3.2.2 **Table B: List of dangerous goods in alphabetical order**

The following Table B is an alphabetical list of the substances and articles which are listed in the UN numerical order in Table A of 3.2.1. It does not form an integral part of ADN. It has been prepared, with all necessary care by the Secretariat of the United Nations Economic Commission for Europe, in order to facilitate the consultation of the annexed Regulations, but it cannot be relied upon as a substitute for the careful study and observance of the actual provisions of those annexed Regulations which, in case of conflict, are deemed to be authoritative.

***NOTE 1:** For the purpose of determining the alphabetical order the following information has been ignored, even when it forms part of the proper shipping name: numbers; Greek letters; the abbreviations "sec" and "tert"; and the letters "N" (nitrogen), "n" (normal), "o" (ortho), "m" (meta), "p" (para) and "N.O.S." (not otherwise specified).*

***NOTE 2:** The name of a substance or article in block capital letters indicates a proper shipping name (see 3.1.2).*

***NOTE 3:** The name of a substance or article in block capital letters followed by the word "see" indicates an alternative proper shipping name or part of a proper shipping name (except for PCBs) (see 3.1.2.1).*

***NOTE 4:** An entry in lower case letters followed by the word "see" indicates that the entry is not a proper shipping name; it is a synonym.*

***NOTE 5:** Where an entry is partly in block capital letters and partly in lower case letters, the latter part is considered not to be part of the proper shipping name (see 3.1.2.1).*

***NOTE 6:** A proper shipping name may be used in the singular or plural, as appropriate, for the purposes of documentation and package marking (see 3.1.2.3).*

***NOTE 7:** For the exact determination of a proper shipping name, see 3.1.2.*

CHAPTER 3.3

SPECIAL PROVISIONS APPLICABLE TO CERTAIN ARTICLES OR SUBSTANCES

- 3.3.1 When Column (6) of Table A of Chapter 3.2 indicates that a special provision is relevant to a substance or article, the meaning and requirements of that special provision are as set forth below. Where a special provision includes a requirement for package marking, the provisions of 5.2.1.2 (a) and (b) shall be met. If the required mark is in the form of specific wording indicated in quotation marks, such as "LITHIUM BATTERIES FOR DISPOSAL", the size of the mark shall be at least 12 mm, unless otherwise indicated in the special provision or elsewhere in ADN.
- 16 Samples of new or existing explosive substances or articles may be carried as directed by the competent authorities (see 2.2.1.1.3) for purposes including: testing, classification, research and development, quality control, or as a commercial sample. Explosive samples which are not wetted or desensitised shall be limited to 10 kg in small packages as specified by the competent authorities. Explosive samples which are wetted or desensitised shall be limited to 25 kg.
- 23 Even though this substance has a flammability hazard, it only exhibits such hazard under extreme fire conditions in confined areas.
- 32 This substance is not subject to the requirements of ADN when in any other form.
- 37 This substance is not subject to the requirements of ADN when coated.
- 38 This substance is not subject to the requirements of ADN when it contains not more than 0.1% calcium carbide.
- 39 This substance is not subject to the requirements of ADN when it contains less than 30% or not less than 90% silicon.
- 43 When offered for carriage as pesticides, these substances shall be carried under the relevant pesticide entry and in accordance with the relevant pesticide provisions (see 2.2.61.1.10 to 2.2.61.1.11.2).
- 45 Antimony sulphides and oxides which contain not more than 0.5% of arsenic calculated on the total mass are not subject to the requirements of ADN.
- 47 Ferricyanides and ferrocyanides are not subject to the requirements of ADN.
- 48 The carriage of this substance, when it contains more than 20% hydrocyanic acid, is prohibited.
- 59 These substances are not subject to the requirements of ADN when they contain not more than 50% magnesium.
- 60 If the concentration is more than 72%, the carriage of this substance is prohibited.
- 61 The technical name which shall supplement the proper shipping name shall be the ISO common name (see also ISO 1750:1981 "*Pesticides and other agrochemicals - common names*", as amended), other names listed in the WHO "*Recommended Classification of Pesticides by Hazard and Guidelines to Classification*" or the name of the active substance (see also 3.1.2.8.1 and 3.1.2.8.1.1).
- 62 This substance is not subject to the requirements of ADN when it contains not more than 4% sodium hydroxide.

Copyright © United Nations, 2021. All rights reserved

- 65 Hydrogen peroxide aqueous solutions with less than 8% hydrogen peroxide are not subject to the requirements of ADN.
- 66 Cinnabar is not subject to the requirements of ADN.
- 103 The carriage of ammonium nitrites and mixtures of an inorganic nitrite with an ammonium salt is prohibited.
- 105 Nitrocellulose meeting the descriptions of UN No. 2556 or UN No. 2557 may be classified in Class 4.1.
- 113 The carriage of chemically unstable mixtures is prohibited.
- 119 Refrigerating machines include machines or other appliances which have been designed for the specific purpose of keeping food or other items at a low temperature in an internal compartment, and air conditioning units. Refrigerating machines and refrigerating machine components are not subject to the provisions of ADN if they contain less than 12 kg of gas in Class 2, group A or O according to 2.2.2.1.3, or if they contain less than 12 litres ammonia solution (UN No. 2672).
- 122 The subsidiary hazards, control and emergency temperatures if any, and the UN number (generic entry) for each of the currently assigned organic peroxide formulations are given in 2.2.52.4, 4.1.4.2 packing instruction IBC520 and 4.2.5.2.6 portable tank instruction T23 of ADR.
- 123 *(Reserved)*
- 127 Other inert material or inert material mixture may be used, provided this inert material has identical phlegmatizing properties.
- 131 The phlegmatized substance shall be significantly less sensitive than dry PETN.
- 135 The dihydrated sodium salt of dichloroisocyanuric acid does not meet the criteria for inclusion in Class 5.1 and is not subject to ADN unless meeting the criteria for inclusion in another Class.
- 138 p-Bromobenzyl cyanide is not subject to the requirements of ADN.
- 141 Products which have undergone sufficient heat treatment so that they present no hazard during carriage are not subject to the requirements of ADN.
- 142 Solvent extracted soya bean meal containing not more than 1.5% oil and 11% moisture, which is substantially free of flammable solvent, is not subject to the requirements of ADN.
- 144 An aqueous solution containing not more than 24% alcohol by volume is not subject to the requirements of ADN.
- 145 Alcoholic beverages of packing group III, when carried in receptacles of 250 litres or less, are not subject to the requirements of ADN.
- 152 The classification of this substance will vary with particle size and packaging, but borderlines have not been experimentally determined. Appropriate classifications shall be made in accordance with 2.2.1.
- 153 This entry applies only if it is demonstrated, on the basis of tests, that the substances when in contact with water are not combustible nor show a tendency to auto-ignition and that the mixture of gases evolved is not flammable.

- 163 A substance mentioned by name in Table A of Chapter 3.2 shall not be carried under this entry. Substances carried under this entry may contain 20% or less nitrocellulose provided the nitrocellulose contains not more than 12.6% nitrogen (by dry mass).
- 168 Asbestos which is immersed or fixed in a natural or artificial binder (such as cement, plastics, asphalt, resins or mineral ore) in such a way that no escape of hazardous quantities of respirable asbestos fibres can occur during carriage is not subject to the requirements of ADN. Manufactured articles containing asbestos and not meeting this provision are nevertheless not subject to the requirements of ADN when packed so that no escape of hazardous quantities of respirable asbestos fibres can occur during carriage.
- 169 Phthalic anhydride in the solid state and tetrahydrophthalic anhydrides, with not more than 0.05% maleic anhydride, are not subject to the requirements of ADN. Phthalic anhydride molten at a temperature above its flash-point, with not more than 0.05% maleic anhydride, shall be classified under UN No. 3256.
- 172 Where a radioactive material has (a) subsidiary hazard(s):
- (a) The substance shall be allocated to packing group I, II or III, if appropriate, by application of the packing group criteria provided in Part 2 corresponding to the nature of the predominant subsidiary hazard;
 - (b) Packages shall be labelled with subsidiary risk labels corresponding to each subsidiary hazard exhibited by the material; corresponding placards shall be affixed to cargo transport units in accordance with the relevant provisions of 5.3.1;
 - (c) For the purposes of documentation and package marking, the proper shipping name shall be supplemented with the name of the constituents which most predominantly contribute to this (these) subsidiary hazard(s) and which shall be enclosed in parenthesis;
 - (d) The dangerous goods transport document shall indicate the label model number(s) corresponding to each subsidiary hazard in parenthesis after the Class number "7" and, where assigned the packing group as required by 5.4.1.1.1 (d).
- For packing, see also 4.1.9.1.5 of ADR.
- 177 Barium sulphate is not subject to the requirements of ADN.
- 178 This designation shall be used only when no other appropriate designation exists in Table A of Chapter 3.2, and only with the approval of the competent authority of the country of origin (see 2.2.1.1.3).
- 181 Packages containing this type of substance shall bear a label conforming to model No. 1 (see 5.2.2.2.2) unless the competent authority of the country of origin has permitted this label to be dispensed with for the specific packaging employed because test data have proved that the substance in this packaging does not exhibit explosive behaviour (see 5.2.2.1.9).
- 182 The group of alkali metals includes lithium, sodium, potassium, rubidium and caesium.
- 183 The group of alkaline earth metals includes magnesium, calcium, strontium and barium.
- 186 *(Deleted)*

Copyright © United Nations, 2021. All rights reserved

188 Cells and batteries offered for carriage are not subject to other provisions of ADN if they meet the following:

- (a) For a lithium metal or lithium alloy cell, the lithium content is not more than 1 g, and for a lithium-ion cell, the Watt-hour rating is not more than 20 Wh;

NOTE: When lithium batteries in conformity with 2.2.9.1.7 (f) are carried in accordance with this special provision, the total lithium content of all lithium metal cells contained in the battery shall not exceed 1.5 g and the total capacity of all lithium ion cells contained in the battery shall not exceed 10 Wh (see special provision 387).

- (b) For a lithium metal or lithium alloy battery the aggregate lithium content is not more than 2 g, and for a lithium-ion battery, the Watt-hour rating is not more than 100 Wh. Lithium ion batteries subject to this provision shall be marked with the Watt-hour rating on the outside case except those manufactured before 1 January 2009;

NOTE: When lithium batteries in conformity with 2.2.9.1.7 (f) are carried in accordance with this special provision, the total lithium content of all lithium metal cells contained in the battery shall not exceed 1.5 g and the total capacity of all lithium ion cells contained in the battery shall not exceed 10 Wh (see special provision 387).

- (c) Each cell or battery meets the provisions of 2.2.9.1.7 (a), (e), (f) if applicable, and (g);

- (d) Cells and batteries, except when installed in equipment, shall be packed in inner packagings that completely enclose the cell or battery. Cells and batteries shall be protected so as to prevent short circuits. This includes protection against contact with electrically conductive material within the same packaging that could lead to a short circuit. The inner packagings shall be packed in strong outer packagings which conform to the provisions of 4.1.1.1, 4.1.1.2 and 4.1.1.5 of ADR;

- (e) Cells and batteries when installed in equipment shall be protected from damage and short circuit, and the equipment shall be equipped with an effective means of preventing accidental activation. This requirement does not apply to devices which are intentionally active in carriage (radio frequency identification (RFID) transmitters, watches, sensors, etc.) and which are not capable of generating a dangerous evolution of heat. When batteries are installed in equipment, the equipment shall be packed in strong outer packagings constructed of suitable material of adequate strength and design in relation to the packaging's capacity and its intended use unless the battery is afforded equivalent protection by the equipment in which it is contained;

- (f) Each package shall be marked with the appropriate lithium battery mark, as illustrated in 5.2.1.9;

This requirement does not apply to:

- (i) packages containing only button cell batteries installed in equipment (including circuit boards); and
- (ii) packages containing no more than four cells or two batteries installed in equipment, where there are not more than two packages in the consignment.

Copyright © United Nations, 2021. All rights reserved

When packages are placed in an overpack, the lithium battery mark shall either be clearly visible or be reproduced on the outside of the overpack and the overpack shall be marked with the word "OVERPACK". The lettering of the "OVERPACK" mark shall be at least 12 mm high.

NOTE: Packages containing lithium batteries packed in conformity with the provisions of Part 4, Chapter 11, packing instructions 965 or 968 Section IB of the ICAO Technical Instructions that bear the mark as shown in 5.2.1.9 (lithium battery mark) and the label shown in 5.2.2.2, model No. 9A shall be deemed to meet the provisions of this special provision.

- (g) Except when cells or batteries are installed in equipment, each package shall be capable of withstanding a 1.2 m drop test in any orientation without damage to cells or batteries contained therein, without shifting of the contents so as to allow battery to battery (or cell to cell) contact and without release of contents; and
- (h) Except when cells or batteries are installed in or packed with equipment, packages shall not exceed 30 kg gross mass.

As used above and elsewhere in ADN, "lithium content" means the mass of lithium in the anode of a lithium metal or lithium alloy cell. As used in this special provision "equipment" means apparatus for which the lithium cells or batteries will provide electrical power for its operation.

Separate entries exist for lithium metal batteries and lithium ion batteries to facilitate the carriage of these batteries for specific modes of carriage and to enable the application of different emergency response actions.

A single cell battery as defined in Part III, sub-section 38.3.2.3 of the *Manual of Tests and Criteria* is considered a "cell" and shall be carried according to the requirements for "cells" for the purpose of this special provision.

- 190 Aerosol dispensers shall be provided with protection against inadvertent discharge. Aerosols with a capacity not exceeding 50 ml containing only non-toxic constituents are not subject to the requirements of ADN.
- 191 Receptacles, small, with a capacity not exceeding 50 ml, containing only non-toxic constituents are not subject to the requirements of ADN.
- 193 This entry may only be used for ammonium nitrate based compound fertilizers. They shall be classified in accordance with the procedure as set out in the Manual of Tests and Criteria, Part III, Section 39. Fertilizers meeting the criteria for this UN number are subject to the requirements of ADN only when carried in bulk.
- 194 The control and emergency temperatures, if any, and the UN number (generic entry) for each of the currently assigned self-reactive substances are given in 2.2.41.4.
- 196 Formulations which in laboratory testing neither detonate in the cavitated state nor deflagrate, which show no effect when heated under confinement and which exhibit no explosive power may be carried under this entry. The formulation must also be thermally stable (i.e. the SADT is 60 °C or higher for a 50 kg package). Formulations not meeting these criteria shall be carried under the provisions of Class 5.2, (see 2.2.52.4).
- 198 Nitrocellulose solutions containing not more than 20 % nitrocellulose may be carried as paint, perfumery products or printing ink, as applicable (see UN Nos. 1210, 1263, 1266, 3066, 3469 and 3470).

Copyright © United Nations, 2021. All rights reserved

- 199 Lead compounds which, when mixed in a ratio of 1:1000 with 0.07M hydrochloric acid and stirred for one hour at a temperature of $23\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$, exhibit a solubility of 5 % or less (see ISO 3711:1990 "*Lead chromate pigments and lead chromate-molybdate pigments – Specifications and methods of test*") are considered insoluble and are not subject to the requirements of ADN unless they meet the criteria for inclusion in another class.
- 201 Lighters and lighter refills shall comply with the provisions of the country in which they were filled. They shall be provided with protection against inadvertent discharge. The liquid portion of the gas shall not exceed 85% of the capacity of the receptacle at $15\text{ }^{\circ}\text{C}$. The receptacles, including the closures, shall be capable of withstanding an internal pressure of twice the pressure of the liquefied petroleum gas at $55\text{ }^{\circ}\text{C}$. The valve mechanisms and ignition devices shall be securely sealed, taped or otherwise fastened or designed to prevent operation or leakage of the contents during carriage. Lighters shall not contain more than 10 g of liquefied petroleum gas. Lighter refills shall not contain more than 65 g of liquefied petroleum gas.
- NOTE: For waste lighters collected separately see Chapter 3.3, special provision 654.*
- 203 This entry shall not be used for polychlorinated biphenyls, liquid, UN No. 2315 and polychlorinated biphenyls, solid, UN No. 3432.
- 204 *(Deleted)*
- 205 This entry shall not be used for UN No. 3155 PENTACHLOROPHENOL.
- 207 Plastics moulding compounds may be made from polystyrene, poly(methyl methacrylate) or other polymeric material.
- 208 The commercial grade of calcium nitrate fertilizer, when consisting mainly of a double salt (calcium nitrate and ammonium nitrate) containing not more than 10% ammonium nitrate and at least 12% water of crystallization, is not subject to the requirements of ADN.
- 210 Toxins from plant, animal or bacterial sources which contain infectious substances, or toxins that are contained in infectious substances, shall be classified in Class 6.2.
- 215 This entry only applies to the technically pure substance or to formulations derived from it having an SADT higher than $75\text{ }^{\circ}\text{C}$ and therefore does not apply to formulations which are self-reactive substances (for self-reactive substances, see 2.2.41.4). Homogeneous mixtures containing not more than 35% by mass of azodicarbonamide and at least 65% of inert substance are not subject to the requirements of ADN unless criteria of other classes are met.
- 216 Mixtures of solids which are not subject to the requirements of ADN and flammable liquids may be carried under this entry without first applying the classification criteria of Class 4.1, provided there is no free liquid visible at the time the substance is loaded or at the time the packaging or cargo transport unit is closed. Sealed packets and articles containing less than 10 ml of a packing group II or III flammable liquid absorbed into a solid material are not subject to ADN provided there is no free liquid in the packet or article.
- 217 Mixtures of solids which are not subject to the requirements of ADN and toxic liquids may be carried under this entry without first applying the classification criteria of Class 6.1, provided there is no free liquid visible at the time the substance is loaded or at the time the packaging or cargo transport unit is closed. This entry shall not be used for solids containing a packing group I liquid.

Copyright © United Nations, 2021. All rights reserved

218 Mixtures of solids which are not subject to the requirements of ADN and corrosive liquids may be carried under this entry without first applying the classification criteria of Class 8, provided there is no free liquid visible at the time the substance is loaded or at the time the packaging or cargo transport unit is closed.

219 Genetically modified microorganisms (GMMOs) and genetically modified organisms (GMOs) packed and marked in accordance with packing instruction P904 of 4.1.4.1 of ADR are not subject to any other requirements of ADN.

If GMMOs or GMOs meet the criteria for inclusion in Class 6.1 or 6.2 (see 2.2.61.1 and 2.2.62.1) the requirements in ADN for the carriage of toxic substances or infectious substances apply.

220 Only the technical name of the flammable liquid component of this solution or mixture shall be shown in parentheses immediately following the proper shipping name.

221 Substances included under this entry shall not be of packing group I.

224 Unless it can be demonstrated by testing that the sensitivity of the substance in its frozen state is no greater than in its liquid state, the substance shall remain liquid during normal transport conditions. It shall not freeze at temperatures above -15 °C.

225 Fire extinguishers under this entry may include installed actuating cartridges (cartridges, power device of classification code 1.4C or 1.4S), without changing the classification of Class 2, group A or O according to 2.2.2.1.3 provided the total quantity of deflagrating (propellant) explosives does not exceed 3.2 g per extinguishing unit.

Fire extinguishers shall be manufactured, tested, approved and labelled according to the provisions applied in the country of manufacture.

***NOTE:** Provisions applied in the country of manufacture" means the provisions applicable in the country of manufacture or those applicable in the country of use.*

Fire extinguishers under this entry include:

- (a) portable fire extinguishers for manual handling and operation;
- (b) fire extinguishers for installation in aircraft;
- (c) fire extinguishers mounted on wheels for manual handling;
- (d) fire extinguishing equipment or machinery mounted on wheels or wheeled platforms or units carried similar to (small) trailers, and
- (e) fire extinguishers composed of a non-rollable pressure drum and equipment, and handled e.g. by fork lift or crane when loaded or unloaded.

***NOTE:** Pressure receptacles which contain gases for use in the above-mentioned fire extinguishers or for use in stationary fire-fighting installations shall meet the requirements of Chapter 6.2 of ADR and all requirements applicable to the relevant dangerous goods when these pressure receptacles are carried separately.*

226 Formulations of this substance containing not less than 30% non-volatile, non-flammable phlegmatizer are not subject to the requirements of ADN.

227 When phlegmatized with water and inorganic inert material the content of urea nitrate may not exceed 75% by mass and the mixture shall not be capable of being detonated by the Series 1, type (a), test in the *Manual of Tests and Criteria*, Part 1.

Copyright © United Nations, 2021. All rights reserved

- 228 Mixtures not meeting the criteria for flammable gases (see 2.2.2.1.5) shall be carried under UN No. 3163.
- 230 Lithium cells and batteries may be carried under this entry if they meet the provisions of 2.2.9.1.7.
- 235 This entry applies to articles which contain Class 1 explosive substances and which may also contain dangerous goods of other classes. These articles are used to enhance safety in vehicles, vessels or aircraft – e.g. air bag inflators, air bag modules, seat-belt pretensioners, and pyromechanical devices.
- 236 Polyester resin kits consist of two components: a base material (either Class 3 or Class 4.1, packing group II or III) and an activator (organic peroxide). The organic peroxide shall be type D, E, or F, not requiring temperature control. The packing group shall be II or III, according to the criteria of either Class 3 or Class 4.1, as appropriate, applied to the base material. The quantity limit shown in column (7a) of Table A of Chapter 3.2 applies to the base material.
- 237 The membrane filters, including paper separators, coating or backing materials, etc., that are present in carriage, shall not be liable to propagate a detonation as tested by one of the tests described in the *Manual of Tests and Criteria*, Part I, Test series 1 (a).

In addition, the competent authority may determine, on the basis of the results of suitable burning rate tests taking account of the standard tests in the *Manual of Tests and Criteria*, Part III, sub-section 33.2, that nitrocellulose membrane filters in the form in which they are to be carried are not subject to the requirements applicable to flammable solids in Class 4.1.

- 238 (a) Batteries can be considered as non-spillable provided that they are capable of withstanding the vibration and pressure differential tests given below, without leakage of battery fluid.

Vibration test: The battery is rigidly clamped to the platform of a vibration machine and a simple harmonic motion having an amplitude of 0.8 mm (1.6 mm maximum total excursion) is applied. The frequency is varied at the rate of 1 Hz/min between the limits of 10 Hz and 55 Hz. The entire range of frequencies and return is traversed in 95 ± 5 minutes for each mounting position (direction of vibration) of the battery. The battery is tested in three mutually perpendicular positions (to include testing with fill openings and vents, if any, in an inverted position) for equal time periods.

Pressure differential test: Following the vibration test, the battery is stored for six hours at $24\text{ °C} \pm 4\text{ °C}$ while subjected to a pressure differential of at least 88 kPa. The battery is tested in three mutually perpendicular positions (to include testing with fill openings and vents, if any, in an inverted position) for at least six hours in each position.

- (b) Non-spillable batteries are not subject to the requirements of ADN if, at a temperature of 55 °C , the electrolyte will not flow from a ruptured or cracked case and there is no free liquid to flow and if, as packaged for carriage, the terminals are protected from short circuit.

Copyright © United Nations, 2021. All rights reserved

- 239 Batteries or cells shall not contain dangerous substances other than sodium, sulphur or sodium compounds (e.g. sodium polysulphides and sodium tetrachloroaluminate). Batteries or cells shall not be offered for carriage at a temperature such that liquid elemental sodium is present in the battery or cell unless approved and under the conditions established by the competent authority of the country of origin. If the country of origin is not a Contracting Party to ADN, the approval and conditions of carriage shall be recognized by the competent authority of the first country Contracting Party to ADN reached by the consignment.

Cells shall consist of hermetically sealed metal casings which fully enclose the dangerous substances and which are so constructed and closed as to prevent the release of the dangerous substances under normal conditions of carriage.

Batteries shall consist of cells secured within and fully enclosed by a metal casing so constructed and closed as to prevent the release of the dangerous substances under normal conditions of carriage.

- 240 *(Deleted)*

- 241 The formulation shall be prepared so that it remains homogeneous and does not separate during carriage. Formulations with low nitrocellulose contents and not showing dangerous properties when tested for their liability to detonate, deflagrate or explode when heated under defined confinement by tests of Test series 1 (a), 2 (b) and 2 (c) respectively in the *Manual of Tests and Criteria*, Part I and not being a flammable solid when tested in accordance with Test N.1 in the *Manual of Tests and Criteria*, Part III, sub-section 33.2.4 (chips, if necessary, crushed and sieved to a particle size of less than 1.25 mm) are not subject to the requirements of ADN.

- 242 Sulphur is not subject to the requirements of ADN when it has been formed to a specific shape (e.g. prills, granules, pellets, pastilles or flakes).

- 243 Gasoline, motor spirit and petrol for use in spark-ignition engines (e.g. in automobiles, stationary engines and other engines) shall be assigned to this entry regardless of variations in volatility.

- 244 This entry includes e.g. aluminium dross, aluminium skimmings, spent cathodes, spent potliner, and aluminium salt slags.

- 247 Alcoholic beverages containing more than 24% alcohol but not more than 70% by volume, when carried as part of the manufacturing process, may be carried in wooden barrels with a capacity of more than 250 litres and not more than 500 litres meeting the general requirements of 4.1.1 of ADR, as appropriate, on the following conditions:

- (a) The wooden barrels shall be checked and tightened before filling;
- (b) Sufficient ullage (not less than 3%) shall be left to allow for the expansion of the liquid;
- (c) The wooden barrels shall be carried with the bungholes pointing upwards;
- (d) The wooden barrels shall be carried in containers meeting the requirements of the CSC. Each wooden barrel shall be secured in custom-made cradles and be wedged by appropriate means to prevent it from being displaced in any way during carriage.

- 249 Ferrocium, stabilized against corrosion, with a minimum iron content of 10% is not subject to the requirements of ADN.

Copyright © United Nations, 2021. All rights reserved

- 250 This entry may only be used for samples of chemicals taken for analysis in connection with the implementation of the Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and on their Destruction. The carriage of substances under this entry shall be in accordance with the chain of custody and security procedures specified by the Organisation for the Prohibition of Chemical Weapons.

The chemical sample may only be carried providing prior approval has been granted by the competent authority or the Director General of the Organisation for the Prohibition of Chemical Weapons and providing the sample complies with the following provisions:

- (a) It shall be packed according to packing instruction 623 in the ICAO Technical Instructions; and
- (b) During carriage, a copy of the document of approval for transport, showing the quantity limitations and the packing provisions shall be attached to the transport document.

- 251 The entry CHEMICAL KIT or FIRST AID KIT is intended to apply to boxes, cases etc. containing small quantities of various dangerous goods which are used for example for medical, analytical or testing or repair purposes.

Such kits shall only contain dangerous goods that are permitted as:

- (a) Excepted quantities not exceeding the quantity indicated by the code in column (7b) of Table A of Chapter 3.2, provided that the net quantity per inner packaging and net quantity per package are as prescribed in 3.5.1.2 and 3.5.1.3; or;
- (b) Limited quantities as indicated in column (7a) of Table A of Chapter 3.2, provided that the net quantity per inner packaging does not exceed 250 ml or 250 g.

Components shall not react dangerously (see "dangerous reaction" in 1.2.1). The total quantity of dangerous goods in any one kit shall not exceed either 1 l or 1 kg.

For the purposes of completion of the transport document as set out in 5.4.1.1.1, the packing group shown on the document shall be the most stringent packing group assigned to any individual substance in the kit. Where the kit contains only dangerous goods to which no packing group is assigned, no packing group need be indicated on the dangerous goods transport document.

Kits which are carried on board vessels for first-aid or operating purposes are not subject to the requirements of ADN.

Chemical kits and first aid kits containing dangerous goods in inner packagings which do not exceed the quantity limits for limited quantities applicable to individual substances as specified in Column (7a) of Table A of Chapter 3.2 may be carried in accordance with Chapter 3.4.

- 252 Provided the ammonium nitrate remains in solution under all conditions of carriage, aqueous solutions of ammonium nitrate, with not more than 0.2% combustible material, in a concentration not exceeding 80%, are not subject to the requirements of ADN.

- 266 This substance, when containing less alcohol, water or phlegmatizer than specified, shall not be carried unless specifically authorized by the competent authority (see 2.2.1.1).

Copyright © United Nations, 2021. All rights reserved

- 267 Any explosives, blasting, type C containing chlorates shall be segregated from explosives containing ammonium nitrate or other ammonium salts.
- 270 Aqueous solutions of Class 5.1 inorganic solid nitrate substances are considered as not meeting the criteria of Class 5.1 if the concentration of the substances in solution at the minimum temperature encountered during carriage is not greater than 80% of the saturation limit.
- 271 Lactose or glucose or similar materials may be used as a phlegmatizer provided that the substance contains not less than 90%, by mass, of phlegmatizer. The competent authority may authorize these mixtures to be classified in Class 4.1 on the basis of a test Series 6 (c) of Section 16 of Part I of the *Manual of Tests and Criteria* on at least three packages as prepared for carriage. Mixtures containing at least 98%, by mass, of phlegmatizer are not subject to the requirements of ADN. Packages containing mixtures with not less than 90%, by mass, of phlegmatizer need not bear a label conforming to model No. 6.1.
- 272 This substance shall not be carried under the provisions of Class 4.1 unless specifically authorized by the competent authority (see UN No. 0143 or UN No. 0150 as appropriate).
- 273 Maneb and maneb preparations stabilized against self-heating need not be classified in Class 4.2 when it can be demonstrated by testing that a cubic volume of 1 m³ of substance does not self-ignite and that the temperature at the centre of the sample does not exceed 200 °C, when the sample is maintained at a temperature of not less than 75 °C ± 2 °C for a period of 24 hours.
- 274 The provisions of 3.1.2.8 apply.
- 278 These substances shall not be classified and carried unless authorized by the competent authority on the basis of results from Series 2 tests and a Series 6(c) test of Part I of the *Manual of Tests and Criteria* on packages as prepared for carriage (see 2.2.1.1). The competent authority shall assign the packing group on the basis of 2.2.3 criteria and the package type used for the Series 6(c) test.
- 279 The substance is assigned to this classification or packing group based on human experience rather than the strict application of classification criteria set out in ADN.
- 280 This entry applies to safety devices for vehicles, vessels or aircraft, e.g. air bag inflators, air bag modules, seat-belt pretensioners, and pyromechanical devices, which contain dangerous goods of Class 1 or of other classes, when carried as component parts and if these articles as presented for carriage have been tested in accordance with Test Series 6(c) of Part 1 of the *Manual of Tests and Criteria*, with no explosion of the device, no fragmentation of device casing or pressure receptacle, and no projection hazard nor thermal effect which would significantly hinder fire-fighting or emergency response efforts in the immediate vicinity. This entry does not apply to life saving appliances described in special provision 296 (UN Nos. 2990 and 3072).
- 283 Articles containing gas, intended to function as shock absorbers, including impact energy-absorbing devices, or pneumatic springs are not subject to the requirements of ADN provided:
- (a) Each article has a gas space capacity not exceeding 1.6 litres and a charge pressure not exceeding 280 bar where the product of the capacity (litres) and charge pressure (bars) does not exceed 80 (i.e. 0.5 litres gas space and 160 bar charge pressure, 1 litre gas space and 80 bar charge pressure, 1.6 litres gas space and 50 bar charge pressure, 0.28 litres gas space and 280 bar charge pressure);

Copyright © United Nations, 2021. All rights reserved

- (b) Each article has a minimum burst pressure of 4 times the charge pressure at 20 °C for products not exceeding 0.5 litres gas space capacity and 5 times charge pressure for products greater than 0.5 litres gas space capacity;
- (c) Each article is manufactured from material which will not fragment upon rupture;
- (d) Each article is manufactured in accordance with a quality assurance standard acceptable to the competent authority; and
- (e) The design type has been subjected to a fire test demonstrating that the article relieves its pressure by means of a fire degradable seal or other pressure relief device, such that the article will not fragment and that the article does not rocket.

See also 1.1.3.2 (d) of ADR for equipment used for the operation of the vehicle.

- 284 An oxygen generator, chemical, containing oxidizing substances shall meet the following conditions:
- (a) The generator when containing an explosive actuating device shall only be carried under this entry when excluded from Class 1 in accordance with the NOTE under paragraph 2.2.1.1.1 (b);
 - (b) The generator, without its packaging, shall be capable of withstanding a 1.8 m drop test onto a rigid, non-resilient, flat and horizontal surface, in the position most likely to cause damage, without loss of its contents and without actuation;
 - (c) When a generator is equipped with an actuating device, it shall have at least two positive means of preventing unintentional actuation.
- 286 Nitrocellulose membrane filters covered by this entry, each with a mass not exceeding 0.5 g, are not subject to the requirements of ADN when contained individually in an article or a sealed packet.
- 288 These substances shall not be classified and carried unless authorized by the competent authority on the basis of results from Series 2 tests and a Series 6 (c) test of Part I of the *Manual of Tests and Criteria* on packages as prepared for carriage (see 2.2.1.1).
- 289 Safety devices, electrically initiated and safety devices, pyrotechnic installed in vehicles, wagons, vessels or aircraft or in completed components such as steering columns, door panels, seats, etc. are not subject to ADN.
- 290 When this radioactive material meets the definitions and criteria of other classes as defined in Part 2, it shall be classified in accordance with the following:
- (a) Where the substance meets the criteria for dangerous goods in excepted quantities as set out in Chapter 3.5, the packagings shall be in accordance with 3.5.2 and meet the testing requirements of 3.5.3. All other requirements applicable to radioactive material, excepted packages as set out in 1.7.1.5 shall apply without reference to the other class;

Copyright © United Nations, 2021. All rights reserved

- (b) Where the quantity exceeds the limits specified in 3.5.1.2 the substance shall be classified in accordance with the predominant subsidiary hazard. The transport document shall describe the substance with the UN number and proper shipping name applicable to the other class supplemented with the name applicable to the radioactive excepted package according to Column (2) of Table A of Chapter 3.2, and the substance shall be carried in accordance with the provisions applicable to that UN number. An example of the information shown on the transport document is:

"UN 1993, Flammable liquid, N.O.S. (ethanol and toluene mixture), Radioactive material, excepted package – limited quantity of material, 3, PG II".

In addition, the requirements of 2.2.7.2.4.1 shall apply;

- (c) The provisions of Chapter 3.4 for the carriage of dangerous goods packed in limited quantities shall not apply to substances classified in accordance with subparagraph (b);
- (d) When the substance meets a special provision that exempts this substance from all dangerous goods provisions of the other classes it shall be classified in accordance with the applicable UN number of Class 7 and all requirements specified in 1.7.1.5 shall apply.

291 Flammable liquefied gases shall be contained within refrigerating machine components. These components shall be designed and tested to at least three times the working pressure of the machinery. The refrigerating machines shall be designed and constructed to contain the liquefied gas and preclude the risk of bursting or cracking of the pressure retaining components during normal conditions of carriage. Refrigerating machines and refrigerating-machine components are not subject to the requirements of ADN if they contain less than 12 kg of gas.

292 *(Deleted)*

293 The following definitions apply to matches:

- (a) Fusee matches are matches the heads of which are prepared with a friction-sensitive igniter composition and a pyrotechnic composition which burns with little or no flame, but with intense heat;
- (b) Safety matches are matches that are combined with or attached to the box, book or card that can be ignited by friction only on a prepared surface;
- (c) Strike anywhere matches are matches that can be ignited by friction on a solid surface;
- (d) Wax Vesta matches are matches that can be ignited by friction either on a prepared surface or on a solid surface.

295 Batteries need not be individually marked and labelled if the pallet bears the appropriate mark and label.

296 These entries apply for life-saving appliances such as life rafts, personal flotation devices and self-inflating slides. UN No. 2990 applies to self-inflating appliances and UN No. 3072 applies to life-saving appliances that are not self-inflating. Life-saving appliances may contain:

- (a) Signal devices (Class 1) which may include smoke and illumination signal flares packed in packagings that prevent them from being inadvertently activated;

Copyright © United Nations, 2021. All rights reserved

- (b) For UN No. 2990 only, cartridges, power devices of Division 1.4, compatibility group S, may be contained for purposes of the self-inflating mechanism and provided that the quantity of explosives per appliance does not exceed 3.2 g;
- (c) Class 2 compressed or liquefied gases, group A or O, according to 2.2.2.1.3;
- (d) Electric storage batteries (Class 8) and lithium batteries (Class 9);
- (e) First aid kits or repair kits containing small quantities of dangerous goods (e.g.: substances of Class 3, 4.1, 5.2, 8 or 9); or
- (f) "Strike anywhere" matches packed in packagings that prevent them from being inadvertently activated.

Life-saving appliances packed in strong rigid outer packagings with a total maximum gross mass of 40 kg, containing no dangerous goods other than compressed or liquefied gases of Class 2, group A or group O, in receptacles with a capacity not exceeding 120 ml, installed solely for the purpose of the activation of the appliance, are not subject to the requirements of ADN.

- 300 Fish meal, fish scrap and krill meal shall not be loaded if the temperature at the time of loading exceeds 35 °C or 5 °C above the ambient temperature whichever is higher.
- 301 This entry only applies to articles such as machinery, apparatus or devices containing dangerous goods as a residue or an integral element of the articles. It shall not be used for articles for which a proper shipping name already exists in Table A of Chapter 3.2. Articles carried under this entry shall only contain dangerous goods which are authorized to be carried in accordance with the provisions of Chapter 3.4 (Limited quantities). The quantity of dangerous goods in articles shall not exceed the quantity specified in Column (7a) of Table A of Chapter 3.2 for each item of dangerous goods contained. If the articles contain more than one item of dangerous goods, the individual dangerous goods shall be enclosed to prevent them reacting dangerously with one another during carriage (see 4.1.1.6 of ADR). When it is required to ensure liquid dangerous goods remain in their intended orientation, orientation arrows shall be displayed on at least two opposite vertical sides with the arrows pointing in the correct direction in accordance with 5.2.1.10.
- 302 Fumigated cargo transport units containing no other dangerous goods are only subject to the provisions of 5.5.2.
- 303 Receptacles shall be assigned to the classification code of the gas or mixture of gases contained therein determined in accordance with the provisions of section 2.2.2.
- 304 This entry may only be used for the transport of non-activated batteries which contain dry potassium hydroxide and which are intended to be activated prior to use by addition of an appropriate amount of water to the individual cells.
- 305 These substances are not subject to the requirements of ADN when in concentrations of not more than 50 mg/kg.
- 306 This entry may only be used for substances that are too insensitive for acceptance into Class 1 when tested in accordance with Test Series 2 (see *Manual of Tests and Criteria*, Part I).

Copyright © United Nations, 2021. All rights reserved

307 This entry may only be used for ammonium nitrate based fertilizers. They shall be classified in accordance with the procedure as set out in the Manual of Tests and Criteria, Part III, Section 39 subject to the restrictions of 2.2.51.2.2, thirteenth and fourteenth indents. When used in the said Section 39, the term “competent authority” means the competent authority of the country of origin. If the country of origin is not a Contracting Party to ADN, the classification and conditions of carriage shall be recognized by the competent authority of the first country Contracting Party to ADN reached by the consignment.

309 This entry applies to non-sensitized emulsions, suspensions and gels consisting primarily of a mixture of ammonium nitrate and fuel, intended to produce a Type E blasting explosive only after further processing prior to use.

The mixture for emulsions typically has the following composition: 60-85% ammonium nitrate, 5-30% water, 2-8% fuel, 0.5-4% emulsifier agent, 0-10% soluble flame suppressants, and trace additives. Other inorganic nitrate salts may replace part of the ammonium nitrate.

The mixture for suspensions and gels typically has the following composition: 60-85% ammonium nitrate, 0-5% sodium or potassium perchlorate, 0-17% hexamine nitrate or monomethylamine nitrate, 5-30% water, 2-15% fuel, 0.5-4% thickening agent, 0-10% soluble flame suppressants, and trace additives. Other inorganic nitrate salts may replace part of the ammonium nitrate.

Substances shall satisfy the criteria for classification as an ammonium nitrate emulsion, suspension or gel, intermediate for blasting explosives (ANE) of Test Series 8 of the *Manual of Tests and Criteria*, Part I, Section 18 and be approved by the competent authority.

310 The testing requirements in the Manual of Tests and Criteria, part III, sub-section 38.3 do not apply to production runs, consisting of not more than 100 cells or batteries, or to pre-production prototypes of cells or batteries when these prototypes are carried for testing when packaged in accordance with packing instruction P910 of 4.1.4.1 of ADR or LP905 of 4.1.4.3 of ADR, as applicable.

The transport document shall include the following statement: “Carriage in accordance with special provision 310”.

Damaged or defective cells, batteries, or cells and batteries contained in equipment shall be carried in accordance with special provision 376.

Cells, batteries or cells and batteries contained in equipment carried for disposal or recycling may be packaged in accordance with special provision 377 and packing instruction P909 of 4.1.4.1 of ADR.

311 Substances shall not be carried under this entry unless approved by the competent authority on the basis of the results of appropriate tests according to Part I of the *Manual of Tests and Criteria*. Packaging shall ensure that the percentage of diluent does not fall below that stated in the competent authority approval, at any time during carriage.

