezené v tunelu kategorie C, a
- následující nebezpečné věci:

Třída 1:	Podtřída 1.3 (skupina snášenlivosti C a G);
Třída 2:	Klasifikační kódy F, FC, T, TF, TC, TO, TFC a TOC;
Třída 4.1:	Samovolně se rozkládající látky, typy C, D, E a F; a UN 2956, 3241, 3242 a 3251;
Třída 5.2:	Organické peroxidy, typy C, D, E a F;
Třída 6.1:	Obalová skupina I pro klasifikační kódy TF1 a TFC; a Látky toxické při vdechování, jimž je ve sloupci (6) tabulky A kapitoly 3.2 přiřazeno zvláštní ustanovení 354 a látky toxické při vdechování UN čísel 3381 až 3390;
Třída 8:	Obalová skupina I pro klasifikační kód CT1, CFT a COT a UN 3507;
Třída 9:	Klasifikační kódy M9 a M10.
Pokud jsou přepravovány volně ložené nebo v cisternách:	
Třída 3	
Třída 4.2:	Obalová skupina II;
Třída 4.3:	Obalová skupina II;
Třída 6.1:	Obalová skupina II; a Obalová skupina III pro klasifikační kód TF2;
Třída 8:	Obalová skupina I pro klasifikační kódy CF1, CFT a CW1; a Obalová skupina II pro klasifikační kódy CF1 a CFT".
Třída 9:	Klasifikační kódy M2 a M3.

Kategorie tunelu E:

Omezení pro všechny nebezpečné věci jiné než UN 2919, 3291, 3331 a 3373 a pro všechny nebezpečné věci podle ustanovení kapitoly 3.4, jestliže přepravované množství překračuje 8 tun celkové (btto) hmotnosti na dopravní jednotku.

POZNÁMKA: Pro nebezpečné věci přiřazené do UN 2919 a 3331 omezení průjezdu tunely však mohou být částí zvláštních ujednání schválených příslušným(i) orgánem(y) podle pododdílu 1.7.4.2.

1.9.5.3***Ustanovení o dopravních značkách a vyhlášení omezení***

1.9.5.3.1

Smluvní strany musí označit zakazy průjezdu tunelem a alternativní trasy prostřednictvím značek a signálů.

1.9.5.3.2

Pro tento účel mohou být použity značky C, 3h a D, 10a, 10b a 10c podle Vídeňské úmluvy o dopravních značkách a signálech (Vídeň, 1968) a Evropské dohody doplňující Úmluvu o dopravních

značkách a signálech (Ženeva, 1971), jak je uvedeno v Rezoluci o dopravních značkách a signálech (R.E.2) Hlavní pracovní skupiny pro silniční dopravu Výboru pro pozemní dopravu EHK OSN, se změnami a doplňky.

- 1.9.5.3.3 Za účelem usnadnění výkladu značek je systém značek a signálů předepsaný Vídeňskou úmluvou založen na používání tvarů a charakteristiky barev každé třídy značek a, kde je to možné, na použití grafických symbolů (piktogramů) spíše než popisů. Kde Smluvní strany považují za nezbytné upravit předepsané značky a symboly, tyto úpravy nesmí měnit jejich podstatné charakteristiky. Kde Smluvní strany neuplatňují Vídeňskou úmluvu, předepsané značky a symboly mohou být upravovány, tyto úpravy nesmí měnit jejich podstatný smysl.
- 1.9.5.3.4 Dopravní značky a signály určené pro zákaz vjezdu vozidel přepravujících nebezpečné věci do silniční tunelů musí umístěny na místě, kde je možná volba alternativní trasy.
- 1.9.5.3.5 Kde vjezd do tunelů je omezen, nebo jsou předepsány alternativní trasy, značky musí být označeny doplňkovými tabulkami takto:
- Žádná značka: žádné omezení
- Značka s doplňkovou tabulkou opatřenou písmenem B: vztahuje se na vozidla přepravující nebezpečné věci nedovolené pro dopravu tunely kategorie B;
- Značka s doplňkovou tabulkou opatřenou písmenem C: vztahuje se na vozidla přepravující nebezpečné věci nedovolené pro dopravu tunely kategorie C;
- Značka s doplňkovou tabulkou opatřenou písmenem D: vztahuje se na vozidla přepravující nebezpečné věci nedovolené pro dopravu tunely kategorie D;
- Značka s doplňkovou tabulkou opatřenou písmenem E: vztahuje se na vozidla přepravující nebezpečné věci nedovolené pro dopravu tunely kategorie E;
- 1.9.5.3.6 Omezení průjezdu tunely platí pro dopravní jednotky, pro které je vyžadováno označení oranžovými tabulkami podle 5.3.2, s výjimkou přepravy nebezpečných věcí, pro které je ve sloupci (15) tabulky A kapitoly 3.2 uvedeno „(-)“. Pro nebezpečné věci přiřazené k UN číslům 2919 a 3331 smějí však být omezení průjezdu tunely součástí zvláštního ujednání schváleného příslušným orgánem nebo příslušnými orgány na základě ustanovení uvedených v 1.7.4.2. Pro tunely kategorie E platí omezení průjezdu tunely též pro dopravní jednotky, pro které je vyžadováno označení podle 3.4.13, nebo které přepravují kontejnery, pro něž je vyžadováno označení podle 3.4.13.
- Omezení průjezdu tunely neplatí, pokud jsou nebezpečné věci přepravovány podle 1.1.3, s výjimkou případů, kdy jsou vozidla přepravující takové věci označena podle 3.4.13 s přihlédnutím k 3.4.14³
- 1.9.5.3.7 Omezení musí být úředně publikována a zpřístupněna veřejnosti. Smluvní strany musí taková omezení sdělit sekretariátu UNECE a sekretariát tyto informace zveřejní na své webové stránce.
- 1.9.5.3.8 Pokud Smluvní strany uplatňují zvláštní provozní opatření pro snížení rizik a vztahující se na některá nebo všechna vozidla používající tunely, taková jako prohlášení před vjezdem nebo průjezdem v konvoji doprovázeném doprovodnými vozidly, taková provozní opatření musí být úředně publikována a zpřístupněna veřejnosti.

³ nebo podle 3.4.10 s přihlédnutím k 3.4.11 ADR platné do 31. prosince 2010, jestliže se použije přechodných ustanovení v 1.6.1.20.

KAPITOLA 1.10

BEZPEČNOSTNÍ PŘEDPISY

POZNÁMKA: Pro účely této kapitoly se slovem „bezpečnost“ rozumí opatření nebo preventivní kroky ke snížení nebezpečí odcizení nebo zneužití nebezpečných věcí, v jehož důsledku by mohlo dojít k ohrožení osob, majetku nebo životního prostředí.

1.10.1 Všeobecná ustanovení

- 1.10.1.1 Všechny osoby podílející se na přepravě nebezpečných věcí musí dodržovat bezpečnostní předpisy pro přepravu nebezpečných věcí uvedené v této kapitole v přiměřené míře ke svým odpovědnostem.
- 1.10.1.2 Nebezpečné věci smějí být předány k přepravě pouze dopravcům, jejichž totožnost byla vhodným způsobem ověřena.
- 1.10.1.3 Prostory terminálů pro dočasné skladování, plochy pro dočasné skladování, odstavné plochy pro vozidla, kotviště a seřadovací nádraží používané pro dočasné skladování během přepravy nebezpečných věcí musí být vhodně zabezpečeny, dobře osvětleny a, kde je to možné a vhodné, nepřístupné veřejnosti.
- 1.10.1.4 Každý člen osádky vozidla musí mít během přepravy nebezpečných věcí u sebe průkaz totožnosti opatřený fotografií.
- 1.10.1.5 Bezpečnostní kontroly podle oddílu 1.8.1 a pododdílu 7.5.1.1 se musí zaměřit také na vhodná opatření k zajištění bezpečnosti.
- 1.10.1.6 Příslušný orgán musí vést aktuální soupisy všech platných osvědčení o školení řidičů předepsaných v oddílu 8.2.1, vydaných jím nebo jakoukoli uznávanou organizací.

1.10.2 Školení o obecné bezpečnosti

- 1.10.2.1 Úvodní a obnovovací školení uvedené v kapitole 1.3 musí zahrnovat také prvky poučení o bezpečnosti. Obnovovací školení nemusí být nutně vázáno jen na změny předpisů.
- 1.10.2.2 Školení musí být zaměřeno na povahu bezpečnostních rizik, jejich rozpoznávání a postupů k jejich snížení, jakož i na opatření, která je nutno provést při narušení bezpečnosti. Musí zahrnovat seznámení s příslušnými bezpečnostními plány, v přiměřené míře k odpovědnostem povinnostem jednotlivých pracovníků a jejich účasti při aplikaci bezpečnostních plánů.
- 1.10.2.3 Toto školení musí být poskytnuto při přijímání osob na pracovní místa spojená s přepravou nebezpečných věcí, nebo musí být ověřeno, že takové školení již absolvovaly. Následně musí být periodicky doplňováno obnovovacím školením.
- 1.10.2.4 Záznamy o všech absolvovaných bezpečnostních školeních musí být uchovávány zaměstnavatelem a musí být na požádání zpřístupněny zaměstnanci nebo příslušnému orgánu. Záznamy musí být uchovávány zaměstnavatelem po dobu stanovenou příslušným orgánem.

1.10.3 Ustanovení pro vysoce rizikové nebezpečné věci

1.10.3.1 Definice vysoce rizikových nebezpečných věcí

- 1.10.3.1.1 Vysoce rizikové nebezpečné věci jsou takové nebezpečné věci, které mají potenciál být zneužity při teroristické akci a které mohou, jako výsledek, vyvolat vážné důsledky, jako jsou hromadné oběti na životech, hromadné ničení nebo, zejména pro třídu 7, hromadný socio-ekonomický rozvrat.

- 1.10.3.1.2 Vysoce rizikové nebezpečné věci jiných tříd, než je třída 7, jsou nebezpečné věci uvedené v tabulce 1.10.3.1.2 níže a přepravované v množstvích větších, než jsou množství uvedená v této tabulce.

Tabulka 1.10.3.1.2: Seznam vysoce rizikových nebezpečných věcí

Třída	Podtřída	Látka nebo předmět	Množství		
			Cisterna (l) ^c	Volně ložené (kg) ^d	Kusy (kg)
1	1.1	Výbušné látky a předměty	a	a	0
	1.2	Výbušné látky a předměty	a	a	0
	1.3	Výbušné látky a předměty skupiny snášenlivosti C	a	a	0
	1.4	Výbušné látky a předměty UN čísel 0104, 0237, 0255, 0267, 0289, 0361, 0365, 0366, 0440, 0441, 0455, 0456 a 0500	a	a	0
	1.5	Výbušné látky a předměty	0	a	0
2		Hořlavé plyny (klasifikační kódy zahrnující jen písmeno F)	3000	a	b
		Toxické plyny (klasifikační kódy zahrnující písmena T, TF, TC, TO, TFC nebo TOC), s výjimkou aerosolů	0	a	0
3		Hořlavé kapaliny obalových skupin I a II	3000	a	b
		Znečištěné výbušné kapaliny	0	a	0
4.1		Znečištěné výbušné látky	a	a	0
4.2		Látky obalové skupiny I	3000	a	b
4.3		Látky obalové skupiny I	3000	a	b
5.1		Kapaliny podporující hoření obalové skupiny I	3000	a	b
		Chloristany, dusičnan amonný, hnojiva obsahující dusičnan amonný a emulze nebo suspenze nebo gely obsahující dusičnan amonný	3000	3000	b
6.1		Toxické látky obalové skupiny I	0	a	0
6.2		Infekční látky (UN čísel 2814 a 2900, kromě materiálu živočišného původu)	a	0	0
8		Žiravé látky obalové skupiny I	3000	a	b

^a Nevztahuje se.

^b Ustanovení oddílu 1.10.3 neplatí, bez ohledu na množství.

^c Hodnota uvedená v tomto sloupci platí pouze tehdy, je-li přeprava v cisternách podle kapitoly 3.2, tabulky A, sloupce (10) nebo (12) dovolena. Pro látky, které není dovoleno v cisternách přepravovat, instrukce uvedená v tomto sloupci neplatí.

^d Hodnota uvedená v tomto sloupci platí pouze tehdy, je-li přeprava ve volně loženém stavu podle kapitoly 3.2, tabulky A, sloupce (10) nebo (17) dovolena. Pro látky, které není dovoleno ve volně loženém stavu přepravovat, instrukce uvedená v tomto sloupci neplatí.

- 1.10.3.1.3 Pro třídu 7 jsou vysoce rizikové radioaktivní látky takové látky, které mají úroveň aktivity stejnou nebo vyšší než je práh dopravní bezpečnosti 3 000 A2 pro jednotlivý kus (viz též 2.2.7.2.2.1), s výjimkou následujících radionuklidů, pro které je práh dopravní bezpečnosti udán v tabulce 1.10.3.1.3 níže.

Tabulka 1.10.3.1.3: Prahy dopravní bezpečnosti pro jednotlivé radionuklidy

Prvek	Radionuklid	Práh dopravní bezpečnosti (TBq)
Americium	Am-241	0,6
Zlato	Au-198	2
Kadmium	Cd-109	200
Kalifornium	Cf-252	0,2
Curium	Cm-244	0,5
Kobalt	Co-57	7
Kobalt	Co-60	0,3
Cesium	Cs-137	1
Železo	Fe-55	8000
Germanium	Ge-68	7
Gadolinium	Gd-153	10
Iridium	Ir-192	0,8
Nikl	Ni-63	600
Paladium	Pd-103	900
Prometium	Pm-147	400
Polonium	Po-210	0,6
Plutonium	Pu-238	0,6
Plutonium	Pu-239	0,6
Radium	Ra-226	0,4
Ruthenium	Ru-106	3
Selen	Se-75	2
Stroncium	Sr-90	10
Thalium	Tl-204	200
Thulium	Tm-170	200
Yterbium	Yb-169	3

- 1.10.3.1.4 Pro směsi radionuklidů může být zjištěno, zda je dosažen nebo překročen práh dopravní bezpečnosti, provedeno výpočtem tak, že se sečte aktivita každého radionuklidu podělená prahem dopravní bezpečnosti pro tento radionuklid. Je-li součet těchto zlomků menší než 1, potom nebyl překročen práh radioaktivity pro směs.

Výpočet může být proveden podle tohoto vzorce:

$$\sum \frac{A_i}{T_i} < 1$$

kde:

A_i = aktivita radionuklidu i , který je přítomen v kusu (TBq)

T_i = práh dopravní bezpečnosti pro radionuklid i (TBq)

- 1.10.3.1.5 Pokud má radioaktivní látka vedlejší nebezpečí jiných tříd, musí být vzata v úvahu také kritéria tabulky 1.10.3.1.2 (viz též 1.7.5).

1.10.3.2 Bezpečnostní plány

- 1.10.3.2.1 Dopravci, odesílatelé a ostatní účastníci přepravy uvedení v oddílech 1.4.2 a 1.4.3, podílející se na přepravě vysoce rizikových nebezpečných věcí (viz tabulku 1.10.3.1.2), nebo vysoce rizikových radioaktivních látek (viz tabulku 1.10.3.1.3) musí přijmout, aplikovat a dodržet bezpečnostní plán, který musí obsahovat alespoň součásti uvedené v 1.10.3.2.2.

- 1.10.3.2.2 Bezpečnostní plán musí obsahovat alespoň následující součásti:
- (a) specifické stanovení odpovědností za bezpečnost způsobitelným a kvalifikovaným osobám s odpovídající pravomocí k uplatnění svých odpovědností;
 - (b) seznamy dotčených nebezpečných věcí nebo skupin nebezpečných věcí;
 - (c) přehled běžných činností a rozbor bezpečnostních rizik, které z nich vyplývají, včetně všech zastávek nutných při přepravě, přítomnosti nebezpečných věcí ve vozidle, cisterně nebo kontejneru před jízdou, během ní a po jízdě a dočasného skladování nebezpečných věcí za účelem jejich intermodální překládky nebo překládky na jiné vozidlo;
 - (d) jasná specifikace opatření, která je třeba učinit ke snížení bezpečnostních rizik, přiměřených k odpovědnostem a povinnostem účastníka, včetně:
 - školení;
 - bezpečnostní politiky (např. reakce na podmínky velkého ohrožení, prověření nově přijímaných zaměstnanců nebo zaměstnanců přidělovaných na některá místa atd.);
 - provozní praxe (např. volba nebo používání známých tras, přístup k nebezpečným věcem při jejich dočasném skladování (jak je definováno pod písmenem c)), blízkost ohrožitelné infrastruktury atd.);
 - zařízení a zdroje, které je nutno použít ke snížení bezpečnostních rizik;
 - (e) účinné a moderní postupy pro ohlašování ohrožení, narušení bezpečnosti nebo případů s takovými situacemi souvisejících, a pro jednání v takových situacích
 - (f) postupy pro posuzování a testování bezpečnostních plánů a postupy pro periodickou revizi a aktualizaci těchto plánů;
 - (g) opatření pro zajištění fyzické bezpečnosti dopravních informací obsažených v bezpečnostním plánu; a
 - (h) opatření pro zajištění toho, aby šíření informací týkajících se přepravy, obsažených v bezpečnostním plánu, bylo omezeno na ty osoby, které je potřebují mít. Tato opatření nesmějí být přitom překážkou sdělování informací vyžadovaných v jiných ustanoveních ADR.

POZNÁMKA: Dopravci, odesílatelé a příjemci by měli spolupracovat mezi sebou a s příslušnými orgány při výměně informací týkajících se případných ohrožení, aplikaci vhodných bezpečnostních opatření a reakci na bezpečnostní incidenty.

- 1.10.3.3 Na vozidlech, kterými jsou přepravovány vysoce rizikové nebezpečné věci (viz tabulku 1.10.3.1.2) nebo vysoce rizikové radioaktivní látky (viz tabulku 1.10.3.1.3), musí být nainstalovány prostředky, zařízení nebo systémy k ochraně proti odcizení vozidla a jeho nákladu a musí být učiněna opatření, aby se zajistila jejich funkčnost a účinnost v každém okamžiku. Použití těchto ochranných opatření nesmí ohrozit zásah záchranných jednotek.

POZNÁMKA: Pokud je to vhodné a pokud jsou potřebná zařízení již nainstalována, měly by být použity telematické systémy nebo jiné metody nebo přístroje pro sledování pohybu vysoce rizikových nebezpečných věcí (viz tabulka 1.10.3.1.2) nebo vysoce rizikových radioaktivních látek (viz tabulka 1.10.3.1.3).

- 1.10.4 Podle ustanovení v 1.1.3.6 se požadavky oddílů 1.10.1, 1.10.2, 1.10.3 a pododdílu 8.1.2.1 (d) nepoužijí, jestliže množství přepravovaná v kusech v dopravní jednotce nepřekročí množství uvedená v 1.1.3.6.3, s výjimkou UN čísel 0029, 0030, 0059, 0065, 0073, 0104, 0237, 0255, 0267, 0288, 0289, 0290, 0360, 0361, 0364, 0365, 0366, 0439, 0440, 0441, 0455, 0456 a 0500 a s výjimkou UN čísel 2910 a 2911, jestliže úroveň aktivity překračuje hodnotu A_2 (viz první odsek v 1.1.3.6.2). Kromě toho se ustanovení 1.10.1, 1.10.2, 1.10.3 a 8.1.2.1 (d) nepoužijí, jestliže množství přepravovaná v cisternách nebo volně ložená v dopravní jednotce nepřekročí množství uvedená v 1.1.3.6.3. Kromě toho se ustanovení této kapitoly nepoužijí pro přepravu UN 2912 LÁTKA RADIOAKTIVNÍ, S NÍZKOU

SPECIFICKOU AKTIVITOU (LSA-I) a UN 2913 LÁTKA, RADIOAKTIVNÍ - POVRCHOVĚ KONTAMINOVANÉ PŘEDMĚTY (SCO-I).

1.10.5

Pro radioaktivní látky se ustanovení této kapitoly považují za splněná, pokud se použije ustanovení Úmluvy o fyzické ochraně jaderných materiálů¹ a oběžníku IAEA „Fyzická ochrana jaderných materiálů a jaderných zařízení“².

¹ INFCIRC/274/Rev.1, IAEA, Vídeň (1980).

² INFCIRC/225/Rev.4 (korigováno), IAEA, Vídeň (1999).

ČÁST 2

KLASIFIKACE

KAPITOLA 2.1

VŠEOBECNÁ USTANOVENÍ

2.1.1 Úvod

2.1.1.1 V ADR jsou následující třídy nebezpečných věcí:

Třída 1	Výbušné látky a předměty
Třída 2	Plyny
Třída 3	Hořlavé kapaliny
Třída 4.1	Hořlavé tuhé látky, samovolně se rozkládající látky a znečtivěné tuhé výbušné látky
Třída 4.2	Samozápalné látky
Třída 4.3	Látky, které ve styku s vodou vyvíjejí hořlavé plyny
Třída 5.1	Látky podporující hoření
Třída 5.2	Organické peroxidy
Třída 6.1	Toxické látky
Třída 6.2	Infekční látky
Třída 7	Radioaktivní látky
Třída 8	Žiravé látky
Třída 9	Jiné nebezpečné látky a předměty

2.1.1.2 Ke každé položce v různých třídách je přiřazeno UN číslo. Používají se následující druhy položek:

- A. Samostatné položky pro přesně definované látky nebo předměty, včetně položek pokrývajících více isomerů, např.:

UN 1090	ACETON
UN 1104	AMYLACETÁTY
UN 1194	ETHYLNITRIT, ROZTOK

- B. Druhovité položky pro přesně definované skupiny látek nebo předmětů, které nejsou j.n. položkami, např.:

UN 1133	LEPIDLA
UN 1266	VÝROBKY KOSMETICKÉ
UN 2757	PESTICID KARBAMÁT, TUHÝ, TOXICKÝ
UN 3101	PEROXID ORGANICKÝ TYP B, KAPALNÝ

- C. Specifické j.n. položky zahrnující skupiny látek nebo předmětů určité chemické nebo technické povahy, jinde nejmenované, např.:

UN 1477	DUSIČNANY, ANORGANICKÉ, J.N.
UN 1987	ALKOHOLY, J.N.

- D. Všeobecné j.n. položky zahrnující skupiny látek nebo předmětů, mající jednu nebo více všeobecných nebezpečných vlastností, jinde nejmenované, např.

UN 1325	LÁTKA, HOŘLAVÁ, TUHÁ, ORGANICKÁ, J.N.
UN 1993	LÁTKA HOŘLAVÁ, KAPALNÁ, J.N.

Položky definované pod písmeny B, C a D se označují jako hromadné položky.

- 2.1.1.3** Pro účely balení jsou látky, kromě látek tříd 1, 2, 5.2, 6.2 a 7 a kromě samovolně se rozkládajících látek třídy 4.1, přiřazeny k obalovým skupinám v závislosti na svém stupni nebezpečí:
Obalová skupina I : látky velmi nebezpečné
Obalová skupina II : látky středně nebezpečné
Obalová skupina III : látky málo nebezpečné

Obalová skupina (obalové skupiny), k nimž je látka přiřazena, je (jsou) uvedena(y) v tabulce A kapitoly 3.2.

Předměty nejsou přiřazeny k obalovým skupinám. Pro účely balení je jakýkoli požadavek na specifickou konstrukční úroveň obalu uveden v příslušném pokynu pro balení.

2.1.2 Zásady klasifikace

- 2.1.2.1** Nebezpečné věci, které spadají pod název třídy, jsou definovány na základě svých vlastností dle pododdílu 2.2.x.1 odpovídající třídy. Zařazení nebezpečných věcí do určité třídy a přiřazení k obalové skupině se provádí podle kritérií uvedených ve stejném pododdílu 2.2.x.1. Přiřazení jednoho nebo více vedlejších nebezpečí nebezpečné látce nebo předmětu se provádí podle kritérií třídy nebo tříd odpovídajících těmto nebezpečím, uvedených v příslušném(-ých) pododdílu(-ech) 2.2.x.1.

- 2.1.2.2** Všechny položky nebezpečných věcí jsou uvedeny v tabulce A kapitoly 3.2 v číselném pořadí UN čísel. Tato tabulka obsahuje odpovídající informace o uvedených věcech, jako pojmenování, třídu, obalovou(-é) skupinu(-y), bezpečnostní značku(y), která(é) musí být umístěna(y), jakož i ustanovení o balení a přepravě¹.

- 2.1.2.3** Látka smí obsahovat technické nečistoty (například takové, které pocházejí z výrobního procesu) nebo přísady pro stabilizaci nebo jiné účely, které neovlivňují její klasifikaci. Avšak látka jmenovitě uvedená, tj. uvedená jako samostatná položka v tabulce A kapitoly 3.2, která obsahuje technické nečistoty nebo přísady pro stabilizaci nebo jiné účely ovlivňující její klasifikaci, musí být považována za roztok nebo směs (viz 2.1.3.3).

- 2.1.2.4** K přepravě nejsou připuštěny nebezpečné věci uvedené nebo definované v pododdílu 2.2.x.2 každé třídy.

- 2.1.2.5** Jmenovitě neuvedené nebezpečné věci, tj. věci, které nejsou uvedeny jako samostatné položky v tabulce A kapitoly 3.2 a které nejsou uvedeny ani definovány v jednom z výše uvedených pododdílů 2.2.x.2, musí být zařazeny do příslušné třídy v souladu s postupem dle oddílu 2.1.3. Dále musí být stanoveno vedlejší nebezpečí (pokud je) a obalová skupina (pokud je). Po stanovení třídy, vedlejšího nebezpečí (pokud je) a obalové skupiny (pokud je), musí být určeno odpovídající UN číslo. Rozhodovací stromy uvedené v pododdílu 2.2.x.3 (seznam hromadných položek) na konci každé třídy uvádějí určující parametry pro výběr příslušné hromadné položky (UN čísla). Ve všech případech musí být vybrána nejspecifičtější hromadná položka zahrnující vlastnosti látky nebo předmětu v pořadí vyjádřeném v pododdílu 2.1.1.2 písmeny B, C a D. Pouze v tom případě, že látka nebo předmět nemohou být zařazeny pod položku typu B nebo C podle pododdílu 2.1.1.2, je možné je zařadit pod položku typu D.

- 2.1.2.6** Na základě zkušebních postupů kapitoly 2.3 a kritérií stanovených v pododdílech 2.2.x.1 jednotlivých tříd může být stanoveno, jak je to uvedeno ve zmíněných pododdílech, že látka, roztok nebo směs určité třídy, které jsou jmenovitě uvedeny v tabulce A kapitoly 3.2, nesplňují kritéria této třídy. V tomto případě nenáleží dotyčná látka, roztok nebo směs do této třídy.

- 2.1.2.7** Pro účely klasifikace jsou látky s bodem tání nebo počátkem tání 20°C nebo nižším při tlaku 101,3 kPa považovány za kapalné látky. Viskózní látku, pro kterou nelze stanovit přesný bod tání, je třeba podrobit zkoušce dle ASTM D 4359-90 nebo zkoušce stanovení tekutosti (zkouška penetrometrem) předepsané v oddílu 2.3.4.

¹ **Poznámka sekretariátu:** Abecední seznam těchto položek byl připraven sekretariátem a je uveden v tabulce B kapitoly 3.2. Tato tabulka není oficiální částí ADR.

2.1.3 Klasifikace jmenovitě neuvedených látek, včetně roztoků a směsí (jako přípravky a odpady)

2.1.3.1 Látky, včetně roztoků a směsí, jmenovitě neuvedené, musí být zařazeny podle svého stupně nebezpečnosti na základě kritérií uvedených v pododdílu 2.2.x.1 jednotlivých tříd. Nebezpečí vyplývající z látky musí být určeno(a) na základě jejích fyzikálních, chemických a fyziologických vlastností. Tyto vlastnosti je nutné rovněž zohlednit, pokud praktické zkušenosti vedou k přísnějšímu zařazení.

2.1.3.2 Látka jmenovitě neuvedená v tabulce A kapitoly 3.2, která vykazuje jediné nebezpečí, musí být zařazena do příslušné třídy pod hromadnou položku dle pododdílu 2.2.x.3 této třídy.

2.1.3.3 Roztok nebo směs splňující klasifikační kritéria ADR, složené z jedné převažující látky, jmenovitě uvedené v tabulce A kapitoly 3.2, a z jedné nebo více látek nepodléhající(ch) ADR, nebo stopových množství jedné nebo více látek jmenovitě uvedených v tabulce A kapitoly 3.2, musí být přiřazeny k UN číslu a oficiálnímu pojmenování pro přepravu převažující látky, jmenovitě uvedené v tabulce A kapitoly 3.2, ledaže:

- (a) roztok nebo směs je jmenovitě uveden(a) v tabulce A kapitoly 3.2;
- (b) pojmenování a popis látky jmenovitě uvedené v tabulce A kapitoly 3.2 výslovně vyjadřují, že se vztahují jen na čistou látku;
- (c) třída, klasifikační kód, obalová skupina nebo fyzikální stav tohoto roztoku nebo směsi jsou odlišné od třídy, klasifikačního kódu, obalové skupiny nebo fyzikálního stavu látky jmenovitě uvedené v tabulce A kapitoly 3.2; nebo
- (d) charakteristiky nebezpečnosti a vlastnosti roztoku nebo směsi vyžadují opatření v případě nehody nebo nouzové situace, která jsou odlišná od opatření vyžadovaných pro látku jmenovitě uvedenou v tabulce A kapitoly 3.2.

V těchto jiných případech, kromě případu pod písmenem (a), musí být roztok nebo směs zařazena jako jmenovitě neuvedená látka do odpovídající třídy a přiřazena pod hromadnou položku uvedenou v pododdílu 2.2.x.3 této třídy, se zohledněním případných vedlejších nebezpečí představovaných tímto roztokem nebo směsí, ledaže by roztok nebo směs neodpovídaly kritériím žádné třídy a proto nepodléhaly předpisům ADR.

2.1.3.4 Roztoky a směsi obsahující látku spadající pod jednu z položek uvedených v odstavci 2.1.3.4.1 nebo 2.1.3.4.2 musí být zařazeny podle ustanovení těchto odstavců.

2.1.3.4.1 Roztoky a směsi, obsahující jednu z následujících jmenovitě uvedených látek, musí být vždy přiřazeny pod stejnou položkou, jako v nich obsažená látka, za podmínky, že tyto roztoky a směsi nemají nebezpečné vlastnosti uvedené v odstavci 2.1.3.5.3:

- Třída 3

UN 1921	PROPYLENIMIN, STABILIZOVANÝ
UN 3064	NITROGLYCERIN, ROZTOK V ALKOHOLU s více než 1 %, ale nejvýše 5 % nitroglycerinu

- Třída 6.1

UN 1051	KYANOVOĐÍK, STABILIZOVANÝ, obsahující méně než 3 % vody
UN 1185	ETYLENIMIN, STABILIZOVANÝ
UN 1259	TETRAKARBONYL NIKLU
UN 1613	KYSELINA KYANOVOĐÍKOVÁ, VODNÝ ROZTOK (KYANOVOĐÍK, VODNÝ ROZTOK), obsahující nejvýše 20 % kyanovodíku
UN 1614	KYANOVOĐÍK, STABILIZOVANÝ, obsahující méně než 3 % vody a nasákly v porézní inertní hmotě
UN 1994	PENTAKARBONYL ŽELEZA
UN 2480	METHYLISOKYANÁT
UN 2481	ETHYLISOKYANÁT
UN 3294	KYANOVOĐÍK, ROZTOK V ALKOHOLU, obsahující nejvýše 45 % kyanovodíku

- Třída 8

UN 1052	FLUOROVODÍK, BEZVODÝ
UN 1744	BROM nebo BROM, ROZTOK
UN 1790	KYSELINA FLUOROVODÍKOVÁ, roztok, s více než 85 % fluorovodíku
UN 2576	BROMID FOSFORYLU, ROZTAVENÝ

2.1.3.4.2 Roztoky a směsi obsahující látky spadající pod jednu z následujících položek třídy 9:

UN 2315	BIFENYLY POLYCHLOROVANÉ, KAPALNÉ (PCB)
UN 3151	BIFENYLY POLYHALOGENOVANÉ, KAPALNÉ, nebo
UN 3151	TERFENYLY POLYHALOGENOVANÉ, KAPALNÉ
UN 3152	BIFENYLY POLYHALOGENOVANÉ, TUHÉ
UN 3152	TERFENYLY POLYHALOGENOVANÉ, TUHÉ, nebo
UN 3432	BIFENYLY POLYCHLOROVANÉ, TUHÉ (PCB)

musí být vždy přiřazeny pod tutéž položku třídy 9, pokud

- neobsahují žádnou další nebezpečnou složku, jinou než složky obalové skupiny III tříd 3, 4.1, 4.2, 4.3, 5.1, 6.1 nebo 8; a
- nemají nebezpečné vlastnosti uvedené v odstavci 2.1.3.5.3.

2.1.3.5 Látky jmenovitě neuvedené v tabulce A kapitoly 3.2, mající více nebezpečných vlastností, jakož i roztoky nebo směsi splňující klasifikační kritéria ADR a obsahující více nebezpečných látek, musí být přiřazeny pod hromadnou položku (viz pododdíl 2.1.2.5) a obalovou skupinou příslušné třídy v závislosti na svých nebezpečných vlastnostech. Takovéto zařazení podle nebezpečných vlastností musí být provedeno následovně:

2.1.3.5.1 Fyzikální, chemické a fyziologické charakteristiky musí být určeny měřením nebo výpočtem a zařazení látek, roztoků nebo směsí musí být provedeno podle kritérií uvedených v pododdíle 2.2.x.1 jednotlivých tříd.

2.1.3.5.2 Je-li toto určení možné jen s neúměrně vysokými náklady (např. u určitých odpadů), musí být látka, roztok nebo směs zařazena do třídy komponentu, který představuje převažující nebezpečí.

2.1.3.5.3 Pokud nebezpečné vlastnosti látky, roztoku nebo směsi spadají do více než jedné třídy nebo skupiny látek uvedených níže, potom látka, roztok nebo směs musí být zařazen do třídy nebo skupiny látek odpovídající převažujícímu nebezpečí na základě následujícího pořadí:

- (a) látky třídy 7 (kromě radioaktivních látek ve vyjmutých kusech, pro něž, s výjimkou UN 3507 HEXAFLUORID URANU, RADIOAKTIVNÍ LÁTKA, VYJMUTÝ KUS, platí zvláštní ustanovení 290 kapitoly 3.3, u kterých převažují jiné nebezpečné vlastnosti);
- (b) látky třídy 1;
- (c) látky třídy 2;
- (d) znečtivěné kapalně výbušné látky třídy 3;
- (e) samovolně se rozkládající látky a znečtivěné tuhé výbušné látky třídy 4.1;
- (f) pyroforní látky třídy 4.2;
- (g) látky třídy 5.2;
- (h) látky třídy 6.1 splňující kritéria toxicity při vdechnutí pro obalovou skupinu I [látky splňující klasifikační kritéria třídy 8 a mající toxicitu při vdechnutí prachů a mlhy (LC₅₀) v rozsahu obalové skupiny I, ale toxicita při požití nebo při dotyku s pokožkou jen v rozsahu obalové skupiny III nebo nižší, musí být zařazeny do třídy 8];
- (i) infekční látky třídy 6.2.

- 2.1.3.5.4** Pokud nebezpečné vlastnosti látky spadají do více tříd nebo skupin látek, které nejsou uvedeny v odstavci 2.1.3.5.3, musí být látka zařazena stejným postupem, avšak odpovídající třída se vybere podle tabulky převažujících nebezpečí v pododdíle 2.1.3.10.
- 2.1.3.5.5** Je-li látka, která se má přepravovat, odpadem se složením, které není přesně známo, smí být její přiřazení k UN číslu a obalové skupině podle 2.1.3.5.2 založeno na odesílatelově znalosti odpadu, včetně všech dostupných technických a bezpečnostních údajů, jak jsou vyžadovány platnou legislativou pro bezpečnost a životní prostředí².
- V případě pochybnosti musí být zvolena nejvyšší úroveň nebezpečí.
- Jestliže je však možno na základě znalosti složení odpadu a fyzikálních a chemických vlastností jeho identifikovaných složek dokázat, že vlastnosti odpadu neodpovídají vlastnostem obalové skupiny I, smí být odpad zařazen pod nejvhodnější j.n. položku obalové skupiny II. Avšak je-li známo, že odpad má jen vlastnosti nebezpečné životnímu prostředí, může být přiřazen k obalové skupině III pod UN čísla 3077 nebo 3082.
- Tento postup nesmí být použit pro odpady obsahující látky zmíněné v 2.1.3.5.3, látky třídy 4.3, látky případu zmíněného v 2.1.3.7 ani pro látky, které nejsou připuštěny k přepravě podle pododdlů 2.2.x.2.
- 2.1.3.6** Je vždy nutno použít nejspecifičtější hromadné položky (viz pododdlil 2.1.2.5), tj. všeobecné j.n. položky se používá jen tehdy, pokud nelze použít druhové položky nebo specifické j.n. položky.
- 2.1.3.7** Roztoky a směsi látek podporujících hoření nebo látek, jejichž vedlejším nebezpečím je podpora hoření, mohou mít výbušné vlastnosti. V tomto případě nejsou připuštěny k přepravě, ledaže by splňovaly předpisy pro třídu 1.
- 2.1.3.8** Látky tříd 1 až 6.2, 8 a 9, jiné než jsou látky přiřazené k UN číslům 3077 nebo 3082, splňující kritéria odstavce 2.2.9.1.10 se navíc ke svým nebezpečím tříd 1 až 6.2, 8 a 9 považují za látky ohrožující životní prostředí. Jiné látky nesplňující kritéria žádné jiné třídy, nýbrž jen kritéria odstavce 2.2.9.1.10, se přiřadí k UN číslům 3077 nebo 3082, jak je to náležité.
- 2.1.3.9** Odpady, které nesplňují kritéria pro zařazení do tříd 1 až 9, avšak spadají pod Basilejskou úmluvu o kontrolu pohybu nebezpečných odpadů přes hranice států a jejich zneškodňování, se směji přepravovat pod UN čísla 3077 nebo 3082.

² Takovou legislativou je např. rozhodnutí Komise 2000/532/ES ze 3. května 2000 nahrazující rozhodnutí 94/3/ES stanovící seznam odpadů na základě článku 1(a) směrnice Rady 75/442/EHS o odpadech (nahrazena směrnicí Evropského parlamentu a Rady 2006/12/ES (Úřední věstník Evropských společenství č. L 114 z 27. dubna 2006, strana 9)) a rozhodnutí Rady 94/904/ES stanovící seznam nebezpečných odpadů na základě článku 1(4) směrnice Rady 91/689/EHS o nebezpečných odpadech (Úřední věstník Evropských společenství č. L 226 ze 6. září 2000, strana 3).

SOL = tuhé látky a směsi
 LIQ = kapalné látky, směsi a roztoky
 DERMAL = toxicita při absorpci pokožkou
 ORAL = toxicita při požití
 INHAL = toxicita při vdechnutí
 *) Třída 6.1 pro pesticidy.

POZNÁMKA 1: Příklady pro použití tabulky**Zařazení jediné látky**

Popis zařazované látky:

Amin, jmenovitě neuvedený, vyhovující kritériím pro třídu 3, obalovou skupinu II, jakož i kritériím pro třídu 8, obalovou skupinu I.

Postup:

Průsečík řádky 3 II se sloupcem 8 I dává 8 I.

Tento amin je tímto zařazen do třídy 8, a sice pod:

UN 2734 AMINY, KAPALNÉ, ŽÍRAVÉ, HOŘLAVÉ, J.N. nebo UN 2734 POLYAMINY, KAPALNÉ, ŽÍRAVÉ, HOŘLAVÉ, J.N., obalová skupina I.

Zařazení směsi

Popis zařazované směsi:

Směs skládající se z hořlavé kapaliny třídy 3, obalové skupiny III, toxické látky třídy 6.1, obalové skupiny II, a žíravé látky třídy 8, obalové skupiny I.

Postup:

Průsečík řádky 3 III se sloupcem 6.1 II dává 6.1 II.

Průsečík řádky 6.1 II se sloupcem 8 I dává 8 I LIQ.

Tato blíže nedefinovaná směs je tímto zařazena do třídy 8, a sice pod:

UN 2922 LÁTKA ŽÍRAVÁ, KAPALNÁ, TOXICKÁ, J.N., obalová skupina I.

POZNÁMKA 2: Příklady zařazení roztoků a směsí do třídy a obalové skupiny:

Roztok fenolu třídy 6.1, obalové skupiny II, v benzenu třídy 3, obalové skupiny II, musí být zařazen do třídy 3, obalové skupiny II. Tento roztok musí být na základě toxicity fenolu zařazen pod UN 1992 LÁTKA HOŘLAVÁ, KAPALNÁ, TOXICKÁ, J.N. třídy 3, obalové skupiny II.

Tuhá směs arzeničnanu sodného třídy 6.1, obalové skupiny II, a hydroxidu sodného třídy 8, obalové skupiny II, musí být zařazena pod UN 3290 LÁTKA TOXICKÁ, TUHÁ, ŽÍRAVÁ, ANORGANICKÁ, J.N. do třídy 6.1, obalové skupiny II.

Roztok surového nebo rafinovaného naftalenu třídy 4.1, obalové skupiny III, v benzenu třídy 3, obalové skupiny II, musí být zařazen pod UN 3295 UHLOVODÍKY, KAPALNÉ, J.N. do třídy 3, obalové skupiny II.

Směs uhlovodíků třídy 3, obalové skupiny III, a polychlorovaných bifenylů (PCB) třídy 9, obalové skupiny II, musí být zařazena pod UN 2315 BIFENYLY POLYCHLOROVANÉ, KAPALNÉ nebo UN 3432 BIFENYLY POLYCHLOROVANÉ, TUHÉ do třídy 9, obalové skupiny II.

Směs propyleniminu třídy 3 a polychlorovaných bifenylů (PCB) třídy 9, obalové skupiny II, musí být zařazena pod UN 1921 PROPYLENIMIN, STABILIZOVANÝ do třídy 3.

2.1.4**Klasifikace zkušebních vzorků****2.1.4.1**

Jestliže třída látky není přesně známa a látka je přepravována k dalšímu zkoušení, musí být zařazena na základě znalostí odesílatele do předběžné třídy, pod předběžné oficiální pojmenování pro přepravu a pod předběžné UN číslo, a sice za použití:

- (a) klasifikačních kritérií kapitoly 2.2; a
- (b) ustanovení této kapitoly.

Musí se použít nejpřísnější obalové skupiny odpovídající zvolenému oficiálnímu pojmenování pro přepravu.

Při použití těchto předpisů musí být oficiální pojmenování pro přepravu doplněno slovem „VZOREK“ (např. „HORLAVÁ KAPALINA, J.N., VZOREK“). V některých případech, kdy pro vzorek, který vyhovuje určitým klasifikačním kritériím, existuje specifické oficiální pojmenování pro přepravu (např. VZOREK PLYNU, NESTLAČENÝ, HORLAVÝ, UN číslo 3167), musí být použito toto oficiální pojmenování pro přepravu. Pokud je pro přepravu vzorku použita j.n.. položka, nemusí být oficiální pojmenování pro přepravu doplněno technickým názvem, jak je vyžadováno zvláštním ustanovením 274 kapitoly 3.3.

2.1.4.2

Vzorek látky musí být přepravován v souladu s ustanoveními vztahujícími se na předběžné oficiální pojmenování pro přepravu za podmínky, že:

- (a) látka se nepovažuje za látku nepřípuštěnou k přepravě podle pododdílů 2.2.x.2 kapitoly 2.2 anebo podle kapitoly 3.2;
- (b) látka se nepovažuje za látku, která splňuje kritéria třídy 1, nebo se nepovažuje za látku infekční ani radioaktivní;
- (c) látka vyhovuje ustanovením odstavce 2.2.41.1.15 nebo odstavce 2.2.52.1.9, jde-li o samovolně se rozkládající látku nebo organický peroxid;
- (d) vzorek je přepravován ve skupinovém obalu s čistou (netto) hmotností jednoho kusu nejvýše 2,5 kg; a
- (e) vzorek není balen společně s jinými věcmi do jednoho kusu.

2.1.5

Klasifikace obalů, vyřazených, prázdných, nevyčištěných

„Prázdné nevyčištěné obaly, velké obaly nebo IBC, nebo jejich části, přepravované k likvidaci, recyklaci nebo rekuperaci jejich materiálu, s výjimkou jejich rekondicionování, opravy, běžné údržby, rekonstrukce nebo opětovného používání, smějí být přiřazeny k UN 3509, pokud splňují požadavky pro tuto položku.

KAPITOLA 2.2

ZVLÁŠTNÍ USTANOVENÍ PRO JEDNOTLIVÉ TŘÍDY

2.2.1 Třída 1 Výbušné látky a předměty

2.2.1.1 Kritéria

2.2.1.1.1 Pod název třídy 1 spadají:

- (a) výbušné látky: tuhé nebo kapalné látky (nebo směsi látek), které mohou chemickou reakcí vyvinout plyny takové teploty, takového tlaku a takové rychlosti, že mohou způsobit škody v okolním prostředí.

Pyrotechnické látky: látky nebo směsi látek určené k vyvolání tepelných, světelných, zvukových, plynových nebo dýmových efektů nebo jejich kombinaci pomocí nedetonačních, samovolně probíhajících exotermických chemických reakcí.

POZNÁMKA1: Látky, které samy nejsou výbušnými látkami, ale mohou vytvořit směs plynu, páry nebo prachu schopnou výbuchu nejsou látkami třídy 1.

POZNÁMKA2: Z třídy 1 jsou vyjmuty také vodou nebo alkoholem navlhčené výbušniny, jejichž obsah vody nebo alkoholu překračuje udané mezní hodnoty, a výbušniny obsahující plastifikační prostředky - tyto výbušniny jsou zařazeny do třídy 3 nebo 4.1; vyjmuty jsou rovněž výbušniny, které jsou na základě svých převažujících nebezpečných vlastností zařazeny do třídy 5.2.

- (b) Výbušné předměty: předměty, které obsahují jednu nebo více výbušných nebo pyrotechnických látek.

POZNÁMKA: Zařízení, která obsahují výbušné nebo pyrotechnické látky v tak malém množství nebo takového druhu, že se jejich neúmyslný nebo náhodný zážeh nebo počín během přepravy neprojeví vně zařízení rozletem, ohněm, mlhou, dýmem, teplem nebo silným zvukem, nepodléhají předpisům třídy 1.

- (c) Látky a předměty výše nejmenované, které byly vyrobeny k vyvolání praktického účinku pomocí výbuchu nebo pyrotechnického efektu.

Pro účely třídy 1 platí následující definice:

Flegmatizovaná znamená, že k výbušné látce byla přidána látka (nebo „flegmatizátor“) ke zvýšení její bezpečnosti při manipulaci a přepravě. Flegmatizátor činí výbušnou látku necitlivou nebo méně citlivou k těmto účinkům: teplo, otřes, náraz, úder nebo tření. Typické flegmatizační prostředky zahrnují mimo jiné: vosk, papír, vodu, polymery (jako jsou chlorfluoropolymery), alkohol a oleje (jako jsou vazelína a parafin).

2.2.1.1.2 Každá látka nebo předmět, které mají nebo by mohly mít výbušné vlastnosti, musí být posouzeny pro zařazení do třídy 1 na základě zkoušek, zkušebních postupů a kritérií stanovených v Příručce zkoušek a kritérií, část I.

Látka nebo předmět zařazené do třídy 1 smějí být připuštěny k přepravě pouze tehdy, jsou-li přiřazeny k jednomu z pojmenování nebo k jedné z j.n. položek uvedených v tabulce A kapitoly 3.2 a splňují kritéria Příručky zkoušek a kritérií.

2.2.1.1.3 Látky a předměty třídy 1 musí být přiřazeny k UN číslu a pojmenování nebo k j.n. položce tabulky A kapitoly 3.2. Interpretace pojmenování látek a předmětů tabulky A kapitoly 3.2 musí být založena na glosáři uvedeném v odstavci 2.2.1.4.

Vzorky nových nebo již existujících výbušných látek nebo předmětů, s výjimkou třaskavin, které jsou přepravovány pro účely zkoušení, zařazování, výzkumu a vývoje, kontroly kvality nebo jako obchodní vzorek mohou být přiřazeny k položce UN 0190 VZORKY, VÝBUŠNÉ.

Přiřazení výbušných látek a předmětů, jmenovitě neuvedených v Kapitole 3.2, tabulce A, k j.n. položce . třídy 1 nebo k položce UN 0190 VZORKY, VÝBUŠNÉ, jakož i přiřazení určitých

látek, u kterých je podle zvláštních ustanovení uvedených v kapitole 3.2, tabulce A, sloupci (6), přeprava závislá na vydání zvláštního povolení příslušného orgánu, musí být provedeno příslušným orgánem země původu. Tento příslušný orgán musí také písemně schválit přepravní podmínky těchto látek a předmětů. Není-li země původu smluvní stranou ADR, musí být klasifikace a přepravní podmínky uznány příslušným orgánem prvního státu smluvní strany ADR, který přijde do styku se zásilkou.

2.2.1.1.4 Látky a předměty třídy 1 musí být přiřazeny k některé podtřídě podle odstavce 2.2.1.1.5 a k některé skupině snášenlivosti podle odstavce 2.2.1.1.6. Podtřída musí být stanovena na základě výsledků zkoušek popsaných v oddílech 2.3.0 a 2.3.1 s použitím definic v odstavci 2.2.1.1.5. Skupina snášenlivosti musí být stanovena podle definic odstavci 2.2.1.1.6. Číslo podtřídy spolu s písmenem skupiny snášenlivosti tvoří klasifikační kód.

2.2.1.1.5 *Definice podtříd*

Podtřída 1.1 Látky a předměty nebezpečné hromadným výbuchem (hromadný výbuch je takový výbuch, který postihne téměř celý náklad zdánlivě okamžitě).

Podtřída 1.2 Látky a předměty nebezpečné rozletem, které však nejsou nebezpečné hromadným výbuchem.

Podtřída 1.3 Látky a předměty nebezpečné prudkým ohněm, s malým nebezpečím od tlakové vlny nebo rozletu nebo oběma těmito účinky, které ale nejsou nebezpečné hromadným výbuchem:

(a) která při hoření vydávají značné tepelné záření, nebo

(b) které hoří postupně za projevu malé tlakové vlny nebo rozletu nebo obou těchto účinků.

Podtřída 1.4 Látky a předměty, které v případě jejich zážehu nebo počinu během přepravy vykazují pouze malé nebezpečí výbuchu. Účinky jsou převážně omezeny na kus bez rozletu úlomků větších rozměrů nebo do větší vzdálenosti. Vnější oheň nesmí vyvolat zdánlivě okamžitý výbuch téměř celého obsahu kusu.

Podtřída 1.5 Velmi necitlivé látky schopné hromadného výbuchu, které jsou tak necitlivé, že pravděpodobnost jejich počinu nebo přechodu z hoření v detonaci je při běžných podmínkách přepravy velmi nízká. Jako minimální požadavek pro tyto látky je stanoveno, že nesmějí detonovat při zkoušce ve vnějším ohni.

Podtřída 1.6 Velmi málo citlivé předměty, které nejsou nebezpečné hromadným výbuchem. Předměty obsahují jen velmi málo citlivé látky a pravděpodobnost jejich náhodného roznětu nebo přenosu výbuchu je velmi nízká.

POZNÁMKA: Předměty podtřídy 1.6 vykazují nebezpečí, které je omezeno na výbuch pouze jednoho předmětu.

2.2.1.1.6 *Definice skupin snášenlivosti látek a předmětů*

A Třaskavina

B Předmět obsahující třaskavinu, který má méně než dvě účinná pojistná zařízení. Zahmuty jsou i některé předměty, jako rozbušky a počínová zařízení pro trhací práce a zápalky pro náboje, i když neobsahují třaskaviny.

C Střelivina nebo jiná deflagrující výbušnina nebo předmět obsahující takovou výbušninu.

D Trhavina, černý prach nebo předmět obsahující trhavinu, vždy bez roznětných prostředků a bez hnací náplně nebo předmět obsahující třaskavinu, který má nejméně dvě účinná pojistná zařízení.

E Předmět, obsahující trhavinu, bez roznětných prostředků a s hnací náplní (jinou než takovou, která obsahuje hořlavou kapalinu nebo hořlavý gel nebo hypergoly).

- F Předmět obsahující trhavinu s vlastním roznětným prostředkem, s hnací náplní (jinou než takovou, která sestává z hořlavé kapaliny nebo hořlavého gelu nebo hypergolů) nebo bez hnací náplně.
- G Pyrotechnická látka nebo předmět obsahující pyrotechnickou látku nebo předmět obsahující jak výbušnou látku, tak i osvětlovací, zápalnou, slzotvornou nebo dýmotvornou látku (kromě předmětů aktivovaných vodou nebo předmětů, které obsahují bílý fosfor, fosfidy, pyroforní látku, hořlavou kapalinu nebo hořlavý gel nebo hypergoly).
- H Předmět, který obsahuje výbušnou látku a bílý fosfor.
- J Předmět, který obsahuje výbušnou látku a hořlavou kapalinu nebo hořlavý gel.
- K Předmět, který obsahuje výbušnou látku a toxickou chemickou látku.
- L Výbušná látka nebo předmět obsahující výbušnou látku, které představují zvláštní nebezpečí (např. pro svoji aktivaci vodou nebo pro přítomnost hypergolů, fosfidů nebo pyroforní látky) a vyžadující oddělení jednotlivých druhů.
- N Předměty, které obsahují jen velmi málo citlivé látky.
- S Látka nebo předmět, který je zabalen nebo zkonstruován tak, aby všechny nebezpečné účinky vyvolané náhodným uvedením do činnosti zůstaly omezeny na vnitřek obalu, pokud nebyl obal poškozen požárem. V takovém případě musí zůstat účinky tlaku vzduchu a rozletu omezeny tak, aby opatření ke zdolání požáru nebo jiná nouzová opatření v bezprostřední blízkosti kusu nebyla podstatně omezena ani jim nebylo zabráněno.

POZNÁMKA 1: Každá látka nebo předmět ve specifikovaném obalu směji být přiřazeny jen k jedné skupině snášenlivosti. Protože kritérium skupiny snášenlivosti S je empirické povahy, je přiřazení k této skupině nutně vázáno na zkoušky k přidělení klasifikačního kódu.

POZNÁMKA 2: Předměty skupin snášenlivosti D nebo E směji být opatřeny vlastními roznětnými prostředky nebo s nimi být baleny společně za předpokladu, že tyto prostředky mají nejméně dvě účinná pojistná zařízení určená k zamezení výbuchu v případě náhodného uvedení roznětného prostředku do činnosti. Takové předměty a kusy se přiřadí ke skupině snášenlivosti D nebo E.

POZNÁMKA 3: Předměty skupin snášenlivosti D nebo E směji být baleny společně se svými vlastními roznětnými prostředky, které neobsahují dvě účinná pojistná zařízení (t.j. z rozněčovači, které jsou přiřazeny ke skupině snášenlivosti B) za předpokladu, že je dodrženo zvláštní ustanovení MP21 oddílu 4.1.10. Takové kusy se přiřadí skupinám snášenlivosti D nebo E.

POZNÁMKA 4: Předměty směji být opatřeny svými vlastními roznětnými prostředky nebo s nimi být baleny společně za předpokladu, že se roznětné prostředky nemohou za normálních přepravních podmínek uvést v činnost.

POZNÁMKA 5: Předměty skupin snášenlivosti C, D a E směji být baleny společně. Takové kusy musí být přiřazeny ke skupině snášenlivosti E.