312 (Deleted)

313 (Deleted)

- 314 (a) These substances are liable to exothermic decomposition at elevated temperatures. Decomposition can be initiated by heat or by impurities (e.g. powdered metals (iron, manganese, cobalt, magnesium) and their compounds);
- (b) During the course of carriage, these substances shall be shaded from direct sunlight and all sources of heat and be placed in adequately ventilated areas.
- 315 This entry shall not be used for Class 6.1 substances which meet the inhalation toxicity criteria for packing group I described in 2.2.61.1.8.
- 316 This entry applies only to calcium hypochlorite, dry, when carried in non-friable tablet form.
- 317 "Fissile-excepted" applies only to those fissile material and packages containing fissile material which are excepted in accordance with 2.2.7.2.3.5.
- 318 For the purposes of documentation, the proper shipping name shall be supplemented with the technical name (see 3.1.2.8). When the infectious substances to be carried are unknown, but suspected of meeting the criteria for inclusion in category A and assignment to UN No. 2814 or 2900, the words "suspected category A infectious substance" shall be shown, in parentheses, following the proper shipping name on the transport document.
- 319 Substances packed and packages marked in accordance with packing instruction P650 of ADR are not subject to any other requirements of ADN.
- 321 These storage systems shall always be considered as containing hydrogen.
- 322 When carried in non-friable tablet form, these goods are assigned to packing group III.
- 323 *(Reserved)*
- 324 This substance needs to be stabilized when in concentrations of not more than 99%.
- 325 In the case of non-fissile or fissile excepted uranium hexafluoride, the material shall be classified under UN No. 2978.
- 326 In the case of fissile uranium hexafluoride, the material shall be classified under UN No. 2977.
- 327 Waste aerosols and waste gas cartridges consigned in accordance with 5.4.1.1.3 may be carried under UN Nos. 1950 or 2037, as appropriate, for the purposes of reprocessing or disposal. They need not be protected against movement and inadvertent discharge provided that measures to prevent dangerous build up of pressure and dangerous atmospheres are addressed. Waste aerosols, other than those leaking or severely deformed, shall be packed in accordance with packing instruction P207 of ADR and special provision PP87 of ADR, or packing instruction LP200 of ADR and special packing provision L2 of ADR. Waste gas cartridges, other than those leaking or severely deformed, shall be packed in accordance with packing instruction P003 and special packing provisions PP17 and PP96 of ADR, or packing instruction LP200 and special packing provision L2 of ADR. Leaking or severely deformed aerosols and gas cartridges shall be carried in salvage pressure receptacles or salvage packagings provided appropriate measures are taken to ensure there is no dangerous build up of pressure.

NOTE: For maritime carriage, waste aerosols and waste gas cartridges shall not be carried in closed containers.

Copyright © United Nations, 2021. All rights reserved

Waste gas cartridges that were filled with non-flammable, non-toxic gases of Class 2, group A or O and have been pierced are not subject to ADN.

- 328 This entry applies to fuel cell cartridges including when contained in equipment or packed with equipment. Fuel cell cartridges installed in or integral to a fuel cell system are regarded as contained in equipment. Fuel cell cartridge means an article that stores fuel for discharge into the fuel cell through (a) valve(s) that control(s) the discharge of fuel into the fuel cell. Fuel cell cartridges, including when contained in equipment, shall be designed and constructed to prevent fuel leakage under normal conditions of carriage.

Fuel cell cartridge design types using liquids as fuels shall pass an internal pressure test at a pressure of 100 kPa (gauge) without leakage.

Except for fuel cell cartridges containing hydrogen in metal hydride which shall be in compliance with special provision 339, each fuel cell cartridge design type shall be shown to pass a 1.2 meter drop test onto an unyielding surface in the orientation most likely to result in failure of the containment system with no loss of contents.

When lithium metal or lithium ion batteries are contained in the fuel cell system, the consignment shall be consigned under this entry and under the appropriate entries for UN 3091 LITHIUM METAL BATTERIES CONTAINED IN EQUIPMENT or UN 3481 LITHIUM ION BATTERIES CONTAINED IN EQUIPMENT.

- 329 *(Reserved)*

- 331 *(Reserved)*

- 332 Magnesium nitrate hexahydrate is not subject to the requirements of ADN.

- 333 Ethanol and gasoline, motor spirit or petrol mixtures for use in spark-ignition engines (e.g. in automobiles, stationary engines and other engines) shall be assigned to this entry regardless of variations in volatility.

- 334 A fuel cell cartridge may contain an activator provided it is fitted with two independent means of preventing unintended mixing with the fuel during carriage.

- 335 Mixtures of solids which are not subject to the requirements of ADN and environmentally hazardous liquids or solids shall be classified as UN 3077 and may be carried under this entry provided there is no free liquid visible at the time the substance is loaded or at the time the packaging or cargo transport unit is closed. Each cargo transport unit shall be leakproof when used for carriage in bulk. If free liquid is visible at the time the mixture is loaded or at the time the packaging or cargo transport unit is closed, the mixture shall be classified as UN 3082. Sealed packets and articles containing less than 10 ml of an environmentally hazardous liquid, absorbed into a solid material but with no free liquid in the packet or article, or containing less than 10 g of an environmentally hazardous solid, are not subject to the requirements of ADN.

- 336 A single package of non-combustible solid LSA-II or LSA-III material, if carried by air, shall not contain an activity greater than 3 000 A₂.

Copyright © United Nations, 2021. All rights reserved

- 337 Type B(U) and Type B(M) packages, if carried by air, shall not contain activities greater than the following:
- (a) For low dispersible radioactive material: as authorized for the package design as specified in the certificate of approval;
 - (b) For special form radioactive material: 3 000 A₁ or 100 000 A₂, whichever is the lower; or
 - (c) For all other radioactive material: 3 000 A₂.
- 338 Each fuel cell cartridge carried under this entry and designed to contain a liquefied flammable gas shall:
- (a) Be capable of withstanding, without leakage or bursting, a pressure of at least two times the equilibrium pressure of the contents at 55 °C;
 - (b) Not contain more than 200 ml liquefied flammable gas, the vapour pressure of which shall not exceed 1 000 kPa at 55 °C; and
 - (c) Pass the hot water bath test prescribed in 6.2.6.3.1 of ADR.
- 339 Fuel cell cartridges containing hydrogen in a metal hydride carried under this entry shall have a water capacity less than or equal to 120 ml.

The pressure in the fuel cell cartridge shall not exceed 5 MPa at 55 °C. The design type shall withstand, without leaking or bursting, a pressure of twice the design pressure of the cartridge at 55 °C or 200 kPa more than the design pressure of the cartridge at 55 °C, whichever is greater. The pressure at which this test is conducted is referred to in the drop test and the hydrogen cycling test as the “minimum shell burst pressure”.

Fuel cell cartridges shall be filled in accordance with procedures provided by the manufacturer. The manufacturer shall provide the following information with each fuel cell cartridge:

- (a) Inspection procedures to be carried out before initial filling and before refilling of the fuel cell cartridge;
- (b) Safety precautions and potential hazards to be aware of;
- (c) Method for determining when the rated capacity has been achieved;
- (d) Minimum and maximum pressure range;
- (e) Minimum and maximum temperature range; and
- (f) Any other requirements to be met for initial filling and refilling including the type of equipment to be used for initial filling and refilling.

The fuel cell cartridges shall be designed and constructed to prevent fuel leakage under normal conditions of carriage. Each cartridge design type, including cartridges integral to a fuel cell, shall be subjected to and shall pass the following tests:

Drop test

A 1.8 metre drop test onto an unyielding surface in four different orientations:

- (a) Vertically, on the end containing the shut-off valve assembly;

Copyright © United Nations, 2021. All rights reserved

- (b) Vertically, on the end opposite to the shut-off valve assembly;
- (c) Horizontally, onto a steel apex with a diameter of 38 mm, with the steel apex in the upward position; and
- (d) At a 45° angle on the end containing the shut-off valve assembly.

There shall be no leakage, determined by using a soap bubble solution or other equivalent means on all possible leak locations, when the cartridge is charged to its rated charging pressure. The fuel cell cartridge shall then be hydrostatically pressurized to destruction. The recorded burst pressure shall exceed 85% of the minimum shell burst pressure.

Fire test

A fuel cell cartridge filled to rated capacity with hydrogen shall be subjected to a fire engulfment test. The cartridge design, which may include a vent feature integral to it, is deemed to have passed the fire test if:

- (a) The internal pressure vents to zero gauge pressure without rupture of the cartridge; or
- (b) The cartridge withstands the fire for a minimum of 20 minutes without rupture.

Hydrogen cycling test

This test is intended to ensure that a fuel cell cartridge design stress limits are not exceeded during use.

The fuel cell cartridge shall be cycled from not more than 5% rated hydrogen capacity to not less than 95% rated hydrogen capacity and back to not more than 5% rated hydrogen capacity. The rated charging pressure shall be used for charging and temperatures shall be held within the operating temperature range. The cycling shall be continued for at least 100 cycles.

Following the cycling test, the fuel cell cartridge shall be charged and the water volume displaced by the cartridge shall be measured. The cartridge design is deemed to have passed the hydrogen cycling test if the water volume displaced by the cycled cartridge does not exceed the water volume displaced by an uncycled cartridge charged to 95% rated capacity and pressurized to 75% of its minimum shell burst pressure.

Production leak test

Each fuel cell cartridge shall be tested for leaks at $15\text{ °C} \pm 5\text{ °C}$, while pressurized to its rated charging pressure. There shall be no leakage, determined by using a soap bubble solution or other equivalent means on all possible leak locations.

Each fuel cell cartridge shall be permanently marked with the following information:

- (a) The rated charging pressure in MPa;
- (b) The manufacturer's serial number of the fuel cell cartridges or unique identification number; and
- (c) The date of expiry based on the maximum service life (year in four digits; month in two digits).

- 340 Chemical kits, first aid kits and polyester resin kits containing dangerous substances in inner packagings which do not exceed the quantity limits for excepted quantities applicable to individual substances as specified in column (7b) of Table A of Chapter 3.2, may be carried in accordance with Chapter 3.5. Class 5.2 substances, although not individually authorized as excepted quantities in column (7b) of Table A of Chapter 3.2, are authorized in such kits and are assigned Code E2 (see 3.5.1.2).
- 341 *(Reserved)*
- 342 Glass inner receptacles (such as ampoules or capsules) intended only for use in sterilization devices, when containing less than 30 ml of ethylene oxide per inner packaging with not more than 300 ml per outer packaging, may be carried in accordance with the provisions in Chapter 3.5, irrespective of the indication of "E0" in column (7b) of Table A of Chapter 3.2 provided that:
- (a) After filling, each glass inner receptacle has been determined to be leak-tight by placing the glass inner receptacle in a hot water bath at a temperature, and for a period of time, sufficient to ensure that an internal pressure equal to the vapour pressure of ethylene oxide at 55 °C is achieved. Any glass inner receptacle showing evidence of leakage, distortion or other defect under this test shall not be carried under the terms of this special provision;
 - (b) In addition to the packaging required by 3.5.2, each glass inner receptacle is placed in a sealed plastics bag compatible with ethylene oxide and capable of containing the contents in the event of breakage or leakage of the glass inner receptacle; and
 - (c) Each glass inner receptacle is protected by a means of preventing puncture of the plastics bag (e.g. sleeves or cushioning) in the event of damage to the packaging (e.g. by crushing).
- 343 This entry applies to crude oil containing hydrogen sulphide in sufficient concentration that vapours evolved from the crude oil can present an inhalation hazard. The packing group assigned shall be determined by the flammability hazard and inhalation hazard, in accordance with the degree of danger presented.
- 344 The provisions of 6.2.6 of ADR shall be met.
- 345 This gas contained in open cryogenic receptacles with a maximum capacity of 1 litre constructed with glass double walls having the space between the inner and outer wall evacuated (vacuum insulated) is not subject to ADN provided each receptacle is carried in an outer packaging with suitable cushioning or absorbent materials to protect it from impact damage.
- 346 Open cryogenic receptacles conforming to the requirements of packing instruction P203 of 4.1.4.1 of ADR and containing no dangerous goods except for UN No. 1977 nitrogen, refrigerated liquid, which is fully absorbed in a porous material, are not subject to any other requirements of ADN.
- 347 This entry shall only be used if the results of Test series 6 (d) of Part I of the *Manual of Tests and Criteria* have demonstrated that any hazardous effects arising from functioning are confined within the package.
- 348 Batteries manufactured after 31 December 2011 shall be marked with the Watt-hour rating on the outside case.
- 349 Mixtures of a hypochlorite with an ammonium salt are not to be accepted for carriage. UN No. 1791 hypochlorite solution is a substance of Class 8.

Copyright © United Nations, 2021. All rights reserved

- 350 Ammonium bromate and its aqueous solutions and mixtures of a bromate with an ammonium salt are not to be accepted for carriage.
- 351 Ammonium chlorate and its aqueous solutions and mixtures of a chlorate with an ammonium salt are not to be accepted for carriage.
- 352 Ammonium chlorite and its aqueous solutions and mixtures of a chlorite with an ammonium salt are not to be accepted for carriage.
- 353 Ammonium permanganate and its aqueous solutions and mixtures of a permanganate with an ammonium salt are not to be accepted for carriage.
- 354 This substance is toxic by inhalation.
- 355 Oxygen cylinders for emergency use carried under this entry may include installed actuating cartridges (cartridges, power device of Division 1.4, Compatibility Group C or S), without changing the classification in Class 2 provided the total quantity of deflagrating (propellant) explosives does not exceed 3.2 g per oxygen cylinder. The cylinders with the installed actuating cartridges as prepared for carriage shall have an effective means of preventing inadvertent activation.
- 356 Metal hydride storage systems intended to be installed in vehicles, wagons, vessels, machinery, engines or aircraft shall be approved by the competent authority of the country of manufacture¹ before acceptance for carriage. The transport document shall include an indication that the package was approved by the competent authority of the country of manufacture¹ or a copy of the competent authority of the country of manufacture¹ approval shall accompany each consignment.
- 357 Petroleum crude oil containing hydrogen sulphide in sufficient concentration that vapours evolved from the crude oil can present an inhalation hazard shall be consigned under the entry UN 3494 PETROLEUM SOUR CRUDE OIL, FLAMMABLE, TOXIC.
- 358 Nitroglycerin solution in alcohol with more than 1% but not more than 5% nitroglycerin may be classified in Class 3 and assigned to UN No. 3064 provided all the requirements of packing instruction P300 of 4.1.4.1 of ADR are complied with.
- 359 Nitroglycerin solution in alcohol with more than 1% but not more than 5% nitroglycerin shall be classified in Class 1 and assigned to UN No. 0144 if not all the requirements of packing instruction P300 of 4.1.4.1 of ADR are complied with.
- 360 Vehicles only powered by lithium metal batteries or lithium ion batteries shall be assigned to the entry UN 3171 battery-powered vehicle. Lithium batteries installed in cargo transport units, designed only to provide power external to the transport unit shall be assigned to entry UN 3536 LITHIUM BATTERIES INSTALLED IN CARGO TRANSPORT UNIT lithium ion batteries or lithium metal batteries.
- 361 This entry applies to electric double layer capacitors with an energy storage capacity greater than 0.3 Wh. Capacitors with an energy storage capacity of 0.3 Wh or less are not subject to ADN. Energy storage capacity means the energy held by a capacitor, as calculated using the nominal voltage and capacitance. All capacitors to which this entry applies, including capacitors containing an electrolyte that does not meet the classification criteria of any class of dangerous goods, shall meet the following conditions:

¹ If the country of manufacture is not a Contracting Party to ADN, the approval shall be recognized by the competent authority of a Contracting Party to ADN.

Copyright © United Nations, 2021. All rights reserved

- (a) Capacitors not installed in equipment shall be carried in an uncharged state. Capacitors installed in equipment shall be carried either in an uncharged state or protected against short circuit;
- (b) Each capacitor shall be protected against a potential short circuit hazard in carriage as follows:
 - (i) When a capacitor's energy storage capacity is less than or equal to 10Wh or when the energy storage capacity of each capacitor in a module is less than or equal to 10 Wh, the capacitor or module shall be protected against short circuit or be fitted with a metal strap connecting the terminals; and
 - (ii) When the energy storage capacity of a capacitor or a capacitor in a module is more than 10 Wh, the capacitor or module shall be fitted with a metal strap connecting the terminals;
- (c) Capacitors containing dangerous goods shall be designed to withstand a 95 kPa pressure differential;
- (d) Capacitors shall be designed and constructed to safely relieve pressure that may build up in use, through a vent or a weak point in the capacitor casing. Any liquid which is released upon venting shall be contained by the packaging or by the equipment in which a capacitor is installed; and
- (e) Capacitors shall be marked with the energy storage capacity in Wh.

Capacitors containing an electrolyte not meeting the classification criteria of any class of dangerous goods, including when installed in equipment, are not subject to other provisions of ADN.

Capacitors containing an electrolyte meeting the classification criteria of any class of dangerous goods, with an energy storage capacity of 10 Wh or less are not subject to other provisions of ADN when they are capable of withstanding a 1.2 metre drop test unpackaged on an unyielding surface without loss of contents.

Capacitors containing an electrolyte meeting the classification criteria of any class of dangerous goods that are not installed in equipment and with an energy storage capacity of more than 10 Wh are subject to ADN.

Capacitors installed in equipment and containing an electrolyte meeting the classification criteria of any class of dangerous goods are not subject to other provisions of ADN provided the equipment is packaged in a strong outer packaging constructed of suitable material and of adequate strength and design, in relation to the packaging's intended use and in such a manner as to prevent accidental functioning of capacitors during carriage. Large robust equipment containing capacitors may be offered for carriage unpackaged or on pallets when capacitors are afforded equivalent protection by the equipment in which they are contained.

***NOTE:** Capacitors which by design maintain a terminal voltage (e.g. asymmetrical capacitors) do not belong to this entry.*

362 (Reserved).

Copyright © United Nations, 2021. All rights reserved

363 This entry may only be used when the conditions of this special provision are met. No other requirements of ADN apply.

- (a) This entry applies to engines or machinery, powered by fuels classified as dangerous goods via internal combustion systems or fuel cells (e.g. combustion engines, generators, compressors, turbines, heating units, etc.), except vehicle equipment assigned to UN No. 3166 referred to in special provision 666;

NOTE: This entry does not apply to equipment referred to in 1.1.3.2 (a), (d) and (e), 1.1.3.3 and 1.1.3.7.

- (b) Engines or machinery which are empty of liquid or gaseous fuels and which do not contain other dangerous goods, are not subject to ADN.

NOTE 1: An engine or machinery is considered to be empty of liquid fuel when the liquid fuel tank has been drained and the engine or machinery cannot be operated due to a lack of fuel. Engine or machinery components such as fuel lines, fuel filters and injectors do not need to be cleaned, drained or purged to be considered empty of liquid fuels. In addition, the liquid fuel tank does not need to be cleaned or purged.

NOTE 2: An engine or machinery is considered to be empty of gaseous fuels when the gaseous fuel tanks are empty of liquid (for liquefied gases), the pressure in the tanks does not exceed 2 bar and the fuel shut-off or isolation valve is closed and secured.

- (c) Engines and machinery containing fuels meeting the classification criteria of Class 3, shall be assigned to the entries UN No. 3528 ENGINE, INTERNAL COMBUSTION, FLAMMABLE LIQUID POWERED or UN No. 3528 ENGINE, FUEL CELL, FLAMMABLE LIQUID POWERED or UN No. 3528 MACHINERY, INTERNAL COMBUSTION, FLAMMABLE LIQUID POWERED or UN No. 3528 MACHINERY, FUEL CELL, FLAMMABLE LIQUID POWERED, as appropriate.
- (d) Engines and machinery containing fuels meeting the classification criteria of flammable gases of Class 2, shall be assigned to the entries UN No. 3529 ENGINE, INTERNAL COMBUSTION, FLAMMABLE GAS POWERED or UN No. 3529 ENGINE, FUEL CELL, FLAMMABLE GAS POWERED or UN No. 3529 MACHINERY, INTERNAL COMBUSTION, FLAMMABLE GAS POWERED or UN No. 3529 MACHINERY, FUEL CELL, FLAMMABLE GAS POWERED, as appropriate.

Engines and machinery powered by both a flammable gas and a flammable liquid shall be assigned to the appropriate UN No. 3529 entry.

- (e) Engines and machinery containing liquid fuels meeting the classification criteria of 2.2.9.1.10 for environmentally hazardous substances and not meeting the classification criteria of any other class shall be assigned to the entries UN No. 3530 ENGINE, INTERNAL COMBUSTION or UN No. 3530 MACHINERY, INTERNAL COMBUSTION, as appropriate.
- (f) Engines or machinery may contain other dangerous goods than fuels (e.g. batteries, fire extinguishers, compressed gas accumulators or safety devices) required for their functioning or safe operation without being subject to any additional requirements for these other dangerous goods, unless otherwise specified in ADN. However, lithium batteries shall meet the provisions of 2.2.9.1.7, except as provided for in special provision 667.

Copyright © United Nations, 2021. All rights reserved

- (g) The engine or machinery, including the means of containment containing dangerous goods, shall be in compliance with the construction requirements specified by the competent authority of the country of manufacture²;
- (h) Any valves or openings (e.g. venting devices) shall be closed during carriage;
- (i) The engines or machinery shall be oriented to prevent inadvertent leakage of dangerous goods and secured by means capable of restraining the engines or machinery to prevent any movement during carriage which would change the orientation or cause them to be damaged;
- (j) For UN No. 3528 and UN No. 3530:

Where the engine or machinery contains more than 60 l of liquid fuel and has a capacity of more than 450 l but not more than 3 000 l, it shall be labelled on two opposite sides in accordance with 5.2.2.

Where the engine or machinery contains more than 60 l of liquid fuel and has a capacity of more than 3 000 l, it shall be placarded on two opposite sides. Placards shall correspond to the labels required in Column (5) of Table A of Chapter 3.2 and shall conform to the specifications given in 5.3.1.7. Placards shall be displayed on a background of contrasting colour, or shall have either a dotted or solid outer boundary line.

- (k) For UN No. 3529:

Where the fuel tank of the engine or machinery has a water capacity of more than 450 l but not more than 1 000 l, it shall be labelled on two opposite sides in accordance with 5.2.2.

Where the fuel tank of the engine or machinery has a water capacity of more than 1 000 l, it shall be placarded on two opposite sides. Placards shall correspond to the labels required in Column (5) of Table A of Chapter 3.2 and shall conform to the specifications given in 5.3.1.7. Placards shall be displayed on a background of contrasting colour, or shall have either a dotted or solid outer boundary line.

- (l) When the engine or machinery contains more than 1 000 l of liquid fuels, for UN No. 3528 and UN No. 3530, or the fuel tank has a water capacity of more than 1 000 l, for UN No. 3529:
 - A transport document in accordance with 5.4.1 is required. This transport document shall contain the following additional statement "Transport in accordance with special provision 363".
- (m) The requirements specified in packing instruction P005 of 4.1.4.1 of ADR shall be met.

364 This article may only be carried under the provisions of Chapter 3.4 if, as presented for carriage, the package is capable of passing the test in accordance with Test Series 6(d) of Part I of the *Manual of Tests and Criteria* as determined by the competent authority.

365 For manufactured instruments and articles containing mercury, see UN No. 3506.

² For example, compliance with the relevant provisions of Directive 2006/42/EC of the European Parliament and of the Council of 17 May 2006 on machinery, and amending Directive 95/16/EC (Official Journal of the European Union No. L 157 of 9 June 2006, pp. 0024-0086).

Copyright © United Nations, 2021. All rights reserved

366 Manufactured instruments and articles containing not more than 1 kg of mercury are not subject to ADN.

367 For the purposes of documentation:

The proper shipping name "Paint related material" may be used for consignments of packages containing "Paint" and "Paint related material" in the same package;

The proper shipping name "Paint related material, corrosive, flammable" may be used for consignments of packages containing "Paint, corrosive, flammable" and "Paint related material, corrosive, flammable" in the same package;

The proper shipping name "Paint related material, flammable, corrosive" may be used for consignments of packages containing "Paint, flammable, corrosive" and "Paint related material, flammable, corrosive" in the same package; and

The proper shipping name "Printing ink related material" may be used for consignments of packages containing "Printing ink" and "Printing ink related material" in the same package.

368 In the case of non-fissile or fissile-excepted uranium hexafluoride, the material shall be classified under UN No. 3507 or UN No. 2978.

369 In accordance with 2.1.3.5.3 (a), this radioactive material in an excepted package possessing toxic and corrosive properties is classified in Class 6.1 with radioactivity and corrosivity subsidiary hazards.

Uranium hexafluoride may be classified under this entry only if the conditions of 2.2.7.2.4.1.2, 2.2.7.2.4.1.5, 2.2.7.2.4.5.2 and, for fissile-excepted material, of 2.2.7.2.3.5 are met.

In addition to the provisions applicable to the carriage of Class 6.1 substances with a corrosivity subsidiary hazard, the provisions of 5.1.3.2, 5.1.5.2.2, 5.1.5.4.1 (b), 7.5.11 CV33 (3.1), (5.1) to (5.4) and (6) of ADR shall apply.

No Class 7 label is required to be displayed.

370 This entry only applies to ammonium nitrate that meets one of the following criteria:

- (a) ammonium nitrate with more than 0.2% combustible substances, including any organic substance calculated as carbon, to the exclusion of any added substance; or
- (b) ammonium nitrate with not more than 0.2% combustible substances, including any organic substance calculated as carbon, to the exclusion of any added substance, that gives a positive result when tested in accordance with Test Series 2 (see Manual of Tests and Criteria, Part I). See also UN No. 1942.

This entry shall not be used for ammonium nitrate for which a proper shipping name already exists in Table A of Chapter 3.2 including ammonium nitrate mixed with fuel oil (ANFO) or any of the commercial grades of ammonium nitrate.

371 (1) This entry also applies to articles, containing a small pressure receptacle with a release device. Such articles shall comply with the following requirements:

- (i) The water capacity of the pressure receptacle shall not exceed 0.5 litres and the working pressure shall not exceed 25 bar at 15 °C;

Copyright © United Nations, 2021. All rights reserved

- (ii) The minimum burst pressure of the pressure receptacle shall be at least four times the pressure of the gas at 15 °C;
 - (iii) Each article shall be manufactured in such a way that unintentional firing or release is avoided under normal conditions of handling, packing, carriage and use. This may be fulfilled by an additional locking device linked to the activator;
 - (iv) Each article shall be manufactured in such a way as to prevent hazardous projections of the pressure receptacle or parts of the pressure receptacle;
 - (v) Each pressure receptacle shall be manufactured from material which will not fragment upon rupture;
 - (vi) The design type of the article shall be subjected to a fire test. For this test, the provisions of paragraphs 16.6.1.2 except letter g, 16.6.1.3.1 to 16.6.1.3.6, 16.6.1.3.7 (b) and 16.6.1.3.8 of the *Manual of Tests and Criteria* shall be applied. It shall be demonstrated that the article relieves its pressure by means of a fire degradable seal or other pressure relief device, in such a way that the pressure receptacle will not fragment and that the article or fragments of the article do not rocket more than 10 metres;
 - (vii) The design type of the article shall be subjected to the following test. A stimulating mechanism shall be used to initiate one article in the middle of the packaging. There shall be no hazardous effects outside the package such as disruption of the package, metal fragments or a receptacle which passes through the packaging.
- (2) The manufacturer shall produce technical documentation of the design type, manufacture as well as the tests and their results. The manufacturer shall apply procedures to ensure that articles produced in series are made of good quality, conform to the design type and are able to meet the requirements in (1). The manufacturer shall provide such information to the competent authority on request.
- 372 This entry applies to asymmetric capacitors with an energy storage capacity greater than 0.3 Wh. Capacitors with an energy storage capacity of 0.3 Wh or less are not subject to ADN.

Energy storage capacity means the energy stored in a capacitor, as calculated according to the following equation,

$$Wh = 1/2C_N(U_R^2 - U_L^2) \times (1/3600),$$

using the nominal capacitance (C_N), rated voltage (U_R) and rated lower limit voltage (U_L).

All asymmetric capacitors to which this entry applies shall meet the following conditions:

- (a) Capacitors or modules shall be protected against short circuit;
- (b) Capacitors shall be designed and constructed to safely relieve pressure that may build up in use, through a vent or a weak point in the capacitor casing. Any liquid which is released upon venting shall be contained by packaging or by equipment in which a capacitor is installed;

Copyright © United Nations, 2021. All rights reserved

- (c) Capacitors shall be marked with the energy storage capacity in Wh; and
- (d) Capacitors containing an electrolyte meeting the classification criteria of any class of dangerous goods shall be designed to withstand a 95 kPa pressure differential;

Capacitors containing an electrolyte not meeting the classification criteria of any class of dangerous goods, including when configured in a module or when installed in equipment are not subject to other provisions of ADN.

Capacitors containing an electrolyte meeting the classification criteria of any class of dangerous goods, with an energy storage capacity of 20 Wh or less, including when configured in a module, are not subject to other provisions of ADN when the capacitors are capable of withstanding a 1.2 metre drop test unpackaged on an unyielding surface without loss of contents.

Capacitors containing an electrolyte meeting the classification criteria of any class of dangerous goods that are not installed in equipment and with an energy storage capacity of more than 20 Wh are subject to ADN.

Capacitors installed in equipment and containing an electrolyte meeting the classification criteria of any class of dangerous goods, are not subject to other provisions of ADN provided that the equipment is packaged in a strong outer packaging constructed of suitable material, and of adequate strength and design, in relation to the packaging's intended use and in such a manner as to prevent accidental functioning of capacitors during carriage. Large robust equipment containing capacitors may be offered for carriage unpackaged or on pallets when capacitors are afforded equivalent protection by the equipment in which they are contained.

NOTE: Notwithstanding the provisions of this special provision, nickel-carbon asymmetric capacitors containing Class 8 alkaline electrolytes shall be carried as UN 2795 BATTERIES, WET, FILLED WITH ALKALI, electric storage.

- 373 Neutron radiation detectors containing non-pressurized boron trifluoride gas may be carried under this entry provided that the following conditions are met:

- (a) Each radiation detector shall meet the following conditions.
 - (i) The pressure in each detector shall not exceed 105 kPa absolute at 20 °C;
 - (ii) The amount of gas shall not exceed 13 g per detector;
 - (iii) Each detector shall be manufactured under a registered quality assurance programme;

NOTE: ISO 9001 may be used for this purpose.

- (iv) Each neutron radiation detector shall be of welded metal construction with brazed metal to ceramic feed through assemblies. These detectors shall have a minimum burst pressure of 1800 kPa as demonstrated by design type qualification testing; and
- (v) Each detector shall be tested to a 1×10^{-10} cm³/s leaktightness standard before filling.

Copyright © United Nations, 2021. All rights reserved

- (b) Radiation detectors carried as individual components shall be carried as follows:
- (i) Detectors shall be packed in a sealed intermediate plastics liner with sufficient absorbent or adsorbent material to absorb or adsorb the entire gas contents;
 - (ii) They shall be packed in strong outer packaging. The completed package shall be capable of withstanding a 1.8 m drop test without leakage of gas contents from detectors;
 - (iii) The total amount of gas from all detectors per outer packaging shall not exceed 52 g.
- (c) Completed neutron radiation detection systems containing detectors meeting the conditions of paragraph (a) shall be carried as follows:
- (i) The detectors shall be contained in a strong sealed outer casing;
 - (ii) The casing shall contain sufficient absorbent or adsorbent material to absorb or adsorb the entire gas contents;
 - (iii) The completed systems shall be packed in strong outer packagings capable of withstanding a 1.8 m drop test without leakage unless a system's outer casing affords equivalent protection.

Packing instruction P200 of 4.1.4.1 of ADR is not applicable.

The transport document shall include the following statement "Transport in accordance with special provision 373".

Neutron radiation detectors containing not more than 1 g of boron trifluoride, including those with solder glass joints, are not subject to ADN provided they meet the requirements in paragraph (a) and are packed in accordance with paragraph (b). Radiation detection systems containing such detectors are not subject to ADN provided they are packed in accordance with paragraph (c).

374 *(Reserved)*

375 These substances when carried in single or combination packagings containing a net quantity per single or inner packaging of 5 l or less for liquids or having a net mass per single or inner packaging of 5 kg or less for solids, are not subject to any other provisions of ADN provided the packagings meet the general provisions of 4.1.1.1, 4.1.1.2 and 4.1.1.4 to 4.1.1.8 of ADR.

376 Lithium ion cells or batteries and lithium metal cells or batteries identified as being damaged or defective such that they do not conform to the type tested according to the applicable provisions of the Manual of Tests and Criteria shall comply with the requirements of this special provision.

For the purposes of this special provision, these may include, but are not limited to:

- Cells or batteries identified as being defective for safety reasons;
- Cells or batteries that have leaked or vented;
- Cells or batteries that cannot be diagnosed prior to carriage; or
- Cells or batteries that have sustained physical or mechanical damage.

Copyright © United Nations, 2021. All rights reserved

NOTE: In assessing a cell or battery as damaged or defective, an assessment or evaluation shall be performed based on safety criteria from the cell, battery or product manufacturer or by a technical expert with knowledge of the cell's or battery's safety features. An assessment or evaluation may include, but is not limited to, the following criteria:

- (a) *Acute hazard, such as gas, fire, or electrolyte leaking;*
- (b) *The use or misuse of the cell or battery;*
- (c) *Signs of physical damage, such as deformation to cell or battery casing, or colours on the casing;*
- (d) *External and internal short circuit protection, such as voltage or isolation measures;*
- (e) *The condition of the cell or battery safety features; or*
- (f) *Damage to any internal safety components, such as the battery management system.*

Cells and batteries shall be carried according to the provisions applicable to UN No. 3090, UN No. 3091, UN No. 3480 and No. UN 3481, except special provision 230 and as otherwise stated in this special provision.

Cells and batteries shall be packed in accordance with packing instructions P908 of 4.1.4.1 of ADR or LP904 of 4.1.4.3 of ADR, as applicable.

Cells and batteries identified as damaged or defective and liable to rapidly disassemble, dangerously react, produce a flame or a dangerous evolution of heat or a dangerous emission of toxic, corrosive or flammable gases or vapours under normal conditions of carriage shall be packed and carried in accordance with packing instruction P911 of 4.1.4.1 of ADR or LP906 of 4.1.4.3 of ADR, as applicable. Alternative packing and/or carriage conditions may be authorized by the competent authority of any ADN Contracting Party who may also recognize an approval granted by the competent authority of a country which is not an ADN Contracting Party provided that this approval has been granted in accordance with the procedures applicable according to RID, ADR, ADN, the IMDG Code or the ICAO Technical Instructions. In both cases the cells and batteries are assigned to transport category 0.

Packages shall be marked "DAMAGED/DEFECTIVE LITHIUM-ION BATTERIES" or "DAMAGED/DEFECTIVE LITHIUM METAL BATTERIES", as applicable.

The transport document shall include the following statement "Transport in accordance with special provision 376".

If applicable, a copy of the competent authority approval shall accompany the carriage.

- 377 Lithium ion and lithium metal cells and batteries and equipment containing such cells and batteries carried for disposal or recycling, either packed together with or packed without non-lithium batteries, may be packaged in accordance with packing instruction P909 of 4.1.4.1 of ADR.

These cells and batteries are not subject to the provisions of 2.2.9.1.7 (a) to (g).

Packages shall be marked "LITHIUM BATTERIES FOR DISPOSAL" or "LITHIUM BATTERIES FOR RECYCLING".

Copyright © United Nations, 2021. All rights reserved

Identified damaged or defective batteries shall be carried in accordance with special provision 376.

378 Radiation detectors containing this gas in non-refillable pressure receptacles not meeting the requirements of Chapter 6.2 and packing instruction P200 of 4.1.4.1 of ADR may be carried under this entry provided:

- (a) The working pressure in each receptacle does not exceed 50 bar;
- (b) The receptacle capacity does not exceed 12 litres;
- (c) Each receptacle has a minimum burst pressure of at least 3 times the working pressure when a relief device is fitted and at least 4 times the working pressure when no relief device is fitted;
- (d) Each receptacle is manufactured from material which will not fragment upon rupture;
- (e) Each detector is manufactured under a registered quality assurance programme;

NOTE: ISO 9001 may be used for this purpose.

- (f) Detectors are carried in strong outer packagings. The complete package shall be capable of withstanding a 1.2 metre drop test without breakage of the detector or rupture of the outer packaging. Equipment that includes a detector shall be packed in a strong outer packaging unless the detector is afforded equivalent protection by the equipment in which it is contained; and
- (g) The transport document includes the following statement “Transport in accordance with special provision 378”.

Radiation detectors, including detectors in radiation detection systems, are not subject to any other requirements of ADN if the detectors meet the requirements in (a) to (f) above and the capacity of detector receptacles does not exceed 50 ml.

379 Anhydrous ammonia adsorbed or absorbed on a solid contained in ammonia dispensing systems or receptacles intended to form part of such systems are not subject to the other provisions of ADN if the following conditions are observed:

- (a) The adsorption or absorption presents the following properties:
 - (i) The pressure at a temperature of 20 °C in the receptacle is less than 0.6 bar;
 - (ii) The pressure at a temperature of 35 °C in the receptacle is less than 1 bar;
 - (iii) The pressure at a temperature of 85 °C in the receptacle is less than 12 bar.
- (b) The adsorbent or absorbent material shall not have dangerous properties listed in classes 1 to 8;
- (c) The maximum contents of a receptacle shall be 10 kg; and

Copyright © United Nations, 2021. All rights reserved

- (d) Receptacles containing adsorbed or absorbed ammonia shall meet the following conditions:
- (i) Receptacles shall be made of a material compatible with ammonia as specified in ISO 11114-1:2012 + A1:2017;
 - (ii) Receptacles and their means of closure shall be hermetically sealed and able to contain the generated ammonia;
 - (iii) Each receptacle shall be able to withstand the pressure generated at 85 °C with a volumetric expansion no greater than 0.1%;
 - (iv) Each receptacle shall be fitted with a device that allows for gas evacuation once pressure exceeds 15 bar without violent rupture, explosion or projection; and
 - (v) Each receptacle shall be able to withstand a pressure of 20 bar without leakage when the pressure relief device is deactivated.

When carried in an ammonia dispenser, the receptacles shall be connected to the dispenser in such a way that the assembly is guaranteed to have the same strength as a single receptacle.

The properties of mechanical strength mentioned in this special provision shall be tested using a prototype of a receptacle and/or dispenser filled to nominal capacity, by increasing the temperature until the specified pressures are reached.

The test results shall be documented, shall be traceable and shall be communicated to the relevant authorities upon request.

380 *(Reserved)*

381 *(Reserved)*

382 Polymeric beads may be made from polystyrene, poly (methyl methacrylate) or other polymeric material. When it can be demonstrated that no flammable vapour, resulting in a flammable atmosphere, is evolved according to test U1 (Test method for substances liable to evolve flammable vapours) of Part III, sub-section 38.4.4 of the Manual of Tests and Criteria, polymeric beads, expandable need not be classified under this UN number. This test should only be performed when de-classification of a substance is considered.

383 Table tennis balls manufactured from celluloid are not subject to ADN where the net mass of each table tennis ball does not exceed 3.0 g and the total net mass of table tennis balls does not exceed 500 g per package.

384 *(Reserved)*

385 *(Deleted)*

Copyright © United Nations, 2021. All rights reserved

- 386 When substances are stabilized by temperature control, the provisions of 2.2.41.1.21, 7.1.7, special provision V8 of Chapter 7.2 of ADR, special provision S4 of Chapter 8.5 of ADR and the requirements of Chapter 9.6 of ADR apply. When chemical stabilization is employed, the person offering the packaging, IBC or tank for carriage shall ensure that the level of stabilization is sufficient to prevent the substance in the packaging, IBC or tank from dangerous polymerization at a bulk mean loading temperature of 50 °C, or, in the case of a portable tank, 45 °C. Where chemical stabilization becomes ineffective at lower temperatures within the anticipated duration of carriage, temperature control is required. In making this determination factors to be taken into consideration include, but are not limited to, the capacity and geometry of the packaging, IBC or tank and the effect of any insulation present, the temperature of the substance when offered for carriage, the duration of the journey and the ambient temperature conditions typically encountered in the journey (considering also the season of year), the effectiveness and other properties of the stabilizer employed, applicable operational controls imposed by regulation (e.g. requirements to protect from sources of heat, including other cargo carried at a temperature above ambient) and any other relevant factors.
- 387 Lithium batteries in conformity with 2.2.9.1.7 (f) containing both primary lithium metal cells and rechargeable lithium ion cells shall be assigned to UN Nos. 3090 or 3091 as appropriate. When such batteries are carried in accordance with special provision 188, the total lithium content of all lithium metal cells contained in the battery shall not exceed 1.5 g and the total capacity of all lithium ion cells contained in the battery shall not exceed 10 Wh.
- 388 UN No. 3166 entries apply to vehicles powered by flammable liquid or gas internal combustion engines or fuel cells.

Vehicles powered by a fuel cell engine shall be assigned to the entries UN No. 3166 VEHICLE, FUEL CELL, FLAMMABLE GAS POWERED or UN No. 3166 VEHICLE, FUEL CELL, FLAMMABLE LIQUID POWERED, as appropriate. These entries include hybrid electric vehicles powered by both a fuel cell and an internal combustion engine with wet batteries, sodium batteries, lithium metal batteries or lithium ion batteries, carried with the battery(ies) installed.

Other vehicles which contain an internal combustion engine shall be assigned to the entries UN No. 3166 VEHICLE, FLAMMABLE GAS POWERED or UN No. 3166 VEHICLE, FLAMMABLE LIQUID POWERED, as appropriate. These entries include hybrid electric vehicles powered by both an internal combustion engine and wet batteries, sodium batteries, lithium metal batteries or lithium ion batteries, carried with the battery(ies) installed.

If a vehicle is powered by a flammable liquid and a flammable gas internal combustion engine, it shall be assigned to UN No. 3166 VEHICLE, FLAMMABLE GAS POWERED.

Entry UN No. 3171 only applies to vehicles powered by wet batteries, sodium batteries, lithium metal batteries or lithium ion batteries and equipment powered by wet batteries or sodium batteries carried with these batteries installed.

Copyright © United Nations, 2021. All rights reserved

For the purpose of this special provision, vehicles are self-propelled apparatus designed to carry one or more persons or goods. Examples of such vehicles are cars, motorcycles, scooters, three- and four-wheeled vehicles or motorcycles, trucks, locomotives, bicycles (pedal cycles with a motor) and other vehicles of this type (e.g. self-balancing vehicles or vehicles not equipped with at least one seating position), wheelchairs, lawn tractors, self-propelled farming and construction equipment, boats and aircraft. This includes vehicles carried in a packaging. In this case some parts of the vehicle may be detached from its frame to fit into the packaging.

Examples of equipment are lawnmowers, cleaning machines or model boats and model aircraft. Equipment powered by lithium metal batteries or lithium ion batteries shall be assigned to the entries UN No. 3091 LITHIUM METAL BATTERIES CONTAINED IN EQUIPMENT or UN No. 3091 LITHIUM METAL BATTERIES PACKED WITH EQUIPMENT or UN No. 3481 LITHIUM ION BATTERIES CONTAINED IN EQUIPMENT or UN No. 3481 LITHIUM ION BATTERIES PACKED WITH EQUIPMENT, as appropriate. Lithium ion batteries or lithium metal batteries installed in a cargo transport unit and designed only to provide power external to the cargo transport unit shall be assigned to the entry UN 3536 LITHIUM BATTERIES INSTALLED IN CARGO TRANSPORT UNIT lithium ion batteries or lithium metal batteries.

Dangerous goods, such as batteries, airbags, fire extinguishers, compressed gas accumulators, safety devices and other integral components of the vehicle that are necessary for the operation of the vehicle or for the safety of its operator or passengers, shall be securely installed in the vehicle and are not otherwise subject to ADN. However, lithium batteries shall meet the provisions of 2.2.9.1.7, except as otherwise provided for in special provision 667.

Where a lithium battery installed in a vehicle or equipment is damaged or defective, the vehicle or equipment shall be carried in accordance with the conditions defined in special provision 667 (c).

- 389 This entry only applies to cargo transport units in which lithium ion batteries or lithium metal batteries are installed and which are designed only to provide power external to the unit. The lithium batteries shall meet the provisions of 2.2.9.1.7 (a) to (g) and contain the necessary systems to prevent overcharge and over discharge between the batteries.

The batteries shall be securely attached to the interior structure of the cargo transport unit (e.g., by means of placement in racks, cabinets, etc.) in such a manner as to prevent short circuits, accidental operation, and significant movement relative to the cargo transport unit under the shocks, loadings and vibrations normally incident to carriage. Dangerous goods necessary for the safe and proper operation of the cargo transport unit (e.g., fire extinguishing systems and air conditioning systems), shall be properly secured to or installed in the cargo transport unit and are not otherwise subject to ADN. Dangerous goods not necessary for the safe and proper operation of the cargo transport unit shall not be carried within the cargo transport unit.

The batteries inside the cargo transport unit are not subject to marking or labelling requirements. The cargo transport unit shall bear orange-coloured plates in accordance with 5.3.2.2 and placards in accordance with 5.3.1.1 on two opposing sides.

Copyright © United Nations, 2021. All rights reserved

- 390 When a package contains a combination of lithium batteries contained in equipment and lithium batteries packed with equipment, the following requirements apply for the purposes of package marking and documentation:
- (a) the package shall be marked “UN 3091” or “UN 3481”, as appropriate. If a package contains both lithium ion batteries and lithium metal batteries packed with and contained in equipment, the package shall be marked as required for both battery types. However, button cell batteries installed in equipment (including circuit boards) need not be considered;
 - (b) the transport document shall indicate “UN 3091 LITHIUM METAL BATTERIES PACKED WITH EQUIPMENT” or “UN 3481 LITHIUM ION BATTERIES PACKED WITH EQUIPMENT”, as appropriate. If a package contains both lithium metal batteries and lithium ion batteries packed with and contained in equipment, then the transport document shall indicate both “UN 3091 LITHIUM METAL BATTERIES PACKED WITH EQUIPMENT” and “UN 3481 LITHIUM ION BATTERIES PACKED WITH EQUIPMENT”.
- 391 *(Reserved)*
- 392 For the carriage of fuel gas containment systems designed and approved to be fitted in motor vehicles containing this gas the provisions of 4.1.4.1 and Chapter 6.2 of ADR need not be applied when carried for disposal, recycling, repair, inspection, maintenance or from where they are manufactured to a vehicle assembly plant, provided the following conditions are met:
- (a) The fuel gas containment systems shall meet the requirements of the standards or regulations for fuel tanks for vehicles, as applicable. Examples of applicable standards and regulations are:

LPG tanks	
UN Regulation No. 67 Revision 2	Uniform provisions concerning: I. Approval of specific equipment of vehicles of category M and N using liquefied petroleum gases in their propulsion system; II. Approval of vehicles of category M and N fitted with specific equipment for the use of liquefied petroleum gases in their propulsion system with regard to the installation of such equipment
UN Regulation No. 115	Uniform provisions concerning the approval of: I. Specific LPG (liquefied petroleum gases) retrofit systems to be installed in motor vehicles for the use of LPG in their propulsion systems; II Specific CNG (compressed natural gas) retrofit systems to be installed in motor vehicles for the use of CNG in their propulsion system
CNG and LNG tanks	
UN Regulation No. 110	Uniform provisions concerning the approval of: I. Specific components of motor vehicles using compressed natural gas (CNG) and/or liquefied natural gas (LNG) in their propulsion system II. Vehicles with regard to the installation of specific components of an approved type for the use of compressed natural gas (CNG) and/or liquefied natural gas (LNG) in their propulsion system

Copyright © United Nations, 2021. All rights reserved

UN Regulation No. 115	Uniform provisions concerning the approval of: I. Specific LPG (liquefied petroleum gases) retrofit systems to be installed in motor vehicles for the use of LPG in their propulsion systems; II Specific CNG (compressed natural gas) retrofit systems to be installed in motor vehicles for the use of CNG in their propulsion system
ISO 11439:2013	Gas cylinders — High pressure cylinders for the on-board storage of natural gas as a fuel for automotive vehicles
ISO 15500-Series	Road vehicles -- Compressed natural gas (CNG) fuel system components – several parts as applicable
ANSI NGV 2	Compressed natural gas vehicle fuel containers
CSA B51 Part 2:2014	Boiler, pressure vessel, and pressure piping code Part 2 Requirements for high-pressure cylinders for on-board storage of fuels for automotive vehicles
Hydrogen pressure tanks	
Global Technical Regulation (GTR) No. 13	Global technical regulation on hydrogen and fuel cell vehicles (ECE/TRANS/180/Add.13).
ISO/TS 15869:2009	Gaseous hydrogen and hydrogen blends - Land vehicle fuel tanks
Regulation (EC) No.79/2009	Regulation (EC) No. 79/2009 of the European Parliament and of the Council of 14 January 2009 on type approval of hydrogen-powered motor vehicles, and amending Directive 2007/46/EC
Regulation (EU) No. 406/2010	Commission Regulation (EU) No 406/2010 of 26 April 2010 implementing Regulation (EC) No 79/2009 of the European Parliament and of the Council on type-approval of hydrogen-powered motor vehicles
UN Regulation No. 134	Uniform provisions concerning the approval of motor vehicles and their components with regard to the safety-related performance of hydrogen-fuelled vehicles (HFCV)
CSA B51 Part 2: 2014	Boiler, pressure vessel, and pressure piping code – Part 2: Requirements for high-pressure cylinders for on-board storage of fuels for automotive vehicles

Gas tanks designed and constructed in accordance with previous versions of relevant standards or regulations for gas tanks for motor vehicles, which were applicable at the time of the certification of the vehicles for which the gas tanks were designed and constructed may continue to be carried;

- (b) The fuel gas containment systems shall be leakproof and shall not exhibit any signs of external damage which may affect their safety;

NOTE 1: Criteria may be found in standard ISO 11623:2015 Gas cylinders – Composite construction – Periodic inspection and testing (or ISO 19078:2013 Gas cylinders – Inspection of the cylinder installation, and requalification of high pressure cylinders for the on-board storage of natural gas as a fuel for automotive vehicles).

Copyright © United Nations, 2021. All rights reserved

NOTE 2: If the fuel gas containment systems are not leakproof or are overfilled or if they exhibit damage that could affect their safety (e.g. in case of a safety related recall), they shall only be carried in salvage pressure receptacles in conformity with ADN.

- (c) If a fuel gas containment system is equipped with two valves or more integrated in line, the two valves shall be closed as to be gastight under normal conditions of carriage. If only one valve exists or only one valve works, all openings with the exception of the opening of the pressure relief device shall be closed as to be gastight under normal conditions of carriage;
- (d) Fuel gas containment systems shall be carried in such a way as to prevent obstruction of the pressure relief device or any damage to the valves and any other pressurised part of the fuel gas containment systems and unintentional release of the gas under normal conditions of carriage. The fuel gas containment system shall be secured in order to prevent slipping, rolling or vertical movement;
- (e) Valves shall be protected by one of the methods described in 4.1.6.8 (a) to (e) of ADR;
- (f) Except for the case of fuel gas containment systems removed for disposal, recycling, repair, inspection or maintenance, they shall be filled with not more than 20% of their nominal filling ratio or nominal working pressure, as applicable;
- (g) Notwithstanding the provisions of Chapter 5.2, when fuel gas containment systems are consigned in a handling device, marks and labels may be affixed to the handling device; and
- (h) Notwithstanding the provisions of 5.4.1.1.1 (f) the information on the total quantity of dangerous goods may be replaced by the following information:
 - (i) The number of fuel gas containment systems; and
 - (ii) In the case of liquefied gases the total net mass (kg) of gas of each fuel gas containment system and, in the case of compressed gases, the total water capacity (l) of each fuel gas containment system followed by the nominal working pressure.

Examples for information in the transport document:

Example 1: “UN 1971 natural gas, compressed, 2.1, 1 fuel gas containment system of 50 l in total, 200 bar”.

Example 2: “UN 1965 hydrocarbon gas mixture, liquefied, n.o.s., 2.1, 3 fuel gas containment systems, each of 15 kg net mass of gas”

- 393 The nitrocellulose shall meet the criteria of the Bergmann-Junk test or methyl violet paper test in the Manual of Tests and Criteria Appendix 10. Tests of type 3 (c) need not be applied.
- 394 The nitrocellulose shall meet the criteria of the Bergmann-Junk test or methyl violet paper test in the Manual of Tests and Criteria Appendix 10.
- 395 This entry shall only be used for solid medical waste of Category A carried for disposal.
- 396-499 (Reserved)

- 500 *(Deleted)*
- 501 For naphthalene, molten, see UN No. 2304.
- 502 UN No. 2006 plastics, nitrocellulose-based, self-heating, n.o.s., and UN No. 2002 celluloid scrap are substances of Class 4.2.
- 503 For phosphorus, white, molten, see UN No. 2447.
- 504 UN No. 1847 potassium sulphide, hydrated with not less than 30% water of crystallization, UN No. 1849 sodium sulphide, hydrated with not less than 30% water of crystallization and UN No. 2949 sodium hydrosulphide, hydrated with not less than 25% water of crystallization are substances of Class 8.
- 505 UN No. 2004 magnesium diamide is a substance of Class 4.2.
- 506 Alkaline earth metals and alkaline earth metal alloys in pyrophoric form are substances of Class 4.2.
- UN No. 1869 magnesium or magnesium alloys containing more than 50% magnesium as pellets, turnings or ribbons, are substances of Class 4.1.
- 507 UN No. 3048 aluminium phosphide pesticides, with additives inhibiting the emission of toxic flammable gases are substances of Class 6.1.
- 508 UN No. 1871 titanium hydride and UN No. 1437 zirconium hydride are substances of Class 4.1. UN No. 2870 aluminium borohydride is a substance of Class 4.2.
- 509 UN No. 1908 chlorite solution is a substance of Class 8.
- 510 UN No. 1755 chromic acid solution is a substance of Class 8.
- 511 UN No. 1625 mercuric nitrate, UN No. 1627 mercurous nitrate and UN No. 2727 thallium nitrate are substances of Class 6.1. Thorium nitrate, solid, uranyl nitrate hexahydrate solution and uranyl nitrate, solid are substances of Class 7.
- 512 UN No. 1730 antimony pentachloride, liquid, UN No. 1731 antimony pentachloride solution, UN No. 1732 antimony pentafluoride and UN No. 1733 antimony trichloride are substances of Class 8.
- 513 UN No. 0224 barium azide, dry or wetted with less than 50% water, by mass, is a substance of Class 1. UN No. 1571 barium azide, wetted with not less than 50% water, by mass, is a substance of Class 4.1. UN No. 1854 barium alloys, pyrophoric, are substances of Class 4.2. UN No. 1445 barium chlorate, solid, UN No. 1446 barium nitrate, UN No. 1447 barium perchlorate, solid, UN No. 1448 barium permanganate, UN No. 1449 barium peroxide, UN No. 2719 barium bromate, UN No. 2741 barium hypochlorite with more than 22% available chlorine, UN No. 3405 barium chlorate, solution and UN No. 3406 barium perchlorate, solution, are substances of Class 5.1. UN No. 1565 barium cyanide and UN No. 1884 barium oxide are substances of Class 6.1.
- 514 UN No. 2464 beryllium nitrate is a substance of Class 5.1.
- 515 UN No. 1581 chloropicrin and methyl bromide mixture and UN No. 1582 chloropicrin and methyl chloride mixture are substances of Class 2.
- 516 UN No. 1912 methyl chloride and methylene chloride mixture is a substance of Class 2.

Copyright © United Nations, 2021. All rights reserved

- 517 UN No. 1690 sodium fluoride, solid, UN No. 1812 potassium fluoride, solid, UN No. 2505 ammonium fluoride, UN No. 2674 sodium fluorosilicate, UN No. 2856 fluorosilicates, n.o.s., UN No. 3415 sodium fluoride, solution and UN No. 3422 potassium fluoride, solution, are substances of Class 6.1.
- 518 UN No. 1463 chromium trioxide, anhydrous (chromic acid, solid) is a substance of Class 5.1.
- 519 UN No. 1048 hydrogen bromide, anhydrous, is a substance of Class 2.
- 520 UN No. 1050 hydrogen chloride, anhydrous, is a substance of Class 2.
- 521 Solid chlorites and hypochlorites are substances of Class 5.1.
- 522 UN No. 1873 perchloric acid aqueous solution with more than 50% but not more than 72% pure acid, by mass are substances of Class 5.1. Perchloric acid solutions containing more than 72% pure acid, by mass, or mixtures of perchloric acid with any liquid other than water, are not to be accepted for carriage.
- 523 UN No. 1382 anhydrous potassium sulphide and UN No. 1385 anhydrous sodium sulphide and their hydrates with less than 30% water of crystallization, and UN No. 2318 sodium hydrosulphide with less than 25% water of crystallization are substances of Class 4.2.
- 524 UN No. 2858 finished zirconium products of a thickness of 18 µm or more are substances of Class 4.1.
- 525 Solutions of inorganic cyanides with a total cyanide ion content of more than 30% shall be classified in packing group I, solutions with a total cyanide ion content of more than 3% and not more than 30% in packing group II and solutions with a cyanide ion content of more than 0.3% and not more than 3% in packing group III.
- 526 UN No. 2000 celluloid is assigned to Class 4.1.
- 527 *(Reserved)*
- 528 UN No. 1353 fibres or fabrics impregnated with weakly nitrated cellulose, non-self heating are substances of Class 4.1.
- 529 UN No. 0135 mercury fulminate, wetted with not less than 20% water, or mixture of alcohol and water, by mass, is a substance of Class 1. Mercurous chloride (calomel) is a substance of Class 6.1 (UN No. 2025).
- 530 UN No. 3293 hydrazine, aqueous solution with not more than 37% hydrazine, by mass, is a substance of Class 6.1.
- 531 Mixtures having a flash-point below 23 °C and containing more than 55% nitrocellulose, whatever its nitrogen content or containing not more than 55% nitrocellulose with a nitrogen content above 12.6% (by dry mass), are substances of Class 1 (see UN Nos. 0340 or 0342) or of Class 4.1 (UN Nos. 2555, 2556 or 2557).
- 532 UN No. 2672 ammonia solution containing not less than 10% but not more than 35% ammonia is a substance of Class 8.
- 533 UN No. 1198 formaldehyde solutions, flammable are substances of Class 3. Formaldehyde solutions, non-flammable, with less than 25% formaldehyde are not subject to the requirements of ADN.

- 534 While in some climatic conditions, petrol (gasoline) may have a vapour pressure at 50 °C of more than 110 kPa (1.10 bar) but not more than 150 kPa (1.50 bar) it is to continue to be considered as a substance having a vapour pressure at 50 °C of not more than 110 kPa (1.10 bar).
- 535 UN No. 1469 lead nitrate, UN No. 1470 lead perchlorate, solid and UN No. 3408 lead perchlorate, solution are substances of Class 5.1.
- 536 For naphthalene, solid, see UN No. 1334.
- 537 UN No. 2869 titanium trichloride mixture, not pyrophoric, is a substance of Class 8.
- 538 For sulphur (in the solid state), see UN No. 1350.
- 539 Solutions of isocyanates having a flash-point of not less than 23 °C are substances of Class 6.1.
- 540 UN No. 1326 hafnium powder, wetted, UN No. 1352 titanium powder, wetted or UN No. 1358 zirconium powder, wetted, with not less than 25% water, are substances of Class 4.1.
- 541 Nitrocellulose mixtures with a water content, alcohol content or plasticizer content lower than the stated limits are substances of Class 1.
- 542 Talc containing tremolite and/or actinolite is covered by this entry.
- 543 UN No. 1005 ammonia, anhydrous, UN No. 3318 ammonia solution with more than 50% ammonia and UN No. 2073 ammonia solution, with more than 35% but not more than 50% ammonia, are substances of Class 2. Ammonia solutions with not more than 10% ammonia are not subject to the requirements of ADN.
- 544 UN No. 1032 dimethylamine, anhydrous, UN No. 1036 ethylamine, UN No. 1061 methylamine, anhydrous and UN No. 1083 trimethylamine, anhydrous, are substances of Class 2.
- 545 UN No. 0401 dipicryl sulphide, wetted with less than 10% water by mass is a substance of Class 1.
- 546 UN No. 2009 zirconium, dry, finished sheets, strip or coiled wire, in thicknesses of less than 18 µm, is a substance of Class 4.2. Zirconium, dry, finished sheets, strip or coiled wire, in thicknesses of 254 µm or more, is not subject to the requirements of ADN.
- 547 UN No. 2210 maneb or UN No. 2210 maneb preparations in self-heating form are substances of Class 4.2.
- 548 Chlorosilanes which, in contact with water, emit flammable gases, are substances of Class 4.3.
- 549 Chlorosilanes having a flash-point of less than 23 °C and which, in contact with water, do not emit flammable gases are substances of Class 3. Chlorosilanes having a flash-point equal to or greater than 23 °C and which, in contact with water, do not emit flammable gases are substances of Class 8.
- 550 UN No. 1333 cerium in slabs, rods or ingots is a substance of Class 4.1.
- 551 Solutions of these isocyanates having a flash-point below 23 °C are substances of Class 3.

Copyright © United Nations, 2021. All rights reserved

- 552 Metals and metal alloys in powdered or other flammable form, liable to spontaneous combustion, are substances of Class 4.2. Metals and metal alloys in powdered or other flammable form which, in contact with water, emit flammable gases are substances of Class 4.3.
- 553 This mixture of hydrogen peroxide and peroxyacetic acid shall, in laboratory testing (see *Manual of Tests and Criteria*, Part II, section 20), neither detonate in the cavitated state nor deflagrate at all and shall show no effect when heated under confinement nor any explosive power. The formulation shall be thermally stable (self-accelerating decomposition temperature 60 °C or higher for a 50 kg package), and a liquid compatible with peroxyacetic acid shall be used for desensitization. Formulations not meeting these criteria are to be regarded as substances of Class 5.2 (see *Manual of Tests and Criteria*, Part II, paragraph 20.4.3 (g)).
- 554 Metal hydrides which, in contact with water, emit flammable gases are substances of Class 4.3. UN No. 2870 aluminium borohydride or UN No. 2870 aluminium borohydride in devices is a substance of Class 4.2.
- 555 Dust and powder of metals in non-spontaneously combustible form, non-toxic which nevertheless, in contact with water, emit flammable gases, are substances of Class 4.3.
- 556 *(Deleted)*
- 557 Dust and powder of metals in pyrophoric form are substances of Class 4.2.
- 558 Metals and metal alloys in pyrophoric form are substances of Class 4.2. Metals and metal alloys which, in contact with water, do not emit flammable gases and are not pyrophoric or self-heating, but which are easily ignited, are substances of Class 4.1.
- 559 *(Deleted)*
- 560 An elevated temperature liquid, n.o.s. at or above 100 °C (including molten metals and molten salts) or, for a substance having a flash-point, at a temperature below its flash-point, is a substance of Class 9 (UN No. 3257).
- 561 Chloroformates having predominantly corrosive properties are substances of Class 8.
- 562 Spontaneously combustible organometallic compounds are substances of Class 4.2. Water-reactive organometallic compounds, flammable, are substances of Class 4.3.
- 563 UN No. 1905 selenic acid is a substance of Class 8.
- 564 UN No. 2443 vanadium oxytrichloride, UN No. 2444 vanadium tetrachloride and UN No. 2475 vanadium trichloride are substances of Class 8.
- 565 Unspecified wastes resulting from medical/veterinary treatment of humans/animals or from biological research, and which are unlikely to contain substances of Class 6.2 shall be assigned to this entry. Decontaminated clinical wastes or wastes resulting from biological research which previously contained infectious substances are not subject to the requirements of Class 6.2.
- 566 UN No. 2030 hydrazine aqueous solution, with more than 37% hydrazine, by mass, is a substance of Class 8.
- 567 *(Deleted)*
- 568 Barium azide with a water content lower than the stated limit is a substance of Class 1, UN No. 0224.

569-579 (Reserved)

580 (Deleted)

581 This entry covers mixtures of propadiene with 1 to 4% methylacetylene as well as the following mixtures:

Mixture	Content, % by volume			Permitted technical name for purposes of 5.4.1.1
	Methylacetylene and propadiene, not more than	Propane and propylene, not more than	C ₄ -saturated hydrocarbons, not less than	
P1	63	24	14	“Mixture P1”
P2	48	50	5	“Mixture P2”

582 This entry covers, *inter alia*, mixtures of gases indicated by the letter R ..., with the following properties:

Mixture	Maximum vapour pressure at 70 °C (MPa)	Minimum density at 50 °C (kg/l)	Permitted technical name for purposes of 5.4.1.1
F1	1.3	1.30	“Mixture F1”
F2	1.9	1.21	“Mixture F2”
F3	3.0	1.09	“Mixture F3”

NOTE 1: Trichlorofluoromethane (refrigerant R 11), 1,1,2-trichloro-1,2,2-trifluoroethane (refrigerant R 113), 1,1,1-trichloro-2,2,2-trifluoroethane (refrigerant R 113a), 1-chloro-1,2,2-trifluoroethane (refrigerant R 133) and 1-chloro-1,1,2-trifluoroethane (refrigerant R 133 b) are not substances of Class 2. They may, however, enter into the composition of mixtures F 1 to F 3.

NOTE 2: The reference densities correspond to the densities of dichlorofluoromethane (1.30 kg/l), dichloridifluoromethane (1.21 kg/l) and chlorodifluoromethane (1.09 kg/l).

583 This entry covers, *inter alia*, mixtures of gases, with the following properties:

Mixture	Maximum vapour pressure at 70 °C (MPa)	Minimum density at 50 °C (kg/l)	Permitted technical name ^a for purposes of 5.4.1.1
A	1.1	0.525	“Mixture A” or “Butane”
A01	1.6	0.516	“Mixture A01” or “Butane”
A02	1.6	0.505	“Mixture A02” or “Butane”
A0	1.6	0.495	“Mixture A0” or “Butane”
A1	2.1	0.485	“Mixture A1”
B1	2.6	0.474	“Mixture B1”
B2	2.6	0.463	“Mixture B2”
B	2.6	0.450	“Mixture B”
C	3.1	0.440	“Mixture C” or “Propane”

^a For carriage in tanks, the trade names “Butane” or “Propane” may be used only as a complement.

584 This gas is not subject to the requirements of ADN when:

- it contains not more than 0.5% air in the gaseous state;
- it is contained in metal capsules (sodors, sparklets) free from defects which may impair their strength;
- the leakproofness of the closure of the capsule is ensured;

Copyright © United Nations, 2021. All rights reserved

- a capsule contains not more than 25 g of this gas;
- a capsule contains not more than 0.75 g of this gas per cm³ of capacity.

585 *(Deleted)*.

586 Hafnium, titanium and zirconium powders shall contain a visible excess of water. Hafnium, titanium and zirconium powders, wetted, mechanically produced, of a particle size of 53 µm and over, or chemically produced, of a particle size of 840 µm and over, are not subject to the requirements of ADN.

587 Barium stearate and barium titanate are not subject to the requirements of ADN.

588 Solid hydrated forms of aluminium bromide and aluminium chloride are not subject to the requirements of ADN.

589 *(Deleted)*

590 Ferric chloride hexahydrate is not subject to the requirements of ADN.

591 Lead sulphate with not more than 3% free acid is not subject to the requirements of ADN.

592 Uncleaned empty packagings (including empty IBCs and large packagings), empty tank-vehicles, empty tank wagons, empty demountable tanks, empty portable tanks, empty tank-containers and empty small containers which have contained this substance are not subject to the requirements of ADN.

593 This gas, intended for the cooling of e.g. medical or biological specimens, if contained in double wall receptacles which comply with the provisions of packing instruction P203, paragraph (6) for open cryogenic receptacles of 4.1.4.1 of ADR is not subject to the requirements of ADN except as specified in 5.5.3.

594 The following articles, manufactured and filled according to the provisions applied in the country of manufacture, are not subject to the requirements of ADN:

- (a) UN No. 1044 fire extinguishers provided with protection against inadvertent discharge, when:
 - they are packaged in a strong outer packaging; or
 - they are large fire extinguishers which meet the requirements of special packing provision PP91 of packing instruction P003 in 4.1.4.1 of ADR;
- (b) UN No. 3164 articles, pressurized pneumatic or hydraulic, designed to withstand stresses greater than the internal gas pressure by virtue of transmission of force, intrinsic strength or construction, when they are packaged in a strong outer packaging.

NOTE: *"Provisions applied in the country of manufacture" means the provisions applicable in the country of manufacture or those applicable in the country of use.*

596 Cadmium pigments, such as cadmium sulphides, cadmium sulphoselenides and cadmium salts of higher fatty acids (e.g. cadmium stearate), are not subject to the requirements of ADN.

597 Acetic acid solutions with not more than 10% pure acid by mass are not subject to the requirements of ADN.

Copyright © United Nations, 2021. All rights reserved

598 The following are not subject to the requirements of ADN:

(a) New storage batteries when:

- they are secured in such a way that they cannot slip, fall or be damaged;
- they are provided with carrying devices, unless they are suitably stacked, e.g. on pallets;
- there are no dangerous traces of alkalis or acids on the outside;
- they are protected against short circuits;

(b) Used storage batteries when:

- their cases are undamaged;
- they are secured in such a way that they cannot leak, slip, fall or be damaged, e.g. by stacking on pallets;
- there are no dangerous traces of alkalis or acids on the outside of the articles;
- they are protected against short circuits.

"Used storage batteries" means storage batteries carried for recycling at the end of their normal service life.

599 *(Deleted)*

600 Vanadium pentoxide, fused and solidified, is not subject to the requirements of ADN.

601 Pharmaceutical products (medicines) ready for use, which are substances manufactured and packaged for retail sale or distribution for personal or household consumption are not subject to the requirements of ADN.

602 Phosphorus sulphides which are not free from yellow and white phosphorus are not to be accepted for carriage.

603 Anhydrous hydrogen cyanide not meeting the description for UN No. 1051 or UN No. 1614 is not to be accepted for carriage. Hydrogen cyanide (hydrocyanic acid) containing less than 3% water is stable, if the pH-value is 2.5 ± 0.5 and the liquid is clear and colourless.

604 to 606 *(Deleted)*

607 Mixtures of potassium nitrate and sodium nitrite with an ammonium salt are not to be accepted for carriage.

608 *(Deleted)*

609 Tetranitromethane not free from combustible impurities is not to be accepted for carriage.

610 The carriage of this substance, when it contains more than 45% hydrogen cyanide is prohibited.

Copyright © United Nations, 2021. All rights reserved

- 611 Ammonium nitrate containing more than 0.2% combustible substances (including any organic substance calculated as carbon) is not to be accepted for carriage unless it is a constituent of a substance or article of Class 1.
- 612 *(Reserved)*
- 613 Chloric acid solution containing more than 10% chloric acid and mixtures of chloric acid with any liquid other than water is not to be accepted for carriage.
- 614 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) in concentrations considered highly toxic according to the criteria in 2.2.61.1 is not to be accepted for carriage.
- 615 *(Reserved)*
- 616 Substances containing more than 40% liquid nitric esters shall satisfy the exudation test specified in 2.3.1.
- 617 In addition to the type of explosive, the commercial name of the particular explosive shall be marked on the package.
- 618 In receptacles containing 1,2-butadiene, the oxygen concentration in the gaseous phase shall not exceed 50 ml/m³.
- 619 to 622 *(Reserved)*
- 623 UN No. 1829 sulphur trioxide shall be inhibited. Sulphur trioxide, 99.95% pure or above, may be carried without inhibitor in tanks provided that its temperature is maintained at or above 32.5 °C. For the carriage of this substance without inhibitor in tanks at a minimum temperature of 32.5 °C, the specification "**Transport under minimum temperature of the product of 32.5 °C**" shall appear in the transport document.
- 625 Packages containing these articles shall be clearly marked as follows:
- "UN 1950 AEROSOLS"**
- 626-631 *(Reserved)*
- 632 Considered to be spontaneously flammable (pyrophoric).
- 633 Packages and small containers containing this substance shall bear the following mark: "**Keep away from any source of ignition**". This mark shall be in an official language of the forwarding country, and also, if that language is not English, French or German, in English, French or German, unless any agreements concluded between the countries concerned in the transport operation provide otherwise.
- 635 Packages containing these articles need not bear a label conforming to model No. 9 unless the article is fully enclosed by packaging, crates or other means that prevent the ready identification of the article.
- 636 Up to the intermediate processing facility, lithium cells and batteries with a gross mass of not more than 500 g each, lithium ion cells with a Watt-hour rating of not more than 20 Wh, lithium ion batteries with a Watt-hour rating of not more than 100 Wh, lithium metal cells with a lithium content of not more than 1 g and lithium metal batteries with an aggregate lithium content of not more than 2 g, not contained in equipment, collected and handed over for carriage for sorting, disposal or recycling, together with or without other non-lithium cells or batteries, are not subject to the other provisions of ADN including special provision 376 and 2.2.9.1.7, if the following conditions are met:

Copyright © United Nations, 2021. All rights reserved

- (a) The cells and batteries are packed according to packing instruction P909 of 4.1.4.1 of ADR except for the additional requirements 1 and 2;
- (b) A quality assurance system is in place to ensure that the total amount of lithium cells and batteries per transport unit does not exceed 333 kg;

NOTE: The total quantity of lithium cells and batteries in the mix may be assessed by means of a statistical method included in the quality assurance system. A copy of the quality assurance records shall be made available to the competent authority upon request.

- (c) Packages are marked "LITHIUM BATTERIES FOR DISPOSAL" or "LITHIUM BATTERIES FOR RECYCLING" as appropriate.

637 Genetically modified microorganisms and genetically modified organisms are those which are not dangerous for humans and animals, but which could alter animals, plants, microbiological substances and ecosystems in such a way as cannot occur naturally. Genetically modified microorganisms and genetically modified organisms are not subject to the requirements of ADN when authorized for use by the competent authorities of the countries of origin, transit and destination³.

Live vertebrate or invertebrate animals shall not be used to carry these substances classified under this UN number unless the substance can be carried in no other way.

For the carriage of easily perishable substances under this UN number appropriate information shall be given, e.g.: "Cool at +2 °/+4 °C" or "Carry in frozen state" or "Do not freeze".

638 Substances related to self-reactive substances (see 2.2.41.1.19).

639 See 2.2.2.3, classification code 2F, UN No. 1965, Note 2.

640 The physical and technical characteristics mentioned in column (2) of Table A of Chapter 3.2 determine different tank codes for the carriage of substances of the same packing group in tanks conforming to Chapter 6.8 of RID or ADR.

In order to identify these physical and technical characteristics of the product carried in the tank, the following shall be added to the particulars required in the transport document only in case of carriage in tanks conforming to Chapter 6.8 of ADR or RID:

"Special provision 640X" where "X" is the applicable capital letter appearing after the reference to special provision 640 in column (6) of Table A of Chapter 3.2.

These particulars may, however, be dispensed with in the case of carriage in the type of tank which, for substances of a specific packing group of a specific UN number, meets at least the most stringent requirements.

643 Stone or aggregate asphalt mixture is not subject to the requirements for Class 9.

³ See in particular Part C of Directive 2001/18/EC of the European Parliament and of the Council on the deliberate release into the environment of genetically modified organisms and repealing Council Directive 90/220/EEC (Official Journal of the European Communities, No. L 106, of 17 April 2001, pp. 8-14), which sets out the authorization procedures for the European Community.

Copyright © United Nations, 2021. All rights reserved

- 644 This substance is admitted for carriage provided that:
- The pH is between 5 and 7 measured in an aqueous solution of 10% of the substance carried;
 - The solution does not contain more than 0.2% combustible material or chlorine compounds in quantities such that the chlorine level exceeds 0.02%.
- 645 The classification code as mentioned in Column (3b) of Table A of Chapter 3.2 shall be used only with the approval of the competent authority of a Contracting Party to ADN prior to carriage. The approval shall be given in writing as a classification approval certificate (see 5.4.1.2.1 (g)) and shall be provided with a unique reference. When assignment to a division is made in accordance with the procedure in 2.2.1.1.7.2, the competent authority may require the default classification to be verified on the basis of test data derived from Test Series 6 of the *Manual of Tests and Criteria*, Part I, Section 16.
- 646 Carbon made by steam activation process is not subject to the requirements of ADN.
- 647 Except for carriage in tank vessels, the carriage of vinegar and acetic acid with not more than 25 % pure acid by mass is subject only to the following requirements:
- (a) Packagings, including IBCs and large packagings, and tanks shall be manufactured from stainless steel or plastic material which is permanently resistant to corrosion of vinegar/acetic acid food grade;
 - (b) Packagings, including IBCs and large packagings, and tanks shall be subjected to a visual inspection by the owner at least once a year. The results of the inspections shall be recorded and the records kept for at least one year. Damaged packagings, including IBCs and large packagings, and tanks shall not be filled;
 - (c) Packagings, including IBCs and large packagings, and tanks shall be filled in a way that no product is spilled or adheres to the outer surface;
 - (d) Seals and closures shall be resistant to vinegar/acetic acid food grade. Packagings, including IBCs and large packagings, and tanks shall be hermetically sealed by the person in charge of packaging and/or filling so that under normal conditions of carriage there will be no leakage;
 - (e) Combination packagings with inner packaging made of glass or plastic (see packing instruction P001 in 4.1.4.1 of ADR) which fulfil the general packing requirements of 4.1.1.1, 4.1.1.2, 4.1.1.4, 4.1.1.5, 4.1.1.6, 4.1.1.7 and 4.1.1.8 of ADR may be used;

The other provisions of ADN do not apply except those relating to carriage in tank vessels.

- 648 Articles impregnated with this pesticide, such as fibreboard plates, paper strips, cotton-wool balls, sheets of plastics material, in hermetically closed wrappings, are not subject to the provisions of ADN.
- 649 *(Deleted)*
- 650 Waste consisting of packaging residues, solidified residues and liquid residues of paint may be carried under the conditions of packing group II. In addition to the provisions of UN No. 1263, packing group II, the waste may also be packed and carried as follows:

Copyright © United Nations, 2021. All rights reserved

- (a) The waste may be packed in accordance with packing instruction P002 of 4.1.4.1 of ADR or to packing instruction IBC006 of 4.1.4.2 of ADR;
- (b) The waste may be packed in flexible IBCs of types 13H3, 13H4 and 13H5 in overpacks with complete walls;
- (c) Testing of packagings and IBCs indicated under (a) or (b) may be carried out in accordance with the requirements of Chapters 6.1 or 6.5 of ADR, as appropriate, in relation to solids, at the packing group II performance level.

The tests shall be carried out on packagings and IBCs, filled with a representative sample of the waste, as prepared for carriage;

- (d) Carriage in bulk in sheeted wagons, movable roof wagons/sheeted vehicles, closed containers or sheeted large containers, all with complete walls is allowed. The wagons, containers or body of vehicles shall be leakproof or rendered leakproof, for example by means of a suitable and sufficiently stout inner lining;
- (e) If the waste is carried under the conditions of this special provision, the goods shall be declared in accordance with 5.4.1.1.3 in the transport document, as follows: "UN 1263 WASTE PAINT, 3, II", or "UN 1263 WASTE PAINT, 3, PG II".

651 Special provision V2 (1) of ADR is only applicable for a net explosive content of more than 3,000 kg (4,000 kg with trailer).

652 *(Reserved)*

653 The carriage of this gas in cylinders having a test pressure capacity product of maximum 15.2 MPa.litre (152 bar.litre) is not subject to the other provisions of ADN if the following conditions are met:

- The provisions for construction, testing and filling of cylinders are observed;
- The cylinders are contained in outer packagings which at least meet the requirements of Part 4 for combination packagings. The general provisions of packing of 4.1.1.1, 4.1.1.2 and 4.1.1.5 to 4.1.1.7 of ADR shall be observed;
- The cylinders are not packed together with other dangerous goods;
- The total gross mass of a package does not exceed 30 kg; and
- Each package is clearly and durably marked with "UN 1006" for argon compressed, "UN 1013" for carbon dioxide, "UN 1046" for helium compressed or "UN 1066" for nitrogen compressed. This mark is displayed within a diamond-shaped area surrounded by a line that measures at least 100 mm by 100 mm.

654 Waste lighters collected separately and consigned in accordance with 5.4.1.1.3 may be carried under this entry for the purposes of disposal. They need not be protected against inadvertent discharge provided that measures are taken to prevent the dangerous build up of pressure and dangerous atmospheres.

Waste lighters, other than those leaking or severely deformed, shall be packed in accordance with packing instruction P003 of ADR. In addition the following provisions shall apply:

- only rigid packagings of a maximum capacity of 60 litres shall be used;

Copyright © United Nations, 2021. All rights reserved

- the packagings shall be filled with water or any other appropriate protection material to avoid any ignition;
- under normal conditions of carriage all ignition devices of the lighters shall fully be covered by the protection material;
- the packagings shall be adequately vented to prevent the creation of flammable atmosphere and the build up of pressure;
- the packages shall only be carried in ventilated or open wagons/vehicles or containers.

Leaking or severely deformed lighters shall be carried in salvage packagings, provided appropriate measures are taken to ensure there is no dangerous build up of pressure.

NOTE: Special provision 201 and special packing provisions PP84 and RR5 of packing instruction P002 in 4.1.4.1 of ADR do not apply to waste lighters.

- 655 Cylinders and their closures designed, constructed, approved and marked in accordance with Directive 97/23/EC⁴ or Directive 2014/68/EU⁵ and used for breathing apparatus may be carried without conforming to Chapter 6.2 of ADR, provided that they are subject to inspections and tests specified in 6.2.1.6.1 of ADR and the interval between tests specified in packing instruction P200 in 4.1.4.1 of ADR is not exceeded. The pressure used for the hydraulic pressure test is the pressure marked on the cylinder in accordance with Directive 97/23/EC⁴ or Directive 2014/68/EU⁵.
- 656 *(Deleted)*
- 657 This entry shall be used for the technically pure substance only; for mixtures of LPG components, see UN 1965 or see UN 1075 in conjunction with NOTE 2 in 2.2.2.3.
- 658 UN No. 1057 LIGHTERS complying with standard EN ISO 9994:2019 "Lighters – Safety Specification" and UN No. 1057 LIGHTER REFILLS, may be carried subject only to the provisions of 3.4.1 (a) to (f), 3.4.2 (except for the total gross mass of 30 kg), 3.4.3 (except for the total gross mass of 20 kg), 3.4.11 and 3.4.12, provided the following conditions are met:
- (a) The total gross mass of each package is not more than 10 kg;
 - (b) Not more than 100 kg gross mass of such packages is carried in a wagon or vehicle or large container; and
 - (c) Each outer packaging is clearly and durably marked with "UN 1057 LIGHTERS" or "UN 1057 LIGHTER REFILLS", as appropriate.