2.2.1.1.7 Přiřazení výrobků zábavné pyrotechniky k podtřídám

2.2.1.1.7.1 Výrobky zábavné pyrotechniky musí být obvykle přiřazeny k podtřídám 1.1, 1.2, 1.3 a 1.4 na základě dat získaných ze zkoušek série 6 Příručky zkoušek a kritérií. Jelikož je však počet druhů takových předmětů velmi rozsáhlý a kapacita zkušebních zařízení může být omezená, přiřazení k podtřídám může být také provedeno v souladu s postupem uvedeným v 2.2.1.1.7.2.

2.2.1.1.7.2 Přiřazení výrobků zábavné pyrotechniky k UN číslům 0333, 0334, 0335 a 0336 může být rovněž provedeno na základě analogie, bez zkoušek série 6, v souladu se stanovenou klasifikací výrobků zábavné pyrotechniky dle tabulky v 2.2.1.1.7.5. Takové přiřazení může být provedeno pouze se souhlasem příslušného orgánu. Výrobky neuvedené v této tabulce musí být klasifikovány na základě dat získaných ze zkoušek série 6.

POZNÁMKA 1: Zařazení nových druhů výrobků zábavné pyrotechniky do sloupce 1 tabulky v 2.2.1.1.7.5 může být provedeno pouze na základě výsledků všech předepsaných zkoušek postoupených Podvýboru expertů pro přepravu nebezpečných věcí OSN k posouzení.

POZNÁMKA 2: Výsledky zkoušek získané příslušnými orgány, které potvrzují nebo vyvracejí přiřazení výrobků zábavné pyrotechniky uvedených ve sloupci 4 tabulky v 2.2.1.1.7.5 k podtřídám ve sloupci 5, by měly být postoupeny Podvýboru expertů pro přepravu nebezpečných věcí OSN pro informaci.

- 2.2.1.1.7.3 Jestliže jsou výrobky zábavné pyrotechniky více než jedné podtřídy zabaleny ve stejném kusu, musí být klasifikovány jako nejnebezpečnější podtřída, pokud z dat získaných ze zkoušek série 6 nevyplyne jiná klasifikace.
- 2.2.1.1.7.4 Klasifikace uvedená v tabulce 2.2.1.1.7.5 platí pouze pro předměty zabalené v lepenkových bednách (4G).
- 2.2.1.1.7.5 Tabulka stanovených klasifikací výrobků zábavné pyrotechniky¹

POZNÁMKA 1: Odkazy na procenta v tabulce znamenají, není-li stanoveno jinak, hmotnost všech pyrotechnických látek (například raketových motorů, výmetné náložky, trhavé náložky a efektové náložky).

POZNÁMKA 2: „Výbušková slož“ se v této tabulce vztahuje na pyrotechnické látky v práškové formě nebo jako pyrotechnické díly v předmětech zábavné pyrotechniky, které se používají k vytváření zvukového efektu nebo se používají jako trhaví nebo hnací náložka, vyjma toho, když se Zkouškou HSL výbuškové složky v přílohu 7 Příručky zkoušek a kritérií prokáže, že doba nárůstu tlaku je delší než 6 ms pro 0,5 g pyrotechnické látky.

POZNÁMKA 3: Uvedené rozměry v mm se vztahují:

- pro kulové nebo válcové kombinované efektové pumy k průměru tělesa pumy,
- pro válcové efektové pumy k délce pumy,
- pro efektové pumy v moždíři, římské svíce, vystřelovací trubice nebo miny k vnitřnímu průměru trubice obsahující předmět zábavné pyrotechniky,
- pro sáčkovou nebo válcovou minu, k vnitřnímu průměru moždíře určeného pro minu.

¹ Tato tabulka obsahuje seznam klasifikace předmětů zábavné pyrotechniky, která může být použita bez zkoušek série 6, Příručky zkoušek a kritérií (viz 2.2.1.1.7.2).

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	KLASIFIKACE
Puma,kulová nebo válcová	Kulová výšková barevná kombinovaná námořní padáková dýmová hvězdicová dělostřelecká zvukové třesková hromová pumová sestava	Zařízení s hnací náplní nebo bez ní, se zpožďovací zápalnicí a trhavou náložkou, pyrotechnickými díly nebo volně loženou pyrotechnickou látkou, určené k odpalování z moždíře	Všechny třeskové pumy	1.1G
			Barevná puma: ≥ 180 mm	1.1G
			Barevná puma: < 180 mm s $> 25\%$ výbuškové slože, jako volný prášek a/nebo s třeskovým efektem	1.1G
			Barevná puma: < 180 mm s $\leq 25\%$ výbuškové slože, jako volný prášek a/nebo s třeskovým efektem	1.3G
			Barevná puma: ≤ 50 mm, nebo ≤ 60 g pyrotechnické slože, s $\leq 2\%$ výbuškové slože, jako volný prášek a/nebo s třeskovým efektem	1.4G
	Kombinovaná efekťová puma	Zařízení s dvěma nebo více kulovými efekťovými pumami ve společném obalu, s oddělenými vnějšími zpožďovacími zápalnicemi, vystřelované společnou hnací náplní	Nejnebezpečnější kulová efekťová puma určuje klasifikaci.	
Přebitý moždíř, puma v moždíři		Zařízení sestávající z kulové nebo válcové efekťové pumy umístěné v moždíři, který je určen k jejímu vystřelení	Všechny třeskové pumy	1.1G
			Barevné pumy: ≥ 180 mm	1.1G
			Barevná puma: s $>25\%$ výbuškové slože jako volný prášek a/nebo s třeskovým efektem	1.1G
			Barevné pumy > 50 mm a < 180 mm	1.2G
			Barevné pumy ≤ 50 mm, nebo s ≤ 60 g pyrotechnické látky, s $\leq 25\%$ zábleskové slože jako volný prášek a/nebo s třeskovým efektem	1.3G

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	KLASIFIKACE
Puma kulová nebo válcová (pokračování)	Pumy v pumě (kulová) (Odkazy na procenta pro pumy v pumě se vztahují na hrubou hmotnost pyrotechnického předmětu)	Zařízení, bez hnací náplně se zpožďovací zápalnicí a s trhavou náložkou, obsahující třeskové pumy a inertní materiály, které je určeno k vystřelování z moždíře	> 120 mm	1.1G
		Zařízení, bez hnací náplně se zpožďovací zápalnicí a s trhavou náložkou, obsahující třeskové pumy s ≤ 25g výbuškové složky v jedné pumě, s ≤ 33% výbuškové složky a s ≥ 60% inertního materiálu, které je určeno k vystřelování z moždířů	≤ 120 mm	1.3G
		Zařízení, bez hnací náplně se zpožďovací zápalnicí a trhavou náložkou, obsahující barevné pumy a/nebo pyrotechnické díly, které je určeno k vystřelování z moždířů	> 300 mm	1.1G
		Zařízení, bez hnací náplně se zpožďovací zápalnicí a trhavou náložkou, obsahující barevné pumy ≤ 70mm a/nebo pyrotechnické díly s ≤ 25% výbuškové složky a s ≤ 60% pyrotechnických látek, které je určeno k vystřelování z moždířů	> 200 mm a ≤ 300 mm	1.3G
		Zařízení, s hnací náplní, se zpožďovací zápalnicí a trhavou náložkou, obsahující barevné pumy ≤ 70mm a/nebo pyrotechnické díly s ≤ 25% výbuškové složky a s ≤ 60% pyrotechnické látky, které je určeno k vystřelování z moždířů	≤ 200 mm	1.3G
Baterie/kombi nace	Přehradová palba, dělostřelecká palba, prostorové efekty, květinové efekty, pumové koule, výbuchy, palebné baterie, palebné baterie se zábleskem, vzdušná pumová sestava	Sestava obsahující několik dílů buď stejného typu nebo různých typů, které odpovídají jednomu z typů předmětu zábavní pyrotechniky uvedeného v této tabulce. Má jedno nebo dvě místa zážehu	Nejnebezpečnější typ předmětu zábavní pyrotechniky určuje klasifikaci	

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	KLASIFIKACE
Římská svíce	Efektová svíce, svíce, bombičky	Trubice obsahující sestavu pyrotechnických dílů, sestávající z podobných pyrotechnických látek, hnací a přenosové zápalnice	<p>≥ 50 mm vnitřního průměru, obsahující výbuškovou slož, nebo</p> <p><50 mm s > 25% výbuškové slože</p>	1.1G
Jednoranná svíce	Jednoranná svíce		≥ 50 mm vnitřního průměru, neobsahující výbuškovou slož	1.2G
			< 50 mm vnitřního průměru a s ≤ 25% výbuškové slože	1.3G
			≤ 30 mm vnitřního průměru každého pyrotechnického elementu ≤ 25 g a s ≤ 5% výbuškové slože	1.4G
Raketa	Lavínové rakety, signální rakety, pískavé, lahvéové rakety, nebeské rakety, rakety typu střel, stolní rakety	Trubice obsahující pyrotechnické díly sestávající z pyrotechnické látky, hnací náplně a přenosové zápalnice nebo bez ní	≤ 30 mm vnitřního průměru a pyrotechnický element > 25 g, nebo s > 5% a s ≤ 25% výbuškové slože	1.3G
			≤ 30 mm vnitřního průměru, pyrotechnický element ≤ 25 g a s ≤ 5% výbuškové slože	1.4G
			Pouze s efektem výbuškové slože	1.1G
		Trubice obsahující pyrotechnickou látku a/nebo pyrotechnické díly, opatřená latí nebo jiným prostředkem stabilizace letu, která je určena k vystřelování do vzduchu	Výbušková slož s > 25% pyrotechnické látky	1.1G
			s > 20 g pyrotechnické látky s ≤ 25% výbuškové slože	1.3G
			s ≤ 20 g pyrotechnické látky, černého prachu, trhavé směsi a s ≤ 0,13 g výbuškové slože na ránu a ≤ 1 g celkové	1.4G

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	KLASIFIKACE
Mina	Povrchová mina, sáčková mina, válcová mina	Trubice obsahující hnací náplň a pyrotechnické díly, která je určena k položení nebo upevnění na zem. Základním efektem je vymetení všech pyrotechnických dílů do vzduchu v jediném ohnivém prostorovém vizuálním a/nebo zvukovém efektu nebo: Tkaninový nebo papírový sáček nebo válec obsahující hnací náplň a pyrotechnické díly, určený k umístění do močidle s funkcí miny	s > 25% výbuškové slože, jako volný prášek a/nebo s třeskovými efekty ≥ 180 mm a s ≤ 25% výbuškové slože jako volný prášek a/nebo s třeskovými efekty < 180 mm a s ≤ 25% výbuškové slože jako volný prášek a/nebo s třeskovými efekty s ≤ 150 g pyrotechnické látky, obsahující ≤ 5% výbuškové slože jako volný prášek a/nebo s třeskovým efektem. Každý pyrotechnický element ≤ 25 g, každý třeskový efekt < 2 g; každý hvízd, jestliže existuje ≤ 3 g	1.1G 1.1G 1.3G 1.4G
Fontány	Sopky, ohňopády, bengálské ohně, osvětlovací pochodně, fontány, létající jiskry	Nekovové pouzdro obsahující lisovanou nebo zhutněnou pyrotechnickou látku vytvářející jiskry a plamen	≥ 1 kg pyrotechnické látky < 1 kg pyrotechnické látky	1.3G 1.4G
Prskavky	Ruční prskavky, prskavky neurčené k držení v ruce, drátové prskavky	Tuhý drát částečně položený (z jednoho konce) pomalu hořící pyrotechnickou látku s nebo bez zapalovací špičky	Prskavky s chloristany: > 5 g na kus nebo > 10 kusů v balíčku Prskavky s chloristany: ≤ 5 g na kus a ≤ 10 kusů v balíčku; Prskavky s dusičňany: ≤ 30 g na kus	1.3G 1.4G
Bengálská tyčinka	Tlumená tyčinka	Nekovové tyčinky částečně položené (z jednoho konce) pomalu hořící pyrotechnickou látku, určené k držení v ruce	Prskavky s chloristany: > 5 g na kus nebo > 10 kusů v balíčku Prskavky s chloristany: ≤ 5 g na kus a ≤ 10 kusů v balíčku; Prskavky s dusičňany: ≤ 30 g na kus	1.3 G 1.4G

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	KLASIFIKACE
Drobné předměty zábavné pyrotechniky s nízkou nebezpečností	Stolní bomby, bouchací kuličky, kapsle, dýmovnice, mlhovnice, hadi, červí, serpentíny, praskací provázky, oslavné rány	Zařízení určené k vytváření velmi omezených vizuálních a/nebo zvukových efektů, které obsahuje malé množství pyrotechnické a/nebo výbušné slož	Bouchací kuličky a kapsle mohou obsahovat nejvýše 1,6 mg třaskavého stříbra; kapsle a oslavné rány mohou obsahovat nejvýše 16 mg směsi chlorečnanu draselného a červeného fosforu; jiné předměty mohou obsahovat nejvýše 5 g pyrotechnické látky, ale žádnou výbuškovou slož	1.4G
Kotouče	Vzdušný kotouč; helikoptéra, pozemní kotouč	Nekovová trubička nebo trubičky obsahující pyrotechnickou látku, která vytváří plyn nebo jiskry s nebo bez slož produkující zvuk, s nebo bez křidélek	Pyrotechnická látka v kusu > 20 g, obsahující ≤ 3% výbuškové slož vytvářející třesk, nebo hvízdající slož ≤ 5 g	1.3G
Světelná kola	Saxon	Zařízení opatřené pohonnými jednotkami obsahujícími pyrotechnickou látku a vybavené přidavnými prostředky, které umožňují převést přímočarý pohyb v rotaci	Pyrotechnická látka v kusu ≤ 20 g, obsahující ≤ 3% zábleskové slož vytvářející třesk, nebo hvízdavé slož ≤ 5 g ≥ 1 kg pyrotechnické látky celkem, bez třaskavého efektu, každý hvízd (jestliže existuje) ≤ 25 g a ≤ 50 g hvízdavé slož v kole	1.4G 1.3G
Vzdušné kolo	Létající Saxon, UFO, vznášející se koruna	Trubice obsahující hnací náplně a pyrotechnické látky vytvářející jiskry, plamen a/nebo zvuk. Trubice jsou upevněny k nosnému kolu	< 1 kg pyrotechnické látky celkem, bez třaskavého efektu, každý hvízd(jestliže existuje) ≤ 5 g a ≤ 10 g hvízdavé slož v kole > 200 g pyrotechnické látky nebo > 60 g pyrotechnické látky v jednom elementu s ≤ 3% výbuškové slož s třeskovými efekty, každý hvízd (jestliže existuje) ≤ 25 g a ≤ 50 g hvízdavé slož v jednom kole	1.4G 1.3G

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	KLASIFIKACE
			<p>≤ 200 g pyrotechnické látky celkem a ≤ 60 g pyrotechnické látky v jedné pohonné jednotce s ≤ 3% výbuškové slože s třeskovými efekty, každý hvízd (jestliže existuje) ≤ 5 g a ≤ 10 g hvízdové slože v jednom kole</p> <p>Nejnebezpečnější výrobek zábavné pyrotechniky určuje klasifikaci</p>	1.4G
Výběrový balíček	Ukázková sestava, zahradní sestava, pokojová sestava	Balíček s více než jedním typem, který odpovídá jednomu z typu výrobku zábavné pyrotechniky uvedeného v této tabulce		
Práskající sestava	Oslavná petarda, oslavná rulička	Sestava trubic (papírových nebo lepenkových) spojená pyrotechnickou zápalnicí. Každá trubice je určena k tvorbě zvukového efektu	Každá trubice ≤ 140 mg výbuškové slože nebo ≤ 1 g černého prachu	1.4G
Petarda	Pozdravná petarda, záblesková petarda, žertovná petarda	Nekovová trubice obsahující třeskovou slož určená k tvorbě zvukového efektu	<p>> 2 g výbuškové slože v elementu</p> <p>≤ 2 g výbuškové slože v elementu a ≤ 10 g ve vnitřním obalu</p> <p>≤ 1 g výbuškové slože v elementu a ≤ 10 g ve vnitřním obalu nebo ≤ 10 g černého prachu v elementu</p>	<p>1.1G</p> <p>1.3G</p> <p>1.4G</p>

2.2.1.1.8 *Vyloučení z třídy 1*

2.2.1.1.8.1 Předmět nebo látka může být vyloučen(a) z třídy 1 na základě výsledků zkoušek a definice třídy 1 se schválením příslušného orgánu kterékoli smluvní strany ADR, který může také uznat schválení udělené příslušným orgánem země, která není smluvní stranou ADR, za podmínky, že toto schválení bylo uděleno v souladu s postupy platnými podle RID, ADR, ADN, IMDG Code nebo ICAO Technical Instructions.

2.2.1.1.8.2 Se schválením příslušného orgánu podle 2.2.1.1.8.1 smí být předmět vyloučen z třídy 1, jestliže tři nezabalené předměty, každý jednotlivě aktivovaný svými vlastními iniciačními nebo roznětnými prostředky nebo vnějšími prostředky tak, aby fungoval stanoveným způsobem, splní následující zkušební kritéria:

- (a) Žádný vnější povrch nesmí mít teplotu vyšší než 65 °C. Okamžitý nárůst teploty do 200 °C je akceptovatelný;
- (b) Žádné prasknutí nebo roztržení vnějšího pláště nebo pohyb předmětu nebo jeho uvolněných částí do vzdálenosti větší než jeden metr v kterémkoli směru;

POZNÁMKA: Pokud by celistvost předmětu mohla být ovlivněna v případě vnějšího požáru, musí být tato kritéria prověřena zkouškou vystavením ohni, jak je popsána v normě ISO 12097-3.

- (c) Žádný akustický záznam překračující špičkovou hodnotu 135 dB(C) ve vzdálenosti jednoho metru;
- (d) Žádný záblesk nebo plamen schopný zažehnout materiál, jako je list papíru gramáže 80 ± 10 g/m², při dotyku s tímto předmětem; a
- (e) Žádné tvoření kouře, dýmu nebo prachu v takových množstvích, že viditelnost v komoře o velikosti jednoho kubického metru, vybavené vyfukovacími panely náležité velikosti, je snížena o více než 50 %, jak se naměřeno kalibrovaným fotometrem (luxmetrem) nebo radiometrem umístěnými ve vzdálenosti jednoho metru od konstantního světelného zdroje umístěného ve středu protilehlých stěn. Je možno použít též všeobecný návod ke zkoušení optické hustoty v normě ISO 5659-1 a všeobecný návod k fotometrickému systému popsanému v oddílu 7.5 normy ISO 5659-2 nebo je možno použít také podobné metody měření optické hustoty určené ke stejnému účelu. K minimalizaci účinků rozptýleného nebo pronikajícího světla, které není emitováno přímo světelným zdrojem, musí být použit vhodný kryt obklopující zadní a boční strany fotometru.

POZNÁMKA 1: Jestliže během zkoušek vztahujících se ke kritériím uvedeným pod písmeny (a), (b), (c) a (d) není zpozorován žádný nebo je zpozorován jen velmi malý kouř, je možno od zkoušky uvedené pod písmenem (e) upustit.

POZNÁMKA 2: Příslušný orgán zmíněný v 2.2.1.1.8.1 může vyžadovat provedení zkoušek v balené formě, je-li zjištěno, že předmět, jak je zabalen pro přepravu, může představovat větší riziko.

2.2.1.2 *K přepravě nepřípuštěné látky a předměty*

2.2.1.2.1 Výbušné látky, které vykazují podle kritérií Příručky zkoušek a kritérií nepřipustně vysokou citlivost, nebo u kterých může nastat samovolná reakce; jakož i výbušné látky a předměty, které nemohou být přiřazeny k pojmenování nebo j.n. položce uvedeným v tab. A, kapitoly 3.2, nejsou připuštěny k přepravě.

2.2.1.2.2 Předměty skupiny snášenlivosti K (1.2 K, UN číslo 0020 a 1.3 K, UN číslo 0021) nejsou připuštěny k přepravě.

2.2.1.3 Seznam hromadných položek

Klasifikační kód (viz 2.2.1.1.4)	UN číslo	Pojmenování látek nebo předmětů

POZNÁMKA: Podtřída a skupina snášenlivosti musí být určeny příslušným orgánem a v souladu s ustanoveními v odstavci 2.2.1.1.4		

2.2.1.4*Glosář pojmenování*

POZNÁMKA 1: Smyslem popisů v glosáři není náhrada zkušebních postupů, ani stanovení klasifikace látky nebo předmětu třídy 1. Rozhodnutí o zařazení do správné podtřídy a o tom, zda mohou být přiřazeny ke skupině snášenlivosti S, musí být založeno na zkouškách výrobku podle Příručky zkoušek a kritérií, části I, nebo na analogii s podobnými, již odzkoušenými výrobky, zařazenými podle postupů Příručky zkoušek a kritérií.

POZNÁMKA 2: Za pojmenováními jsou uvedena příslušná UN čísla (kapitola 3.2, tabulka A, sloupec 1). Pokud jde o klasifikační kód, viz odstavec 2.2.1.1.4

BLESKOVICE, ohebná: UN čísla 0065, 0289

Předmět sestávající z duše z detonující výbušniny opředené textilním vláknem, buď s povlakem nebo bez povlaku z plastu nebo jiného materiálu. Povlak není potřebný, pokud je opředení z textilních vláken přachotěsné.

BLESKOVICE, s kovovým pláštěm : UN čísla 0102, 0290

Předmět sestávající z duše z detonující výbušniny v trubici z měkkého kovu s ochranným povlakem nebo bez ochranného povlaku.

BLESKOVICE, S MALÝM ÚČINKEM, s kovovým pláštěm: UN číslo 0104

Předmět sestávající z duše z detonující výbušniny v plášti z měkkého kovu s ochranným povlakem nebo bez ochranného povlaku. Množství výbušné látky je tak malé, že se vně bleskovice projevuje jen nepatrný účinek výbuchu.

BOJOVÉ HLAVICE, RAKETA, s trhací náplní: UN čísla 0286, 0287

Předměty sestávající z detonující výbušniny. Buď neobsahují roznětné prostředky nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení. Jsou určeny pro připevnění k raketě. Pod toto pojmenování spadají také bojové hlavice pro řízené střely.

BOJOVÉ HLAVICE, RAKETA, s trhací náplní: UN číslo 0369

Předměty sestávající z detonující výbušniny. Obsahují roznětné prostředky, které nemají nejméně dvě účinná pojistná zařízení. Jsou určeny pro připevnění k raketě. Pod toto pojmenování spadají také bojové hlavice pro řízené střely.

BOJOVÉ HLAVICE, RAKETA, s trhovou náložkou nebo výmetnou náplní: UN číslo 0370

Předměty sestávající z nevýbušné užitečné zátěže a z malé nálože detonující nebo deflagující výbušniny. Buď neobsahují roznětné prostředky nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení. Jsou určeny po připevnění k raketovému motoru k rozhozu nevýbušného materiálu. Pod toto pojmenování spadají také bojové hlavice pro řízené střely.

BOJOVÉ HLAVICE, RAKETA, s trhovou náložkou nebo výmetnou náplní: UN číslo 0371

Předměty sestávající z nevýbušné užitečné zátěže a malé nálože detonující nebo deflagující výbušniny. Obsahují roznětné prostředky, které nemají nejméně dvě účinná pojistná zařízení. Jsou určeny po připevnění k raketovému motoru k rozhozu nevýbušného materiálu. Pod toto pojmenování spadají také bojové hlavice pro řízené střely.

BOJOVÉ HLAVICE, TORPÉDO s trhací náplní: UN číslo 0221

Předměty sestávající z detonující výbušniny. Buď neobsahují roznětné prostředky, nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení. Jsou určeny pro připevnění k torpédu.

GRANÁTY, CVIČNÉ, ruční nebo puškové: UN čísla 0110, 0318, 0372, 0452

Předměty bez hlavní trhací nálože, které jsou určeny k ručnímu vrhání nebo k vystřelování z pušek. Obsahují roznětný prostředek a mohou obsahovat značkovací náplň.

GRANÁTY, ruční nebo puškové, s trhací náplní: UN čísla 0284, 0285

Předměty, které jsou určeny k ručnímu vrhání nebo k vystřelování z pušek. Neobsahují roznětné prostředky nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

GRANÁTY, ruční nebo puškové, s trhací náplní: UN čísla 0292, 0293

Předměty, které jsou určeny k ručnímu vrhání nebo k vystřelování z pušek. Obsahují roznětné prostředky, které mají méně než dvě účinná pojistná zařízení.

HEXOLIT (HEXOTOL), suchý nebo vlhčený méně než 15 % hm.: UN číslo 0118

Látka sestávající z těsné směsi 1,3,5-trinitro-1,3,5-triazacyklohexanu (RDX) a trinitrotoluenu (TNT). Pod toto pojmenování spadá také „Composition B“.

HEXOTONAL: UN číslo 0393

Látka sestávající z těsné směsi z 1,3,5-trinitro-1,3,5-triazacyklohexanu (RDX), trinitrotoluenu (TNT) a hliníku.

HLOUBKOVÉ SONDY, VÝBUŠNÉ: UN čísla 0204, 0296

Předměty sestávající z nálože trhaviny s roznětnými prostředky, které nemají nejméně dvě účinná pojistná zařízení. Jsou shazovány z lodí a jsou uváděny v činnost při dosažení určené hloubky nebo po dopadu na dno.

HLOUBKOVÉ SONDY, VÝBUŠNÉ: UN čísla 0374, 0375

Předměty sestávající z nálože trhaviny bez roznětných prostředků nebo s roznětnými prostředky, které mají nejméně dvě účinná pojistná zařízení. Jsou shazovány z lodí a jsou uváděny v činnost při dosažení určené hloubky nebo po dopadu na dno.

KUMULATIVNÍ NÁLOŽE, PERFORAČNÍ, pro ropné vrty, bez rozbušky: UN čísla 0124, 0494

Předměty sestávající z ocelových trubek nebo kovových pouzder, do kterých jsou vloženy kumulativní nálože, které jsou propojenybleskovicí. Neobsahují roznětné prostředky.

LÁTKY VÝBUŠNÉ, VELMI NECITLIVÉ (EVI), J.N.: UN číslo 0482

Látky nebezpečné hromadným výbuchem, které jsou tak necitlivé, že při normálních přepravních podmínkách je jen velmi malá pravděpodobnost jejich roznětu nebo přechodu z hoření v detonaci. Tyto látky musí obstát ve zkouškách série 5 dle Příručky zkoušek a kritérií.

MINY, s trhací náplní: UN čísla 0136, 0294

Předměty sestávající obvykle z obalu z kovu nebo kompozitních materiálů, které jsou naplněny detonující výbušninou, s roznětnými prostředky, které nemají nejméně dvě účinná pojistná zařízení. Jsou určeny k uvedení v činnost při styku s plavidly, vozidly nebo osobami. Pod toto pojmenování spadají také „Bangalore torpedoes“.

MINY, s trhací náplní: UN čísla 0137, 0138

Předměty sestávající obvykle z kovových nebo kompozitních obalů, které jsou naplněny detonující výbušninou bez nebo s roznětnými prostředky, které mají nejméně dvě účinná pojistná zařízení. Jsou určeny k uvedení v činnost při styku s plavidly, vozidly nebo osobami. Pod toto pojmenování spadají také „Bangalore torpedoes“.

MUNICE, CVIČNÁ: UN čísla 0362, 0488

Munice, bez hlavní trhavé nálože, která obsahuje trhavou nebo výmetnou náložku. Obvykle obsahuje také rozněcovadlo a hnací náplň.

POZNÁMKA: GRANÁTY, CVIČNÉ nejsou zahrnuty pod toto pojmenování. Ty jsou v tomto glosáři uvedeny zvlášť.

MUNICE, DÝMOVÁ, S BÍLÝM FOSFOREM, s nebo bez trhavé náložky, výmetné nebo hnací náplně: UN čísla 0245, 0246

Munice, která obsahuje bílý fosfor jako dýmotvornou látku. Kromě toho obsahuje jeden nebo více těchto komponentů: hnací náplň se zápalkou a zažehovačem; rozněcovadlo s trhavou nebo výmetnou náplní. Toto pojmenování zahrnuje též dýmové granáty.

MUNICE, DÝMOVÁ, s nebo bez trhavé náložky, výmetné nebo hnací náplně: UN čísla 0015, 0016, 0303

Munice, která obsahuje dýmotvornou látku; jako směs kyseliny chlorsulfonové, chlorid titaničitý, nebo dýmotvornou pyrotechnickou slož založenou na hexachlorethanu nebo červeném fosforu. Pokud není dýmotvorná látka sama výbušninou, obsahuje munice také jednu nebo více následujících složek: hnací náplň se zapalovačem a zažehovačem, rozněcovadlo s trhavou nebo výmetnou náplní. Toto pojmenování zahrnuje též dýmové granáty.

POZNÁMKA: SIGNÁLNÍ PROSTŘEDKY, DÝMOVÉ nejsou zahrnuty pod toto pojmenování. Ty jsou v tomto glosáři uvedeny zvlášť.

MUNICE, OSVĚTLOVACÍ, s nebo bez trhavé náložky, výmetné nebo hnací náplně: UN čísla 0171, 0254, 0297

Munice určená k vytvoření jednotlivého zdroje intenzivního světla k osvětlení prostoru. Toto pojmenování zahrnuje osvětlovací nálože, granáty, střely a bomby osvětlovací a identifikující cíle.

POZNÁMKA: Následující předměty nespádají pod toto pojmenování: NÁBOJE, SIGNÁLNÍ; PROSTŘEDKY SIGNÁLNÍ, TÍSŇOVÉ; PROSTŘEDKY SIGNÁLNÍ RUČNÍ; SVĚTLICE, LETECKÉ; SVĚTLICE, POZEMNÍ. Ty jsou v tomto glosáři uvedeny zvlášť.

MUNICE, SLZOTVORNÁ, s trhavou náložkou, výmetnou nebo hnací náplní: UN čísla 0018, 0019, 0301

Munice obsahující slzotvornou látku. Kromě toho obsahuje jeden nebo více těchto komponentů: pyrotechnickou látku, hnací náplň se zápalkou a zažehovačem, rozněcovadlo s trhavou nebo výmetnou náplní.

MUNICE, ZÁPALNÁ S BÍLÝM FOSFOREM, s trhavou náložkou, výmetnou nebo hnací náplní: UN čísla 0243, 0244

Munice, která obsahuje jako zápalnou látku bílý fosfor. Kromě toho obsahuje jednu nebo více těchto složek: hnací náplň se zápalkou a zažehovačem, rozněcovadlo s trhavou nebo výmetnou náplní.

MUNICE, ZÁPALNÁ, s kapalinou nebo gelem, s trhavou náložkou, výmetnou nebo hnací náplní: UN číslo 0247

Munice, která obsahuje kapalnou nebo gelovitou zápalnou látku. Pokud není zápalná látka sama výbušninou, obsahuje munice kromě toho ještě jednu nebo více těchto složek: hnací náplň se zápalkou a zažehovačem, rozněcovadlo s trhavou náložkou nebo výmetnou náplní.

MUNICE, ZÁPALNÁ, s nebo bez trhavé náložky, výmetné nebo hnací náplně: UN čísla 0009, 0010, 0300

Munice, která obsahuje zápalnou slož. Pokud není zápalná slož sama výbušninou, obsahuje munice kromě toho jednu nebo více těchto složek: pohonnou náplň se zápalkou a zažehovačem, rozněcovadlo s trhavou nebo výmetnou náložkou.

MUNICE, ZKUŠEBNÍ: UN číslo 0363

Munice, která obsahuje pyrotechnické látky. Slouží ke zkoušce funkce nebo odolnosti nové munice, zbraňových dílů nebo zařízení.

NÁBOJE, MALORÁŽOVÉ: UN čísla 0012, 0339, 0417

Munice, která sestává z nábojnice se středovým nebo okrajovým zápalem, obsahující hnací náplň a pevnou střelu. Náboje jsou určeny k vystřelování ze zbraní o ráži nejvýše 19,1 mm. Pod toto pojmenování jsou zahrnuty také brokové náboje všech ráží.

POZNÁMKA: *NÁBOJE MALORÁŽOVÉ, CVIČNÉ nespádají pod toto pojmenování. Tyto jsou uvedeny zvlášť. Také některé vojenské malorážové náboje nespádají pod toto pojmenování. Tyto jsou uvedeny pod pojmenováním NÁBOJE PRO ZBRANĚ, S INERTNÍ STŘELOU.*

NÁBOJE PRO NÁŘADÍ, SLEPÉ: UN číslo 0014

Předmět, používaný v nářadí, sestávající z uzavřené nábojnice se středovým nebo okrajovým zápalem a s náplní bezdýmného nebo černého prachu nebo bez ní, ale bez střely.

NÁBOJE PRO ZBRANĚ CVIČNÉ, nebo NÁBOJE MALORÁŽOVÉ, CVIČNÉ: UN čísla 0014, 0327, 0338

Munice, která sestává z uzavřené nábojnice se středovým nebo okrajovým zápalem a náplně z bezdýmného nebo z černého prachu. Náboje neobsahují střely. Jsou určeny k vystřelování ze zbraní o ráži nejvýše 19,1 mm a slouží k vyvolání silného zvukového efektu. Používají se pro cvičné účely, k pozdravné střelbě, jako hnací náplně, pro startovací pistole atd.

NÁBOJE PRO ZBRANĚ, CVIČNÉ: UN čísla 0014, 0326, 0327, 0338, 0413

Munice, která sestává z uzavřené nábojnice se středovým nebo okrajovým zápalem a z náplně bezdýmného nebo černého prachu. Náboje neobsahují střely. Předměty slouží k vyvolání silného zvukového efektu. Používají se pro cvičné účely, k pozdravné střelbě, jako hnací náplně, pro startovací pistole atd. Pod toto pojmenování spadá také munice, cvičná.

NÁBOJE PRO ZBRANĚ, S INERTNÍ STŘELOU: UN čísla 0012, 0328, 0339, 0417

Munice, která sestává ze střely bez trhací nálože a z nábojky, s nebo bez zápalného šroubu. Předměty mohou obsahovat stopovku za předpokladu, že převažující nebezpečí představuje hnací náplň.

NÁBOJE PRO ZBRANĚ s trhací náplní: UN čísla 0005, 0007, 0348

Munice, která sestává ze střely s trhavinovou náplní s roznětnými prostředky, které nemají nejméně dvě účinná pojistná zařízení a hnací náplně, s nebo bez zápalného šroubu. Pojmenování zahrnuje jednotné náboje, částečně dělené náboje a dělené náboje, jestliže jsou jednotlivé díly baleny společně.

NÁBOJE PRO ZBRANĚ s trhací náplní: UN čísla 0006, 0321, 0412

Munice, která sestává ze střely s trhací náplní bez roznětných prostředků nebo s roznětnými prostředky, které mají nejméně dvě účinná pojistná zařízení, a hnací náplně, s nebo bez zápalného šroubu. Pojmenování zahrnuje jednotné náboje, částečně dělené náboje a dělené náboje, jestliže jsou jednotlivé díly baleny společně.

NÁBOJE, SIGNÁLNÍ: UN čísla 0054, 0312, 0405

Předměty, které jsou určeny pro vytváření barevných světelných nebo jiných signálů. Jsou vystřelovány ze signálních pistolí apod.

NÁBOJE, ZÁBLESKOVÉ: UN čísla 0049, 0050

Předměty sestávají z pouzdra, zápalky a zábleskové složky. Všechny součásti jsou sestaveny do jednoho celku připraveného ke střelbě.

NÁBOJKY, PRO ROPNÉ VRTY: UN čísla 0277, 0278

Předměty, sestávající z tenkého pouzdra z lepenky, kovu nebo jiného materiálu, které obsahují pouze bezdýmný prach a slouží k vystřelování tvrzených střel k prorážení pažení ropných vrtů.

NÁBOJKY PRO TECHNICKÉ ÚČELY: UN čísla 0275, 0276, 0323, 0381

Předměty jsou určeny k vyvolání mechanických účinků. Sestávají z pouzdra s náloží z deflagrující výbušniny a roznětného prostředku. Plyné produkty deflagrace slouží k nafukování, k podélnému nebo rotačnímu pohybu nebo k aktivaci funkce přepážek, ventilů nebo spínačů nebo k vystřelování upevňovacích prvků nebo hasicích prostředků.

POZNÁMKA: *Následující předměty nespádají pod toto pojmenování: NÁLOŽE KUMULATIVNÍ. Ty jsou v tomto glosáři uvedeny zvlášť.*

NÁBOJNICE, PRÁZDNÉ, SE ZÁPALKOU: UN čísla 0055, 0379

Předměty, sestávající z nábojnice z kovu, plastu nebo jiného nehořlavého materiálu, jejichž jedinou výbušnou součástí je zápalka nebo zápalkový šroub.

NÁBOJNICE, SPALITELNÉ, PRÁZDNÉ, BEZ ZÁPALKY: UN čísla 0446, 0444

Předměty sestávající z nábojnice, která je z části nebo celá zhotovena z nitrocelulózy.

NÁLOŽE, DESTRUKČNÍ: UN číslo 0048

Předměty, sestávající z pouzdra z lepenky, plastu, kovu nebo jiného materiálu, které obsahuje náplň z detonující výbušniny. Neobsahují roznětné prostředky, nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

POZNÁMKA: *Následující předměty nespádají pod tento pojem: PUMY, MINY, STŘELY, atd. Tyto jsou v tomto glosáři uvedeny zvlášť.*

NÁLOŽE, KUMULATIVNÍ, bez rozbušky: UN čísla 0059, 0439, 0440, 0441

Předměty sestávající z pouzdra obsahujícího nálož detonující výbušniny s dutinou, která je vyložena tuhým materiálem. Předměty jsou určeny k vyvolání mohutného usměrněného průrazného efektu.

NÁLOŽE, KUMULATIVNÍ, OHEBNÉ, LINEÁRNÍ: UN čísla 0237, 0288

Předměty sestávající z duše z detonující výbušniny tvarované do „V“ opláštěvané pružnou hmotou.

NÁLOŽE POČINOVÉ, bez rozbušky: UN čísla 0042, 0283

Předměty sestávají z nálože výbušniny schopné detonace, bez roznětného prostředku. Jsou určeny k zesílení počínového účinku rozbušky nebo bleskovice.

NÁLOŽE POČINOVÉ, S ROZBUŠKOU: UN čísla 0225, 0268

Předměty sestávají z nálože výbušniny schopné detonace a roznětného prostředku. Jsou určeny k zesílení počínového účinku rozbušky nebo bleskovice.

NÁLOŽE, HLUBINNÉ: UN číslo 0056

Předměty sestávající z nálože výbušniny schopné detonace, umístěné v sudu nebo ve střele, bez roznětných prostředků nebo s roznětnými prostředky, které mají nejméně dvě pojistná zařízení. Předměty jsou určeny k detonaci pod vodou.

NÁLOŽE TRHACÍ, S PLASTICKÝM POJIVEM: UN čísla 0457, 0458, 0459, 0460

Předměty, sestávající z nálože specifického tvaru bez pouzdra, vyrobené z trhaviny s plastickým pojivem. Neobsahují roznětné prostředky. Používají se jako součást munice jako jsou bojové hlavice.

NÁLOŽE, VÝBUŠNÉ, PRŮMYSLOVÉ, bez rozbušky: UN čísla 0442, 0443, 0444, 0445

Předměty sestávající z nálože výbušniny schopné detonace, bez roznětného prostředku. Používají se ke svařování, plátování a tvarování výbuchem nebo pro jiné metalurgické procesy.

NÁBOJKY PRO TECHNICKE ÚČELY: UN čísla 0275, 0276, 0323, 0381

Předměty jsou určeny k vyvolání mechanických účinků. Sestávají z pouzdra s náloží z deflagrující výbušniny a roznětného prostředku. Plynné produkty deflagrace slouží k nafukování, k podélnému nebo rotačnímu pohybu nebo k aktivaci funkce přepážek, ventilů nebo spínačů nebo k vystřelování upevňovacích prvků nebo hasících prostředků.

NÁLOŽKY PŘÍDAVNÉ, VÝBUŠNÉ: UN číslo 0060

Předměty sestávající z malé odnímatelné počinové náložky umístěné v dutině střely mezi zapalovačem a trhavinovou náplní.

NÁPLNĚ HNACÍ: UN čísla 0271, 0272, 0415, 0491

Předměty sestávající z hnací náplně, v jakékoliv fyzikální formě, s pláštěm nebo bez pláště. Slouží jako součást raketových motorů nebo ke snížení odporu vzduchu u střel.

NÁPLNĚ HNACÍ, PRO DĚLA: UN čísla 0242, 0279, 0414

Hnací náplně, v jakékoli fyzikální formě, pro dělenou dělostřeleckou municí.

NÝTY, VÝBUŠNÉ: UN číslo 0174

Předměty sestávající z malé náplně výbušniny uvnitř kovového nýtu.

OKTOLIT (OKTOL) suchý, nebo vlhčený méně než 15% hm. vody: UN číslo: 0266

Látka sestávající z těsné směsi 1,3,5,7-tetranitro-1,3,5,7-tetrazacyklooktanu (HMX) a trinitrotoluenu (TNT).

OKTONAL: UN číslo 0496

Látka sestávající z těsné směsi 1,3,5,7-tetranitro-1,3,5,7-tetrazacyklooktanu, trinitrotoluenu (TNT) a hliníku.

PENTOLIT, suchý nebo vlhčený méně než 15 % hm. vody: UN číslo 0151

Látka sestává z těsné směsi pentaeritritoltetranitratu (PETN) a trinitrotoluenu (TNT).

Předměty, obsahující pyrotechnické látky, které se používají v automobilech jako součásti záchranných prostředků, jako jsou airbagy nebo bezpečnostní pásy.

POHONNÁ HMOTA, KAPALNÁ: UN čísla 0495, 0497

Látka, sestávající z deflagrující kapalně výbušniny, která se používá k reaktivnímu pohonu.

POHONNÁ HMOTA, TUHÁ: UN čísla 0498, 0499, 0501

Látka, sestávající z deflagrující pevně výbušniny, která se používá k reaktivnímu pohonu.

PRACH BEZDÝMNÝ: UN čísla 0160, 0161, 0509

Látka, s obsahem nitrocelulózy jako hlavní složkou, která se používá jako pohonná hmota. Tento pojem zahrnuje jednosložkové bezdýmné prachy (samotná nitrocelulóza (NC)), dvousložkové bezdýmné prachy (jako NC s nitroglycerinem (NG)) a trojsložkové bezdýmné prachy (jako NC/NG/nitroguanidin).

POZNÁMKA: *Bezdymný prach lité, lisovaný nebo balený v pytlících je uveden pod pojmem NÁPLNĚ HNACÍ PRO DĚLA nebo SLOŽE HNACÍ.*

PRACH ČERNÝ, LISOVANÝ nebo PRACH ČERNÝ, V PELETÁCH: UN číslo 0028

Látka sestávající z tvarovaného černého prachu.

PRACH ČERNÝ, zrnitý nebo moučkový: UN číslo 0027

Látka sestávající z těsné směsi dřevěného uhlí nebo jiného zdroje uhlíku a dusičnanu draselného nebo dusičnanu sodného se sírou nebo bez ní.

PRACHOVINA SUROVÁ, VLNĚNÁ, nejméně 17 % hm. alkoholu
PRACHOVINA SUROVÁ, VLNĚNÁ nejméně 25 % hm. vody: UN čísla 0433, 0159

Látka sestávající z nitrocelulózy a nejvýše 60 % nitroglycerínu nebo jiné kapalné organické nitrolátky nebo jejich směsi.

PROSTŘEDKY SIGNÁLNÍ, DÝMOVÉ: UN čísla 0196, 0197, 0313, 0487, 0507

Předměty, které obsahují pyrotechnické látky a vyvíjejí dým. Mohou také obsahovat zařízení k vysílání akustických signálů.

PROSTŘEDKY SIGNÁLNÍ RUČNÍ: UN čísla 0191, 0373

Přenosné prostředky, které obsahují pyrotechnické látky, a které vydávají vizuální signály nebo výstražná znamení. Pod toto pojmenování spadají také malé světlice, jako dálniční světlice, železniční světlice nebo malé světlice pro lodě v tísni.

PROSTŘEDKY SIGNÁLNÍ, TÍSNOVÉ, lodní: UN čísla 0194, 0195, 0505, 0506

Předměty, které obsahují pyrotechnické látky a jsou určeny k vytváření signálů ve formě zvukového efektu, plamene nebo dýmu nebo kombinace těchto efektů.

PROSTŘEDKY ZÁCHRANNÉ, PYROTECHNICKÉ: UN číslo 0503

Prostředky, které obsahují pyrotechnické látky nebo nebezpečné věci jiných tříd a jsou používány ve vozidlech, plavidlech nebo letadlech ke zvýšení bezpečnosti osob. Příklady jsou: plynové generátory airbagů, moduly airbagů, předpínače bezpečnostních pásů a pyromechanické prostředky. Tyto pyromechanické prostředky jsou komponenty sestavené k zajištění, mimo jiné, funkcí oddělení, zablokování nebo zadržení cestujících.

PŘEDMĚTY, PYROFORICKÉ: UN číslo 0380

Předměty obsahující pyroforní látku, která je ve styku se vzduchem schopná samovznícení a výbušnou látku nebo složku. Toto pojmenování nezahrnuje předměty obsahující bílý fosfor.

PŘEDMĚTY PYROTECHNICKÉ, pro technické účely: UN čísla 0428, 0429, 0430, 0431, 0432

Předměty, které obsahují pyrotechnické látky. Jsou používány pro technické účely, jako je vývin tepla, vývin plynu nebo pro divadelní efekty a pod.

PŘEDMĚTY, VÝBUŠNÉ, VELMI NECITLIVÉ (EEI): UN číslo 0486

Předměty, které obsahují jen zvlášť necitlivé látky, které při normálních přepravních podmínkách vykazují jen nepatrnou pravděpodobnost náhodného roznětu nebo přenosu detonace a obstály ve zkušební sérii 7 dle Příručky zkoušek a kritérií.

POZNÁMKA: *Následují předměty nespádají pod toto pojmenování: všechny druhy munice; ZAŘÍZENÍ UVOLŇOVACÍ, VÝBUŠNÁ; VÝROBKY ZÁBAVNÉ PYROTECHNIKY; TRÁSKAVKY, ŽELEZNIČNÍ; SVĚTLICE, POZEMNÍ; SVĚTLICE, LETECKÉ; NÁBOJE, SIGNÁLNÍ; ŘEZAČKY, KABELŮ, VÝBUŠNÉ; PROSTŘEDKY, SIGNÁLNÍ, RUČNÍ; PROSTŘEDKY, SIGNÁLNÍ, DÝMOVÉ; PROSTŘEDKY SIGNÁLNÍ, TÍSNOVÉ; NÝTY, VÝBUŠNÉ. Tyto předměty jsou v tomto glosáři uvedeny zvlášť.*

PUMY, S HOŘLAVOU KAPALINOU, s trhací náplní: UN čísla 0399, 0400

Předměty, které jsou shazovány z letadel. Sestávají z nádržky obsahující hořlavou kapalinu a trhací nálož.

PUMY, s trhací náplní: UN čísla 0033, 0291

Výbušné předměty, které jsou shazovány z letadel. Obsahují roznětné prostředky, které nemají nejméně dvě účinná pojistná zařízení.

PUMY, s trhací náplní: UN čísla 0034, 0035

Výbušné předměty, které jsou shazovány z letadel. Buď neobsahují roznětné prostředky, nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

PUMY, ZÁBLESKOVÉ: UN číslo 0037

Výbušné předměty, které jsou shazovány z letadel pro dosažení krátkodobě působícího intenzivního osvětlení pro fotografické účely. Obsahují nálož detonující výbušniny s roznětnými prostředky, které nemají nejméně dvě účinná pojistná zařízení.

PUMY, ZÁBLESKOVÉ: UN číslo 0038

Výbušné předměty, které jsou shazovány z letadel pro dosažení krátkodobě působícího intenzivního osvětlení pro fotografické účely. Obsahují nálož detonující výbušniny bez roznětných prostředků nebo s roznětnými prostředky, které mají nejméně dvě účinná pojistná zařízení.

PUMY, ZÁBLESKOVÉ: UN číslo 0039, 0299

Výbušné předměty, které jsou shazovány z letadel pro dosažení krátkodobě působícího intenzivního osvětlení pro fotografické účely. Obsahují zábleskovou slož.

RAKETOVÉ MOTORY: UN čísla 0186, 0280, 0281

Předměty sestávající z výbušniny, obvykle tuhé pohonné hmoty, která je umístěna ve válci opatřeném jednou nebo více tryskami. Jsou určeny k pohonu raket nebo řízených střel.

RAKETOVÉ MOTORY S HYPERGOLY, s nebo bez výmetné náplně: UN čísla 0250, 0322

Předměty sestávající z válce s jednou nebo více tryskami, který obsahuje hypergolicou pohonnou látku. Jsou určeny k pohonu raket nebo řízených střel.

RAKETOVÉ MOTORY S KAPALNÝM PALIVEM: UN čísla 0395, 0396

Předměty sestávající z válce s jednou nebo více tryskami, který obsahuje kapalné palivo. Jsou určeny k pohonu raket nebo řízených střel.

RAKETY s inertní hlavicí UN čísla: 0183, 0502

Předměty sestávající z raketového motoru a nevýbušné hlavice. Toto pojmenování zahrnuje také řízené střely.

RAKETY, S KAPALNÝM PALIVEM s trhací náplní: UN čísla 0397, 0398

Předměty, sestávající z kapalného paliva a válce opatřeného jednou nebo více tryskami, ke kterým je připevněna bojová hlavice. Toto pojmenování zahrnuje také řízené střely.

RAKETY, s trhací náplní: UN čísla 0180, 0295

Předměty sestávající z raketového motoru a bojové hlavice s roznětnými prostředky, které nemají nejméně dvě účinná pojistná zařízení. Toto pojmenování zahrnuje také řízené střely.

RAKETY, s trhací náplní: UN čísla 0181, 0182

Předměty sestávající z raketového motoru a bojové hlavice bez roznětných prostředků nebo s roznětnými prostředky, které mají nejméně dvě účinná pojistná zařízení. Toto pojmenování zahrnuje také řízené střely.

RAKETY, s výmetnou náplní: UN čísla 0436, 0437, 0438

Předměty sestávající z raketového motoru a náložky sloužící k výmetu užitečného nákladu z hlavičky rakety. Toto pojmenování zahrnuje také řízené střely.

RAKETY, TAHAČE LAN: UN čísla 0238, 0240, 0453

Předměty sestávající z raketového motoru, které jsou určeny k roztahování lan.

ROZBUŠKOVÉ SESTAVY, NEELEKTRICKÉ, pro trhací práce: UN čísla 0360, 0361, 0500

Neelektrické rozbušky opatřené prostředky, kterými jsou uváděny v činnost jako jsou zápalnice, bleskovice, mikrobleskovice a detonační trubice. Mohou být mžikové nebo časované. Pod toto pojmenování spadají detonační zařízení s bleskovicí.

ROZBUŠKY, ELEKTRICKÉ pro trhací práce: UN čísla 0030, 0255, 0456

Předměty, které jsou určeny zejména k počínu průmyslových trhavin. Rozbušky mohou být mžikové i časované. Elektrické rozbušky se uvádějí v činnost elektrickým proudem.

ROZBUŠKY, NEELEKTRICKÉ pro trhací práce: UN čísla 0029, 00267, 0455

Předměty, které jsou určeny zejména k počínu průmyslových trhavin. Rozbušky mohou být mžikové i časované. Neelektrické rozbušky se uvádějí v činnost zápalnicí, bleskovicí, mikrobleskovicí, detonační trubicí nebo jinými roznětnými prostředky. Pod toto pojmenování spadají detonační zařízení bez bleskovice.

ROZBUŠKY, PRO MUNICI: UN 0073, 00364, 0365, 0366.

Předměty sestávající z malého kovového nebo plastového pouzdra, které obsahuje výbušniny jako azid olovnatý, PETN nebo směs výbušnin. Jsou určeny k počínu detonačních zařízení.

ROZRUŠOVACÍ ZAŘÍZENÍ, VÝBUŠNÁ, pro ropné vrty, bez rozbušky: UN číslo 0099

Předměty sestávající z trhavinové nálože v pouzdře, bez roznětného prostředku. Používají se k rozrušení horniny v okolí vrtného otvoru, pro usnadnění výtoku ropy z horniny.

ŘEZAČKY KABELŮ, VÝBUŠNÉ: UN číslo 0070

Předměty sestávající ze zařízení s nožovým ostřím, které je vymršťováno malou náloží deflagrační výbušniny na kovadlinu.

SLOŽ PYROTECHNICKÁ, ZÁBLESKOVÁ: UN čísla 0094, 0305

Pyrotechnická slož, která po zážehu produkuje intenzivní světlo.

SOUČÁSTI ROZNĚTNÝCH ŘETĚZCŮ, J.N.: UN čísla 0382, 0383, 0384, 0461

Předměty, obsahující výbušninu, určené k přenosu detonace nebo deflagrace v zapalovačích munice.

STOPINA: UN číslo 0101

Předmět sestávající z bavlněných vláken obalených jemně zrněným černým prachem. Hoří vnějším plamenem a používá se k zážehu pyrotechnických předmětů atd. Může být uzavřena v papírové trubici pro získání okamžitého efektu.

STOPOVKY PRO MUNICI: UN čísla 0212, 0306

Uzavřené předměty, které obsahují pyrotechnické látky. Slouží k zviditelnění dráhy letu střely.

STŘELY, inertní se stopovkou: UN čísla 0345, 0424, 0425

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní, pušek nebo jiných malorážových střelných zbraní.

STŘELY, s trhací náplní: UN čísla 0167, 0324

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní. Obsahují roznětné prostředky, které nemají nejméně dvě účinná pojistná zařízení.

STŘELY, s trhací náplní: UN čísla 0168, 0169, 0344

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní. Neobsahují roznětné prostředky nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

STŘELY, s trhavou náložkou nebo výmetnou náplní: UN čísla 0346, 0347

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní. Střely neobsahují roznětné prostředky nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení. Používají se k rozhozu značkovacího barviva nebo jiných nevýbušných látek

STŘELY, s trhavou náložkou nebo výmetnou náplní: UN čísla 0426, 0427

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní. Střely obsahují roznětné prostředky, které nemají nejméně dvě účinná pojistná zařízení. Používají se k rozhozu značkovacího barviva nebo jiných nevýbušných látek.

STŘELY, s trhavou náložkou nebo výmetnou náplní: UN čísla 0434, 0435

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní, pušek nebo jiných malorážových střelných zbraní. Používají se k rozhozu značkovacího barviva nebo jiných nevýbušných látek.

SVĚTLICE, LETECKÉ: UN čísla 0093, 0403, 0404, 0420, 0421

Předměty, obsahující pyrotechnické látky, které jsou určeny ke shazování z letadel. Používají se k osvětlovacím, identifikačním, signálním nebo varovným účelům.

SVĚTLICE, POZEMNÍ: UN čísla 0092, 0418, 0419

Předměty, obsahující pyrotechnické látky, které jsou určeny k používání na zemi. Používají se k osvětlovacím, identifikačním, signálním nebo varovným účelům.

TORPÉDA, S KAPALNÝM PALIVEM, s nebo bez trhací nálože: UN číslo 0449

Předměty sestávající z kapalného výbušného pohonného systému k pohonu torpéda ve vodě, s nebo bez bojové hlavice; nebo předměty sestávající z kapalného nevýbušného pohonného systému k pohonu torpéda ve vodě a z bojové hlavice.

TORPÉDA, S KAPALNÝM PALIVEM s inertní hlavicí: UN číslo 0450

Předměty sestávající z kapalného výbušného pohonného systému k pohonu torpéda ve vodě a z inertní hlavice.