⁴ Directive 97/23/EC of the European Parliament and of the Council of 29 May 1997 on the approximation of the laws of the Member States concerning pressure equipment (PED) (Official Journal of the European Communities No. L 181 of 9 July 1997, p. 1 - 55).

⁵ Directive 2014/68/EU of the European Parliament and of the Council of 15 May 2014 on the harmonisation of the laws of the Member States relating to the making available on the market of pressure equipment (PED) (Official Journal of the European Union No. L 189 of 27 June 2014, p. 164 - 259).

Copyright © United Nations, 2021. All rights reserved

- 659 Substances to which PP86 or TP7 are assigned in Column (9a) and Column (11) of Table A in Chapter 3.2 of ADR and therefore require air to be eliminated from the vapour space, shall not be used for carriage under this UN number but shall be carried under their respective UN numbers as listed in Table A of Chapter 3.2.

NOTE: See also 2.2.2.1.7.

660 *(Deleted)*

661 *(Deleted).*

- 662 Cylinders not conforming to the provisions of Chapter 6.2 which are used exclusively on board a ship or aircraft, may be carried for the purpose of filling or inspection and subsequent return, provided the cylinders are designed and constructed in accordance with a standard recognized by the competent authority of the country of approval and all the other relevant requirements of ADN and other conditions are met including:

- (a) The cylinders shall be carried with valve protection in conformity with 4.1.6.8;
- (b) The cylinders shall be marked and labelled in conformity with 5.2.1 and 5.2.2; and
- (c) All the relevant filling requirements of packing instruction P200 of 4.1.4.1 of ADR are complied with.

The transport document shall include the following statement: “Carriage in accordance with Special Provision 662”.

- 663 This entry may only be used for packagings, large packagings or IBCs, or parts thereof, which have contained dangerous goods which are carried for disposal, recycling or recovery of their material, other than reconditioning, repair, routine maintenance, remanufacturing or reuse, and which have been emptied to the extent that only residues of dangerous goods adhering to the packaging parts are present when they are handed over for carriage.

Scope:

Residues present in the packagings, discarded, empty, uncleaned shall only be of dangerous goods of classes 3, 4.1, 5.1, 6.1, 8 or 9. In addition, they shall not be:

- Substances assigned to packing group I or that have “0” assigned in Column (7a) of Table A of Chapter 3.2; nor
- Substances classified as desensitized explosive substances of Class 3 or Class 4.1; nor
- Substances classified as self-reactive substances of Class 4.1; nor
- Radioactive material; nor
- Asbestos (UN 2212 and UN 2590), polychlorinated biphenyls (UN 2315 and UN 3432) and polyhalogenated biphenyls, halogenated monomethyldiphenylmethanes or polyhalogenated terphenyls (UN 3151 and UN 3152).

Copyright © United Nations, 2021. All rights reserved

General provisions:

Packagings, discarded, empty, uncleaned with residues presenting a hazard or a subsidiary hazard of Class 5.1 shall not be packed together with other packagings, discarded, empty, uncleaned, or loaded together with other packagings, discarded, empty, uncleaned in the same container, wagon, vehicle or bulk container.

Documented sorting procedures shall be implemented on the loading site to ensure compliance with the provisions applicable to this entry.

NOTE: All the other provisions of ADN apply.

664 (Reserved)

665 Except in the case of carriage in bulk, unground hard coal, coke and anthracite, meeting the classification criteria of Class 4.2, packing group III, are not subject to the requirements of ADN.

666 Vehicles and battery powered equipment, referred to by special provision 388, when carried as a load, as well as any dangerous goods they contain that are necessary for their operation or the operation of their equipment, are not subject to any other provisions of ADN, provided the following conditions are met:

- (a) For liquid fuels, any valves between the engine or equipment and the fuel tank shall be closed during carriage unless it is essential for the equipment to remain operational. Where appropriate, the vehicles shall be loaded upright and secured against falling;
- (b) For gaseous fuels, the valves between the gas tank and engine shall be closed and the electric contact open unless it is essential for the equipment to remain operational;
- (c) Metal hydride storage systems shall be approved by the competent authority of the country of manufacture. If the country of manufacture is not a contracting party to ADN the approval shall be recognized by the competent authority of a contracting party to ADN;
- (d) The provisions of (a) and (b) do not apply to vehicles which are empty of liquid or gaseous fuels,

NOTE 1: A vehicle is considered to be empty of liquid fuel when the liquid fuel tank has been drained and the vehicle cannot be operated due to a lack of fuel. Vehicle components such as fuel lines, fuel filters and injectors do not need to be cleaned, drained or purged to be considered empty of liquid fuels. In addition, the liquid fuel tank does not need to be cleaned or purged.

NOTE 2: A vehicle is considered to be empty of gaseous fuels when the gaseous fuel tanks are empty of liquid (for liquefied gases), the pressure in the tanks does not exceed 2 bar and the fuel shut-off or isolation valve is closed and secured.

667 (a) The provisions of 2.2.9.1.7 (a) do not apply when pre-production prototype lithium cells or batteries or lithium cells or batteries of a small production run, consisting of not more than 100 cells or batteries, are installed in the vehicle, engine or machinery;

Copyright © United Nations, 2021. All rights reserved

- (b) The provisions of 2.2.9.1.7 do not apply to lithium cells or batteries installed in damaged or defective vehicles, engine or machinery. In such cases the following conditions shall be met:
- (i) If the damage or defect has no significant impact on the safety of the cell or battery, damaged and defective vehicles, engines or machinery, may be carried under the conditions defined in special provisions 363 or 666, as appropriate;
 - (ii) If the damage or defect has a significant impact on the safety of the cell or battery, the lithium cell or battery shall be removed and carried according to special provision 376.

However, if it is not possible to safely remove the cell or battery or it is not possible to verify the status of the cell or battery, the vehicle, engine or machinery may be towed or carried as specified in (i).

- (c) The procedures described in (b) also apply to damaged lithium cells or batteries in vehicles, engines or machinery.

668 Elevated temperature substances for the purpose of applying road markings are not subject to the requirements of ADN, provided that the following conditions are met:

- (a) They do not fulfil the criteria of any class other than Class 9;
- (b) The temperature of the outer surface of the boiler does not exceed 70 °C;
- (c) The boiler is closed in such a way that any loss of product is prevented during carriage;
- (d) The maximum capacity of the boiler is limited to 3 000 l.

669 A trailer fitted with equipment powered by a liquid or gaseous fuel or an electric energy storage and production system, that is intended for use during carriage operated by this trailer as a part of a transport unit, shall be assigned to UN Nos. 3166 or 3171 and be subject to the same conditions as specified for these UN Nos., when carried as a load on a vessel, provided that the total capacity of the tanks containing liquid fuel does not exceed 500 litres.

670 (a) Lithium cells and batteries installed in equipment from private households collected and handed over for carriage for depollution, dismantling, recycling or disposal are not subject to the other provisions of ADN including special provision 376 and 2.2.9.1.7 when:

- (i) They are not the main power source for the operation of the equipment in which they are contained;
- (ii) The equipment in which they are contained does not contain any other lithium cell or battery used as the main power source; and
- (iii) They are afforded protection by the equipment in which they are contained.

Examples for cells and batteries covered by this paragraph are button cells used for data integrity in household appliances (e.g. refrigerators, washing machines, dishwashers) or in other electrical or electronic equipment;

Copyright © United Nations, 2021. All rights reserved

(b) Up to the intermediate processing facility lithium cells and batteries contained in equipment from private households not meeting the requirements of (a) collected and handed over for carriage for depollution, dismantling, recycling or disposal are not subject to the other provisions of ADN including special provision 376 and 2.2.9.1.7, if the following conditions are met:

(i) The equipment is packed in accordance with packing instruction P909 of 4.1.4.1 of ADR except for the additional requirements 1 and 2; or it is packed in strong outer packagings, e.g. specially designed collection receptacles, which meet the following requirements:

- The packagings shall be constructed of suitable material and be of adequate strength and design in relation to the packaging capacity and its intended use. The packagings need not meet the requirements of 4.1.1.3 of ADR;
- Appropriate measures shall be taken to minimize the damage of the equipment when filling and handling the packaging, e.g. use of rubber mats; and
- The packagings shall be constructed and closed so as to prevent any loss of contents during carriage, e.g. by lids, strong inner liners, covers for transport. Openings designed for filling are acceptable if they are constructed so as to prevent loss of content;

(ii) A quality assurance system is in place to ensure that the total amount of lithium cells and batteries per transport unit does not exceed 333 kg;

NOTE: The total quantity of lithium cells and batteries in the equipment from private households may be assessed by means of a statistical method included in the quality assurance system. A copy of the quality assurance records shall be made available to the competent authority upon request.

(iii) Packages are marked "LITHIUM BATTERIES FOR DISPOSAL" or "LITHIUM BATTERIES FOR RECYCLING" as appropriate.

If equipment containing lithium cells or batteries is carried unpackaged or on pallets in accordance with packing instruction P909 (3) of 4.1.4.1 of ADR, this mark may alternatively be affixed to the external surface of the vehicles, wagons or containers).

NOTE: "Equipment from private households" means equipment which comes from private households and equipment which comes from commercial, industrial, institutional and other sources which, because of its nature and quantity, is similar to that from private households. Equipment likely to be used by both private households and users other than private households shall in any event be considered to be equipment from private households.

671 For the purposes of the exemption related to quantities carried on board vessels (see 1.1.3.6), the transport category shall be determined in relation to the packing group (see paragraph 3 of special provision 251):

- Transport category 3 for kits assigned to packing group III;
- Transport category 2 for kits assigned to packing group II;
- Transport category 1 for kits assigned to packing group I.

Copyright © United Nations, 2021. All rights reserved

Kits containing only dangerous goods to which no packing group is assigned shall be allocated to transport category 2 for completion of transport documents and the exemption related to quantities carried per vessel (see 1.1.3.6).

672 Articles, such as machinery, apparatus or devices carried under this entry and in conformity with special provision 301 are not subject to any other provision of ADN provided they are either:

- packed in a strong outer packaging constructed of suitable material, and of adequate strength and design in relation to the packaging's capacity and its intended use, and meeting the applicable requirements of 4.1.1.1 of ADR; or
- carried without outer packaging if the article is constructed and designed so that the receptacles containing the dangerous goods are afforded adequate protection.

673 *(Reserved)*

674 This special provision applies to periodic inspection and test of over-moulded cylinders as defined in 1.2.1.

Over-moulded cylinders subject to 6.2.3.5.3.1 of ADR shall be subject to periodic inspection and test in accordance with 6.2.1.6.1 of ADR, adapted by the following alternative method:

- Substitute test required in 6.2.1.6.1 d) of ADR by alternative destructive tests;
- Perform specific additional destructive tests related to the characteristics of over-moulded cylinders.

The procedures and requirements of this alternative method are described below.

Alternative method:

(a) General

The following provisions apply to over-moulded cylinders produced serially and based on welded steel cylinders in accordance with EN 1442:2017, EN 14140:2014 + AC:2015 or annex I, parts 1 to 3 to Council Directive 84/527/EEC. The design of the over-moulding shall prevent water from penetrating on to the inner steel cylinder. The conversion of the steel cylinder to an over-moulded cylinder shall comply with the relevant requirements of EN 1442:2017 and EN 14140:2014 + AC:2015.

Over-moulded cylinders shall be equipped with self-closing valves.

(b) Basic population

A basic population of over-moulded cylinders is defined as the production of cylinders from only one over-moulding manufacturer using new inner cylinders manufactured by only one manufacturer within one calendar year, based on the same design type, the same materials and production processes.

Copyright © United Nations, 2021. All rights reserved

(c) Sub-groups of a basic population

Within the above defined basic population, over-moulded cylinders belonging to different owners shall be separated into specific sub-groups, one per owner.

If the whole basic population is owned by one owner, the sub-group equals the basic population.

(d) Traceability

Inner steel cylinder marks in accordance with 6.2.3.9 of ADR shall be repeated on the over-moulding. In addition, each over-moulded cylinder shall be fitted with an individual resilient electronic identification device. The detailed characteristics of the over-moulded cylinders shall be recorded by the owner in a central database. The database shall be used to:

- Identify the specific sub-group;
- Make available to inspection bodies, filling centres and competent authorities the specific technical characteristics of the cylinders consisting of at least the following: serial number, steel cylinder production batch, over-moulding production batch, date of over-moulding;
- Identify the cylinder by linking the electronic device to the database with the serial number;
- Check individual cylinder history and determine measures (e.g. filling, sampling, retesting, withdrawal);
- Record performed measures including the date and the address of where it was done.

The recorded data shall be kept available by the owner of the over-moulded cylinders for the entire life of the sub-group.

(e) Sampling for statistical assessment

The sampling shall be random among a sub-group as defined in sub-paragraph (c). The size of each sample per sub-group shall be in accordance with the table in sub-paragraph (g).

(f) Test procedure for destructive testing

The inspection and test required by 6.2.1.6.1 of ADR shall be carried out except (d) which shall be substituted by the following test procedure:

- Burst test (according to EN 1442:2017 or EN 14140:2014 + AC:2015).

In addition, the following tests shall be performed:

- Adhesion test (according to EN 1442:2017 or EN 14140:2014 + AC:2015);
- Peeling and Corrosion tests (according to EN ISO 4628-3:2016).

Adhesion test, peeling and corrosion tests, and burst test shall be performed on each related sample according to the table in sub-paragraph (g) and shall be conducted after the first 3 years in service and every 5 years thereafter.

Copyright © United Nations, 2021. All rights reserved

(g) Statistical evaluation of test results – Method and minimum requirements

The procedure for statistical evaluation according to the related rejection criteria is described in the following.

Test interval (years)	Type of test	Standard	Rejection criteria	Sampling out of a sub-group
After 3 years in service (see (f))	Burst test	EN 1442:2017	Burst pressure point of the representative sample must be above the lower limit of tolerance interval on the Sample Performance Chart $\Omega_m \geq 1 + \Omega_s \times k3(n;p;1-\alpha)^a$ No individual test result shall be less than the test pressure	$3\sqrt[3]{Q}$ or $Q/200$ whichever is lower, and with a minimum of 20 per sub-group (Q)
	Peeling and corrosion	EN ISO 4628-3:2016	Max corrosion grade: Ri2	Q/1 000
	Adhesion of Polyurethane	ISO 2859-1:1999 + A1:2011 EN 1442:2017 EN 14140:2014 + AC:2015	Adhesion value > 0.5 N/mm ²	See ISO 2859-1:1999 + A1:2011 applied to Q/1000
Every 5 years thereafter (see (f))	Burst test	EN 1442:2017	Burst pressure point of the representative sample must be above the lower limit of tolerance interval on the Sample Performance Chart $\Omega_m \geq 1 + \Omega_s \times k3(n;p;1-\alpha)^a$ No individual test result shall be less than the test pressure	$6\sqrt[3]{Q}$ or $Q/100$ whichever is lower, and with a minimum of 40 per sub-group (Q)
	Peeling and corrosion	EN ISO 4628-3:2016	Max corrosion grade: Ri2	Q/1 000
	Adhesion of Polyurethane	ISO 2859-1:1999 + A1:2011 EN 1442:2017 EN 14140:2014 + AC:2015	Adhesion value > 0.5 N/mm ²	See ISO 2859-1:1999 + A1:2011 applied to Q/1000

^a *Burst pressure point (BPP) of the representative sample is used for the evaluation of test results by using a Sample Performance Chart:*

Step 1: Determination of the burst pressure point (BPP) of a representative sample

Each sample is represented by a point whose coordinates are the mean value of burst test results and the standard deviation of burst test results, each normalised to the relevant test pressure.

$$BPP: (\Omega_s = \frac{s}{PH}; \Omega_m = \frac{x}{PH})$$

Copyright © United Nations, 2021. All rights reserved

with

x : sample mean value;

s : sample standard deviation;

PH : test pressure

Step 2: Plotting on a Sample Performance Chart

Each BPP is plotted on a Sample Performance Chart with following axis:

- Abscissa : Standard Deviation normalised to test pressure (Ω_s)
- Ordinate : Mean value normalised to test pressure (Ω_m)

Step 3: Determination of the relevant lower limit of tolerance interval in the Sample Performance Chart

Results for burst pressure shall first be checked according to the Joint Test (multidirectional test) using a significance level of $\alpha=0.05$ (see paragraph 7 of ISO 5479:1997) to determine whether the distribution of results for each sample is normal or non-normal.

- For a normal distribution, the determination of the relevant lower limit of tolerance is given in step 3.1.
- For a non-normal distribution, the determination of the relevant lower limit of tolerance is given in step 3.2.

Step 3.1: Lower limit of tolerance interval for results following a normal distribution

In accordance with the standard ISO 16269-6:2014, and considering that the variance is unknown, the unilateral statistical tolerance interval shall be considered for a confidence level of 95% and a fraction of population equal to 99.9999%.

By application in the Sample Performance Chart, the lower limit of tolerance interval is represented by a line of constant survival rate defined by the formula:

$$\Omega_m = 1 + \Omega_s \times k3(n; p; 1 - \alpha)$$

with

$k3$: factor function of n , p and $1-\alpha$;

p : proportion of the population selected for the tolerance interval (99.9999%);

$1-\alpha$: confidence level (95%);

n : sample size.

The value for $k3$ dedicated to Normal Distributions shall be taken from the table at end of Step 3.

Step 3.2: Lower limit of tolerance interval for results following a non-normal distribution

The unilateral statistical tolerance interval shall be calculated for a confidence level of 95% and a fraction of population equal to 99.9999%.

The lower limit of tolerance is represented by a line of constant survival rate defined by the formula given in previous step 3.1, with factors $k3$ based and calculated on the properties of a Weibull Distribution.

The value for $k3$ dedicated to Weibull Distributions shall be taken from the table below at end of Step 3.

Copyright © United Nations, 2021. All rights reserved

<i>Table for k3</i> <i>p=99.9999% and (1-α)=0.95</i>		
<i>Sample size</i> <i>n</i>	<i>Normal distribution</i> <i>k3</i>	<i>Weibull distribution</i> <i>k3</i>
20	6.901	16.021
22	6.765	15.722
24	6.651	15.472
26	6.553	15.258
28	6.468	15.072
30	6.393	14.909
35	6.241	14.578
40	6.123	14.321
45	6.028	14.116
50	5.949	13.947
60	5.827	13.683
70	5.735	13.485
80	5.662	13.329
90	5.603	13.203
100	5.554	13.098
150	5.393	12.754
200	5.300	12.557
250	5.238	12.426
300	5.193	12.330
400	5.131	12.199
500	5.089	12.111
1000	4.988	11.897
∞	4.753	11.408

NOTE: If sample size is between two values, the closest lower sample size shall be selected.

(h) Measures if the acceptance criteria are not met

If a result of the burst test, peeling and corrosion test or adhesion test does not comply with the criteria detailed in the table in paragraph (g), the affected sub-group of over-moulded cylinders shall be segregated by the owner for further investigations and not be filled or made available for transport and use.

In agreement with the competent authority or the Xa-body which issued the design approval, additional tests shall be performed to determine the root cause of the failure.

If the root cause cannot be proved to be limited to the affected sub-group of the owner, the competent authority or the Xa-body shall take measures concerning the whole basic population and potentially other years of production.

Copyright © United Nations, 2021. All rights reserved

If the root cause can be proved to be limited to a part of the affected sub-group, not affected parts may be authorized by the competent authority to return to service. It shall be proved that no individual over-moulded cylinder returning to service is affected.

(i) Filling centre requirements

The owner shall make available to the competent authority documentary evidence that the filling centres:

- Comply with the provisions of packing instruction P200 (7) of 4.1.4.1 of ADR and that the requirements of the standard on pre-fill inspections referenced in table P200 (11) of 4.1.4.1 of ADR are fulfilled and correctly applied;
- Have the appropriate means to identify over-moulded cylinders through the electronic identification device;
- Have access to the database as defined in (d);
- Have the capacity to update the database;
- Apply a quality system, according to the standard ISO 9000 (series) or equivalent, certified by an accredited independent body recognized by the competent authority.

675 For packages containing these dangerous goods, mixed loading with substances and articles of Class 1, with the exception of 1.4S, shall be prohibited.

800 Oil seeds, crushed seeds and seedcake containing vegetable oil, treated with solvents, not subject to spontaneous combustion, are allocated to UN No. 3175. These substances are not subject to ADN when they have been prepared or treated to ensure that they cannot give off dangerous gases in dangerous quantities (no risk of explosion) during carriage and when this is mentioned in the transport document.

801 Ferrosilicon with between 25 and 30% or more than 90% silicon content by mass is a dangerous substance of Class 4.3 for carriage in bulk or without packaging by inland navigation vessel.

802 See 7.1.4.10.

803 Hard coal, coke and anthracite, when carried in bulk, are not subject to the provisions of ADN if:

- (a) The temperature of the cargo has been determined using an appropriate procedure and is not higher than 60°C before, during or immediately after loading of the hold;

Copyright © United Nations, 2021. All rights reserved

- (b) Depending on the temperature of the cargo before, during and immediately after loading of the hold, the expected duration of carriage without temperature monitoring does not exceed the maximum number of days shown in the table below:

<i>Maximum temperature on loading (°C)</i>	<i>Maximum duration of journey (days)</i>
60	10
50	18
40	32
30	57

- (c) Where the effective duration of carriage exceeds the maximum duration shown in sub-paragraph (b), temperature monitoring is carried out from the first day over the maximum duration. The necessary monitoring apparatus shall be on board as from the first day of the carriage following the maximum duration of the journey;
- (d) The master is given, at the time of loading and in a traceable form, instructions on how to proceed if there is a significant heating of the cargo.

CHAPTER 3.4

DANGEROUS GOODS PACKED IN LIMITED QUANTITIES

3.4.1 This Chapter provides the provisions applicable to the carriage of dangerous goods of certain classes packed in limited quantities. The applicable quantity limit for the inner packaging or article is specified for each substance in Column (7a) of Table A of Chapter 3.2. In addition, the quantity "0" has been indicated in this column for each entry not permitted to be carried in accordance with this Chapter.

Limited quantities of dangerous goods packed in such limited quantities, meeting the provisions of this Chapter are not subject to any other provisions of ADN except the relevant provisions of:

- (a) Part 1, Chapters 1.1, 1.2, 1.3, 1.4, 1.5, 1.6, 1.8, 1.9;
- (b) Part 2;
- (c) Part 3, Chapters 3.1, 3.2, 3.3 (except special provisions 61, 178, 181, 220, 274, 625, 633 and 650 (e));
- (d) Part 4, paragraphs 4.1.1.1, 4.1.1.2, 4.1.1.4 to 4.1.1.8 of ADR;
- (e) Part 5, 5.1.2.1(a) (i) and (b), 5.1.2.2, 5.1.2.3, 5.2.1.10, 5.4.2;
- (f) Part 6, construction requirements of 6.1.4 and paragraphs 6.2.5.1 and 6.2.6.1 to 6.2.6.3 of ADR;

3.4.2 Dangerous goods shall be packed only in inner packagings placed in suitable outer packagings. Intermediate packagings may be used. In addition, for articles of Division 1.4, Compatibility Group S, the provisions of section 4.1.5 of ADR shall be fully complied with. The use of inner packagings is not necessary for the carriage of articles such as aerosols or "receptacles, small, containing gas". The total gross mass of the package shall not exceed 30 kg.

3.4.3 Except for articles of Division 1.4, Compatibility Group S, shrink-wrapped or stretch-wrapped trays meeting the conditions of 4.1.1.1, 4.1.1.2 and 4.1.1.4 to 4.1.1.8 of ADR are acceptable as outer packagings for articles or inner packagings containing dangerous goods carried in accordance with this Chapter. Inner packagings that are liable to break or be easily punctured, such as those made of glass, porcelain, stoneware or certain plastics, shall be placed in suitable intermediate packagings meeting the provisions of 4.1.1.1, 4.1.1.2 and 4.1.1.4 to 4.1.1.8 of ADR, and be so designed that they meet the construction requirements of 6.1.4 of ADR. The total gross mass of the package shall not exceed 20 kg.

3.4.4 Liquid goods of Class 8, packing group II in glass, porcelain or stoneware inner packagings shall be enclosed in a compatible and rigid intermediate packaging.

3.4.5 and 3.4.6 (*Reserved*)

3.4.7 **Marking of packages containing limited quantities**

3.4.7.1 Except for air transport, packages containing dangerous goods in limited quantities shall bear the mark shown in Figure 3.4.7.1:

Copyright © United Nations, 2021. All rights reserved

Figure 3.4.7.1

Mark for packages containing limited quantities

The mark shall be readily visible, legible and able to withstand open weather exposure without a substantial reduction in effectiveness.

The mark shall be in the form of a square set at an angle of 45° (diamond-shaped). The top and bottom portions and the surrounding line shall be black. The centre area shall be white or a suitable contrasting background. The minimum dimensions shall be 100 mm x 100 mm and the minimum width of the line forming the diamond shall be 2 mm. Where dimensions are not specified, all features shall be in approximate proportion to those shown.

3.4.7.2 If the size of the package so requires, the minimum outer dimensions shown in Figure 3.4.7.1 may be reduced to be not less than 50 mm x 50 mm provided the mark remains clearly visible. The minimum width of the line forming the diamond may be reduced to a minimum of 1 mm.

3.4.8 Marking of packages containing limited quantities conforming to Part 3, Chapter 4 of the ICAO Technical Instructions

3.4.8.1 Packages containing dangerous goods packed in conformity with the provisions of Part 3, Chapter 4 of the ICAO Technical Instructions may bear the mark shown in Figure 3.4.8.1 to certify conformity with these provisions:

Figure 3.4.8.1

Mark for packages containing limited quantities conforming to Part 3, Chapter 4 of the ICAO Technical Instructions

The mark shall be readily visible, legible and able to withstand open weather exposure without a substantial reduction in effectiveness.

Copyright © United Nations, 2021. All rights reserved

The mark shall be in the form of a square set at an angle of 45° (diamond-shaped). The top and bottom portions and the surrounding line shall be black. The centre area shall be white or a suitable contrasting background. The minimum dimensions shall be 100 mm x 100 mm and the minimum width of the line forming the diamond shall be 2 mm. The symbol “Y” shall be placed in the centre of the mark and shall be clearly visible. Where dimensions are not specified, all features shall be in approximate proportion to those shown.

- 3.4.8.2 If the size of the package so requires, the minimum outer dimensions shown in Figure 3.4.8.1 may be reduced to be not less than 50 mm x 50 mm provided the mark remains clearly visible. The minimum width of the line forming the diamond may be reduced to a minimum of 1 mm. The symbol “Y” shall remain in approximate proportion to that shown in Figure 3.4.8.1.
- 3.4.9 Packages containing dangerous goods bearing the mark shown in 3.4.8 with or without the additional labels and marks for air transport shall be deemed to meet the provisions of section 3.4.1 as appropriate and of sections 3.4.2 to 3.4.4 and need not bear the mark shown in 3.4.7.
- 3.4.10 Packages containing dangerous goods in limited quantities bearing the mark shown in 3.4.7 and conforming with the provisions of the ICAO Technical Instructions, including all necessary marks and labels specified in Parts 5 and 6, shall be deemed to meet the provisions of section 3.4.1 as appropriate and of sections 3.4.2 to 3.4.4.

3.4.11 Use of overpacks

For an overpack containing dangerous goods packed in limited quantities, the following applies:

Unless the marks representative of all dangerous goods in an overpack are visible, the overpack shall be:

- marked with the word “OVERPACK”. The lettering of the “OVERPACK” mark shall be at least 12 mm high. The mark shall be in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German, unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise; and
- marked with the marks required by this Chapter.

Except for air transport, the other provisions of 5.1.2.1 apply only if other dangerous goods which are not packed in limited quantities are contained in the overpack and only in relation to these other dangerous goods.

- 3.4.12 In advance of carriage, consignors of dangerous goods packed in limited quantities shall inform the carrier in a traceable form of the total gross mass of such goods to be consigned.
- 3.4.13
- (a) Transport units with a maximum mass exceeding 12 tonnes carrying dangerous goods packed in limited quantities shall be marked in accordance with 3.4.15 at the front and at the rear except when the transport unit contains other dangerous goods for which orange-coloured plate marking in accordance with 5.3.2 is required. In this latter case, the transport unit may display the required orange-coloured plate marking only, or both the orange-coloured plate marking in accordance with 5.3.2 and the marks in accordance with 3.4.15.
 - (b) Wagons carrying packages with dangerous goods in limited quantities shall be marked in accordance with 3.4.15 on both sides except when placards in accordance with section 5.3.1 are already affixed.

Copyright © United Nations, 2021. All rights reserved

- (c) Containers carrying dangerous goods packed in limited quantities, on transport units with a maximum mass exceeding 12 tonnes, shall be marked in accordance with 3.4.15 on all four sides except when the container contains other dangerous goods for which placarding in accordance with 5.3.1 is required. In this latter case, the container may display the required placards only, or both the placards in accordance with 5.3.1 and the marks in accordance with 3.4.15.

If the containers are loaded on a transport unit or wagon, the carrying transport unit or wagon need not be marked, except when the marks affixed to the containers are not visible from the outside of this carrying transport unit or wagon. In this latter case, the same marks shall also be affixed at the front and the rear of the carrying transport unit, or on both sides of the carrying wagon.

- 3.4.14 The marks specified in 3.4.13 may be dispensed with, if the total gross mass of the packages containing dangerous goods packed in limited quantities carried does not exceed 8 tonnes per transport unit or wagon.
- 3.4.15 The marks specified in 3.4.13 shall be the same as the one required in 3.4.7, except that their minimum dimensions shall be 250 mm x 250 mm. These marks shall be removed or covered if no dangerous goods in limited quantities are carried.

CHAPTER 3.5

DANGEROUS GOODS PACKED IN EXCEPTED QUANTITIES

3.5.1 Excepted quantities

3.5.1.1 Excepted quantities of dangerous goods of certain classes, other than articles, meeting the provisions of this Chapter are not subject to any other provisions of ADN except for:

- (a) The training requirements in Chapter 1.3;
- (b) The classification procedures and packing group criteria in Part 2;
- (c) The packaging requirements of 4.1.1.1, 4.1.1.2, 4.1.1.4 and 4.1.1.6 of ADR.

NOTE: In the case of radioactive material, the requirements for radioactive material in excepted packages in 1.7.1.5 apply.

3.5.1.2 Dangerous goods which may be carried as excepted quantities in accordance with the provisions of this Chapter are shown in column (7b) of Table A of Chapter 3.2 by means of an alphanumeric code as follows:

Code	Maximum net quantity per inner packaging (in grams for solids and ml for liquids and gases)	Maximum net quantity per outer packaging (in grams for solids and ml for liquids and gases, or sum of grams and ml in the case of mixed packing)
E0	Not permitted as Excepted Quantity	
E1	30	1000
E2	30	500
E3	30	300
E4	1	500
E5	1	300

For gases, the volume indicated for inner packagings refers to the water capacity of the inner receptacle and the volume indicated for outer packagings refers to the combined water capacity of all inner packagings within a single outer packaging.

3.5.1.3 Where dangerous goods in excepted quantities for which different codes are assigned are packaged together the total quantity per outer packaging shall be limited to that corresponding to the most restrictive code.

3.5.1.4 Excepted quantities of dangerous goods assigned to codes E1, E2, E4 and E5 with a maximum net quantity of dangerous goods per inner packaging limited to 1 ml for liquids and gases and 1 g for solids and a maximum net quantity of dangerous goods per outer packaging which does not exceed 100 g for solids or 100 ml for liquids and gases are only subject to:

- (a) The provisions of 3.5.2, except that an intermediate packaging is not required if the inner packagings are securely packed in an outer packaging with cushioning material in such a way that, under normal conditions of carriage, they cannot break, be punctured, or leak their contents; and for liquids, the outer packaging contains sufficient absorbent material to absorb the entire contents of the inner packagings; and
- (b) The provisions of 3.5.3.

Copyright © United Nations, 2021. All rights reserved

3.5.2 Packagings

Packagings used for the carriage of dangerous goods in excepted quantities shall be in compliance with the following:

- (a) There shall be an inner packaging and each inner packaging shall be constructed of plastic (with a minimum thickness of 0.2 mm when used for liquids), or of glass, porcelain, stoneware, earthenware or metal (see also 4.1.1.2 of ADR) and the closure of each inner packaging shall be held securely in place with wire, tape or other positive means; any receptacle having a neck with moulded screw threads shall have a leakproof threaded type cap. The closure shall be resistant to the contents;
- (b) Each inner packaging shall be securely packed in an intermediate packaging with cushioning material in such a way that, under normal conditions of carriage, they cannot break, be punctured or leak their contents. For liquid dangerous goods, the intermediate or outer packaging shall contain sufficient absorbent material to absorb the entire contents of the inner packagings. When placed in the intermediate packaging, the absorbent material may be the cushioning material. Dangerous goods shall not react dangerously with cushioning, absorbent material and packaging material or reduce the integrity or function of the materials. Regardless of its orientation, the package shall completely contain the contents in case of breakage or leakage;
- (c) The intermediate packaging shall be securely packed in a strong, rigid outer packaging (wooden, fibreboard or other equally strong material);
- (d) Each package type shall be in compliance with the provisions in 3.5.3;
- (e) Each package shall be of such a size that there is adequate space to apply all necessary marks; and
- (f) Overpacks may be used and may also contain packages of dangerous goods or goods not subject to the requirements of ADN.

3.5.3 Tests for packages

3.5.3.1 The complete package as prepared for carriage, with inner packagings filled to not less than 95% of their capacity for solids or 98% for liquids, shall be capable of withstanding, as demonstrated by testing which is appropriately documented, without breakage or leakage of any inner packaging and without significant reduction in effectiveness:

- (a) Drops onto a rigid, non-resilient flat and horizontal surface from a height of 1.8 m:
 - (i) Where the sample is in the shape of a box, it shall be dropped in each of the following orientations:
 - flat on the base;
 - flat on the top;
 - flat on the longest side;
 - flat on the shortest side;
 - on a corner.
 - (ii) Where the sample is in the shape of a drum, it shall be dropped in each of the following orientations:

Copyright © United Nations, 2021. All rights reserved

- diagonally on the top chime, with the centre of gravity directly above the point of impact;
- diagonally on the base chime;
- flat on the side.

NOTE: Each of the above drops may be performed on different but identical packages.

- (b) A force applied to the top surface for a duration of 24 hours, equivalent to the total weight of identical packages if stacked to a height of 3 m (including the sample).

3.5.3.2 For the purposes of testing, the substances to be carried in the packaging may be replaced by other substances except where this would invalidate the results of the tests. For solids, when another substance is used, it must have the same physical characteristics (mass, grain size, etc.) as the substance to be carried. In the drop tests for liquids, when another substance is used, its relative density (specific gravity) and viscosity should be similar to those of the substance to be carried.

3.5.4 Marking of packages

3.5.4.1 Packages containing excepted quantities of dangerous goods prepared in accordance with this Chapter shall be durably and legibly marked with the mark shown in 3.5.4.2. The first or only label number indicated in column (5) of Table A of Chapter 3.2 for each of the dangerous goods contained in the package shall be shown in the mark. Where the name of the consignor or consignee is not shown elsewhere on the package this information shall be included within the mark.

3.5.4.2 Excepted quantities mark

Figure 3.5.4.2

* The first or only label number indicated in column (5) of Table A of Chapter 3.2 shall be shown in this location.

** The name of the consignor or of the consignee shall be shown in this location if not shown elsewhere on the package.

Copyright © United Nations, 2021. All rights reserved

The mark shall be in the form of a square. The hatching and symbol shall be of the same colour, black or red, on white or suitable contrasting background. The minimum dimensions shall be 100 mm x 100 mm. Where dimensions are not specified, all features shall be in approximate proportion to those shown.

3.5.4.3 *Use of overpacks*

For an overpack containing dangerous goods packed in excepted quantities, the following applies:

Unless the marks representative of all dangerous goods in an overpack are visible, the overpack shall be:

- marked with the word “OVERPACK”. The lettering of the “OVERPACK” mark shall be at least 12 mm high. The mark shall be in an official language of the country of origin and also, if that language is not English, French or German, in English, French or German, unless agreements, if any, concluded between the countries concerned in the transport operation provide otherwise; and
- marked with the marks required by this Chapter.

The other provisions of 5.1.2.1 apply only if other dangerous goods which are not packed in excepted quantities are contained in the overpack and only in relation to these other dangerous goods.

3.5.5 **Maximum number of packages in any vehicle, wagon or container**

The number of packages in any vehicle, wagon or container shall not exceed 1 000.

3.5.6 **Documentation**

If a document or documents (such as a bill of lading, air waybill or CMR/CIM consignment note) accompanies(y) dangerous goods in excepted quantities, at least one of these documents shall include the statement “Dangerous Goods in Excepted Quantities” and indicate the number of packages.

PŘEKLAD

EVROPSKÁ HOSPODÁŘSKÁ KOMISE
Výbor pro vnitrozemskou dopravu

ADN

platná od 1. ledna 2021

Evropská dohoda o mezinárodní přepravě nebezpečných věcí po vnitrozemských vodních cestách

včetně Příloh, použitelné od 1. ledna 2021

Díl I

UNITED NATIONS
New York a Geneva, 2020

PŘEDMLUVA

Evropská dohoda o mezinárodní přepravě nebezpečných věcí po vnitrozemských vodních cestách (ADN) daná v Ženevě 26. května 2000 pod patronátem Evropské hospodářské komise Organizace spojených národů (UNECE) a Ústřední komise pro plavbu na Rýně (CCNR) vstoupila v platnost dne 28. února 2008.

Vlastní Dohoda a příložené Předpisy v jejich originální verzi byly vydány v roce 2001 pod symbolem ECE/TRANS/150. Tato publikace obsahuje rovněž Závěrečný protokol z diplomatické konference konané v Ženevě od 22. do 26. května 2000, během níž byla Dohoda přijata, jakož i text Rezoluce přijatý touto konferencí.

V době vydání této publikace měla Dohoda 18 smluvních stran: Rakousko, Belgie, Bulharsko, Chorvatsko, Českou republiku, Francii, Německo, Maďarsko, Lucembursko, Nizozemsko, Polsko, Moldavskou republiku, Rumunsko, Ruskou federaci, Srbsko, Slovensko, Švýcarsko a Ukrajinu. Jiné členské státy Evropské hospodářské komise Organizace spojených národů, na jejichž území se nacházejí vnitrozemské vodní cesty, jiné než ty, které vytvářejí pobřežní trasu, se mohou také stát smluvními stranami Dohody přistoupením k ní, za podmínky, že vnitrozemské vodní cesty jsou součástí sítě vnitrozemských vodních cest mezinárodního významu, jak je to definováno v Evropské dohodě o hlavních vnitrozemských vodních cestách mezinárodního významu (AGN).

Předpisy příložené k ADN obsahují ustanovení týkající se nebezpečných látek a předmětů, ustanovení týkající se přepravy v kusech a ve volně loženém stavu v plavidlech vnitrozemské plavby nebo v tankových plavidlech, jakož i ustanovení týkající se stavby a provozu takových plavidel. Dále obsahují požadavky a postupy pro inspekce, vydávání osvědčení o schválení, uznávání klasifikačních společností, monitorování, školení a zkoušení odborníků.

S výjimkou ustanovení týkajících se uznávání klasifikačních organizací, které jsou platné od vstupu Dohody v platnost, příložené Předpisy vstupují v platnost až dvanáct měsíců po vstupu Dohody v platnost, tj. dne 28. února 2009 (viz Článek 11 (1) Dohody).

Před vstupem Dohody v platnost byly prováděny novelizace příložených Předpisů pravidelně na Společných zasedáních znalců UNECE a CCNR. Tyto novelizace byly přijaty Administrativním výborem ADN na jeho prvním zasedání, které se konalo v Ženevě dne 19. června 2008 (viz dokument ECE/ADN/2, odstavce 13 až 16).

V důsledku toho sekretariát zveřejnil konsolidované znění („ADN 2009“) pod symbolem ECE/TRANS/203, („ADN 2011“) pod symbolem ECE/TRANS/220, („ADN 2013“) pod symbolem ECE/TRANS/231, („ADN 2015“) pod symbolem ECE/TRANS/243, („ADN 2017“) pod symbolem ECE/TRANS/258, („ADN 2019“) pod symbolem ECE/TRANS/276 a („ADN 2021“) pod symbolem ECE/TRANS/301.

Příložené předpisy obsažené v předkládané publikaci jsou konsolidovanou verzí, které zahrnují tyto novinky, a které jsou aplikovatelné od 1. ledna 2021.

Mělo by se dbát toho, že podle Směrnice 2008/68/EC Evropského parlamentu a Rady z 24. září 2008 o vnitrozemské dopravě nebezpečných věcí musí členské státy Evropské unie, s vyloučením odchylky stanovené v Článku 1, odstavci 3 Směrnice, používat tyto předpisy, jakož i Článek 3 (f) a (h) a Článek 8, odstavce 1 a 3 Dohody ADN, pro vnitrostátní a mezinárodní přepravu nebezpečných věcí mezi členskými státy na jejich území po vnitrozemských vodních cestách.

Všechny žádosti o informace týkající se aplikace ADN by měly být adresovány dotčenému příslušnému orgánu.

Dodatečné informace je možno nalézt na webové stránce Dopravní Divize UNECE na následující adrese:

http://www.unece.org/trans/danger/publi/adn/adn_e.html

Tato stránka, která je průběžně novelizována, obsahuje spojení k následujícím informacím:

5.1.1	Rozsah použití a všeobecná ustanovení	
5.1.2	Používání přepravních obalových souborů	
5.1.3	Prázdné nevyčištěné obaly (včetně IBC a velkých obalů), cisterny, MEMU, vozidla, železniční vozy a kontejnery pro přepravu volně ložených látek	
5.1.4	Společné balení	
5.1.5	Všeobecná ustanovení pro třídu 7	
Kapitola 5.2	Nápisy a bezpečnostní značky	
5.2.1	Značení kusů	
5.2.2	Označování kusů	
Kapitola 5.3	Označování kontejnerů, kontejnerů pro volně ložené látky, MEGC, MEMU, cisternových kontejnerů, přemístitelných cisteren, vozidel a železničních vozů velkými bezpečnostními značkami a nápisy	
5.3.1	Označování velkými bezpečnostními značkami	
5.3.2	Označování oranžovými tabulkami	
5.3.3	Značka pro zahřáté látky	
5.3.4	Označování pro přepravu v přepravním řetězci zahrnujícím námořní dopravu	
5.3.5	(Vyhrazeno)	
5.3.6	Značka pro látky ohrožující životní prostředí	
Kapitola 5.4	Průvodní doklady	
5.4.0	Všeobecná ustanovení	
5.4.1	Přepravní doklad pro nebezpečné věci a předepsané údaje	
5.4.2	Osvědčení o naložení kontejneru, vozidla nebo železničního vozu	

	5.4.3	Písemné pokyny
	5.4.4	Uchovávání informací o přepravě nebezpečných věcí
	5.4.5	Příklad formuláře pro multimodální přepravu nebezpečných věcí
Kapitola	5.5	Zvláštní ustanovení
	5.5.1	(Vypuštěno)
	5.5.2	Zvláštní ustanovení pro zaplynované nákladní (přepravní) dopravní jednotky (UN 3359)
	5.5.3	Zvláštní ustanovení platná pro přepravu suchého ledu (UN 1845) a pro kusy a vozidla a kontejnery obsahující látky představující riziko udušení, jsou-li používány pro účely chlazení nebo kondicionování (jako jsou suchý led (UN 1845) nebo dusík, hluboce zchlazený, kapalný (UN 1977) nebo argon, hluboce zchlazený, kapalný (UN 1951) nebo dusík)
	5.5.4	Nebezpečné věci obsažené v zařízení používaném nebo určeném k použití během přepravy, připojené nebo obsažené v kusech, přepravních obalových souborech, kontejnerech nebo nákladových prostorech vozidel
Část 6	POŽADAVKY NA KONSTRUKCI A TESTOVÁNÍ OBALŮ, IBC, VELKÝCH OBALŮ, CISTEREN A KONTEJNERŮ PRO VOLNĚ LOŽENÉ LÁTKY	
	6.1	Všeobecná ustanovení
Část 7	POŽADAVKY PRO NAKLÁDKU, PŘEPRAVU, VYKLÁDKU A OSTATNÍ MANIPULACI S NÁKLADEM	
Kapitola	7.1	Plavidla přepravující suchý náklad
	7.1.0	Všeobecné předpisy
	7.1.1	Způsob přepravy
	7.1.2	Požadavky na plavidla
	7.1.3	Všeobecné provozní předpisy
	7.1.4	Doplňkové předpisy pro nakládku, přepravu, vykládku a ostatní manipulaci s nákladem
	7.1.5	Doplňkové předpisy pro provoz plavidel
	7.1.6	Doplňkové požadavky
	7.1.7	Zvláštní ustanovení použitelná pro přepravu samovolně se rozkládajících látek třídy 4.1, organických peroxidů třídy 5.2 a látek stabilizovaných řízenou teplotou (jiných než samovolně se rozkládajících látky a organických peroxidů)
Kapitola	7.2	Tanková plavidla
	7.2.0	Všeobecné předpisy
	7.2.1	Způsob přepravy
	7.2.2	Požadavky na plavidla
	7.2.3	Všeobecné provozní předpisy
	7.2.4	Doplňkové předpisy pro nakládku, přepravu, vykládku a ostatní manipulaci s nákladem
	7.2.5	Doplňkové předpisy pro provoz plavidel

EVROPSKÁ DOHODA O MEZINÁRODNÍ PŘEPRAVĚ NEBEZPEČNÝCH VĚCÍ PO VNITROZEMSKÝCH VODNÍCH CESTÁCH (ADN)

SMLUVNÍ STRANY,

USILUJÍ stanovit na základě obecného souhlasu jednotné principy a pravidla s cílem:

- a) zvýšení bezpečnosti mezinárodních přeprav nebezpečných věcí po vnitrozemských vodních cestách;
- b) efektivní pomoci při ochraně životního prostředí zamezením znečištění v důsledku havárií a událostí v průběhu takových přeprav;
- c) ulehčení přeprav a napomáhání rozvoji mezinárodního obchodu,

POVAŽUJÍ za nejlepší způsob pro dosažení tohoto cíle uzavření dohody, která nahradí "Evropské předpisy, týkající se mezinárodní přepravy nebezpečných věcí po vnitrozemských vodních cestách", obsažené v příloze k Rezoluci č. 223 Výboru pro vnitrozemskou dopravu Evropské hospodářské komise včetně změn,

DOHODLY se na následujícím:

KAPITOLA I

OBEČNÁ USTANOVENÍ

Článek 1

Oblast použití

1. Tato Dohoda se vztahuje na mezinárodní přepravu nebezpečných věcí plavidly po vnitrozemských vodních cestách.
2. Tato Dohoda se nevztahuje na přepravu nebezpečných věcí námořními plavidly po námořních vodních cestách, které jsou součástí vnitrozemských vodních cest.
3. Tato Dohoda se nevztahuje na přepravu nebezpečných věcí, uskutečňovanou vojenskými plavidly nebo vojenskými pomocnými plavidly nebo jinými plavidly, náležejícími státu nebo jím provozovanými v případě, že jsou jím využívána výhradně pro vládní a nevědlečné cíle. Přitom každá smluvní strana formou přijetí příslušných opatření, která neovlivňují provoz nebo provozní možnosti takových plavidel, jež jí patří nebo je provozuje, zajišťuje, aby tato plavidla byla provozována, pokud je to prakticky možné, v souladu s touto Dohodou.

Článek 2

Předpisy přiložené k této Dohodě

1. Předpisy přiložené k této Dohodě jsou její neoddělitelnou částí. Každý odkaz na tuto Dohodu znamená současně odkaz na Předpisy k ní přiložené.
2. Přiložené Předpisy zahrnují:
 - a) ustanovení týkající se mezinárodní přepravy nebezpečných věcí po vnitrozemských vodních cestách;
 - b) požadavky a postupy týkající se inspekci, vystavování osvědčení o schválení plavidla, uznávání klasifikačních společností, odchylek, zvláštních povolení, kontroly, přípravy a zkoušek znalců;
 - c) všeobecná přechodná ustanovení;
 - d) doplňující přechodná ustanovení používaná na jednotlivých vnitrozemských vodních cestách.

Článek 3

Názvosloví

Pro účely této Dohody:

- a) „plavidlo“ znamená plavidlo vnitrozemské plavby nebo námořní plavidlo;
- b) „nebezpečné věci“ znamenají látky a předměty, jejichž mezinárodní přeprava je podle příložených Předpisů zakázána nebo se připouští jen za určitých podmínek;
- c) „mezinárodní přeprava nebezpečných věcí“ znamená každou přepravu nebezpečných věcí uskutečňovanou plavidlem po vnitrozemských vodních cestách po územích nejméně dvou smluvních stran;
- d) „vnitrozemské vodní cesty“ znamenají všechny vnitrozemské vodní cesty, včetně námořních vodních cest na území smluvní strany, otevřené pro plavbu plavidel v souladu s vnitrostátním právem;
- e) „námořní vodní cesty“ znamenají vnitrozemské vodní cesty spojené s mořem, využívané především pro provoz námořních plavidel a stanovené jako takové v souladu s vnitrostátním právem;
- f) „uznaná klasifikační společnost“ znamená klasifikační společnost odpovídající kritériím stanoveným v příložených Předpisech a uznanou, v souladu s uvedenými příloženými Předpisy, příslušným orgánem smluvní strany, kde bylo vydáno osvědčení o uznání;
- g) „příslušný orgán“ znamená orgán jmenovaný nebo uznávaný za takový v každé smluvní straně a pro každý konkrétní případ ve spojení s ustanoveními této Dohody;
- h) „inspekční organizace“ znamená organizaci, určenou nebo uznanou smluvní stranou pro účely provádění inspekcí plavidel v souladu s postupy uvedenými v příložených Předpisech.

KAPITOLA II

TECHNICKÁ USTANOVENÍ

Článek 4

Zákazy přepravy, podmínky přepravy, kontrola

1. S výhradou ustanovení článků 7 a 8 nesmějí být nebezpečné věci, které nejsou připuštěny k přepravě podle příložených Předpisů, předmětem mezinárodní přepravy.
2. Nehledě na ustanovení článku 6 je mezinárodní přeprava ostatních nebezpečných věcí povolena při dodržení podmínek stanovených v příložených Předpisech.
3. Dodržení zákazů přepravy a podmínek uvedených v odstavcích 1 a 2 výše je kontrolováno smluvními stranami v souladu s ustanoveními příložených Předpisů.

Článek 5

Výjimky

Tato Dohoda se nepoužije zčásti nebo zcela pro přepravy nebezpečných věcí, které jsou v příložených Předpisech uvedeny jako výjimky. Výjimky se mohou používat pouze tehdy, pokud množství věcí, charakter přepravy nebo obaly zaručují bezpečnost přepravy.

Článek 6

Právo států

Každá smluvní strana si ponechává právo upravit nebo zakázat dovoz nebezpečných věcí na své území z důvodů jiných, než je bezpečnost během přepravy.

Článek 7

Zvláštní pravidla, odchylky

1. Smluvní strany si vyhražují právo sjednávat na omezenou dobu, stanovenou v příložených Předpisech, formou uzavření zvláštních dvoustranných nebo mnohostranných dohod a bez ohrožení bezpečnosti, následující pravidla:
 - a) nebezpečné věci, jejichž mezinárodní přeprava je touto Dohodou zakázána, mohou být za určitých podmínek připuštěny k mezinárodní přepravě po jejich vnitrozemských vodních cestách; nebo
 - b) nebezpečné věci, jejichž mezinárodní přeprava je touto Dohodou povolena pouze za stanovených podmínek, mohou být připuštěny k mezinárodní přepravě po jejich vnitrozemských vodních cestách též za podmínek odlišných od těch, jež jsou stanoveny v příložených Předpisech.

Zvláštní dvoustranné nebo mnohostranné dohody uvedené v tomto odstavci se bezodkladně zasílají na vědomí výkonnému tajemníkovi Evropské hospodářské komise, který o nich informuje ty smluvní strany, které nejsou signatáři těchto dohod.
2. Každá smluvní strana si vyhražuje právo vydávat zvláštní povolení pro mezinárodní přepravu nebezpečných látek tankovými plavidly, jejichž přeprava těmito plavidly není podle ustanovení příložených Předpisů povolena, za podmínky dodržení postupů předepsaných v Předpisech, které se týkají zvláštních povolení.
3. Smluvní strany si vyhražují právo povolovat v následujících případech mezinárodní přepravu nebezpečných věcí na palubě plavidla, které neodpovídá požadavkům stanoveným v příložených Předpisech, za podmínky dodržení postupu podle těchto příložených Předpisů:
 - a) v případě použití materiálů, zařízení nebo vybavení na palubě plavidla, nebo použití určitých konstrukčních řešení na palubě plavidla, nebo určitých opatření, jiných než ta, která jsou uvedena v příložených Předpisech;
 - b) v případě plavidla s technickými novinkami, které představují odchylku od ustanovení příložených Předpisů.

Článek 8

Přechodná ustanovení

1. Osvědčení o schválení plavidla a jiné listiny vystavené v souladu s požadavky Předpisů pro přepravu nebezpečných věcí po Rýně (Předpisy ADN-R), Předpisů pro přepravu nebezpečných věcí po Dunaji (Předpisy ADN-D) nebo podle vnitrostátních předpisů, které vycházejí z Evropských předpisů týkajících se mezinárodní přepravy nebezpečných věcí po vnitrozemských vodních cestách, obsažených v příloze k Rezoluci č. 223 Výboru pro vnitrozemskou dopravu Evropské hospodářské komise, nebo podle jejich variant s úpravami, používané ke dni vstupu příložených Předpisů v platnost podle článku 11 odst. 1 zůstávají v platnosti až do konce své platnosti, jmenovitě ve vztahu k jejich uznávání jinými státy, za stejných podmínek, které existovaly do vstupu příložených Předpisů v platnost. Při tom taková osvědčení zůstávají v platnosti po dobu jednoho roku od data platnosti příložených Předpisů, pokud jejich platnost skončí v této době. Avšak lhůta jejich platnosti v žádném případě nepřevyšuje pět let od data vstupu příložených Předpisů v platnost.
2. Plavidla, která jsou ke dni vstupu příložených Předpisů v platnost podle článku 11 odst. 1 schválena pro přepravu nebezpečných věcí po území jedné ze smluvních stran a která odpovídají požadavkům příložených Předpisů s ohledem, v případě nutnosti, na všeobecná přechodná ustanovení, mohou obdržet osvědčení o schválení plavidla ADN v souladu s postupem stanoveným v příložených Předpisech.
3. V případě plavidel uvedených v odstavci 2, určených výhradně pro provádění přeprav po těch vnitrozemských vodních cestách, na kterých se v souladu s vnitrostátním právem do dne vstupu příložených Předpisů v platnost podle článku 11 odst. 1 ustanovení ADN-R nepoužívala, se mohou, mimo všeobecných přechodných ustanovení, používat doplňující přechodná ustanovení platná na jednotlivých vnitrozemských vodních cestách. Taková plavidla obdrží osvědčení o schválení plavidla ADN platné pro výše uvedené vnitrozemské vodní cesty nebo jejich úseky.

4. V případě doplnění nových ustanovení do přiložených Předpisů mohou smluvní strany uvažovat s novými všeobecnými přechodnými ustanoveními. V těchto přechodných ustanoveních se uvádějí pravidla, na která se vztahují a lhůta jejich platnosti.

Článek 9

Použití jiných pravidel

Na přepravy podléhající této Dohodě se nadále vztahují místní, regionální nebo mezinárodní předpisy, platné obecně pro přepravu nákladů po vnitrozemských vodních cestách.

KAPITOLA III

ZÁVĚREČNÁ USTANOVENÍ

Článek 10

Smluvní strany

1. Členské státy Evropské hospodářské komise, na jejichž území se nacházejí vodní cesty, kromě těch, které jsou tvořeny příbřežními trasami, které tvoří část sítě vodních cest mezinárodního významu, stanovené Evropskou dohodou o hlavních vnitrozemských vodních cestách mezinárodního významu (Dohoda AGN), se mohou stát smluvními stranami této Dohody:
 - a) podpisem bez výhrady ratifikace, přijetí nebo schválení;
 - b) uložením ratifikační listiny, listiny o přijetí nebo schválení po jejím podpisu s výhradou ratifikace, přijetí nebo schválení;
 - c) uložením listiny o přístupu.
2. Tato Dohoda je otevřena k podpisu do 31. května 2001 v Kanceláři Výkonného tajemníka Evropské hospodářské komise v Ženevě. Po tomto dni bude otevřena k přístupu.
3. Ratifikační listiny, listiny o přijetí, schválení nebo přístupu se ukládají u generálního tajemníka Organizace spojených národů.

Článek 11

Vstup v platnost

1. Tato Dohoda vstoupí v platnost po uplynutí jednoho měsíce ode dne, kdy počet států, uvedených v článku 10 odst. 1, které ji podepsaly bez výhrad nebo uložily své ratifikační listiny, listiny o přijetí, schválení nebo přístupu, dosáhne sedmi.

Přitom přiložené Předpisy, s výjimkou ustanovení týkajících se uznání klasifikačních společností, vstoupí v platnost po uplynutí dvanácti měsíců po vstupu této Dohody v platnost.
2. Pro každý stát, který podepíše tuto Dohodu bez výhrad nebo ji ratifikuje, přijme, schválí nebo k ní přistoupí poté, kdy sedm států, uvedených v článku 10 odst. 1, ji podepsalo bez výhrad nebo uložilo své ratifikační listiny nebo listiny o přijetí, schválení nebo přístupu, vstoupí tato Dohoda v platnost po uplynutí jednoho měsíce ode dne podpisu bez výhrad tímto státem nebo uložení jeho ratifikační listiny nebo listiny o přijetí, schválení nebo přístupu.

Přiložené Předpisy vstoupí v platnost téhož dne. Jestliže lhůta uvedená v odstavci 1 ve vztahu ke vstupu přiložených Předpisů v platnost ještě neuplynula, vstupují v platnost po uplynutí této lhůty.

Článek 12

Výpověď

1. Každá smluvní strana může tuto Dohodu vypovědět písemným oznámením, zaslaným generálnímu tajemníkovi Organizace spojených národů.
2. Výpověď nabývá účinnosti po uplynutí dvanácti měsíců ode dne, kdy generální tajemník; obdržel písemné oznámení o výpovědi.

Článek 13

Ukončení platnosti

1. Jestliže po vstupu této Dohody v platnost je počet států, které jsou smluvními stranami, v průběhu po sobě následujících dvanácti měsíců menší než pět, pozbude tato Dohoda svou platnost po uplynutí výše uvedené dvanáctiměsíční lhůty.
2. V případě sjednání universální dohody, upravující kombinovanou přepravu nebezpečných věcí, pozbude každé ustanovení této Dohody, kromě těch, která se týkají výlučně vnitrozemské plavby, stavby a vybavení plavidel, přepravy volně ložených látek nebo přepravy tankovými plavidly, které by odporovalo libovolnému ustanovení této universální dohody, automaticky svou platnost ve vztazích mezi těmi smluvními stranami této Dohody, které by se staly smluvními stranami universální dohody, ode dne vstupu posledně jmenované dohody v platnost a nahradí se ipso facto příslušnými ustanoveními universální dohody.

Článek 14

Prohlášení

1. Každý stát může při podpisu této Dohody bez výhrad nebo při ukládání své ratifikační listiny, listiny o přijetí, schválení nebo přístupu nebo kdykoli později písemným sdělením zaslaným generálnímu tajemníkovi Organizace spojených národů prohlásit, že tato Dohoda bude uplatňována na všech nebo na některých územích, která zastupuje ve vnějších vztazích. Tato dohoda začne platit na území nebo k územím, uvedených ve sdělení, po uplynutí jednoho měsíce ode dne obdržení tohoto sdělení generálním tajemníkem.
2. Každý stát, který učiní v souladu s odstavcem 1 tohoto článku prohlášení o rozšíření platnosti této Dohody na jakékoli území, které zastupuje ve vnějších vztazích, může vypovědět tuto Dohodu ve vztahu k tomuto území způsobem uvedeným v článku 12.
3. a) Kromě toho může každý stát při podpisu této Dohody bez výhrad nebo při ukládání své ratifikační listiny, listiny o přijetí, schválení nebo přístupu nebo kdykoli později učinit formou písemného sdělení generálnímu tajemníkovi Organizace spojených národů prohlášení o tom, že se tato Dohoda nebude vztahovat na některé určité vnitrozemské vodní cesty na jeho území, s podmínkou, že tyto vodní cesty nejsou zahrnuty do sítě vodních cest mezinárodního významu podle AGN. Je-li takovéto prohlášení učiněno poté, kdy stát bez výhrady podepsal tuto Dohodu nebo uložil svou ratifikační listinu, listinu o přijetí, schválení nebo přístupu, pozbude Dohoda platnost ve vztahu k příslušným vnitrozemským vodním cestám po uplynutí jednoho měsíce poté, kdy generální tajemník obdržel toto sdělení.
b) Spolu s tím každý stát, na jehož území se nacházejí vodní cesty zahrnuté do AGN, na kterých v den přijetí této Dohody platí povinný mezinárodně-právní režim upravující přepravu nebezpečných věcí, může učinit prohlášení o tom, že použití této Dohody na takovýchto vodních cestách podléhá dodržení postupů uvedených v právním instrumentu, který tento režim stanovuje. Takovéto prohlášení se činí při podpisu této Dohody bez výhrad nebo při ukládání ratifikační listiny, listiny o přijetí, schválení nebo přístupu.
4. Každý stát, který učinil prohlášení podle odstavce 3 a) nebo 3 b) tohoto článku, může následně formou písemného oznámení generálnímu tajemníkovi Organizace spojených národů učinit prohlášení o tom, že se tato Dohoda vztahuje na všechny nebo některé jeho vnitrozemské vodní cesty uvedené v prohlášení, učiněném podle odstavce 3 a) nebo 3 b). Tato Dohoda se bude používat na vnitrozemských vodních cestách uvedených ve sdělení po uplynutí jednoho měsíce od dne, kdy generální tajemník obdržel toto sdělení.

Článek 15

Spory

1. Každý spor mezi dvěma nebo několika smluvními stranami týkající se výkladu nebo provádění této Dohody musí být, podle možnosti, řešen jednáním mezi stranami, které jsou účastníky sporu.
2. Každý spor, který nebude vyřešen cestou přímých jednání, může být předán smluvními stranami zúčastněnými ve sporu Administrativnímu výboru, který daný spor projedná a vydá doporučení k jeho řešení.
3. Každý spor, který nebude vyřešen v souladu s ustanoveními odstavce 1 nebo 2, musí být předán na žádost jedné ze smluvních stran ve sporu do rozhodčího řízení a v důsledku toho se předá jednomu nebo několika rozhodcům, zvoleným na základě dohody mezi stranami ve sporu. Jestliže strany ve sporu v průběhu tří měsíců ode dne předání žádosti o rozhodčí řízení nedosáhnou dohody ohledně výběru rozhodce nebo rozhodců, může se každá z těchto stran obrátit na generálního tajemníka Organizace spojených národů se žádostí, aby určil jediného rozhodce, kterému se spor předá k rozhodnutí.
4. Rozhodnutí rozhodce nebo rozhodců určených v souladu s odstavcem 3 tohoto článku je závazné pro smluvní strany zúčastněné ve sporu.

Článek 16

Výhrady

1. Každý stát může při podpisu této Dohody bez výhrad nebo při ukládání ratifikační listiny, listiny o přijetí, schválení nebo přístupu k ní učinit prohlášení, že se nepovažuje být vázán článkem 15. Ostatní smluvní strany nejsou vázány článkem 15 ve vztahu ke každé smluvní straně, která takovou výhradu učinila.
2. Každý smluvní stát, který učinil výhradu v souladu s odstavcem 1 tohoto článku, ji může kdykoli vzít zpět písemným oznámením zasláným generálnímu tajemníkovi Organizace spojených národů.
3. Výhrady, které nejsou předpokládány touto Dohodou, se nepřipouštějí.

Článek 17

Administrativní výbor

1. Pro projednávání implementace této Dohody, posouzení jakýchkoliv k ní navržených změn a rovněž opatření k zajištění jednotného výkladu a používání jejích ustanovení se zřizuje Administrativní výbor.
2. Smluvní strany jsou členy tohoto Administrativního výboru. Výbor může rozhodnout, že státy uvedené v článku 10 odst. 1 této Dohody, které nejsou smluvními stranami, jakýkoliv jiný členský stát Evropské hospodářské komise nebo Organizace spojených národů nebo představitelé mezinárodních vládních nebo nevládních organizací se mohou účastnit jeho zasedání jako pozorovatelé při projednávání otázek, které je zajímají.
3. Generální tajemník Organizace spojených národů a generální tajemník Ústřední komise pro plavbu na Rýně zajišťují funkci sekretariátu Administrativního výboru.
4. Administrativní výbor volí každoročně na svém prvním zasedání předsedu a místopředsedu.
5. Výkonný tajemník Evropské hospodářské komise svolává Administrativní výbor každoročně nebo v jiných intervalech stanovených Výborem a rovněž na základě žádosti nejméně pěti smluvních stran.
6. Pro přijetí rozhodnutí je nutné kvórum, které představuje nejméně jednu polovinu Smluvních stran.
7. O návrzích se hlasuje. Každá smluvní strana přítomná na zasedání má jeden hlas. Platí tato pravidla:
 - a) navrhované změny stávající Dohody a rozhodnutí o nich se přijímají v souladu s ustanoveními článku 19 odst. 2;
 - b) navrhované změny příložených Předpisů a rozhodnutí o nich se přijímají v souladu s ustanoveními článku 20 odst. 4;
 - c) návrhy a rozhodnutí, které se týkají doporučení na uznání klasifikačních společností nebo odvolání takových doporučení, se přijímají v souladu s postupem podle článku 20 odst. 4;

- d) každý návrh nebo rozhodnutí, kromě těch, které jsou uvedeny v pododstavcích a) až c) výše, se přijímají většinou hlasů přítomných a hlasujících členů Administrativního výboru.
8. Administrativní výbor může vytvářet pracovní skupiny, které považuje za nutné pro poskytnutí pomoci při plnění svých funkcí.
9. Při neexistenci příslušných ustanovení ve stávající Dohodě se používá jednací řád Evropské hospodářské komise, jestliže Administrativní Výbor nepřijme jiné rozhodnutí.

Článek 18

Výbor pro otázky bezpečnosti

K projednání jakýchkoliv návrhů na změny příložených Předpisů, zejména návrhů, které se týkají plavební bezpečnosti, stavby, vybavení a posádek plavidel, se ustanovuje Výbor pro otázky bezpečnosti. Výbor pracuje v rámci činnosti orgánů Evropské hospodářské komise, Ústřední komise pro plavbu na Rýně a Dunajské komise, které jsou kompetentní v oblasti přepravy nebezpečných věcí po vnitrozemských vodních cestách.

Článek 19

Postup při provádění změn této Dohody s výjimkou příložených Předpisů

1. Změny této Dohody, s výjimkou příložených Předpisů, se mohou provádět na návrh smluvní strany v souladu s postupem stanoveným tímto článkem.
2. Každá navržená změna této Dohody, s výjimkou příložených Předpisů, se projednává Administrativním výborem. Každou takovou změnu, projednanou nebo připravenou na zasedání Administrativního výboru a přijatou Administrativním výborem dvoutřetinovou většinou přítomných a hlasujících členů, sdělí generální tajemník Organizace spojených národů smluvním stranám za účelem schválení.
3. Každá změna zasláná ke schválení v souladu s ustanovením odstavce 2, vstupuje v platnost pro všechny smluvní strany po šesti měsících od uplynutí lhůty dvaceti čtyř měsíců od data odeslání sdělení o takovéto změně, jestliže v této lhůtě neobdrží generální tajemník Organizace spojených národů v písemné formě žádné námítky proti navrhované změně od kterékoliv smluvní strany.

Článek 20

Postup při provádění změn příložených Předpisů

1. Změny příložených Předpisů mohou být prováděny na návrh smluvní strany.
Generální tajemník Organizace spojených národů může rovněž navrhopvat změny směřující ke sladění příložených Předpisů s jinými mezinárodními dohodami týkajícími se přepravy nebezpečných věcí nebo s Doporučením Organizace spojených národů pro přepravu nebezpečných věcí, jakož i změny navrhované pomocným orgánem Evropské hospodářské komise majícím působnost v oblasti přepravy nebezpečných věcí.
2. Každá navrhovaná změna příložených Předpisů se v zásadě předává k projednání Výboru pro otázky bezpečnosti, který předává přijaté návrhy změn Administrativnímu výboru.
3. Na výslovnou žádost Smluvní strany, nebo jestliže to sekretariát Administrativního výboru považuje za účelné, mohou být navrhované změny rovněž předkládány přímo Administrativnímu výboru. Takové navrhované změny se projednávají na prvním zasedání, a když jsou považovány za přijatelné, znovu na příštím zasedání Výboru spolu s jakýmkoliv jinými, k nim se vztahujícími návrhy, pokud Výbor nepřijme jiné rozhodnutí.
4. Rozhodnutí o návrzích změn a o předkládaných navrhovaných změnách předaných Administrativnímu výboru v souladu s odstavci 2 a 3, se přijímají většinou přítomných a hlasujících členů. Přitom se změna nepovažuje za přijatou, jestliže nejméně pět členů oznámí ihned po hlasování svoji výhradu. Přijaté změny zasílá generální tajemník Organizace spojených národů smluvním stranám ke schválení.
5. Každý návrh změny příložených Předpisů, zasláný za účelem schválení v souladu s odstavcem 4, se považuje za schválený, jestliže v průběhu tří měsíců ode dne jeho rozeslání generálním tajemníkem nejméně jedna třetina smluvních stran nebo pět z nich, jestliže jedna třetina převyšuje tento počet, nesdělí písemně generálnímu tajemníkovi svoji výhradu proti navrhované změně. Považuje-li se změna za schválenou, vstupuje v platnost pro všechny smluvní strany po uplynutí další tříměsíční lhůty, s výjimkou následujících případů:

- a) v případě, kdy obdobné změny k jiným mezinárodním dohodám upravujícím přepravu nebezpečných věcí již vstoupily v platnost, nebo vstoupí v platnost od jiného data, může generální tajemník na základě písemné žádosti výkonného tajemníka Evropské hospodářské komise rozhodnout o tom, že daná změna vstupuje v platnost po uplynutí jiné lhůty tak, aby byl zajištěn současný vstup v platnost těchto změn a změn jiných takových dohod, nebo není-li toto možné, co nejrychlejší vstup v platnost této změny po vstupu v platnost změn v jiných dohodách; takováto lhůta přitom nemůže být kratší než jeden měsíc;
- b) při přijetí návrhu změny může Administrativní výbor stanovit lhůtu, která přesahuje tři měsíce, s cílem vstupu v platnost změny v případě jejího schválení.

Článek 21

Žádosti, sdělení a námítky

Generální tajemník Organizace spojených národů informuje všechny smluvní strany a všechny státy uvedené v článku 10 odst. 1 této Dohody, o všech žádostech, sděleních nebo námítkách učiněných v souladu s výše uvedenými články 19 a 20 a rovněž o schválení a o datu vstupu v platnost každé změny.

Článek 22

Revizní konference

1. Nehledě na postupy podle článků 19 a 20 se může každá smluvní strana písemným oznámením obrátit na generálního tajemníka Organizace spojených národů se žádostí o svolání konference za účelem revize této Dohody.

Revizní konferenci, na kterou jsou pozvány všechny smluvní strany a všechny státy uvedené v článku 10 odst. 1, svolá výkonný tajemník Evropské hospodářské komise, jestliže v průběhu šesti měsíců od data odeslání oznámení generálním tajemníkem Organizace spojených národů mu nejméně čtvrtina smluvních stran sdělí svůj souhlas s touto žádostí.

2. Nehledě na postup podle článků 19 a 20 bude revizní konference, na kterou se pozvou všechny smluvní strany a všechny státy uvedené v článku 10 odst. 1, rovněž svolána výkonným tajemníkem Evropské hospodářské komise po obdržení písemného sdělení o příslušné žádosti Administrativního výboru. Administrativní výbor přijímá rozhodnutí o vyslovení takovéto žádosti většinou přítomných a hlasujících členů Výboru.
3. Je-li v souladu s odstavcem 1 nebo 2 tohoto článku svolána konference, navrhne výkonný tajemník Evropské hospodářské komise smluvním stranám, aby do tří měsíců předaly návrhy, které by chtěly mít projednány na konferenci.
4. Nejpozději šest měsíců před zahájením konference rozešle výkonný tajemník Evropské hospodářské komise všem smluvním stranám a všem státům uvedených v článku 10 odst. 1 předběžný program konference a rovněž texty takovýchto návrhů.

Článek 23

Depozitář

Depozitářem této Dohody je generální tajemník Organizace spojených národů.

NA DŮKAZ TOHO níže podepsaní, náležitě k tomu zmocnění, podepsali tuto Dohodu.

DÁNO v Ženevě dne dvacátého šestého května roku dva tisíce v jednom vyhotovení v jazyce anglickém, francouzském, německém a ruském a v případě textu vlastní dohody a ve francouzském jazyce v případě textu příložených Předpisů, přičemž všechny čtyři texty vlastní dohody mají stejnou platnost.

Generálnímu tajemníkovi Organizace spojených národů se navrhuje připravit překlad příložených Předpisů do anglického a ruského jazyka.

Generálnímu tajemníkovi Ústřední Komise pro plavbu na Rýně se navrhuje připravit překlad příložených Předpisů do německého jazyka.

ČÁST 1
VŠEOBECNÁ USTANOVENÍ

KAPITOLA 1.1

ROZSAH A POUŽITÍ

1.1.1 Struktura

Pravidla tvořící přílohu k ADN jsou rozdělena do devíti částí. Každá část se dělí do kapitol a každá kapitola do oddílů a pododdílů (viz obsah). Uvnitř každé části je číslo části zahrnuto do čísel kapitol, oddílů a pododdílů, např. část 2, kapitola 2, oddíl 1 je očíslován „2.2.1“.

1.1.2 Rozsah platnosti

1.1.2.1 Pro účely článku 2 odstavce 2 (a) a článku 4 Pravidla přiložená k ADN uvádějí:

- (a) nebezpečné věci, které jsou z mezinárodní přepravy vyloučeny;
- (b) nebezpečné věci, které jsou připuštěny k mezinárodní přepravě, a podmínky, které musí být při této přepravě splněny (včetně vynětí z platnosti), zejména:
 - klasifikace věcí, včetně klasifikačních kritérií a příslušných zkušebních metod;
 - používání obalů (včetně společného balení);
 - používání cisteren (včetně jejich plnění);
 - postupy před odesláním (včetně nápisů a bezpečnostních značek na kusech a označování vozidel a železničních vozů, označování plavidel, jakož i doklady a požadované informace);
 - ustanovení o konstrukci, zkoušení a schvalování obalů a cisteren;
 - používání dopravních prostředků (včetně nakládky, společné nakládky a vykládky).

1.1.2.2 Pro účely článku 5 ADN uvádí oddíl 1.1.3 této kapitoly případy, kdy je přeprava nebezpečných věcí částečně nebo úplně vyňata z platnosti podmínek stanovených ADN.

1.1.2.3 Pro účely článku 7 ADN uvádí kapitola 1.5 této části pravidla týkající se odchylek, zvláštních povolení a rovnocenných opatření, které tento článek stanoví.

1.1.2.4 Pro účely článku 8 ADN uvádí kapitola 1.6 této části přechodná opatření týkající se aplikace Pravidel přiložených k ADN.

1.1.2.5 Ustanovení ADN se vztahují také na prázdná plavidla nebo plavidla, která byla vyložena, pokud nákladní prostory, nákladní tanky nebo nádoby nebo cisterny naložené na plavidla nejsou prosty nebezpečných látek nebo plynů, s výjimkou vynětí z platnosti podmínek ADN uvedených v oddílu 1.1.3.

1.1.3 Vynětí z platnosti

1.1.3.1 *Vynětí z platnosti vztahující se k druhu přepravy*

Ustanovení uvedená v ADN se nevztahují na:

- (a) přepravu nebezpečných věcí soukromými osobami, pokud jsou dotyčné věci baleny pro maloobchodní prodej a jsou určeny pro jejich osobní nebo domácí použití nebo pro jejich aktivity ve volném čase nebo pro sportovní činnost, pokud byla učiněna opatření k zamezení úniku obsahu za normálních přepravních podmínek. Pokud jsou tyto věci hořlavými kapalinami přepravovanými v opakovaně plnitelných nádobách naplněných soukromými osobami nebo pro tyto osoby, nesmí celkové množství překročit 60 litrů na nádobu a 240 litrů na nákladní dopravní jednotku. Nebezpečné věci v IBC, velkých obalech nebo cisternách se nepovažují za věci balené pro maloobchodní prodej;
- (b) (Vypuštěno);
- (c) přepravu prováděnou podniky jako vedlejší činnost k jejich hlavní činnosti, jako je zásobování staveníšť pozemních nebo inženýrských staveb nebo zpětné jízdy z nich, nebo přepravy související s měřičskými, opravářskými a údržbářskými pracemi, v množstvích nejvýše 450 litrů

v jednom obalu, včetně IBC a velkých obalů, a nepřekračujících nejvyšší celková množství uvedená v pododdílu 1.1.3.6. Musí být učiněna opatření k zamezení úniku obsahu za normálních podmínek přepravy. Tato vyloučení se nevztahují na třídu 7.

Přepravy prováděné takovými podniky pro jejich zásobování nebo vnější nebo vnitřní distribuci však nespádají do rozsahu tohoto vyloučení;

- (d) přepravu prováděnou zásahovými jednotkami nebo pod jejich dozorem, pokud je taková přeprava nutná ve vztahu k nouzovým opatřením, zejména přepravu prováděnou za účelem sběru nebezpečných věcí, které byly zapleteny do mimořádné události nebo nehody, a jejich přemístění na bezpečné místo.
- (e) nouzové přepravy prováděné pod dozorem příslušných orgánů, určené pro záchranu lidských životů nebo ochranu životního prostředí, za podmínky, že byla učiněna všechna opatření zajišťující plnou bezpečnost takové přepravy;
- (f) přepravu nevyčištěných prázdných stabilních nebo skladovacích nádob, které obsahovaly plyny třídy 2, skupin A, O nebo F, látky třídy 3 nebo třídy 9 spadající pod obalovou skupinu II nebo III, nebo pesticidy třídy 6.1 spadající pod obalovou skupinu II nebo III, za dodržení následujících podmínek:

Všechny otvory, s výjimkou zařízení pro vyrovnávání tlaku (pokud jsou), jsou hermeticky uzavřeny;

Byla učiněna opatření k zamezení jakéhokoli úniku obsahu za normálních podmínek přepravy;
a

Náklad je upevněn v lůžkách nebo latěních nebo jiných manipulačních prostředcích nebo ve vozidle nebo kontejneru takovým způsobem, aby se nemohl uvolnit ani posunout za normálních podmínek přepravy.

Toto vyloučení se nevztahuje na stabilní nebo skladovací nádoby, které obsahovaly znečištěné výbušné látky nebo látky, jejichž přeprava je podle ADN zakázána.

POZNÁMKA: K radioaktivním látkám viz také 1.7.1.4.

1.1.3.2 Vyloučení z platnosti pro přepravu plynů

Ustanovení uvedená v ADN se nevztahují na přepravu:

- (a) (Vyhrazeno)
- (b) (Vyhrazeno)
- (c) plynů skupin A a O (podle pododdílu 2.2.2.1), jestliže tlak plynu v nádobě nebo cisterně při teplotě 20 °C nepřevyšuje 200 kPa (2 bary) a jestliže plyn není zkapalněným nebo hluboce zchlazeným zkapalněným plynem. To platí pro všechny druhy nádob nebo cisteren, např. rovněž pro různé části strojů a přístrojů;

POZNÁMKA: Toto vyloučení se nevztahuje na lampy a žárovky. K lampám a žárovkám viz 1.1.3.10.

- (d) plynů obsažených v zařízení, používaných k provozu plavidla (např. v hasicích přístrojích), včetně náhradních dílů;
- (e) (Vyhrazeno)
- (f) plynů obsažených v potravinách (kromě UN 1950), včetně sycených nápojů;
- (g) plynů obsažených v míčích určených pro použití ve sportech; a
- (h) (Vypuštěno)

1.1.3.3 Vynětí z platnosti vztahující se na nebezpečné věci používané pro pohon přepravovaných plavidel, vozidel, železničních vozů nebo po silnici nepojízdných strojních zařízení, pro činnost jejich zvláštní výbavy, pro jejich údržbu a bezpečnost

Požadavky ADN se nevztahují na látky používané

- přepravovaných plavidel, vozidel, železničních vozů nebo po silnici nepojízdných strojních zařízení¹;
- pro údržbu plavidel;
- pro činnost nebo údržbu jejich trvale zabudované zvláštní výbavy;
- pro činnost nebo údržbu jejich mobilní zvláštní výbavy používané nebo určené k použití během přepravy; nebo
- k zajištění bezpečnosti,

a které jsou přepravovány na plavidle v obalech, nádobách nebo cisternách určených pro použití k tomuto účelu.

1.1.3.4 Vynětí z platnosti podle zvláštních ustanovení nebo pro nebezpečné věci balené v omezených nebo vyňatých množstvích

POZNÁMKA: K radioaktivním látkám viz také 1.7.1.4

1.1.3.4.1 Některá zvláštní ustanovení kapitoly 3.3 vyjímají částečně nebo úplně přepravu určitých nebezpečných věcí z platnosti ustanovení ADN. Toto vynětí z platnosti platí pouze tehdy, pokud je ve sloupci (6) tabulky A kapitoly 3.2 uvedeno zvláštní ustanovení u příslušné položky nebezpečných věcí.