TORPÉDA, s trhací náplní: UN číslo 0329

Předměty sestávající z výbušného pohonného systému k pohonu torpéda ve vodě a z bojové hlavice. Bojová hlavice neobsahuje roznětné prostředky nebo obsahuje roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

TORPÉDA, s trhací náplní: UN číslo 0330

Předměty sestávající z výbušného nebo nevýbušného pohonného systému, k pohonu torpéda ve vodě a z bojové hlavice. Bojová hlavice obsahuje roznětné prostředky, které mají méně než dvě účinná pojistná zařízení.

TORPÉDA, s trhací náplní: UN číslo 0451

Předměty sestávající z nevýbušného pohonného systému, k pohonu torpéda ve vodě a z bojové hlavice. Bojová hlavice neobsahuje roznětné prostředky nebo obsahuje roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

TRHAVÉ NÁLOŽKY, výbušné: UN číslo 0043

Předměty, sestávající z malé náložky výbušniny. Slouží k roztržení pláště střel nebo jiné munice, aby se mohla rozptýlit jejich náplň.

TRHAVINA, TYP A: UN číslo 0081

Látky sestávající z kapalných nitroesterů, takových jako nitroglycerin nebo směsi takových látek. Obsahují kromě toho jednu nebo více těchto složek: nitrocelulózu, dusičnan amonný nebo jiné anorganické dusičnany, aromatické nitrosloučeniny nebo hořlavé látky, jako dřevěnou moučku nebo hliníkový prášek. Kromě toho mohou obsahovat inertní součásti, jako je křemelina a přísady, jako barviva a stabilizátory. Trhaviny mají konzistenci práškovou, želatinovou, plastickou nebo poloplastickou. Pod toto pojmenování spadají také dynamity, trhací želatiny, želatinové dynamity.

TRHAVINA, TYP B: UN čísla 0082, 0331

Látky sestávající ze

- (a) směsi dusičnanu amonného nebo jiných anorganických dusičnanů s výbušninami takovými jako trinitrotoluen (TNT), mohou také obsahovat jiné látky, jako dřevěnou moučku a hliníkový prášek; nebo
- (b) směsi z dusičnanu amonného nebo jiných anorganických dusičnanů s jinými hořlavými, nevýbušnými látkami.

V obou případech mohou trhaviny obsahovat inertní součásti, jako křemelinu a přísady, jako barviva a stabilizátory. Tyto trhaviny nesmějí obsahovat nitroglycerin nebo podobné kapalné nitroestery nebo chlorečnany.

TRHAVINA, TYP C: UN číslo 0083

Látky sestávající ze směsi chlorečnanu draselného nebo chlorečnanu sodného nebo chloristanu draselného nebo chloristanu sodného nebo chloristanu amonného a organických nitrosloučenin nebo hořlavých látek, jako dřevěná moučka, hliníkový prášek nebo uhlovodíky. Látky mohou kromě toho obsahovat inertní součásti jako křemelinu a přísady jako barviva a stabilizátory. Tyto trhaviny nesmějí obsahovat nitroglycerin nebo podobné kapalné nitroestery.

TRHAVINA, TYP D: UN číslo 0084

Látky sestávající ze směsi organických nitrosloučenin a hořlavých látek, jako uhlovodíků a hliníkového prášku. Látky mohou obsahovat inertní součásti jako křemelinu a přísady jako barviva a stabilizátory. Tyto trhaviny nesmějí obsahovat nitroglycerin nebo podobné kapalné nitroestery, chlorečnany a dusičnan amonný. Pod toto pojmenování spadají plastické trhaviny.

TRHAVINA, TYP E: UN čísla 0241, 0332

Látky sestávající z vody, jako hlavní součásti a vysokého podílu dusičnanu amonného nebo jiných oxidačních prostředků, které mohou být v roztoku. Ostatními součástmi mohou být nitrosloučeniny jako trinitrotoluen, uhlovodíky nebo hliníkový prášek. Mohou obsahovat inertní součásti, jako křemelinu a přísady, jako barviva a stabilizátory. Pod toto pojmenování spadají emulzní trhaviny, trhaviny typu slurry a „vodní gely“.

TRITONAL: UN číslo 0390

Látka sestává ze směsi trinitrotoluen (TNT) a hliníku.

TŘASKAVKY, ŽELEZNIČNÍ: UN čísla 0192, 0193, 0492, 0493

Předměty, obsahující pyrotechnickou látku, které při nárazu vybuchují se silným zvukovým efektem. Předměty jsou určeny k umístění na železničních kolejích.

VÝROBKY ZÁBAVNÉ PYROTECHNIKY: UN čísla 0333, 0334, 0335, 0336, 0337

Pyrotechnické předměty určené pro zábavné účely.

VZORKY, VÝBUŠNÉ, kromě třaskavin: UN číslo 0190

Nové nebo již existující výbušné látky nebo předměty, které dosud nejsou přiřazeny k žádnému pojmenování v kapitole 3.2, tabulce A, které jsou přepravovány v malém množství v souladu s pokyny příslušného orgánu mimo jiné k pokusným, klasifikačním, výzkumným a vývojovým účelům, za účelem kontroly jakosti nebo jako obchodní vzorek.

POZNÁMKA: *Výbušné látky nebo předměty, které již jsou jmenovitě uvedené v kapitole 3.2, tabulce A, pod tento pojem nespádají.*

ZÁPALKOVÉ ŠROUBY: UN čísla 0319, 0320, 0376

Předměty sestávající ze zápalky pro zážeh a přídavné náplně deflagrující výbušniny, jako je černý prach. Používají se k zážehu hnací náplně v nábojnicích pro děla atd.

ZÁPALKY, KALÍŠKOVÉ: UN čísla 0044, 0377, 0378

Předměty sestávající se z kovových nebo plastových kalíšků, které obsahují malé množství třaskavé složky, která se snadno zažehuje úderem. Slouží jako zažehový prostředek v malorážových nábojích a v nárazových zápalkách hnacích náplní.

ZÁPALNICE: UN číslo 0066

Předmět, který se buď sestává z textilních vláken obalených černým prachem nebo jinou rychle hořící pyrotechnickou složkou a z pružného ochranného povlaku nebo z duše z černého prachu opředené pružnými textilními vlákny. Předmět hoří podélně otevřeným plamenem a slouží k přenosu zážehu z jednoho zařízení k náloži nebo k zažehovači.

ZÁPALNICE, BEZPEČNOSTNÍ: UN číslo 0105

Předmět, sestávající z duše z jemnozrnného černého prachu, která je omotaná ohebným textilním vláknem. Je opatřený jedním nebo více ochrannými obaly a po zažehnutí hoří stanovenou rychlostí bez jakéhokoli vnějšího výbušného účinku.

ZÁPALNICE, trubičková, s kovovým pláštěm: UN číslo 0103

Předmět sestávající z kovové trubičky s duší z deflagrující výbušniny.

ZAPALOVAČE, DETONAČNÍ: UN čísla 0106, 0107, 0257, 0367

Předměty, s výbušnými díly, určené k vyvolání detonace v munici. Obsahují mechanické, elektrické, chemické nebo hydrostatické zařízení k vyvolání detonace. Obvykle obsahují pojistná zařízení.

ZAPALOVAČE, DETONAČNÍ s pojistným zařízením: UN čísla 0408, 0409, 0410

Předměty, s výbušnými díly, určené k vyvolání detonace v munici. Obsahují mechanické, elektrické, chemické nebo hydrostatické zařízení k vyvolání detonace. Detonační zapalovače musí obsahovat nejméně dvě účinná pojistná zařízení.

ZAPALOVAČE, ZÁŽEHOVÉ: UN čísla 0316, 0317, 0368

Předměty, s třaskavými složkami, určené k vyvolání deflagrace v munici. Obsahují mechanické, elektrické, chemické nebo hydrostatické zařízení k vyvolání deflagrace. Obvykle obsahují pojistná zařízení.

ZAŘÍZENÍ, AKTIVOVATELNÁ VODOU, s trhavou náložkou, výmetnou nebo hnací náplní: UN čísla 0248, 0249

Předměty, jejichž funkce je závislá na fyzikálně-chemické reakci jejich složek s vodou.

ZAŘÍZENÍ UVOLŇOVACÍ, VÝBUŠNÁ: UN číslo 0173

Předměty sestávající z malé výbušné náložky s roznětným prostředkem a tyče nebo spojovacího dílu. Preražením tyče nebo spojovacího dílu se zařízení uvede rychle v činnost.

ZAŽEHOVAČE: UN čísla 0121, 0314, 0315, 0454

Předměty, které obsahují jednu nebo více výbušných látek, které jsou určeny k vyvolání deflagrace ve výbušných zařízeních. Do činnosti mohou být uváděny chemicky, elektricky nebo mechanicky.

POZNÁMKA: *Následující předměty nespadají pod tento pojem: ZÁPALNICE, ZÁPALNICE trubičková; ZÁPALNICE BEZPEČNOSTNÍ; ZÁPALKY KALÍŠKOVÉ; STOPINA; ZÁPALKOVÉ ŠROUBY; ZAŽEHOVAČE ZÁPALNIC. Tyto jsou v tomto glosáři uvedeny zvlášť.*

ZAŽEHOVAČE ZÁPALNIC: UN číslo 0131

Předměty různé konstrukce, které se uvádějí v činnost třením, úderem nebo elektricky a které slouží k zažehnutí zápalnice.

2.2.2 Třída 2 Plyny**2.2.2.1 Kritéria**

2.2.2.1.1 Název třídy 2 zahrnuje čisté plyny, směsi plynů, směsi jednoho nebo více plynů s jednou nebo více jinými látkami, jakož i předměty, které takové látky obsahují.

Plyny jsou látky, které:

- (a) při 50 °C mají tenzi par vyšší než 300 kPa (3 bary), nebo
- (b) při 20 °C a standardním tlaku 101,3 kPa jsou zcela plynné.

POZNÁMKA 1: UN 1052 FLUOROVODÍK, BEZVODÝ je však látkou třídy 8.

POZNÁMKA 2: Čistý plyn smí obsahovat jiné složky, které pocházejí z výrobního procesu nebo které jsou přidávány, aby zachovaly stabilitu výrobku, za předpokladu, že koncentrace těchto složek nemění zařazení nebo přepravní podmínky, jako stupeň plnění, plnicí tlak nebo zkušební tlak.

POZNÁMKA 3: J.N. položky v pododdíle 2.2.2.3 mohou zahrnovat čisté plyny, jakož i směsi plynů.

2.2.2.1.2 Látky a předměty třídy 2 jsou rozděleny následovně:

1. *Stlačený plyn:* plyn, který, je-li naplněn pod tlakem pro přepravu, je zcela plynný při teplotě -50 °C; tato kategorie zahrnuje všechny plyny s kritickou teplotou -50 °C nebo nižší;
2. *Zkapalněný plyn:* plyn, který, je-li naplněn pod tlakem pro přepravu, je částečně kapalný při teplotách nad -50 °C. Rozlišuje se:
 - Vysokotlaký zkapalněný plyn:* plyn s kritickou teplotou nad -50 °C a nejvýše +65 °C; a
 - Nízkotlaký zkapalněný plyn:* plyn s kritickou teplotou nad +65 °C;
3. *Hluboce zchlazený zkapalněný plyn:* plyn, který, je-li naplněn pro přepravu, je částečně zkapalněn v důsledku své nízké teploty;
4. *Rozpuštěný plyn:* plyn, který, je-li naplněn pod tlakem pro přepravu, je rozpuštěn v kapalném rozpouštědle;
5. Aerosoly a malé nádoby obsahující plyn (plynové kartuše);
6. Jiné předměty obsahující plyn pod tlakem;
7. Plyny, které nejsou pod tlakem, podléhající zvláštním předpisům (vzorky plynů);
8. Chemické látky pod tlakem: kapaliny, pasty nebo prášky natlakované s hnací látkou, která splňuje definici stlačeného nebo zkapalněného plynu a jejich směsí.
9. Adsorbovaný plyn: plyn, který je, je-li zabalen pro přepravu, absorbován v tuhém porézním materiálu, s výsledným vnitřním tlakem nádoby nižším než 101,3 kPa při 20 °C a nižším než 300 kPa při 50 °C.

2.2.2.1.3 Látky a předměty (kromě aerosolů a chemických látek pod tlakem) třídy 2 jsou podle svých nebezpečných vlastností přiřazeny k jedné z následujících skupin:

- A dusivé
- O podporující hoření
- F hořlavé
- T toxické

TF	toxické, hořlavé
TC	toxické, žíravé
TO	toxické, podporující hoření
TFC	toxické, hořlavé, žíravé
TOC	toxické, podporující hoření, žíravé.

Jestliže podle těchto kritérií mají plyny nebo směsi plynů nebezpečné vlastnosti, které lze přiřadit více než jedné skupině, mají skupiny označené písmenem T přednost před všemi ostatními skupinami. Skupiny označené písmenem F mají přednost před skupinami označenými písmeny A nebo O.

POZNÁMKA 1: Ve Vzorových předpisech OSN, v IMDG Code a v Technických instrukcích ICAO jsou plyny zařazovány na základě svého hlavního nebezpečí do jedné z následující tří podtříd:

- Podtřída 2.1: Hořlavé plyny (odpovídá skupinám, které jsou označeny písmenem F)
- Podtřída 2.2: Nehořlavé, netoxické plyny (odpovídá skupinám, které jsou označeny písmeny A nebo O)
- Podtřída 2.3: Toxické plyny (odpovídá skupinám, které jsou označeny písmeny T, tzn. T, TF, TC, TO, TFC a TOC)

POZNÁMKA 2: Malé nádoby obsahující plyn (UN číslo 2037) musí být přiřazeny dle nebezpečí plynoucího z jejich obsahu ke skupinám A až TOC. K aerosolům (UN číslo 1950) viz 2.2.2.1.6. K chemickým látkám pod tlakem (UN čísel 3500 až 3505) viz 2.2.2.1.7.

POZNÁMKA 3: Žíravé plyny se považují za toxické, a proto se zařazují do skupiny TC, TFC nebo TOC.

2.2.2.1.4 Pokud v kapitole 3.2, tabulce A jmenovitě uvedená směs třídy 2 odpovídá různým kritériím uvedeným v 2.2.2.1.2 a 2.2.2.1.5, je třeba tuto směs zařadit dle těchto kritérií a přiřadit ji k vhodné J.N. položce.

2.2.2.1.5 Látky a předměty (kromě aerosolů) třídy 2 jmenovitě neuvedené v kapitole 3.2, tabulce A je třeba přiřadit podle 2.2.2.1.2 a 2.2.2.1.3 k hromadné položce uvedené v pododdíle 2.2.2.3. Platí následující kritéria:

Dusivé plyny

Plyny nepodporující hoření, nehořlavé a netoxické, které zředují nebo vypuzují kyslík, který je za normálních podmínek přítomen v ovzduší.

Hořlavé plyny

Plyny, které při teplotě 20 °C a standardním tlaku 101,3 kPa:

- (a) jsou zápalné ve směsi s nejvýše 13 % obj. plynu se vzduchem, nebo
- (b) mají rozsah hořlavosti se vzduchem nejméně 12 procentních bodů bez ohledu na spodní mez hořlavosti.

Hořlavost musí být stanovena za pomoci zkoušek nebo výpočtů dle metod schválených ISO (viz normu ISO 10156:2010).

Pokud jsou pro použití těchto metod k dispozici pouze nedostatečné údaje, mohou být použity rovnocenné metody zkoušek, pokud jsou uznány příslušným orgánem země původu.

Není-li země původu smluvní stranou ADR, musí být tyto metody uznány příslušným orgánem prvního státu smluvní strany ADR, který přijde do styku se zásilkou.

Plyny podporující hoření

Plyny, které mohou obecně přívodem kyslíku způsobit nebo podpořit hoření jiných látek účinněji než vzduch. Jsou to čisté plyny nebo směsi plynů s oxidační mohutností větší než 23,5 %, určenou metodou uvedenou v ISO 10156:2010.

Toxické plyny

POZNÁMKA: *Plyny, které kvůli své žíravosti částečně nebo úplně odpovídají kritériím pro toxicitu, musí být zařazeny jako toxické. K možnému vedlejšímu nebezpečí žíravosti, viz také kritéria pod nadpisem „Žíravé plyny“.*

Plyny:

- (a) o nichž je známo, že mají takový toxický nebo žíravý účinek na člověka, že představují nebezpečí pro jeho zdraví; nebo
- (b) o kterých se předpokládá, že mají toxický nebo žíravý účinek na člověka, protože při zkouškách podle pododdílu 2.2.61.1 vykazují hodnotu LC₅₀ pro akutní toxicitu nejvýše 5000 ml/m³ (ppm).

Pro zařazení směsí plynů (včetně par látek jiných tříd) může být použit následující vzorec:

$$LC_{50} \text{ toxická (směs)} = \frac{1}{\sum_{i=1}^n \frac{f_i}{T_i}}$$

přičemž f_i = molární zlomek i-té části směsi.

T_i = index toxicity i - té části směsi.
Hodnota T_i odpovídá hodnotě LC₅₀ dle P200 pododdílu 4.1.4.1.

Pokud hodnota LC₅₀ není v P200 pododdílu 4.1.4.1 uvedena, je třeba použít hodnotu LC₅₀, která je uvedena ve vědecké literatuře.

Pokud hodnota LC₅₀ není známa, vypočítá se index toxicity na základě nejnižší hodnoty LC₅₀ látek s podobnými fyziologickými a chemickými účinky, nebo, je-li to jediná možnost, na základě pokusů.

Žíravé plyny

Plyny nebo směsi plynů, které kvůli svým žíravým účinkům zcela odpovídají kritériím pro toxicitu, je třeba zařadit jako toxické s vedlejším nebezpečím žíravosti.

Směs plynů, která je z důvodu svých kombinovaných účinků žíravosti a toxicity považována za toxickou, představuje vedlejší nebezpečí žíravosti, jestliže je z lidské zkušenosti známo, že je směs škodlivá pro kůži, oči nebo sliznice, nebo je-li hodnota LC₅₀ žíravých částí směsi při výpočtu podle následujícího vzorce nejvýše 5000 ml/m³ (ppm):

$$LC_{50} \text{ žíravá (směs)} = \frac{1}{\sum_{i=1}^n \frac{f_{Ci}}{T_{Ci}}}$$

přičemž f_{Ci} = molární zlomek i- té žíravé části směsi.

T_{Ci} = index toxicity i- té žíravé části směsi.

Hodnota T_{ci} odpovídá hodnotě LC_{50} dle P200 pododdílu 4.1.4.1.

Pokud hodnota LC_{50} není v P200 pododdílu 4.1.4.1 uvedena, je třeba použít hodnotu LC_{50} , která je uvedena ve vědecké literatuře.

Pokud hodnota LC_{50} není známa, vypočítá se index toxicity na základě nejnižší hodnoty LC_{50} látek s podobnými fyziologickými a chemickými účinky, nebo, je-li to jediná možnost, na základě pokusů.

2.2.2.1.6 Aerosoly

Aerosoly (UN číslo 1950) se přiřazují k jedné z následujících skupin podle svých nebezpečných vlastností takto:

A	dusivé
O	podporující hoření
F	hořlavé
T	toxické
C	žiravé
CO	žiravé, podporující hoření
FC	hořlavé, žiravé
TF	toxické, hořlavé
TC	toxické, žiravé
TO	toxické, podporující hoření
TFC	toxické, hořlavé, žiravé
TOC	toxické, podporující hoření, žiravé.

Zařazení závisí na povaze obsahu aerosolového rozprašovače.

POZNÁMKA: Plyny, které vyhovují definici toxických plynů podle 2.2.2.1.5 a plynů identifikovaných v tabulce 2 pokynu pro balení P200 poznámkou c „Je považován za pyroforní“ v pododdílu 4.1.4.1, nesmějí být použity jako hnací náplň v aerosolovém rozprašovači. Aerosoly s obsahem splňujícím kritéria pro obalovou skupinu I z hlediska toxicity nebo žiravosti nejsou připuštěny k přepravě (viz také 2.2.2.2.2) .

Platí tato kritéria:

- Přiřazení ke skupině A se provede, pokud obsah nesplňuje kritéria pro žádnou jinou skupinu podle pododstavců b) až f) dále;
- Přiřazení ke skupině O se provede, pokud aerosol obsahuje plyn podporující hoření podle 2.2.2.1.5;
- Přiřazení ke skupině F se provede, jestliže obsah zahrnuje nejméně 85 % hm. hořlavých složek a chemické spalné teplo je nejméně 30 kJ/g. Přiřazení se neprovede, jestliže obsah zahrnuje nejvýše 1 % hm. hořlavých složek a spalné teplo je menší než 20 kJ/g. Jinak musí být aerosol odzkoušen na hořlavost zkouškami popsány v Příručce zkoušek a kritérií, části III, oddíl 31. Lehce hořlavé a hořlavé aerosoly musí být přiřazeny ke skupině F.

POZNÁMKA: Hořlavé složky jsou hořlavé kapaliny, hořlavé tuhé látky nebo hořlavé plyny a směsi plynů, jak jsou definovány v poznámkách 1 až 3 pododdílu 31.1.3 části III Příručky zkoušek a kritérií. Tento pojem nezahrnuje pyroforní látky, látky schopné samoohřevu ani látky reagující s vodou. Chemické spalné teplo se určí jedním z následujících postupů: ASTM D 240, ISO/FDIS 13943:1999 (E/F) 86.1 až 86.3 nebo NFPA 30B.

- d) Přiřazení ke skupině T se provede, pokud je obsah, s výjimkou hnací náplně aerosolového rozprašovače, zařazen do třídy 6.1, obalových skupin II nebo III;
- e) Přiřazení ke skupině C se provede, pokud obsah, s výjimkou hnací náplně aerosolového rozprašovače, splňuje kritéria pro třídu 8, obalové skupiny II nebo III;
- f) Pokud jsou splněna kritéria pro více než jednu skupinu mezi skupinami O, F, T a C, provede se přiřazení k příslušné skupině CO, FC, TF, TC, TO, TFC nebo TOC.

2.2.2.1.7

Chemické látky pod tlakem

Chemické látky pod tlakem (UN čísel 3500 až 3505) se přiřazují k jedné z následujících skupin podle svých nebezpečných vlastností takto:

- A dusivé
- F hořlavé
- T toxické
- C žíravé
- FC hořlavé, žíravé
- TF toxické, hořlavé.

Zařazení závisí na nebezpečných vlastnostech komponentů v různých stavech:

- Hnací látka;
- Kapalina; nebo
- Tuhá látka.

POZNÁMKA 1: Plyny, které vyhovují definici toxických plynů nebo plynů podporujících hoření podle 2.2.2.1.5, nebo plyny identifikované v tabulce 2 pokynu pro balení P200 v 4.1.4.1 poznámkou c „Je považován za pyroforní“, nesmějí být používány jako hnací látka pro chemické látky pod tlakem.

POZNÁMKA 2: Chemické látky pod tlakem, jejichž obsah splňuje kritéria pro obalovou skupinu I z hlediska toxicity nebo žíravosti, nebo jejichž obsah splňuje jak kritéria pro obalovou skupinu II nebo III z hlediska toxicity, tak i kritéria pro obalovou skupinu II nebo III z hlediska žíravosti, nesmějí být přijímány k přepravě pod těmito UN čísly.

POZNÁMKA 3: Chemické látky pod tlakem s komponentami odpovídajícími vlastnostem třídy 1; znečtivěné výbušné kapaliny třídy 3; samovolně se rozkládající látky a znečtivěné tuhé výbušné látky třídy 4.1; třída 4.2; třída 4.3; třída 5.1; třída 5.2; třída 6.2 nebo třída 7 nesmějí být používány pro přepravu pod těmito UN čísly.

POZNÁMKA 4: Chemické látky pod tlakem v aerosolovém rozprašovači musí být přepravovány pod UN číslem 1950.

Platí tato kritéria:

- (a) Přiřazení ke skupině A se provede, pokud obsah nesplňuje kritéria pro žádnou jinou skupinu podle pododstavců (b) až (e) dále;
- (b) Přiřazení ke skupině F se provede, jestliže jeden z komponentů, kterým může být čistá látka nebo směs, musí být klasifikován jako hořlavý. Hořlavé komponenty jsou hořlavé

kapaliny a kapalné směsi, hořlavé tuhé látky a tuhé směsi nebo hořlavé plyny a směsi plynů splňující následující kritéria:

- (i) Hořlavá kapalina je kapalina s bodem vzplanutí nejvýše 93 °C;*
- (ii) Hořlavá tuhá látka je tuhá látka, která splňuje kritéria uvedená v 2.2.41.1;*
- (iii) Hořlavý plyn je plyn, který splňuje kritéria uvedená v 2.2.2.1.5;*
- (c) Přiřazení ke skupině T se provede, pokud je obsah, s výjimkou hnací látky, zařazen jako nebezpečné věci třídy 6.1, obalových skupin II nebo III;*
- (d) Přiřazení ke skupině C se provede, pokud je obsah, s výjimkou hnací látky, zařazen jako nebezpečné věci třídy 8, obalových skupin II nebo III;*
- (e) Pokud jsou splněna kritéria pro dvě skupiny mezi skupinami F, T a C, provede se přiřazení ke skupinám FC nebo TF, jak je to náležité.*

2.2.2.2 Plyny nepřipustěné k přepravě

2.2.2.2.1 Chemicky nestálé látky třídy 2 jsou připuštěny k přepravě jen tehdy, byla-li učiněna potřebná opatření k zabránění všech možností nebezpečné reakce za normálních podmínek přepravy, jako např. rozkladu, přeměny nebo polymerizaci. Za tímto účelem je zvláště třeba dbát na to, aby nádoby a cisterny neobsahovaly látky, které by tyto reakce mohly podporovat.

2.2.2.2.2 Následující látky a směsi nejsou připuštěny k přepravě:

- UN 2186 - CHLOROVODÍK, HLUBOCE ZCHLAZENÝ, KAPALNÝ;
- UN 2421 – OXID DUSITÝ;
- UN 2455 - METHYLNITRIT;
- hluboce zchlazené zkapalněné plyny, kterým nelze přiřadit klasifikační kódy 3A, 3O nebo 3 F;
- rozpuštěné plyny, které nemohou být přiřazeny pod UN čísla 1001, 2073 nebo 3318;
- aerosoly, u nichž jsou jako hnací náplně použity plyny, které jsou toxické podle 2.2.2.1.5 nebo pyroforní podle pokynu pro balení P200 v pododdílu 4.1.4.1;
- aerosoly s obsahem splňujícím kritéria pro obalovou skupinu I z hlediska toxicity nebo žíravosti (viz oddíly 2.2.61 a 2.2.8);
- malé nádoby obsahující plyny, které jsou velmi toxické (LC₅₀ nižší než 200 ppm) nebo pyroforní podle pokynu pro balení P200 v pododdílu 4.1.4.1.

2.2.2.3 Seznam hromadných položek

Stlačené plyny		
Klasifikační kód	UN číslo	Pojmenování látek nebo předmětů
1 A	1956	PLYN STLAČENÝ, J.N.
1 O	3156	PLYN STLAČENÝ, PODPORUJÍCÍ HOŘENÍ, J.N.
1 F	1964	UHLOVODÍKY, PLYNNÉ, SMĚS, STLAČENÁ, J.N.
	1954	PLYN, STLAČENÝ HOŘLAVÝ, J.N.
1 T	1955	PLYN, STLAČENÝ, TOXICKÝ, J.N.
1 TF	1953	PLYN, STLAČENÝ, TOXICKÝ, HOŘLAVÝ, J.N.
1 TC	3304	PLYN, STLAČENÝ, TOXICKÝ, ŽÍRAVÝ, J.N.
1 TO	3303	PLYN, STLAČENÝ, TOXICKÝ, PODPORUJÍCÍ HOŘENÍ, J.N.
1 TFC	3305	PLYN, STLAČENÝ, TOXICKÝ, HOŘLAVÝ, ŽÍRAVÝ, J.N.
1 TOC	3306	PLYN, STLAČENÝ, TOXICKÝ, PODPORUJÍCÍ HOŘENÍ, ŽÍRAVÝ, J.N.

Zkapalněné plyny		
Klasifikační kód	UN číslo	Pojmenování látek nebo předmětů
2 A	1058	PLYNY ZKAPALNĚNÉ, nehořlavé, s přidáním dusíku, oxidu uhličitého nebo vzduchu
	1078	PLYN JAKO CHLADICÍ PROSTŘEDEK, J.N., jako směsi plynů s pojmenováním R..., které mají jako: směs F1 při 70 °C tenzi par nepřesahující 1,3 MPa (13 bar) a při 50 °C hustotu, která odpovídá minimálně hustotě dichlorfluormethanu (1,30 kg/l); směs F2 při 70 °C tenzi par nepřesahující 1,9 MPa (19 bar) a při 50 °C hustotu, která odpovídá minimálně hustotě dichlorfluormethanu (1,21 kg/l); směs F3 při 70 °C tenzi par nepřesahující 3 MPa (30 bar) a při 50 °C hustotu, která odpovídá minimálně hustotě chlordifluormethanu (1,09 kg/l); POZN.: Trichlorfluormethan (chladicí prostředek R11), 1,1,2-Trichlor-1,2,2-trifluorethan (chladicí prostředek R 113), 1,1,1-Trichlor-2,2,2-trifluorethan (chladicí prostředek R 113a), 1-Chlor-1,2,2-trifluorethan (chladicí prostředek R133) a 1-Chlor-1,1,2-trifluorethan (chladicí prostředek R133b) nejsou látkami třídy 2, mohou však být částmi směsí F1 až F3
	1968	INSEKTICID, PLYNNÝ, J.N.
	3163	PLYN ZKAPALNĚNÝ, J.N.
2 O	3157	PLYN ZKAPALNĚNÝ, PODPORUJÍCÍ HOŘENÍ, J.N.
2 F	1010	SMĚSI BUTADIENŮ A UHLOVODÍKŮ, STABILIZOVANÉ, které mají při teplotě 70 °C tenzi par nepřesahující 1,1 MPa (11 bar) a jejichž hustota neklesne při 50 °C pod hodnotu 0,525 kg/l POZN. Butadieny, stabilizované, jsou také zařazeny pod UN číslo 1010, viz tabulku A kapitoly 3.2.
	1060	METHYLACETYLEN A PROPADIEN, směs, STABILIZOVANÁ, jako směsi methylacetylenu a propadienu s uhlovodíky, kterými jsou: Směs P1 obsahující nejvýše 63 % obj. methylacetylenu a propadienu a nejvýše 24 % obj. propanu a propenu, přičemž procentuální podíl nasycených uhlovodíků C ₄ musí být nejméně 14 % obj.; Směs P2 obsahující nejvýše 48 % obj. methylacetylenu a propadienu a nejvýše 50 % obj. propanu a propenu, přičemž procentuální podíl nasycených uhlovodíků C ₄ musí být nejméně 5 % obj.; jakož i směsi propadienu s 1 % až 4 % methylacetylenu

Zkapalněné plyny (pokračování)		
Klasifikační kód	UN číslo	Pojmenování látek nebo předmětů
2 F	1965	UHLOVODÍKY PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N., které jsou jako směsi: Směs A při 70 °C tenzi par nejvýše 1,1 MPa (11bar) a při 50 °C hustotu nejméně 0,525 kg/l Směs A 01 při 70 °C tenzi par nejvýše 1,6 MPa (16 bar) a při 50 °C hustotu nejméně 0,516 kg/l Směs A 02 při 70 °C tenzi par nejvýše 1,6 MPa (16 bar) a při 50 °C hustotu nejméně 0,505 kg/l Směs A 0 při 70 °C tenzi par nejvýše 1,6 MPa (16bar) a při 50 °C hustotu nejméně 0,495 kg/l Směs A 1 při 70 °C tenzi par nejvýše 2,1 MPa (21bar) a při 50 °C hustotu nejméně 0,485 kg/l Směs B 1 při 70 °C tenzi par nejvýše 2,6 MPa (26bar) a při 50 °C hustotu nejméně 0,474 kg/l Směs B 2 při 70 °C tenzi par nejvýše 2,6 MPa (26bar) a při 50 °C hustotu nejméně 0,463 kg/l Směs B při 70 °C tenzi par nejvýše 2,6 MPa (26bar) a při 50 °C hustotu nejméně 0,450 kg/l Směs C při 70 °C tenzi par nejvýše 3,1 MPa (31bar) a při 50 °C hustotu nejméně 0,440 kg/l POZN. 1. Pro výše uvedené směsi jsou také přípustná jako označení látek následující obchodní pojmenování: pro směsi A, A01, A02, a A0: BUTAN, pro směs C: PROPAN. POZN. 2. Jestliže předchází nebo následuje námořní nebo letecká přeprava, smí být pro UN 1965 UHLOVODÍKY PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N. použita alternativní položka UN 1075 PLYNY ROPNÉ, ZKAPALNĚNÉ
	3354	INSEKTICID PLYNNÝ, HOŘLAVÝ, J.N.
	3161	PLYN ZKAPALNĚNÝ, HOŘLAVÝ, J.N.
	1967	INSEKTICID PLYNNÝ, TOXICKÝ, J.N.
2 T	3162	PLYN ZKAPALNĚNÝ, TOXICKÝ, J.N.
2 TF	3355	INSEKTICID PLYNNÝ, TOXICKÝ, HOŘLAVÝ, J.N.
	3160	PLYN ZKAPALNĚNÝ TOXICKÝ, HOŘLAVÝ, J.N.
2 TC	3308	PLYN ZKAPALNĚNÝ, TOXICKÝ, ŽÍRAVÝ, J.N.
2 TO	3307	PLYN ZKAPALNĚNÝ, TOXICKÝ, PODPORUJÍCÍ HOŘENÍ, J.N.
2 TFC	3309	PLYN ZKAPALNĚNÝ, TOXICKÝ, HOŘLAVÝ, ŽÍRAVÝ, J.N.
2 TOC	3310	PLYN ZKAPALNĚNÝ, TOXICKÝ, PODPORUJÍCÍ HOŘENÍ, ŽÍRAVÝ, J.N.

Hluboce zchlazené zkapalněné plyny		
Klasifikační kód	UN číslo	Pojmenování látek nebo předmětů
3 A	3158	PLYN, HLUBOCE ZCHLAZENÝ, KAPALNÝ, J.N.
3 O	3311	PLYN, HLUBOCE ZCHLAZENÝ, KAPALNÝ, PODPORUJÍCÍ HOŘENÍ, J.N.
3 F	3312	PLYN, HLUBOCE ZCHLAZENÝ, KAPALNÝ, HOŘLAVÝ, J.N.

Rozpuštěné plyny		
Klasifikační kód	UN čísla	Pojmenování látek nebo předmětů
4		K přepravě jsou připuštěny jen látky jmenovitě uvedené v tabulce A kapitoly 3.2.

Aerosoly a nádoby, malé, obsahující plyn		
Klasifikační kód	UN číslo	Pojmenování látek nebo předmětů
5	1950	AEROSOLY
	2037	NÁDOBKY, MALÉ, OBSAHUJÍCÍ PLYN (KARTUŠE), bez odběrného ventilu, které nelze opětovně plnit

Jiné předměty, které obsahují plyn pod tlakem		
Klasifikační kód	UN číslo	Pojmenování látek nebo předmětů
6 A	2857	STROJE CHLADICI, obsahující nehořlavé, netoxické plyny nebo roztoky amoniaku (UN 2672)
	3164	PŘEDMĚTY POD PNEUMATICKÝM TLAKEM (s nehořlavým plynem) nebo
	3164	PŘEDMĚTY POD HYDRAULICKÝM TLAKEM (s nehořlavým plynem)
6 F	3150	PŘÍSTROJE MALÉ, POHÁNĚNÉ PLYNNÝM UHLOVODÍKEM, s odběrním ventilem, nebo
	3150	NÁDOBKY S PLYNNÝM UHLOVODÍKEM, OPAKOVANĚ PLNITELNÉ, PRO MALÉ PŘÍSTROJE, s odběrním ventilem
	3478	ZÁSOBNÍKY DO PALIVOVÝCH ČLÁNKŮ, obsahující zkapalněný hořlavý plyn nebo
	3478	ZÁSOBNÍKY DO PALIVOVÝCH ČLÁNKŮ OBSAŽENÉ V ZAŘÍZENÍCH, obsahující zkapalněný hořlavý plyn nebo
	3478	ZÁSOBNÍKY DO PALIVOVÝCH ČLÁNKŮ BALENÉ SE ZAŘÍZENÍMI, obsahující zkapalněný hořlavý plyn
	3479	ZÁSOBNÍKY DO PALIVOVÝCH ČLÁNKŮ, obsahující vodík v kovovém hydridu nebo
	3479	ZÁSOBNÍKY DO PALIVOVÝCH ČLÁNKŮ OBSAŽENÉ V ZAŘÍZENÍCH, obsahující vodík v kovovém hydridu nebo
	3479	ZÁSOBNÍKY DO PALIVOVÝCH ČLÁNKŮ BALENÉ SE ZAŘÍZENÍMI, obsahující vodík v kovovém hydridu
	3479	ZÁSOBNÍKY DO PALIVOVÝCH ČLÁNKŮ BALENÉ SE ZAŘÍZENÍMI, obsahující vodík v kovovém hydridu

Vzorky plynů		
Klasifikační kód	UN číslo	Pojmenování látek nebo předmětů
7 F	3167	VZOREK PLYNU, NESTLAČENÝ, HOŘLAVÝ, J.N., který není hluboce zchlazený
7 T	3169	VZOREK PLYNU, NESTLAČENÝ, TOXICKÝ, J.N., který není hluboce zchlazený
7 TF	3168	VZOREK PLYNU, NESTLAČENÝ, TOXICKÝ, HOŘLAVÝ, J.N., který není hluboce zchlazený

Chemické látky pod tlakem		
Klasifikační kód	UN číslo	Pojmenování látky nebo předmětu
8 A	3500	CHEMICKÁ LÁTKA POD TLAKEM, J.N.
8 F	3501	CHEMICKÁ LÁTKA POD TLAKEM, HOŘLAVÁ, J.N.
8 T	3502	CHEMICKÁ LÁTKA POD TLAKEM, TOXICKÁ, J.N.
8 C	3503	CHEMICKÁ LÁTKA POD TLAKEM, ŽÍRAVÁ, J.N.
8 TF	3504	CHEMICKÁ LÁTKA POD TLAKEM, HOŘLAVÁ, TOXICKÁ, J.N.
8 FC	3505	CHEMICKÁ LÁTKA POD TLAKEM, HOŘLAVÁ, ŽÍRAVÁ, J.N.

Adsorbované plyny		
Klasifikační kód	UN číslo	Pojmenování látky nebo předmětu
9A	3511	PLYN ADSORBOVANÝ, J.N.
9O	3513	PLYN ADSORBOVANÝ, PODPORUJÍCÍ HOŘENÍ, J.N.
9F	3510	PLYN ADSORBOVANÝ, HOŘLAVÝ, J.N.
9T	3512	PLYN ADSORBOVANÝ, TOXICKÝ, J.N.
9TF	3514	PLYN ADSORBOVANÝ, TOXICKÝ, HOŘLAVÝ, J.N.
9TC	3516	PLYN ADSORBOVANÝ, TOXICKÝ, ŽÍRAVÝ, J.N.
9TO	3515	PLYN ADSORBOVANÝ, TOXICKÝ, PODPORUJÍCÍ HOŘENÍ, J.N.
9TFC	3517	PLYN ADSORBOVANÝ, TOXICKÝ, HOŘLAVÝ, ŽÍRAVÝ, J.N.
9TOC	3518	PLYN ADSORBOVANÝ, TOXICKÝ, PODPORUJÍCÍ HOŘENÍ, ŽÍRAVÝ, J.N.

2.2.3 Třída 3 Hořlavé kapaliny

2.2.3.1 Kritéria

2.2.3.1.1 Název třídy 3 zahrnuje látky, jakož i předměty, které obsahují látky této třídy, které:

- jsou kapalné podle odstavce (a) definice pojmu "kapalina" v oddíle 1.2.1;
- mají při 50 °C tenzi par nejvýše 300 kPa (3 bary) a při 20 °C a standardním tlaku 101,3 kPa nejsou zcela plynné; a
- mají bod vzplanutí nejvýše 60 °C (viz pododdíl 2.3.3.1 k odpovídající zkoušce).

Název třídy 3 zahrnuje také kapaliny a tuhé látky v roztaveném stavu s bodem vzplanutí nad 60 °C, které jsou podány k přepravě nebo přepravovány zahřáté na teplotu rovnající se jejich bodu vzplanutí nebo vyšší. Tyto látky jsou přiřazeny k UN číslu 3256.

Název třídy 3 zahrnuje také znečtivěné kapalné výbušné látky. Znečtivěné kapalné výbušné látky jsou látky, které jsou ve vodě nebo v jiných kapalinách rozpuštěny nebo rozptýleny tak, aby vytvořily homogenní kapalnou směs, která už nemá výbušné vlastnosti. V tabulce A kapitoly 3.2 jsou tyto položky pod UN číslu 1204, 2059, 3064, 3343, 3357 a 3379.

POZNÁMKA 1: Látky s bodem vzplanutí vyšším než 35 °C, které za podmínek zkoušky hořením stanovených v Příručce zkoušek a kritérií, části III, pododdílu 32.2.5, samostatně nehoří, nejsou látkami třídy 3; jsou-li však tyto látky podány k přepravě nebo přepravovány zahřáté na teplotu rovnající se jejich bodu vzplanutí nebo vyšší, jsou látkami třídy 3.

POZNÁMKA 2: Odchylkou od 2.2.3.1.1 se považují paliva pro vznětové motory, plynový olej nebo topný olej (lehký) včetně synteticky vyrobených produktů s bodem vzplanutí nad 60 °C až do nejvýše 100 °C za látky třídy 3, UN čísla 1202.

POZNÁMKA 3: Hořlavé kapaliny, které jsou velmi toxické při vdechnutí, jak je definováno v 2.2.61.1.4 až 2.2.61.1.9, a toxické látky s bodem vzplanutí 23 °C nebo vyšším jsou látkami třídy 6.1 (viz 2.2.61.1). Kapaliny, které jsou velmi toxické při vdechnutí, jsou identifikovány jako „toxické při vdechnutí“ ve svém oficiálním pojmenování pro přepravu ve sloupci (2) nebo zvláštním ustanovením 354 ve sloupci (6) tabulky A kapitoly 3.2.

POZNÁMKA 4: Hořlavé kapalné látky a přípravky, používané jako pesticidy, které jsou velmi toxické, toxické nebo slabě toxické a mají bod vzplanutí 23 °C nebo vyšší, jsou látkami třídy 6.1 (viz 2.2.61.1).

2.2.3.1.2 Látky a předměty třídy 3 jsou rozděleny následovně:

- | | |
|-----|--|
| F | Hořlavé kapaliny bez vedlejšího nebezpečí a předměty obsahující takové látky; |
| F1 | Hořlavé kapaliny s bodem vzplanutí nejvýše 60 °C; |
| F2 | Hořlavé kapaliny s bodem vzplanutí nad 60 °C, přepravované nebo podávané k přepravě při teplotě rovnající se jejich bodu vzplanutí nebo vyšší (zahřáté látky); |
| F3 | Předměty obsahující hořlavé kapaliny |
| FT | Hořlavé kapaliny, toxické; |
| FT1 | Hořlavé kapaliny, toxické; |
| FT2 | Pesticidy; |
| FC | Hořlavé kapaliny, žíravé; |
| FTC | Hořlavé kapaliny, toxické, žíravé. |
| D | Znečtivěné kapalné výbušné látky. |

2.2.3.1.3 Látky a předměty zařazené do třídy 3 jsou uvedeny v tabulce A kapitoly 3.2. Látky, které nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2 musí být přiřazeny k příslušné položce v pododdíle

2.2.3.3 a k odpovídající obalové skupině podle ustanovení tohoto oddílu. Hořlavé kapaliny musí být přiřazeny k jedné z následujících obalových skupin podle stupně nebezpečí, který představují pro přepravu:

Obalová skupina	Bod vzplanutí (uzavřený kelímek)	Teplota začátku varu
I	--	$\leq 35\text{ °C}$
II ^a	$< 23\text{ °C}$	$> 35\text{ °C}$
III ^a	$\geq 23\text{ °C}$ a $\leq 60\text{ °C}$	$> 35\text{ °C}$

^a Viz též 2.2.3.1.4.

Pro kapalinu s vedlejším nebezpečím (vedlejšími nebezpečími) se musí zohlednit obalová skupina určená podle výše uvedené tabulky a obalová skupina vyplývající ze závažnosti vedlejšího (vedlejších) nebezpečí; klasifikace a obalová skupina se potom určí podle tabulky převažujících nebezpečí v pododdílu 2.1.3.10.

2.2.3.1.4

Viskózní hořlavé kapaliny, jako jsou barvy, emaily, laky, fermeže, lepidla a leštidla, s bodem vzplanutí pod 23 °C smějí být přiřazeny k obalové skupině III podle postupů popsanych v Příručce zkoušek a kritérii, části III, pododdílu 32.3, za podmínky, že

(a) viskozita² a bod vzplanutí odpovídají následující tabulce:

Kinematická viskozita (extrapolovaná) v (při stříhové rychlosti blízké 0) mm^2/s při 23 °C	Doba výtoku t v sekundách	Průměr výtokové trysky (mm)	Bod vzplanutí, uzavřený kelímek (°C)
$20 < v \leq 80$	$20 < t \leq 60$	4	nad 17
$80 < v \leq 135$	$60 < t \leq 100$	4	nad 10
$135 < v \leq 220$	$20 < t \leq 32$	6	nad 5
$220 < v \leq 300$	$32 < t \leq 44$	6	nad -1
$300 < v \leq 700$	$44 < t \leq 100$	6	nad -5
$700 < v$	$100 < t$	6	bez omezení

(b) méně než 3 % vrstvy čirého rozpouštědla se oddělí při dělicí zkoušce rozpouštědla;

(c) směs ani oddělené rozpouštědlo nesmějí splňovat kritéria pro třídu 6.1 nebo třídu 8;

(d) látky jsou baleny do nádob o vnitřním objemu nejvýše 450 litrů.

POZNÁMKA: Tato ustanovení se vztahují také na směsi obsahující nejvýše 20 % nitrocelulózy s obsahem dusíku nejvýše 12,6 % v suché hmotě. Směsi obsahující více než 20 %, avšak nejvýše 55 % nitrocelulózy s obsahem dusíku nejvýše 12,6 % v suché hmotě, jsou látkami přiřazenými k UN číslu 2059.

Směsi s bodem vzplanutí pod 23 °C a obsahující:

- více než 55 %, nitrocelulózy, s jakýmkoli obsahem dusíku; nebo
- nejvýše 55 %, nitrocelulózy s obsahem dusíku nad 12,6 % v suché hmotě

jsou látkami třídy 1 (UN 0340 nebo 0342) nebo třídy 4.1 (UN 2555, 2556 nebo 2557).

2.2.3.1.5

Viskózní kapalné látky, které:

- mají bod vzplanutí nejméně 23 °C a nejvýše 60 °C ;
- nejsou toxické, žíravé nebo ohrožující životní prostředí;
- obsahují nejvýše 20 % nitrocelulózy, za podmínky, že nitrocelulóza obsahuje nejvýše 12,6 % dusíku v suché hmotě; a
- jsou zabaleny do nádob o vnitřním objemu nejvýše 450 litrů;

² Stanovení viskozity: Jestliže předemtná látka nemá gravitační vlastnosti kapaliny nebo není-li metoda s použitím výtokového kelímku vhodná ke stanovení viskozity, musí být použit viskozimetr s proměnnou stříhovou rychlostí, aby mohly být stanoveny koeficienty dynamické viskozity látky při 23 °C u řady hodnot stříhových rychlostí. Zjištěné hodnoty v závislosti na stříhových rychlostech musí být extrapolovány na hodnotu stříhové rychlosti 0. Tímto způsobem stanovená dynamická viskozita dělena hustotou dává zdánlivou kinematickou viskozitu při stříhové rychlosti blízké 0.

nepodléhají ADR, jestliže

- (a) při dělicí zkoušce rozpouštědla (viz Příručku zkoušek a kritérií, část III, pododdíl 32.5.1) výška oddělené vrstvy rozpouštědla činí méně než 3 % celkové výšky; a
- (b) doba výtoku při zkoušce viskozity (viz Příručku zkoušek a kritérií, část III, pododdíl 32.4.3) s tryskou o průměru 6 mm je nejméně:
 - (i) 60 sekund; nebo
 - (ii) 40 sekund, jestliže viskózní kapalina obsahuje nejvýše 60 % látek třídy 3.

2.2.3.1.6 Spadají-li látky třídy 3 vlivem příměsí do jiných kategorií nebezpečnosti než těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, přiřadí se tyto směsi nebo roztoky k položkám, ke kterým na základě svého skutečného nebezpečí patří.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz také oddíl 2.1.3.

2.2.3.1.7 Na základě zkušebních postupů podle pododdílu 2.3.3.1 a oddílu 2.3.4 a kritérií uvedených v 2.2.3.1.1 se může také zjistit, zda je jmenovitě uvedený roztok nebo jmenovitě uvedená směs, popřípadě roztok nebo směs, který(á) obsahuje jmenovitě uvedenou látku, takové povahy, že tento roztok nebo tato směs nepodléhá ustanovením pro tuto třídu (viz také oddíl 2.1.3).

2.2.3.2 *Látky nepřipustěné k přepravě*

2.2.3.2.1 Látky třídy 3, které snadno peroxidují (jako ethery nebo určité heterocyklické kyslíkaté látky), smějí být přepravovány jen tehdy, jestliže jejich obsah peroxidu nepřekročí 0,3 % přepočítáno na peroxid vodíku (H_2O_2). Obsah peroxidu se stanoví podle pododdílu 2.3.3.3.

2.2.3.2.2 Chemicky nestálé látky třídy 3 je dovoleno přepravovat jen tehdy, byla-li učiněna potřebná opatření k zabránění nebezpečnému rozkladu nebo polymeraci během přepravy. Za tímto účelem je zejména nutno zajistit, aby nádoby a cisterny neobsahovaly látky, které by takové reakce mohly podporovat.

2.2.3.2.3 Znečitlivěné kapalné výbušné látky, které nejsou uvedeny v tabulce A kapitoly 3.2, nejsou připuštěny k přepravě jako látky třídy 3.

2.2.3.3 Seznam hromadných položek

2.2.41 Třída 4.1 Hořlavé tuhé látky, samovolně se rozkládající látky a znečitlivěné tuhé výbušné látky**2.2.41.1 Kritéria**

2.2.41.1.1 Název třídy 4.1 zahrnuje hořlavé látky a předměty a znečitlivěné výbušné látky, které jsou tuhými látkami podle písmene a) definice "tuhý" uvedené v oddíle 1.2.1, jakož i samovolně se rozkládající tuhé nebo kapalné látky.

Třídě 4.1 jsou přiřazeny :

- lehce hořlavé tuhé látky a předměty (viz 2.2.41.1.3 až 2.2.41.1.8);
- samovolně se rozkládající tuhé nebo kapalné látky (viz 2.2.41.1.9 až 2.2.41.1.17);
- znečitlivěné tuhé výbušné látky (viz 2.2.41.1.18);
- látky příbuzné samovolně se rozkládajícím látkám (viz 2.2.41.1.19).

2.2.41.1.2 Látky a předměty třídy 4.1 se dále dělí následovně :

F Hořlavé tuhé látky bez vedlejšího nebezpečí:

- F1 organické
- F2 organické, roztavené
- F3 anorganické

FO Hořlavé tuhé látky, podporující hoření

FT Hořlavé tuhé látky, toxické:

- FT1 organické, toxické
- FT2 anorganické, toxické

FC Hořlavé tuhé látky, žíravé:

- FC1 organické, žíravé
- FC2 anorganické, žíravé

D Znečitlivěné tuhé výbušné látky bez vedlejšího nebezpečí

DT Znečitlivěné tuhé výbušné látky, toxické

SR Samovolně se rozkládající látky:

- SR1 nevyžadující řízení teploty
- SR2 vyžadující řízení teploty.

Hořlavé tuhé látky*Definice a vlastnosti*

2.2.41.1.3 *Hořlavé tuhé látky* jsou lehce hořlavé tuhé látky a tuhé látky, které se mohou zapálit třením.

Lehce hořlavé tuhé látky jsou práškovité, zrnité nebo pastovité látky, které jsou nebezpečné, jestliže se po krátkém styku se zápalným zdrojem, jako např. s hořící zápalkou, mohou snadno zapálit a plamen se po zapálení rychle rozšiřuje. Nebezpečí přitom nemusí vycházet jen z ohně, nýbrž také z toxických zplodin hoření. Kovové prášky jsou kvůli obtížím při hašení ohně zvláště nebezpečné, protože normální hasicí prostředky, jako oxid uhličitý nebo voda, mohou zvětšit nebezpečí.

Klasifikace

2.2.41.1.4 Látky a předměty zařazené jako hořlavé tuhé látky třídy 4.1 jsou uvedeny v tabulce A kapitoly 3.2. Přiřazení organických látek a předmětů, které nejsou v tabulce A kapitoly 3.2 jmenovitě uvedeny, pod příslušnou položku pododdílu 2.2.41.3, podle ustanovení kapitoly 2.1, se může provést na základě zkušenosti nebo na základě výsledků zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.2.1. Přiřazení jmenovitě neuvedených anorganických látek musí být provedeno na základě výsledků zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.2.1, přičemž musí být zohledněny rovněž zkušenosti, vedou-li k přísnějšímu zařazení.

2.2.41.1.5 Jestliže se jmenovitě neuvedené látky na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.2.1 přiřazují k jedné z položek uvedených v pododdíle 2.2.41.3, platí následující kritéria:

- (a) Práškovité, zrnité nebo pastovité látky, s výjimkou kovových prášků nebo prášků kovových slitin, se klasifikují jako lehce hořlavé látky třídy 4.1, jestliže se mohou snadno zapálit po krátkém styku se zápalným zdrojem (např. hořící zápalkou), nebo jestliže se plamen po zapálení rychle rozšiřuje, doba vyhoření je menší než 45 sekund na měrnou vzdálenost 100 mm, nebo rychlost vyhoření je větší než 2,2 mm/s.
- (b) Kovové prášky nebo prášky kovových slitin se přiřadí ke třídě 4.1, jestliže mohou být zapáleny při styku s plamenem a reakce se rozšíří na celou délku vzorku za 10 minut nebo méně.

Tuhé látky, které se mohou zapálit třením, se musí zařadit do třídy 4.1 analogicky k existujícím položkám (např. zápalkám) nebo v souladu s příslušným zvláštním ustanovením.

2.2.41.1.6 Na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, oddílu 33.2.1 a kritérií uvedených v 2.2.41.1.4 a 2.2.41.1.5 se může také zjistit, zda je jmenovitě uvedená látka takové povahy, že nepodléhá předpisům pro tuto třídu.

2.2.41.1.7 Spadají-li látky třídy 4.1 vlivem příměsí do jiných kategorií nebezpečnosti, než těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, přiřadí se tyto směsi k položkám, ke kterým na základě svého skutečného nebezpečí patří.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz také oddíl 2.1.3.

Přiřazení k obalovým skupinám

2.2.41.1.8 Hořlavé tuhé látky zařazené pod různé položky tabulky A kapitoly 3.2 musí být přiřazeny k obalovým skupinám II nebo III na základě zkušebních postupů Příručky zkoušek a kritérií, části III, pododdílu 33.2.1 podle těchto kritérií:

- (a) Lehce hořlavé tuhé látky, které mají při zkoušce dobu vyhoření menší než 45 sekund na měrnou vzdálenost 100 mm, jsou přiřazeny k
 - obalové skupině II: proběhl-li plamen navlhčenou zónou;
 - obalové skupině III: jestliže navlhčená zóna zastaví šíření plamene po dobu nejméně 4 minut;
- (b) Kovové prášky nebo prášky kovových slitin jsou přiřazeny k:
 - obalové skupině II: jestliže se reakce při zkoušce rozšíří po celé délce vzorku za 5 minut nebo méně;
 - obalové skupině III: jestliže se reakce při zkoušce rozšíří po celé délce vzorku za více než 5 minut.

U tuhých látek, které mohou vzplanout třením, musí být jejich přiřazení k obalové skupině provedeno v analogii k existujícím položkám nebo podle odpovídajícího zvláštního ustanovení.

Samovolně se rozkládající látky

Definice

2.2.41.1.9

Pro účely ADR jsou *samovolně se rozkládající látky* tepelně nestálé látky, které se mohou i bez přítomnosti kyslíku (vzduchu) silně exotermicky rozkládat. Látky se nepovažují za samovolně se rozkládající látky třídy 4.1, jestliže:

- (a) jsou výbušnými látkami dle kritérií pro třídu 1;
- (b) jsou látkami podporujícími hoření podle přiřazovacího postupu pro třídu 5.1 (viz pododdíl 2.2.51.1), s výjimkou toho, že směsi látek podporujících hoření, které obsahují nejméně 5 % hořlavých organických látek, musí být podrobeny klasifikačnímu postupu definovanému v POZNÁMCE 2;
- (c) jsou organickými peroxidy podle kritérií pro třídu 5.2 (viz pododdíl 2.2.52.1);
- (d) jejich rozkladné teplo je menší než 300 J/g; nebo
- (e) jejich teplota samourychlujícího se rozkladu (SADT) (viz POZNÁMKA 3 níže) je vyšší než 75 °C pro kus o hmotnosti 50 kg.

POZNÁMKA 1: Rozkladné teplo může být určeno libovolnou mezinárodně uznávanou metodou, např. dynamickou diferenční kalorimetrií a adiabatickou kalorimetrií.

POZNÁMKA 2: Směsi látek podporujících hoření splňující kritéria třídy 5.1, které obsahují nejméně 5 % hořlavých organických látek, ale které nesplňují kritéria uvedená výše pod písmeny (a), (c), (d) nebo (e), musí být podrobeny klasifikačnímu postupu pro samovolně se rozkládající látky.

Směs vykazující vlastnosti samovolně se rozkládající látky typu B až F musí být zařazena jako samovolně se rozkládající látka třídy 4.1.

Směs vykazující vlastnosti samovolně se rozkládající látky typu G podle zásady uvedené v pododdílu 20.4.3 (g) části II Příručky zkoušek a kritérií musí být posouzena pro zařazení jako látka třídy 5.1 (viz 2.2.51.1).

POZNÁMKA 3: Teplota samourychlujícího se rozkladu (SADT) je nejnižší teplota, při které může dojít k samovolnému rozkladu látky v obalu používaném během přepravy. Potřebné předpisy k určení této teploty jsou obsaženy v Příručce zkoušek a kritérií, části II, kapitole 20 a oddílu 28.4.

POZNÁMKA 4: Všechny látky, které vykazují vlastnosti samovolně se rozkládajících látek, musí být zařazeny jako takové, i když vykazují podle 2.2.42.1.5 pozitivní výsledek zkoušky pro zařazení do třídy 4.2.

Vlastnosti

2.2.41.1.10

Rozklad samovolně se rozkládajících látek může být vyvolán teplem, stykem s katalytickými nečistotami (např. kyselinami, sloučeninami těžkých kovů, zásadami), třením nebo nárazem. Rychlost rozkladu se zvyšuje se stoupající teplotou a je rozdílná podle druhu látky. Rozklad může mít, zvláště jestliže nedojde k zapálení, za následek vývin toxických plynů nebo par. U určitých samovolně se rozkládajících látek musí být teplota řízena. Některé samovolně se rozkládající látky se mohou především pod uzavřením výbušně rozkládat. Tato vlastnost může být zmenšena přidáním ředidel nebo použitím vhodných obalů. Určité samovolně se rozkládající látky prudce hoří. Samovolně se rozkládající látky jsou například určité sloučeniny níže uvedených typů:

alifatické azosloučeniny (-C-N=N-C-)
organické azidy (-C-N₃);
diazoniové soli (-CN₂⁺ Z⁻);
N - nitroso sloučeniny (-N=N-O); a
aromatické sulfohydrazidy (-SO₂-NH-NH₂).

Tento výčet není úplný; látky s jinými reaktivními skupinami a některé směsi látek mohou mít podobné vlastnosti.

Klasifikace

2.2.41.1.11 Samovolně se rozkládající látky jsou na základě svého stupně nebezpečnosti rozděleny do sedmi typů. Typy samovolně se rozkládajících látek začínají od typu A, který není připuštěn k přepravě v obalu, ve kterém byl zkoušen, až po typ G, který nepodléhá ustanovením pro samovolně se rozkládající látky třídy 4.1. Zařazení samovolně se rozkládajících látek typů B až F přímo závisí na největším přípustném množství v jednom obalu. Zásady pro zařazování, jeho postupy, zkušební metody a kritéria a vzor vhodného zkušebního protokolu jsou uvedeny v Příručce zkoušek a kritérií, části II.

2.2.41.1.12 Již zařazené samovolně se rozkládající látky, které jsou připuštěny k přepravě v obalech, jsou uvedeny v pododdílu 2.2.41.4, ty, které jsou již připuštěny k přepravě ve velkých nádobách pro volně ložené látky (IBC), jsou uvedeny v pododdílu 4.1.4.2, pokynu pro balení IBC520 a ty, které jsou již připuštěny k přepravě v cisternách podle kapitoly 4.2, jsou uvedeny v pododdílu 4.2.5.2, pokynu pro přemístitelné cisterny T23. Každá uvedená připuštěná látka je přiřazena k druhové položce tabulky A kapitoly 3.2 (UN čísla 3221 až 3240) a udávají se příslušná vedlejší nebezpečí a poznámky obsahující informace pro přepravu.

Tyto hromadné položky udávají :

- typy samovolně se rozkládajících látek B až F, viz 2.2.41.1.11;
- skupenství (kapalné/ tuhé) ; a
- řízení teploty (je-li vyžadováno), viz 2.2.41.1.17.

Klasifikace samovolně se rozkládajících látek uvedených v pododdíle 2.2.41.4 se provádí na základě technicky čisté látky (pokud není uvedena koncentrace menší než 100 %).

2.2.41.1.13 Klasifikaci samovolně se rozkládajících látek, které nejsou uvedeny v pododdílu 2.2.41.4, pododdílu 4.1.4.2, pokynu pro balení IBC520 nebo v pododdílu 4.2.5.2, pokynu pro přemístitelné cisterny T23, jakož i jejich přiřazení k hromadné položce musí provést příslušný orgán země původu na základě zkušebního protokolu. Osvědčení o schválení musí obsahovat klasifikaci a odpovídající přepravní podmínky. Jestliže země původu není smluvní stranou ADR, musí zařazení a přepravní podmínky uznat příslušný orgán prvního státu smluvní strany ADR, který přijde do styku se zásilkou.

2.2.41.1.14 Aktivační přísady, jako zinkové sloučeniny, se mohou přidat k některým samovolně se rozkládajícím látkám ke změně jejich reakční schopnosti. Podle druhu a koncentrace aktivační přísady může poklesnout tepelná stálost, což může mít za následek změnu výbušných vlastností. Pokud dojde ke změně jedné z těchto vlastností, je třeba nový přípravek posoudit podle klasifikačního postupu.

2.2.41.1.15 Vzorky samovolně se rozkládajících látek nebo přípravků samovolně se rozkládajících látek, které nejsou uvedeny v pododdíle 2.2.41.4, pro které není k dispozici úplná sada výsledků zkoušek a které je nutno přepravit k provedení dalších zkoušek a hodnocení, je třeba zařadit pod odpovídající položku samovolně se rozkládajících látek typu C, jestliže

- podle dostupných údajů není vzorek nebezpečnější než samovolně se rozkládající látka typu B;
- vzorek je zabalen podle způsobu balení OP2 a množství na dopravní jednotku nepřesahuje 10 kg;
- dostupné údaje ukazují, že řízená teplota, pokud je, je dostatečně nízká, aby se zabránilo nebezpečnému rozkladu a zároveň dostatečně vysoká, aby se předešlo nebezpečnému oddělování (separaci) fází.

Znecitlivění

2.2.41.1.16 Pro zajištění bezpečné přepravy samovolně se rozkládajících látek, jsou tyto v mnoha případech znecitlivěny ředidlem. Jestliže je pevně stanoven procentní podíl látky, vztahuje se k podílu hmotnosti, zaokrouhlenému na nejbližší celé číslo. Jestliže je použito ředidlo, musí být samovolně se rozkládající látka spolu s ředidlem vyzkoušena, a to v koncentraci a formě užívaných k přepravě. Ředidla, která mohou dovolit samovolně se rozkládající látce koncentrovat se na nebezpečný stupeň při úniku z obalu, se nesmějí používat. Každé použité ředidlo se musí snášet se samovolně se rozkládající látkou. Z toho hlediska jsou tuhá nebo kapalná ředidla snášitelná, jestliže nemají

žádné nepříznivé účinky na tepelnou stálost a druh nebezpečnosti samovolně se rozkládající látky. Kapalná ředidla v přípravcích vyžadujících řízení teploty (viz 2.2.41.1.14) musí mít bod varu nejméně 60 °C a bod vzplanutí nejméně 5 °C. Bod varu kapaliny musí být o nejméně 50 °C vyšší než řízená teplota samovolně se rozkládající látky.

Ustanovení o řízení teploty

2.2.41.1.17

Určité samovolně se rozkládající látky smějí být přepravovány pouze za podmínek řízené teploty. Řízenou teplotou se rozumí nejvyšší teplota, při které mohou být samovolně se rozkládající látky bezpečně přepravovány. Předpokládá se, že teplota bezprostředního okolí kusu přesáhne během přepravy hodnotu 55 °C pouze na relativně krátkou dobu za 24-hodinový časový interval. V případě výpadku systému řízení teploty, může být nutné provést nouzová opatření. Kritická teplota je teplota, při níž musí být provedena nouzová opatření. Řízená a kritická teplota jsou odvozeny od teploty samourchluujícího se rozkladu SADT (viz tabulku 1). SADT musí být stanovena za účelem rozhodnutí, zda látka musí být přepravována při řízené teplotě. Předpisy pro stanovení SADT jsou obsaženy v Příručce zkoušek a kritérií, části II, kapitole 20 a oddílu 28.4.

Tabulka 1: Odvození řízených a kritických teplot

Druh nádoby	SADT ^a	Řízená teplota	Kritická teplota
Samostatné obaly a IBC	20 °C a méně	o 20 °C nižší než SADT	o 10 °C nižší než SADT
	20 °C až 35 °C	o 15 °C nižší než SADT	o 10 °C nižší než SADT
	více než 35 °C	o 10 °C nižší než SADT	o 5 °C nižší než SADT
Cisterny	nejvýše 50 °C	o 10 °C nižší než SADT	o 5 °C nižší než SADT

^a SADT látky zabalené pro přepravu

Při řízené teplotě se musí přepravovat samovolně se rozkládající látky, u kterých SADT nepřekračuje 55 °C. Řízené a kritické teploty jsou uvedeny v pododdílu 2.2.41.4. Skutečná teplota při přepravě smí být nižší než řízená teplota, avšak musí být zvolena tak, aby nedošlo k nebezpečnému oddělování (separaci) fází.

Znečitlivěné tuhé výbušné látky

2.2.41.1.18

Znečitlivěné tuhé výbušné látky jsou látky, které jsou navlhčeny vodou nebo alkoholy, nebo jsou zředěny jinými látkami tak, aby se potlačily jejich výbušné vlastnosti. Takové položky jsou v tabulce A kapitoly 3.2 označeny následujícími UN čísly: 1310, 1320, 1321, 1322, 1336, 1337, 1344, 1347, 1348, 1349, 1354, 1355, 1356, 1357, 1517, 1571, 2555, 2556, 2557, 2852, 2907, 3317, 3319, 3344, 3364, 3365, 3366, 3367, 3368, 3369, 3370, 3376, 3380 a 3474.

Látky příbuzné samovolně se rozkládajícím látkám

2.2.41.1.19

Látky, které

- (a) jsou podle výsledků sérií zkoušek 1 a 2 předběžně přiřazeny ke třídě 1, avšak podle výsledků série zkoušek 6 jsou vyřaty z platnosti třídy 1,
- (b) nejsou samovolně se rozkládajícími látkami třídy 4.1, a
- (c) nejsou látkami třídy 5.1 nebo 5.2,

jsou rovněž přiřazeny ke třídě 4.1, a to k položkám UN čísel 2956, 3241, 3242 a 3251.

2.2.41.2

Látky nepřipustěné k přepravě

2.2.41.2.1

Chemicky nestálé látky třídy 4.1 jsou připuštěny k přepravě pouze tehdy, pokud byla provedena potřebná opatření zabraňující jejich nebezpečnému rozkladu nebo polymeraci během přepravy. Za tímto účelem se musí dbát zvláště na to, aby nádoby a cisterny neobsahovaly žádné látky, které by tyto reakce mohly podporovat.

2.2.41.2.2

Hořlavé tuhé látky, podporující hoření, které jsou přiřazeny k UN číslu 3097, nejsou k přepravě připuštěny, ledaže by odpovídaly předpisům pro třídu 1 (viz také pododdíl 2.1.3.7).

2.2.41.2.3 Následující látky nejsou k přepravě připuštěny :

- samovolně se rozkládající látky typu A [viz Příručku zkoušek a kritérií, část II, odstavec 20.4.2 (a)];
- sulfidy fosforu, které nejsou prosty žlutého nebo bílého fosforu;
- jiné, než v tabulce A kapitoly 3.2 uvedené znečtivěné tuhé výbušné látky;
- anorganické hořlavé látky v roztaveném stavu, s výjimkou UN 2448 SÍRA, ROZTAVENÁ;

2.2.41.3 Seznam hromadných položek

^a Kovy a slitiny kovů v práškové nebo jiné hořlavé formě, které jsou samozápalné, jsou látkami třídy 4.2

^b Kovy a slitiny kovů v práškové nebo jiné hořlavé formě, které ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3

^c Hydridy kovů, které ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3. Tetrahydroboritan hliníkový nebo tetrahydroboritan hliníkový v přístrojích je látkou třídy 4.2, UN čísla 2870.

2.2.41.4 Seznam již zařazených samovolně se rozkládajících látek v obalech

Kódy „OP1“ až „OP8“ uvedené ve sloupci „Způsob balení“ se vztahují ke způsobům balení v pododdílu 4.1.4.1, pokynu pro balení P520 (viz též pododdíl 4.1.7.1). Samovolně se rozkládající látky, které se mají přepravovat, musí odpovídat klasifikaci a řízeným a kritickým teplotám (odvozeným od SADT), jak jsou uvedeny. K látkám připuštěným v IBC viz pododdíl 4.1.4.2, pokyn pro balení IBC520 a k látkám připuštěným v cisternách podle kapitoly 4.2, viz pododdíl 4.2.5.2, pokyn pro přemístitelné cisterny T23.

POZNÁMKA: Zařídění uvedené v této tabulce se zakládá na technicky čisté látce (s výjimkou případů, kde je udána koncentrace nižší než 100 %). Pro jiné koncentrace může být látka zařazena rozdílně podle postupů uvedených v části II Příručky zkoušek a kritérií a v 2.2.41.1.17.

Poznámky :

- (1) Azoformamid-přípravky, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (b). Řízená a kritická teplota musí být stanoveny postupem uvedeným v 2.2.41.1.17.
- (2) Vyžaduje se bezpečnostní značka označující vedlejší nebezpečí "VÝBUŠNÝ" podle vzoru č.1 (viz 5.2.2.2.2).
- (3) Azoformamid-přípravky, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (c).
- (4) Azoformamid-přípravky, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (c). Řízená a kritická teplota musí být stanoveny postupem uvedeným v 2.2.41.1.17.
- (5) Azoformamid-přípravky, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (d).
- (6) Azoformamid-přípravky, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (d). Řízená a kritická teplota musí být stanoveny postupem uvedeným v 2.2.41.1.17.
- (7) Se snášenlivým ředidlem s bodem varu nejméně 150 °C.
- (8) Viz 2.2.41.1.15.
- (9) Tato položka platí pro směsi esterů kyseliny 2-diazo-1-naftol-4-sulfonové a kyseliny 2-diazo-1-naftol-5-sulfonové, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (d).

2.2.42 Třída 4.2 Samozápalné látky**2.2.42.1 Kritéria****2.2.42.1.1** Název třídy 4.2 zahrnuje:

- *pyroforní látky*, což jsou látky včetně směsí a roztoků (kapalné nebo tuhé), které při styku se vzduchem již v malých množstvích vzplanou do 5 minut. Toto jsou látky třídy 4.2, které jsou nejvíce náchylné k samovznícení; a
- *látky a předměty schopné samoohřevu*, což jsou látky a předměty včetně směsí a roztoků, které jsou ve styku se vzduchem bez přívodu energie schopné se zahřívat. Tyto látky mohou vzplanout jen ve velkých množstvích (kilogramech) a po dlouhé době (hodiny nebo dny).

2.2.42.1.2 Látky a předměty třídy 4.2 se dělí následovně:

S	Samozápalné látky bez vedlejšího nebezpečí:
S1	organické, kapalné
S2	organické, tuhé
S3	anorganické, kapalné
S4	anorganické, tuhé
S5	organokovové
SW	Samozápalné látky, které ve styku s vodou vyvíjejí hořlavé plyny
SO	Samozápalné látky, podporující hoření
ST	Samozápalné látky, toxické
ST1	organické, toxické, kapalné
ST2	organické, toxické, tuhé
ST3	anorganické, toxické, kapalné
ST4	anorganické, toxické, tuhé
SC	Samozápalné látky, žíravé
SC1	organické, žíravé, kapalné
SC2	organické, žíravé, tuhé
SC3	anorganické, žíravé, kapalné
SC4	anorganické, žíravé, tuhé

*Vlastnosti***2.2.42.1.3** Samozahřívání látky je proces, při němž postupná reakce této látky s kyslíkem (ve vzduchu) vytváří teplo. Jestliže je množství vytvořeného tepla větší než množství tepelných ztrát, bude teplota látky narůstat, což může vést po latentní periodě k samovznícení a hoření.*Klasifikace***2.2.42.1.4** Látky a předměty zařazené do třídy 4.2 jsou uvedeny v tabulce A kapitoly 3.2. Přřazení látek a předmětů, které nejsou v tabulce A kapitoly 3.2 jmenovitě uvedeny, pod příslušnou specifickou J.N. položku pododdílu 2.2.42.3, podle ustanovení kapitoly 2.1, může být provedeno na základě zkušeností nebo na základě výsledků zkušebních postupů podle Příručky zkoušek a kritérií, části III, oddílu 33.3. Přřazení k všeobecným J.N. položkám třídy 4.2 se musí provést na základě výsledků zkušebních postupů podle Příručky zkoušek a kritérií, části III, oddílu 33.3; přitom se musí přihlídnout také ke zkušenostem, jestliže vedou k přísnějšímu zařazení.**2.2.42.1.5** Jestliže se jmenovitě neuvedené látky nebo předměty na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, oddílu 33.3 přiřazují k jedné z položek uvedených v pododdíle 2.2.42.3, platí následující kritéria:

- (a) samozápalné (pyroforní) tuhé látky se přiřadí ke třídě 4.2, jestliže vzplanou při pádu s výšky 1 m nebo do 5 minut poté, nebo
- (b) samozápalné (pyroforní) kapalně látky se přiřadí ke třídě 4.2, jestliže
 - (i) nanesené na inertní nosný materiál vzplanou do 5 minut, nebo
 - (ii) v případě negativního výsledku zkoušky podle (i), po nanesení na vroubkovaný suchý filtrační papír (Whatman-filtr č. 3), tento do 5 minut zapálí nebo zuhelnatí;
- (c) látky, u nichž dojde u krychlového vzorku o straně 10 cm při zkušební teplotě 140 °C do 24 hodin k samovznícení nebo stoupnutí teploty nad 200 °C, se přiřadí ke třídě 4.2. Toto kritérium se zakládá na samozápalné teplotě dřevěného uhlí, která činí 50 °C pro krychlový vzorek 27 m³. Látky s vyšší samozápalnou teplotou než 50 °C pro objem 27 m³ se ke třídě 4.2 nepřijíždí.

POZNÁMKA 1: Látky, které budou přepravovány v kusech o objemu nepřesahujícím 3 m³, nespádají do třídy 4.2, pokud při zkoušce provedené na krychlovém vzorku o straně 10 cm při teplotě 120 °C nedojde do 24 hodin k samovznícení nebo ke stoupnutí teploty nad 180 °C.

POZNÁMKA 2: Látky, které budou přepravovány v kusech o objemu nepřesahujícím 450 l, nespádají do třídy 4.2, pokud při zkoušce provedené na krychlovém vzorku o straně 10 cm při teplotě 100 °C nedojde do 24 hodin k samovznícení nebo ke stoupnutí teploty nad 160 °C.

POZNÁMKA 3: Jelikož organokovové látky mohou být v závislosti na svých vlastnostech zařazeny do třídy 4.2 nebo 4.3 s dodatečnými vedlejšími nebezpečími, je pro tyto látky uveden v oddílu 2.3.5 zvláštní klasifikační postupový diagram.

- 2.2.42.1.6** Spadají-li látky třídy 4.2 vlivem příměsí do jiných kategorií nebezpečnosti než těch, do kterých patří látky jmenovitě uvedené látky v tabulce A kapitoly 3.2, přiřadí se tyto směsi k položkám, ke kterým na základě svého skutečného nebezpečí patří.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz oddíl 2.1.3.

- 2.2.42.1.7** Na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, oddílu 33.3 a kritérií uvedených v 2.2.42.1.5 se může také zjistit, zda je jmenovitě uvedená látka takové povahy, že nepodléhá předpisům pro tuto třídu.

Přiřazení k obalovým skupinám

- 2.2.42.1.8** Látky a předměty zařazené pod různé položky tabulky A kapitoly 3.2 musí být přiřazeny k obalovým skupinám I, II nebo III na základě zkušebních postupů Příručky zkoušek a kritérií, části III, oddílu 33.3 podle těchto kritérií:

- (a) samozápalné (pyroforní) látky se přiřadí k obalové skupině I;
- (b) látky a předměty schopné samoohřevu, u nichž dojde u krychlového vzorku o straně 2,5 cm při zkušební teplotě 140 °C do 24 hodin k samovznícení nebo ke stoupnutí teploty nad 200 °C, se přiřadí k obalové skupině II;

Látky s teplotou samovznícení vyšší než 50 °C pro objem 450 l se nemusí přiřadit k obalové skupině II;
- (c) látky méně schopné samoohřevu, u nichž u krychlového vzorku o straně 2,5 cm nedojde za podmínek uvedených pod bodem b) k jmenovaným jevům, ale u krychlového vzorku o straně 10 cm při zkušební teplotě 140 °C dojde do 24 hodin k samovznícení nebo ke stoupnutí teploty nad 200 °C, se přiřadí k obalové skupině III.

2.2.42.2 *Látky nepřipuštěné k přepravě*

Následující látky nejsou připuštěny k přepravě:

- UN 3255 terc- BUTYLHYPOCHLORID; a
- tuhé látky schopné samoohřevu, podporující hoření, přiřazené k UN číslu 3127, ledaže by odpovídaly ustanovením pro třídu 1 (viz pododdíl 2.1.3.7).

POZN:^a

Kovový prach a prášek, které nejsou toxické a nejsou v samozápalné formě, avšak ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3.

2.2.43 Třída 4.3 Látky, které ve styku s vodou vyvíjejí hořlavé plyny**2.2.43.1 Kritéria**

2.2.43.1.1 Název třídy 4.3 zahrnuje látky, které při reakci s vodou vyvíjejí hořlavé plyny, náchylné k vytváření výbušných směsí se vzduchem, jakož i předměty, které takové látky obsahují.

2.2.43.1.2 Látky a předměty třídy 4.3 se dělí následovně:

W Látky, které ve styku s vodou vyvíjejí hořlavé plyny, bez vedlejšího nebezpečí, jakož i předměty, které takové látky obsahují:

W1 kapalné
W2 tuhé
W3 předměty

WF1 Látky, které ve styku s vodou vyvíjejí hořlavé plyny, kapalné, hořlavé

WF2 Látky, které ve styku s vodou vyvíjejí hořlavé plyny, tuhé, hořlavé

WS Látky, které ve styku s vodou vyvíjejí hořlavé plyny, tuhé, schopné samoohřevu

WO Látky, které ve styku s vodou vyvíjejí hořlavé plyny, tuhé, podporující hoření

WT Látky, které ve styku s vodou vyvíjejí hořlavé plyny, toxické:

WT1 kapalné
WT2 tuhé

WC Látky, které ve styku s vodou vyvíjejí hořlavé plyny, žíravé:

WC1 kapalné
WC2 tuhé

WFC Látky, které ve styku s vodou vyvíjejí hořlavé plyny, hořlavé, žíravé.

Vlastnosti

2.2.43.1.3 Určité látky mohou ve styku s vodou vyvíjet hořlavé plyny, které mohou se vzduchem vytvářet výbušné směsi. Takové směsi se snadno zapálí všemi obvyklými zapalovacími zdroji, např. otevřeným ohněm, jiskrami pocházejícími z nářadí, nechráněnou žárovkou atd. Přitom vytvořené tlakové vlny a plameny mohou ohrozit lidi a životní prostředí. Ke zjištění, zda látka reaguje s vodou takovým způsobem, že se vytváří nebezpečné množství plynů, které mohou být hořlavé, se použije zkušební postup popsáný v 2.2.43.1.4. Tento zkušební postup nesmí být použit u pyroforních látek.

Klasifikace

2.2.43.1.4 Látky a předměty zařazené do třídy 4.3 jsou uvedeny v tabulce A kapitoly 3.2. Přřazení látek a předmětů, které nejsou tabulce A kapitoly 3.2 jmenovitě uvedeny, k příslušné položce pododdílu 2.2.43.3, podle ustanovení kapitoly 2.1, se provede na základě výsledků zkušebního postupu podle Příručky zkoušek a kritérií, části III, oddílu 33.4; přitom musí být zohledněny i zkušenosti, pokud vedou k přísnějšímu zařazení.

2.2.43.1.5 Jestliže se jmenovitě neuvedené látky přiřazují na základě zkušebního postupu podle Příručky zkoušek a kritérií, části III, oddílu 33.4 k jedné z položek uvedených v pododdíle 2.2.43.3, platí následující kritéria:

Látka se přiřadí ke třídě 4.3, pokud:

- (a) se během některé fáze zkoušky uvolněný plyn sám vznítí, nebo
- (b) je rychlost uvolňování hořlavého plynu větší než 1 litr na kilogram zkoušené látky za hodinu.

POZNÁMKA: Jelikož organokovové látky mohou být v závislosti na svých vlastnostech zařazeny do třídy 4.2 nebo 4.3 s dodatečnými vedlejšími nebezpečími, je pro tyto látky uveden v oddílu 2.3.5 zvláštní klasifikační postupový diagram.

- 2.2.43.1.6** Pokud látky třídy 4.3 spadají vlivem příměsí do jiných kategorií nebezpečnosti, než těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, je třeba tyto směsi přiřadit k položkám, ke kterým patří na základě svého skutečného nebezpečí.

POZNÁMKA: K zařazení roztoků a směsí (jako jsou přípravky a odpady) viz také oddíl 2.1.3.

- 2.2.43.1.7** Na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, oddílu 33.4 a kritérií uvedených v 2.2.43.1.5 se může také zjistit, zda je jmenovitě uvedená látka takové povahy, že nepodléhá předpisům pro tuto třídu.

Přiřazení k obalovým skupinám

- 2.2.43.1.8** Látky a předměty zařazené pod různé položky tabulky A kapitoly 3.2 musí být přiřazeny k obalovým skupinám I, II nebo III na základě zkušebních postupů Příručky zkoušek a kritérií, části III, oddílu 33.4 podle těchto kritérií:

- (a) K obalové skupině I se přiřadí každá látka, která při teplotě okolí prudce reaguje s vodou, přičemž vyvinutý plyn se může sám vznítit, nebo jestliže při teplotě okolí snadno reaguje s vodou, přičemž množství vyvinutého hořlavého plynu je větší nebo se rovná 10 litrům na kg látky za 1 minutu.
- (b) K obalové skupině II se přiřadí každá látka, která při teplotě okolí snadno reaguje s vodou, přičemž nejvyšší množství vyvinutého hořlavého plynu je větší nebo se rovná 20 litrům na kg látky za hodinu, a nesplňuje kritéria pro obalovou skupinu I.
- (c) K obalové skupině III se přiřadí každá látka, která při teplotě okolí pomalu reaguje s vodou, přičemž nejvyšší množství vyvinutého hořlavého plynu je větší nebo se rovná 1 litru na kg látky za hodinu, a nesplňuje kritéria pro obalovou skupinu I nebo II.

2.2.43.2 **Látky nepřípuštěné k přepravě**

Tuhé látky reagující s vodou, podporující hoření, přiřazené k UN číslu 3133 nejsou připuštěny k přepravě, ledaže by odpovídaly ustanovením pro třídu 1 (viz také pododdíl 2.1.3.7).

2.2.43.3 Seznam hromadných položek

^a Kovy a slitiny kovů, které ve styku s vodou nevyvíjejí hořlavé plyny a nejsou pyroforní nebo schopné samoohřevu, ale jsou lehce hořlavé, jsou látkami třídy 4.1. Kovy alkalických zemin a slitiny kovů alkalických zemin v pyroforní formě jsou látkami třídy 4.2. Kovový prach a prášek v pyroforní formě jsou látkami třídy 4.2. Kovy a slitiny kovů v pyroforní formě jsou látkami třídy 4.2. Sloučeniny fosforu s těžkými kovy, jako železem, mědí atd., nepodléhají ustanovením ADR.

^b Kovy a slitiny kovů v pyroforní formě jsou látkami třídy 4.2.

^c Chlorsilany s bodem vzplanutí pod 23 °C, které ve styku s vodou nevyvíjejí hořlavé plyny, jsou látkami třídy 3. Chlorsilany s bodem vzplanutí 23 °C nebo vyšším, které ve styku s vodou nevyvíjejí hořlavé plyny, jsou látkami třídy 8.

2.2.51 Třída 5.1 Látky podporující hoření**2.2.51.1 Kritéria**

2.2.51.1.1 Název třídy 5.1 zahrnuje látky, které ač samy nejsou nezbytně hořlavé, mohou všeobecně uvolňováním kyslíku vyvolat nebo podporovat hoření jiných látek, jakož i předměty, které takové látky obsahují.

2.2.51.1.2 Látky třídy 5.1, jakož i předměty, které takové látky obsahují, se dělí následovně:

O Látky podporující hoření bez vedlejšího nebezpečí nebo předměty, které takové látky obsahují:

- O1 kapalné
- O2 tuhé
- O3 předměty

OF Látky podporující hoření, tuhé, hořlavé

OS Látky podporující hoření, tuhé, schopné samoohřevu

OW Látky podporující hoření, tuhé, které ve styku s vodou vyvíjejí hořlavé plyny

OT Látky podporující hoření, toxické

- OT1 kapalné
- OT2 tuhé

OC Látky podporující hoření, žíravé

- OC1 kapalné
- OC2 tuhé

OTC Látky podporující hoření, toxické, žíravé.

2.2.51.1.3 Látky a předměty zařazené do třídy 5.1 jsou uvedeny v tabulce A kapitoly 3.2. Látky a předměty, které nejsou jmenovitě uvedeny v této tabulce, mohou být přiřazeny k příslušné položce pododdílu 2.2.51.3 podle ustanovení kapitoly 2.1 na základě zkoušek, postupů a kritérií uvedených v 2.2.51.1.6 až 2.2.51.1.9 a podle Příručky zkoušek a kritérií, části III, oddílu 34.4. Pokud se výsledky zkoušek liší od získaných zkušeností, musí se dát přednost získaným zkušenostem před výsledky zkoušek.

2.2.51.1.4 Spadají-li látky třídy 5.1 vlivem příměsí do jiných kategorií nebezpečnosti, než těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, přiřadí se tyto směsi k položkám, ke kterým patří na základě svého skutečného nebezpečí.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz také oddíl 2.1.3.

2.2.51.1.5 Na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, oddílu 34.4 a kritérií uvedených v 2.2.51.1.6 až 2.2.51.1.9 se může také zjistit, zda je jmenovitě uvedená látka takové povahy, že nepodléhá předpisům pro tuto třídu.

Tuhé látky podporující hoření*Klasifikace*

2.2.51.1.6 Jestliže se tuhé látky podporující hoření, které nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2, přiřazují k jedné z položek uvedených v 2.2.51.3 na základě zkušebního postupu podle Příručky zkoušek a kritérií, části III, pododdílu 34.4.1 (zkouška O.1), nebo alternativně pododdílu 34.4.3 (zkouška O.3), platí následující kritéria:

- (a) Při zkoušce O.1 je nutno tuhoun látku přiřadit ke třídě 5.1, jestliže zkoušený vzorek ve směsi s celulórou v hmotnostním poměru 4:1 nebo 1:1 vzplane nebo hoří, nebo

vykazuje stejnou nebo kratší průměrnou dobu hoření, než je průměrná doba hoření směsi bromičnanu draselného s celulórou v hmotnostním poměru 3:7; nebo

- (b) Při zkoušce O.3 je nutno tuhrou látku přiřadit ke třídě 5.1, jestliže zkoušený vzorek ve směsi s celulórou v hmotnostním poměru 4:1 nebo 1:1 vykazuje stejnou nebo větší průměrnou rychlost hoření, než je průměrná rychlost hoření směsi peroxidu vápníku s celulórou v hmotnostním poměru 1:2.

Přiřazení k obalovým skupinám

2.2.51.1.7 Tuhé látky podporující hoření zařazené pod různé položky v tabulce A kapitoly 3.2 musí být přiřazeny k obalovým skupinám I, II nebo III na základě zkušebních postupů Příručky zkoušek a kritérií, části III, pododdílu 34.4.1 (zkouška O.1) nebo pododdílu 34.4.3 (zkouška O.3) podle následujících kritérií:

- (a) Zkouška O.1:
- (i) Obalová skupina I: každá látka, která ve směsi s celulórou v hmotnostním poměru 4:1 nebo 1:1 vykazuje kratší průměrnou dobu hoření, než je průměrná doba hoření směsi bromičnanu draselného s celulórou v hmotnostním poměru 3:2;
 - (ii) Obalová skupina II: každá látka, která ve směsi s celulórou v hmotnostním poměru 4:1 nebo 1:1 vykazuje stejnou nebo kratší průměrnou dobu hoření, než je průměrná doba hoření směsi bromičnanu draselného s celulórou v hmotnostním poměru 2:3 a kritéria pro obalovou skupinu I nejsou splněna;
 - (iii) Obalová skupina III: každá látka, která ve směsi s celulórou v hmotnostním poměru 4:1 nebo 1:1 vykazuje stejnou nebo kratší průměrnou dobu hoření, než je průměrná doba hoření směsi bromičnanu draselného s celulórou v hmotnostním poměru 3:7 a kritéria pro obalové skupiny I a II nejsou splněna;
- (b) Zkouška O.3:
- (i) Obalová skupina I: každá látka, která ve směsi s celulórou v hmotnostním poměru 4:1 nebo 1:1 vykazuje větší průměrnou rychlost hoření, než je průměrná rychlost hoření směsi peroxidu vápníku s celulórou v hmotnostním poměru 3:1;
 - (ii) Obalová skupina II: každá látka, která ve směsi s celulórou v hmotnostním poměru 4:1 nebo 1:1 vykazuje stejnou nebo větší průměrnou rychlost hoření, než je průměrná rychlost hoření směsi peroxidu vápníku s celulórou v hmotnostním poměru 1:1 a kritéria pro obalovou skupinu I nejsou splněna;
 - (iii) Obalová skupina III: každá látka, která ve směsi s celulórou v hmotnostním poměru 4:1 nebo 1:1 vykazuje stejnou nebo větší průměrnou rychlost hoření, než je průměrná rychlost hoření směsi peroxidu vápníku s celulórou v hmotnostním poměru 1:2 a kritéria pro obalové skupiny I a II nejsou splněna.

Kapalné látky podporující hoření

Klasifikace

2.2.51.1.8 Jestliže se kapalné látky podporující hoření, které nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2, přiřazují k jedné z položek pododdílu 2.2.51.3 na základě zkušebního postupu podle Příručky zkoušek a kritérií, části III, pododdílu 34.4.2, platí následující kritéria:

Kapalnou látku je nutno přiřadit ke třídě 5.1, jestliže ve směsi s celulórou v hmotnostním poměru 1:1 vykazuje nárůst tlaku nejméně 2070 kPa (přetlak) a vykazuje stejnou nebo kratší průměrnou dobu

zvyšování tlaku než směs 65% vodného roztoku kyseliny dusičné s celulózą v hmotnostním poměru 1:1.

Přiřazení k obalovým skupinám

2.2.51.1.9 Kapalně látky podporující hoření zařazené pod různé položky tabulky A kapitoly 3.2 musí být přiřazeny k obalovým skupinám I, II nebo III na základě zkušebních postupů Příručky zkoušek a kritérií, části III, pododdílu 34.4.2 podle těchto kritérií:

- a) Obalová skupina I: každá látka, která ve směsi s celulózą v hmotnostním poměru 1:1 se sama vznítí, nebo vykazuje kratší průměrnou dobu zvýšení tlaku než směs 50% kyseliny chloristé s celulózą v hmotnostním poměru 1:1;
- b) Obalová skupina II: každá látka, která ve směsi s celulózą v hmotnostním poměru 1:1 vykazuje stejnou nebo kratší průměrnou dobu zvyšování tlaku než směs 40% vodného roztoku chlorečnanu sodného s celulózą v hmotnostním poměru 1:1, a kritéria pro obalovou skupinu I nejsou splněna;
- c) Obalová skupina III: každá látka, která ve směsi s celulózą v hmotnostním poměru 1:1 vykazuje stejnou nebo kratší průměrnou dobu zvyšování tlaku než směs 65% vodného roztoku kyseliny dusičné s celulózą v hmotnostním poměru 1:1, a kritéria pro obalové skupiny I a II nejsou splněna.

2.2.51.2 *Látky nepřipustěné k přepravě*

2.2.51.2.1 Chemicky nestálé látky třídy 5.1 jsou k přepravě připuštěny jen tehdy, jestliže byla provedena potřebná opatření k zabránění jejich nebezpečnému rozkladu nebo polymeraci během přepravy. Za tímto účelem musí být dbáno zvláště na to, aby nádoby a cisterny neobsahovaly žádné látky, které by mohly tyto reakce podporovat.

2.2.51.2.2 Následující látky a směsi nejsou připuštěny k přepravě :

- Tuhé látky podporující hoření, schopné samoohřevu, přiřazené k UN číslu 3100, tuhé látky podporující hoření, reagující s vodou, přiřazené k UN číslu 3121 a tuhé látky podporující hoření, hořlavé, přiřazené k UN číslu 3137, ledaže by odpovídaly předpisům pro třídu 1 (viz také pododdíl 2.1.3.7);
- Peroxid vodíku, nestabilizovaný nebo peroxid vodíku, vodné roztoky, nestabilizované, s více než 60 % peroxidu vodíku;
- Tetranitromethan, nezbavený hořlavých nečistot;
- Roztoky kyseliny chloristé s více než 72 % (hmotnosti) kyseliny nebo směsi kyseliny chloristé s jakoukoli kapalinou, kromě vody;
- Roztoky kyseliny chlorečné s více než 10 % kyseliny chlorečné nebo směsi kyseliny chlorečné s jakoukoli kapalinou, kromě vody;
- Halogenované sloučeniny fluoru, jiné než UN 1745 FLUORID BROMIČNÝ, UN 1746 FLUORID BROMITÝ a UN 2495 FLUORID JODIČNÝ třídy 5.1, jakož i UN 1749 FLUORID CHLORITÝ a UN 2548 FLUORID CHLOREČNÝ třídy 2;
- Chlorečnan amonný a jeho vodné roztoky a směsi chlorečnanu s amonnou solí;
- Chloritan amonný a jeho vodné roztoky a směsi chloritanu s amonnou solí;
- Směsi chlornanu s amonnou solí;
- Bromičnan amonný a jeho vodné roztoky a směsi bromičnanu s amonnou solí;
- Manganistan amonný a jeho vodné roztoky a směsi manganistanu s amonnou solí;
- Dusičnan amonný s více než 0,2 % hořlavých látek (včetně všech organických látek počítaných jako uhlík), ledaže je složkou látek nebo předmětů třídy 1;

- Hnojiva s obsahem dusičnanu amonného (pro stanovení obsahu dusičnanu amonného musí být všechny ionty dusičnanu, pro které je ve směsi molekulární ekvivalent amonných iontů, počítány jako dusičnan amonný) nebo s obsahem hořlavých látek vyšším, než jsou hodnoty uvedené ve zvláštním ustanovení 307, vyjma za podmínek platných pro třídu 1;
- Dusitan amonný a jeho vodné roztoky a směsi anorganického dusitanu s amonnou solí;
- Směsi dusičnanu draselného, dusitanu sodného a amonné soli.

2.2.51.3 Seznam hromadných položek

2.2.52 Třída 5.2: Organické peroxidy

2.2.52.1 Kritéria

2.2.52.1.1 Název třídy 5.2 zahrnuje organické peroxidy a přípravky organických peroxidů.

2.2.52.1.2 Látky třídy 5.2 se dělí následovně:

- P1 Organické peroxidy, nevyžadující řízení teploty
P2 Organické peroxidy, vyžadující řízení teploty

Definice

2.2.52.1.3 Organické peroxidy jsou organické látky, které obsahují dvojmocnou skupinu -O-O- a na které může být nahlíženo jako na deriváty peroxidu vodíku, ve kterých je nahrazen jeden nebo oba atomy vodíku organickými radikály.

Vlastnosti

2.2.52.1.4 Organické peroxidy se mohou exotermicky rozkládat při normální nebo zvýšené teplotě. Rozklad může být vyvolán působením tepla, třením, nárazem nebo stykem s nečistotami (např. kyselinami, sloučeninami těžkých kovů, aminy). Rychlost rozkladu stoupá s teplotou a závisí na složení organického peroxidu. Při rozkladu se mohou vyvíjet škodlivé nebo hořlavé páry nebo plyny. Pro některé organické peroxidy je povinné řízení teploty během přepravy. Některé organické peroxidy se mohou, zvláště pod uzavřením, rozkládat výbušným způsobem. Tato vlastnost se může změnit přidáním ředidel nebo použitím vhodných obalů. Mnoho organických peroxidů prudce hoří. Oči nesmí přijít do styku s organickými peroxidy. Některé organické peroxidy mohou již po velmi krátkém styku způsobit vážné poškození rohovky nebo mohou mít žíravé účinky na pokožku.

POZNÁMKA: Zkušební postupy k určení hořlavosti organických peroxidů jsou obsaženy v Příručce zkoušek a kritérií, části III, pododdílu 32.4. Jelikož organické peroxidy mohou při zahřátí prudce reagovat, doporučuje se určit jejich bod vzplanutí za použití zkušebních vzorků malých rozměrů, jak je popsáno v normě ISO 3679:1983.

Klasifikace

2.2.52.1.5 Každý organický peroxid se pokládá za zařazený do třídy 5.2, ledaže by přípravek organického peroxidu:

- (a) neobsahoval více než 1,0 % aktivního kyslíku pro nejvýše 1,0 % peroxidu vodíku;
(b) neobsahoval více než 0,5 % aktivního kyslíku pro více než 1,0 %, nejvýše však 7 % peroxidu vodíku.

POZNÁMKA: Obsah aktivního kyslíku (%) v přípravku organického peroxidu se vypočítá ze vzorce:

$$16 \times \sum (n_i \times c_i / m_i),$$

kde

- n_i = počet peroxy skupin na molekulu organického peroxidu i ;
 c_i = koncentrace (% hmotnosti) organického peroxidu i ;
 m_i = molekulová hmotnost organického peroxidu i .

2.2.52.1.6 Organické peroxidy se rozdělují na základě jejich stupně nebezpečnosti do sedmi typů. Typy jsou v rozsahu od typu A, který není připuštěn k přepravě v obalu, v němž byl podroben zkoušce, až k typu G, který nepodléhá ustanovením pro organické peroxidy třídy 5.2. Klasifikace typů B až F je v přímém vztahu k nejvyššímu dovolenému množství v jednom kusu. Zásady pro zařazování látek, které nejsou uvedeny v pododdíle 2.2.52.4, jsou obsaženy v Příručce zkoušek a kritérií, části II.

2.2.52.1.7 Již zařazené organické peroxidy, které jsou připuštěny k přepravě v obalech jsou uvedeny v pododdílu 2.2.52.4, ty, které jsou již připuštěny k přepravě ve velkých nádobách pro volně ložené látky (IBC), jsou uvedeny v pododdílu 4.1.4.2, pokynu pro balení IBC520 a ty, které jsou již připuštěny k přepravě v cisternách podle kapitol 4.2 a 4.3 jsou uvedeny v pododdílu 4.2.5.2, pokynu

pro přemístitelné cisterny T23. Každá uvedená přípustěná látka je přiřazena k druhové položce tabulky A kapitoly 3.2 (UN čísla 3101 až 3120) a udávají se příslušná vedlejší nebezpečí a poznámky obsahující informace pro přepravu.

Tyto druhové položky udávají:

- typ (B až F) organického peroxidu (viz 2.2.52.1.6);
- fyzikální stav (kapalný/tuhý); a
- řízenou teplotu (pokud se vyžaduje), viz 2.2.52.1.15 až 2.2.52.1.18.

Směsi těchto přípravků mohou být zařazeny shodně s typem organického peroxidu, který je nejnebezpečnějším komponentem směsi, a přepravovány podle podmínek platných pro tento typ. Jestliže však dva stabilní komponenty mohou vytvářet tepelně méně stabilní směs, je třeba určit teplotu samourychlujícího se rozkladu (SADT) směsi, a pokud je to nutné, řízenou teplotu a kritickou teplotu, odvozené od SADT podle 2.2.52.1.16.

2.2.52.1.8 Zařazení organických peroxidů, které nejsou uvedeny v pododdílu 2.2.52.4, pododdílu 4.1.4.2, pokynu pro balení IBC520 nebo pododdílu 4.2.5.2, pokynu pro přemístitelné cisterny T23, jakož i jejich přiřazení k hromadné položce musí být provedeno příslušným orgánem země původu. Osvědčení o schválení musí obsahovat zařazení a odpovídající přepravní podmínky. Jestliže země původu není smluvní stranou ADR, musí být zařazení a přepravní podmínky uznány příslušným orgánem prvního státu smluvní strany ADR, který přijde do styku se zásilkou.

2.2.52.1.9 Vzorky organických peroxidů nebo přípravků organických peroxidů, které nejsou uvedeny v pododdíle 2.2.52.4, pro něž není k dispozici úplná sada výsledků zkoušek a které se přepravují za účelem dalších zkoušek nebo vyhodnocení, se přiřadí k jedné z vhodných položek pro organické peroxidy typu C za předpokladu, že :

- z údajů, které jsou k dispozici, vyplývá, že vzorek není nebezpečnější než organický peroxid typu B,
- vzorek je balen podle způsobu balení OP2 a množství na dopravní jednotku není větší než 10 kg.
- z údajů, které jsou k dispozici, vyplývá, že řízená teplota, pokud je, je dostatečně nízká, aby se zabránilo nebezpečnému rozkladu a dostatečně vysoká, aby nedošlo k nebezpečné separaci fázi.

Znecitlivění organických peroxidů

2.2.52.1.10 K zajištění bezpečnosti během přepravy se organické peroxidy často znecitlivují organickými kapalnými nebo tuhými látkami, anorganickými tuhými látkami nebo vodou. Jestliže je předepsán procentuální podíl látky, vztahuje se k podílu hmotnosti, zaokrouhlenému na nejbližší celé číslo. Všeobecně se znecitlivění musí provést tak, aby při úniku nemohlo dojít k nebezpečné koncentraci organického peroxidu.

2.2.52.1.11 Pokud není pro jednotlivý přípravek organického peroxidu stanoveno jinak, platí pro ředidla, která se použijí ke znecitlivění, následující definice:

- Ředidla typu A jsou organické kapaliny, snášejlivé s organickým peroxidem, které mají bod varu nejméně 150 °C. Ředidla typu A se mohou používat pro znecitlivění všech organických peroxidů.
- Ředidla typu B jsou organické kapaliny, snášejlivé s organickým peroxidem, které mají bod varu nižší než 150 °C, nejméně však 60 °C, a bod vzplanutí nejméně 5 °C.

Ředidla typu B se mohou používat pro znecitlivění všech organických peroxidů za podmínky, že bod varu kapaliny je nejméně o 60 °C vyšší než SADT v kusu o hmotnosti 50 kg.

2.2.52.1.12 Ředidla, která nepatří k typu A nebo B, smějí být přidána k přípravkům organických peroxidů uvedeným v pododdíle 2.2.52.4, pokud jsou s nimi snášejlivá. Avšak úplné nebo částečné nahrazení ředidla typu A nebo B jiným ředidlem s rozdílnými vlastnostmi vyžaduje nové přehodnocení přípravku organického peroxidu podle normálního klasifikačního postupu pro třídu 5.2.

2.2.52.1.13 Voda smí být přidávána ke znečitlivění jen těch organických peroxidů, u kterých je v pododdíle 2.2.52.4 nebo v povolení příslušného orgánu podle 2.2.52.1.8 uveden dovětek „s vodou“ nebo jako „jako stabilní disperse ve vodě“. Vzorky organických peroxidů nebo přípravků organických peroxidů, které nejsou uvedeny v pododdíle 2.2.52.4, smějí být rovněž znečitlivěny vodou za podmínky, že jsou splněny požadavky 2.2.52.1.9.

2.2.52.1.14 Organické a anorganické tuhé látky smějí být použity ke znečitlivění organických peroxidů, pokud se s nimi snášejí. Kapalně a tuhé látky se považují za snášitelné, pokud nepříznivě nepůsobí ani na tepelnou stabilitu, ani na druh nebezpečí přípravku organického peroxidu.

Ustanovení o řízení teploty

2.2.52.1.15 Určité organické peroxidy smějí být přepravovány pouze za podmínek řízené teploty. Řízenou teplotou se rozumí nejvyšší teplota, při které mohou být organické peroxidy bezpečně přepravovány. Předpokládá se, že teplota bezprostředního okolí kusu přesáhne během přepravy hodnotu 55 °C pouze na relativně krátkou dobu za 24-hodinový časový interval. V případě výpadku systému řízení teploty, může být nutné provést nouzová opatření. Kritická teplota je teplota, při níž musí být provedena nouzová opatření.

2.2.52.1.16 Řízená a kritická teplota jsou odvozeny od teploty samourychlujícího se rozkladu SADT (viz tabulku 1), která je definovaná jako nejnižší teplota, při níž může dojít k samourychlujícímu se rozkladu pro látku v obalu použitém během přepravy. SADT musí být stanovena za účelem rozhodnutí, zda látka musí být přepravována při řízené teplotě. Předpisy pro stanovení SADT jsou obsaženy v Příručce zkoušek a kritérií, části II, oddílu 20 a pododdílu 28.4.

Tabulka 1: Odvození řízených a kritických teplot

Druh nádoby	SADT ^a	Řízená teplota	Kritická teplota
Samostatné obaly a IBC	20 °C a méně	o 20 °C nižší než SADT	o 10 °C nižší než SADT
	20 °C až 35 °C	o 15 °C nižší než SADT	o 10 °C nižší než SADT
	více než 35 °C	o 10 °C nižší než SADT	o 5 °C nižší než SADT
Cisterny	nejvýše 50 °C	o 10 °C nižší než SADT	o 5 °C nižší než SADT

^a SADT látky zabalené pro přepravu

2.2.52.1.17 Tyto organické peroxidy musí být přepravovány při řízené teplotě:

- organické peroxidy typů B a C se SADT ≤ 50 °C;
- organické peroxidy typu D se SADT ≤ 50 °C, vykazující střední účinek při zahřívání v uzavřeném prostoru, nebo se SADT ≤ 45 °C, vykazující při zahřívání v uzavřeném prostoru malý nebo žádný účinek; a
- organické peroxidy typů E a F se SADT ≤ 45 °C.

POZNÁMKA: Předpisy pro stanovení účinků při zahřívání v uzavřeném prostoru jsou uvedeny v Příručce zkoušek a kritérií, části II, oddílu 20 a pododdílu 28.4.

2.2.52.1.18 Řízené a kritické teploty jsou uvedeny v pododdílu 2.2.52.4. Skutečná teplota během přepravy smí být nižší než řízená teplota, avšak musí být stanovena tak, aby nedošlo k nebezpečnému oddělování (separaci) fází.

2.2.52.2 *Látky nepřipuštěné k přepravě*

Organické peroxidy typu A není podle ustanovení třídy 5.2 dovoleno přepravovat [viz Příručku zkoušek a kritérií, část II, odstavec 20.4.3 (a)];

2.2.52.3 Seznam hromadných položek

Klasifikační Kód	UN- číslo	Pojmenování látek nebo předmětů

2.2.52.4 Seznam již zařazených organických peroxidů v obalech

Kódy „OP1“ až „OP8“ uvedené ve sloupci „Způsob balení“ se vztahují ke způsobům balení v pododdílu 4.1.4.1, pokynu pro balení P520 (viz též 4.1.7.1). Organické peroxidy, které se mají přepravovat, musí odpovídat klasifikaci a řízením a kritickým teplotám (odvozeným od SADT), jak jsou uvedeny. K látkám připuštěným v IBC viz 4.1.4.2, pokyn pro balení IBC520 a k látkám připuštěným v cisternách podle kapitol 4.2 a 4.3 viz 4.2.5.2, pokyn pro přemísitelné cisterny T23.