1.1.3.4.2 Některé nebezpečné věci mohou podléhat vynětí z platnosti, pokud jsou splněny podmínky uvedené v kapitole 3.4.

1.1.3.4.3 Některé nebezpečné věci mohou podléhat vynětím z platnosti, pokud jsou splněny podmínky kapitoly 3.5.

1.1.3.5 Vynětí z platnosti pro prázdné nevyčištěné obaly

Prázdné nevyčištěné obaly (včetně IBC a velkých obalů), které obsahovaly látky tříd 2, 3, 4.1, 5.1, 6.1, 8 a 9, nepodléhají ustanovením ADN, jestliže byla provedena přiměřená opatření vylučující jakékoli nebezpečí. Nebezpečí jsou vyloučena, jestliže byla provedena přiměřená opatření vylučující všechna nebezpečí tříd 1 až 9.

1.1.3.6 Vynětí z platnosti pro množství přepravovaná plavidly

1.1.3.6.1 V případě přepravy nebezpečných věcí v kusech se nepoužijí žádná jiná ustanovení ADN než ustanovení v 1.1.3.6.2, pokud celková hmotnost všech přepravovaných nebezpečných věcí nepřesahuje 3 000 kg a pro jednotlivé třídy nepřesahuje množství uvedené v následující tabulce:

¹ K definici po silnici nepojízdného strojního zařízení viz odstavec 2.7 Konsolidované rezoluce o konstrukci vozidel (R.E.3) (dokument Spojených národů ECE/TRANS/WP. 29/78/Rev.3) nebo článek 2 Směrnice 97/68/ES Evropského parlamentu a Rady z 16. prosince 1997 o sblížení právních a správních předpisů členských států týkajících se opatření proti emisím plyných a prachových škodlivin z motorů s vnitřním spalováním určených pro po silnici nepojízdná strojní zařízení (Úřední věstník Evropských společenství č. L 059 z 27. února 1998).

<i>Třída</i>	<i>Látky nebo předměty v kusech</i>	<i>Maximální povolené množství v kg:</i>
Všechny	Přeprava všech tříd v cisternách	0
1	Látky a předměty třídy 1	0
2	Látky a předměty třídy 2, skupin T, TF, TC, TO, TFC nebo TOC, podle 2.2.2.1.3 a Aerosoly skupin C, CO, FC, T, TF, TC, TO, TFC a TOC podle 2.2.2.1.6;	0
	Látky a předměty třídy 2, skupiny F podle 2.2.2.1.3 nebo Aerosoly skupiny F podle 2.2.2.1.6;	300
	Ostatní látky třídy 2	3 000
3	Látky a předměty třídy 3, obalová skupina I	300
	Ostatní látky třídy 3	3 000
4.1	Látky a předměty třídy 4.1, pro které se ve sloupci (5) tabulky A kapitoly 3.2 vyžaduje bezpečnostní značka vzoru č. 1;	0
	Ostatní látky a předměty třídy 4.1, obalová skupina I	300
	Ostatní látky a předměty třídy 4.1	3 000
4.2	Látky a předměty třídy 4.2, obalová skupina I	300
	Ostatní látky a předměty třídy 4.2	3 000
4.3	Látky a předměty třídy 4.3, obalová skupina I	300
	Ostatní látky a předměty třídy 4.3	3 000
5.1	Látky a předměty třídy 5.1, obalová skupina I	300
	Ostatní látky a předměty třídy 5.1	3 000
5.2	Látky a předměty třídy 5.2, pro které se ve sloupci (5) tabulky A kapitoly 3.2 vyžaduje bezpečnostní značka vzoru č. 1;	0
	Ostatní látky a předměty třídy 5.2	3 000
6.1	Látky a předměty třídy 6.1, obalová skupina I	0

7	Látky a předměty třídy 7 pod UN 2908, UN 2909, UN 2910 a UN 2911	3 000
	Ostatní látky a předměty třídy 7	0
8	Látky a předměty třídy 8, obalová skupina I	300
	Ostatní látky a předměty třídy 8	3 000
9	Všechny látky a předměty třídy 9	3 000

- 1.1.3.6.2 Avšak pro přepravu podle vynětí z platnosti pro množství podle 1.1.3.6.1, se přitom použijí následující požadavky:
- (a) zůstává v platnosti povinnost hlášení v souladu s 1.8.5;
 - (b) požadavky oddílů 1.10.1, 1.10.2 a 1.10.3 se vztahují na kusy označené UN 2910 a UN 2911 třídy 7, pokud úroveň aktivity (na kus) přesahuje hodnotu A₂;
 - (c) kusy, s výjimkou dopravních prostředků a kontejnerů (včetně snímatelných koreb), musí odpovídat požadavkům pro obaly částí 4 a 6 ADR nebo RID; použijí se ustanovení kapitoly 5.2 pro označování nápisy a bezpečnostními značkami;
 - (d) na palubě se musí nacházet tyto dokumenty:
 - přepravní doklady (viz. 5.4.1.1); musí být v souladu se všemi nebezpečnými věcmi naloženými na plavidle;
 - plán uložení nákladu (viz. 7.1.4.11.1);
 - (e) věci musí být uloženy do nákladních prostor.

Toto ustanovení se nepoužije pro věci naložené do:

 - uzavřených kontejnerů;
 - vozidel nebo vagónů krytých plachtou;
 - (f) věci různých tříd musí být od sebe horizontálně ukládány na vzdálenost nejméně 3,00 m. Ukládání takových věcí na sebe se nepřipouští.

Toto ustanovení se nepoužívá pro:

 - uzavřené kontejnery;
 - vozidla nebo vagony kryté plachtou;
 - (g) pro námořní plavidla a plavidla vnitrozemské plavby, kde jsou naloženy pouze kontejnery, výše uvedené požadavky pod písmeny (e) a (f) se považují za splněné, pokud jsou dodržena ustanovení IMDG Code o uložení a vzájemném oddělení a je o tom uveden zápis v přepravním dokladu.

1.1.3.6.3 (Vyhrazeno)

1.1.3.6.4 (Vyhrazeno)

1.1.3.6.5 Pro účely tohoto pododdílu se nebezpečné věci vyňaté z platnosti podle 1.1.3.1 (a), (b) a (d) až (f), 1.1.3.2 až 1.1.3.5, 1.1.3.7, 1.1.3.9 a 1.1.3.10 neberou v úvahu.

1.1.3.7 **Vynětí z platnosti pro přepravu systémů akumulace a výroby elektrické energie**

Ustanovení uvedená v ADN se nevztahují na systémy akumulace a výroby elektrické energie (např. lithiové baterie, elektrické kondenzátory, asymetrické kondenzátory, zásobníkové systémy s hydridem kovu a palivové články):

- (a) instalované v dopravních prostředcích provádějících přepravu a určené pro jejich pohon nebo pro provoz kteréhokoli z jejich zařízení;
- (b) obsažené ve výbavě pro provoz tohoto zařízení, používané nebo určené k použití během přepravy (např. laptop), kromě zařízení jako např. záznamníky dat a zařízení pro sledování nákladu připojené nebo obsažené v kusech, přepravních obalových souborech, kontejnerech nebo nákladových prostorech vozidel, na které se vztahují pouze požadavky v 5.5.4.

1.1.3.8 (Vyhrazeno)

1.1.3.9 Vynětí z platnosti vztahující se na nebezpečné věci používané pro chlazení nebo kondicionování během přepravy

Jsou-li ve vozidlech, železničních vozech nebo kontejnerech používány pro účely chlazení nebo kondicionování nebezpečné věci, které jsou jen dusivé (které ředí nebo nahrazují kyslík normálně v ovzduší), podléhají pouze ustanovením oddílu 5.5.3.

1.1.3.10 Vynětí z platnosti vztahující se na přepravu lamp a žárovek obsahujících nebezpečné věci

Následující lampy a žárovky nepodléhají ADN, pokud neobsahují radioaktivní látku a neobsahují rtuť v množstvích větších, než jsou množství uvedené ve zvláštním ustanovení 366 kapitoly 3.3:

- (a) Lampy a žárovky, které jsou sesbírány přímo od jednotlivců a z domácností, jsou-li přepravovány do sběrného nebo recyklačního objektu;

POZNÁMKA: Toto zahrnuje také lampy a žárovky přinesené nebo přivezené jednotlivci do prvního sběrného místa a poté přepravované do jiného sběrného místa, mezipracovatelského nebo recyklačního objektu.

- (b) Lampy a žárovky, každá z nich obsahující nejvýše 1 gram nebezpečných věcí, a zabalené tak, že je nejvýše 30 gramů nebezpečných věcí v jednom kusu, za podmínky, že

- (i) lampy a žárovky jsou vyrobeny v souladu s certifikovaným systémem řízení kvality;

POZNÁMKA: ISO 9001 smí být použita k tomuto účelu.

a

- (ii) lampy nebo žárovky jsou buď jednotlivě zabaleny ve vnitřních obalech a odděleny přepážkami, nebo každá obklopena fixačním materiálem, aby byly chráněny, a poté zabaleny do pevných vnějších obalů splňujících všeobecná ustanovení uvedená v 4.1.1.1 ADR a schopných vyhovět při zkoušce volným pádem z výšky 1,2 metru;

- (c) Použité, poškozené nebo vadné lampy a žárovky, každá z nich obsahující nejvýše 1 gram nebezpečných věcí s nejvýše 30 gramy nebezpečných věcí na kus, jsou-li přepravovány ze sběrného nebo recyklačního objektu. Lampy a žárovky musí být zabaleny do pevných vnějších obalů, dostačujících k zamezení úniku obsahu za normálních podmínek přepravy, splňujících všeobecná ustanovení uvedená v 4.1.1.1 ADR a které jsou schopné vyhovět zkoušce volným pádem z výšky nejméně 1,2 metru;

- (d) Lampy a žárovky obsahující jen plyny skupin A a O (podle 2.2.2.1), za podmínky, že jsou zabaleny tak, aby účinky rozletu při jakémkoli prasknutí lampy nebo žárovky byly omezeny na vnitřek kusu.

POZNÁMKA: Lampy a žárovky obsahující radioaktivní látky jsou popsány v 2.2.7.2.2.2 (b).

1.1.4 Použitelnost jiných předpisů**1.1.4.1 Všeobecně**

Následující požadavky se vztahují na kusy:

- (a) v případě obalů (včetně velkých obalů a IBC) musí být dodržena příslušná ustanovení jednoho z mezinárodních předpisů (viz též část 4 a část 6);
- (b) v případě kontejnerů, cisternových kontejnerů, přemístitelných cisteren a vícečlánkových kontejnerů na plyn (MEGC) musí být dodržena příslušná ustanovení ADR, RID nebo IMDG Code (viz též část 4 a část 6);
- (c) v případě vozidel nebo železničních vozů musí vozidla nebo železniční vozy a jejich náklad splňovat příslušná ustanovení ADR nebo RID.

POZNÁMKA: K označování nápisy, bezpečnostními značkami, velkými bezpečnostními značkami a oranžovými tabulkami viz též kapitoly 5.2 a 5.3.

1.1.4.2 **Přeprava v přepravním řetězci zahrnujícím námořní, silniční, železniční nebo leteckou dopravu**

1.1.4.2.1 Kusy, kontejnery, kontejnery pro volně ložené látky, přemístitelné cisterny, cisternové kontejnery a MEGC, které neodpovídají plně ustanovením pro balení, společné balení, nápisy a bezpečnostní značky na kusech nebo označení velkými bezpečnostními značkami a oranžovými tabulkami ADN, ale odpovídají ustanovením IMDG Code (pro námořní dopravu) nebo ICAO Technické pokyny (pro leteckou dopravu) musí být připuštěny k přepravě v přepravním řetězci zahrnujícím námořní nebo leteckou dopravu, pokud splňují následující podmínky:

- (a) pokud kusy nejsou opatřeny nápisy a bezpečnostními značkami podle ADR, musí být označeny nápisy a bezpečnostními značkami podle IMDG Code pro námořní nebo podle ICAO Technické pokyny pro leteckou dopravu;
- (b) pro společné balení v jednom kusu platí předpisy IMDG Code nebo ICAO Technické pokyny;
- (c) jestliže kontejnery, kontejnery pro volně ložené látky, přemístitelné cisterny, cisternové kontejnery nebo MEGC nejsou pro přepravu v dopravním řetězci zahrnujícím námořní přepravu označeny velkými bezpečnostními značkami a výstražnými oranžovými tabulkami podle kapitoly 5.3 těchto Pravidel, musí být opatřeny velkými bezpečnostními značkami a označením podle kapitoly 5.3 IMDG Code. V tomto případě se vztahují na označení vozidla samého pouze ustanovení uvedená v 5.3.2.1.1 těchto Pravidel. Toto ustanovení se vztahuje i na prázdné nevyčištěné přemístitelné cisterny, cisternové kontejnery a MEGC a též na jejich následnou přepravu do čistící stanice.

Tato odchylka se nevztahuje na věci, které jsou zařazeny jako nebezpečné věci tříd 1 až 9 ADN, ale nejsou považovány za nebezpečné podle příslušných ustanovení IMDG Code nebo ICAO Technické pokyny.

1.1.4.2.2 Jestliže námořní, silniční, železniční nebo letecká přeprava následuje nebo předchází přepravě vnitrozemskou vodní dopravou, může být přepravní doklad používán nebo vyžadován v námořní, silniční, železniční nebo letecké přepravě použit namísto přepravního dokladu předepsaného v oddílu 5.4.1 za předpokladu, že údaje, které obsahuje, jsou v souladu s platnými ustanoveními IMDG Code, ADR, RID nebo ICAO Technické pokyny, s výjimkou toho, že když jsou podle ADN vyžadovány dodatečné informace, musí být tyto informace doplněny nebo zapsány na vhodném místě.

POZNÁMKA: K přepravě podle 1.1.4.2.1 viz též 5.4.1.1.7. K přepravě v kontejnerech viz též 5.4.2.

1.1.4.3 **Používání přemístitelných cisteren typu IMO schválených pro námořní dopravu**

Přemístitelné cisterny typu IMO (typy 1, 2, 5 a 7), které neodpovídají předpisům kapitol 6.7 nebo 6.8 ADR, ale které byly vyrobeny a schváleny před 1. lednem 2003 podle ustanovení IMDG Code (Změna 29-98), smí být dále používány za podmínky, že odpovídají příslušným ustanovením IMDG Code o periodických inspekcích a zkouškách². Kromě toho musí splňovat ustanovení odpovídající pokynům uvedeným ve sloupcích (10) a (11) tabulky A v kapitole 3.2 a ustanovením kapitoly 4.2 ADR. Viz též 4.2.0.1 IMDG Code.

1.1.4.4 **(Vyhrazeno)**

1.1.4.5 **(Vyhrazeno)**

1.1.4.6 **1.1.4.6 Jiné předpisy pro přepravu vnitrozemskou vodní dopravou**

1.1.4.6.1 V souladu s článkem 9 ADN zůstávají přepravy podrobeny místním, regionálním a mezinárodním předpisům obecně platným pro přepravu věcí vnitrozemskou vodní dopravou.

1.1.4.6.2 Jsou-li ustanovení těchto Pravidel v rozporu s ustanoveními uvedenými v 1.1.4.6.1, ustanovení uvedená v 1.1.4.6.1 se nepoužijí.

² Mezinárodní námořní organizace (IMO) vydala oběžníkem CCC.1/Circ.3 „Směrnici pro další používání existujících přemístitelných cisteren a silničních cisternových vozidel typu IMO pro přepravu nebezpečných věcí“. Text směrnice je možno nalézt na webových stránkách IMO: www.imo.org.

1.1.5 Použití norem

Pokud se vyžaduje použití normy a existuje rozpor mezi touto normou a ustanoveními ADN, mají ustanovení ADN přednost.

Požadavky normy, které nejsou v rozporu s ADN, se použijí tak, jak je stanoveno, včetně požadavků jakékoli jiné normy nebo části normy, na něž tato norma odkazuje jako na normativní.

KAPITOLA 1.2

DEFINICE A MĚRNÉ JEDNOTKY

1.2.1 Definice

POZNÁMKA: *Tento oddíl obsahuje všechny všeobecné a zvláštní definice.*

Pro účely těchto Pravidel:

A

ADR Dohoda o mezinárodní silniční přepravě nebezpečných věcí;

Aerosol nebo Aerosolový rozprašovač předmět sestávající z nádoby pro jedno použití splňující ustanovení oddílu 6.2.4 ADR, vyrobený z kovu, skla nebo plastu a obsahující plyn, zkapalněný nebo rozpuštěný pod tlakem, s kapalinou nebo bez kapaliny, pastu nebo prášek, a vybavený rozprašovacím zařízením umožňujícím rozprášení obsahu ve formě tuhých nebo kapalných částic ve směsi s plynem ve formě pěny, pasty nebo prášku nebo v kapalném nebo plynném stavu;

ASTM American Society for Testing and Materials (Americká společnost pro zkoušení a materiály) (ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA, 19428-2959, United States of America);

B

Balič podnik, který balí nebezpečné věci do obalů, včetně velkých obalů a IBC, a, pokud je to nutné, připravuje kusy k přepravě;

Bateriové vozidlo vozidlo se souborem článků vzájemně propojených sběrným potrubím, stabilně upevněných na tomto vozidle. Následující články jsou považovány za články bateriového vozidla: láhve, trubkové nádoby, svazky lahví (známé též jako rámy), tlakové sudy, jakož i cisterny určené pro přepravu plynů, jak jsou definovány v 2.2.2.1.1, s vnitřním objemem větším než 450 litrů;

Bateriový vůz železniční vůz se souborem článků vzájemně propojených sběrným potrubím, stabilně upevněných na železničním voze. Následující články jsou považovány za články bateriového vozu: láhve, trubkové nádoby, svazky lahví (známé též jako rámy), tlakové sudy, jakož i cisterny určené pro přepravu plynů třídy 2 s vnitřním objemem větším než 450 litrů;

Bedna pravoúhlý nebo mnohoúhelníkový plnostěnný obal z kovu, dřeva, překližky, rekonstituovaného dřeva, lepenky, plastu nebo jiného vhodného materiálu. Malé otvory pro usnadnění manipulace nebo otevírání nebo pro splnění klasifikačních požadavků jsou dovoleny, pokud nejsou v rozporu s požadavkem neporušenosti obalu během přepravy;

Bezpečná zóna určená, rozpoznatelná zóna mimo oblast nákladu, která může být snadno přístupná pro všechny osoby na plavidle. Bezpečná zóna poskytuje ochranu proti identifikovaným nebezpečím od nákladu pomocí postřikovacího zařízení po dobu nejméně 60 minut. Bezpečná zóna může být během nehody evakuována. Bezpečná zóna je nepřístupná, je-li identifikovaným nebezpečím výbuch;

Bezpečné útočiště určená, rozpoznatelná, snadno přístupná buňka (stabilní nebo plovoucí) schopná ochránit všechny osoby na plavidle proti identifikovaným nebezpečím od nákladu po dobu nejméně 60 minut, během nichž je možná komunikace s pohotovostními a záchrannými službami. Bezpečné útočiště může být integrováno do kormidelny nebo do obytného prostoru. Bezpečné útočiště může být během nehody evakuováno. Bezpečné útočiště je nepřístupné, je-li identifikovaným nebezpečím výbuch. Bezpečné útočiště na plavidle a plovoucí bezpečné útočiště mimo plavidlo jsou certifikovány uznanou klasifikační společností. Bezpečné útočiště na pevnině je konstruováno podle místních právních předpisů;

Bezpečnostní plán v případě havárie plán obsahující hranice vodotěsných částí plavidla sloužící jako základ pro výpočet stability v případě vzniku trhliny v plavidle, opatření k vyrovnání náklonu plavidla, který vznikl vniknutím vody, jakož i všechna uzavírací zařízení, která musí být během plavby uzavřena;

Bezpečnostní poradce osoba, která je v podniku, jehož činnosti zahrnují přepravu, nebo s ní související operace balení, nakládky, plnění nebo vykládky, nebezpečných věcí vnitrozemskou vodní dopravou, odpovědná za pomoc při zabránění rizikům vlastním přepravě nebezpečných věcí;

Biologický/technický název název běžně používaný ve vědeckých a technických příručkách, časopisech a tectech. Obchodní název se pro tyto účely nesmí používat;

Bod vzplanutí (Fp) nejnižší teplota kapaliny, při které její páry tvoří se vzduchem hořlavou směs;

C

CDNI Úmluva o sběru, skladování a přijímání odpadů vzniklých během plavby po Rýnu a jiných vnitrozemských vodních cestách;

CEVNI Evropské pravidla pro plavbu po vnitrozemských / vodních cestách EHK OSN;

CGA Compressed Gas Association (Sdružení pro stlačené plyny) (CGA, 14501 George Carter Way, Suite 103, Chantilly, VA 20151, United States of America);

CIM Jednotná pravidla týkající se smlouvy o mezinárodní železniční nákladní přepravě (Přípojek B Úmluvy o mezinárodní železniční přepravě (COTIF)), se změnami;

Cisterna nádrž včetně své provozní a konstrukční výstroje. Pokud je používán tento pojem samostatně, označuje cisternový kontejner, přemístitelnou cisternu, snímatelnou cisternu, nesnímatelnou cisternu nebo cisternový železniční vůz, jak jsou definovány v této oddílu, včetně cisteren tvořících články bateriových vozidel, bateriových železničních vozů nebo MEGC;

POZNÁMKA: K přemístitelným cisternám viz 6.7.4.1.

Cisterna nesnímatelná cisterna s vnitřním objemem větším než 1000 litrů, která je konstrukčně trvale připevněna k vozidlu (které se tím stává cisternovým vozidlem nebo k železničnímu vozu (který se tím stává cisternovým železničním vozem)) nebo tvoří nedílnou část rámu takového vozidla nebo železničního vozu;

Cisterna pro podtlakové vyčerpávání odpadů nesnímatelná nebo snímatelná cisterna používaná zejména pro přepravu nebezpečných odpadů, se zvláštními konstrukčními vlastnostmi a/nebo zařízením usnadňujícím plnění a vyprazdňování odpadů, jak je uvedeno v kapitole 6.10 ADR. Cisterna, která plně odpovídá požadavkům kapitol 6.7 nebo 6.8 se nepovažuje za cisternu pro podtlakové vyčerpávání odpadů;

Cisterna přemístitelná multimodální cisterna mající, je-li použita pro přepravu plynů, jak jsou definovány v 2.2.2.1.1, vnitřní objem větší než 450 litrů v souladu s definicemi v kapitole 6.7 ADR nebo IMDG Code a uvedená pokynem pro přemístitelné cisterny (T-kódem) ve sloupci (10) tabulky A kapitoly 3.2 ADR;

Cisterna snímatelná cisterna, kromě nesnímatelné cisterny, přemístitelné cisterny, cisternového kontejneru nebo článku bateriového vozidla nebo MEGC, která má vnitřní objem větší než 450 litrů, není konstruována pro přepravu věcí beze změny nákladu a může s ní být normálně manipulováno pouze, když je prázdná; nebo zvláštním zařízením vozu přizpůsobená cisterna, která může být odebrána až po uvolnění upevňovacích prostředků;

Cisternová výměnná nástavba se považuje za cisternový kontejner;

Cisternové vozidlo vozidlo určené pro přepravu kapalin, plynů nebo práškových nebo zrnitých látek a zahrnující jednu nebo více nesnímatelných cisteren. Kromě vlastního vozidla nebo je nahrazujících částí podvozku cisternové vozidlo zahrnuje jednu nebo více nádrží, jejich výstroj a upevňovací prvky pro jejich připevnění na vozidlo nebo na části podvozku;

Cisternový kontejner přepravní prostředek odpovídající definici kontejneru a zahrnující nádrž a její výstroj včetně zařízení umožňujícího přemístění cisternového kontejneru bez významné změny rovnovážné polohy, používaný pro přepravu plynů, kapalin, práškových nebo zrnitých látek a, je-li použit pro přepravu plynů, jak jsou definovány v 2.2.2.1.1, mající vnitřní objem větší než 0,45 m³ (450 litrů);

POZNÁMKA: IBC, které odpovídají požadavkům kapitoly 6.5, se nepovažují za cisternové kontejnery.

Cisternový železniční vůz vůz určený k přepravě kapalin, plynů, práškových nebo zrnitých látek, zahrnující nástavbu, sestávající z jedné nebo více cisteren a jejich výstroje, a podvozek s jeho vlastními součástmi (pojezdem, pérováním, tažným a narážecím ústrojím, brzdami a nápisy);

POZNÁMKA: Za cisternové vozy se považují také vozy se snímatelnými cisternami.

Cívka (třída 1) zařízení vyrobené z plastu, dřeva, lepenky, kovu nebo jiného vhodného materiálu tvořené centrálním vřetenem s nebo bez postranních stěn na každém konci vřetena. Předměty a látky mohou být navinuty na vřeteno a mohou být zadržovány postranními stěnami;

CMNI Úmluva o smlouvě pro přepravu věcí po vnitrozemské vodní cestě (Budapešť, 22. června 2001).

CMR Úmluva o přepravní smlouvě v mezinárodní silniční nákladní dopravě (Ženeva, 19. května 1956), se změnami;

CSC (International Convention for Safe Containers, Ženeva 1972) viz „**KBK**“

Č

Čistá hmotnost výbušniny (NEM) celková hmotnost výbušných látek, bez obalů, pouzder atd. (Čisté množství výbušniny (NEQ), čistý obsah výbušniny (NEC), čistá váha výbušniny (NEW) nebo čistá hmotnost výbušného obsahu se často používají ke sdělení stejného významu);

D

Deflagrace výbuch, který se šíří podzvukovou rychlostí (viz EN 13237:2011);

Detektor plynů přenosné zařízení umožňující měření jakékoli významné koncentrace hořlavých plynů pod dolní mezí výbušnosti, které jasně signalizuje koncentraci takových plynů. Detektory hořlavých plynů mohou být určeny pouze k měření hořlavých plynů, ale také k měření hořlavých plynů a kyslíku. Toto zařízení má být konstruováno tak, aby měření mohlo proběhnout bez nutnosti vstoupit do kontrolovaného prostoru.

Maximální úroveň detekce senzorů je 5% dolní meze výbušnosti nejkritičtější látky v seznamu látek povolených na přepravu v plavidle pro cisternová plavidla nebo nákladu pro plavidla pro suchý náklad. Detektor hořlavých plynů musí být certifikován v souladu s IEC/EN¹ 60079-29-1:2016. Používá-li se v oblasti s nebezpečím výbuchu, musí rovněž splňovat požadavky na použití v dané zóně a musí být doložen doklad o jejich splnění (např. postup posuzování shody podle Směrnice 2014/34/EU,² systém IECEx System,³ ECE/TRADE/391⁴ nebo alespoň jejich ekvivalent);

Detektor neutronového záření přístroj, který zjišťuje neutronové záření. V takovém přístroji může být v hermeticky uzavřeném elektronkovém měničci obsažen plyn, který přeměňuje neutronové záření na měřitelný elektrický signál;

Detektor toxických plynů přenosné zařízení umožňující měření jakékoli významné koncentrace toxických plynů a par. Zařízení musí odpovídat normám EN 45544-1:2015, EN 45544-2:2015, EN 45544-3:2015 a EN 45544-4:2016 nebo normě ISO 17621:2015.

Je-li toto zařízení používáno v prostředí s nebezpečím výbuchu, musí být navíc vhodné pro použití v příslušné zóně a musí být prokázáno, že jsou splněny příslušné požadavky (např. postup posuzování shody podle Směrnice 2014/34/EU⁷, Systém IECEx,⁸ nebo ECE/TRADE/391⁹ nebo alespoň jejich ekvivalentem).

Toto zařízení má být konstruováno tak, aby měření mohlo proběhnout bez nutnosti vstoupit do kontrolovaného prostoru;

¹ IEC/EN znamená: Tato norma existuje jako norma IEC i jako evropská norma.

⁸ <http://iecex.com/rules>.

⁹ Společný předpisový rámec pro zařízení používaná v prostředích s výbušnou atmosférou, OSN, 2011.

Detonace výbuch, který se šíří nadzvukovou rychlostí a je charakterizován tlakovou vlnou (viz EN 13237:2011);

Dočerpávací systém (účinný) systém podle Přílohy II CDNI pro úplné vyprazdňování, je-li to možné, nákladních tanků a potrubí pro nákladku a vykládku, kromě zbytků nákladu;

Dokumentace cisterny složka obsahující všechny důležité technické informace týkající se cisterny, bateriového vozidla nebo MEGC, jako jsou osvědčení zmíněná v 6.8.2.3, 6.8.2.4 a 6.8.3.4 ADR;

Dokumentace plavidla složka obsahující všechny důležité technické údaje týkající se plavidla nebo nákladního říčního člunu jako jsou konstrukční plány a dokumenty k zařízením.

Dolní mez výbušnosti (LEL) znamená nejnižší koncentraci hranice výbušnosti, při které může dojít k výbuchu;

Dopravce podnik, který provádí přepravu podle nebo bez přepravní smlouvy;

Dopravní jednotka motorové vozidlo bez přípojného vozidla nebo jízdní souprava tvořená motorovým a přípojným vozidlem;

Dopravní prostředek pro přepravu po vnitrozemských vodních cestách je jakékoli plavidlo, nákladní prostor nebo definovaná oblast paluby plavidla; pro silniční nebo železniční přepravu je to vozidlo nebo železniční vůz;

Druhy ochrany (viz IEC 60079-0:2011)

Elektrická zařízení (viz IEC 60079-0:2014 nebo alespoň ekvivalent);

EEx (d): pevný závěr (IEC 60079-1: 2014 nebo alespoň ekvivalent);

EEx (e): zajištěné provedení (IEC 60079-7:2016 nebo alespoň ekvivalent);

EEx (m): zalití zalévací hmotou (IEC 60079-18:2014 nebo alespoň ekvivalent);

EEx (p): závěr s vnitřním přetlakem (IEC 60079-2:2015 nebo alespoň ekvivalent);

EEx (q): pískový závěr (IEC 60079-5:2015 nebo alespoň ekvivalent);

Neelektrická zařízení (viz ISO 80079-36:2016 nebo alespoň ekvivalent);

EEx (fr): závěr omezující průtok (EN 13463-2:2005 nebo alespoň ekvivalent);

EEx (d): pevný závěr (EN 13463-3:2005 nebo alespoň ekvivalent);

EEx (c): bezpečná konstrukce (ISO 80079-37:2016 nebo alespoň ekvivalent);

EEx (b): hlídání iniciačních zdrojů (EN 13463-6:2005 nebo alespoň ekvivalent);

EEx (k): kapalinový závěr: (EN 13463-8:2003 nebo alespoň ekvivalent).

Dřevěná IBC viz **IBC dřevěná**

Dřevěný sud obal vyrobený z přírodního dřeva, kruhového průřezu, mající vypouklé stěny, tvořený dužinami a víky a opatřený obručemi;

Dýchací přístroj (nezávislý) přístroj, který zásobuje osobu, která přístroj používá při práci v nebezpečné atmosféře, dýchacím vzduchem pomocí stlačeného vzduchu, který si nese s sebou, nebo pomocí vnějšího přívodu hadic. K takovým přístrojům viz například Evropská norma EN 137:2006 nebo EN 138:1994;

Dýchací přístroj (závislý na vnějším prostředí) přístroj, který chrání osobu při práci v nebezpečné atmosféře vhodným dýchacím filtrem. K takovým přístrojům viz například Evropská norma EN 136:1998. K používaným dýchacím filtrům viz například Evropská norma EN 14387:2004 + A1:2008;

E

EHK OSN znamená Evropskou hospodářskou komisi Organizace spojených Národů (UNECE, Calais des Nations, 8-14 avenue de la Paix, CH-1211 Geneva 10, Switzerland);

Elektrické zařízení chráněné proti stříkající vodě elektrické zařízení, které zkonstruováno tak, že proud vody tryskající z hubice libovolným směrem nezpůsobí žádnou škodu. Zkušební podmínky jsou stanoveny v publikaci IEC 60529, nejnižší stupeň ochrany IP55;

Elektrické zařízení typu „omezené nebezpečí výbuchu“ elektrické zařízení, které během normálního provozu nevyvolá jiskření ani nevykazuje povrchové teploty, které jsou nad 200 °C. Sem patří např.

- třífázové asynchronní motory;
- bezkartáčové generátory s bezdotykovým indukčním buzením;
- pojistky s uzavřeným tavným prvkem;
- bezdotykové elektronické zařízení;

nebo znamená elektrické zařízení s alespoň krytem chráněným proti proudům vody (stupeň ochrany IP55 nebo vyšší), který při normálním provozu nevykazuje povrchové teploty vyšší než 200 °C.

EN (norma) evropská norma uveřejněná Evropským výborem pro normalizaci (CEN) (CEN, Avenue Marnix 17, B-1000 Brusel);

Evakuační plavidlo speciálně vybavený člun s posádkou, zavolaný k záchraně osob v nebezpečí nebo pro jejich evakuaci v nejkratší bezpečné době vzhledem k bezpečnému útočišti nebo bezpečné zóně;

Evakuační prostředky jakékoli prostředky, které mohou být použity osobami k přemístění z nebezpečí do bezpečí při respektování následujících podmínek:
Nebezpečí, která musí být vzata v úvahu, jsou:

- pro třídu 3, obalovou skupinu III, UN 1202, druhou a třetí položku a pro třídy 4.1, 8 a 9 na tankových plavidlech: únik z rozdělovacího potrubí;
- pro jiné látky třídy 3 a třídu 2 a pro hořlavé látky třídy 8 na tankových plavidlech: požár v oblasti rozdělovacího potrubí na palubě a hořící kapalina na vodě;
- pro třídu 5.1 na tankových plavidlech: látky podporující hoření v kombinaci s hořlavými kapalinami mohou způsobit výbuch;
- pro třídu 6.1 na tankových plavidlech: toxické plyny v okolí rozdělovacího potrubí a ve směru větru;
- pro nebezpečné věci na plavidlech pro suchý náklad: nebezpečí vycházející z věcí uložených v nákladních prostorech;

F

Fixační podložka (třída 1) plát kovu, plastu, lepenky nebo jiného vhodného materiálu, který je uložen ve vnitřním obalu, meziobalu nebo vnějším obalu a dosahuje těsného uložení v takovém obalu. Povrch takové fixační podložky může být vytvarován tak, že obaly nebo předměty mohou být vloženy dovnitř, zajištěny a odděleny od sebe navzájem;

Flexibilní IBC viz **IBC flexibilní**

Flexibilní kontejner pro volně ložené látky viz **Kontejner pro volně ložené látky, flexibilní**

G

GHS (Globally Harmonized System of Classification and Labelling of Chemicals) Osmé revidované vydání Globální harmonizovaný systém klasifikace a označování chemických látek, uveřejněný Spojenými národy jako dokument ST/SG/AC.10/30/Rev.8;

GESAMP Společná skupina znalců pro vědecké aspekty ochrany mořského prostředí. Publikace IMO: „The Revised GESAMP Hazard Evaluation Procedure for Chemical Substances Carried by Ships“, GESAMP Reports and Studies No. 64, IMO, London, 2002.

Při aplikaci modelu GESAMP pro účely těchto předpisů je referenční teplota pro relativní hustotu, tenzi par a rozpustnost ve vodě 20 °C. Referenční relativní hustota pro rozlišení mezi plovoucími látkami („floater“) a látkami, které klesají pod hladinu („sinker“) je 1,000 (odpovídající hustotě vody na vnitrozemských vodních cestách 1000 kg/m³);

H

Hadice flexibilní trubkovité polovýrobky z elastomerů, termoplastů nebo z nerezavějící oceli sestávající z jednoho nebo více plášťů a vystýlek;

Hadicové armatury spojky a spojovací prvky hadic;

Hermeticky uzavřená cisterna cisterna, která:

- není vybavena pojistnými ventily, průtržnými kotouči, jinými podobnými pojistnými zařízeními ani podtlakovými ventily; nebo
- je vybavena pojistnými ventily s předřazeným průtržným kotoučem podle 6.8.2.2.10, ale není vybavena podtlakovými ventily.

Cisterna určená pro přepravu kapalin s výpočtovým tlakem nejméně 4 bary nebo určená pro přepravu tuhých látek (práškovitých nebo zrnitých), bez ohledu na svůj výpočtový tlak, je rovněž považována za hermeticky uzavřenou, jestliže:

- je vybavena pojistnými ventily s předřazeným průtržným kotoučem podle 6.8.2.2.10 a podtlakovými ventily podle požadavků v 6.8.2.2.3; nebo
- není vybavena pojistnými ventily, průtržnými kotouči nebo jinými podobnými pojistnými zařízeními, ale je vybavena podtlakovými ventily podle požadavků v 6.8.2.2.3“.

Hmotnost kusu pokud není stanoveno jinak, je to celková (brutto) hmotnost kusu. Hmotnost kontejnerů, cisteren, vozidel a železničních vozů používaných pro přepravu věcí se do celkové (brutto) hmotnosti nezahrnuje;

Horní mez výbušnosti (UEL) znamená nejvyšší koncentraci hranice výbušnosti, při které může dojít výbuchu.

Hořlavá složka (pro aerosoly) hořlavé kapaliny, hořlavé tuhé látky nebo hořlavé plyny a směsi plynů, jak jsou definovány v poznámkách 1 až 3 pododdílu 31.1.3 části III Příručky zkoušek a kritérií. Tento pojem nezahrnuje pyroforní látky, látky schopné samoohřevu ani látky reagující s vodou. Chemické spalné teplo se určí jednou z následujících metod ASTM D 240, ISO/FDIS 13943: 1999 (E/F) 86.1 až 86.3 nebo NFPA 30B;

Hromadná položka položka pro definovanou skupinu látek nebo předmětů (viz 2.1.1.2, B, C a D);

Hustota se vyjadřuje v kg/m³. V případě opakování se použije jen číslo;

CH

Chráněná IBC viz **IBC chráněná**

Chráněná oblast

Veškeré následující prostory na palubě plavidel pro suchý náklad:

- (a) nákladní prostor nebo nákladní prostory (vyžaduje-li se ochrana proti explozi, zóna 1);
- (b) prostor, který se nachází na palubě (vyžaduje-li se ochrana proti explozi, zóna 2), který je ohraničen:
 - (i) příčně vertikálními rovinami, které sbíhají s boky plavidla;
 - (ii) v podélném směru vertikálními rovinami, které sbíhají s přepážkami nákladních prostorů;
 - (iii) směrem nahoru horizontální rovinou probíhající 2,00 m nad vrchní hranou nákladu, nejméně však horizontální rovinou probíhající 3,00 m nad palubou.

I

IAEA (International Atomic Energy Agency) Mezinárodní agentura pro atomovou energii (IAEA), (IAEA, P.O. Box 100 – A-1400 Vídeň);

IAEA Pravidla pro bezpečnou přepravu radioaktivních látek jedno z vydání těchto předpisů:

- (a) Pro vydání 1985 a 1985 (ve znění 1990): IAEA Řada bezpečnostních standardů č. 6;
- (b) Pro vydání 1996: IAEA Řada bezpečnostních standardů č. ST-1;
- (c) Pro vydání 1996 (revidované): IAEA Řada bezpečnostních standardů č. TS-R-1 (ST-1 revidované)
- (d) Pro vydání 1996 (ve znění 2003), 2005 a 2009: IAEA Řada bezpečnostních standardů č. TS-R-1;
- (e) Pro vydání 2012: IAEA Řada bezpečnostních standardů č. SSR-6;
- (f) Pro vydání 2018: IAEA Řada bezpečnostních standardů č. SSR-6 (Rev.1);

IBC (Intermediate bulk container) tuhý nebo flexibilní přepravní obalový prostředek, který není uveden v kapitole 6.1 ADR a který:

- (a) má vnitřní objem:
 - (i) nejvýše 3 m³ pro tuhé a kapalné látky obalových skupin II a III;
 - (ii) nejvýše 1,5 m³ pro tuhé látky obalové skupiny I, jestliže jsou baleny ve flexibilních IBC, v IBC z tuhého plastu, v kompozitních, lepenkových nebo dřevěných IBC;
 - (iii) nejvýše 3 m³ pro tuhé látky obalové skupiny I, jestliže jsou baleny v kovových IBC;
 - (iv) nejvýše 3 m³ pro radioaktivní látky třídy 7;
- (b) je zkonstruován pro mechanickou manipulaci;
- (c) odolává namáháním při manipulaci a přepravě ověřeným zkouškami uvedenými v kapitole 6.5 ADR;

POZNÁMKA 1: Přemístitelné cisterny nebo cisternové kontejnery splňující požadavky kapitoly 6.7 nebo 6.8 se nepovažují za velké nádoby pro volně ložené látky (IBC).

POZNÁMKA 2: Velké nádoby pro volně ložené látky (IBC) splňující požadavky kapitoly 6.5 ADR se nepovažují za kontejnery pro účely ADN.