Poznámky k pododdílu 2.2.52.4:

- 1) Ředidlo typu B může být vždy nahrazeno ředidlem typu A. Bod varu ředidla typu B musí být nejméně o 60 °C vyšší než je SADT organického peroxidu.
- 2) Obsah aktivního kyslíku $\leq 4,7$ %.
- 3) Vyžaduje se bezpečnostní značka pro vedlejší nebezpečí "VÝBUŠNÝ" podle vzoru 1 (viz 5.2.2.2.2).
- 4) Ředidlo může být nahrazeno di-terc-butylperoxidem.
- 5) Obsah aktivního kyslíku ≤ 9 %.
- 6) Nejvýše 9% peroxidu vodíku; obsah aktivního kyslíku $\leq 10\%$.
- 7) Smí se použít pouze nekovových obalů.
- 8) Obsah aktivního kyslíku > 10 % a $\leq 10,7$ %, s vodou nebo bez vody.
- 9) Obsah aktivního kyslíku ≤ 10 %, s vodou nebo bez vody.
- 10) Obsah aktivního kyslíku $\leq 8,2$ %, s vodou nebo bez vody.
- 11) Viz 2.2.52.1.9.
- 12) Do 2000 kg na nádobu přiřazenou ORGANICKÉMU PEROXIDU TYPU F, na základě výsledků zkoušek ve velkém měřítku.
- 13) Vyžaduje se bezpečnostní značka pro vedlejší nebezpečí "ŽÍRAVÝ" podle vzoru č. 8 (viz 5.2.2.2.2).
- 14) Přípravky kyseliny peroxyoctové, které odpovídají kritériím Příručky zkoušek a kritérií, odstavce 20.4.3 d).
- 15) Přípravky kyseliny peroxyoctové, které odpovídají kritériím Příručky zkoušek a kritérií, odstavce 20.4.3 e).
- 16) Přípravky kyseliny peroxyoctové, které odpovídají kritériím Příručky zkoušek a kritérií, odstavce 20.4.3 f).
- 17) Přidáním vody k tomuto organickému peroxidu se zmenší jeho tepelná stabilita.
- 18) Pro koncentrace pod 80 % se nevyžaduje bezpečnostní značka pro vedlejší nebezpečí "ŽÍRAVÝ" podle vzoru č. 8 (viz 5.2.2.2.2).
- 19) Směsí s peroxidem vodíku, vodou a kyselinou(ami).
- 20) S ředidlem typu A, s vodou nebo bez vody.
- 21) S nejméně 25 % hm. ředidla typu A a k tomu ethylbenzen.
- 22) S nejméně 19 % hm. ředidla typu A a k tomu methylisobutylketon.
- 23) S méně než 6 % di-terc-butylperoxidu.
- 24) Do 8 % 1-isopropylhydroperoxy-4-isopropylhydroxybenzénu.
- 25) Ředidlo typu B s bodem varu vyšším než 110 °C.
- 26) Obsah hydroperoxidů $< 0,5$ %.
- 27) Pro koncentrace nad 56 % se vyžaduje bezpečnostní značka pro vedlejší nebezpečí "ŽÍRAVÝ" podle vzoru č. 8 (viz 5.2.2.2.2).
- 28) Obsah aktivního kyslíku $\leq 7,6$ % v ředidle typu A s bodem varu v rozmezí 200 °C až 260 °C.
- 29) Nepodléhá ustanovením ADR pro třídu 5.2.
- 30) Ředidlo typu B s bodem varu > 130 °C.
- 31) Aktivní kyslík $\leq 6,7$ %.

2.2.61 Třída 6.1 Toxické látky**2.2.61.1 Kritéria**

2.2.61.1.1 Název třídy 6.1 zahrnuje látky, o nichž je ze zkušenosti známo nebo o nichž lze na základě pokusů se zvířaty usuzovat, že jejich příjmem dýchacími cestami, pokožkou nebo zažívacími orgány při jednorázovém nebo krátkodobém působení v poměrně malém množství může dojít k poškození zdraví nebo ke smrti člověka.

POZNÁMKA: Geneticky změněné mikroorganismy a organismy musí být přiřazeny do této třídy, jestliže splňují podmínky pro tuto třídu.

2.2.61.1.2 Látky třídy 6.1 jsou rozděleny následovně:

T	Toxické látky bez vedlejšího nebezpečí
T1	organické, kapalné
T2	organické, tuhé
T3	organokovové
T4	anorganické, kapalné
T5	anorganické, tuhé
T6	kapalné, používané jako pesticidy
T7	tuhé, používané jako pesticidy
T8	vzorky
T9	jiné toxické látky
TF	Toxické látky, hořlavé
TF1	kapalné
TF2	kapalné, používané jako pesticidy
TF3	tuhé
TS	Toxické látky, schopné samoohřevu, tuhé
TW	Toxické látky, které ve styku s vodou vyvíjejí hořlavé plyny
TW1	kapalné
TW2	tuhé
TO	Toxické látky, podporující hoření
TO1	kapalné
TO2	tuhé
TC	Toxické látky, žíravé
TC1	organické, kapalné
TC2	organické, tuhé
TC3	anorganické, kapalné
TC4	anorganické, tuhé
TFC	Toxické látky, hořlavé, žíravé.
TFW	Toxické látky, hořlavé, které ve styku s vodou vyvíjejí hořlavé plyny

Definice

2.2.61.1.3 Pro účely ADR se následujícími pojmy rozumí:

LD₅₀ (střední smrtelná dávka) pro akutní toxicitu při požití je statisticky odvozená jedna dávka látky, od níž lze očekávat, že způsobí během 14 dnů smrt 50 % mladých dospělých bílých krys, je-li podána orální cestou. Hodnota LD₅₀ se vyjadřuje jako podíl hmotnosti zkoušené látky ku hmotnosti pokusného zvířete (mg/kg).

LD₅₀-Hodnota pro akutní toxicitu při absorpci pokožkou je takové množství látky, které při nepřetržitém styku s holou pokožkou bílých králíků po dobu 24 hodin způsobí s největší pravděpodobností v průběhu 14 dnů smrt poloviny počtu skupiny zvířat. Počet zvířat, který je tomuto pokusu podroben, musí být dostatečně velký, aby byl získaný výsledek statisticky významný a odpovídal dobrým zvyklům farmakologie. Výsledek se vyjadřuje v mg na kg tělesné hmotnosti.

LC₅₀-Hodnota pro akutní toxicitu při vdechnutí je taková koncentrace páry, mlhy nebo prachu, která při nepřetržitém vdechování mladými dospělými, samčími a samičími, bílými krysami po dobu jedné hodiny způsobí s největší pravděpodobností v průběhu 14 dnů smrt poloviny počtu skupiny zvířat. Tuhá látka musí být podrobena zkouškám, jestliže existuje nebezpečí, že nejméně 10 % celkové hmotnosti je složeno z prachu, který může být vdechnut, např. jestliže aerodynamický průměr této frakční částice činí nejvýše 10 µm. Kapalná látka musí být podrobena zkouškám, jestliže existuje nebezpečí, že se při netěsnosti obalu nebo cisterny, použitých pro přepravu, může vytvořit mlha. Jak u tuhých, tak i u kapalných látek se musí více než 90 % hmotnosti vzorku připraveného ke zkoušce sestávat z částic, které lze vdechnout, jak je výše popsáno. Výsledek se vyjadřuje v mg na litr vzduchu u prachu nebo mlhy a v ml na m³ vzduchu (ppm) u páry.

Klasifikace a přiřazení k obalovým skupinám

2.2.61.1.4 Látky třídy 6.1 musí být přiřazeny na základě svého stupně nebezpečí, které představují při přepravě, k následujícím obalovým skupinám:

Obalová skupina I: velmi toxické látky;
Obalová skupina II: toxické látky;
Obalová skupina III: slabě toxické látky

2.2.61.1.5 Látky, směsi, roztoky a předměty zařazené do třídy 6.1 jsou uvedeny v tabulce A kapitoly 3.2. Přiřazení látek, směsí a roztoků, které nejsou v tabulce A kapitoly 3.2 jmenovitě uvedeny, k vhodné položce pododdílu 2.2.61.3 a k příslušné obalové skupině podle ustanovení kapitoly 2.1 musí být provedeno podle následujících kritérií v 2.2.61.1.6 až 2.2.61.1.11.

2.2.61.1.6 Při posuzování stupně toxicity se musí vzít v úvahu zkušenosti z případů otrav osob, jakož i zvláštní vlastnosti posuzované látky, jako kapalný stav, vysoká tékavost, zvláštní pravděpodobnost příjmu pokožkou a zvláštní biologické účinky.

2.2.61.1.7 Pokud nejsou zkušenosti z pozorování učiněných na člověku, posoudí se stupeň toxicity z vyhodnocených výsledků pokusů na zvířatech podle následující tabulky:

	Obalová skupina	Toxicita při požití LD ₅₀ (mg/kg)	Toxicita při absorpci pokožkou LD ₅₀ (mg/kg)	Toxicita při vdechnutí prachu a mlhy LC ₅₀ (mg/l)
Velmi toxická	I	≤ 5,0	≤ 50	≤ 0,2
Toxická	II	> 5,0 a ≤ 50	> 50 a ≤ 200	>0,2 a ≤ 2,0
Slabě toxická	III ^a	> 50 a ≤ 300	> 200 a ≤ 1000	>2,0 a ≤ 4,0

^a *Szotvorné látky musí být přiřazeny k obalové skupině II, i když údaje o jejich toxicitě odpovídají kritériím obalové skupiny III.*

2.2.61.1.7.1 Jestliže látka vykazuje při dvou nebo více různých způsobech příjmu různé hodnoty toxicity, použije se pro klasifikaci nejvyšší hodnota toxicity.

2.2.61.1.7.2 Látky, které splňují kritéria třídy 8 a vykazují toxicitu při vdechnutí prachu a mlhy (LC₅₀) odpovídající obalové skupině I, se mohou zařadit do třídy 6.1 jen tehdy, pokud zároveň toxicita při požití nebo při absorpci pokožkou odpovídá alespoň obalové skupině I nebo II. V opačném případě se látka, pokud je to potřeba, musí přiřadit ke třídě 8 (viz 2.2.8.1.5).

2.2.61.1.7.3 Tato kritéria pro toxicitu při vdechnutí prachu a mlhy spočívají na hodnotách LC₅₀ při době pokusu jedné hodiny a tyto hodnoty musí být také použity, pokud jsou k dispozici. Jsou-li však k dispozici jen hodnoty LC₅₀ 4-hodinového pokusu, mohou být takové hodnoty vynásobeny čtyřmi a výsledek pak může nahradit výše uvedené kritérium, tzn., že čtyřnásobná hodnota LC₅₀ (4 hodiny) se považuje za ekvivalentní hodnotě LC₅₀ (1 hodina).
Toxicita při vdechnutí par

2.2.61.1.8

Kapaliny, které vylučují toxické páry, je třeba přiřadit do následujících skupin, kde písmeno „V“ představuje koncentraci nasycené páry (prchavost) (v ml/m³ vzduchu) při 20 °C a normálním atmosférickém tlaku.

	Obalová skupina	
Velmi toxická	I	Pokud $V \geq 10 \text{ LC}_{50}$ a $\text{LC}_{50} \leq 1\,000 \text{ ml/m}^3$
Toxická	II	Pokud $V \geq \text{LC}_{50}$ a $\text{LC}_{50} \leq 3\,000 \text{ ml/m}^3$ a nejsou splněna kritéria pro obalovou skupinu I.
Slabě toxická	III ^a	Pokud $V \geq 1/5 \text{ LC}_{50}$ a $\text{LC}_{50} \leq 5\,000 \text{ ml/m}^3$ a nejsou splněna kritéria pro obalovou skupinu I a II.

^a Slizotvorné látky musí být přiřazeny k obalové skupině II, i když údaje o jejich toxicitě odpovídají kritériím obalové skupiny III.

Tato kritéria toxicity při vdechnutí par spočívají na hodnotách LC_{50} při době pokusu 1 hodiny a tyto hodnoty musí být také použity, jsou-li k dispozici.

Jsou-li však k dispozici jen hodnoty LC_{50} ze 4-hodinového pokusu, mohou být takové hodnoty vynásobeny dvěma a výsledek může pak nahradit výše uvedená kritéria, tzn. dvojnásobná hodnota LC_{50} (4 hodiny) se považuje za ekvivalent k hodnotě LC_{50} (1 hodina).

Dělicí čáry obalových skupin - toxicita při vdechnutí par

Na tomto vyobrazení jsou pro usnadnění zařazení kritéria znázorněna graficky. Z důvodů jen přibližné přesnosti grafického znázornění musí se však látky, které leží v blízkosti nebo přímo na dělicí čáře, přezkoušet pomocí číselných kritérií.

Směsi kapalných látek

2.2.61.1.9

Směsi kapalných látek, které jsou při vdechnutí toxické, je třeba přiřadit k obalovým skupinám podle těchto kritérií:

2.2.61.1.9.1 Je-li hodnota LC_{50} pro každou toxickou látku, která je částí směsi, známa, lze určit obalovou skupinu následovně :

(a) výpočet hodnoty LC_{50} směsi:

$$LC_{50} (\text{směs}) = \frac{1}{\sum_{i=1}^n \frac{f_i}{LC_{50i}}}$$

kde :

$$\begin{aligned} f_i &= \text{molární zlomek } i\text{-té části směsi} \\ LC_{50i} &= \text{střední smrtelná koncentrace } i\text{-té části v ml/m}^3 \end{aligned}$$

(b) výpočet prchavosti každé části směsi :

$$V_i = P_i \times \frac{10^6}{101,3} \text{ v ml/m}^3$$

kde:

$$P_i = \text{parciální tlak } i\text{-té části v kPa při } 20^\circ \text{C a při normálním atmosférickém tlaku}$$

(c) výpočet poměru prchavosti k hodnotě LC_{50} :

$$R = \sum_{i=1}^n \frac{V_i}{LC_{50i}}$$

(d) vypočítané hodnoty pro LC_{50} (směs) a R pak slouží k určení obalové skupiny směsi:

Obalová skupina I: $R \geq 10$ a $LC_{50} (\text{směs}) \leq 1000 \text{ ml/m}^3$

Obalová skupina II: $R \geq 1$ a $LC_{50} (\text{směs}) \leq 3000 \text{ ml/m}^3$ a jestliže směs nesplňuje kritéria obalové skupiny I

Obalová skupina III: $R \geq 1/5$ a $LC_{50} (\text{směs}) \leq 5000 \text{ ml/m}^3$ a jestliže směs nesplňuje kritéria obalové skupiny I nebo II.

2.2.61.1.9.2 Není-li hodnota LC_{50} toxických komponentů známa, lze směs přiřadit k jedné z obalových skupin na základě dále popsaných zjednodušených zkoušek prahové toxicity. V takovém případě musí být určena a pro přepravu směsi použita nej přísnější obalová skupina.

2.2.61.1.9.3 Směs bude přiřazena k obalové skupině I jen tehdy, jestliže splňuje obě následující kritéria:

(a) Vzorek kapalně směsi se rozpraší a rozředí se vzduchem tak, že vznikne zkušební ovzduší o 1000 ml/m^3 rozprašené směsi ve vzduchu. 10 bílých krys (5 samečků a 5 samic) se nechá v tomto zkušebním ovzduší po dobu 1 hodiny a následně se budou 14 dnů pozorovat. Jestliže nejméně 5 pokusných zvířat v průběhu sledovaného období 14 dnů uhynie, lze se domnívat, že směs má hodnotu LC_{50} rovnou nebo menší než 1000 ml/m^3 .

(b) Vzorek páry v rovnováze s kapalnou směsí se zředí devítinásobným objemem vzduchu, čímž se vytvoří zkušební ovzduší. 10 bílých krys (5 samečků a 5 samic) se nechá v tomto zkušebním ovzduší po dobu 1 hodiny a následně se budou 14 dnů pozorovat. Jestliže nejméně 5 pokusných zvířat v průběhu sledovaného období 14 dnů uhynie, lze se domnívat, že směs má prchavost, která je rovna nebo větší než desetinasobná hodnota LC_{50} směsi.

2.2.61.1.9.4 Směs bude přiřazena k obalové skupině II jen tehdy, jestliže splňuje obě následující kritéria, ne však kritéria pro obalovou skupinu I:

(a) Vzorek kapalně směsi se rozpraší a rozředí se vzduchem tak, že vznikne zkušební ovzduší o 3000 ml/m^3 rozprašené směsi ve vzduchu. 10 bílých krys (5 samečků a 5 samic) se nechá v tomto zkušebním ovzduší po dobu 1 hodiny a následně se budou 14 dnů pozorovat. Jestliže nejméně 5 pokusných zvířat v průběhu sledovaného období 14 dnů uhynie, lze se domnívat, že směs má hodnotu LC_{50} rovnou nebo menší než 3000 ml/m^3 .

- (b) Vzorek páry v rovnováze s kapalnou směsí se použije k vytvoření zkušební ovzduší. 10 bílých krys (5 samečků a 5 samic) se nechá v tomto zkušebním ovzduší po dobu 1 hodiny a následně se budou 14 dnů pozorovat. Jestliže nejméně 5 pokusných zvířat v průběhu sledovaného období 14 dnů uhynie, lze se domnívat, že směs má prchavost, která je rovna nebo větší než hodnota LC_{50} směsi.

2.2.61.1.9.5 Směs bude přiřazena k obalové skupině III jen tehdy, jestliže splňuje obě následující kritéria, ne však kritéria pro obalové skupiny I nebo II.

- (a) Vzorek kapalně směsi se rozpraší a rozředí se vzduchem tak, že vznikne zkušební ovzduší o 5000 ml/m^3 rozprašené směsi ve vzduchu. 10 bílých krys (5 samečků a 5 samic) se nechá v tomto zkušebním ovzduší po dobu 1 hodiny a následně se budou 14 dnů pozorovat. Jestliže nejméně 5 pokusných zvířat v průběhu sledovaného období 14 dnů uhynie, lze se domnívat, že směs má hodnotu LC_{50} rovnou nebo menší než 5000 ml/m^3 .
- (b) Změří se koncentrace par (prchavost) kapalně směsi; je-li rovna nebo větší než 1000 ml/m^3 , lze se domnívat, že směs má prchavost, která je rovna nebo větší než 1/5 hodnoty LC_{50} směsi.

Metody výpočtu toxicity směsí při požití a při absorpci pokožkou

2.2.61.1.10 Pro zařazení směsí třídy 6.1 a jejich přiřazení k vhodné obalové skupině podle kritérií pro toxicitu při požití a při absorpci pokožkou (viz 2.2.61.1.3) je nutné vypočítat akutní hodnotu LD_{50} směsi.

2.2.61.1.10.1 Pokud směs obsahuje pouze jednu účinnou látku, jejíž hodnota LD_{50} je známa, lze při chybějících spolehlivých údajích o akutní toxicitě při požití a při absorpci pokožkou u směsi, která má být přepravována, vypočítat hodnotu LD_{50} při požití a při absorpci pokožkou následovně:

$$LD_{50} \text{ přípravku} = \frac{LD_{50} \text{ účinné látky} \times 100}{\text{podíl účinné látky (\% hm.)}}$$

2.2.61.1.10.2 Pokud směs obsahuje více než jednu účinnou látku, mohou být použity tři možné metody pro výpočet hodnoty LD_{50} při požití a při absorpci pokožkou. Je třeba upřednostnit metodu, kterou se získají spolehlivé údaje pro akutní toxicitu při požití a při absorpci pokožkou konkrétní směsi, která se má přepravovat. Pokud nejsou spolehlivé přesné údaje k dispozici, je třeba použít jedné z následujících metod:

- (a) zařadit přípravek podle nejnebezpečnější složky směsi, jakoby tato složka byla přítomna ve stejné koncentraci jako je celková koncentrace všech účinných složek; nebo

- (b) použít vzorce

$$\frac{C_A}{T_A} + \frac{C_B}{T_B} + \dots + \frac{C_Z}{T_Z} = \frac{100}{T_M}$$

kde:

C = koncentrace v procentech složek A, B, ..., Z směsi;

T = hodnota LD_{50} při požití složek A, B, ..., Z;

T_M = hodnota LD_{50} při požití směsi.

POZNÁMKA.: Tento vzorec lze také použít pro toxicitu při absorpci pokožkou, za předpokladu, že tyto informace jsou k dispozici ve stejné formě pro všechny složky. Použití tohoto vzorce nezohledňuje případné jevy stupňování nebo ochrany.

Klasifikace pesticidů

2.2.61.1.11 Všechny účinné látky pesticidů a jejich přípravky, u kterých jsou známy hodnoty LC_{50} a/nebo LD_{50} a které jsou zařazeny do třídy 6.1, musí být přiřazeny podle kritérií uvedených v 2.2.61.1.6 až

2.2.61.1.9 k odpovídajícím obalovým skupinám. Látky a přípravky, které vykazují vedlejší nebezpečí, musí být zařazeny podle tabulky převažujících nebezpečí v pododdíle 2.1.3.10 s přiřazením k odpovídajícím obalovým skupinám.

- 2.2.61.1.11.1 Není-li pro přípravek pesticidů známa hodnota LD_{50} pro požití nebo absorpci pokožkou, avšak je známa hodnota LD_{50} jeho účinné(yh) složky(ek), může být hodnota LD_{50} přípravku zjištěna použitím postupu uvedeného v 2.2.61.1.10.

POZNÁMKA: Údaje o toxicitě týkající se hodnoty LD_{50} určitého počtu běžných pesticidů lze nalézt v nejnovějším vydání dokumentu „The WHO Recommended Classification of Pesticides by Hazard and Guidelines to Classification“, který je možno si obstarat u Světové zdravotnické organizace (WHO) na adrese: International Programme on Chemical Safety, World Health Organisation (WHO), CH-1211, Geneva 27, Švýcarsko. Zatímco tento dokument může být použit jako zdroj dat pro hodnoty LD_{50} pesticidů, jeho klasifikační systém není možno použít pro účely zařazování pesticidů pro přepravu nebo pro jejich přiřazení k obalovým skupinám, které musejí odpovídat ustanovením ADR.

- 2.2.61.1.11.2 Oficiální pojmenování pro přepravu pesticidu se volí na základě aktivní složky, fyzikálního stavu pesticidu a všech vedlejších nebezpečí, které by mohl představovat (viz oddíl oddíl 3.1.2).

- 2.2.61.1.12** Jestliže látky třídy 6.1 vlivem příměsí spadají do jiných kategorií nebezpečnosti než těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, přiřadí se tyto směsi nebo roztoky k položkám, ke kterým na základě svého skutečného nebezpečí patří.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz také oddíl 2.1.3.

- 2.2.61.1.13** Na základě kritérií uvedených v 2.2.61.1.6 až 2.2.61.1.11 se může také zjistit, zda je jmenovitě uvedený roztok nebo jmenovitě uvedená směs, popřípadě roztok nebo směs, která obsahuje jmenovitě uvedenou látku, takové povahy, že tento roztok nebo tato směs nepodléhá ustanovením pro tuto třídu.

- 2.2.61.1.14** Látky, roztoky a směsi, s výjimkou látek a přípravků používaných jako pesticidy, které neodpovídají kritériím směrnic 67/548/EHS³ nebo 1999/45/ES⁴ v jejich platném znění a které proto nejsou zařazeny jako velmi toxické, toxické nebo zdraví škodlivé podle těchto směrnic v jejich platném znění, mohou být považovány za látky nepatřící do třídy 6.1.

2.2.61.2 Látky nepřipustěné k přepravě

- 2.2.61.2.1 Chemicky nestálé látky třídy 6.1 je dovoleno přepravovat jen tehdy, jestliže byla učiněna potřebná opatření k zabránění jejich nebezpečnému rozkladu nebo polymeraci během přepravy. Za tímto účelem je zejména nutno dbát na to, aby nádoby a cisterny neobsahovaly látky, které by mohly takové reakce vyvolat.

- 2.2.61.2.2 Následující látky a směsi nejsou připuštěny k přepravě:

- kyanovodík (bezvodý nebo v roztoku), který neodpovídá popisům UN čísel 1051, 1613, 1614 a 3294,
- karbonyly kovů s bodem vzplanutí nižším než 23 °C, jiné než UN 1259 TETRAKARBONYL NIKLU a UN 1994 PENTAKARBONYL ŽELEZA,
- 2,3,7,8-TETRACHLORDIBENZO-1,4-DIOXIN (TCDD) v koncentracích, které se považují podle kritérií v 2.2.61.1.7 za velmi toxické,
- UN 2249 DICHLORDIMETHYLETER, SYMETRICKÝ,
- přípravky fosfidů bez přísad, které zabraňují vývinu toxických hořlavých plynů.

³ Směrnice Rady evropského společenství 67/548/EHS z 27. června 1967 o sblížení právních a správních předpisů týkající se klasifikace, balení a označování nebezpečných věcí (uveřejněná v úředním věstníku Evropského společenství č. L 196 z 16.8.1967)

⁴ Směrnice 1999/45/ES Evropského parlamentu a Rady z 31. května 1999 o sblížení právních a správních předpisů členských států týkající se klasifikace, balení a označování nebezpečných přípravků (Úřední věstník Evropského společenství č. L 200 z 30. července 1999).

POZNÁMKY:

- a *Látky a přípravky obsahující alkaloidy nebo nikotin používané jako pesticidy jsou přiřazeny pod UN 2588 PESTICID, TUHÝ, TOXICKÝ, J.N., UN 2902 PESTICID, KAPALNÝ, TOXICKÝ, J.N. nebo UN 2903 PESTICID, KAPALNÝ, TOXICKÝ, HOŘLAVÝ, J.N.*
- b *Účinné látky, jakož i "přípravky nebo směsi látek určených pro laboratorní a pokusné účely, jakož i k výrobě farmaceutických výrobků, s jinými látkami musí být zařazeny podle své toxicity (viz 2.2.61.1.7 až 2.2.61.1.11).*
- c *Slabě toxické látky schopné samoohřevu a samozápalné organokovové sloučeniny jsou látkami třídy 4.2.*
- d *Slabě toxické látky reagující s vodou a organokovové sloučeniny reagující s vodou jsou látkami třídy 4.3.*
- e *Fulminát rtuťnatý, navlhčený, s nejméně 20 % hm. vody nebo směsi alkoholu a vody je látkou třídy 1, UN číslo 0135.*
- f *Ferikyanidy, ferokyanidy, jakož i thiokyanatany alkalické a amonné nepodléhají ustanovením ADR.*
- g *Olověné soli a olověná barviva, které smíchány v poměru 1 : 1000 s kyselinou chlorovodíkovou 0,07 M a míchány po dobu jedné hodiny při teplotě 23 °C ± 2 °C vykazují rozpustnost nejvýše 5 %, nepodléhají ustanovením ADR.*
- h *Předměty napuštěné tímto pesticidem, jako jsou lepenkové podložky, papírové proužky, kuličky vaty, plastové fólie, v hermeticky uzavřených obalech nepodléhají ustanovením ADR.*
- i *Směsi tuhých látek, které nepodléhají ustanovením ADR, a toxických kapalných látek mohou být přepravovány pod UN číslem 3243, bez toho, že by se předtím použila klasifikační kritéria pro třídu 6.1, za podmínky, že v době nakládky látky nebo uzavírání obalu, kontejneru nebo dopravní jednotky není vidět žádná uvolněná kapalina. Každý obal musí odpovídat konstrukčnímu typu, který úspěšně obstál při zkoušce těsnosti pro obalovou skupinu II. Tato položka nesmí být použita pro tuhé látky, které obsahují kapalnou látku obalové skupiny I.*
- j *Velmi toxické a toxické hořlavé kapaliny látky s bodem vzplanutí pod 23 °C jsou látkami třídy 3, s výjimkou látek, které jsou velmi toxické při vdechnutí, jak je definováno v 2.2.61.1.4 až 2.2.61.1.9. Kapaliny, které jsou velmi toxické při vdechnutí, jsou identifikovány jako „toxické při vdechnutí“ ve svém oficiálním pojmenování pro přepravu ve sloupci (2) nebo zvláštním ustanovením 354 ve sloupci (6) tabulky A kapitoly 3.2.*
- k *Slabě toxické hořlavé kapalné látky s bodem vzplanutí od 23 °C do 60 °C, včetně limitních hodnot, s výjimkou látek a přípravků sloužících jako pesticidy, jsou látkami třídy 3.*
- l *Slabě toxické látky podporující hoření jsou látkami třídy 5.1.*
- m *Slabě toxické a slabě žíravé látky jsou látkami třídy 8.*
- n *Fosfidy kovů přiřazené k UN číslům 1360, 1397, 1432, 1714, 2011 a 2013 jsou látkami třídy 4.3.*

2.2.62 Třída 6.2 Infekční látky**2.2.62.1 Kritéria**

2.2.62.1.1 Název třídy 6.2 zahrnuje látky schopné vyvolat nákazu. Pro účely ADR jsou infekčními látkami ty látky, o kterých je známo nebo lze důvodně předpokládat, že obsahují původce nemoci. Původci nemoci jsou definováni jako mikroorganismy (včetně bakterií, virů, rickettsií, parazitů a plísňů) a jiní činitelé, jako jsou priony, které(kterí) mohou způsobit onemocnění u lidí nebo zvířat.

POZNÁMKA 1: Geneticky změněné mikroorganismy a organismy, biologické produkty, diagnostické vzorky a infikovaná živá zvířata se zařadí do této třídy, jestliže splňují podmínky pro tuto třídu.

POZNÁMKA 2: Toxiny z rostlin, zvířat nebo bakterií, které neobsahují žádnou infekční látku nebo organismy, nebo které nejsou obsaženy v infekčních látkách nebo organismech, jsou látkami třídy 6.1, UN číslo 3172 nebo 3462.

2.2.62.1.2 Látky třídy 6.2 jsou rozděleny následovně:

I1	Infekční látky nebezpečné pro lidi
I2	Infekční látky nebezpečné jen pro zvířata
I3	Klinické odpady
I4	Látky biologické

Definice

2.2.62.1.3 Pro účely ADR se následujícími pojmy rozumí:

„*Biologické produkty*“ jsou produkty z živých organismů, které se vyrábějí a rozesílají v souladu s předpisy příslušných národních orgánů, které mohou uložit podmínku zvláštních povolení. Biologické produkty se používají buď pro prevenci, léčení nebo diagnostikování nemocí u lidí nebo zvířat, nebo pro vývojové, pokusné nebo výzkumné účely s tím spojené. Zahrnují hotové výrobky nebo meziprodukty, jako očkovací látky, ale nejsou na ně omezeny;

„*Kultury*“ jsou výsledkem procesu, při kterém se původci nemocí záměrně rozmnožují. Tato definice nezahrnuje lidské nebo zvířecí vzorky od pacientů, jak jsou definovány v tomto odstavci.

„*Medicínské nebo klinické odpady*“ jsou odpady pocházející z lékařského ošetření zvířat nebo lidí nebo z biologického výzkumu.

„*Vzorky od pacientů*“ jsou lidské nebo materiály živočišného původu odebrané přímo z lidí nebo zvířat včetně, avšak ne pouze, stolice, výměšků, krve a jejích složek, tkáně a tkáňových tekutin a částí těl, které jsou přepravovány k takovým účelům, jako je výzkum, diagnostika, vyšetření, léčení nemocí a prevence.

Klasifikace

2.2.62.1.4 Infekční látky musí být zařazeny do třídy 6.2 a přiřazeny k UN číslům 2814, 2900, 3291 nebo popřípadě 3373.

Infekční látky se dělí do těchto kategorií:

2.2.62.1.4.1 Kategorie A: Infekční látka, která je přepravována ve formě, která je schopna, dojde-li k vystavení jejímu účinku, způsobit trvalou invaliditu, nemoc ohrožující život nebo smrtelnou nemoc jinak zdravých lidí nebo zvířat. Informativní příklady látek, které splňují tato kritéria, jsou uvedeny v tabulce tohoto odstavce.

POZNÁMKA: Vystavení účinku látky nastane, jestliže látka unikne ven z ochranného obalu a dojde k fyzickému kontaktu s lidmi nebo zvířaty.

(a) Infekční látky splňující tato kritéria, které způsobují nemoc u lidí, nebo u lidí i zvířat musí být přiřazeny k UN číslu 2814. Infekční látky, které způsobují nemoc jen u zvířat, musí být přiřazeny k UN číslu 2900;

- (b) Přiřazení k UN číslu 2814 nebo k UN číslu 2900 musí být založeno na známých lékařských chorobopisech a známých příznacích nemoci u lidí nebo zvířat, endemických místních podmínek nebo odborném posouzení individuálního stavu člověka nebo zvířete.

POZNÁMKA 1: Oficiální pojmenování pro přepravu UN čísla 2814 je LÁTKA INFEKČNÍ, NEBEZPEČNÁ PRO LIDI. Oficiální pojmenování pro přepravu UN čísla 2900 je LÁTKA INFEKČNÍ, NEBEZPEČNÁ pouze PRO ZVÍŘATA.

POZNÁMKA 2: Následující tabulka není vyčerpávající. Infekční látky, včetně nových nebo nově se objevivších původců nemocí, které nejsou uvedeny v tabulce, avšak které splňují stejná kritéria, musí být přiřazeny ke kategorii A. Kromě toho, je-li pochybnost, zda látka splňuje či nesplňuje tato kritéria, musí být začleněna do kategorie A.

POZNÁMKA 3: Ty mikroorganismy, které jsou v následující tabulce napsány kurzívou, jsou bakterie, mykoplazmy, rickettsie nebo plísňe.

JMENOVITÉ PŘÍKLADY INFEKČNÍCH LÁTEK ZAHRNUTÝCH DO KATEGORIE A V JAKÉKOLI FORMĚ, NENÍ-LI PŘÍMO UVEDENO JINAK (2.2.62.1.4.1)	
UN číslo a pojmenování	Mikroorganismus
UN2814 Infekční látky nebezpečné pro lidi	<i>Bacillus anthracis</i> (pouze kultury) <i>Brucella abortus</i> (pouze kultury) <i>Brucella melitensis</i> (pouze kultury) <i>Brucella suis</i> (pouze kultury) <i>Burkholderia mallei</i> – <i>Pseudomonas mallei</i> – vozňvka (pouze kultury) <i>Burkholderia pseudomallei</i> – <i>Pseudomonas pseudomallei</i> (pouze kultury) <i>Chlamydia psittaci</i> – ptačí kmeny (pouze kultury) <i>Clostridium botulinum</i> (pouze kultury) <i>Coccidioides immitis</i> (pouze kultury) <i>Coxiella burnetii</i> (pouze kultury) virus konžsko-krymské hemoragické horečky virus dengue (pouze kultury) virus /americký/ východní koňské encefalomyelitidy (pouze kultury) <i>Escherichia coli</i> , verotoxigenická (pouze kultury)* virus Ebola virus Flexal <i>Francisella tularensis</i> (pouze kultury) virus Guanarito virus Hantaan Hantaviry vyvolávající hemoragickou horečku s ledvinovým syndromem virus Hendra virus hepatitidy B (pouze kultury) virus herpes B (pouze kultury) virus lidské imunodeficiencie /HIV/ (pouze kultury) vysoce patogenní virus moru drůbeže /ptačí chřipky/ (pouze kultury) virus japonské encefalitidy (pouze kultury) virus Junin /argentinská hemoragická horečka/ virus horečky Kyasanurského lesa /indická klíšťová horečka/ virus horečky Lassa virus Machupo /bolivijská hemoragická horečka/ virus Marburg virus opičích neštovic <i>Mycobacterium tuberculosis</i> (pouze kultury) * virus Nipah virus omské hemoragické horečky virus poiomyelitidy /dětské obrny/ (pouze kultury) virus vztekliny /Rabies virus/ (pouze kultury) <i>Rickettsia prowazekii</i> (pouze kultury) <i>Rickettsia rickettsii</i> (pouze kultury) virus horečky Rift / Rift Valley/ (pouze kultury) virus ruské jaro-letní encefalitidy (pouze kultury) virus Sabia <i>Shigella dysenteriae</i> typ 1 (pouze kultury) *

JMENOVITÉ PŘÍKLADY INFEKČNÍCH LÁTEK ZAHRNUTÝCH DO KATEGORIE A V JAKÉKOLI FORMĚ, NENÍ-LI PŘÍMO UVEDENO JINAK (2.2.62.1.4.1)	
UN číslo a pojmenování	Mikroorganismus
	virus klíšťové encefalitidy (pouze kultury) virus pravých neštovic /Variola/ virus venezuelské koňské encefalomyelitidy (pouze kultury) virus západní nilské /západonilské/ encefalomyelitidy (pouze kultury) virus žluté zimnice (pouze kultury) <i>Yersinia pestis</i> (pouze kultury)
UN 2900 Infekční látky nebezpečné jen pro zvířata	virus afrického moru prasat (pouze kultury) ptačí paramyxovirus typ 1 – Velogenový virus newcastleské choroby drůbeže (pouze kultury) virus klasického moru prasat (pouze kultury) virus slintavky a kulhavky (pouze kultury) virus nodulární dermatitidy skotu (pouze kultury) <i>Mycoplasma mycoides</i> – infekční hovězí pleuropneumonie (pouze kultury) virus moru malých přežvýkavců (pouze kultury) virus dobytčího moru (pouze kultury) virus ovčích neštovic (pouze kultury) virus kozích neštovic (pouze kultury) virus vezikulární stomatitidy prasat (pouze kultury) virus vezikulární stomatitidy (pouze kultury)

* Jsou-li kultury určeny pro diagnostické nebo klinické účely, mohou být zařazeny jako infekční látky kategorie B.

2.2.62.1.4.2 Kategorie B: Infekční látka, která nesplňuje kritéria pro zařazení do kategorie A. Infekční látky v kategorii B musí být přiřazeny k UN číslu 3373.

POZNÁMKA: *Oficiální pojmenování pro přepravu UN čísla 3373 je LÁTKY BIOLOGICKÉ, KATEGORIE B*

2.2.62.1.5 Vynětí z platnosti

2.2.62.1.5.1 Látky, které neobsahují infekční látky, nebo látky, u nichž není pravděpodobné, že způsobí nemoc u lidí nebo zvířat, nepodléhají ustanovením ADR, ledaže splňují kritéria pro zařazení do jiné třídy.

2.2.62.1.5.2 Látky obsahující mikroorganismy, které jsou nepatogenní vůči lidem nebo zvířatům, nepodléhají ustanovením ADR, ledaže splňují kritéria pro zařazení do jiné třídy.

2.2.62.1.5.3 Látky v takové formě, že všichni přítomní původci nemoci byli neutralizováni nebo deaktivováni, takže už nepředstavují zdravotní riziko, nepodléhají ustanovením ADR, ledaže splňují kritéria pro zařazení do jiné třídy.

POZNÁMKA: *Lékařské vybavení, které bylo zbaveno volné kapaliny, je považováno za splňující požadavky tohoto odstavce a nepodléhá ustanovením ADR.*

2.2.62.1.5.4 Látky, u nichž je koncentrace původců nemoci na stejné úrovni jako v přírodě (včetně vzorků potravin a vody) a které nejsou považovány za látky představující významné riziko infekce, nepodléhají ustanovením ADR, ledaže splňují kritéria pro zařazení do jiné třídy.

2.2.62.1.5.5 Suché krevní skvrny, získané odkápnutím krve na absorpční materiál, nepodléhají ustanovením ADR.

2.2.62.1.5.6 Vzorky pro test okultního krvácení do stolice nepodléhají ustanovením ADR.

2.2.62.1.5.7 Krev nebo krevní složky, které byly shromážděny pro účely transfúze nebo pro přípravu krevních produktů k použití pro transfúze nebo transplantace a jakékoli tkáně nebo orgány určené k použití při transplantacích, jakož i vzorky odebrané ve spojení s takovými účely, nepodléhají ustanovením ADR.

2.2.62.1.5.8 Lidské nebo zvířecí vzorky, u nichž je minimální pravděpodobnost, že jsou v nich přítomni původci nemoci, nepodléhají ustanovením ADR, jsou-li vzorky přepravovány v obalu, který zabrání

jakémukoli úniku a který je označen slovy „VYJMUTÝ LIDSKÝ VZOREK“ nebo „VYJMUTÝ ZVÍŘECÍ VZOREK“.

Obal je považován za obal vyhovující výše uvedeným požadavkům, jestliže splňuje následující podmínky:

- (a) Obal sestává ze tří částí:
- (i) jedné nebo více těsných primárních nádob;
 - (ii) těsného sekundárního obalu; a
 - (iii) vnějšího obalu přiměřené pevnosti vzhledem k jeho vnitřnímu objemu, hmotnosti a zamýšlenému použití s alespoň jedním povrchem o rozměrech nejméně 100 x 100 mm;
- (b) Pro kapaliny musí být mezi primární nádobu(y) a sekundární obal vložen savý materiál v dostatečném množství, aby pohltil celý obsah tak, aby během přepravy žádný únik kapalně látky nezasáhl vnější obal a neporušil celistvost vycpávkového materiálu;
- (c) Je-li více křehkých primárních nádob vloženo do jednoho sekundárního obalu, musí být buď jednotlivě zabaleny, nebo navzájem odděleny, aby se zamezilo jejich vzájemnému dotyku.

POZNÁMKA 1: *K určení, zda je látka vyňata podle tohoto odstavce, se vyžaduje odborné posouzení. Toto posouzení by mělo být založeno na předchozích lékařských případech, příznacích a individuálních okolnostech zdroje, lidského nebo zvířecího, a na endemických místních podmínkách. Příklady vzorků, které mohou být přepravovány podle tohoto odstavce zahrnují:*

- vzorky krve nebo moči ke zjištění hladiny cholesterolu, hladiny cukru, hladiny hormonů nebo prostatických specifických protilátek (PSA);
- vzorky vyžadované k ověření funkce orgánů, jako srdce, jater nebo ledvin, u lidí nebo zvířat s neinfekčními chorobami, nebo pro terapeutickou kontrolu léků;
- vzorky odebrané na žádost pojišťovacích společností nebo zaměstnavatelů ke zjištění přítomnosti drog nebo alkoholu;
- vzorky odebrané pro těhotenské testy;
- biopsie ke zjištění rakoviny; a
- zjišťování protilátek u lidí nebo zvířat pokud není žádná obava z infekce (např. vyhodnocení imunity vyvolané vakcínou, diagnostikování autoimunní nemoci atd.).

POZNÁMKA 2: *Pro leteckou dopravu musí obaly pro vzorky vyňaté podle tohoto odstavce splňovat podmínky uvedené pod písmeny (a) až (c).*

2.2.62.1.5.9

S výjimkou:

- (a) medicínského odpadu (UN 3291);
- (b) lékařských přístrojů nebo zařízení kontaminovaných nebo obsahujících infekční látky kategorie A (UN 2814 nebo UN 2900); a
- (c) lékařských přístrojů nebo zařízení kontaminovaných nebo obsahujících jiné nebezpečné látky, které vyhovují definici jiné třídy,

lékařské přístroje nebo zařízení potenciálně kontaminované nebo obsahující infekční látky, které jsou přepravovány k desinfekci, čištění, sterilizaci, opravě nebo k ocenění zařízení nepodléhají jiným ustanovením ADR, než jsou ustanovení tohoto odstavce, jsou-li zabaleny do obalů konstruovaných a vyrobených takovým způsobem, že za normálních podmínek přepravy nemohou prasknout, být propíchnuty nebo propuštět svůj obsah. Obaly musí být konstruovány tak, aby splnily konstrukční požadavky uvedené v 6.1.4 nebo 6.6.5.

Tyto obaly musí splňovat všeobecná ustanovení pro balení v 4.1.1.1 a 4.1.1.2 a být schopny zadržet lékařské přístroje a zařízení při pádu z výšky 1,2 m.

Obaly musí být označeny nápisem „POUŽITÝ LÉKAŘSKÝ PŘÍSTROJ“ nebo „POUŽITÉ LÉKAŘSKÉ ZAŘÍZENÍ“. Při použití přepravních obalových souborů musí být tyto soubory označeny stejným způsobem, kromě případů, kdy nápis zůstává viditelným.

2.2.62.1.6 (Vyhrazeno)

2.2.62.1.7 (Vyhrazeno)

2.2.62.1.8 (Vyhrazeno)

2.2.62.1.9 Biologické produkty

Pro účely ADR se biologické produkty dělí do následujících skupin:

- (a) Produkty, které jsou vyrobeny a zabaleny v souladu s předpisy příslušných národních orgánů a jsou přepravovány za účelem jejich konečného zabalení nebo distribuce a k použití pro léčebné účely lékaři nebo jednotlivci. Látky této skupiny nepodléhají ustanovením ADR ;
- (b) Produkty, které nespadají pod písmeno a) a o kterých je známo nebo se o nich důvodně předpokládá, že obsahují infekční látky, a které splňují kritéria pro zařazení do kategorie A nebo kategorie B. Látky v této skupině se musí přiřadit k UN číslu 2814, 2900 nebo popřípadě 3373.

POZNÁMKA: U některých biologických produktů schválených pro uvedení na trh může biologické nebezpečí hrozit jen v určitých částech světa. V tomto případě mohou příslušné orgány požadovat, aby tyto biologické produkty vyhovovaly místním předpisům pro infekční látky nebo mohou uložit jiná omezení.

2.2.62.1.10 Geneticky změněné mikroorganismy a organismy

Geneticky změněné mikroorganismy, které neodpovídají definici infekční látky, musí být zařazeny podle oddílu 2.2.9.

2.2.62.1.11 Medicínské nebo klinické odpady

2.2.62.1.11.1 Medicínské nebo klinické odpady obsahující infekční látky kategorie A musí být přiřazeny k UN číslu 2814 nebo popřípadě k UN číslu 2900. Medicínské nebo klinické odpady obsahující infekční látky v kategorii B, musí být přiřazeny k UN číslu 3291.

POZNÁMKA: Medicínské nebo klinické odpady přiřazené k číslu 18 01 03 (Odpady z lékařské nebo veterinární zdravotní péče a/nebo s ní spojeného výzkumu – odpady z porodnic, diagnostiky, léčení nebo prevence nemocí u lidí – odpady, jejichž sběr a likvidace podléhá zvláštním požadavkům vzhledem k prevenci infekce) nebo 18 02 02 (Odpady z lékařské nebo veterinární zdravotní péče a/nebo s ní spojeného výzkumu – odpady z výzkumu, diagnostiky, léčení nebo prevence nemocí u zvířat – odpady, jejichž sběr a likvidace podléhá zvláštním požadavkům vzhledem k prevenci infekce) podle seznamu odpadů přiloženého k Rozhodnutí Komise 2000/532/ES⁵, se změnami, musí být zařazeny podle ustanovení uvedených v tomto odstavci, na základě lékařské nebo veterinární diagnózy týkající se pacienta nebo zvířete.

2.2.62.1.11.2 Medicínské nebo klinické odpady, u nichž je možno důvodně předpokládat malou pravděpodobnost, že obsahují infekční látky, musí být přiřazeny k UN číslu 3291. Pro přiřazení se mohou vzít v úvahu mezinárodní, regionální nebo vnitrostátní katalogy odpadů.

POZNÁMKA 1: Oficiální pojmenování pro přepravu UN čísla 3291 je „ODPAD KLINICKÝ, NESPECIFIKOVANÝ, J.N.“ nebo „ODPAD (BIO)MEDICÍNSKÝ, J.N.“ nebo „ODPAD MEDICÍNSKÝ REGULOVANÝ, J.N.“.

POZNÁMKA 2: Bez ohledu na výše uvedená klasifikační kritéria nepodléhají ustanovením ADR medicínské nebo klinické odpady přiřazené k číslu 18 01 04 (Odpady z lékařské nebo veterinární

⁵ Rozhodnutí Komise 2000/532/ES z 3. května 2000 nahrazující Rozhodnutí 94/3/ES zavádějící seznam odpadů k provádění článku 1(a) Směrnice Rady 75/442/EHS o odpadech nahrazena Směrnicí 2006/12/ES Evropského parlamentu a Rady (Úřední věstník Evropského společenství č. L 114 z 27. dubna 2006, strana 9) a Rozhodnutí Rady 94/904/ES zavádějící seznam nebezpečných odpadů k provádění článku 1(4) Směrnice Rady 91/689/EHS o nebezpečných odpadech (Úřední věstník Evropských společenství č. L 226 z 6.9.2000, strana 3).

zdravotní péče a/nebo s ní spojeného výzkumu – odpady z porodnic, diagnostiky, léčení nebo prevence nemocí u lidí – odpady, jejichž sběr a likvidace nepodléhá zvláštním požadavkům vzhledem k prevenci infekce) nebo 18 02 03 (Odpady z lékařské nebo veterinární zdravotní péče a/nebo s ní spojeného výzkumu – odpady z výzkumu, diagnostiky, léčení nebo prevence nemocí u zvířat – odpady, jejichž sběr a likvidace nepodléhá zvláštním požadavkům vzhledem k prevenci infekce) podle seznamu odpadů přiloženého k Rozhodnutí Komise 2000/532/ES⁶, se změnami.

- 2.2.62.1.11.3 Dekontaminované medicínské nebo klinické odpady, které dříve obsahovaly infekční látky, nepodléhají ustanovením ADR, ledaže splňují kritéria pro zařazení do jiné třídy.
- 2.2.62.1.11.4 Medicínské nebo klinické odpady přiřazené k UN číslu 3291 jsou přiřazeny k obalové skupině II.
- 2.2.62.1.12 *Infikovaná zvířata*
- 2.2.62.1.12.1 Živá zvířata smějí být použita k zaslání infekční látky, jen pokud nemůže být zaslána nějakým jiným způsobem. Živá zvířata, která byla záměrně infikována a je známo nebo je podezření, že obsahují infekční látku, smějí být přepravována jen za podmínek schválených příslušným orgánem⁶.
- 2.2.62.1.12.2 Materiál živočišného původu obsahující původce nemocí kategorie A nebo původce nemocí, kteří by byli přiřazeni ke kategorii A jen v kulturách, musí být přiřazen k UN 2814 nebo UN 2900, jak je to náležité. Materiál živočišného původu obsahující původce nemocí kategorie B, jiné než původce nemocí, kteří by byli přiřazeni ke kategorii A, pokud by byli v kulturách, musí být přiřazen k UN 3373.

2.2.62.2 **Látky nepřipuštěné k přepravě**

Živí obratlovci nebo bezobratlá zvířata nesmějí být použiti(a) k tomu, aby přepravovali(a) infekční látku, ledaže by tato látka nemohla být přepravována jiným způsobem nebo ledaže by tato přeprava byla schválena příslušným orgánem (viz 2.2.62.1.12.1).

2.2.62.3 **Seznam hromadných položek**

Infekční látky nebezpečné pro lidi	I1	2814	LÁTKA INFEKČNÍ, NEBEZPEČNÁ PRO LIDI
Infekční látky nebezpečné jen pro zvířata	I2	2900	LÁTKA INFEKČNÍ, NEBEZPEČNÁ pouze PRO ZVÍŘATA
Klinické odpady	I3	3291	ODPAD KLINICKÝ, NESPECIFIKOVANÝ, J.N. nebo
		3291	ODPAD (BIO)MEDICÍNSKÝ, J.N. nebo
		3291	ODPAD MEDICÍNSKÝ REGULOVANÝ, J.N.
Biologické látky	I4	3373	LÁTKY BIOLOGICKÉ, KATEGORIE B

⁶ Předpisy upravující přepravu živých zvířat jsou obsaženy např. ve Směrnici 91/628/EHS z 19. listopadu 1991 o ochraně zvířat během přepravy (Úřední věstník Evropských společenství č. L 340 z 11.12.1991, str. 17) a v Doporučení Rady Evropy (Výbor ministrů) o přepravě některých druhů zvířat.

2.2.7 Třída 7: Radioaktivní látky**2.2.7.1 Definice**

2.2.7.1.1 *Radioaktivní látky* jsou jakékoliv látky obsahující radionuklidy, ve kterých jak hmotnostní aktivita tak i celková aktivita v zásilce převyšuje hodnoty uvedené v bodech 2.2.7.2.2.1 a 2.2.7.2.2.6

2.2.7.1.2 Kontaminace

Kontaminace - přítomnost radioaktivní látky na povrchu v množstvích větších než 0,4 Bq/cm² pro beta a gama zářiče a nízkotoxické alfa zářiče, nebo 0,04 Bq/cm² pro všechny ostatní alfa zářiče.

Nefixovaná kontaminace - kontaminace, která může být odstraněna z povrchu za běžných podmínek během přepravy.

Fixovaná kontaminace - jakákoliv jiná kontaminace než nefixovaná kontaminace.

2.2.7.1.3 Definice specifických termínů***A₁ a A₂***

A₁ - je hodnota aktivity radioaktivních látek zvláštní formy uvedená v tabulce 2.2.7.2.1 nebo odvozená podle 2.2.7.2.2.2, která se používá pro určení mezních hodnot aktivity pro účely předpisů ADR.

A₂ - je hodnota aktivity radioaktivních látek, jiných než jsou radioaktivní látky zvláštní formy, která je uvedena v tabulce 2.2.7.2.1 nebo odvozena podle pododdílu 2.2.7.2 a která se používá pro určení mezních hodnot aktivity pro účely předpisů ADR.

Látka s nízkou specifickou aktivitou (LSA) - je radioaktivní látka, která má ze své povahy omezenou specifickou aktivitu nebo radioaktivní látka, pro kterou platí mezní hodnoty odhadované střední specifické aktivity. Při stanovení odhadované střední specifické aktivity se neberou v úvahu vnější stínící materiály obklopující LSA.

Neozářené thorium - thorium, které obsahuje nejvýše 10⁻⁷ g uranu-233 na gram thoria-232,

Neozářený uran - uran, který obsahuje nejvýše 2x10³ Bq plutonia na gram uranu-235, nejvýše 9x10⁶ Bq štěpných produktů na gram uranu-235 a nejvýše 5x10⁻³ g uranu-236 na gram uranu-235.

Nízkodisperzní radioaktivní látka je buď tuhá radioaktivní látka, nebo tuhá radioaktivní látka v uzavřené kapsli, která má omezenou schopnost se rozptýlovat a není v práškovité formě.

Nízkotoxické alfa zářiče jsou: přírodní uran, ochuzený uran, přírodní thorium, uran-235 nebo uran-238, thorium-232, thorium-228 a thorium-230, jsou-li tyto obsaženy v rudách nebo fyzikálních nebo chemických koncentrátech, nebo alfa zářiče s poločasem rozpadu kratším než 10 dní.

Povrchově kontaminovaný předmět (SCO) - tuhý předmět, který sám není radioaktivní, ale na jehož povrchu je rozptýlena radioaktivní látka.

Radioaktivní látka zvláštní formy - je

- a) nerozptýlitelná tuhá radioaktivní látka; nebo
- b) těsně uzavřené pouzdro, obsahující radioaktivní látku.

Specifická aktivita radionuklidu - aktivita radionuklidu vztažená na jednotku hmotnosti tohoto nuklidu. Specifická aktivita látky je aktivita vztažená na jednotku hmotnosti této látky, ve které je radionuklid v podstatě rovnoměrně rozptýlen.

Štěpné nuklidy jsou uran-233, uran-235, plutonium-239 a plutonium-241. **Štěpné látky** jsou látky obsahující kterýkoli z těchto štěpných nuklidů. Vyjmuty z definice štěpných látek jsou:

- a) neozářený přírodní uran nebo neozářený ochuzený uran;
- b) přírodní uran nebo ochuzený uran, které byly ozářeny výhradně v tepelných reaktorech;
- c) materiál se štěpnými nuklidy o celkové hmotnosti menší než 0,25 g;

d) libovolná kombinace (a), (b) anebo (c).

Tyto výjimky jsou platné pouze tehdy, jestliže žádný další materiál se štěpnými nuklidy není obsažen v radioaktivní zásilce, nebo v dodávce, je-li přepravován nebalený

Uranem - přírodním, ochuzeným, obohaceným se rozumí:

Přírodní uran je uran (včetně chemicky separovaného), ve kterém se vyskytují izotopy uranu (v množství cca 99,28 % hmot. uranu-238, a cca 0,72 % hmot. uranu-235).

Ochuzený uran s menším hmotnostním podílem uranu-235 než má přírodní uran;

Obohacený uran s vyšším hmotnostním podílem uranu-235 než 0,72 % hmot.

Ve všech případech se vyskytuje nepatrný hmotnostní podíl uranu-234.

2.2.7.2 Klasifikace

2.2.7.2.1 Všeobecné předpisy

2.2.7.2.1.1 Radioaktivní látky musí být přiřazeny k jednomu z UN čísel specifikovanému v tabulce 2.2.7.2.1.1, v souladu s 2.2.7.2.4 a 2.2.7.2.5, s přihlédnutím k materiálovým charakteristikám stanoveným v 2.2.7.2.3.

Tabulka 2.2.7.2.1.1 Přiřazení UN čísel

UN číslo	Pojmenování a popis ^a
Vyjmuté kusy (1.7.1.5)	
UN 2908	LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS – PRAZDNÝ OBAL

UN 2977	LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, ŠTĚPNÁ
UN 2978	LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, jiná než štěpná nebo vyjmutá štěpná ^b
UN 3507	LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, VYJMUTÝ KUS méně než 0.1 kg v radioaktivní zásilce, ^{b, c}

^a Pojmenování lze nalézt v kolonce „Pojmenování a popis“ a je omezeno na část napsanou velkými písmeny V položkách UN 2909, UN 2911, UN 2913 a UN 3326 se musí použít pouze odpovídající pojmenování z alternativních pojmenování, které jsou odděleny slovy „nebo“.