IBC Code je Mezinárodní řád pro stavbu a vybavení pravidel přepravujících nebezpečné chemikálie ve volně loženém stavu, vydaný Mezinárodní námořní organizací (IMO);

IBC dřevěná tuhé nebo skládací dřevěné těleso společně s vnitřní vložkou (avšak nikoli s vnitřním obalem) a příslušnou provozní a konstrukční výstrojí;

IBC flexibilní těleso nádoby tvořené fólií, tkaninou nebo jiným flexibilním materiálem nebo kombinací těchto materiálů, a v nezbytném případě vnitřním povlakem nebo vložkou, spolu s příslušnou provozní výstrojí a manipulačním zařízením;

IBC chráněná (pro kovové IBC) IBC vybavená dodatečnou ochranou proti nárazu mající formu např. vícevrstvé (sendvičové) konstrukce nebo konstrukce s dvojitou stěnou nebo rámu s kovovým mřížovým opláštěním;

IBC kompozitní s vnitřní nádobou z plastu IBC sestávající z konstrukční výstroje tvořené tuhým vnějším pláštěm obklopujícím vnitřní plastovou nádobu s jakoukoliv provozní výstrojí nebo další konstrukční výstrojí. Je provedena tak, že vnitřní nádoba a vnější plášť tvoří po sestavení nedělitelnou jednotku, která se jako taková plní, skladuje, přepravuje nebo vyprazdňuje.

POZNÁMKA: „Plast“, pokud je použit ve spojení s vnitřními nádobami pro kompozitní IBC, zahrnuje jiné polymerní materiály, takové jako je guma.

IBC kovová kovové těleso společně s příslušnou provozní a konstrukční výstrojí;

IBC lepenková lepenkový plášť s nebo bez oddělených horních a dolních vík, popřípadě s vnitřní vložkou (avšak bez vnitřních obalů), a s příslušnou provozní výstrojí a konstrukční výbavou;

IBC z tuhého plastu tuhé těleso z plastu, které může mít konstrukční výstroj společně s příslušnou provozní výstrojí;

ICAO International Civil Aviation Organization (Mezinárodní organizace pro civilní letectví) (ICAO, 999 University Street, Montreal, Quebec H3C 5H7, Canada);

ICAO Technické pokyny Technical Instructions for the Safe Transport of Dangerous Goods by Air, které doplňují Přílohu 18 Chicagské úmluvy o mezinárodním civilním letectví (Chicago 1944), uveřejněné Mezinárodní organizací pro civilní letectví (ICAO) v Montrealu;

Identifikační číslo číslo určené k identifikaci látky, které nebylo přiděleno UN číslo nebo která nemůže být přiřazena pod hromadnou položku s UN číslem.
Tato čísla mají čtyři číslice začínající číslicí 9;

IEC Mezinárodní elektrotechnická komise;

IMO International Maritime Organization (Mezinárodní námořní organizace) (IMO, 4 Albert Embankment, London SE1 7SR, United Kingdom);

IMSBC Code Mezinárodní námořní předpis pro tuhé volně ložené náklady Mezinárodní námořní organizace (IMO);

Index bezpečné podkritičnosti (CSI) přidělený kusu, přepravnímu obalovému souboru nebo kontejneru se štěpnými látkami pro přepravu radioaktivních látek je číslo, pomocí kterého se omezuje nahromadění kusů, přepravních obalových souborů nebo kontejnerů obsahujících štěpné látky;

Inspekční organizace nezávislá monitorovací a ověřovací organizace certifikovaná příslušným orgánem;

UIC International Union of Railways (Mezinárodní železniční unie) (UIC, 16 rue Jean Rey, F-75015 Paris, France);

IMDG Code (International Maritime Dangerous Goods Code) předpisy pro mezinárodní námořní přepravu nebezpečných věcí naplňující kapitulu VII, část A Mezinárodní úmluvy o bezpečnosti života na moři – International Convention for the Safety of Life at Sea, 1974 (SOLAS), vydané Mezinárodní námořní organizací (IMO), Londýn;

Instruktaž předávání know-how nebo školení, jak něco dělat nebo jak postupovat. To předávání know-how nebo školení může být zajištěno interně vlastním personálem;

ISO (norma) mezinárodní norma uveřejněná Mezinárodní organizací pro standardizaci (ISO) (ISO, 1 rue de Varembe, CH-1204, Geneva 20);

J

J.N. položka (jinde nejmenovaná položka) hromadná položka, k níž mohou být látky, směsi, roztoky nebo předměty přiřazeny, jestliže:

- (a) nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2; a
- (b) vykazují chemické, fyzikální a/nebo nebezpečné vlastnosti odpovídající třídě, klasifikačnímu kódu, obalové skupině a pojmenování a popisu položky j.n.;

K

Kalové plavidlo tankové plavidlo typu N, otevřené, s nosností až do 300 tun, zkonstruované a vybavené pro příjem a přepravu lodních provozních odpadů obsahujících oleje a maziva. Plavidla bez nákladních tanků se považují za plavidla podléhající ustanovením kapitol 9.1 nebo 9.2;

Kaly směs zbytků nákladu s mycí vodou, rzí nebo usazeninami, která může být nebo nemusí být vhodná k vyčerpání;

Kanystř obal z kovu nebo plastu, pravoúhelníkového nebo mnohoúhelníkového průřezu s jedním nebo více otvory;

Kapalina látka mající při 50 °C tenzi par nejvýše 300 kPa (3 bary), která není kompletně v plynném stavu při 20 °C a 101,3 kPa a která

- (a) má bod tání nebo bod počátku tání nejvýše 20 °C při tlaku 101,3 kPa; nebo
- (b) je kapalná podle zkušební metody ASTM D 4359-90; nebo
- (c) není kašovitá podle kritérií vztahujících se na zkoušku pro stanovení tekutosti (penetrometrická zkouška) popsanou v 2.3.4;

POZNÁMKA: „Přepřavou v kapalném stavu“ ve smyslu požadavků na cisterny se rozumí:

- přepřava kapalin podle výše uvedené definice, nebo
- přepřava tuhých látek podaných k přepřavě v roztaveném stavu.

Kategorií zařízení (viz směrnice 2014/34/EU²) se rozumí klasifikace zařízení, která mají být používána v oblasti s rizikem výbuchu, a stanoví požadovanou úroveň ochrany, která má být zajištěna.

Kategorie zařízení 1 zahrnuje zařízení konstruovaná tak, aby byla schopna provozu v souladu s provozními parametry stanovenými výrobcem a zajišťovat velmi vysokou úroveň ochrany.

Zařízení v této kategorii je určeno pro použití v oblastech, kde je výbušná atmosféra způsobená směsí vzduchu a plynů, par nebo mlhy nebo směsí vzduchu a prachu nepřetržitě, po dlouhou dobu nebo často.

Zařízení v této kategorii musí zajistit požadovanou úroveň ochrany, a to i v případě mimořádných událostí týkajících se zařízení, a je charakterizováno prostředky ochrany, u nichž:

- Budto, v případě selhání jednoho ochranného prostředku, poskytuje požadovanou úroveň ochrany alespoň jeden nezávislý druhý prostředek; nebo
- je zajištěna požadovaná úroveň ochrany v případě dvou poruch, které se vyskytnou nezávisle na sobě.

Zařízení kategorie 1 v souladu se směrnicí 2014/34/EU⁴ je označeno jako II 1 G. Takové zařízení odpovídá EPL⁵ 'Ga' podle IEC 60079-0.

Zařízení kategorie 1 je vhodné pro použití v zónách 0,1 a 2.

Kategorie zařízení 2 zahrnuje zařízení konstruovaná tak, aby byla schopna provozu v souladu s provozními parametry stanovenými výrobcem a zajišťovat vysokou úroveň ochrany.

Zařízení v této kategorii je určeno pro použití v oblastech, ve kterých se příležitostně vyskytuje výbušná atmosféra způsobená směsí vzduchu a plynů, par nebo mlhy nebo směsí vzduchu a prachu.

Prostředky ochrany zařízení v této kategorii zajišťují požadovanou úroveň ochrany i v případě často se vyskytujících poruch nebo závad zařízení, které se obvykle musí brát v úvahu.

Zařízení kategorie 2 v souladu se směrnicí 2014/34/EU² je označeno jako II 2 G. Takové zařízení odpovídá EPL⁵ 'Ga' podle IEC 60079-0.

Zařízení kategorie 2 je vhodné pro použití v zónách 1 a 2.

² Úřední věstník Evropské unie č. L 96 z 29.3.2014, str. 309.

⁴ Úřední věstník Evropské unie č. L 96 z 29.3.2014, str. 309.

Kategorie zařízení 3 zahrnuje zařízení konstruovaná tak, aby byla schopna provozu v souladu s provozními parametry stanovenými výrobcem a zajišťovat normální úroveň ochrany.

Zařízení v této kategorii je určeno pro použití v oblastech, ve kterých je nepravděpodobný výskyt výbušné atmosféry způsobené směsí vzduchu a plynů, par nebo mlhy nebo směsí vzduchu a prachu, nebo, pokud se vyskytne, pak jen na krátkou dobu.

Zařízení v této kategorii zajišťuje požadovanou úroveň ochrany během normálního provozu.

Zařízení kategorie 3 v souladu se směrnicí 2014/34/EU² je označeno jako II 3 G. Takové zařízení odpovídá EPL¹ 'Ga' podle IEC 60079-0.

Zařízení kategorie 3 je vhodné pro použití v zóně 2;

KBK Mezinárodní úmluva o bezpečných kontejnerech (International Convention for Safe Containers) (Ženeva, 1972) se změnami, uveřejněná Mezinárodní námořní organizací (International Maritime Organization – IMO), Londýn;

Klasifikační společnost (uznaná) klasifikační společnost, která je uznána příslušnými orgány podle kapitoly 1.15;

Kofrdam příčně položený oddíl plavidla, ohraničený vodotěsnými přepážkami, který může být kontrolován. Kofrdam musí pokrývat celou plochu koncových přepážek nákladních tanků. Přepážka odvrácená od oblasti nákladu (vnější přepážka kofrdamu) musí vést od jednoho boku plavidla k druhému a ode dna k palubě v jedné rovině žeber;

Kompozitní IBC s vnitřní nádobou z plastu viz **IBC kompozitní s vnitřní nádobou z plastu**

Kompozitní obal viz **Obal kompozitní**

Kompozitní obal (plast) viz **Obal kompozitní (plast)**

Konstrukční tlak tlak, na jehož základě byl nákladní tank nebo zbytkový tank zkonstruován a vyroben.

Konstrukční životnost pro kompozitní láhve a trubkové nádoby je maximální životnost (v počtu roků), pro kterou je láhev nebo trubková nádoba zkonstruována a schválena podle platné normy;

Kontejner přepravní prostředek (výměnná skříň nebo jiná podobná konstrukce):

- určený ke stálému používání a dostatečně dimenzovaný pro opakované použití;
- speciálně zkonstruovaný pro usnadnění přepravy věcí jedním nebo více druhy dopravy beze změny nákladu;
- opatřený zařízením pro usnadnění manipulace, zvláště při jeho překládce z jednoho dopravního prostředku na jiný;
- zkonstruovaný tak, aby mohl být lehce naplněn a vyprázdněn.
- mající vnitřní objem nejméně 1 m³, s výjimkou kontejnerů pro přepravu radioaktivních látek

Kromě toho:

Kontejner malý kontejner, který má vnitřní objem nejvýše 3 m³;

Výměnná nástavba je kontejner, který má podle Evropské normy EN 283 (vydání 1991) následující charakteristiky:

- z hlediska mechanického namáhání je zkonstruován pouze pro pozemní přepravu na železničním voze nebo silničním vozidle nebo na plavidla v systému roll-on roll-off;
- nemůže být stohován;

¹ Zkratka EPL znamená: Úroveň ochrany zařízení.

- může být přemístěn z vozidla na podpěry a naložen zpět pomocí zařízení vozidla.

Kontejner nekrytý kontejner beze střechy nebo plošinový kontejner;

Kontejner s plachtou nekrytý kontejner opatřený plachtou pro ochranu nákladu;

Kontejner velký

- (a) kontejner, který nespĺňuje definici malého kontejneru;
- (b) ve smyslu dohody KBK (CSC) kontejner s takovými rozměry, že ložná plocha mezi čtyřmi vnějšími dolními rohy je buď
 - (i) nejméně 14 m² (150 čtverečných stop), nebo
 - (ii) nejméně 7 m² (75 čtverečných stop), pokud je vybaven horními rohovými prvky;

Kontejner uzavřený plně uzavřený kontejner s pevnou střešou, pevnými bočními stěnami, pevnými koncovými stěnami a podlahou. Tento pojem zahrnuje kontejner s otevíratelnou střešou, pokud je během přepravy uzavřena.

POZNÁMKA: Pojem „kontejner“ nezahrnuje obvyklé obaly, IBC, cisternové kontejnery vozidla ani železniční vozy. Kontejner však smí být použit jako obal pro přepravu radioaktivních látek.

Kontejner MEGC viz *Vícečlánkový kontejner na plyn (MEGC)*;

Kontejner pro volně ložené látky přepravní prostředek (včetně všech vložek nebo vyložení) určené pro přepravu tuhých látek, které jsou v přímém styku s tímto přepravním prostředkem. Tento pojem nezahrnuje obaly, IBC, velké obaly ani cisterny;

Kontejner pro volně ložené látky je:

- trvalé povahy a dostatečně pevné, aby byly vhodné pro opakované použití;
- speciálně zkonstruované pro usnadnění přepravy věcí jedním nebo více dopravními prostředky bez překládky nákladu;
- opatřené prostředky dovolujícími jejich snadnou manipulaci;
- o vnitřním objemu nejméně 1,0 m³.

Příklady kontejnerů pro volně ložené látky jsou kontejnery, kontejnery pro přepravu volně ložených látek v systému off shore, skipové nádoby, zásobníky na volně ložené látky, výměnné nástavby, násypné kontejnery, valivé kontejnery, ložné komory vozidel nebo železničních vozů.

POZNÁMKA: Tato definice platí jen pro cisternové kontejnery pro volně ložené látky splňující požadavky kapitoly 6.11 ADR.

Uzavřený kontejner pro volně ložené látky zcela uzavřený kontejner pro volně ložené látky mající tuhou střešou, boční stěny, koncové stěny a podlahu (včetně den výsypného typu). Tento pojem zahrnuje kontejnery pro volně ložené látky s otevírací střešou, boční nebo koncovou stěnou, které mohou být během přepravy uzavřeny. Uzavřené kontejnery pro volně ložené látky smějí být opatřeny otvory, které umožňují výměnu par a plynů se vzduchem a které zabraňují za normálních podmínek přepravy ztrátě tuhého obsahu, jakož i vnikání deště a stříkající vody;

Kontejner s plachtou pro volně ložené látky kontejner pro volně ložené látky s otevřeným vrchem, s tuhým dnem (včetně dna výsypného typu), bočními a koncovými stěnami a s netuhou střešou;

Kontejner pro volně ložené látky, flexibilní flexibilní kontejner o vnitřním objemu nejvýše 15 m³, s vnitřními vložkami a přípevnými manipulačními prostředky a provozní výstrojí;

Kontejner pro přepravu volně ložených látek v systému off shore kontejner pro přepravu volně ložených látek, speciálně zkonstruovaný pro opakované použití k přepravě z přiběžných zařízení, do těchto zařízení a mezi nimi navzájem. Kontejner pro přepravu volně ložených látek je zkonstruován

a vyroben podle předpisů pro schvalování kontejnerů manipulovaných na širých mořích vypracovaných Mezinárodní námořní organizací (IMO) v dokumentu MSC/Circ.860;

Kontejner s plachtou pro volně ložené látky viz **Kontejner pro volně ložené látky**;

Kontejnementový systém pro přepravu radioaktivních látek je soubor částí obalu specifikovaný konstruktérem, který má zabránit unikání radioaktivních látek během přepravy;

Koš vnější obal s neplnými stěnami;

Kovová IBC viz **IBC kovová**

Kritická teplota teplota, nad níž se nemůže látka vyskytovat v kapalném stavu;

Kritická teplota teplota, při které musí být učiněna nouzová opatření v případě selhání ovládání teploty.

Kryogenní nádoba viz **Nádoba kryogenní**

Kryt pojistky proti prošlehnutí plamenů část lapače plamenů, jejímž hlavním účelem je tvořit vhodný plášť pro pojistku proti prošlehnutí plamene a zajistit mechanické spojení s jinými systémy;

Krytý železniční vůz je vůz se stěnami a s pevnou nebo pohyblivou střechou;

Kus konečný produkt balení sestávající z obalu nebo velkého obalu nebo IBC a z jejich obsahu, připravený k přepravě. Pojem zahrnuje nádoby na plyny, jak jsou definovány v tomto oddílu, jakož i předměty, které vzhledem k jejich rozměrům, hmotnosti nebo tvaru mohou být přepravovány bez obalu nebo v lůžkách, latěních nebo manipulačních přípravcích.

S výjimkou přepravy radioaktivních látek se tento pojem nevztahuje na věci, které se přepravují volně ložené, ani na látky přepravované v cisternách.

Na pravidlech tento pojem zahrnuje také vozidla, železniční vozy, kontejnery (včetně výměnných nástaveb), cisternové kontejnery, přemístitelné cisterny, bateriová vozidla, bateriové železniční vozy cisternová vozidla, cisternové železniční vozy a vícečlánkové kontejnery na plyn (MEGC).

POZNÁMKA: K radioaktivním látkám viz 2.2.7.2, 4.1.9.1.1 a 6.4 ADR.

L

Láhev přemístitelná tlaková nádoba s hydraulickým vnitřním objemem nejvýše 150 litrů (viz též „Svazek lahví“).

Lapač plamenů zařízení namontované do otvoru části instalace nebo do spojovacího potrubí instalačního systému, jehož účelem je dovést průtok, ale zabránit prošlehnutí plamene. Toto zařízení musí být odzkoušeno podle Evropské normy EN ISO 16852:2010;

Latění vnější obal s neplnými stěnami;

LEL viz **Dolní mez výbušnosti**

Lepenková IBC viz **IBC lepenková**

M

Malá nádobka obsahující plyn (plynová kartuše) nádoba na jedno použití s hydraulickým vnitřním objemem nepřesahujícím 1000 ml pro nádobky vyrobené z kovu a nepřesahujícím 500 ml pro nádobky vyrobené ze syntetického materiálu nebo ze skla, obsahující plyn nebo směs plynů pod tlakem. Může být vybavena ventilem;

Malý kontejner viz **Kontejner malý**

Manipulační prvky (pro flexibilní IBC) nosné pásy, popruhy, oka, poutka nebo rámy, které jsou připevněny k tělesu nádoby IBC nebo vytvořeny z materiálu tělesa nádoby;

Materiál živočišného původu jsou těla mrtvých zvířat (kadávery), části zvířecích těl nebo potraviny nebo krmiva pocházející ze zvířat;

MEGC viz *Vícečlánkový kontejner na plyn*;

MEMU viz *Mobilní jednotka přepravující výbušniny*

Měřicí otvor uzavíratelný otvor nádob na zbytky a nádob na kaly o průměru nejvýše 0,10 m. Otvor musí být navržen tak, aby bylo možné určit stupeň naplnění pomocí měřících tyčí;

Měřicí přístroj kyslíku přenosné zařízení umožňující měření jakéhokoli významného snížení obsahu kyslíku ve vzduchu. Měřicí přístroj kyslíku může být buď zařízení určené pouze pro měření kyslíku, nebo část kombinovaného zařízení pro měření jak hořlavých plynů, tak kyslíku. Toto zařízení má být konstruováno tak, aby měření mohlo proběhnout bez nutnosti vstoupit do kontrolovaného prostoru.

Musí být testováno v souladu s IEC/EN4 5010¹:2010. Používá-li se v prostředí s nebezpečím výbuchu, musí rovněž splňovat požadavky na použití v dané zóně a musí být doložen doklad o jejich splnění (např. postup posuzování shody podle Směrnice 2014/34/EU,² systém IECEx System,³ ECE/TRADE/391⁴ nebo alespoň jejich ekvivalent);

Mezinárodní předpisy jsou ADR, IMSBC Code, ICAO-TI, IMDG Code nebo RID;

Meziobal obal umístěný mezi vnitřními obaly nebo předměty a vnějším obalem;

Mobilní jednotka připravující výbušniny jednotka, nebo vozidlo smontované s jednotkou, pro přípravu a nabíjení výbušnin z nebezpečných věcí, které nejsou výbušninami. Jednotka sestává z různých cisteren a kontejnerů pro volně ložené látky a provozní výstroje, jakož i čerpadel a příslušného zařízení. MEMU může mít zvláštní komory pro balené výbušniny;

POZNÁMKA: I když definice MEMU zahrnuje výraz „příprava a nabíjení výbušnin“ vztahují se požadavky na MEMU pouze na přepravu a nikoli na přípravu a nabíjení výbušnin.“

Motor na palivové články prostředek používaný k pohonu zařízení, který sestává z palivového článku a jeho zásoby paliva, ať už je tato zásoba paliva s palivovým článkem integrována, nebo je od něj oddělena, a zahrnuje veškeré příslušenství nutné k plnění své funkce;

Možnost ohřevu nákladu zařízení pro ohřev nákladu v nákladních tancích za použití tepelného izolátoru. Tepelný izolátor může být vyhříván pomocí kotle tankového plavidla (zařízení pro ohřev nákladu podle 9.3.2.42 nebo 9.3.3.42) nebo z břehu;

N

Nádoba prostředek pro naplnění a udržení látek nebo předmětů, včetně všech uzávěrů. Tato definice se nevztahuje na nádrže cisteren;

Nádoba (třída 1) zahrnuje bedny, láhve, plechovky, sudy, konve nebo pouzdra, včetně jakýchkoli uzávěrů, používané jako vnitřní obal nebo meziobal;

Nádoba kryogenní přemístitelná tepelně izolovaná tlaková nádoba pro hluboce zchlazené zkapalněné plyny s hydraulickým vnitřním objemem nejvýše 1000 litrů (viz též *Nádoba kryogenní, otevřená*);

Nádoba kryogenní, otevřená přepravitelná tepelně izolovaná nádoba na hluboce zchlazené zkapalněné plyny udržovaná na atmosférickém tlaku průběžným odvětráváním hluboce zchlazeného zkapalněného plynu;

¹ IEC/EN znamená: Tato norma existuje jako norma IEC i jako evropská norma.

² Úřední věstník Evropské unie č. L 96 z 29.3.2014, str. 309.

³ <http://iecex.com/rules>.

⁴ Společný předpisový rámec pro zařízení používaná v prostředích s výbušnou atmosférou, OSN, 2011

Nádoba na kaly ohnivzdorná nádoba, kterou lze uzavřít víkem určeným ke sběru kalu, které nejsou vhodné pro čerpání. Nádoba musí být schválena podle ADR, RID nebo předpisu IMDG Code a povolena pro danou látku. Maximální přípustná kapacita je 450 l. Měla by být snadno ovladatelná a označená nápisem „SLOP“ (výška nápisu: 0,10 m);

Nádoba na zbytkové produkty IBC, cisternový kontejner nebo přemístitelná cisterna určené ke shromažďování zbytkového nákladu, mycí vody, zbytků nákladu nebo kalů, které jsou vhodné pro čerpání. Nádoba musí být schválena podle ADR, RID nebo předpisu IMDG Code a povolena pro danou látku. Maximální přípustná kapacita IBC je 3 m³ a cisternového kontejneru nebo přemístitelná cisterna je 12 m³;

Nádoba tlaková společný název, který zahrnuje láhve, trubkové nádoby, tlakové sudy, uzavřené kryogenní nádoby, zásobníkové systémy s hydridem kovu, svazky lahví a záchranné tlakové nádoby;

Nádoba trubková přepravitelná tlaková nádoba bezešvé nebo kompozitní konstrukce s hydraulickým vnitřním objemem větším než 150 litrů, nejvýše však 3 000 litrů;

Nádoba tuhá vnitřní (pro kompozitní IBC) nádoba, která zachovává svůj původní tvar, když je prázdná, bez svých uzávěrů a bez podpory vnějšího pouzdra. Jakákoli vnitřní nádoba, která není „tuhá“, je považována za flexibilní;

Nádoba vnitřní nádoba vyžadující vnější obal, aby mohla plnit svoji obalovou funkci;

Nakládká všechny činnosti vykonávané nakládcem podle definice nakládky;

Nákladní prostor část plavidla, která je, buď otevřená, nebo uzavřená krytem, vepředu a vzadu ohraničená přepážkou a která je určena pro přepravu věcí v kusech nebo ve volně loženém stavu. Horním ohraničením nákladního prostoru je horní hrana jícnu. Náklady přesahující horní hranu jícnu se považují za náklady uložené na palubě;

Nákladní potrubí viz *Potrubí pro nakládku a vykládku (nakládací a vykládací potrubí)*

Nákladní prostor (prázdný) nákladní prostor, který po vyložení neobsahuje žádné suché zbytky nákladu (vymetený);

Nákladní prostor (vyložený) nákladní prostor, který smí po vyložení obsahovat nějaké suché zbytky nákladu;

Nákladní dopravní jednotka vozidlo, železniční vůz, kontejner, cisternový kontejner, přemístitelná cisterna nebo MEGC;

Nákladní tank tank, který je trvale připevněn k plavidlu a je určen pro přepravu nebezpečných věcí;

Konstrukce nákladního tanku:

- (a) **Tlakový nákladní tank** nákladní tank nezávislý na trupu plavidla, postavený podle speciálních uznaných norem pro provozní tlak ≥ 400 kPa;
- (b) **Uzavřený nákladní tank** nákladní tank spojený s vnější atmosférou pomocí zařízení zamezujícího nepřijatelnému vnitřnímu přetlaku nebo podtlaku;
- (c) **Otevřený nákladní tank s pojistkou proti prošlehnutí plamene** nákladní tank spojený s vnější atmosférou pomocí zařízení vybaveného pojistkou proti prošlehnutí plamene;
- (d) **Otevřený nákladní tank** nákladní tank v otevřeném spojení s vnější atmosférou;

Typ nákladního tanku:

- (a) **Nezávislý nákladní tank** nákladní tank, který je trvale zabudován, ale který je nezávislý na konstrukci plavidla;
- (b) **Integrovaný nákladní tank** nákladní tank, který je tvořen vlastní konstrukcí plavidla a je obklopený vnější obšívkou nebo stěnami oddělenými od vnější obšívky;

- (c) *Nákladní tank se stěnami nezávislými na vnější obšívce* integrovaný nákladní tank, jehož dno a boční stěny tvoří vnější obšívku plavidla nebo nezávislý nákladní tank;
- (d) *Membránový tank* nákladní tank, který se skládá z tenké kapalino-těsné a plynotěsné vrstvy (membrány) a izolace nesené přilehlým trupem a vnitřní strukturou dna plavidla s dvojitou obšívkou.

Nákladní tank (odplynovaný) nákladní tank, který po vyložení neobsahuje žádný zbytkový náklad, ani žádnou měřitelnou koncentraci nebezpečných plynů a výparů;

Nákladní tank (prázdný) nákladní tank, který po vyložení neobsahuje žádný zbytkový náklad, ale smí být neodplyněný;

Nákladní tank (vyložený) nákladní tank, který smí po vyložení obsahovat nějaký zbytkový náklad;

Nakládce podnik, který

- (a) nakládá balené nebezpečné věci, malé kontejnery nebo přemístitelné cisterny do dopravního prostředku nebo na dopravní prostředek, nebo do kontejneru; nebo
- (b) nakládá kontejner, kontejner pro volně ložené látky, MEGC, cisternový kontejner nebo přemístitelnou cisternu na dopravní prostředek; nebo
- (c) nakládá vozidlo nebo železniční vůz do plavidla nebo na plavidlo.

Nařízení OSN nařízení připojené k Dohodě, které se týká přijetí jednotných technických předpisů pro zařízení a části kolových vozidel, které mohou být namontovány nebo používány na kolových vozidlech, a podmínky pro vzájemné uznávání schválení udělených na základě těchto předpisů (Dohoda z roku 1958, ve znění pozdějších předpisů).

Nebezpečné reakce jsou

- hoření nebo vývin značného tepla;
- vývin hořlavých, dusivých, hoření podporujících nebo toxických plynů;
- tvoření žíravých látek;
- tvoření nestabilních látek; nebo
- nebezpečné zvýšení tlaku (pouze pro cisterny a nákladní tanky);

Nebezpečné věci látky a předměty, jejichž přeprava je podle ADN zakázána, nebo připuštěna pouze za podmínek v ní stanovených;

Nejvyšší čistá (netto) hmotnost nejvyšší čistá hmotnost obsahu v samostatném obalu nebo nejvyšší součtová hmotnost vnitřních obalů a jejich obsahu vyjádřená v kilogramech;

Nejvyšší dovolená celková hmotnost

- (a) (pro IBC) hmotnost IBC a její provozní a konstrukční výstroje a nejvyšší čistá (netto) hmotnost;
- (b) (pro cisterny) vlastní hmotnost cisterny a nejvyšší dovolená užitečná hmotnost;

POZNÁMKA: K přemístitelným cisternám viz kapitulu 6.7.

Nejvyšší normální provozní tlak pro přepravu radioaktivních látek je nejvyšší přetlak při průměrné výšce nad hladinou moře, který může vzniknout v kontejnmentovém systému v průběhu jednoho roku za teplotních podmínek a slunečního záření odpovídajících okolním podmínkám, bez odvětrávání, vnějšího chlazení pomocným systémem nebo provozních kontrol během přepravy;

Nejvyšší provozní tlak (přetlak) nejvyšší tlak, který vznikne v nákladním tanku nebo zbytkovém tanku během provozu. Tento tlak se rovná otevíracímu tlaku vysokorychlostních ventilů nebo odlehčovacích (odpouštěcích) ventilů.

Nejvyšší vnitřní objem nejvyšší vnitřní objem nádob nebo obalů včetně IBC a velkých obalů, vyjádřený v krychlových metrech nebo litrech;

Nejvyšší třída pravidlo může patřit do nejvyšší třídy, jestliže

- trup plavidla, včetně kormidla a manévrovacího zařízení a vybavení kotvami a řetězy, odpovídá pravidlům a předpisům uznané klasifikační společnosti a byl postaven a vyzkoušen pod jejím dohledem;
- pohonné zařízení, jakož i pomocné stroje, strojní a elektrická zařízení nutné pro palubní provoz, byly vyrobeny a vyzkoušeny podle pravidel a předpisů této klasifikační společnosti, jejich instalace byla provedena pod jejím dohledem a kompletní zařízení bylo po instalaci přezkoušeno k její spokojenosti;

Nekryté vozidlo vozidlo, jehož ložná plocha je tvořena jen plošinou nebo je opatřena pouze bočnicemi a zadním čelem;

Nekrytý kontejner viz **Kontejner nekrytý**

Nekrytý vůz vůz, jehož ložná plocha je tvořena jen plošinou nebo je opatřena pouze čely a bočnicemi;

Nesnadno hořlavý je materiál, který sám o sobě není snadno hořlavý nebo alespoň, jehož vnější povrch není snadno hořlavý a omezuje šíření ohně na vhodnou míru.

Pro určení hořlavosti se uznává postup IMO, Rezoluce A.653(16), nebo jakékoli ekvivalentní předpisy smluvní strany;

Nesnímatelná cisterna viz **Cisterna nesnímatelná**

O

Obal jedna nebo více nádob a všechny jiné součásti nebo materiály nezbytné k tomu, aby nádoby mohly plnit svou obalovou funkci a jiné bezpečnostní funkce (viz také „*Obal kompozitní*“, „*Obal obnovený (rekondiciovaný obal)*“, „*Obal opakovaně použitelný*“, „*Obal prachotěsný*“, „*Obal rekonstruovaný*“, „*Obal skupinový*“, „*Obal velký, opakovaně použitelný*“, „*Obal velký, rekonstruovaný*“, „*Obal vnější*“, „*Obal vnitřní*“, „*Obal z jemného plechu*“, „*Obal záchranný*“, „*Obal záchranný velký*“);

Obal kompozitní obal sestávající z vnějšího obalu a z vnitřní nádoby a zkonstruovaný tak, že vnitřní nádoba a vnější obal tvoří jeden integrální obal. Po sestavení zůstává nadále jednou nedělitelnou jednotkou a jako takový je plněn, skladován, přepravován a vyprazdňován;

POZNÁMKA: Pojem „*vnitřní nádoba*“ používaný pro kompozitní obaly nesmí být zaměňován s pojmem „*vnitřní obal*“ používaným pro skupinové obaly. Například vnitřní část kompozitního obalu (plast) 6HA1 je takovou vnitřní nádobou, neboť není normálně konstruována tak, aby plnila obalovou funkci bez svého vnějšího obalu a není tedy vnitřním obalem.

Tam, kde je za pojmem „*kompozitní obal*“ uveden v závorkách materiál, vztahuje se na vnitřní nádobu.

Obal prachotěsný nepropustný obal pro udržení suchého obsahu včetně jemné tuhé látky (prášku) vznikající během přepravy;

Obal skupinový kombinace obalů vytvořená pro účely přepravy, sestávající z jednoho nebo více vnitřních obalů, které jsou vloženy do jednoho vnějšího obalu podle pododdílu 4.1.1.5 ADR;

POZNÁMKA: Pojem „*vnitřní obal*“ používaný pro skupinové obaly nesmí být zaměňován s pojmem „*vnitřní nádoba*“ používaným pro kompozitní obaly.

Obal velký obal tvořený vnějším obalem, který obsahuje předměty nebo vnitřní obaly a který

- (a) je zkonstruován pro mechanickou manipulaci;
- (b) převyšuje 400 kg čisté (netto) hmotnosti nebo 450 litrů vnitřního objemu, ale má objem nejvýše 3 m³;

Obal velký, opakovaně použitelný velký obal k opakovanému naplnění, který byl prohlédnut a shledán bez závad, které by mohly ovlivnit jeho schopnost vyhovět provozním zkouškám; tento pojem zahrnuje ty velké obaly, které se znovu naplňují stejným nebo podobným snášenlivým obsahem a jsou přepravovány v distribučních řetězcích řízených odesílatelem produktu;

Obal velký, rekonstruovaný kovový velký obal nebo velký obal z tuhého plastu, který

- (a) je vyroben jako typ UN z typu jiného než typu UN; nebo
- (b) je rekonstruován z jednoho konstrukčního typu UN na jiný konstrukční typ UN.

Na rekonstruované velké obaly se vztahují tytéž požadavky ADR, které se vztahují na nové velké obaly téhož typu (viz též definici konstrukčního typu v 6.6.5.1.2 ADR);

Obal vnější vnější ochrana kompozitního nebo skupinového obalu včetně absorpčních a fixačních materiálů a všech ostatních součástí, které jsou nutné, aby obklopily a chránily vnitřní nádoby nebo vnitřní obaly;

Obal vnitřní obal, pro jehož přepravu se vyžaduje vnější obal;

Obal z jemného plechu obal s kruhovým, elipsovým, pravoúhlým nebo mnohoúhelníkovým průřezem (také kónický), jakož i obal s hrdlem kuželového tvaru nebo obal kelímkovitého tvaru z jemného plechu o tloušťce stěny menší než 0,5 mm (např. pocínovaného), s plochým nebo vypouklým dnem, s jedním nebo více otvory, který nespadá pod definici sudu nebo kanystru;

Obal záchranný zvláštní obal, do kterého se ukládají poškozené, vadné nebo netěsnící kusy nebo kusy neodpovídající předpisům obsahující nebezpečné věci, nebo nebezpečné věci, které se rozspaly nebo unikly, za účelem jejich přepravy k obnově nebo likvidaci;

Obal záchranný velký speciální obal, který

- (a) je zkonstruován pro mechanickou manipulaci; a
- (b) překračuje 400 kg čisté (netto) hmotnosti nebo 450 litrů vnitřního objemu, ale má objem nejvýše 3 m³;

do něhož se ukládají poškozené, vadné nebo netěsné kusy nebo kusy neodpovídající předpisům, které obsahují nebezpečné věci, nebo které se vysypaly nebo vytekly, za účelem jejich přepravy k regeneraci nebo likvidaci;

Obalová skupina skupina, ke které mohou být pro účely balení přiřazeny určité látky podle jejich stupně nebezpečnosti. Obalové skupiny mají následující významy, které jsou podrobně vysvětleny v části 2:

Obalová skupina I: látky velmi nebezpečné;
Obalová skupina II: látky středně nebezpečné;
Obalová skupina III: látky málo nebezpečné.

POZNÁMKA: *Určité předměty obsahující nebezpečné věci jsou rovněž přiřazeny k obalové skupině.*

Objem tělesa nebo úseku tělesa s použitím pro cisterny znamená celkový vnitřní objem tělesa nebo úseku tělesa, vyjádřený v litrech nebo kubických metrech. V těch případech, kdy není možné plně naplnit těleso nebo úsek tělesa z hlediska jejich formy nebo konstrukce, pro určení stupně naplnění a označení cisterny se musí použít tento zmenšený objem.

Oblast nákladu zahrnuje veškeré následující prostory na palubě takových plavidel:

Prostor pod palubou:

Prostor mezi dvěma svislými rovinami kolnými na středovou rovinu plavidla, který zahrnuje nákladní tanky, nákladové prostory, kofrdamy, prostory s dvojitými boky a dvojitými dny; tyto roviny se normálně shodují s vnějšími přepážkami kofrdamu nebo přepážkami konce nákladového prostoru.

Prostor nad palubou: prostor, který je vymezen:

- Příčně, vertikálními rovinami plavidla, jež odpovídají obšívce boků;

- Vpředu a na zádi, vertikálními rovinami ve výšce vnějších přepážek kofrdamu/přepážek konce nákladového prostoru;
- Nahoře, vodorovnou rovinou 2,50 m nad palubou.

Hraniční roviny vpředu a zezadu jsou označovány jako „hraniční roviny oblasti nákladu“;

Oblast výbuchu rozmezí koncentrace hořlavé látky nebo směsi látek ve vzduchu, ve které může dojít k výbuchu, resp. rozmezí koncentrace hořlavé látky nebo směsi látek ve směsi se vzduchem/inertním plynem, ve které může dojít k výbuchu, a je stanovena za specifických zkušebních podmínek;

Obsah trupu nebo úseku trupu ve vztahu k cisternám znamená celkový vnitřní objem trupu nebo úseku trupu, vyjádřený v litrech nebo krychlových metrech. V těch případech, kdy není možné zcela naplnit trup nebo úsek trupu s ohledem na jejich formu nebo konstrukci, musí se použít pro určení stupně naplnění a značení cisterny tento snížený objem.

Obytné prostory prostory určené pro osoby běžně žijící na plavidle, včetně kuchyní, spíží, WC, umývárny, koupelny, prádelny, jídelny, chodeb atd., s výjimkou kormidelny;

Odesílatel podnik, který odesílá nebezpečné věci buď pro sebe, nebo pro třetí stranu. Pokud je přeprava prováděna na základě přepravní smlouvy, odesílatelem je odesílatel uvedený v této smlouvě. V případě tanková plavidla, jestliže jsou nákladní tanky prázdné nebo byly právě vyprázdněny, se pro účely přepravního dokladu považuje za odesílatele velitel plavidla.

Odolné proti povětrnosti konstrukční součást nebo zařízení vybavené tak, aby za normálních podmínek dovolily vniknout jen zanedbatelnému množství vody;

Odpady látky, roztoky, směsi nebo předměty, které nemohou být používány jako takové, které se však přepravují pro další zpracování, uložení na skládce nebo likvidaci spálením nebo jinými disponibilními metodami;

Odvětrávací potrubí (na plavidle) potrubí instalované na plavidle a spojující jeden nebo více nákladních tanků s plynovým zpětným potrubím během nakládky nebo vykládky. Toto potrubí je vybaveno pojistnými ventily chránícími nákladní tank(y) před nepřipustným vnitřním přetlakem nebo vznikem vakua;

Odpar (boil-off) pára tvořící se nad povrchem vřícího nákladu v důsledku odpařování. To je způsobeno přívodem tepla nebo poklesem tlaku;

Odplynování operace, jejímž cílem je snížení koncentrace nebezpečných plynů a par v prázdných nebo nevyčištěných nákladních tankách jejich vypouštěním do atmosféry nebo do sběrných zařízení;

Ochrana před explozí všechny požadavky, které musí být splněny, a prostředky, které musí být užity, aby se zabránilo škodám způsobeným výbuchem.

To zahrnuje:

Organizační opatření, jako například:

- Stanovení oblastí s nebezpečím výbuchu (rozdělení zón): v nichž je pravděpodobný výskyt výbušného ovzduší tvořeného směsí hořlavých plynů, par nebo sprejů se vzduchem:
 - nepřetržitě nebo dlouhodobě nebo často (zóna 0);
 - občas za normálního provozu (zóna 1); nebo
 - výjimečně nebo jen krátce (zóna 2);(viz směrnice 1999/92/EC⁶).
- Prevence vzniku zdrojů vznícení (použití ručních nástrojů s nízkým jiskřením, zákaz kouření, používání osobních ochranných prostředků včetně disipativních bot, neizolačních rukavic atd.);
- Vypracování pracovních pokynů.

A technické požadavky, jako například:

⁶ Úřední věstník Evropské unie č. L 23 z 28.1.2000, str. 57.