^b Pojem „vyjmutá štěpná“ se vztahuje pouze na látku vyjmutou podle 2.2.7.2.3.5.

^c Pro UN 3507, viz též zvláštní ustanovení 369 v kapitole 3.3.

2.2.7.2.2 Určení základních hodnot radionuklidů

2.2.7.2.2.1 V tabulce 2.2.7.2.2.1 jsou uvedeny následující základní hodnoty pro jednotlivé radionuklidy:

- (a) A_1 a A_2 v TBq;
- (b) mezní hodnoty koncentrace aktivity pro vyjmuté látky v Bq/g; a
- (c) mezní hodnoty aktivity pro vyjmuté zásilky v Bq.

Tabulka 2.2.7.2.2.1 Základní hodnoty aktivity jednotlivých radionuklidů

Radionuklid (atomové číslo)	A_1 (TBq)	A_2 (TBq)	Mezní hodnoty koncentrace aktivity pro vyjmuté látky (Bq/g)	Mezní hodnota aktivity pro vyjmuté zásilky (Bq)

Am-243	Np-239

- (c) Množství může být určeno pomocí měření doby rozpadu nebo měření dávkové intenzity v předepsané vzdálenosti od zdroje.
- (d) Tyto hodnoty platí pouze pro sloučeniny uranu, které jak za normálních, tak i nevhodných podmínek přepravy zachovávají chemickou podobu UF₆, UO₂F₂ a UO₂(NO₃)₂.
- (e) Tyto hodnoty platí pouze pro uranové sloučeniny, které jak za normálních, tak i nevhodných podmínek přepravy zachovávají chemickou podobu UO₃, UF₄, UCl₄, a pro šestimocné sloučeniny.
- (f) Tyto hodnoty platí pro všechny uranové sloučeniny, kromě těch, které jsou uvedeny pod písmeny d) a e) výše.
- (g) Tyto hodnoty platí pouze pro neozářený uran.

2.2.7.2.2.2

Pro jednotlivé radionuklidy:

- (a) které nejsou uvedeny v tabulce 2.2.7.2.2.1, vyžaduje určení základních hodnot radionuklidů podle ustanovení 2.2.7.2.2.1 vícestranné schválení. Pro tyto radionuklidy musí být meze hmotnostní aktivity pro vyjmutí látky a meze aktivity pro vyjmutí zásilky vypočteny v souladu s principy stanovenými v (dokumentu) International Basic Safety Standards for Protection against Ionizing Radiation and for the Safety of Radiation Sources, Safety Series No.115, IAEA, Vienna (1996). Je dovoleno použít hodnotu A₂ vypočtenou použitím dávkového koeficientu pro příslušný typ absorpce plicemi (retence), jak je doporučeno Mezinárodní komisí pro radiační ochranu (International Commission on Radiological Protection), je-li vzata v úvahu chemická forma každého radionuklidu jak při normálních podmínkách přepravy, tak za podmínek nehody při přepravě. Alternativně mohou být použity hodnoty v tabulce 2.2.7.2.2.2 bez schválení příslušným orgánem.
- (b) v přístrojích nebo výrobcích, ve kterých jsou radioaktivní látky uzavřeny nebo v nich obsaženy jako součást nebo v jiném výrobku a splňují-li tyto přístroje nebo výrobky požadavky 2.2.7.2.4.1.3 (c), jsou povoleny alternativní základní hodnoty radionuklidů k hodnotám v tabulce 2.2.7.2.2.1 pro mezní hodnotu aktivity pro vyjmutou zásilku, avšak vyžadují vícestranné schválení. Takové alternativní mezní hodnoty aktivity pro vyjmuté zásilky musí být vypočteny v souladu s principy (dokumentu) International Basic Safety Standards for

Protection against Ionizing Radiation and for the Safety of Radiation Sources, Safety Series No.115, IAEA, Vienna (1996).

Tabulka 2.2.7.2.2.2 Základní hodnoty aktivity radionuklidů pro neznámé radionuklidy a směsi

Radioaktivní obsah	A ₁	A ₂	Mezní hodnoty koncentrace aktivity pro vyjmuté látky	Mezní hodnota aktivity pro vyjmuté zásilky
	[TBq]	[TBq]	[Bq/g]	[Bq]
Je známa pouze přítomnost radionuklidů emitujících záření beta nebo gama	0.1	0.02	1x10 ¹	1x10 ⁴
Je známa přítomnost nuklidů emitujících záření alfa, ale není známa přítomnost neutronových zářičů	0.2	9x10 ⁻⁵	1x10 ⁻¹	1x10 ³
Je známa přítomnost neutronových zářičů nebo nejsou dostupné žádné údaje	0.001	9x10 ⁻⁵	1x10 ⁻¹	1x10 ³

2.2.7.2.2.3 Při stanovení hodnot A₁ a A₂ pro radionuklid neobsažený v tabulce 2.2.7.2.2.1 se jednoduše radioaktivní rozpadová řada, v níž jsou radionuklidy obsaženy v poměru, ve kterém se vyskytují v přírodě, a v níž žádný dceřinný radionuklid nemá poločas rozpadu delší než 10 dní, nebo delší než poločas rozpadu mateřského radionuklidu, považuje za jednotlivý radionuklid; v tomto případě je třeba vzít v úvahu aktivitu a použít hodnoty A₁ nebo A₂ odpovídající mateřskému nuklidu v řadě. U radioaktivní rozpadové řady, v níž má kterýkoli dceřinný nuklid poločas rozpadu buď delší než 10 dnů, nebo delší než mateřský radionuklid, je nutno považovat mateřský radionuklid a takové dceřinné nuklidy za směsi různých nuklidů.

2.2.7.2.2.4 K určování základních hodnot pro směsi radionuklidů, kde základní hodnoty jednotlivých radionuklidů jsou uvedeny v tabulce 2.2.7.2.2.1, platí vztah:

$$X_m = 1 / \sum [f_{(i)} / X_{(i)}]$$

kde:

$f_{(i)}$ je podíl aktivity nebo specifické aktivity příslušného radionuklidu i ve směsi;

$X_{(i)}$ je příslušná hodnota A₁ nebo A₂ nebo mez specifické aktivity pro vyjmutou látku nebo mez aktivity pro vyjmutou zásilku pro příslušný radionuklid i; a

X_m je odvozená hodnota z hodnot A₁ nebo A₂ nebo specifické aktivity pro vyjmutou látku nebo z meze aktivity pro vyjmutou zásilku v případě směsi.

2.2.7.2.2.5 Je-li známa identita každého radionuklidu, ale nejsou-li známy hodnoty aktivity některých radionuklidů, mohou být radionuklidy seskupeny do skupin a nejnižší hodnota aktivity v každé skupině může být použita při výpočtech podle vzorců uvedených v bodech 2.2.7.2.2.4 a 2.2.7.2.4.4. Skupiny mohou být vytvořeny na základě celkové alfa aktivity a celkové beta/gama aktivity, pokud jsou známy; k výpočtu se používá nejnižších hodnot jak pro zářiče alfa tak pro zářiče beta/gama.

2.2.7.2.2.6 Pro jednotlivé radionuklidy nebo směsi radionuklidů, pro které nejsou k dispozici příslušné údaje, se použijí hodnoty uvedené v tabulce 2.2.7.2.2.2.

2.2.7.2.3 Stanovení dalších materiálových charakteristik

2.2.7.2.3.1 Látky s nízkou specifickou aktivitou (LSA)

2.2.7.2.3.1.1 (Vyhrazeno)

2.2.7.2.3.1.2 Látky LSA se rozdělují do tří skupin

- (a) LSA-I
- (i) uranové a thoriové rudy, koncentráty těchto rud a další rudy obsahující přirodně se vyskytující radionuklidy;
 - (ii) přírodní uran, ochuzený uran, přírodní thorium nebo jejich sloučeniny nebo směsi, které nebyly ozářeny a jsou tuhé nebo kapalné;
 - (iii) radioaktivní látka, pro kterou je hodnota A_2 neomezena. Může obsahovat štěpnou látku pouze za předpokladu, že je vyjmuta podle 2.2.7.2.3.5
 - (iv) další radioaktivní látky, ve kterých je aktivita zcela rozptýlena a stanovená průměrná specifická aktivita nepřekračuje třicetinasobek hodnoty stanovené podle 2.2.7.2.2.1 až 2.2.7.2.2.6. Může obsahovat štěpnou látku pouze za předpokladu, že je vyjmuta podle 2.2.7.2.3.5.
- (b) LSA-II
- (i) voda s tritiem o koncentraci do 0,8 TBq/l;
 - (ii) další látky, ve kterých je aktivita zcela rozptýlena a stanovená průměrná specifická aktivita nepřevyšuje $10^{-4} A_2/g$ pro tuhé látky a plyny a $10^{-5} A_2/g$ pro kapaliny;
- (c) LSA-III - Tuhé látky (t.j. zpevněné odpady, aktivované materiály) s výjimkou prášků, které splňují požadavky uvedené v 2.2.7.2.3.1.3, v nichž současně:
- (i) radioaktivní látka je zcela rozptýlena v tuhé látce nebo v tuhých předmětech nebo je v podstatě rovnoměrně rozptýlena v kompaktní pojivě látky (jako je beton, bitumen a keramika);
 - (ii) radioaktivní látka je relativně nerozpustná nebo je vázána v relativně nerozpustném podkladu, takže ani v případě ztráty funkčnosti obalového souboru by ztráta radioaktivních látek z jednoho obalu loužením ve vodě po dobu sedm dní nepřesáhla $0,1 A_2$; a
 - (iii) stanovená průměrná hmotnostní aktivita tuhé látky bez stínícího materiálu nepřekračuje $2 \cdot 10^{-3} A_2/g$.

2.2.7.2.3.1.3 Látky LSA-III musí být tuhými látkami takové povahy, že jestliže by se celkový obsah kusu podrobil zkoušce uvedené v 2.2.7.2.3.1.4, aktivita ve vodě by nepřekročila $0,1 A_2$

2.2.7.2.3.1.4 Látky LSA-III se zkoušejí následovně:

Vzorek tuhé látky představující úplný obsah kusu (ne méně) musí být na sedm dní ponořený do vody (ke stanovení vyluhovatelnosti) při pokojové teplotě. Objem vody použité ke zkoušce musí být takový, aby na konci sedmidenního zkušebního období zaručoval, že volný objem neabsorbované a nezreagované vody bude přinejmenším dosahovat 10 % objemu samotného vzorku tuhé látky. Voda musí mít počáteční pH 6 - 8 a maximální měrnou vodivost 1 mS/m při 20°C . Celková aktivita volného objemu vody musí být měřena po skončení sedmidenní zkoušky.

2.2.7.2.3.1.5 Důkaz o dodržení požadovaných kritérií podle 2.2.7.2.3.1.4 musí být v souladu s 6.4.12.1 a 6.4.12.2

2.2.7.2.3.2 Povrchově kontaminovaný předmět (SCO)

SCO se zařazují do jedné ze dvou skupin:

(a) SCO-I, tuhý předmět, na kterém:

- (i) nefixovaná kontaminace na přístupném povrchu o ploše průměrně 300 cm^2 (nebo na celé ploše, je-li menší než 300 cm^2) nepřekračuje 4 Bq/cm^2 u beta a gama zářičů a alfa zářičů s nízkou toxicitou, nebo $0,4 \text{ Bq/cm}^2$ u všech ostatních alfa zářičů; a
- (ii) fixovaná kontaminace na přístupném povrchu o ploše průměrně 300 cm^2 (nebo na celé ploše, je-li menší než 300 cm^2) nepřekračuje $4 \times 10^4 \text{ Bq/cm}^2$ u beta a gama zářičů a alfa zářičů s nízkou toxicitou, nebo $4 \times 10^3 \text{ Bq/cm}^2$ u všech ostatních alfa zářičů; a
- (iii) součet nefixované a fixované kontaminace na nepřístupném povrchu větším než 300 cm^2 (nebo na celé ploše, je-li menší než 300 cm^2) nepřekračuje $4 \times 10^4 \text{ Bq/cm}^2$

u beta a gama zářičů a alfa zářičů s nízkou toxicitou, nebo 4×10^3 Bq/cm² u všech ostatních alfa zářičů;

- (b) SCO-II, tuhý předmět, na jehož povrchu překračuje fixovaná nebo nefixovaná kontaminace meze uvedené pro SCO-I v (a), a na kterém:
- (i) nefixovaná kontaminace na přístupném povrchu o ploše větší než 300 cm² (nebo na celé ploše, je-li menší než 300 cm²) nepřekračuje 400 Bq/cm² u beta a gama zářičů a alfa zářičů s nízkou toxicitou, nebo 40 Bq/cm² u všech ostatních alfa zářičů; a
 - (ii) fixovaná kontaminace na přístupném povrchu na ploše větší než 300 cm² (nebo na celé ploše, je-li menší než 300 cm²) nepřekračuje 8×10^5 Bq/cm² u beta a gama zářičů a alfa zářičů s nízkou toxicitou nebo 8×10^4 Bq/cm² u všech ostatních alfa zářičů; a
 - (iii) součet nefixované a fixované kontaminace na nepřístupném povrchu o ploše větší než 300 cm² (nebo na celé ploše, je-li menší než 300 cm²) nepřekračuje 8×10^5 Bq/cm² u beta a gama zářičů a alfa zářičů s nízkou toxicitou nebo 8×10^4 Bq/cm² u všech ostatních alfa zářičů.

2.2.7.2.3.3 Radioaktivní látky zvláštní formy

2.2.7.2.3.3.1 Radioaktivní látka zvláštní formy musí mít alespoň jeden rozměr nejméně 5 mm. Pokud uzavřené pouzdro obsahuje část radioaktivní látky zvláštní formy, pouzdro musí být vyrobeno tak, aby je bylo možno otevřít pouze destrukcí. Vzor radioaktivní látky zvláštní formy vyžaduje jednostranné schválení.

2.2.7.2.3.3.2 Radioaktivní látka zvláštní formy musí být takové povahy, nebo musí být vyrobena tak, aby po provedených zkouškách podle 2.2.7.2.3.3.4 až 2.2.7.2.3.3.8 splňovala následující požadavky:

- (a) nepraskne nebo se nerozdrtí v průběhu zkoušek na náraz, tlak a ohyb podle 2.2.7.2.3.3.5 (a), (b), (c) a 2.2.7.2.3.3.6(a);
- (b) neroztaví se nebo se nerozptýlí při tepelných zkouškách specifikovaných v 2.2.7.2.3.3.5 (d) nebo 2.2.7.2.3.3.6 (b); a
- (c) aktivita vody při stanovení vyluhovatelnosti podle 2.2.7.2.3.3.7. a 2.2.7.2.3.3.8 nepřekročí 2 kBq; nebo u uzavřených zářičů rychlost objemového úniku při zkoušce hodnotící objemový únik, specifikovaný v publikaci Mezinárodní organizace pro standardizaci: „Radiální ochrana - uzavřené radioaktivní zářiče - metody zkoušek netěsnosti, ISO 9987:1992 E, ISO, Geneva, 1992“, nepřekročí příslušnou mez stanovenou příslušným orgánem.

2.2.7.2.3.3.3 Důkaz o dodržení požadovaných kritérií podle 2.2.7.2.3.3.2 musí být v souladu s 6.4.12.1 a 6.4.12.2.

2.2.7.2.3.3.4 Vzorky, které obsahují nebo simulují radioaktivní látku zvláštní formy, musí být podrobeny pádové zkoušce, zkoušce nárazem, ohybové zkoušce a tepelné zkoušce podle 2.2.7.2.3.3.5 nebo alternativně zkoušce podle 2.2.7.2.3.3.6. Pro každou z těchto zkoušek může být použit jiný vzorek. Po každé zkoušce musí být provedeno stanovení vyluhovatelnosti nebo test rychlosti objemového úniku daného vzorku pomocí metody, která nesmí být méně citlivá než metody specifikované v 2.2.7.2.3.3.7 pro nerozptýlitelnou tuhou látku nebo podle bodu 2.2.7.2.3.3.8 pro zapouzdřenou látku.

2.2.7.2.3.3.5 Závazné zkušební metody jsou:

- (a) Pádová zkouška: Vzorek musí padnout na podložku (terč) z výšky 9 m. Podložka musí odpovídat definici v 6.4.14;
- (b) Zkouška průrazem: vzorek musí být umístěn na plátu olova, podepřeném hladkou tuhou plochou a musí do něj narazit plochou přední stranou tyč z měkké oceli tak, aby způsobila náraz odpovídající důsledku nárazu hmoty 1,4 kg padající volným pádem z 1 m. Spodní část tyče musí mít průměr 25 mm s hranami zaoblenými na poloměr $(3,0 \pm 0,3)$ mm. Olovo o tvrdosti 3,5 - 4,5 podle Vickersovy stupnice a o tloušťce nejvýše 25 mm musí překrývat plochu větší, než činí plocha vzorku. Pro každý náraz musí být použit nový olověný povrch. Tyč musí na vzorek narazit v místě předpokládaného největšího poškození;

- (c) Zkouška ohybem se musí provádět pouze pro dlouhé a tenké zdroje, které mají minimální délku 10 cm a současně poměr délky k minimální šířce činí nejméně 10. Vzorek musí být pevně uchycen tak, aby jedna jeho polovina vyčnívala přes okraj uchycení. Orientace vzorku musí být taková, aby došlo k jeho maximálnímu poškození, když na jeho volný konec narazí přední plocha ocelové tyče. Ocelová tyč musí na vzorek narazit tak, aby způsobila náraz odpovídající důsledku nárazu hmoty 1,4 kg padající volným pádem z 1 m. Spodní část tyče musí mít průměr 25 mm s hranami zaoblenými na poloměr $(3,0 \pm 0,3)$ mm;
 - (d) Tepelná zkouška: Vzorek musí být ohříván na vzduchu na teplotu 800 °C, na této teplotě musí být udržován 10 minut a po té se musí nechat vychladnout.
- 2.2.7.2.3.3.6 Vzorky, které obsahují nebo simulují radioaktivní látku uzavřenou v hermetickém pouzdru nemusí být prověřovány:
- (a) zkouškami předepsanými v 2.2.7.2.3.3.5 (a) a (b) za předpokladu, že tyto vzorky jsou alternativně vystaveny zkoušce nárazem předepsané v dokumentu ISO 2919:2012: "Radiation Protection - Sealed Radioactive Sources - General requirements and classification (Radiální ochrana – Uzavřené radioaktivní zářiče – Všeobecné požadavky a klasifikace), a to:
 - (i) zkoušce nárazem 4. třídy, pokud hmotnost radioaktivní látky zvláštní formy je rovna nebo menší než 200 g;
 - (ii) zkoušce nárazem 5. třídy, pokud hmotnost radioaktivní látky zvláštní formy je rovna nebo větší než 200 g, avšak menší než 500 g;
 - (b) zkouškou, předepsanou v 2.2.7.2.3.3.5 (d), za předpokladu, že alternativně jsou vystaveny teplotní zkoušce 6. třídy, předepsané v publikaci Mezinárodní organizace pro standardizaci: ISO 2919:2012 „Radiální ochrana – Uzavřené radioaktivní zářiče – Všeobecné požadavky a klasifikace“.
- 2.2.7.2.3.3.7 Pro vzorky obsahující nebo simulující nerozptýlitelnou tuhou látku, musí být stanovení vyluhovatelnosti prováděno následovně:
- (a) vzorek musí být na sedm dní ponořený do vody (ke stanovení vyluhovatelnosti) při pokojové teplotě. Objem vody použité ke zkoušce musí být takový, aby na konci sedmidenního zkušebního období zaručoval, že volný objem neabsorbované a nezreagované vody bude při nejmenším dosahovat 10 % objemu samotného vzorku tuhé látky. Voda musí mít počáteční pH 6 - 8 a maximální vodivost 1 mS/m při 20 °C;
 - (b) voda se vzorkem se musí poté ohřát na teplotu 50 ± 5 °C a tato teplota musí být udržována po dobu 4 hodin;
 - (c) potom musí být stanovena aktivita vody;
 - (d) nato musí být vzorek ponechán v klidném ovzduší po dobu sedmi dnů při minimální teplotě 30 °C a minimální relativní vlhkosti 90 %;
 - (e) následně musí být vzorek ponořen do vody o stejné specifikaci jako v bodě (a) výše a tato voda se musí poté ohřát na teplotu 50 ± 5 °C a, tato teplota musí být udržována po dobu 4 hodin;
 - (f) nakonec musí být stanovena aktivita vody.
- 2.2.7.2.3.3.8 Pro vzorky obsahující nebo simulující radioaktivní látku uzavřenou v hermetickém pouzdru, musí být provedeno buď stanovení vyluhovatelnosti, nebo rychlosti objemového úniku, a to následujícím způsobem:
- (a) Vyluhovací zkouška musí sestávat z následujících kroků:
 - (i) vzorek musí být ponořený do vody při pokojové teplotě. Voda musí mít počáteční pH 6 - 8 a maximální vodivost 1 mS/m při 20 °C;
 - (ii) voda se vzorkem se musí poté ohřát na teplotu 50 ± 5 °C a tato teplota musí být udržována po dobu 4 hodin;
 - (iii) potom musí být stanovena aktivita vody;

- (iv) nato musí být vzorek ponechán v klidném ovzduší po dobu sedmi dnů při minimální teplotě 30 °C a minimální relativní vlhkosti 90 %;
 - (v) postup podle bodů (i), (ii) a (iii) musí být opakován.
 - (b) Alternativní stanovení rychlosti objemového úniku musí zahrnovat kteroukoliv ze zkoušek, předepsaných v publikaci Mezinárodní organizace pro standardizaci: „Radiační ochrana - uzavřené radioaktivní zářiče - metody zkoušek netěsnosti, ISO 9987:1992, pokud jsou přijatelné pro příslušný orgán.
- 2.2.7.2.3.4 Radioaktivní látky s nízkou rozptýlitelností
- 2.2.7.2.3.4.1 Konstrukce radioaktivní látky s malou rozptýlitelností podléhá vícestrannému schválení. Radioaktivní látka s malou rozptýlitelností musí být takové povahy, aby celkové množství této radioaktivní látky v kusu, s přihlédnutím k ustanovením v 6.4.8.14, splnilo následující požadavky:
- (a) hodnota příkonu dávkového ekvivalentu ve vzdálenosti 3 m od nestíněné radioaktivní látky nesmí překročit hodnotu 10 mSv/h;
 - (b) po provedení testů specifikovaných v 6.4.20.3 a 6.20.4, nesmí aktivita uvolněných aerosolů ve formě plynné nebo tuhých částic překročit, až do aerodynamického ekvivalentu průměru 100 μm, hodnotu 100 A₂. Pro každou zkoušku může být použit zvláštní vzorek; a
 - (c) po provedení zkoušky podle 2.2.7.2.3.1.4, aktivita ve vodě nesmí nepřekročit 100 A₂. Při tomto testu musí být vzato v úvahu poškození v důsledku zkoušek uvedených v bodu (b).
- 2.2.7.2.3.4.2 Radioaktivní látka s malou rozptýlitelností musí být zkoušena následovně:
- Vzorek obsahující nebo simulující radioaktivní látku s malou rozptýlitelností musí být podroben rozšířené tepelné zkoušce specifikované v 6.4.20.3 a nárazové zkoušce specifikované v 6.4.20.4. Pro každou ze zkoušek může být použit jiný vzorek. Po každé zkoušce musí být vzorek podroben vyluhovací zkoušce specifikované v 2.2.7.2.3.1.4. Po každé zkoušce musí být stanoveno, zda jsou naplněny aplikovatelné požadavky uvedené v 2.2.7.2.3.4.1.
- 2.2.7.2.3.4.3 Důkaz o dodržení požadovaných kritérií podle 2.2.7.2.3.4.1 a 2.2.7.2.3.4.2 musí být v souladu s 6.4.12.1 a 6.4.12.2.
- 2.2.7.2.3.5 Štěpná látka
- Štěpné látky a kusy obsahující štěpné látky musí být klasifikovány jako „ŠTĚPNÁ“ přiřazením pod příslušnou položku tabulky 2.2.7.2.1.1, ledaže by byly vyjmuty podle jednoho z ustanovení pododstavců (a) až (f) níže a dopravovány podle požadavků 7.5.11 CV33 (4.3). Všechna tato ustanovení se vztahují pouze na látky v kusech, které splňují požadavky 6.4.7.2, pokud není nebalený materiál v ustanovení výslovně povolen.
- (a) uran obohacený maximálně na 1 hmot. % uranu-235 a s celkovým obsahem plutonia a uranu-233 nepřevyšujícím 1 hmot. % uranu-235 za předpokladu, že štěpné nuklidy jsou rozloženy zcela homogenně v celém objemu. Navíc, je-li uran-235 ve formě kovu, oxidu nebo karbidu, nesmí být uspořádán ve tvaru mříže;
 - (b) kapalně roztoky dusičnanu uranuly s uranem obohaceným maximálně na 2 hmot. % uranu-235, přičemž celkový obsah plutonia a uranu-233 nesmí přesáhnout 0,002% hmotnosti uranu a minimální poměr počtu atomů dusíku ku počtu atomů uranu (N/U) musí být 2;
 - (c) Uran obohacený maximálně na 5 % hmot. izotopem uran-235 za předpokladu, že:
 - (i) hmotnost izotopu uran-235 není větší než 3,5 g na kus,
 - (ii) celkový obsah plutonia a izotopu uran-233 nepřekračuje 1 % hmotnosti izotopu uran-235 na radioaktivní zásilku,
 - (iii) pro dopravu kusu platí mez pro zásilku daná v 7.5.11 CV33 (4.3) (c);
 - (d) štěpné nuklidy s celkovou hmotností nepřevyšující 2 g na kus za předpokladu, že pro dopravu kusu platí mez pro zásilku daná v 7.5.11 CV33 (4.3) (d);

- (e) štěpné nuklidy s celkovou hmotností nepřevyšující 45 g, buď v obalovém souboru, nebo volně ložené, za předpokladu, že pro dopravu platí mez pro zásilku daná v 7.5.11 CV33 (4.3) (e);
- (f) štěpné látky, které splňují požadavky 7.5.11 CV33 (4.3) (b), 2.2.7.2.3.6 a 5.1.5.2.1.

2.2.7.2.3.6 Štěpné látky vyjmuté z klasifikace jako „ŠTĚPNÁ“ na základě 2.2.7.2.3.5 (f) musí být v podkritickém stavu bez potřeby kontroly nahromadění za následujících podmínek:

- (a) ustanovení 6.4.11.1 (a);
- (b) shodných s podmínkami pro hodnocení kusů uvedenými v 6.4.11.12 (b) a 6.4.11.13 (b).

2.2.7.2.4 Klasifikace kusů nebo nebalené látky

Množství radioaktivní látky v kusu nesmí překročit příslušné meze na obal, jak je uvedeno níže.

2.2.7.2.4.1 Klasifikace jako vyjmutý kus

2.2.7.2.4.1.1 Kus může být klasifikován jako vyjmutý, splňuje-li jednu z následujících podmínek:

- (a) je prázdným obalem, který obsahoval radioaktivní látku;
- (b) obsahuje přístroje nebo výrobky nepřevyšující meze aktivity, specifikované ve sloupcích (2) a (3) tabulky 2.2.7.2.4.1.2;
- (c) obsahuje výrobky vyrobené z přírodního uranu, ochuzeného uranu nebo přírodního thoria;
- (d) obsahuje radioaktivní látky nepřevyšující meze aktivity, specifikované ve sloupci (4) tabulky 2.2.7.2.4.1.2; nebo
- (e) obsahuje méně než 0.1 kg hexafluoridu uranu nepřevyšující meze aktivity, specifikované ve sloupci (4) tabulky 2.2.7.2.4.1.2

2.2.7.2.4.1.2 Kus, který obsahuje radioaktivní látky, může být klasifikován jako vyjmutý kus pokud dávkový příkon na libovolném místě jeho vnějšího povrchu nepřevyšuje 5 $\mu\text{Sv/h}$.

Tabulka 2.2.7.2.4.1.2 Meze aktivity pro vyjmuté kusy

FYZIKÁLNÍ STAV OBSAHU (SKUPENSTVÍ)	Přístroj nebo výrobek		Látky – meze pro radioaktivní kusy ^a
	Meze pro předměty ^a	Meze pro radioaktivní kusy ^a

^a Pro směsi radionuklidů, viz: 2.2.7.2.2.4 až 2.2.7.2.2.6

2.2.7.2.4.1.3 Radioaktivní látky, které jsou uzavřeny v přístroji nebo obsaženy ve výrobku, nebo tvoří součást těchto předmětů, mohou být klasifikovány jako UN 2911 LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS – PŘÍSTROJE nebo VÝROBKY, za předpokladu že:

- (a) příkon dávkového ekvivalentu ve vzdálenosti 10 cm od libovolného místa vnějšího povrchu nebaleného přístroje nebo výrobku není vyšší než 0,1 mSv/h;
- (b) každý přístroj nebo výrobek je opatřen nápisem „RADIOAKTIVNÍ“ („RADIOACTIVE“) s výjimkou:
 - (i) hodin nebo zařízení opatřených značením provedeným barvami světélkujícími na základě radioluminiscence;

- (ii) spotřebních výrobků majících povolení příslušného úřadu podle 1.7.1.4 (e) nebo jednotlivě nepřevyšují meze aktivity pro vyjmuté zásky, specifikované v tabulce 2.2.7.2.2.1 (sloupec 5), za předpokladu, že takové výrobky jsou dopravovány v obalu, který je označen nápisem „Radioaktivní“ („Radioactive“) na jeho vnitřním povrchu takovým způsobem, že toto upozornění na přítomnost radioaktivní látky je viditelné při otevření obalu;
 - (iii) ostatní přístroje nebo výrobky příliš malé, aby mohly být označeny nápisem „Radioaktivní“ („Radioactive“), za předpokladu, že jsou dopravovány v obalu, který je označen nápisem „Radioaktivní“ („Radioactive“) na jeho vnitřním povrchu takovým způsobem, že toto upozornění na radioaktivní látku je viditelné při otevření obalu;
 - (c) radioaktivní látka je úplně uzavřena neaktivními součástmi (přítom zařízení, jehož jediným účelem je obsahovat radioaktivní látku nelze považovat za přístroj nebo výrobek ve výše uvedeném smyslu); a
 - (d) platí limity specifikované ve sloupcích 2 a 3 tabulky 2.2.7.2.4.1.2 pro každou jednotlivou položku a každý kus.
- 2.2.7.2.4.1.4 Radioaktivní látky v jiných formách, než jsou formy uvedené v 2.2.7.2.4.1.3, jejichž aktivita nepřekračuje meze stanovené ve sloupci 4 tabulky 2.2.7.2.4.1.2, může být klasifikována jako UN 2910 LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS - OMEZENÁ MNOŽSTVÍ, pokud:
- (a) kus udrží svůj radioaktivní obsah za podmínek běžné přepravy; a
 - (b) Kus je označen nápisem „RADIOAKTIVNÍ“ („RADIOACTIVE“), buď:
 - (i) na vnitřním povrchu takovým způsobem, že upozornění na přítomnost radioaktivní látky je viditelné při otevření obalu, nebo
 - (ii) na vnějším povrchu kusu, je-li nepraktické to označovat vnitřní povrch;
- 2.2.7.2.4.1.5 Hexafluorid uranu nepřevyšující meze aktivity, specifikované ve sloupci (4) tabulky 2.2.7.2.4.1.2 může být klasifikován jako UN 3507 Radioaktivní látka, vyjmutý kus – HEXAFLUORID URANU, méně než 0.1 kg na kus, jiná než štěpná nebo vyjmutá štěpná tak, že:
- (a) hmotnost hexafluoridu uranu v kusu je menší než 0.1 kg;
 - (b) jsou splněny podmínky 2.2.7.2.4.5.1 a 2.2.7.2.4.1.4 (a) a (b).
- 2.2.7.2.4.1.6 Výrobky vyrobené z přírodního uranu, ochuzeného uranu nebo přírodního thoria a výrobky, ve kterých jsou jedinými radioaktivními látkami neozářený přírodní uran, neozářený ochuzený uran nebo neozářené přírodní thorium, mohou být klasifikovány jako UN 2909 LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS - VÝROBKY Z PŘÍRODNÍHO URANU nebo OCHUZENÉHO URANU nebo PŘÍRODNÍHO THORIA za předpokladu, že vnější povrch uranu nebo thoria je uzavřen v neaktivním plášti z kovu nebo jiného tuhého materiálu.
- 2.2.7.2.4.1.7 Prázdný obal, který obsahoval radioaktivní látky, může být klasifikován jako UN 2908 LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS - PRÁZDNÝ OBAL za předpokladu, že:
- (a) je v bezvadném stavu a je bezpečně uzavřen;
 - (b) vnější povrch každé jeho součásti z uranu nebo thoria je uzavřen neaktivním pláštěm z kovového nebo jiného tuhého materiálu;
 - (c) úroveň nefixované kontaminace na jeho vnitřním povrchu o ploše větší než 300 cm² nepřekračuje:
 - (i) 400 Bq/cm² pro beta a gama zářiče a nízkotoxické alfa zářiče; a
 - (ii) 40 Bq/cm² pro všechny ostatní alfa zářiče; a
 - (d) veškeré bezpečnostní značky, které na něm mohly být umístěny v souladu s 5.2.2.1.11.1, jsou zakryty, znehodnoceny nebo odstraněny.

2.2.7.2.4.2 Klasifikace jako látka s nízkou specifickou aktivitou (LSA)

Radioaktivní látka může být zaříděna jako látka LSA za předpokladu, že je splněna definice látky LSA v 2.2.7.1.3 a podmínky dle 2.2.7.2.3.1, 4.1.9.2 a 7.5.11 CV33 (2).

2.2.7.2.4.3 Klasifikace jako povrchově kontaminovaný předmět (SCO)

Radioaktivní látka může být zaříděna jako SCO za předpokladu, že je splněna definice SCO v 2.2.7.1.3 a podmínky dle 2.2.7.2.3.2, 4.1.9.2 a 7.5.11 CV33 (2).

2.2.7.2.4.4 Klasifikace jako kus typu A

Kusy obsahující radioaktivní látky mohou být zaříděny jako kus typu A za předpokladu dodržení následujících podmínek:

Kusy typu A nesmí obsahovat aktivity větší než jedna z následujících:

- (a) A_1 ; pro radioaktivní látku zvláštní formy;
- (b) A_2 ; pro všechny ostatní radioaktivní látky.

Pro směsi radionuklidů jejichž identita a příslušné aktivity jsou známy, platí následující podmínka pro radioaktivní látky kusu typu A:

$$\sum_i \frac{B(i)}{A_1(i)} + \sum_j \frac{C(j)}{A_2(j)} \leq 1$$

kde:

$B(i)$ je aktivita radionuklidu i jako radioaktivní látky zvláštní formy;

$A_1(i)$ je hodnota A_1 pro radionuklid i ;

$C(j)$ je aktivita radionuklidu j jako radioaktivní látky jiné než radioaktivní látka zvláštní formy;

$A_2(j)$ je hodnota A_2 pro radionuklid j .

2.2.7.2.4.5 Klasifikace hexafluoridu uranu

2.2.7.2.4.5.1 Hexafluorid uranu může být přiřazen pouze k:

- (a) UN 2977, LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, ŠTĚPNÁ;
- (b) UN 2978, LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, jiná než štěpná nebo vyjmutá štěpná; nebo
- (c) UN 3507 LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, VYJMUTÝ KUS méně než 0.1 kg v radioaktivní zásilce.

2.2.7.2.4.5.2 Obsah kusu obsahujícího hexafluorid uranu musí splňovat následující požadavky:

- (a) pro UN 2977 a UN 2978, nesmí být hmotnost hexafluoridu uranu odlišná od hmotnosti povolené typovým schválením kusu a pro UN 3507 musí být hmotnost hexafluoridu uranu menší než 0.1 kg;
- (b) hmotnost hexafluoridu uranu nesmí být větší než taková hodnota, která by umožňovala menší než 5 % volný objem při maximální teplotě kusu, jak je specifikována pro systémy toho zařízení, kde se bude kus používat; a
- (c) hexafluorid uranu musí být v pevném skupenství a vnitřní tlak nesmí být vyšší než tlak atmosférický při předání k dopravě.

- 2.2.7.2.4.6 Zatřídění jako kusy typu B(U), typu B(M) nebo typu C
- 2.2.7.2.4.6.1 Kusy, které nejsou zatříděny podle 2.2.7.2.4 (2.2.7.2.4.1 až 2.2.7.2.4.5) musí být zatříděny v souladu s rozhodnutím o typovém schválení kusu vydaným příslušným orgánem v zemi původu nebo konstrukce vzoru.
- 2.2.7.2.4.6.2 Obsah kusů typu B(U), typu B(M) nebo typu C musí být takový, jak je specifikováno v rozhodnutí o typovém schválení kusu.
- 2.2.7.2.5 *Zvláštní ujednání*
- Radioaktivní látka musí být zatříděna jako přepravovaná podle zvláštního ujednání, když je určena k přepravě v souladu s 1.7.4.

2.2.8 Třída 8 Žíravé látky**2.2.8.1 Kritéria**

2.2.8.1.1 Název třídy 8 zahrnuje látky a předměty obsahující látky této třídy, které svým chemickým účinkem napadají vlákna epitelu pokožky nebo sliznic, se kterým přicházejí do styku, nebo které v případě úniku mohou způsobit škody na jiných věcech nebo na dopravních prostředcích nebo je mohou zničit. Pod název této třídy spadají také látky, které teprve s vodou tvoří žíravé kapaliny, nebo které za přítomnosti přirozené vlhkosti vzduchu vytvářejí žíravé páry nebo mlhy.

2.2.8.1.2 Látky a předměty třídy 8 jsou rozděleny následovně:

C1 - C11	Žíravé látky bez vedlejšího nebezpečí a předměty obsahující takové látky
C1 - C4	Kyselé látky
	C1 anorganické, kapalné
	C2 anorganické, tuhé
	C3 organické, kapalné
	C4 organické, tuhé
C5 - C8	Zásadité látky
	C5 anorganické, kapalné
	C6 anorganické, tuhé
	C7 organické, kapalné
	C8 organické, tuhé
C9-C10	Jiné žíravé látky
	C9 kapalné
	C10 tuhé
C11	Předměty
CF	Žíravé látky, hořlavé
	CF1 kapalné
	CF2 tuhé
CS	Žíravé látky, schopné samoohřevu
	CS1 kapalné
	CS2 tuhé
CW	Žíravé látky, které ve styku s vodou vyvíjejí hořlavé plyny
	CW1 kapalné
	CW2 tuhé
CO	Žíravé látky, podporující hoření
	CO1 kapalné
	CO2 tuhé
CT	Žíravé látky, toxické a předměty obsahující takové látky
	CT1 kapalné
	CT2 tuhé
	CT3 předměty
CFT	Žíravé látky, kapalné, hořlavé, toxické
COT	Žíravé látky, podporující hoření, toxické.

Klasifikace a přiřazení k obalovým skupinám

2.2.8.1.3 Látky třídy 8 musí být na základě svého stupně nebezpečí, které představují při přepravě, přiřazeny k následujícím obalovým skupinám :

Obalová skupina I : silně žíravé látky;
Obalová skupina II : žíravé látky;
Obalová skupina III: slabě žíravé látky

2.2.8.1.4 Látky a předměty zařazené do třídy 8 jsou uvedeny v tabulce A kapitoly 3.2. Přiřazení látek k obalovým skupinám I, II nebo III je založeno na získaných zkušenostech se zohledněním přídavných faktorů, jako nebezpečí vdechnutí (viz 2.2.8.1.5) a schopnosti reagovat s vodou (včetně vytvoření nebezpečných produktů rozkladu).

2.2.8.1.5 Látka nebo přípravek, které splňují kritéria třídy 8 a mají toxicitu při vdechnutí prachu a mlhy (LC₅₀) odpovídající obalové skupině I, ale toxicitu při požití nebo absorpci kůže odpovídající jen obalové skupině III nebo nižší, musí být přiřazeny ke třídě 8.

2.2.8.1.6 Látky, včetně směsí, které nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2, mohou být přiřazeny k vhodným položkám pododdílu 2.2.8.3 a k odpovídající obalové skupině na základě délky doby kontaktu, která je nutná k tomu, aby byla poškozena lidská pokožka v celé své tloušťce v souladu s kritérii odstavců (a) až (c) dále.

U kapalin a u tuhých látek, které mohou zkapalnit během přepravy, o nichž se předpokládá, že nevyvolají poškození lidské pokožky v celé její tloušťce, je třeba ještě zohlednit jejich schopnost způsobit korozi některých kovových povrchů. Při přiřazování látek k obalovým skupinám se musí zohlednit zkušenosti, získané při jejich náhodném působení. Jestliže takové zkušenosti chybí, je třeba přiřazení provést na základě výsledků pokusů podle směrnice pro zkoušení OECD 404⁷ nebo 435⁸. Látka, která podle směrnice pro zkoušení OECD 430⁹ nebo 431¹⁰ není určena za látku žíravou, smí být považována pro účely ADR bez dalšího zkoušení za látku, která není žíravá vůči pokožce.

- (a) K obalové skupině I jsou přiřazeny látky, které během pozorovací doby 60 minut, počínající po době působení 3 minut nebo kratší, způsobí zničení neporaněné kožní tkáně v celé její tloušťce.
- (b) K obalové skupině II jsou přiřazeny látky, které během pozorovací doby 14 dní, počínající po době působení delší než 3 minuty, nejvýše však 60 minut, způsobí zničení neporaněné kožní tkáně v celé její tloušťce.
- (c) K obalové skupině III jsou přiřazeny látky:
- které během pozorovací doby 14 dní, počínající po době působení delší než 60 minut, nejvýše však 4 hodiny, způsobí zničení neporaněné kožní tkáně v její celé tloušťce; nebo
 - u kterých se předpokládá, že nezpůsobí zničení neporaněné kožní tkáně v celé její tloušťce, u kterých však rychlost koroze buď na ocelových nebo hliníkových površích při zkušební teplotě 55 °C překračuje hodnotu 6,25 mm za rok „zkouší-li se na obou materiálech. Pro zkoušky je nutno použít ocel typu S235JR+CR (1.0037 resp. St 37-2), S275J2G3+CR(1.0144 resp. St 44-3), ISO 3574, Unifikovaný číslovací systém (UNS) G10200 nebo SAE 1020 a pro zkoušky hliníku nepotažené typy 7075-T6 nebo AZ5GU-T6. Uznávaná zkouška je předepsána v Příručce zkoušek a kritérií, části III, oddílu 37.

POZNÁMKA: Pokud první zkouška buď na oceli, nebo hliníku ukáže, že je zkoušená látka korozivní, nevyžaduje se již následná zkouška na tom druhém kovu.

⁷ OECD Guideline for the testing of chemicals No. 404 „Acute Dermal Irritation/Corrosion“ 2002

⁸ OECD Guideline for the testing of chemicals No. 435 „In Vitro Membrane Barrier Test Method for Skin Corrosion“ 2006.

⁹ OECD Guideline for the testing of chemicals No. 430 „In Vitro Skin Corrosion: Transcutaneous Electrical Resistance Test (TER)“ 2004.

¹⁰ OECD Guideline for the testing of chemicals No. 431 „In Vitro Skin Corrosion: Human Skin Model Test“ 2004.

Tabulka sumarizující kritéria uvedená v 2.2.8.1.6

Obalová skupina	Doba působení	Pozorovací doba	Účinek
I	≤ 3 min	≤ 60 min	Úplné zničení neporaněné kožní tkáně v celé její tloušťce
II	>3 min ≤ 1 h	≤ 14 d	Úplné zničení neporaněné kožní tkáně v celé její tloušťce
III	>1 h ≤ 4 h	≤ 14 d	Úplné zničení neporaněné kožní tkáně v celé její tloušťce
III	-	-	Rychlost koroze buď na ocelových, nebo hliníkových površích překračuje 6,25 mm za rok při zkušební teplotě 55 °C, zkouší-li se na obou materiálech

2.2.8.1.7 Jestliže látky třídy 8 vlivem příměsí spadají do jiných kategorií nebezpečnosti než do těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, přiřadí se tyto směsi nebo roztoky k položkám, ke kterým na základě svého skutečného nebezpečí patří.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz také oddíl 2.1.3.

2.2.8.1.8 Na základě kritérií uvedených v 2.2.8.1.6 se může také zjistit, zda je jmenovitě uvedený roztok nebo jmenovitě uvedená směs, popřípadě roztok nebo směs obsahující jmenovitě uvedenou látku takové povahy, že tento roztok nebo tato směs nepodléhá ustanovením této třídy.

2.2.8.1.9 Látky, roztoky a směsi, které:

- neodpovídají kritériím směrnic 67/548/EHS³ nebo 1999/45/ES⁴ v jejich platném znění a nejsou podle těchto směrnic v jejich platném znění zařazeny jako žíravé látky; a
- nepůsobí korozivně na ocel nebo hliník,

mohou být považovány za látky nepatřící do třídy 8.

POZNÁMKA: UN 1910 OXID VÁPENATÝ a UN 2812 HLINITAN SODNÝ, které jsou uvedeny ve Vzorových předpisech i OSN, nepodléhají předpisům ADR.

2.2.8.2 Látky nepřipustěné k přepravě

2.2.8.2.1 Chemicky nestálé látky třídy 8 je dovoleno přepravovat jen tehdy, jestliže byla učiněna potřebná opatření k zabránění jejich nebezpečnému rozkladu nebo polymeraci během přepravy. Pro tento účel je zejména nutno dbát na to, aby nádoby a cisterny neobsahovaly žádné látky, které by mohly tyto reakce podporovat.

2.2.8.2.2 K přepravě nejsou připuštěny následující látky:

- UN 1798 KYSELINA DUSÍČNÁ A CHLOROVODÍKOVÁ (solná), SMĚS,
- chemicky nestálé směsi odpadní kyseliny sírové,
- chemicky nestálé směsi nitrační kyseliny nebo směsi odpadní kyseliny sírové a dusičné, nedenitrované,
- kyselina chloristá, vodné roztoky s více než 72 % hm. čisté kyseliny nebo směsi kyseliny chloristé s jinými kapalnými látkami než s vodou.

³ Směrnice Rady Evropského společenství 67/548/EHS ze dne 27. června 1967 o sblížování právních a správních předpisů týkajících se klasifikace, balení a označování nebezpečných látek (Úřední věstník Evropského společenství č. L 196 ze dne 16. srpna 1967).

⁴ Směrnice 1999/45/ES Evropského parlamentu a Rady z 31. května 1999 o sblížování právních a správních předpisů členských států týkající se klasifikace, balení a označování nebezpečných přípravků (Úřední věstník Evropského společenství č. L 200 z 30. července 1999).

podporující hoření, toxické^{d),e)}		COT	(není k dispozici žádná hromadná položka s tímto klasifikačním kódem; je-li nutné přiřazení k hromadné položce s klasifikačním kódem, určí se z tabulky převažujících nebezpečí v pododdíle 2.1.3.10)

Poznámky:

- a) Směsi tuhých látek, které nepodléhají předpisům ADR, s žiravými kapalnými látkami mohou být přepravovány pod UN číslem 3244, bez toho, aby předtím byla použita přiřazovací kritéria pro třídu 8, za předpokladu, že v době nakládky látky nebo uzavírání obalu, vozidla nebo kontejneru není viditelná žádná volná kapalina. Každý obal musí odpovídat konstrukčnímu typu obalu, který obstál s úspěchem při zkoušce těsnosti pro obalovou skupinu II.
- b) Chlorsilany, které s vodou nebo vlhkým vzduchem vyvíjejí hořlavé plyny, jsou látkami třídy 4.3.
- c) Chlorformiáty s převažujícími toxickými vlastnostmi jsou látkami třídy 6.1.
- d) Žiravé látky, které jsou podle odstavců 2.2.61.1.4 až 2.2.61.1.9 při vdechnutí velmi toxické, jsou látkami třídy 6.1
- e) UN 1690 FLUORID SODNÝ, TUHÝ, UN 1812 FLUORID DRASELNÝ, TUHÝ, UN 2505 FLUORID AMONNÝ, UN 2674 HEXAFLUOROKŘEMIČITAN SODNÝ, UN 2856 HEXAFLUOROKŘEMIČITANY, J. N., UN 3415 FLUORID SODNÝ, ROZTOK a UN 3422 FLUORID DRASELNÝ, ROZTOK jsou látkami třídy 6.1.

2.2.9 Třída 9 Jiné nebezpečné látky a předměty**2.2.9.1 Kritéria**

2.2.9.1.1 Název třídy 9 zahrnuje látky a předměty, které během přepravy představují jiné nebezpečí, než jsou nebezpečí ostatních tříd.

2.2.9.1.2 Látky a předměty třídy 9 jsou rozděleny následovně:

M1	Látky, které při vdechnutí jemného prachu mohou ohrozit zdraví
M2	Látky a přístroje, které mohou v případě požáru vytvářet dioxiny
M3	Látky uvolňující hořlavé páry
M4	Lithiové baterie
M5	Záchranné prostředky
M6-M8	Látky ohrožující životní prostředí
	M6 Látky znečišťující vodu, kapalné
	M7 Látky znečišťující vodu, tuhé
	M8 Geneticky změněné mikroorganismy a organismy
M9-M10	Zahřáté látky
	M9 kapalné
	M10 tuhé
M11	Jiné látky, které během přepravy představují nebezpečí a neodpovídají definici žádné jiné třídy.

Definice a klasifikace

2.2.9.1.3 Látky a předměty zařazené do třídy 9 jsou uvedeny v tabulce A kapitoly 3.2. Přiřazení látek a předmětů, které nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2, k odpovídající položce této tabulky nebo pododdílu 2.2.9.3 musí být provedeno v souladu s ustanoveními odstavců 2.2.9.1.4 až 2.2.9.1.14.

Látky, které při vdechnutí jemného prachu mohou ohrozit zdraví

2.2.9.1.4 Látky, které při vdechnutí jemného prachu mohou ohrozit zdraví, zahrnují azbest a směsi obsahující azbest.

Látky a přístroje, které mohou v případě požáru vytvářet dioxiny

2.2.9.1.5 Látky a přístroje, které v případě požáru mohou vytvářet dioxiny, zahrnují polychlorované bifenylly (PCB) a terfenylly (PCT) a polyhalogenované bifenylly a terfenylly a směsi obsahující tyto látky, jakož i přístroje, jako transformátory, kondensátory a jiné přístroje, které tyto látky nebo směsi obsahují.

POZNÁMKA: Směsi s obsahem PCB nebo PCT nejvýše 50 mg/kg nepodléhají předpisům ADR.

Látky uvolňující hořlavé páry

2.2.9.1.6 Látky uvolňující hořlavé páry zahrnují polymery, které obsahují hořlavé kapaliny s bodem vzplanutí do 55 °C.

Lithiové baterie

2.2.9.1.7 Články a baterie, články a baterie obsažené v zařízení nebo články a baterie balené se zařízením, obsahující lithium v jakékoli formě, musí být přiřazeny k UN číslům 3090, 3091, 3480 nebo 3481, jak je to náležité. Smějí být přepravovány pod těmito položkami, jestliže splňují následující ustanovení:

- (a) Každý článek nebo baterie je typu, u něhož bylo prokázáno, že splňuje požadavky každé zkoušky uvedené v Příručce zkoušek a kritérií, části III, pododdílu 38.3;

POZNÁMKA: Baterie musí být typu, u něhož bylo prokázáno, že splňuje zkušební požadavky Příručky zkoušek a kritérií, části III, pododdílu 38.3, bez ohledu na to, zda jsou články, z nichž jsou baterie složeny, zkoušeného typu.

- (b) Každý článek a baterie je opatřen(a) ochranným zařízením proti vnitřnímu přetlaku, nebo zkonstruován(a) tak, aby se zabránilo jejich prudkému roztržení za normálních podmínek přepravy;
- (c) Každý článek a baterie je vybaven(a) účinným systémem k zabránění vnějším zkratům;
- (d) Každá baterie s více články nebo sériemi článků s paralelním zapojením je vybavena účinným zařízením, které zabráňuje nebezpečným zpětným proudům (např. diody, pojistky atd.);
- (e) Články a baterie musí být vyráběny pod programem řízení kvality, který zahrnuje:
- (i) Popis organizační struktury a odpovědností personálu s ohledem na konstrukci a kvalitu výrobku;
 - (ii) Příslušné instrukce pro inspekce a zkoušky, kontrolu kvality, zajištění kvality a výrobní postup, které budou používány;
 - (iii) Kontroly výroby, které by měly zahrnovat příslušné činnosti k zamezení a zjištění závad, pokud jde o vnitřní zkraty, během výroby článků;
 - (iv) Záznamy o kvalitě, jako jsou inspekční zprávy, údaje ze zkoušek, kalibrační údaje a osvědčení. Údaje ze zkoušek musí být uchovávány a být na požádání poskytnuty příslušnému orgánu;
 - (v) Audit k zajištění účinného fungování programu řízení kvality;
 - (vi) Postup pro kontrolu dokladů a jejich revize;
 - (vii) Způsoby kontroly článků nebo baterií, které neodpovídají typu vyzkoušenému podle ustanovení uvedených pod písmenem (a) výše;
 - (viii) Školící programy a kvalifikační postupy pro příslušný personál; a
 - (ix) Postupy garantující, že finální výrobek není poškozen.

POZNÁMKA: Mohou být akceptovány vlastní programy řízení kvality. Osvědčení od třetí strany se nevyžaduje, ale postupy uvedené pod (i) až (ix) výše musí být řádně zaznamenány a sledovatelné. Kopie programu řízení kvality musí být na požádání poskytnuta příslušnému orgánu.

Lithiové baterie nepodléhají ustanovením ADR, jestliže splňují požadavky zvláštního ustanovení 188 kapitoly 3.3.

POZNÁMKA: Položky UN 3171 Vozidlo na akumulátorový pohon nebo UN 3171 Přístroj na akumulátorový pohon se vztahují pouze na vozidla poháněná mokkými bateriemi, sodíkovými bateriemi, bateriemi s kovem lithia nebo bateriemi s ionty lithia a na přístroje poháněné mokkými bateriemi nebo sodíkovými bateriemi, přepravované s těmito zabudovanými bateriemi.

Pro účely tohoto UN čísla jsou vozidla samohybné stroje zkonstruované pro přepravu jedné nebo více osob nebo věcí. Příklady takových vozidel jsou elektricky poháněné osobní automobily, motocykly, skútry, tří- nebo čtyřkolová vozidla nebo motocykly, motorová kola, invalidní vozíky, motorové sekačky trávy, čluny a letadla.

Příklady přístrojů jsou sekačky trávy, čistící stroje nebo modelové čluny a modelová letadla. Přístroje poháněné bateriemi s kovem lithia nebo bateriemi s ionty lithia musí být přiřazeny pod položky UN 3091 BATERIE LITHIOVÉ KOVOVÉ OBSAŽENÉ V ZAŘÍZENÍ nebo UN 3091 BATERIE LITHIOVÉ KOVOVÉ BALENÉ SE ZAŘÍZENÍM nebo UN 3481 BATERIE LITHIUM-IONTOVÉ OBSAŽENÉ V ZAŘÍZENÍ nebo UN 3481 BATERIE LITHIUM-IONTOVÉ BALENÉ SE ZAŘÍZENÍM, jak je to náležité.

Hybridní elektrická vozidla poháněná jak spalovacím motorem, tak i mokkými bateriemi, sodíkovými bateriemi, bateriemi s kovem lithia nebo bateriemi s ionty lithia, přepravovaná se zabudovanou baterií (bateriemi) musí být zařazena pod položky UN 3166 VOZIDLO POHÁNĚNÉ HOŘLAVÝM PLYNEM nebo UN 3166 VOZIDLO POHÁNĚNÉ HOŘLAVOU KAPALINOU, jak je to náležité. Vozidla, která obsahují palivový článek, musí být zařazena pod položky UN 3166 VOZIDLO

POHÁNĚNÉ PALIVOVÝMI ČLÁNKY OBSAHUJÍCÍMI HOŘLAVÝ PLYN nebo UN 3166 VOZIDLO
POHÁNĚNÉ PALIVOVÝMI ČLÁNKY OBSAHUJÍCÍMI HOŘLAVOU KAPALINU, jak je to náležité.

Záchranné prostředky

- 2.2.9.1.8** Záchranné prostředky zahrnují záchranné prostředky a díly motorových vozidel, které odpovídají definicím uvedeným ve zvláštních ustanoveních 235 nebo 296 kapitoly 3.3.

Látky ohrožující životní prostředí

- 2.2.9.1.9** (Vypuštěno)

Látky znečišťující vodu

- 2.2.9.1.10** *Látky ohrožující životní prostředí (vodní prostředí)*

- 2.2.9.1.10.1 Všeobecné definice

- 2.2.9.1.10.1.1 Látky ohrožující životní prostředí zahrnují, mimo jiné, kapalné nebo tuhé látky znečišťující vodní prostředí a roztoky a směsi takových látek (jako jsou přípravky a odpady).

Pro účely odstavce 2.2.9.1.10 „látky“ znamená chemické prvky a jejich sloučeniny v přírodním stavu nebo získané výrobním procesem, včetně jakékoli přísady potřebné k zachování stálosti produktu a jakýchkoli nečistot pocházejících z použitého procesu, ale s výjimkou jakéhokoli rozpouštědla, které může být odděleno bez ovlivnění stálosti látky nebo změny jejího složení.

- 2.2.9.1.10.1.2 Vodní prostředí může být posuzováno ve smyslu vodních organismů, které žijí ve vodě a vodního ekosystému, jehož jsou součástí¹¹. Proto je základem pro identifikaci nebezpečí vodní toxicita látky nebo směsi, i když tato může být modifikována dalšími informacemi o degračním a bioakumulačním chování.

- 2.2.9.1.10.1.3 I když je následující klasifikační postup určen k použití pro všechny látky a směsi, uznává se, že v některých případech, např. u kovů nebo špatně rozpustných anorganických sloučenin, bude nutný speciální návod¹².

- 2.2.9.1.10.1.4 Pro akronymy nebo pojmy používané v tomto oddílu platí následující definice:

- BCF: Faktor biokoncentrace;
- BOD: Biochemická potřeba kyslíku;
- COD: Chemická potřeba kyslíku;
- GLP: Dobré laboratorní praktiky;
- EC_x: koncentrace spojená s X % reakcí;
- EC₅₀: účinná koncentrace látky, která způsobí 50 % maximální reakce;
- ErC₅₀: EC₅₀ ve smyslu brzdění růstu;
- K_{ow}: rozdělovací koeficient oktanol/voda;
- LC₅₀ (50 % smrtelná koncentrace): koncentrace látky ve vodě, která způsobí smrt 50 % (poloviny) ve skupině pokusných zvířat;
- L(E)C₅₀: LC₅₀ nebo EC₅₀;
- NOEC (No Observed Effect Concentration): zkušební koncentrace, bezprostředně pod nejnižší zkoušenou koncentrací se statisticky významným škodlivým účinkem. NOEC nemá žádný statisticky významný škodlivý účinek ve srovnání se škodlivým účinkem zkoušky;
- Směrnice pro zkoušení OECD – Test Guidelines publikované Organizací pro ekonomickou spolupráci a rozvoj (OECD).

- 2.2.9.1.10.2 Definice a požadavky na údaje

- 2.2.9.1.10.2.1 Základními prvky pro klasifikaci látek ohrožujících životní prostředí (vodní prostředí) jsou:

- (a) akutní vodní toxicita;
- (b) chronická vodní toxicita;

¹¹ To se netýká látek znečišťujících vodu, u nichž může být nutné posoudit účinky nad rámec vodního prostředí, jako jsou dopady na lidské zdraví atd.

¹² Tento návod je možno nalézt v příloze 10 GHS.

(c) bioakumulační potenciál nebo aktuální bioakumulace; a
(d) degradace (biotická nebo abiotická) pro organické sloučeniny.

2.2.9.1.10.2.2 Zatímco se upřednostňují údaje z mezinárodně harmonizovaných zkušebních metod, v praxi se smějí používat také údaje z vnitrostátních metod, kde jsou považovány za rovnocenné. Všeobecně bylo dohodnuto, že údaje o toxicitě sladkovodních a mořských druhů mohou být považovány za rovnocenné údaje a mají být přednostně získány za použití Směrnic pro zkoušení OECD nebo jejich ekvivalentu podle zásad dobrých laboratorních praktik (GLP). Nejsou-li takové údaje k dispozici, musí být klasifikace založena na nejlepších disponibilních údajích.

2.2.9.1.10.2.3 „*Akutní vodní toxicita* je podstatná vlastnost látky, která je škodlivá vodním organismům při jejich krátkodobém vystavení působení této látky ve vodním prostředí.

„*Akutní (krátkodobé) nebezpečí* pro účely klasifikace je nebezpečí chemické látky způsobené její akutní toxicitou pro organismus během jeho krátkodobého vystavení působení této chemické látky ve vodním prostředí.

Akutní vodní toxicita se normálně stanoví za použití rybích druhů 96 hodin LC₅₀ (Směrnice pro zkoušení OECD 203 nebo ekvivalent), koryšovitých druhů 48 hodin EC₅₀ (Směrnice pro zkoušení OECD 202 nebo ekvivalent) a/nebo vodních řas 72 nebo 96 hodin EC₅₀ (Směrnice pro zkoušení OECD 201 nebo ekvivalent). Tyto druhy se považují za náhradu pro všechny vodní organismy a údaje z jiných druhů, jako je lemna, smějí být rovněž vzaty v úvahu, je-li vhodná zkušební metodologie.

2.2.9.1.10.2.4 *Chronická vodní toxicita* je podstatná vlastnost látky, vyvolávající škodlivé účinky na vodní organismy při jejich vystavení působení této látky ve vodním prostředí, která je určena v relaci k životnímu cyklu těchto organismů.

Dlouhodobé nebezpečí pro účely klasifikace je nebezpečí chemické látky způsobené její chronickou toxicitou po dlouhodobém působení této chemické látky ve vodním prostředí.

Údaje o chronické toxicitě jsou méně dostupné než akutní údaje a rozsah zkušebních postupů je méně standardizován. Údaje získané podle Směrnic pro zkoušení OECD 210 (ryby v počátečním stádiu života) nebo 211 (rozmnožování dafnií) a 201 (zábrana růstu řas) mohou být akceptovány. Je dovoleno použít také jiné uznané a mezinárodně akceptované zkoušky. Musí být použity NOEC nebo jiné ekvivalentní EC_x.

2.2.9.1.10.2.5 Bioakumulace znamená čistý výsledek absorpce, přeměny a vyloučení látky v organismu v důsledku vystavení jejímu působení všemi cestami (tj. vzduchem, vodou, usazeninou/půdou a potravou).

Bioakumulační potenciál se normálně stanoví za použití rozdělovacího koeficientu oktanol/voda, obvykle vyjadřovaného jako log K_{ow}, stanoveného podle Směrnic pro zkoušení OECD 107 nebo 117. Zatímco toto představuje bioakumulační potenciál, poskytuje experimentálně zjištěný faktor biokoncentrace (BCF) lepší důkaz a musí být používán přednostně, pokud je k dispozici. BCF se stanoví podle Směrnic pro zkoušení OECD 305.

2.2.9.1.10.2.6 *Degradace* je rozklad organických molekul na menší molekuly a nakonec na oxid uhličitý, vodu a soli.

Environmentální degradace může být biotická nebo abiotická (např. hydrolyza) a použitá kritéria odrážejí tuto skutečnost. Snadná biodegradace se nejsnadněji definuje použitím zkoušek biologické odbouratelnosti (A-F) Směrnic pro zkoušení OECD 301. Překročení úrovně v těchto zkouškách smí být považováno za důkaz rychlé degradace ve většině prostředí. Toto jsou sladkovodní zkoušky a tak bylo zahrnuto také použití výsledků ze Směrnic pro zkoušení OECD 306, která je vhodnější pro mořská prostředí. Nejsou-li takové údaje k dispozici, potom se poměr BOD (5 dní)/COD $\geq 0,5$ považuje za důkaz rychlé degradace.

Abiotická degradace, jako je hydrolyza, primární degradace, jak abiotická, tak i biotická, degradace v nevodních médiích a prokázaná rychlá degradace v životním prostředí smějí být všechny brány v úvahu při definování rychlé odbouratelnosti¹³.

Látky jsou považovány za rychle odbouratelné v životním prostředí, jsou-li splněna následující kritéria:

13 Zvláštní návod k interpretaci údajů poskytuje kapitola 4.1 a příloha 9 ke GHS.

- (a) Při pozorováních snadné biodegradace po dobu 28 dní je dosaženo následujících úrovní degradace:
- (i) zkoušky založené na rozpuštěném organickém uhlíku: 70 %;
 - (ii) zkoušky založené na ztrátě kyslíku nebo vyvíjení oxidu uhličitého: 60 % teoretického maxima;

Těchto úrovní biodegradace musí být dosaženo do 10 dní od počátku degradace, kteréhožto bodu je dosaženo v době, kdy bylo odbouráno 10 % látky, ledaže je látka identifikována jako komplexní, multikomponentní látka se strukturálně podobnými složkami. V tomto případě, a kde je pro to dostatečné ospravedlnění, smí být od podmínky časového intervalu 10 dnů upuštěno a předpokládá se, že požadované úrovně biodegradace je dosaženo do 28 dnů¹⁴; nebo

- (b) v těch případech, kdy jsou k dispozici pouze údaje BOD a COD, je-li poměr $BOD_5 / COD \geq 0,5$; nebo
- (c) je-li k dispozici jiný přesvědčivý vědecký důkaz, který může prokázat, že látka nebo směs může být odbourána (bioticky a/nebo abioticky) ve vodním prostředí na úroveň nad 70 % v období 28 dní.

2.2.9.1.10.3 Kategorie a kritéria klasifikace látek

2.2.9.1.10.3.1 Látky musí být klasifikovány jako „látky ohrožující životní prostředí (vodní prostředí)“, jestliže vyhovují kritériím pro kategorii Akutní 1, Chronická 1 nebo Chronická 2 podle tabulky 2.2.9.1.10.3.1. Tato kritéria popisují podrobně klasifikační kategorie. Ty jsou ve formě diagramu shrnuty v tabulce 2.2.9.1.10.3.2.

Tabulka 2.2.9.1.10.3.1 Kategorie pro látky ohrožující vodní prostředí
(viz **POZNÁMKA 1**)

(a) Akutní (krátkodobé) nebezpečí pro vodu

Kategorie Akutní 1: (viz **POZNÁMKA 2**)

96 hodin LC_{50} (pro ryby)	≤ 1 mg/l a/nebo
48 hodin EC_{50} (pro koryše)	≤ 1 mg/l a/nebo
72 nebo 96 hodin ErC_{50} (pro řasy nebo jiné vodní rostliny)	≤ 1 mg/l (viz POZNÁMKA 3)

(b) Dlouhodobé nebezpečí pro vodu (viz též obr. 2.2.9.1.10.3.1)

- (i) Látky, které nejsou rychle odbouratelné (viz **POZNÁMKA 4**), pro něž jsou k dispozici dostatečné údaje o chronické toxicitě

Kategorie Chronická 1: (viz **POZNÁMKA 2**)

Chronická NOEC nebo EC_x (pro ryby)	$\leq 0,1$ mg/l a/nebo
Chronická NOEC nebo EC_x (pro koryše)	$\leq 0,1$ mg/l a/nebo
Chronická NOEC nebo EC_x (pro řasy nebo jiné vodní rostliny)	$\leq 0,1$ mg/l

Kategorie Chronická 2:

Chronická NOEC nebo EC_x (pro ryby)	≤ 1 mg/l a/nebo
Chronická NOEC nebo EC_x (pro koryše)	≤ 1 mg/l a/nebo
Chronická NOEC nebo EC_x (pro řasy nebo jiné vodní rostliny)	≤ 1 mg/l

¹⁴ Viz kapitola 4.1 a přílohu 9, odstavec A9.4.2.2.3 GHS.

(ii) Rychle odbouratelné látky, pro něž jsou k dispozici dostatečné údaje o chronické toxicitě

Kategorie Chronická 1: (viz POZNÁMKA 2)

Chronická NOEC nebo EC _x (pro ryby)	≤ 0,01 mg/l a/nebo
Chronická NOEC nebo EC _x (pro koryše)	≤ 0,01 mg/l a/nebo
Chronická NOEC nebo EC _x (pro řasy nebo jiné vodní rostliny)	≤ 0,01 mg/l

Kategorie Chronická 2:

Chronická NOEC nebo EC _x (pro ryby)	≤ 0,1 mg/l a/nebo
Chronická NOEC nebo EC _x (pro koryše)	≤ 0,1 mg/l a/nebo
Chronická NOEC nebo EC _x (pro řasy nebo jiné vodní rostliny)	≤ 0,1 mg/l

(iii) Látky, pro něž nejsou k dispozici dostatečné údaje o chronické toxicitě

Kategorie Chronická 1: (viz POZNÁMKA 2)

96 hodin LC ₅₀ (pro ryby)	≤ 1 mg/l a/nebo
48 hodin EC ₅₀ (pro koryše)	≤ 1 mg/l a/nebo
72 nebo 96 hodin ErC ₅₀ (pro řasy nebo jiné vodní rostliny)	≤ 1 mg/l (viz POZNÁMKA 3)

a látka není rychle odbouratelná a/nebo experimentálně zjištěný BCF ≥ 500 (nebo, není-li, log K_{ow} ≥ 4) (viz POZNÁMKA 4 a 5).

Kategorie Chronická 2:

96 hodin LC ₅₀ (pro ryby)	> 1 ale ≤ 10 mg/l a/nebo
48 hodin EC ₅₀ (pro koryše)	> 1 ale ≤ 10 mg/l a/nebo
72 nebo 96 hodin ErC ₅₀ (pro řasy nebo jiné vodní rostliny)	> 1 až ≤ 10 mg/l (viz POZNÁMKA 3)

a látka není rychle odbouratelná a/nebo experimentálně zjištěný BCF ≥ 500 (nebo, není-li, log K_{ow} ≥ 4) (viz POZNÁMKA 4 a 5).

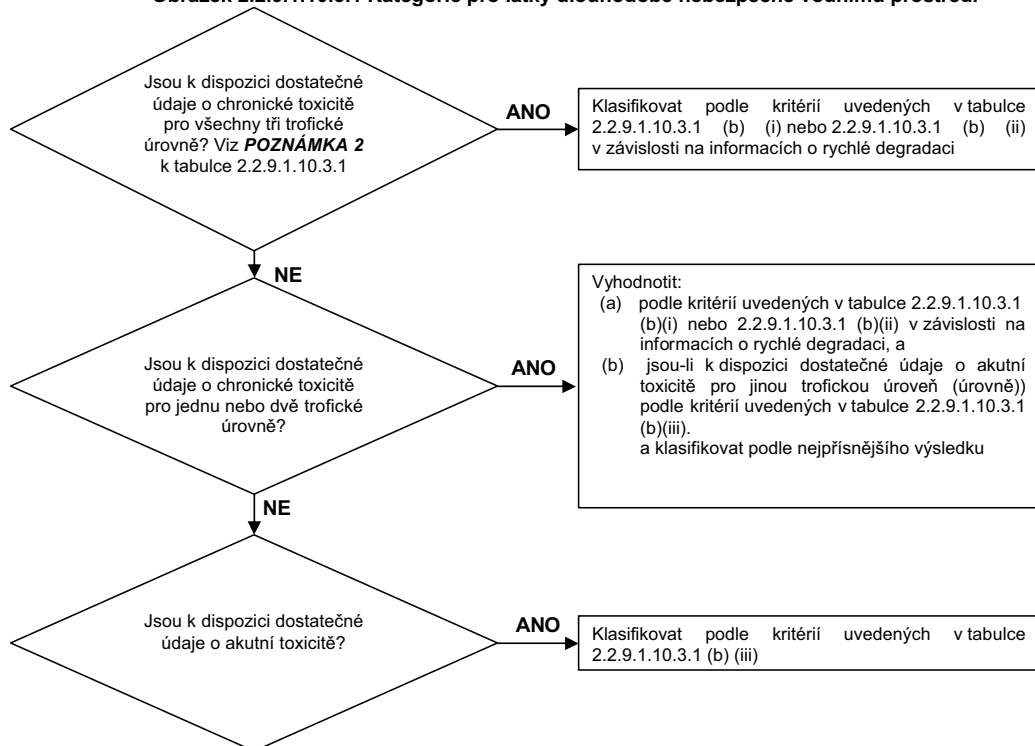

POZNÁMKA 1: Organismy ryby, koryši a řasy jsou testovány jako reprezentativní druhy pokrývající široký rozsah trofických úrovní a dávek a zkušební metody jsou ve vysoké míře standardizovány. Údaje o jiných organismech smějí být rovněž vzaty v úvahu, avšak za podmínky, že představují rovnocenné druhy a experimentální účinky.

POZNÁMKA 2: Při klasifikaci látek jako Akutní 1 a/nebo Chronická 1 je třeba současně uvést náležitý součinitel M (viz 2.2.9.1.10.4.6.4) pro použití při součtové metodě.

POZNÁMKA 3: Pokud je toxicita pro řasy ErC₅₀ (= EC₅₀ (rychlost růstu)) více než 100 krát nižší než toxicita pro nejbližší nejcitlivější druh a povede ke klasifikaci založené pouze na tomto účinku, musí se uvážit, zda je tato toxicita reprezentativní pro toxicitu vůči vodním rostlinám. Pokud se může prokázat, že to není tento případ, musí znalec rozhodnout, zda klasifikaci provést. Klasifikace musí být založena na ErC₅₀. Za okolností, kdy podmínky pro určení EC₅₀ nejsou stanoveny a žádný ErC₅₀ není zaznamenán, musí být klasifikace založena na nejnižším disponibilním EC₅₀.

POZNÁMKA 4: Nedostatek rychlé odbouratelnosti je založen buď na nedostatku snadné biotické odbouratelnosti, nebo na jiných údajích ukazujících nedostatek rychlé degradace. Pokud nejsou k dispozici použitelné údaje o odbouratelnosti, buď údaje experimentálně zjištěné, nebo odhadnuté, musí být látka považována za látku, která není rychle odbouratelná.

POZNÁMKA 5: Bioakumulační potenciál, založený na experimentálně odvozeném BCF ≥ 500 nebo, není-li, log K_{ow} ≥ 4, za podmínky, že log K_{ow} je vhodným popisovačem pro bioakumulační potenciál látky. Naměřené hodnoty log K_{ow} mají přednost před odhadnutými hodnotami a naměřené hodnoty BCF mají přednost před hodnotami log K_{ow}.

Obrázek 2.2.9.1.10.3.1 Kategorie pro látky dlouhodobě nebezpečné vodnímu prostředí

2.2.9.1.10.3.2 Klasifikační schéma v tabulce 2.2.9.1.10.3.2 dále sumarizuje klasifikační kritéria pro látky

Tabulka 2.2.9.1.10.3.2 Klasifikační schéma pro látky ohrožující vodní prostředí

Klasifikační kategorie			
Akutní nebezpečí (viz POZNÁMKA 1)	Dlouhodobě nebezpečí (viz POZNÁMKA 2)		
	Dostatečné údaje o chronické toxicitě jsou k dispozici		Dostatečné údaje o chronické toxicitě nejsou k dispozici (viz POZNÁMKA 1)
	Látky, které nejsou rychle odbouratelné (viz POZNÁMKA 3)	Rychle odbouratelné látky (viz POZNÁMKA 3)	
Kategorie: Akutní 1	Kategorie: Chronická 1	Kategorie: Chronická 1	Kategorie: Chronická 1
$L(E)C_{50} \leq 1,00$	$NOEC$ nebo $EC_x \leq 0,1$	$NOEC$ nebo $EC_x \leq 0,01$	$L(E)C_{50} \leq 1,00$ a nedostatek rychlé odbouratelnosti a/nebo $BCF \geq 500$ nebo, není-li, $\log K_{ow} \geq 4$
	Kategorie: Chronická 2	Kategorie: Chronická 2	Kategorie: Chronická 2
	$0,1 < NOEC$ nebo $EC_x \leq 1$	$0,01 < NOEC$ nebo $EC_x \leq 0,1$	$1,00 < L(E)C_{50} \leq 10,0$ a nedostatek rychlé odbouratelnosti a/nebo $BCF \geq 500$ nebo, není-li, $\log K_{ow} \geq 4$

POZNÁMKA 1: Pásmo akutní toxicity založené na hodnotách $L(E)C_{50}$ v mg/l pro ryby, korýše a/nebo řasy nebo jiné vodní rostliny (nebo vyhodnocení QSAR (Quantitative Structure Activity Relationships), jestliže nejsou žádné experimentální údaje¹⁵).

POZNÁMKA 2: Látky jsou klasifikovány do různých chronických kategorií, pokud nejsou k dispozici dostatečné údaje o chronické toxicitě pro všechny tři trofické úrovně nad rozpustností ve vodě nebo nad 1 mg/l. „Dostatečný“ znamená, že údaje dostatečně pokrývají sledovaný rozsah. Obecně by to znamenalo naměřené údaje při zkoušce, aby se však vyhnulo zbytečnému zkoušení, je možno případ od případu použít údaje z vyhodnocení, např. QSAR, nebo pro jasné případy posudek experta).

POZNÁMKA 3: Pásmo chronické toxicity založené na NOEC nebo ekvivalentních hodnotách EC_x v mg/l pro ryby nebo korýše nebo jiných uznávaných měřeních chronické toxicity.

2.2.9.1.10.4 Kategorie a kritéria klasifikace směsí

2.2.9.1.10.4.1 Klasifikační systém pro směsi zahrnuje klasifikační kategorie, které jsou používány pro látky, tj. kategorie Akutní 1 a Chronické 1 a 2. Za účelem využití všech disponibilních údajů pro klasifikaci nebezpečí směsi pro vodní prostředí se vychází z následujícího předpokladu, který se použije, kde je to nutné:

„Relevantní složky“ směsi jsou ty složky, které jsou přítomny v koncentraci 0,1 % (hm.) nebo vyšší pro složky klasifikované jako Akutní a/nebo Chronická 1 a 1 % (hm.) nebo vyšší pro jiné složky, pokud neexistuje domněnka (např. v případě velmi toxických složek), že složka přítomná v koncentraci nižší než 0,1 % může být přesto významná pro klasifikaci směsi z hlediska jejích nebezpečí pro vodní prostředí.

2.2.9.1.10.4.2 Přístup ke klasifikaci nebezpečí pro vodní prostředí je víceúrovňový a je závislý na druhu disponibilních informací pro vlastní směs a pro její složky. Prvky víceúrovňového přístupu zahrnují:

(a) klasifikaci založenou na vyzkoušených směsích;

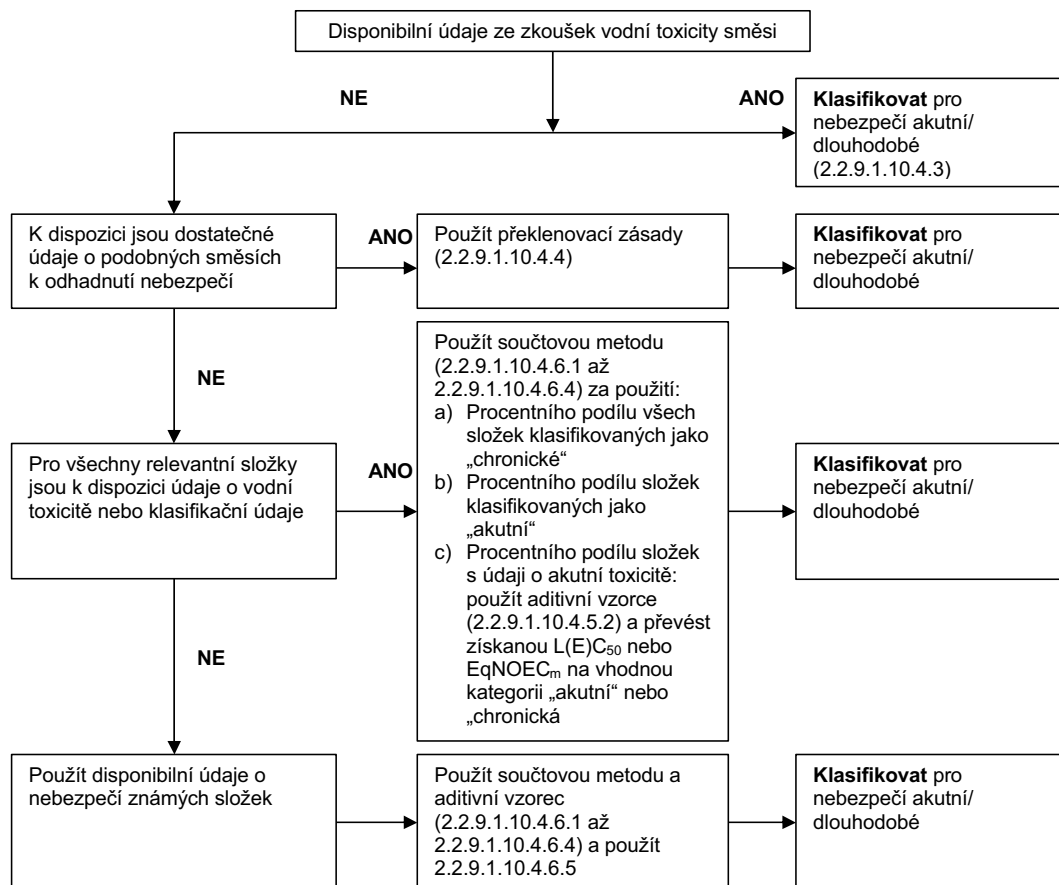

(b) klasifikaci založenou na překlenovacích zásadách;

(c) použití „součtu klasifikovaných složek“ a/nebo „aditivního vzorce“.

Dále uvedený obrázek 2.2.9.1.10.4.2 ukazuje postup, který je nutno dodržet:

¹⁵ Zvláštní návod je uveden v kapitole 4.1, odstavci 4.1.2.13 a příloze 9, oddílu A9.6 GHS.

Obrázek 2.2.9.1.10.4.2 Víceúrovňový přístup ke klasifikaci směsí z hlediska jejich akutních a dlouhodobých nebezpečí pro vodní prostředí

2.2.9.1.10.4.3 Klasifikace směsí, jsou-li k dispozici údaje o toxicitě pro kompletní směs

2.2.9.1.10.4.3.1 Pokud byla směs jako celek podrobena zkoušce za účelem zjištění její vodní toxicity, musí být tyto informace použity pro klasifikaci směsí podle kritérií, která byla schválena pro látky. Klasifikace je normálně založena na údajích pro ryby, korýše a řasy/rostliny (viz 2.2.9.1.10.2.3 a 2.2.9.1.10.2.4). Pokud se nedostává dostatečných akutních nebo chronických údajů pro směs jako celek, musí se použít „překlenovací zásady“ nebo „součtová metoda“ (viz 2.2.9.1.10.4.4 až 2.2.9.1.10.4.6).

2.2.9.1.10.4.3.2 Klasifikace směsí z hlediska dlouhodobého nebezpečí vyžaduje dodatečné informace o odbouratelnosti a v některých případech o bioakumulaci. Neexistují žádné údaje o odbouratelnosti a bioakumulaci pro směsi jako celek. Zkoušky odbouratelnosti a bioakumulace pro směsi se nepoužívají, neboť je obvykle obtížné je vyhodnotit, a takové zkoušky mohou mít význam jen pro jednotlivé látky.

2.2.9.1.10.4.3.3 Klasifikace do kategorie Akutní 1

- (a) Jsou-li k dispozici dostatečné údaje ze zkoušek akutní toxicity (LC_{50} nebo EC_{50}) pro směs jako celek ukazující $L(E)C_{50} \leq 1$ mg/l:

Klasifikovat směs jako Akutní 1 podle tabulky 2.2.9.1.10.3.1 (a);

- (b) Jsou-li k dispozici údaje ze zkoušek akutní toxicity ($LC_{50}(s)$ nebo $EC_{50}(s)$) pro směs jako celek ukazující $L(E)C_{50}(s) > 1 \text{ mg/l}$, nebo nad rozpustností ve vodě:

Není nutno klasifikovat z hlediska akutního nebezpečí pod ADR.

2.2.9.1.10.4.3.4 Klasifikace do kategorií Chronická 1 a 2

- (a) Jsou-li k dispozici dostatečné údaje o chronické toxicitě (EC_x nebo NOEC) pro směs jako celek ukazující EC_x nebo NOEC zkoušené směsi $\leq 1 \text{ mg/l}$:
- (i) klasifikovat směs jako Chronickou 1 nebo 2 podle tabulky 2.2.9.1.10.3.1 (b) (ii) (rychle odbouratelná), pokud dostupné informace dovolují učinit závěr, že všechny relevantní složky směsi jsou rychle odbouratelné;
- (ii) klasifikovat směs jako Chronickou 1 nebo 2 ve všech ostatních případech podle tabulky 2.2.9.1.10.3.1 (b) (i) (není rychle odbouratelná);
- (b) Jsou-li k dispozici dostatečné údaje o chronické toxicitě (EC_x nebo NOEC) pro směs jako celek ukazující $EC_x(s)$ nebo NOEC(s) zkoušené směsi $> 1 \text{ mg/l}$, nebo nad rozpustností ve vodě:

Není nutno klasifikovat z hlediska dlouhodobého nebezpečí pod ADR.

2.2.9.1.10.4.4 Klasifikace směsí, nejsou-li k dispozici údaje o toxicitě pro kompletní směs: překlenovací zásady

2.2.9.1.10.4.4.1 Pokud směs sama nebyla podrobena zkoušce ke zjištění jejího nebezpečí pro vodní prostředí, ale existují dostatečné údaje o jednotlivých složkách a podobných zkoušených směších, aby přiměřeným způsobem charakterizovaly nebezpečí této směsi, musí se tyto údaje použít v souladu s následujícími schválenými překlenovacími pravidly. Tímto se zajišťuje, aby se při klasifikačním procesu využilo k charakteristice nebezpečí směsi v co největším možném rozsahu disponibilních údajů, bez nutnosti dodatečných zkoušek na zvířatech.

2.2.9.1.10.4.4.2 Ředění

Je-li nová směs vytvořena zředěním zkoušené směsi nebo látky ředidlem, které má stejnou nebo nižší klasifikaci z hlediska nebezpečí pro vodní prostředí, než nejméně toxická původní složka, a od něhož se neočekává, že ovlivní nebezpečí pro vodní prostředí jiných složek, musí být výsledná směs klasifikována jako rovnocenná s původní zkoušenou směsí nebo látkou. Alternativně smí být použita metoda vysvětlená v 2.2.9.1.10.4.5.“

2.2.9.1.10.4.4.3 Dávkování

Klasifikace zkoušené výrobní šarže směsi z hlediska nebezpečí pro vodní prostředí musí být považována za v podstatě rovnocennou klasifikaci jiné nezkoušené výrobní šarže téhož obchodního produktu, je-li vyráběn týž výrobcem nebo pod kontrolou téhož výrobce, pokud není důvodu věřit, že došlo k významné změně, takže se změnila klasifikace nezkoušené šarže z hlediska jejího nebezpečí pro vodní prostředí. Pokud k tomuto dojde, je nutná nová klasifikace.

2.2.9.1.10.4.4.4 Koncentrace směsí, které jsou zařazeny do nejpřísnějších klasifikačních kategorií (chronická 1 a akutní 1)

Je-li zkoušená směs klasifikována jako chronická 1 a/nebo akutní 1 a složky směsi, které jsou klasifikovány jako chronická 1 a/nebo akutní 1, jsou ještě více koncentrovány, musí být více koncentrovaná nezkoušená směs zařazena do stejné klasifikační kategorie jako původní zkoušená směs bez dodatečných zkoušek.

2.2.9.1.10.4.4.5 Interpolace uvnitř jedné kategorie toxicity

Pro tři směsi (A, B a C) s identickými složkami, jestliže směsi A a B byly vyzkoušeny a jsou v téže kategorii toxicity a jestliže nezkoušená směs C má tytéž toxikologicky aktivní složky jako směsi A a B, ale má koncentrace toxikologicky aktivních složek mezilehlé mezi koncentracemi ve směších A a B, potom se předpokládá, že směs C je v téže kategorii jako A a B.

2.2.9.1.10.4.4.6 V podstatě podobné směsi

Jsou-li dány následující předpoklady:

(a) dvě směsi:

- (i) A + B;
- (ii) C + B;

(b) koncentrace složky B je v podstatě stejná v obou směsích;

(c) koncentrace složky A ve směsi (i) se rovná koncentraci složky C ve směsi (ii);

(d) údaje o nebezpečích pro vodní prostředí pro A a C jsou k dispozici a jsou v podstatě rovnocenné, tj. jsou v téže kategorii nebezpečí a neočekává se, že ovlivní vodní toxicitu B,

jestliže směs (i) nebo (ii) je již klasifikována na základě údajů ze zkoušek, potom může být té druhé směsi přiřazena tatáž kategorie nebezpečí.

2.2.9.1.10.4.5 Klasifikace směsí, jsou-li k dispozici údaje o toxicitě pro všechny složky nebo jen pro některé složky směsi

2.2.9.1.10.4.5.1 Klasifikace směsi musí být založena na součtu koncentrací jejích klasifikovaných složek. Procentní podíl složek klasifikovaných jako „akutní“ nebo „chronická“ bude zahrnut přímo do součtové metody. Detaily součtové metody jsou popsány v 2.2.9.1.10.4.6.1 až 2.2.9.1.10.4.6.4.

2.2.9.1.10.4.5.2 Směsi mohou být vytvořeny jak ze složek, které jsou klasifikovány (jako Akutní 1 a/nebo Chronická 1,2), tak i ze složek, pro které jsou k dispozici dostatečné údaje ze zkoušek toxicity. Jsou-li k dispozici dostatečné údaje o toxicitě pro více než jednu složku ve směsi, vypočte se celková toxicita těchto složek použitím následujících aditivních vzorců (a) nebo (b) v závislosti na povaze údajů o toxicitě:

(a) Založeno na akutní vodní toxicitě:

$$\frac{\sum C_i}{L(E)C_{50m}} = \sum_n \frac{C_i}{L(E)C_{50i}}$$

kde:

C_i = koncentrace složky i (procento hmotnosti);

$L(E)C_{50i}$ = LC_{50} nebo EC_{50} pro složku i (mg/l);

n = počet složek, i se pohybuje od 1 do n ;

$L(E)C_{50m}$ = $L(E)C_{50}$ části směsi s údaji ze zkoušek.

Vypočtená toxicita se použije k tomu, aby se této části směsi přiřadila kategorie akutního nebezpečí, která se následně použije při aplikaci součtové metody;

(b) Založeno na chronické vodní toxicitě:

$$\frac{\sum C_i + \sum C_j}{EqNOEC_m} = \sum_n \frac{C_i}{NOEC_i} + \sum_n \frac{C_j}{0,1 \cdot NOEC_j}$$

kde:

C_i = koncentrace složky i (procento hmotnosti) pokrývající rychle odbouratelné složky;

C_j = koncentrace složky j (procento hmotnosti) pokrývající složky, které nejsou rychle odbouratelné;

$NOEC_i$ = NOEC (nebo jiná uznávaná měření chronické toxicity) pro složku i, pokrývající rychle odbouratelné složky, v mg/l;

$NOEC_i$ = NOEC (nebo jiná uznávaná měření chronické toxicity) pro složku j , pokrývající složky, které nejsou rychle odbouratelné, v mg/l;

n = počet složek, i a j se pohybují od 1 do n ;

$EqNOEC_m$ = ekvivalent NOEC části směsi s údaji ze zkoušek.

Ekvivalentní toxicita tak odráží skutečnost, že látky, které nejsou rychle odbouratelné, jsou klasifikovány o jednu úroveň kategorie nebezpečí „přísněji“ než rychle odbouratelné látky.

Vypočtená ekvivalentní toxicita se použije k tomu, aby se této části směsi přiřadila kategorie dlouhodobého nebezpečí podle kritérií pro rychle odbouratelné látky (tabulka 2.2.9.1.10.3.1 (b) (ii)), která se následně použije při aplikaci součtové metody.

2.2.9.1.10.4.5.3 Při použití aditivního vzorce pro část směsi je vhodnější vypočítat toxicitu této části směsi tak, že se pro každou složku použijí hodnoty toxicity, které se vztahují ke stejné systematické skupině (tj. rybám, koryšům nebo řasám), a pak se použije nejvyšší toxicita (nejnižší hodnota) (tj. použít nejcitlivější z těchto tří skupin). Nejsou-li však k dispozici údaje o toxicitě pro každou složku od stejné systematické skupiny, musí být hodnota toxicity pro každou složku zvolena stejným způsobem, jakým jsou voleny hodnoty toxicity pro klasifikaci látek, tj. použije se nejvyšší toxicita (od nejcitlivějšího pokusného organismu). Vypočtená akutní a chronická toxicita pak musí být použita pro klasifikaci této části směsi jako akutní 1 a/nebo chronická 1 nebo 2 za použití stejných kritérií, jaká jsou popsána pro látky.

2.2.9.1.10.4.5.4 Jestliže je směs klasifikována více než jen jedním způsobem, musí se použít ta metoda, která dává nejkonzervativnější výsledek.

2.2.9.1.10.4.6 Součtová metoda

2.2.9.1.10.4.6.1 Klasifikační postup

Všeobecně převažuje přísnější klasifikace pro směsi nad méně přísnou klasifikací, např. klasifikace chronická 1 převažuje nad klasifikací chronická 2. V důsledku toho je klasifikační postup již ukončen, je-li výsledkem klasifikace kategorie chronická 1. Přísnější klasifikace než chronická 1 není možná a proto není nutné pokračovat dále v klasifikačním postupu.

2.2.9.1.10.4.6.2 Klasifikace do kategorie akutní 1

2.2.9.1.10.4.6.2.1 Nejprve se posoudí všechny složky klasifikované jako akutní 1. Je-li součet koncentrací (v %) těchto složek nejméně 25 %, musí být celá směs klasifikována jako akutní 1. Je-li výsledkem výpočtu klasifikace směsi jako akutní 1, klasifikační postup je ukončen.

2.2.9.1.10.4.6.2.2 Klasifikace směsi z hlediska akutních nebezpečí založená na tomto součtu koncentrací klasifikovaných složek je sumarizována v tabulce 2.2.9.1.10.4.6.2.2 dále.

Tabulka 2.2.9.1.10.4.6.2.2: Klasifikace směsi z hlediska akutních nebezpečí, založená na součtu koncentrací klasifikovaných složek

Součet koncentrací (v %) složek klasifikovaných jako:	Směs klasifikována jako:
Akutní 1 x $M^{(a)}$ \geq 25 %	Akutní 1

^(a) K vysvětlení součinitele M viz 2.2.9.1.10.4.6.4.

2.2.9.1.10.4.6.3 Klasifikace do kategorií Chronická 1 a 2

2.2.9.1.10.4.6.3.1 Zprv se berou v úvahu všechny složky klasifikované jako chronické 1. Je-li součet koncentrací (v %) těchto složek nejméně 25 %, musí být směs klasifikována jako chronická 1. Je-li výsledkem výpočtu klasifikace směsi jako chronická 1, klasifikační postup je ukončen.

2.2.9.1.10.4.6.3.2 V případech, kdy směs není klasifikována jako chronická 1, uváží se klasifikace směsi jako chronické 2. Směs musí být klasifikována jako chronická 2, jestliže desetinásobek součtu koncentrací (v %) všech složek klasifikovaných jako chronické 1 plus součet koncentrací (v %) všech složek klasifikovaných jako chronické 2 je nejméně 25 %. Je-li výsledkem výpočtu klasifikace směsi jako kategorie chronická 2, klasifikační postup je ukončen.

2.2.9.1.10.4.6.3.3 Klasifikace směsí z hlediska dlouhodobých nebezpečí založená na tomto součtu koncentrací klasifikovaných složek je sumarizována v tabulce 2.2.9.1.10.4.6.3.3 dále.

Tabulka 2.2.9.1.10.4.6.3.3: Klasifikace směsí z hlediska dlouhodobých nebezpečí, založená na součtu koncentrací klasifikovaných složek

Součet koncentrací (v %) složek klasifikovaných jako:	Směs klasifikována jako:
Chronická 1 x $M^{(a)} \geq 25\%$	Chronická 1
$(M \times 10 \times \text{Chronická 1}) + \text{Chronická 2} \geq 25\%$	Chronická 2

^(a) K vysvětlení součinitele M viz 2.2.9.1.10.4.6.4.*.

2.2.9.1.10.4.6.4 Směsi s velmi toxickými složkami

Složky Akutní 1 nebo Chronická 1 s akutními toxicitami značně pod 1 mg/l a/nebo chronickými toxicitami značně pod 0,1 mg/l (nejsou-li rychle odbouratelné) a 0,01 mg/l (jsou-li rychle odbouratelné) mohou ovlivnit toxicitu směsi a dává se jim při použití součtové metody zvýšená váha. Jestliže směs obsahuje složky klasifikované jako kategorie akutní 1 nebo chronická 1, musí se aplikovat vícevrstvý přístup popsáný v odstavcích 2.2.9.1.10.4.6.2 a 2.2.9.1.10.4.6.3 za použití váženého součtu získaného vynásobením koncentrací složek kategorií Akutní 1 a Chronická 1 součinitelem, namísto jen pouhého sečtení procentních podílů. To znamená, že koncentrace „akutní 1“ v levém sloupci tabulky 2.2.9.1.10.4.6.2 a koncentrace „chronická 1“ v levém sloupci tabulky 2.2.9.1.10.4.6.3.3 se vynásobí příslušným násobným součinitelem. Násobné součinitele, které se musí použít pro tyto složky, jsou definovány za použití hodnoty toxicity, jak je to shrnutě uvedeno v tabulce 2.2.9.1.10.4.6.4 dále. Z tohoto důvodu musí být osoba klasifikující směs, která obsahuje složky akutní 1 a/nebo chronická1, informována o hodnotě součinitele M, aby mohla použít součtovou metodu. Alternativně smí být použit aditivní vzorec (viz 2.2.9.1.10.4.5.2), pokud jsou k dispozici údaje o toxicitě pro všechny velmi toxické složky ve směsi a existuje přesvědčivý důkaz, že všechny ostatní složky, včetně těch, pro něž nejsou k dispozici specifické údaje o akutní a/nebo chronické toxicitě, mají malou nebo nemají žádnou toxicitu a nepřispívají významným způsobem k nebezpečí, které směs představuje pro životní prostředí.

Tabulka 2.2.9.1.10.4.6.4: Násobné součinitele pro velmi toxické složky směsi

Akutní toxicita	Součinitel M	Chronická toxicita	Součinitel M	Součinitel M
Hodnota $L(E)C_{50}$		Hodnota NOEC	Složky NRD ^a	Složky RD ^b
$0,1 < L(E)C_{50} \leq 1$	1	$0,01 < NOEC \leq 0,1$	1	-
$0,01 < L(E)C_{50} \leq 0,1$	10	$0,001 < NOEC \leq 0,01$	10	1
$0,001 < L(E)C_{50} \leq 0,01$	100	$0,0001 < NOEC \leq 0,001$	100	10
$0,0001 < L(E)C_{50} \leq 0,001$	1 000	$0,00001 < NOEC \leq 0,0001$	1 000	100
$0,00001 < L(E)C_{50} \leq 0,0001$	10 000	$0,000001 < NOEC \leq 0,00001$	10 000	1 000
(pokračuje v intervalech součinitele 10)		(pokračuje v intervalech součinitele 10)		

^a Nejsou rychle odbouratelné.

^b Rychle odbouratelné.

2.2.9.1.10.4.6.5 Klasifikace směsí se složkami bez použitelných informací

V případě, že nejsou pro jednu nebo více důležitých složek žádné použitelné informace o jejich akutní a/nebo chronické vodní toxicitě, usuzuje se, že směsi nemůže být přisouzena(y) definitivní kategorie nebezpečí (a). V této situaci se směs klasifikuje na základě známých složek jen s dodatečným prohlášením, že: „x procent směsi sestává ze složky (složek) neznámého nebezpečí pro vodní prostředí“.

2.2.9.1.10.5 Látky nebo směsi klasifikované jako látky ohrožující životní prostředí (vodní prostředí) na základě nařízení 1272/2008/ES¹⁶

Jestliže nejsou k dispozici údaje pro klasifikaci podle kritérií v 2.2.9.1.10.3 a 2.2.9.1.10.4, látka nebo směs:

(a) musí být klasifikována jako látka ohrožující životní prostředí (vodní prostředí), jestliže musí být přiřazena ke kategorii (kategoriím) Vodní akutní 1, Vodní chronická 1 nebo Vodní

chronická 2 podle nařízení 1272/2008/ES¹⁶ nebo, pokud je to ještě relevantní, podle uvedeného nařízení, rizikové věty (vět) R50, R50/53 nebo R51/53 podle směrnice 67/548/EHS³ nebo 1999/45/ES⁴;

- (b) smí být považována za látku, která neohrožuje životní prostředí (vodní prostředí), jestliže nemusí být přiřazena k takové rizikové větě nebo kategorii podle uvedených směrnic nebo nařízení.

- 2.2.9.1.10.6 Přiřazení látek nebo směsí klasifikovaných jako látky ohrožující životní prostředí (vodní prostředí) podle ustanovení v 2.2.9.1.10.3, 2.2.9.1.10.4 nebo 2.2.9.1.10.5

Látky nebo směsi klasifikované jako látky ohrožující životní prostředí (vodní prostředí), jinak neklasifikované pod ADR, musí být pojmenovány:

UN 3077 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, TUHÁ, J.N.; nebo

UN 3082 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, KAPALNÁ, J.N.

Musí být přiřazeny k obalové skupině III.

- 2.2.9.1.11 Geneticky změněné mikroorganismy (GMMO) a geneticky změněné organismy (GMO) jsou mikroorganismy a organismy, v nichž byl genetický materiál záměrně změněn genetickým inženýrstvím takovým způsobem, ke kterému v přírodě nedochází. Jsou přiřazeny ke třídě 9 (UN číslu 3245), pokud neodpovídají definici toxických látek nebo infekčních látek, ale jsou schopné měnit zvířata, rostliny nebo mikrobiologické látky způsobem, který není normálně výsledkem přirozené reprodukce.

POZNÁMKA 1: GMMO a GMO, které jsou infekční, jsou látkami třídy 6.2, UN čísel 2814, 2900 nebo 3373.

POZNÁMKA 2: GMMO nebo GMO nepodléhají ustanovením ADR, jestliže byly schváleny pro používání příslušnými orgány země původu, tranzitu a určení¹⁷.

POZNÁMKA 3: Živá zvířata nesmějí být používána k přepravě geneticky změněných mikroorganismů zařazených do třídy 9, ledaže by látka nemohla být přepravována jiným způsobem. Geneticky změněná živá zvířata musí být přepravována za podmínek stanovených příslušnými orgány země původu a určení.

- 2.2.9.1.12 (Vypuštěno)

Zahřáté látky

- 2.2.9.1.13 Zahřáté látky zahrnují látky, které jsou přepravovány nebo podávány k přepravě v kapalném stavu při teplotě 100 °C nebo vyšší a v případě látek, které mají bod vzplanutí, při teplotě pod jejich bodem vzplanutí. Zahrnují také tuhé látky, které jsou přepravovány nebo podávány k přepravě při teplotě 240 °C nebo vyšší.

POZNÁMKA: Zahřáté látky smějí být přiřazeny ke třídě 9 jen tehdy, jestliže nesplňují kritéria některé jiné třídy

Jiné látky, které během přepravy představují nebezpečí a neodpovídají definici žádné jiné třídy

16 Nařízení 1272/2008/ES Evropského parlamentu a Rady z 16. prosince 2008 o klasifikaci, označování a balení látek a směsí (Úřední věstník Evropské unie, č. L 353 ze dne 30. prosince 2008).

3 Směrnice Rady 67/548/EHS z 27. června 1967 o přibližování zákonů, vyhlášek a administrativních nařízení, týkajících se klasifikace, balení a označování nebezpečných věcí (Úřední věstník Evropských společenství, č. L 196 ze dne 16. srpna 1967).

4 Směrnice 1999/45/ES Evropského parlamentu a Rady z 31. května 1999 o přibližování zákonů, vyhlášek a administrativních nařízení členských států, týkajících se klasifikace, balení a označování nebezpečných přípravků (Úřední věstník Evropských společenství, č. L 200 ze dne 30. července 1999).

17 Viz zejména díl C směrnice Evropského parlamentu a Rady 2001/18/ES o záměrném uvolňování geneticky modifikovaných organismů do životního prostředí a o zrušení směrnice Rady 90/220/EHS (Úřední věstník Evropských společenství, č. L 106 ze dne 17. dubna 2001, str. 8-14), v němž je stanoven schvalovací postup pro Evropská společenství.

- 2.2.9.1.14** Tyto různé látky neodpovídají definici žádné jiné třídy a jsou proto přiřazeny ke třídě 9:
- tuhé sloučeniny amoniaku (čpavku) s bodem vzplanutí pod 60 °C
 - méně nebezpečné dithioničitany
 - velmi lehce prchavé kapalné látky
 - látky vyvíjející škodlivé páry
 - látky obsahující alergeny
 - chemické testovací soupravy a soupravy první pomoci
 - elektrické dvouvrstvé kondenzátory (s kapacitou akumulace energie větší než 0,3 Wh)

POZNÁMKA: Následující látky a předměty, uvedené ve Vzorových předpisech OSN, nepodléhají ustanovením ADR :

UN 1845 OXID UHLIČITÝ, TUHÝ (SUCHÝ LED)¹⁸,
 UN 2071 HNOJIVA OBSAHUJÍCÍ DUSIČNAN AMONNÝ,
 UN 2216 MOUČKA RYBÍ (ODPAD RYBÍ), STABILIZOVANÁ(Ý),
 UN 2807 LÁTKY MAGNETIZOVANÉ,
 UN 3166 MOTOR SPALOVACÍ nebo VOZIDLO POHÁNĚNÉ HOŘLAVÝM PLYNEM nebo 3166 VOZIDLO POHÁNĚNÉ HOŘLAVOU KAPALINOU nebo 3166 MOTOR POHÁNĚNÝ PALIVOVÝMI ČLÁNKY OBSAHUJÍCÍMI HOŘLAVÝ PLYN nebo 3166 MOTOR POHÁNĚNÝ PALIVOVÝMI ČLÁNKY OBSAHUJÍCÍMI HOŘLAVOU KAPALINU nebo 3166 VOZIDLO POHÁNĚNÉ PALIVOVÝMI ČLÁNKY OBSAHUJÍCÍMI HOŘLAVÝ PLYN nebo 3166 VOZIDLO POHÁNĚNÉ PALIVOVÝMI ČLÁNKY OBSAHUJÍCÍMI HOŘLAVOU KAPALINU
 UN 3171 VOZIDLO NA AKUMULÁTOROVÝ POHON nebo UN 3171 PŘÍSTROJ NA AKUMULÁTOROVÝ POHON
 UN 3334 LÁTKA KAPALNÁ KTERÁ PODLÉHÁ PŘEDPISŮM PLATNÝM PRO LETECKOU DOPRAVU, J.N.
 UN 3335 LÁTKA TUHÁ KTERÁ PODLÉHÁ PŘEDPISŮM PLATNÝM PRO LETECKOU DOPRAVU, J.N.
 UN 3363 NEBEZPEČNÉ VĚCI VE STROJÍCH nebo UN 3363 NEBEZPEČNÉ VĚCI V PŘÍSTROJÍCH

Přiřazení k obalovým skupinám

- 2.2.9.1.15** Je-li to udáno ve sloupci (4) tabulky A kapitoly 3.2, jsou látky a předměty třídy 9 přiřazeny k jedné z následujících obalových skupin podle svého stupně nebezpečnosti:

Obalová skupina II: středně nebezpečné látky;
 Obalová skupina III: málo nebezpečné látky.

2.2.9.2 Látky a předměty nepřipustěné k přepravě

Následující látky a předměty nejsou k přepravě připuštěny :

- Lithiové baterie, které neodpovídají příslušným podmínkám zvláštních ustanovení 188, 230, 310 nebo 636 kapitoly 3.3;
- Nevycháštěné prázdné zadržovací vany pro přístroje, jako jsou transformátory, kondenzátory a hydraulické přístroje, které obsahují látky přiřazené k UN číslům 2315, 3151, 3152 nebo 3432.

¹⁸ K UN 1845 oxid uhličitý, tuhý (suchý led), který se používá jako chladicí prostředek, viz 5.5.3.

2.2.9.3 Seznam položek

	tuhé M10		3258 LÁTKA ZAHŘÁTÁ, TUHÁ, J.N., při teplotě 240 °C nebo vyšší

Jiné látky, které během přepravy představují nebezpečí a neodpovídají definici žádné jiné třídy M11	Není k dispozici žádná hromadná položka. Pouze následující látky uvedené v kapitole 3.2, tabulce A s tímto klasifikačním kódem podléhají předpisům třídy 9:
	1841 1-AMINOETHANOL (ACETALDEHYD AMONIAK) 1931 DITHIONIČITAN ZINEČNATÝ 1941 DIBROMDIFLUORMETHAN 1990 BENZALDEHYD 2969 BOBY RICINOVÉ nebo 2969 MOUČKA RICINOVÁ nebo 2969 KOLÁČ RICINOVÝ nebo 2969 VLOČKY RICINOVÉ 3316 SOUPRAVA TESTOVACÍ, CHEMICKÁ nebo 3316 SOUPRAVA PRVNÍ POMOCI 3359 ZAPLYNOVANÁ JEDNOTKA 3499 KONDENZÁTOR, ELEKTRICKÝ, DVOUVRSTVÝ (s kapacitou akumulace energie větší než 0,3 Wh) 3508 KONDENZÁTOR, ASYMETRICKÝ (s kapacitou akumulace energie větší než 0,3 Wh) 3509 OBALY, VYŘAZENÉ, PRÁZDNÉ, NEVYČIŠTĚNÉ

KAPITOLA 2.3

ZKUŠEBNÍ POSTUPY

2.3.0 Všeobecně

Pokud v kapitole 2.2 nebo v této kapitole není stanoveno jinak, je třeba pro klasifikaci nebezpečných věcí použít zkušební postupy uvedené v Příručce pro zkoušky a kritéria.

2.3.1 Zkouška na výpotek pro trhaviny typu A

2.3.1.1 Trhaviny typu A (UN číslo 0081) musí, pokud obsahují více než 40 % kapalného esteru kyseliny dusičné, navíc ke zkouškám uvedeným v Příručce zkoušek a kritérií, vyhovět ještě následující zkoušce na výpotek.

2.3.1.2 Přístroj pro zkoušku trhavin na výpotek (obrázky 1 až 3) se skládá z dutého bronzového válce. Tento válec, který je na jedné straně uzavřen deskou z téhož kovu, má vnitřní průměr 15,7 mm a hloubku 40 mm. Ve stěně je po obvodu 20 otvorů o průměru 0,5 mm (4 řady po 5 otvorech). Bronzový píst tvaru válce o délce 48 mm, jehož celková délka činí 52 mm, vniká do svisle postaveného válce; tento píst, jehož průměr činí 15,6 mm se zatíží závažím o hmotnosti 2220 g tak, že se vyvine tlak 120 kPa (1,2 bar) na dno válce.

2.3.1.3 Z 5 až 8 gramů trhaviny se vytvoří žmolek o délce 30 mm a průměru 15 mm, který se obalí velmi jemnou gázou a vloží se do válce; na něj se potom přiloží píst se závažím, aby byla trhavina vystavena tlaku 120 kPa (1,2 bar). Zaznamená se doba, která uplyne, než se ve vnějších otvorech ve válci objeví první olejové kapičky (nitroglycerin).

2.3.1.4 Trhavina se považuje za vyhovující, jestliže se při zkoušce provedené při teplotě 15 až 25 °C objeví první kapičky po časovém období delším než 5 minut.

Zkouška trhavin na výpotek

Obr.1: Těleso závaží, tvaru zvonu; hmotnost 2220 g; pro zavěšení na bronzový píst

Obr.2: Dutý bronzový válec, z jedné strany uzavřen, nárys a půdorys rozměry v mm

Obr.3: Válcovitý bronzový píst, rozměry v mm

Rozměry v mm

- (1) 4 řady po 5 otvorech o průměru 0,5
- (2) Měď
- (3) Olověná deska se středovým kuzelem na spodní straně
- (4) 4 otvory, cca 46 x 56, rozděleny rovnoměrně po obvodu

2.3.2 Zkoušky týkající se nitrovaných směsí celulózy třídy 4.1

2.3.2.1 Nitrocelulóza nesmí během půlhodinového zahřívání při teplotě 132 °C vyvíjet žádné viditelné žlutohnědé nitrozní páry (nitrozní plyny). Zápalná teplota musí být vyšší než 180 °C. Viz 2.3.2.3 až 2.3.2.8, 2.3.2.9a) a 2.3.2.10 dále.

2.3.2.2 3 gramy zvláčené nitrocelulózy nesmějí během hodinového zahřívání při teplotě 132 °C vyvíjet žádné viditelné žlutohnědé nitrozní páry (nitrozní plyny). Zápalná teplota musí být vyšší než 170 °C. Viz 2.3.2.3 až 2.3.2.8, 2.3.2.9 b) a 2.3.2.10 dále.

2.3.2.3 Dále uvedené zkušební postupy se použijí, pokud vzniknou názorové rozdíly v otázce přípustnosti přepravy těchto látek silniční dopravou.

2.3.2.4 Pokud se při zkouškách pro ověření podmínek stálosti, uvedených výše v tomto oddílu, zvolí jiné zkušební postupy, musí tyto postupy vést ke stejným závěrům k jakým vedou postupy uvedené dále.

2.3.2.5 Při dále popsané zkoušce tepelné stálosti se nesmí teplota v sušárně, ve které se zkoušený vzorek nachází, odchýlovat o více než 2 °C od předepsané teploty; předepsaná doba zkoušky 30 nebo 60 minut musí být dodržena s odchylkou nejvýše 2 minut. Sušárna musí být uzpůsobena tak, aby po vložení vzorku bylo dosaženo požadované teploty nejdéle do 5 minut.

2.3.2.6 Zkušební vzorky se musí před zkouškami podle pododdílů 2.3.2.9 a 2.3.2.10 sušit ve vakuovém exsikátoru, obsahujícím roztavený a zrnitý chlorid vápenatý, při okolní teplotě po dobu nejméně 15 hodin, přičemž musí být zkušební látka rozprostřena v tenké vrstvě; k tomuto účelu musí být látky, které nejsou práškovité ani vláknité, rozdrčeny, rozstrouhány nebo rozřezány na malé kousky. Tlak v exsikátoru se musí udržovat pod 6,5 kPa (0,065 bar).

2.3.2.7 Před sušením za podmínek uvedených v pododdílu 2.3.2.6 musí být látky odpovídající pododdílu 2.3.2.2 předsušeny v sušárně s dobrým provzdušněním při teplotě udržované na 70 °C tak dlouho, dokud úbytek hmotnosti za 15 minut není menší než 0,3 % původní hmotnosti.

2.3.2.8 Slabě nitrovaná nitrocelulóza podle pododdílu 2.3.2.1 je nejdříve podrobena předsušení podle podmínek uvedených v pododdílu 2.3.2.7; sušení se dokončí ponecháním nitrocelulózy po dobu nejméně 15 hodin v exsikátoru obsahujícím koncentrovanou kyselinou sírovou.

2.3.2.9 Zkouška chemické stálosti za tepla

(a) *Zkouška látky uvedené v pododdílu 2.3.2.1.*

(i) Do každé ze dvou skleněných zkumavek, které mají

délku	350 mm
vnitřní průměr	16 mm
tloušťku stěny	1,5 mm

se vloží 1 g látky vysušené chloridem vápenatým (látka pro sušení se musí v případě potřeby zmenšit na kousky, jejichž hmotnost jednotlivě nepřesahuje 0,05 g).

Obě zkumavky se úplně přikryjí tak, aby uzávěry nekladly odpor, a vloží se do sušárny tak, aby bylo vidět alespoň 4/5 jejich délky a ponechají se tam po dobu 30 minut při konstantní teplotě 132 °C. Po tuto dobu se pozoruje, zda se vyvíjejí nitrózní plyny ve formě žlutohnědých par, které jsou dobře viditelné na bílém pozadí.

(ii) Látka se považuje za stálou, jestliže se takové páry neobjeví.

(b) *Zkouška zvláčené nitrocelulózy (viz 2.3.2.2)*

(i) 3 g zvláčené nitrocelulózy se vloží do obdobných skleněných zkumavek jako pod písmenem a), které se pak naplněné vloží do sušárny s konstantní teplotou 132 °C.

(ii) Zkumavky se zvláčenou nitrocelulózou zůstanou v sušárně jednu hodinu. Po tuto dobu nesmějí být viditelné žádné žlutohnědé nitrózní páry (nitrózní plyny). Pozorování a vyhodnocení jako pod písmenem (a).

2.3.2.10 Zápalná teplota (viz 2.3.2.1 a 2.3.2.2)

(a) Zápalná teplota se určí zahříváním 0,2 g látky uzavřené ve skleněné zkumavce, která je ponořena do lázně z Woodovy slitiny (kovové lázně). Zkumavka se ponoří do lázně, jakmile tato dosáhla teploty 100 °C. Teplota lázně se pak progresivně zvyšuje každou minutu o 5 °C.

(b) Zkumavky musí mít:

délku	125 mm
-------	--------

vnitřní průměr 15 mm
tloušťku stěny 0,5 mm

a musí být ponořeny do hloubky 20 mm;

- (c) Zkouška se musí opakovat třikrát a pokaždé se musí zaznamenat teplota, při níž došlo k zapálení/vznícení látky, t.j. k pomalému nebo rychlému shoření, deflagraci nebo výbuchu;
- (d) Nejnížší teplota zaznamenaná při těchto třech zkouškách je zápalnou teplotou.

2.3.3 Zkoušky hořlavých kapalných látek tříd 3, 6.1 a 8

2.3.3.1 Zkouška pro stanovení bodu vzplanutí

2.3.3.1.1 Ke stanovení bodu vzplanutí hořlavých kapalin smějí být použity následující metody:

Mezinárodní normy:

ISO 1516 (Determination of flash/no flash – Closed cup equilibrium method)
(Zjišťování vzplanutí/nevzplanutí – Rovnovážná metoda s uzavřeným kelímkem)

ISO 1523 (Determination of flash point – Closed cup equilibrium method)
(Stanovení bodu vzplanutí – Rovnovážná metoda s uzavřeným kelímkem)

ISO 2719 (Determination of flash point – Pensky-Martens closed cup method)
(Stanovení bodu vzplanutí – Metoda Pensky-Martens s uzavřeným kelímkem)

ISO 13736 (Determination of flash point – Abel closed cup method)
(Stanovení bodu vzplanutí – Metoda Abel s uzavřeným kelímkem)

ISO 3679 (Determination of flash point – Rapid equilibrium closed cup method)
(Stanovení bodu vzplanutí – Rychlá rovnovážná metoda s uzavřeným kelímkem)

ISO 3680 (Determination of flash/no flash – Rapid equilibrium; closed cup method)
(Zjišťování vzplanutí/nevzplanutí – Rychlá rovnovážná metoda s uzavřeným kelímkem)

Vnitrostátní normy:

American Society for Testing Materials International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, Pennsylvania, USA 19428-2959:

ASTM D3828-07a, Standard Test Methods for Flash Point by Small Scale Closed-Cup Tester

ASTM D56-05, Standard Test Method for Flash Point by Tag Closed-Cup Tester

ASTM D3278-96(2004)e1, Standard Test Methods for Flash Point of Liquids by Small Scale Closed-Cup Apparatus

ASTM D93-08, Standard Test Methods for Flash Point by Pensky-Martens Closed-Cup Tester

Association française de normalisation, AFNOR, 11, rue de Pressensé, F-93571 La Plaine Saint-Denis Cedex:

Francouzská norma NF M 07-019

Francouzské normy NF M 07-011 / NF T 30-050 / NF T 66-009

Francouzská norma NF M 07-036

Deutsches Institut für Normung, Burggrafenstr. 6, D-10787 Berlin:

Norma DIN 51755 (bod vzplanutí pod 65 °C)

*State Committee of the Council of Ministers for Standardization, RUS-113813, GSP, Moscow, M-49
Leninsky Prospect, 9:*

GOST 12.1.044-84

2.3.3.1.2 Pro stanovení bodu vzplanutí nátěrových hmot, lepidel a podobných viskózních výrobků obsahujících rozpouštědla, smí být použito jen přístrojů a zkušebních metod, které jsou vhodné ke stanovení bodu vzplanutí viskózních kapalin podle těchto norem:

- (a) Mezinárodní norma ISO 3679:1983;
- (b) Mezinárodní norma ISO 3680:1983;
- (c) Mezinárodní norma ISO 1523:1983;
- (d) Mezinárodní normy EN ISO 13736 a EN ISO 2719, metoda B

2.3.3.1.3 Normy uvedené v 2.3.3.1.1 se používají jen pro rozsahy bodů vzplanutí, které jsou v nich uvedené. Při výběru normy je třeba vzít v úvahu možnost chemických reakcí mezi látkou a zkušební nádobou. Přístroj je třeba, pokud to dovoluje bezpečnost, umístit na místě, které je chráněno před průvanem. Z bezpečnostních důvodů se používá pro organické peroxidy a samovolně se rozkládající látky (zvané též "energetické" látky) nebo pro toxické látky metoda, při níž se používá jen malý zkušební vzorek o objemu cca 2 ml.

2.3.3.1.4 Jestliže je bod vzplanutí stanovený nerovnovážnou metodou $23\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$ nebo $60\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$, je třeba tento výsledek potvrdit pro každý teplotní rozsah jednou z rovnovážných metod.

2.3.3.1.5 Je-li zařazení hořlavé kapalné látky sporné, je směrodatné zařazení, které navrhl odesílatel, jestliže se výsledek kontrolní zkoušky pro stanovení bodu vzplanutí dotyčné kapaliny neliší o více než $20\text{ }^{\circ}\text{C}$ od mezních hodnot ($23\text{ }^{\circ}\text{C}$, popř. $60\text{ }^{\circ}\text{C}$) uvedených v pododdílu 2.2.3.1. Liší-li se výsledek kontrolní zkoušky o více než $20\text{ }^{\circ}\text{C}$, je nutno provést druhou kontrolní zkoušku a jako rozhodující platí nejnižší hodnota bodu vzplanutí zjištěná ve dvou kontrolních zkouškách.

2.3.3.2 Stanovení teploty počátku varu

Ke stanovení teploty počátku varu hořlavých kapalin smějí být použity:

Mezinárodní normy:

ISO 3924 (Petroleum products - Determination of boiling range distribution – Gas chromatography method)
(Ropné produkty – Stanovení rozložení destilačního rozmezí – Metoda plynové chromatografie)

ISO 4626 (Volatile organic liquids - Determination of boiling range of organic solvents used as raw materials)
(Těkavé organické kapaliny– Stanovení destilačního rozmezí organických rozpouštědel používaných jako suroviny)

ISO 3405 (Petroleum products - Determination of distillation characteristics at atmospheric pressure)
(Ropné produkty – Stanovení destilačních charakteristik při atmosférickém tlaku)

Vnitrostátní normy:

American Society for Testing Materials International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, Pennsylvania, USA 19428-2959:

ASTM D86-07a, Standard Test Method for Distillation of Petroleum Products at Atmospheric Pressure

ASTM D1078-05, Standard Test Method for Distillation Range of Volatile Organic Liquids

Další přípustné metody:

Metoda A.2, popsaná v části A přílohy k nařízení Komise (ES) č. 440/2008¹.

2.3.3.3 Zkouška pro stanovení obsahu peroxidu

Obsah peroxidu v kapalné látce se určuje následujícím postupem:

Množství p (asi 5 g s přesností vážení na 0,01 g) zkoušené kapaliny se nalije do Erlenmeyerovy baňky; přidá se 20 cm³ anhydridu kyseliny octové a asi 1 g tuhého jodidu draselného rozetřeného na prášek, obsah baňky se protřepe a po 10 minutách se ohřeje během 3 minut na cca 60 °C; poté se nechá chlazenout po dobu 5 minut a přidá se 25 cm³ vody. Potom se nechá stát po dobu půl hodiny a poté se uvolněný jód titruje desetinným roztokem sirnatanu sodného bez přidání indikátoru. Úplné odbarvení značí konec reakce. Označíme-li potřebný počet cm³ roztoku sirnatanu písmenem n , vypočítá se procentní obsah peroxidu ve vzorku (počítán jako H₂O₂) podle vzorce:

$$\frac{17n}{100p}$$

2.3.4 Zkouška ke stanovení tekutosti

Ke stanovení tekutosti kapalných, viskózních nebo pastovitých látek a směsí se používá následující zkušební postup:

2.3.4.1 Zkušební přístroj

Obchodně běžný penetrometr podle normy ISO 2137:1985 s vodící tyčí o hmotnosti 47,5 g \pm 0,05 g; děrovaný kotouč z duralu s kónickými otvory o hmotnosti 102,5 g \pm 0,05 g (viz obrázek 1); penetrační nádobka o vnitřním průměru 72 až 80 mm k jímání vzorku.

2.3.4.2 Zkušební postup

Vzorek se naplní do penetrační nádobky nejméně půl hodiny před začátkem měření. Nádobka se hermeticky uzavře a ponechá v klidu až do začátku měření. Vzorek se v hermeticky uzavřené penetrační nádobce ohřeje na 35 °C \pm 0,5 °C a teprve bezprostředně před měřením (nejvýše 2 minuty) se přemísť na stolek penetrometru. Nyní se na povrch kapaliny nasadí hrot S děrovaného kotouče a změří se hloubka průniku.

2.3.4.3 Vyhodnocení výsledků zkoušky

Látka je pastovitá, jestliže po nasazení hrotu S na povrch vzorku je hodnota penetrace odečtená na stupnici:

- (a) po době zatížení 5 s \pm 0,1 s je menší než 15 mm \pm 0,3 mm, nebo
- (b) při době zatížení 5 s \pm 0,1 s je větší než 15 mm \pm 0,3 mm, avšak dodatečná penetrace po dalších 55 s \pm 0,5 s je menší než 5,0 mm \pm 0,5 mm.

POZNÁMKA: U vzorků majících bod tečení je často nemožné dosáhnout v penetrační nádobce stálého rovného povrchu a tím zajistit při nasazení hrotu S jednoznačné počáteční podmínky měření. Navíc může u některých vzorků nastat při nárazu děrovaného kotouče elastická deformace povrchu a v prvních vteřinách může dojít k naměření vyšších hodnot penetrace. Ve všech těchto případech může být vhodné vyhodnotit výsledky podle odstavce b) výše.

¹ Nařízení Komise (ES) č.440/2008 z 30. května 2008 stanovící zkušební metody v souladu s nařízením (ES) č. 1907/2006 Evropského parlamentu a Rady o registraci, hodnocení, povolování a omezování chemických látek (REACH) (Úřední věstník Evropské unie, č. L 142 ze dne 31.5. 2008, str. 1-739 a č. L 143 ze dne 3.6.2008, str. 55).

Penetrometr

Pro míry bez udání tolerance platí $\pm 0,1 \text{ mm}$

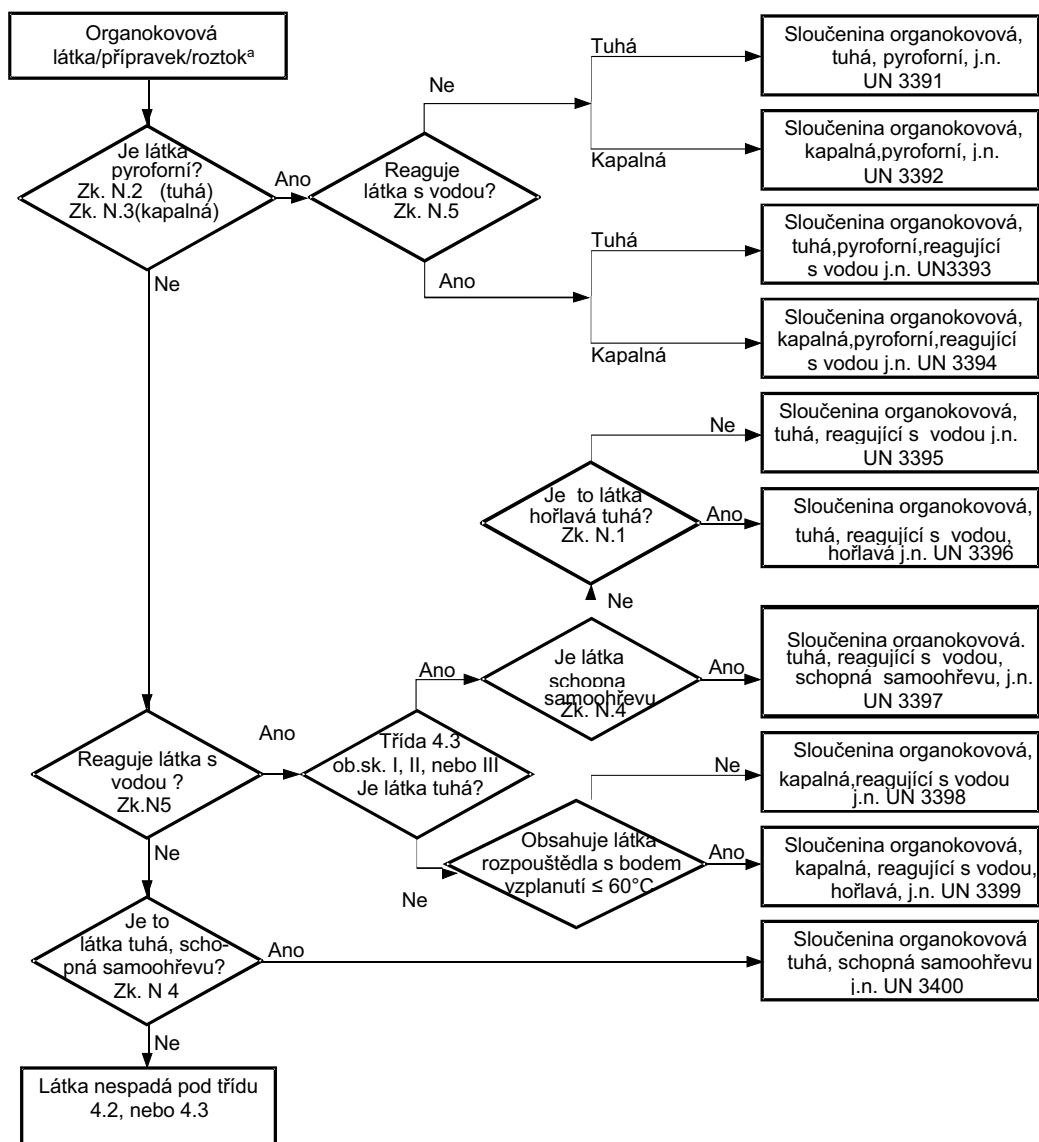

2.3.5 Klasifikace organokovových látek do tříd 4.2 a 4.3

V závislosti na svých vlastnostech, určených na základě zkoušek N.1 až N.5. Příručky zkoušek a kritérií, části III, oddílu 33, mohou být organokovové látky zařazeny do třídy 4.2, popřípadě 4.3 podle postupového diagramu uvedeného na obrázku 2.3.5.

POZNÁMKA 1: V závislosti na svých jiných vlastnostech a na přednosti v tabulce převažujících nebezpečí (viz 2.1.3.10) mohou být organokovové látky zařazeny do jiných tříd, jak je to vhodné.

POZNÁMKA 2: Hořlavé roztoky s organokovovými sloučeninami v koncentracích, které nejsou samozápalné, ani ve styku s vodou nevyvíjejí hořlavé plyny, jsou látkami třídy 3.

2.3.5: Postupový diagram pro klasifikaci organokovových látek do tříd 4.2 a 4.3^b

^a Pokud lze aplikovat a pokud je zkouška s přihlédnutím k reakčním vlastnostem odpovídající, určí se vlastnosti tříd 6.1. a 8 dle tabulky převažujícího nebezpečí v pododíle 2.1.3.10.

^b Zkušební metody N. 1 až N. 5 jsou obsaženy v Příručce zkoušek a kritérií část III, oddíl 33.

ČÁST 3

VYJMENOVÁNÍ NEBEZPEČNÝCH VĚCÍ, ZVLÁŠTNÍ USTANOVENÍ A VYNĚTÍ Z PLATNOSTI PRO OMEZENÁ A VYŇATÁ MNOŽSTVÍ

KAPITOLA 3.1

VŠEOBECNĚ

3.1.1 Úvod

Vedle ustanovení, která jsou uvedena v tabulkách této části, nebo na která se odkazuje, je nutno dbát všeobecných ustanovení každé části, kapitoly a/nebo oddílu. Tato všeobecná ustanovení nejsou v tabulkách uvedena. Jestliže všeobecné ustanovení je v rozporu se zvláštním ustanovením, má zvláštní ustanovení přednost.

3.1.2 Oficiální pojmenování pro přepravu

POZNÁMKA.: *K oficiálním pojmenováním používaným pro přepravu vzorků viz pododdíl 2.1.4.1.*

3.1.2.1 Oficiální pojmenování pro přepravu je tou částí položky, která věci uvedené v tabulce A kapitoly 3.2 nejpřesněji popisuje, a je napsáno velkými písmeny (číslice, řecká písmena a údaje napsané malými písmeny "sec", "terc", "m", "n", "o", a "p" jsou nedílnou součástí pojmenování). Za hlavním oficiálním pojmenováním pro přepravu může být udáno alternativní oficiální pojmenování pro přepravu v závorkách [např. ETHANOL (ETHYLALKOHOL)]. Části názvu položky, které jsou napsány malými písmeny, se nepovažují za součást oficiálního pojmenování pro přepravu.

3.1.2.2 Pokud jsou spojky "a" nebo "nebo" napsány malými písmeny nebo jsou-li části pojmenování odděleny čárkami, nemusí být v přepravním dokladu nebo v označení kusu uvedeno úplné pojmenování položky. Toto platí zvláště v případě, jestliže je pod jedním UN číslem uvedena kombinace více rozdílných položek. Následující příklady znázorňují postup při výběru oficiálního pojmenování pro přepravu v takových případech:

- (a) UN 1057 ZAPALOVAČE nebo NÁDOBKY S NÁPLNÍ DO ZAPALOVAČŮ – jako oficiální pojmenování pro přepravu se použije to z uvedených pojmenování, které je nejvhodnější:

ZAPALOVAČE

NÁDOBKY S NÁPLNÍ DO ZAPALOVAČŮ;

- (b) UN 2793 KOVY ŽELEZNÉ JAKO TŘÍSKY PŘI VRTÁNÍ, FRÉZOVÁNÍ, SOUSTRUŽENÍ, ODPADY ve formě schopné samoohřevu. Oficiální pojmenování pro přepravu je nejvhodnější z následujících kombinací:

KOVY ŽELEZNÉ JAKO TŘÍSKY PŘI VRTÁNÍ

KOVY ŽELEZNÉ JAKO TŘÍSKY PŘI FRÉZOVÁNÍ

KOVY ŽELEZNÉ JAKO TŘÍSKY PŘI SOUSTRUŽENÍ

KOVY ŽELEZNÉ ODPADY

3.1.2.3 Oficiální pojmenování pro přepravu může být použito v jednotném nebo množném čísle. Kromě toho, pokud toto pojmenování obsahuje blíže určující pojmy, je pořadí těchto pojmů v přepravním dokladu nebo v označení kusů libovolné. Například smí být namísto "DIMETHYLAMIN, VODNÝ ROZTOK" alternativně udáno "VODNÝ ROZTOK DIMETHYLAMINU". Pro věci třídy 1 mohou být použity obchodní nebo vojenské názvy, které obsahují oficiální pojmenování pro přepravu doplněné dodatečným popisným textem.

- 3.1.2.4 Mnoho látek má položku jak pro kapalný, tak i tuhý stav (viz definice kapaliny a tuhé látky v oddílu 1.2.1), nebo pro tuhou látku a roztok. Jsou jim přidělena různá UN čísla, která nemusí nutně následovat po sobě¹.
- 3.1.2.5 Je-li látka, která je podle definice uvedené v oddílu 1.2.1 látkou tuhou, podávána k přepravě v roztaveném stavu, doplní se oficiální pojmenování pro přepravu upřesňujícím slovem "ROZTAVENÝ", pokud toto slovo není již uvedeno velkými písmeny v pojmenování obsaženém v tabulce A kapitoly 3.2 (například ALKYLFENOL, TUHÝ, J.N., ROZTAVENÝ).
- 3.1.2.6 S výjimkou samovolně se rozkládajících látek a organických peroxidů, a pokud není slovo „STABILIZOVANÝ“ již velkými písmeny uvedeno v pojmenování obsaženém ve sloupci (2) tabulky A kapitoly 3.2, musí být toto slovo doplněno jako součást oficiálního pojmenování látky, která by bez stabilizace nebyla připuštěna k přepravě podle pododdílů 2.2.X.2 z důvodu své náchylnosti nebezpečně reagovat za normálních podmínek přepravy (např. LÁTKA TOXICKÁ, KAPALNÁ, ORGANICKÁ, J.N., STABILIZOVANÁ)
- Je-li ke stabilizaci takových látek použito řízení teploty k zamezení vzniku nebezpečného přetlaku, pak:
- (a) pro kapaliny: je-li SADT nejvýše 50 °C, platí ustanovení odstavce 2.2.41.1.17, zvláštní ustanovení V8 kapitoly 7.2, zvláštní ustanovení S4 kapitoly 8.5 a požadavky kapitoly 9.6; pro přepravu v IBC a v cisternách platí všechna ustanovení vztahující se na UN číslo 3239 (viz zejména pododdíl 4.1.7.2, pokyn pro balení IBC520 a pododdíl 4.2.1.13);
- (b) pro plyny: podmínky přepravy musí být schváleny příslušným orgánem.
- 3.1.2.7 Hydráty smějí být přepravovány pod oficiálním pojmenováním pro přepravu pro bezvodou látku.
- 3.1.2.8 Druhové položky nebo "jinde nejmenované" (J.N.) položky**
- 3.1.2.8.1 Druhová a "J.N." oficiální pojmenování pro přepravu, u nichž je ve sloupci (6) tabulky A kapitoly 3.2 uvedeno zvláštní ustanovení 274 nebo 318, musí být doplněna technickým názvem věci, pokud jeho zveřejnění nezakazují vnitrostátní předpisy nebo mezinárodní dohoda u látek podléhajících kontrole. Pro výbušné látky třídy 1 může být popis nebezpečných věcí doplněn dodatečným popisným textem uvádějícím obchodní nebo vojenské názvy. Technické názvy musí být uvedeny v závorkách hned za oficiálním pojmenováním pro přepravu. Rovněž je možno použít vhodný modifikátor, jako „obsahuje“ nebo „obsahující“, nebo jiná upřesňující slova, jako „směs“, „roztok“ atd., a procentní podíl technické složky. Např. „UN 1993 LÁTKA HOŘLAVÁ, KAPALNÁ, J.N. (OBSAHUJE XYLEN A BENZEN), 3,II“.
- 3.1.2.8.1.1 Technickým názvem musí být uznávaný chemický název nebo biologický název nebo jiný název běžně používaný ve vědeckých a technických publikacích, časopisech a textech. Obchodní názvy nesmějí být k tomuto účelu používány. U pesticidů se smějí používat jen obvyklé názvy ISO, jiné názvy uvedené v publikaci Světové zdravotnické organizace (WHO) Recommended Classification of Pesticides by Hazard and Guidelines to Classification anebo pojmenování jejich aktivní látky (aktivních látek).
- 3.1.2.8.1.2 Pokud je směs nebezpečných věcí popsána "J.N." položkou nebo „druhovou“ položkou a je-li u této položky uvedeno ve sloupci (6) tabulky A kapitoly 3.2 zvláštní ustanovení 274, stačí uvést jen dva komponenty, které převážně přispívají k nebezpečnosti směsi, vyjma látek, které podléhají kontrole a jejichž přesný popis je zakázán vnitrostátním předpisem nebo mezinárodní dohodou. Je-li kus, který směs obsahuje, opatřen bezpečnostní značkou, která označuje vedlejší nebezpečí, musí být jedním z obou v závorkách udaných technických názvů název komponentu, který vyžaduje použití bezpečnostní značky pro vedlejší nebezpečí.

¹ Detaily jsou uvedeny v abecedním seznamu (Tabulka B kapitoly 3.2), např.:

NITROXYLENY, KAPALNÉ	6.1	1665;
NITROXYLENY, TUHÉ	6.1	3447

POZNÁMKA: Viz odstavec 5.4.1.2.2

- 3.1.2.8.1.3 Následující příklady ukazují, jakým způsobem se u J.N. položek doplňují oficiální pojmenování pro přepravu technickým názvem věcí:

UN 2902	PESTICID KAPALNÝ, TOXICKÝ, J.N. (drazoxolon);
UN 3394	LÁTKA ORGANOKOVOVÁ, KAPALNÁ, PYROFORNÍ, REAGUJÍCÍ S VODOU (trimethylgalium).

3.1.3 Roztoky nebo směsi

POZNÁMKA: Tam, kde je látka jmenovitě uvedená v tabulce A kapitoly 3.2, musí být identifikována oficiálním pojmenováním pro přepravu uvedeným ve sloupci (2) tabulky A kapitoly 3.2. Takové látky mohou obsahovat technické nečistoty (pocházející například z výrobního procesu) nebo stabilizační přísady nebo jiné účely nemající vliv na klasifikaci. Avšak, látka jmenovitě uvedená obsahující technické nečistoty nebo stabilizační přísady nebo jiné účely mající vliv na klasifikaci musí být považována za roztok nebo směs (viz. 2.1.3.3).

- 3.1.3.1 Roztok nebo směs nepodléhá předpisům ADR, jestliže charakteristiky, vlastnosti, forma nebo skupenství roztoku nebo směsi jsou takové, že nesplňují kritéria, včetně kritérií z osobní praxe, pro zařazení do žádné z tříd.

- 3.1.3.2 Roztok nebo směs splňující klasifikační kritéria ADR, složené z jedné převažující látky, jmenovitě uvedené v tabulce A kapitoly 3.2, a z jedné nebo více látek nepodléhající(ch) ADR, nebo stopových množství jedné nebo více látek jmenovitě uvedených v tabulce A kapitoly 3.2, musí být přiřazeny k UN číslu a oficiálnímu pojmenování pro přepravu převažující látky, jmenovitě uvedené v tabulce A kapitoly 3.2, ledaže:

- (a) roztok nebo směs je jmenovitě uveden(a) v tabulce A kapitoly 3.2;
- (b) pojmenování a popis látky jmenovitě uvedené v tabulce A kapitoly 3.2 výslovně vyjadřují, že se vztahují jen na čistou látku;
- (c) třída, klasifikační kód, obalová skupina nebo fyzikální stav tohoto roztoku nebo směsi jsou odlišné od třídy, klasifikačního kódu, obalové skupiny nebo fyzikálního stavu látky jmenovitě uvedené v tabulce A kapitoly 3.2; nebo
- (d) charakteristiky nebezpečnosti a vlastnosti roztoku nebo směsi vyžadují opatření v případě nehody nebo nouzové situace, která jsou odlišná od opatření vyžadovaných pro látku jmenovitě uvedenou v tabulce A kapitoly 3.2.

Upřesňující slova jako jsou "ROZTOK" nebo "SMĚS", musí být přiřazena jako součást oficiálního pojmenování pro přepravu, např. "ACETON ROZTOK". Kromě toho, koncentrace roztoku nebo směsi může být uvedena za základním popisem roztoku nebo směsi, např. "ACETON 75 % ROZTOK".

- 3.1.3.3 Roztok nebo směs, splňující klasifikační kritéria ADR, který není jmenovitě uveden(a) v tabulce A kapitoly 3.2 a je složen(a) ze dvou nebo více nebezpečných věcí se přiřadí pod položku, jejíž oficiální pojmenování pro přepravu, popis, třída, klasifikační kód a obalová skupina popisuje co nejpřesněji roztok nebo směs.

KAPITOLA 3.2

SEZNAM NEBEZPEČNÝCH VĚCÍ

3.2.1 Tabulka A: Seznam nebezpečných věcí

Vysvětlivky

Každý řádek v tabulce A se týká zpravidla látky (látek) nebo předmětu (předmětů), které jsou zahrnuty pod určité UN číslo. Jestliže však látky nebo předměty, které náleží ke stejnému UN číslu, mají rozdílné chemické nebo fyzikální vlastnosti a/nebo přepravní podmínky, může být pro toto UN číslo použito více po sobě jdoucích řádků.

Každý ze sloupců tabulky A je věnován určitému tématu, jak je uvedeno v následujících vysvětlujících poznámkách. Průsečík sloupců a řádků (buňka) obsahuje informace týkající se tématu, o kterém se v tomto sloupci pojednává, pro látku(y) nebo předmět(y) tohoto řádku:

- první čtyři buňky identifikují látku(y) nebo předmět(y) patřící k tomuto řádku (dodatečné informace v tomto ohledu mohou být uvedeny ve zvláštních ustanoveních sloupce (6));
- následující buňky udávají platná zvláštní ustanovení, buď ve formě úplné informace, nebo ve formě kódu. Kódy odkazují na detailní informace obsažené v části, kapitole, oddílu a/nebo pododdílu, které jsou uvedeny v následujících vysvětlujících poznámkách. Prázdná buňka znamená buď, že není žádné zvláštní ustanovení a že platí pouze všeobecná ustanovení, anebo, že platí omezení přepravy uvedené v platných vysvětlujících poznámkách. Je-li v této tabulce použit alfanumerický kód začínající písmeny „ZU“ označuje zvláštní ustanovení kapitoly 3.3.

Jednotlivé buňky neobsahují odvolávky na platná všeobecná ustanovení. Následující vysvětlující poznámky udávají pro každý sloupec část(i), kapitolu(y), oddíl(y) a/nebo pododdíl(y), kde jsou obsažena.

Vysvětlující poznámky pro každý sloupec:

Sloupec (1) „UN číslo“

Tento sloupec obsahuje UN číslo

- nebezpečné látky nebo předmětu, jestliže této látce nebo předmětu bylo přiděleno vlastní specifické UN číslo, nebo
- druhové položky nebo J.N. položky, k níž musí být přiřazeny jmenovitě neuvedené nebezpečné látky nebo předměty podle kritérií („rozhodovacích stromů“) části 2.

Sloupec (2) „Pojmenování a popis“

Tento sloupec obsahuje pojmenování látky nebo předmětu, napsané velkými písmeny, pokud této látce nebo předmětu bylo přiděleno vlastní specifické UN číslo, nebo pojmenování druhové položky nebo J.N. položky, ke kterým byly nebezpečné látky nebo předměty přiřazeny podle kritérií („rozhodovacích stromů“) části 2. Toto pojmenování musí být použito jako oficiální pojmenování pro přepravu, popřípadě jako část oficiálního pojmenování pro přepravu (pro další podrobnosti k oficiálnímu pojmenování pro přepravu viz oddíl 3.1.2).

Za oficiálním pojmenováním pro přepravu je malými písmeny připojen popisný text k upřesnění rozsahu platnosti položky, pokud mohou být klasifikace a/nebo přepravní podmínky látky nebo předmětu za určitých okolností rozdílné.

Sloupec (3a)	<p>“Třída“</p> <p>Tento sloupec obsahuje číslo třídy, pod jejíž název spadá nebezpečná látka nebo předmět. Toto číslo třídy se přiřazuje podle postupů a kritérií části 2.</p>
Sloupec (3b)	<p>“Klasifikační kód“</p> <p>Tento sloupec obsahuje klasifikační kód nebezpečné látky nebo předmětu.</p> <ul style="list-style-type: none">– Pro nebezpečné látky nebo předměty třídy 1 sestává kód z čísla podtřídy a písmena skupiny snášenlivosti, které jsou přiřazeny podle postupů a kritérií uvedených v odstavci 2.2.1.1.4.– Pro nebezpečné látky nebo předměty třídy 2 sestává kód z číslice a písmena nebo písmen pro skupinu nebezpečných vlastností, které jsou vysvětleny v odstavcích 2.2.2.1.2 a 2.2.2.1.3.– Pro nebezpečné látky nebo předměty tříd 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 6.2, 8 a 9 jsou kódy vysvětleny v odstavcích 2.2 x.1.2¹.– Nebezpečné látky nebo předměty třídy 7 nemají klasifikační kód.
Sloupec (4)	<p>“Obalová skupina“</p> <p>Tento sloupec obsahuje číslo(a) obalové skupiny (I, II nebo III), která je k nebezpečné látce přiřazena. Tato čísla obalových skupin jsou přiřazena na základě postupů a kritérií uvedených v části 2. Některým předmětům a látkám není přiřazena žádná obalová skupina.</p>
Sloupec (5)	<p>“Bezpečnostní značky“</p> <p>Tento sloupec obsahuje číslo vzoru bezpečnostních značek/ velkých bezpečnostních značek (viz pododdíly 5.2.2.2 a 5.3.1.7), které se musí umístit na kusy, kontejnery, cisternové kontejnery, přemístitelné cisterny, MEGC a vozidla. Avšak pro látky nebo předměty třídy 7 znamená “7X” vzor bezpečnostní značky č. 7A, 7B, popř. 7C v závislosti na kategorii (viz odstavce 5.1.5.3.4 a 5.2.2.1.11.1) nebo velkou bezpečnostní značku č. 7D (viz odstavce 5.3.1.1.3 a 5.3.1.7.2);</p> <p>Všeobecná ustanovení pro umístění bezpečnostních značek a velkých bezpečnostních značek (např. počet bezpečnostních značek nebo jejich umístění) jsou obsažena pro kusy v pododdílu 5.2.2.1 a pro kontejnery, cisternové kontejnery, MEGC, přemístitelné cisterny a vozidla v oddílu 5.3.1.</p> <p>POZNÁMKA: Výše uvedená ustanovení o označování bezpečnostními značkami nebo velkými bezpečnostními značkami mohou být pozměněna zvláštními ustanoveními uvedenými ve slupci (6).</p>
Sloupec (6)	<p>“Zvláštní ustanovení“</p> <p>Tento sloupec obsahuje číselné kódy zvláštních ustanovení, která je nutno dodržet. Tato ustanovení postihují široký okruh témat, která souvisejí hlavně s obsahem sloupců (1) až (5) (např. zákazy přepravy, vynětí z platnosti některých požadavků, vysvětlivky ke klasifikaci určitých forem dotyčných nebezpečných věcí, jakož i dodatečná ustanovení pro označování nápisy a bezpečnostními značkami), a jsou uvedena v kapitole 3.3 v číselném pořadí. Je-li sloupec (6) prázdný, neplatí pro dotyčné nebezpečné věci ve vztahu k obsahu sloupců (1) až (5) žádné zvláštní ustanovení.</p>

¹ X = číslo třídy nebezpečné látky nebo předmětu, popřípadě bez tečky.

Sloupec (7a)	<p>“Omezená množství”</p> <p>Stanovuje maximální množství na vnitřní obal nebo kus pro přepravu nebezpečných věcí v omezených množstvích podle kapitoly 3.4.</p>
Sloupec (7b)	<p>“Vyňatá množství”</p> <p>Tento sloupec obsahuje alfanumerický kód s následujícím významem:</p> <ul style="list-style-type: none">– „E0” znamená, že pro nebezpečné věci zabalené ve vyňatých množstvích neplatí žádné vynětí z platnosti ustanovení ADR;– všechny ostatní alfanumerické kódy začínající písmenem „E” znamenají, že ustanovení ADR neplatí, pokud jsou splněny podmínky uvedené v kapitole 3.5.
Sloupec (8)	<p>“Pokyny pro balení”</p> <p>Tento sloupec obsahuje alfanumerické kódy příslušných pokynů pro balení:</p> <ul style="list-style-type: none">– alfanumerické kódy začínající písmenem “P” se vztahují na pokyny pro balení pro obaly a nádoby (vyjma IBC a velkých obalů), alfanumerické kódy začínající písmenem “R” se vztahují na pokyny pro balení pro obaly z jemného plechu. Tyto pokyny jsou uvedeny v pododdílu 4.1.4.1 v číselném pořadí a určují, které obaly a nádoby jsou dovoleny. Udávají rovněž, která všeobecná ustanovení pro balení oddílů 4.1.1, 4.1.2 a 4.1.3 a která zvláštní ustanovení pro balení oddílů 4.1.5, 4.1.6, 4.1.7, 4.1.8 a 4.1.9 je nutno dodržet. Pokud sloupec (8) neobsahuje žádný kód začínající písmeny “P” nebo “R”, nesmějí být dotyčné nebezpečné věci přepravovány v obalech;– alfanumerické kódy začínající písmeny “IBC” se vztahují na pokyny pro balení pro IBC. Tyto pokyny jsou uvedeny v pododdílu 4.1.4.2 v číselném pořadí a určují, které IBC jsou dovoleny. Udávají rovněž, která všeobecná ustanovení pro balení oddílů 4.1.1, 4.1.2 a 4.1.3 a která zvláštní ustanovení pro balení oddílů 4.1.5, 4.1.6, 4.1.7, 4.1.8 a 4.1.9 je nutno dodržet. Pokud sloupec (8) neobsahuje žádný kód začínající písmeny “IBC”, nesmějí být dotyčné nebezpečné věci přepravovány v IBC;– alfanumerické kódy začínající písmeny “LP” se vztahují na pokyny pro balení pro velké obaly. Tyto pokyny jsou uvedeny v pododdílu 4.1.4.3 v číselném pořadí a určují, které velké obaly jsou dovoleny. Udávají rovněž, která všeobecná ustanovení pro balení oddílů 4.1.1, 4.1.2 a 4.1.3 a která zvláštní ustanovení pro balení oddílů 4.1.5, 4.1.6, 4.1.7, 4.1.8 a 4.1.9 je nutno dodržet. Pokud sloupec (8) neobsahuje žádný kód začínající písmeny “LP”, nesmějí být dotyčné nebezpečné věci přepravovány ve velkých obalech.; <p>POZNÁMKA: Výše uvedené pokyny pro balení mohou být pozměněny zvláštními ustanoveními pro balení uvedenými ve sloupci (9a).</p>
Sloupec (9a)	<p>“Zvláštní ustanovení pro balení”</p> <p>Tento sloupec obsahuje alfanumerické kódy použitelných zvláštních ustanovení pro balení:</p> <ul style="list-style-type: none">– alfanumerické kódy začínající písmeny “PP” nebo “RR” se vztahují na zvláštní ustanovení pro balení pro obaly a nádoby (vyjma IBC a velkých obalů), která musí být navíc dodržena. Ta jsou uvedena v pododdílu 4.1.4.1 na konci odpovídajícího pokynu pro balení, udaného ve sloupci (8) (s písmeny “P” nebo “R”). Pokud sloupec (9a) neobsahuje žádný kód

začínající písmeny "PP" nebo "RR", neplatí žádné zvláštní ustanovení pro balení, uvedené na konci odpovídajícího pokynu pro balení;

- alfanumerické kódy začínající písmenem "B" nebo písmeny „BB“ se vztahují na zvláštní ustanovení pro balení pro IBC, která musí být navíc dodržena. Ta jsou uvedena v pododdílu 4.1.4.2 na konci odpovídajícího pokynu pro balení, udaného ve sloupci (8) (s písmeny "IBC"). Pokud sloupec (9a) neobsahuje žádný kód začínající písmenem "B" nebo písmeny „BB“, neplatí žádné zvláštní ustanovení pro balení, uvedené na konci odpovídajícího pokynu pro balení;
- alfanumerické kódy začínající písmenem "L" se vztahují na zvláštní ustanovení pro balení pro velké obaly, která musí být navíc dodržena. Ta jsou uvedena v pododdílu 4.1.4.3 na konci odpovídajícího pokynu pro balení, udaného ve sloupci (8) (s písmeny "LP"). Pokud sloupec (9a) neobsahuje žádný kód začínající písmenem "L", neplatí žádné zvláštní ustanovení pro balení, uvedené na konci odpovídajícího pokynu pro balení.

Sloupec (9b) "Ustanovení o společném balení"

Tento sloupec obsahuje alfanumerické kódy, začínající písmeny "MP", ustanovení vztahujících se na společné balení. Tato ustanovení jsou uvedena v oddílu 4.1.10 v číselném pořadí. Jestliže sloupec (9b) neobsahuje žádný kód začínající písmeny "MP", platí jen všeobecná ustanovení (viz pododdíly 4.1.1.5 a 4.1.1.6).

Sloupec (10) "Pokyny pro přemístitelné cisterny a kontejnery pro volně ložené látky"

Tento sloupec obsahuje alfanumerický kód, který je podle odstavců 4.2.5.2.1 až 4.2.5.2.4 a 4.2.5.2.6 přiřazen pokynu pro přemístitelné cisterny. Tento pokyn pro přemístitelné cisterny odpovídá nejméně přísným požadavkům, které jsou dovoleny pro přepravu látky v přemístitelných cisternách. Kódy označující ostatní pokyny pro přemístitelné cisterny, které jsou rovněž dovoleny pro přepravu látky, jsou obsaženy v odstavci 4.2.5.2.5. Pokud není uveden žádný kód, není přeprava v přemístitelných cisternách dovolena, ledaže je uděleno schválení příslušným orgánem, jak je podrobně uvedeno v pododdílu 6.7.1.3.

Všeobecná ustanovení pro konstrukci, výrobu, výstroj, schvalování typu, zkoušení a značení přemístitelných cisteren jsou obsažena v kapitole 6.7. Všeobecná ustanovení pro používání (např. plnění) jsou obsažena v oddílech 4.2.1 až 4.2.4.

Údaj „M“ znamená, že látka smí být přepravována v UN vícečlánekových kontejnerech na plyn (MEGC).

POZNÁMKA: Výše uvedené požadavky mohou být pozměněny zvláštními ustanoveními uvedenými ve sloupci (11).

Může také obsahovat alfanumerické kódy začínající písmeny „BK“ vztahující se k druhům kontejnerů pro volně ložené látky, popsáním v kapitole 6.11, které smějí být používány pro přepravu věcí ve volně loženém stavu podle pododdílu 7.3.1.1 (a) a oddílu 7.3.2.

Sloupec (11) "Zvláštní ustanovení pro přemístitelné cisterny a kontejnery pro volně ložené látky"

Tento sloupec obsahuje alfanumerické kódy zvláštních ustanovení pro přemístitelné cisterny, která musí být navíc dodržena. Tyto kódy, začínající písmeny "TP", se vztahují na zvláštní ustanovení pro výrobu nebo pro používání přemístitelných cisteren. Ta jsou obsažena v pododdílu 4.2.5.3.

POZNÁMKA: Pokud je to technicky aplikovatelné, vztahují se tato zvláštní ustanovení nejen na přemístitelné cisterny uvedené ve sloupci (10), ale i na přemístitelné cisterny, které mohou být používány podle tabulky v 4.2.5.2.5.

Sloupec (12) "Kódy cisteren pro cisterny ADR"

Tento sloupec obsahuje alfanumerické kódy odpovídající typu cisterny podle odstavce 4.3.3.1.1 (pro plyny třídy 2) nebo odstavce 4.3.4.1.1 (pro látky tříd 3 až 9). Tento typ cisterny odpovídá nejméně přísným požadavkům na cisterny, které jsou dovoleny pro přepravu dotyčné látky v cisternách ADR. Kódy odpovídající ostatním dovoleným typům cisteren jsou uvedeny v odstavci 4.3.3.1.2 (pro plyny třídy 2) nebo v odstavci 4.3.4.1.2 (pro látky tříd 3 až 9). Není-li uveden žádný kód, přeprava v cisternách ADR není dovolena.

Pokud je v tomto sloupci uveden kód cisterny pro tuhé látky (S) a pro kapalné látky (L), znamená to, že tato látka smí být podávána k přepravě v cisternách v tuhém nebo kapalném (roztaveném) stavu. Obvykle platí toto ustanovení pro látky s bodem tání mezi 20 °C a 180 °C.

Pokud je v tomto sloupci uveden pro tuhou látku pouze kód cisterny pro kapalné látky (L) znamená to, že tato látka smí být podávána k přepravě v cisternách jen v kapalném (roztaveném) stavu.

Všeobecné požadavky na konstrukci, výstroj, schvalování typu, zkoušení a značení, které nejsou uvedeny v kódu cisteren, jsou obsaženy v oddílech 6.8.1, 6.8.2, 6.8.3 a 6.8.5. Všeobecná ustanovení pro používání (např. nejvyšší stupeň plnění, nejnižší zkušební tlak) jsou obsažena v oddílech 4.3.1 až 4.3.4.

Písmeno "(M)" za kódem cisterny znamená, že látka smí být přepravována také v bateriových vozidlech nebo MEGC.

Znaménko "(+)" za kódem cisterny znamená, že alternativní používání cisteren je povoleno pouze tehdy, je-li to uvedeno v osvědčení o schválení typu.

K cisternám z vyztužených plastů viz oddíl 4.4.1 a kapitulu 6.9.; k cisternám pro podtlakové vyčerpávání odpadů viz oddíl 4.5.1 a kapitulu 6.10.

POZNÁMKA: Výše uvedené požadavky mohou být pozměněny zvláštními ustanoveními uvedenými ve sloupci (13).

Sloupec (13) "Zvláštní ustanovení pro cisterny ADR"

Tento sloupec obsahuje alfanumerické kódy zvláštních ustanovení pro cisterny ADR, která je nutno navíc dodržet:

- Alfnumerické kódy začínající písmeny "TU" se vztahují na zvláštní ustanovení pro používání těchto cisteren. Ta jsou obsažena v oddílu 4.3.5.
- Alfnumerické kódy začínající písmeny "TC" se vztahují na zvláštní ustanovení pro konstrukci těchto cisteren. Ta jsou obsažena v oddílu 6.8.4 (a).
- Alfnumerické kódy začínající písmeny "TE" se vztahují na zvláštní ustanovení pro výstroj těchto cisteren. Ta jsou obsažena v oddílu 6.8.4 (b).
- Alfnumerické kódy začínající písmeny "TA" se vztahují na zvláštní ustanovení pro schvalování typu těchto cisteren. Ta jsou obsažena v oddílu 6.8.4 (c).
- Alfnumerické kódy začínající písmeny "TT" se vztahují na zvláštní ustanovení pro zkoušení těchto cisteren. Ta jsou obsažena v oddílu 6.8.4 (d).
- Alfnumerické kódy začínající písmeny "TM" se vztahují na zvláštní ustanovení pro značení těchto cisteren. Ta jsou obsažena v oddílu 6.8.4 (e).

POZNÁMKA: Pokud je to technicky aplikovatelné, vztahují se tato zvláštní ustanovení nejen na cisterny uvedené ve sloupci (12), ale i na cisterny, které mohou být používány podle hierarchie cisteren v 4.3.3.1.2 a 4.3.4.1.2.

Sloupec (14) "Vozidla pro přepravu v cisternách"

Tento sloupec obsahuje kód specifikující vozidlo (včetně tažného vozidla přívěsů nebo návěsů) (viz oddíl 9.1.1), které je třeba použít pro přepravu látky v cisterně podle oddílu 7.4.2. Požadavky týkající se konstrukce a schvalování těchto vozidel jsou obsaženy v kapitolách 9.1, 9.2 a 9.7.

Sloupec (15) "Převravní kategorie / (Kód omezení pro tunely)"

Tento sloupec obsahuje v horní části buňky číslici udávající přepravní kategorii, do které látka nebo předmět patří, za účelem vynětí z platnosti vztahujícího se k množstvím přepravovaným dopravní jednotkou (viz pododíl 1.1.3.6).

Ve spodní části buňky (v závorkách) obsahuje kód omezení pro tunely, které odkazuje na omezení pro průjezd vozidel převážející látky nebo předměty silničními tunely. Tyto jsou uvedeny v Kapitole 8.6. Není-li uveden žádný kód omezení pro tunely, je to označeno '(–)'.

Sloupec (16) "Zvláštní ustanovení pro přepravu kusů"

Tento sloupec obsahuje alfanumerický(é) kód(y), začínající písmenem „V“, příslušných zvláštních ustanovení (pokud jsou) pro přepravu v kusech. Tato ustanovení jsou uvedena v oddílu 7.2.4. Všeobecná ustanovení pro přepravu v kusech jsou obsažena v kapitolách 7.1 a 7.2.

POZNÁMKA: Navíc platí zvláštní ustanovení pro nakládku, vykládku a manipulaci uvedená ve sloupci (18).

Sloupec (17) „Zvláštní ustanovení pro přepravu ve volně loženém stavu“

Tento sloupec obsahuje alfanumerický(é) kód(y), začínající písmeny „VC“, jakož i alfanumerický(é) kód(y), začínající písmeny „AP“, příslušných ustanovení pro přepravu ve volně loženém stavu. Tato ustanovení jsou uvedena v oddílu 7.3.3. Pokud není uveden žádný kód ani odkaz na zvláštní odstavec, přeprava ve volně loženém stavu není dovolena. Všeobecná a dodatečná ustanovení týkající se přepravy ve volně loženém stavu jsou k nalezení v kapitolách 7.1 a 7.3.

POZNÁMKA: Navíc je nutno dodržet zvláštní ustanovení uvedená ve sloupci (18), týkající se nakládky, vykládky a manipulace.

Sloupec (18) "Zvláštní ustanovení pro nakládku, vykládku a manipulaci"

Tento sloupec obsahuje alfanumerický(é) kód(y), začínající písmeny „CV“, příslušných zvláštních ustanovení pro nakládku, vykládku a manipulaci. Tato ustanovení jsou uvedena v oddílu 7.5.11. Jestliže sloupec (18) neobsahuje žádný kód, platí jen všeobecná ustanovení (viz oddíly 7.5.1 až 7.5.10).

Sloupec (19) "Zvláštní ustanovení pro provoz"

Tento sloupec obsahuje alfanumerický(é) kód(y), začínající písmenem „S“, příslušných zvláštních ustanovení pro provoz, která jsou uvedena v kapitole 8.5. Tato ustanovení je nutno použít vedle předpisů kapitol 8.1 až 8.4, avšak v případě rozporu s předpisy kapitol 8.1 až 8.4 platí zvláštní ustanovení.

Sloupec (20) "Identifikační číslo nebezpečnosti"

Tento sloupec obsahuje číslo, složené ze dvou nebo tří číslic (v určitých případech s předřazeným písmenem "X") pro látky a předměty tříd 2 až 9 a pro látky a předměty třídy 1 klasifikační kód /viz sloupec (3b)/. V případech popsaných v pododílu 5.3.2.1 se toto číslo musí objevit v horní části oranžové tabulky. Význam identifikačních čísel nebezpečnosti je vysvětlen v pododílu 5.3.2.3.