- (a) Použití vybavení a zařízení, u nichž je doložena vhodnost používání v oblastech s rizikem výbuchu.
- (b) Použití samostatných ochranných systémů;
- (c) Monitorování potenciálně výbušného ovzduší pomocí systémů detekce plynů a detektorů plynů;

Ochranná přepážka plynotěsná a vodotěsná se rozumí plynotěsná a vodotěsná přepážka na palubě ve výšce hranice podpalubní oblasti nákladu, která zabraňuje pronikání plynů do oblastí mimo oblast nákladu;

Ochranná obuv (nebo ochranné holínky) obuv nebo holínky, které chrání nohy jejich uživatele během práce v nebezpečné oblasti. Volba vhodných ochranných bot nebo holínek by měla odpovídat pravděpodobným rizikům, zvláště pak těm způsobeným elektrostatickým nábojem, a splňovat požadavky mezinárodního standardu ISO 20345:2012 nebo ISO 20346:2014;

Ochranné brýle, ochranné masky brýle nebo ochrana obličeje, které chrání oči nebo obličej jejich uživatele během práce v nebezpečné oblasti. Volba vhodných brýlí nebo masek musí odpovídat nebezpečím, která pravděpodobně vzniknou. K ochranným brýlím nebo maskám viz například Evropská norma EN 166:2001;

Ochranné rukavice rukavice, které chrání ruce svého nositele během práce v nebezpečné oblasti. Volba vhodných ochranných rukavic by měla odpovídat pravděpodobným rizikům (viz např. evropské normy EN 374-1:2016, EN 374-2:2015 nebo EN 374-4:2013). V případě nebezpečí způsobeného elektrostatickým nábojem musí splňovat požadavky normy EN 16350:2015;

Ochranný oblek oblek, který chrání tělo jejich uživatele během práce v nebezpečné oblasti. Volba vhodného obleku musí odpovídat nebezpečím, která pravděpodobně vzniknou. Ohledně ochranného oblečení, viz např. ISO 13688:2013. V případě nebezpečí způsobeného elektrostatickým nábojem viz také normu EN 1149-5:2008;

Ochranný povlak (pro nákladní tanky) výstelka nebo vnitřní povlak chránící materiál kovových tanků proti přepravovaným látkám;

POZNÁMKA: Tato definice se nevztahuje na výstelku nebo vnitřní povlak používané jen k ochraně přepravované látky.

Olejové kaly zbytky uhlovodíků z běžného provozu námořních plavidel, např. zbytky z manipulace s palivou nebo mazacími oleji pro hlavní nebo pomocné strojí zařízení, odpadní oleje získané separací z olejových filtrů, olejové zbytky shromážděné v jámách a zbytky hydraulických a mazacích olejů;

POZNÁMKA: V ADN zahrnuje definice MARPOL také zbytky vznikající při zpracování vody z nádní na palubě námořních lodí.

Otevírací tlak tlak uvedený ve sloupci (10) tabulky C kapitoly 3.2, při němž jsou pojišťovací ventily, přetlakové ventily/vysokorychlostní odvzdušňovací ventily otevřeny. Pro tlakové tanky se otevírací tlak pojistného ventilu stanoví podle požadavků příslušného orgánu nebo uznávané klasifikační společnosti;

Otevřené světlo světelný zdroj používající plamen, který není uzavřen v ohnivzdorném obalu;

Otevřený železniční vůz vůz s bočními a čelními stěnami nebo bez nich, jehož ložná plocha je otevřená;

OTIF Mezivládní organizace pro mezinárodní dopravu po železnici (OTIF, Gryphenhübeliweg 30, CH-3006 Bern);

Otvor pro odběr vzorků uzavíratelný otvor nákladního tanku o průměru nejvýše 0,30 m. Pokud seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 obsahuje látky, u nichž se vyžaduje zajištění proti explozi ve sloupci (17) tabulky C kapitoly 3.2, musí být bezpečný proti prošlehnutí plamene, schopen odolat stálému hoření pro nejnebezpečnější látku v seznamu látek povolených na přepravu v plavidle, a být navržen tak, aby doba otevírání byla co nejkratší, a aby nemohl zůstat otevřený bez vnějšího zásahu.

Pojistka proti prošlehnutí plamene musí být testována v souladu s mezinárodní normou ISO 16852:2016¹ a musí být doložen doklad o splnění příslušných požadavků (např. postupu o posouzení shody podle Směrnice 2014/34/EU,² Systém IECEx,³ ECE/TRADE/391 nebo alespoň jeho ekvivalent). Ochrana proti prošlehnutí plamene může být zajištěna integrovaným systémem pojistek proti prošlehnutí plamene schopných odolávat stálému hoření (ochrana proti prošlehnutí plamene);

P

Palivový článek elektrochemický prostředek, který přeměňuje chemickou energii paliva na elektrickou energii, teplo a produkty reakce;

Plavidlo vnitrozemské nebo námořní plavidlo;

Plnicí tlak nejvyšší tlak skutečně vyvinutý v cisterně při jejím plnění pod tlakem;

Plnič jakýkoliv podnik, který

- (a) plní nebezpečné věci do cisterny (cisternového vozidla, snímatelné cisterny, přemístitelné cisterny nebo cisternového kontejneru) nebo do bateriového vozidla, cisternového železničního vozu nebo MEGC; nebo
- (b) plní nebezpečné věci do nákladního tanku; nebo
- (c) plní nebezpečné věci do plavidla, vozidla železničního vozu, velkého kontejneru nebo malého kontejneru pro přepravu ve volně loženém stavu;

Plyn látka, která:

- (a) při 50 °C má tenzi par větší než 300 kPa (3 bary); nebo
- (b) je kompletně v plynném stavu při 20 °C, při normálním tlaku 101,3 kPa;

Jinak pojem *Plyny* znamená plyny nebo páry;

Plynová kartuše viz Malá nádobka obsahující plyn;

Plynové zpětné potrubí (na břehu) potrubí břehového zařízení, které je spojeno během nakládky nebo vykládky s odvětrávacím potrubím plavidla; Toto potrubí je zkonstruováno tak, aby chránilo plavidlo před detonacemi nebo prošlehnutím plamenů z břehové strany;

Podnik jakákoli fyzická nebo právnická osoba, ať již zisková nebo nezisková, sdružení nebo skupina osob bez právní subjektivity, ať již ziskové nebo neziskové, nebo instituce s vlastní právní subjektivitou nebo závislá na správním orgánu, který má právní subjektivitu;

Podtlakový ventil automaticky aktivovaný pojistný ventil, jehož účelem je chránit nákladní nádrž před nepřijatelným negativním vnitřním tlakem. Pokud seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 obsahuje látky, u nichž se vyžaduje zajištění proti explozi ve sloupci (17) tabulky C kapitoly 3.2, musí být zajištěna ochrana proti prošlehnutí plamene pro nejnebezpečnější látky v seznamu látek.

Ochrana proti prošlehnutí plamene musí být testována v souladu s mezinárodní normou ISO 16852:2016¹ a musí být doložen doklad o splnění příslušných požadavků (např. postupu o posouzení shody podle Směrnice 2014/34/EU,² Systém IECEx,³ ECE/TRADE/391 nebo alespoň jeho ekvivalent). Ochrana proti prošlehnutí plamene může být zajištěna integrovaným systémem pojistek proti prošlehnutí plamene schopných odolávat stálému hoření (ochrana proti prošlehnutí plamene);

Pojistka proti prošlehnutí plamene část lapače plamenů, jejímž hlavním účelem je zabránit prošlehnutí plamene. Pojistka proti prošlehnutí plamene musí být testována v souladu s mezinárodní normou ISO 16852:2016¹ a musí být doložen doklad o splnění příslušných požadavků (např. postupu o posouzení shody podle Směrnice 2014/34/EU,² ECE/TRADE/391 nebo alespoň jeho ekvivalent).;

¹ Identické s EN ISO 16852:2016.

² Úřední věstník Evropské unie č. L 96 z 29.3.2014, str. 309.

³ <http://iecex.com/rules>.

Pojistný ventil pružinové zařízení automaticky ovládané tlakem, jehož účelem je chránit nákladní tank proti nežádoucímu zvýšení vnitřního tlaku nebo vnitřního podtlaku; (viz také *Vysokorychlostní ventil, Přetlakový ventil a Podtlakový ventil*)

Potrubí pro nakládku a vykládku (nakládací a vykládací potrubí) všechna potrubí, která mohou obsahovat kapalný nebo plynný náklad, včetně trubek, soustav hadic, připojených čerpadel, filtrů a uzavíracích zařízení;

Postřikovací zařízení instalace na plavidle, která je schopna stejnoměrným rozstříkáváním vody chránit všechny vertikální vnější povrchy lodního trupu na přídi a na zádi plavidla, všechny vertikální povrchy nástavby a palubních přístřešků, jakož i palubní povrchy nad nástavbami a palubními přístřešky, strojovny a prostory, v nichž je skladován hořlavý materiál. Kapacita postřikovacího zařízení pro oblast, která má být chráněna, musí být nejméně 10 l/m² za minutu. Postřikovací zařízení musí být zkonstruováno na celoroční používání. Postřikovací zařízení musí být ovladatelné z kormidelní nebo z bezpečné zóny;

Prachotěsný obal viz *Obal prachotěsný*

Prostor s čerpadly provozní prostor, kde jsou instalována čerpadla pro nakládku a vykládku a dočerpávací čerpadla spolu se svým provozním zařízením;

Prostory s nebezpečím výbuchu prostory, v nichž se může vytvořit výbušná atmosféra v takovém měřítku, že jsou nezbytná zvláštní ochranná opatření k zajištění bezpečnosti a zdraví dotčených osob (viz Směrnice 1999/92/EC⁶). Oblasti s nebezpečím výbuchu jsou rozděleny do zón podle četnosti výskytu a trvání přítomnosti výbušné atmosféry. Viz také „Rozdělení oblastí s rizikem výbuchu, Ochrana před výbuchem, Rozdělení zón - pro tanková plavidla a Ochranná oblast - pro plavidla pro suchý náklad.“;

Provozní odpady (obsahující oleje a maziva) použité oleje, voda z nádrží a jiné odpady obsahující oleje a maziva, jako jsou použitá mazadla, použité filtry, použité hadry, jakož i nádoby a obaly na takové odpady;

Provozní prostor prostor, který je přístupný během provozu plavidla a který není součástí obytných prostor ani nákladních tanků, s výjimkou předního a zadního kolizního prostoru, pokud v nich nejsou zabudována strojní zařízení;

Provozní tlak ustálený tlak stlačeného plynu při vztažené teplotě 15 °C v naplněné tlakové nádobě;

POZNÁMKA: *K cisternám viz „Nejvyšší provozní tlak“.*

Provozní životnost pro kompozitní láhve a trubkové nádoby je počet roků, po který je dovoleno láhev nebo trubkovou nádobu používat;

Provozovatel cisternového kontejneru nebo přemístitelné cisterny jakýkoli podnik, jehož jménem je provozován cisternový kontejner nebo přemístitelná cisterna;

Průměr (pro nádrže cisteren) je vnitřní průměr nádrže;

Přemístitelná cisterna viz *Cisterna přemístitelná*

Přepážka kovová stěna, obvykle vertikální, uvnitř plavidla, která je ohraničena dnem, bočními stěnami, palubou, kryty jícnu nebo jinou přepážkou;

Přepážka (vodotěsná)

- pro plavidla na přepravu suchých nákladů: přepážka konstruovaná tak, aby mohla odolat tlaku vody 1,00 metr nad palubou, avšak nejméně po vrchní hranu otvoru jícnu;
- v tankovém plavidle: přepážka konstruovaná tak, aby odolala tlaku vody 1,00 metr nad palubou;

Přeprava přemístění nebezpečných věcí, včetně zastávek nezbytných vzhledem k dopravním podmínkám a včetně všech dob, po které jsou nebezpečné věci uloženy v plavidlech, vozidlech, železničních vozech, cisternách nebo v kontejnerech a které jsou nezbytné vzhledem k provozním podmínkám před, během a po přemístění.

⁶ Úřední věstník Evropské unie č. L 23 z 28. ledna 2000, str. 57

Tato definice zahrnuje též krátké dočasné skladování nebezpečných věcí za účelem změny druhu dopravy nebo dopravního prostředku (překládky). Toto platí, pokud jsou přepravní doklady, v nichž je uvedeno místo odeslání a místo určení, předloženy na požádání a pokud kusy a cisterny nejsou otevírány během krátkodobého skladování, kromě kontroly provedené příslušnými orgány;

Přeprava volně ložených látek přeprava nebalených tuhých látek, které mohou být vyklopeny;

POZNÁMKA: Ve smyslu ADN se přeprava volně ložených látek podle ADR nebo RID považuje za přepravu v kusech.

Přepravní index (TI) přidělený kusu, přepravnímu obalovému souboru nebo kontejneru, nebo nezabalené látce LSA-I nebo nezabalenému předmětu SCO-I nebo SCO-III pro přepravu radioaktivních látek je číslo, které se používá ke kontrole expozice záření;

Přepravní obalový soubor vnější obalový prostředek (používaný jedním odesilatelem v případě radioaktivních látek) obsahující jeden nebo více kusů pevně spojených do jedné manipulační jednotky pro usnadnění manipulace a uložení při přepravě;
Příklady přepravních obalových souborů:

- (a) úložná plošina, jako je paleta, na které je uloženo nebo navrstveno několik kusů a zajištěno plastovou stahovací páskou, smršťovací nebo průtažnou fólií nebo jinými vhodnými prostředky; nebo
- (b) vnější ochranný obal jako bedna nebo latění;

Přes nebo do pro přepravu radioaktivních látek znamená přes stát nebo do státu, v němž nebo do něhož je zásilka přepravována, ale výslovně vylučuje státy, „nad“ nimiž je zásilka přepravována letecky, pokud nejsou v těchto státech podle letového řádu žádné zastávky;

Přetlakový ventil pružinové zařízení automaticky ovládané tlakem, jehož účelem je chránit nákladní tank proti nežádoucímu zvýšení vnitřního tlaku

Příjemce příjemce uvedený v přepravní smlouvě. Jestliže příjemce určí třetí osobu v souladu s ustanoveními platnými pro přepravní smlouvu, je tato osoba považována za příjemce ve smyslu ADN. Pokud je přeprava prováděna bez přepravní smlouvy, podnik, který přebírá nebezpečné věci po příjezdu, se považuje za příjemce;

Příkon dávkového ekvivalentu prostorový dávkový ekvivalent nebo směrový dávkový ekvivalent, jak je to vhodné, za jednotku času, měřený ve sledovaném místě.

Příručka zkoušek a kritérií sedmé revidované vydání „United Nations, Manual of Tests and Criteria“, publikované Organizací spojených národů dokumentů (ST/SG/AC.10/11/Rev.7);

Příslušný orgán orgán nebo orgány nebo jiné instituce určené v každém státě a pro každý jednotlivý případ v souladu s jeho vnitrostátním právním řádem;

Pytel poddajný obal z papíru, plastové fólie, textilu, tkaniny nebo jiného vhodného materiálu;

R

Radioaktivní obsah pro přepravu radioaktivních látek jsou radioaktivní látky spolu se všemi kontaminovanými nebo aktivovanými tuhými látkami, kapalinami a plyny uvnitř obalu;

Rám (třída 2), viz Svazek lahví;

Recyklovaný plast materiál získaný z použitých průmyslových obalů, který byl vyčištěn a připraven pro výrobu nových obalů;

Relativní hustota (nebo specifická hustota) vyjadřuje poměr hustoty látky k hustotě čisté vody při 3,98 °C (1000 kg/m³) a je bezrozměrná;

RID Řád pro mezinárodní železniční přepravu nebezpečných věcí [příloha 1 k přípojkou B (Jednotné právní předpisy pro Smlouvu o mezinárodní železniční přepravě zboží – CIM) Úmluvy o mezinárodní železniční přepravě – COTIF];

Rozdělení oblastí s rizikem výbuchu (viz směrnice 1999/92/CE⁶)

- zóna 0:** oblasti, v nichž nebezpečná výbušná atmosféra plynů, par nebo mlhy existuje trvale nebo po dlouhá období;
- Zóna 1:** oblasti, v nichž se nebezpečná výbušná atmosféra plynů, par nebo mlhy pravděpodobně vyskytne jen příležitostně;
- Zóna 2:** oblasti, v nichž se nebezpečná výbušná atmosféra plynů, par nebo mlhy pravděpodobně vyskytne jen zřídka, a pokud se tak stane, tak jen na krátká období;

Viz také rozdělení zón

Rozdělení zón: toto rozdělení (viz schéma) se vztahuje na tanková plavidla, pokud seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 obsahuje látky, u nichž se požaduje zajištění proti explozi ve sloupci (17) tabulky C kapitoly 3.2.

**Zóna 0** zahrnuje:

- Vnitřek všech nákladních prostor, nádrží pro zbytkové odpadní produkty a nádob na kaly, mycí vody, a potrubí obsahující náklad nebo výpary z nákladu, včetně zařízení, jakožto i čerpadla a kompresory.

**Zóna 1** zahrnuje:

- Všechny prostory umístěné pod palubou v oblasti nákladu, které nejsou součástí zóny 0.
- Uzavřené prostory v oblasti nákladu na palubě.
- Palubu v oblasti nákladu po celé šířce plavidla až po vnější přepážky kofrdamu.
- Až do vzdálenosti nejméně 1,60 m od „hraničních rovin oblasti nákladu“, výška nad palubou je 2,50 m, ale nejméně 1,50 m nad nejvyšším potrubím, které přepravuje náklad nebo výpary z nákladu.

Přílehlé prostory (přední a zadní) k nejvzdálenějším přepážkám nákladního tanku, výška je 0,25 m nad palubou.

Je-li loď postavena s úložným prostorem nebo je-li kofrdam/část kofrdamu uspořádána jako provozní prostor, sousední výška (přední a zadní) k „hraničním rovině oblasti nákladu“ je 1,00 m nad palubou (viz schéma).

- Každý otvor v zóně 0, s výjimkou vysokorychlostních odvodušňovacích ventilů / pojistných ventilů nákladních tanků s vnitřním přetlakem, musí být obklopen válcovým prstencem, jehož vnitřní poloměr je poloměrem otvoru, vnější poloměr se rovná poloměru otvoru plus 2,50 m a výška je 2,50 m nad palubou a 1,50 m nad potrubím.

U otvorů s průměrem menším než 0,026 m (1") může být vzdálenost k vnější přepážce kofrdamu snížena na 0,50 m za předpokladu, že je zajištěno, že takový otvor není v této vzdálenosti otevřen do atmosféry.

- Válcovou oblast obklopující vysokorychlostní odvodušňovací ventil/pojistný ventil nákladních nádrží s vnitřním přetlakem s poloměrem 3,00 m až do výšky 4,00 m nad otvorem vysokorychlostního odvodušňovacího ventilu/pojistného ventilu nákladních nádrží s vnitřním přetlakem.
- Okolí větracích otvorů obslužných prostorů vybavených větracím systémem umístěným v oblasti nákladu, zóna obsažená v části koule o poloměru 1,00 m.

**Zóna 2** zahrnuje:

- Na palubě v oblasti nákladu, zónu 1,00 m nahoru a do stran podélně od zóny 1.
- Na přední palubě a na zadní palubě, oblast o délce 7,50 m po celé šířce plavidla a přílehlou k „hraniční rovině oblasti nákladu“. Mezi boční stranou plavidla a ochrannou stěnou se délka a výška této oblasti rovná rozměrům boční strany ochranné stěny. Jinde je výška v zóně 2 0,50 m.

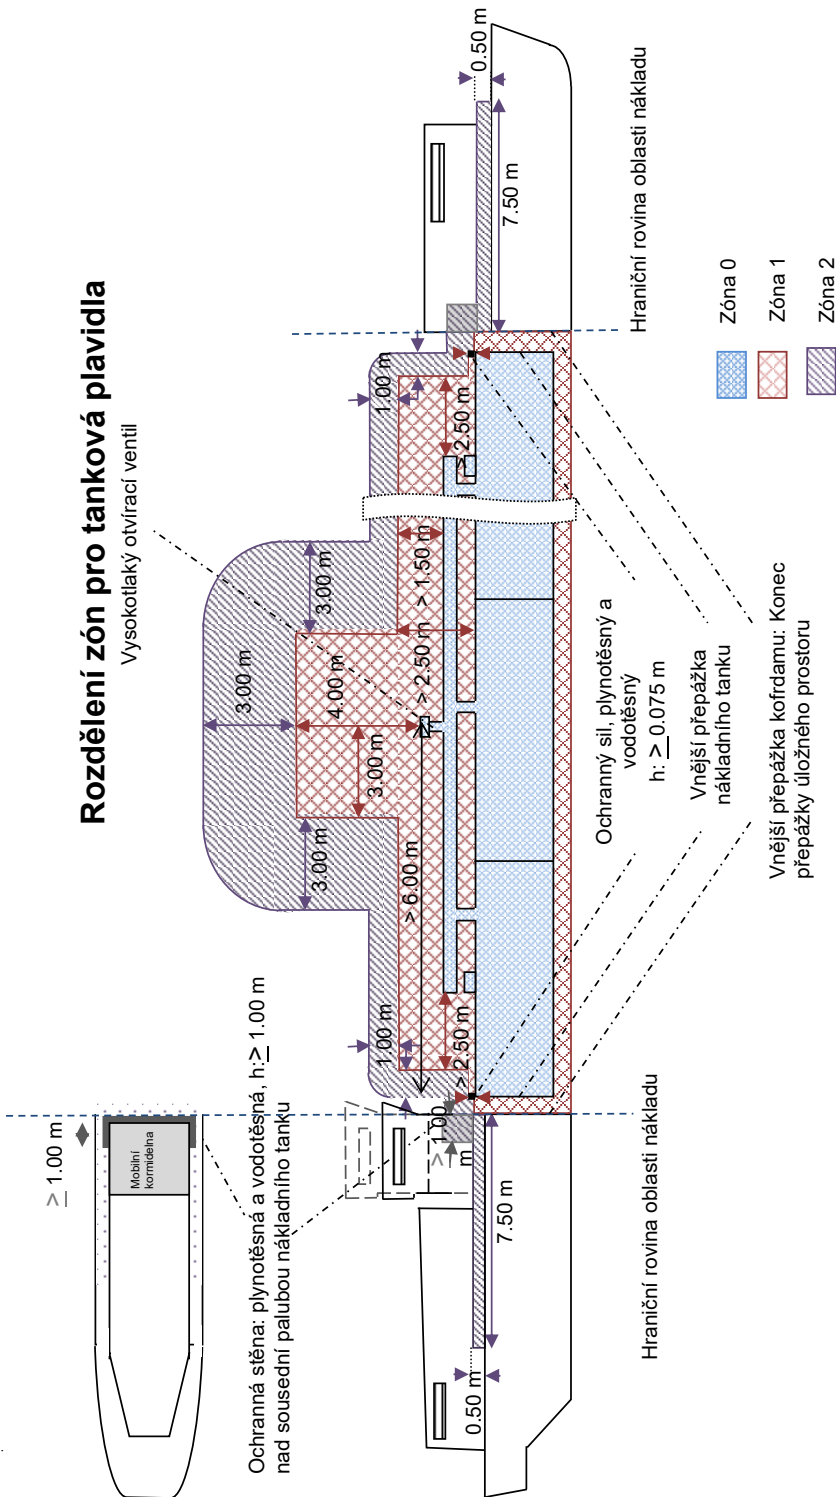

Tato oblast není součástí zóny 2, pokud se ochranná stěna rozkládá od jedné strany plavidla k druhé a nejsou zde žádné otvory.

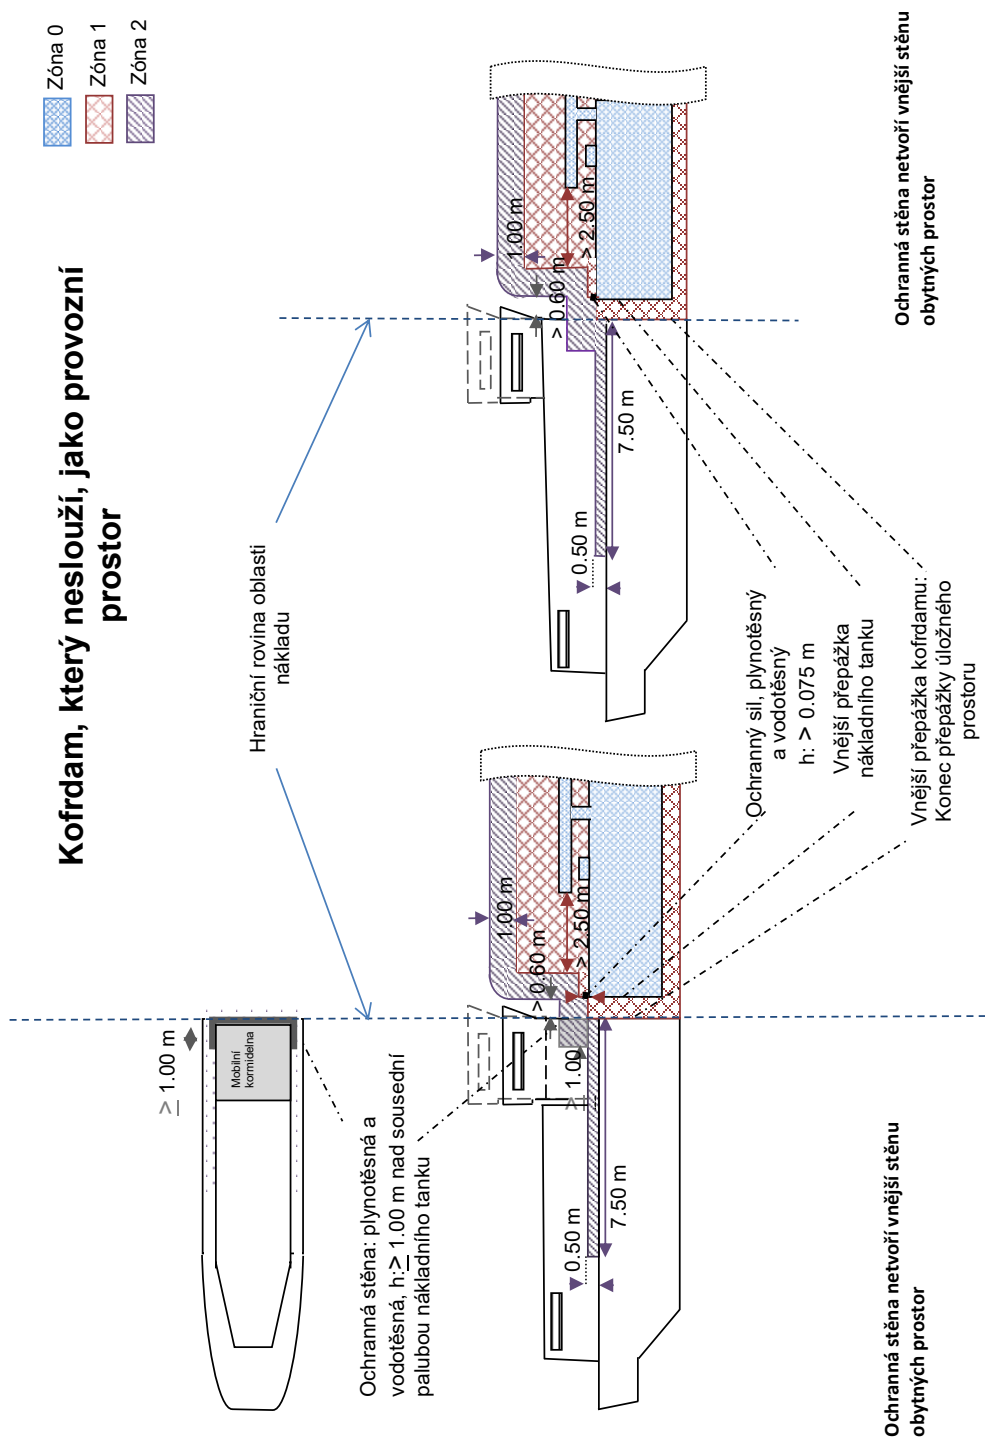

- Plochu 3,00 m, která se rozprostírá kolem zóny 1, která zahrnuje vysokorychlostní odvodušňovací ventily / pojistné ventily nákladních nádrží s vnitřním přetlakem.

⁶ Úřední věstník Evropské unie č. L 23 z 28. ledna 2000, str. 57

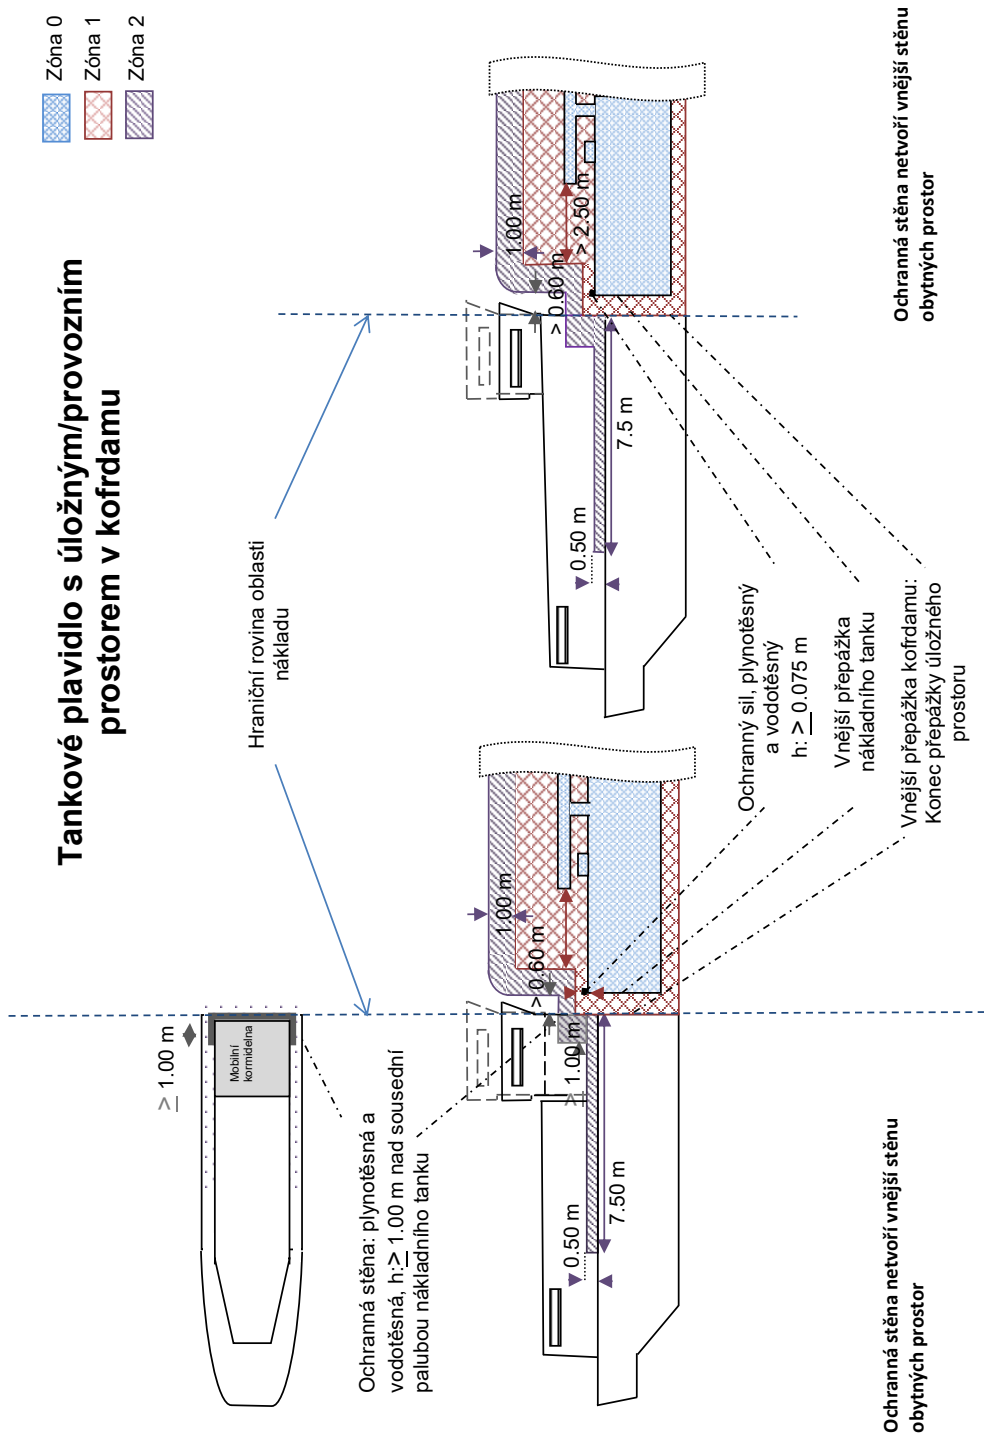

- Okolí větracích otvorů obslužných prostorů vybavených větracím systémem umístěným v oblasti nákladu, zóna obsažená v hemisférickém plášti o poloměru 1,00 m.

Rozdělení zón pro tanková plavidla

Tankové plavidlo s úložným/provozním prostorem v kofrdamu

Ř

Řízená teplota nejvyšší teplota, při které může být bezpečně přepravován organický peroxid, samovolně se rozkládající látka nebo polymerizující látka;

S

SADT viz „*Teplota samourychlujícího se rozkladu*“;

SAPT viz „*Teplota samourychlující se polymerace*“;

Schválení

Vícestranné schválení pro přepravu radioaktivních látek je schválení, které bylo uděleno příslušným orgánem buď země původu vzoru, nebo země odeslání, podle toho, co je relevantní, a také příslušným orgánem každého státu, přes který nebo do kterého má být příslušná zásilka přepravena.

Jednostranné schválení pro přepravu radioaktivních látek je schválení vzoru, které uděluje jen příslušný orgán země původu vzoru. Není-li země původu členským státem ADN, musí být toto schválení uznáno příslušným orgánem smluvní strany ADN (viz 6.4.22.8 ADR);

Sběrné zařízení stacionární nebo mobilní zařízení pro příjem plynů a par při odplyňování prázdných nebo vyložených nákladních tanků a potrubí pro nakládku a vykládku;

Sil vyvýšená část paluby plavidla rovnoběžná s boční obšívkou s uzavíratelnými otvory, pro prevenci úniku kapalin přes palubu. Spojení s ochranným silem, pokud jsou instalovány, musí být vodotěsné.

Sil ochranný vodotěsná vyvýšená část paluby, ve výšce jícnu nákladního tanku (viz schéma rozdělení zón), ale v maximální vzdálenosti 0,60 m k vnější přepážce kofrdamu nebo koncové přepážce nákladního prostoru, která zabraňuje vniknutí kapaliny do přední a zadní části plavidla. Spojení mezi silem a ochranným silem musí být vodotěsné.

Skupina/podskupina výbušnosti seskupování hořlavých plynů a par podle jejich maximálních experimentálních bezpečných spár (standardní šířka spáry, určena podle specifických podmínek) a nejnižších zápalných proudů jakož i elektrických zařízení určených k použití v potenciálně výbušné atmosféře (viz EN IEC 60079-0:2012) pro instalace, vybavení a samostatné ochranné systémy. Pro samostatné ochranné systémy je skupina výbušnosti II B dělena do podskupin;

Skupinový obal viz **Obal skupinový**

Směrnice ES rozhodnutí příslušných orgánů Evropského společenství, která jsou závazná, pokud se týče dosažených výsledků, pro všechny členské státy, jimž je adresováno, avšak volba formy a metod je ponechána národním orgánům;

Snímatelná cisterna viz **Cisterna snímatelná**

SOLAS Mezinárodní dohoda o ochraně lidského života na moři, 1974, v pozdějším znění;

Soustavy hadic hadice, které jsou integrovány nebo přivařeny na obou stranách do hadicových fitinků; hadicové fitinky musí být integrovány tak, aby je bylo možno uvolnit pouze pomocí nástroje;

Spojení pro zařízení pro odběr vzorků spojení umožňující instalaci zařízení pro odběr vzorků uzavřeného nebo částečně uzavřeného typu. Toto spojení musí být vybaveno uzavíracím mechanismem odolávajícím vnitřnímu tlaku nákladního tanku. Toto spojení musí být typu schváleného příslušným orgánem pro zamýšlené použití;

Stabilizovaný tlak tlak obsahu tlakové nádoby v tepelné a difúzní rovnováze;

Stálé hoření hoření ustálené na neomezeně dlouhou dobu (viz EN ISO 16852:2016⁷);

⁷ Identické s EN ISO 16852:2016.

STCW Mezinárodní úmluva o normách výcviku, kvalifikace a strážní služby námořníků, 1978, ve znění pozdějších předpisů;

Stlačený zemní plyn (CNG) stlačený plyn tvořený zemním plynem s vysokým obsahem methanu, přiřazený k UN 1971;

Stupeň plnění poměr hmotnosti plynu k hmotnosti vody při 15 °C, která by zcela naplnila tlakovou nádobu připravenou k použití (vnitřní objem);

Stupeň plnění (nákladního tanku) je-li udán stupeň plnění nákladního tanku, je to procentní podíl z objemu nákladního tanku, který může být zaplněn kapalinou během nakládky.

Sud válcovitý obal z kovu, lepenky, plastu, překližky nebo jiných vhodných materiálů s plochými nebo oblými víky a dny (základnami). Pod tento pojem patří též obaly jiných tvarů, např. oblé obaly s hrdlem kuželovitého tvaru nebo obaly kelímkovitého tvaru. Pod tento pojem nepatří *dřevěné sudy* a *kanystry*.

Svazek lahví soubor lahví, které jsou navzájem pevně spojeny a propojeny sběrným potrubím a jsou přepravovány jako jeden celek. Celkový hydraulický vnitřní objem nesmí přesáhnout 3 000 litrů, u svazku lahví určených pro přepravu toxických plynů třídy 2 (skupin začínajících písmenem T podle 2.2.2.1.3) je tento hydraulický vnitřní objem omezen na 1 000 litrů;

Systémy nezávislé ochrany proti výbuchu všechna zařízení, která jsou určena k okamžitému zastavení výbuchu hned v jejich začátku a / nebo k omezení rozsahu účinku výbuchu, a která jsou na trhu jednotlivě dostupná pro použití jako samostatné systémy. Toto zahrnuje pojistku proti prošlehnutí plamene, vysokorychlostní pojišťovací ventily, podtlakové ventily s integrovanou ochranou proti zpětnému prošlehnutí plamene a přístroje pro bezpečné zbavení pnutí v nákladních tancích, které odolají zpětnému prošlehnutí plamene (viz také Pojistka proti prošlehnutí plamene, Vysokorychlostní ventil, Podtlakový ventil, Zařízení pro bezpečné zbavení pnutí v nákladních tancích a zpětnému prošlehnutí plamene);

Systém měření radiace přístroj, který obsahuje detektory záření jako své součásti;

Systém pro měření kyslíku stacionární monitorovací systém, který je schopen včas detekovat jakékoli významné snížení obsahu kyslíku v atmosféře a aktivovat alarmy v případě, že koncentrace kyslíku dosáhne 19,5 % obj.

Musí být testováno v souladu s evropskou normou IEC/EN¹ 50104:2010. Používá-li se v prostředí s rizikem výbuchu, musí rovněž splňovat požadavky na použití v dané zóně a musí být doložen doklad o jejich splnění (např. postup posuzování shody podle Směrnice 2014/34/EU,² systému IECEx,³ ECE/TRADE/391⁴ nebo alespoň jejich ekvivalent);

Systém pro měření kyslíku může být rovněž konstruován jako součást multifunkčního systému pro měření hořlavých plynů a kyslíku;

Systém pro detekci plynů stacionární monitorovací systém s čidly pro přímé měření schopnými včas detekovat významné koncentrace hořlavých plynů při koncentracích pod jejich hodnotou dolní meze výbušnosti a aktivovat alarmy při překročení mezní hodnoty. Musí být kalibrován alespoň pro n-hexan. Prahová úroveň senzorů musí být nastavena na nejvýše 10 % dolní meze výbušnosti n-hexanu.

Musí být certifikován podle IEC/EN⁵ 60079-29-1:2016 a elektronicky řízené systémy také podle EN 50271:2010. Používá-li se v prostředí s nebezpečím výbuchu, musí rovněž splňovat požadavky na použití v dané zóně a musí být doložen doklad o jejich splnění (např. postup posuzování shody podle Směrnice 2014/34/EU,⁶ systému IECEx System,⁷ ECE/TRADE/391⁸ nebo alespoň jejich ekvivalent)

¹ IEC/EN znamená: Tato norma existuje jako norma IEC i jako evropská norma.

² Úřední věstník Evropské unie č. L 96 z 29.3.2014, str. 309.

³ <http://iecex.com/rules>.

Systém řízení pro přepravu radioaktivních látek je soustava vzájemně propojených nebo vzájemně působících prvků (systém) pro stanovení strategie a cílů a umožňující, aby cílů bylo dosaženo vhodným a účinným způsobem;

Š

Školení výuka, kurzy nebo učení poskytované organizátorem schváleným příslušným orgánem;

T

Tank na zbytkové produkty trvale zabudovaný tank určený ke shromažďování zbytkového nákladu, mycí vody, zbytků nákladu nebo kalů, které jsou vhodné pro čerpání;

Tankové plavidlo plavidlo určené pro přepravu látek v nákladních tancích;

Technický název uznávaný chemický, popřípadě biologický název nebo jiný název běžně používaný ve vědeckých a technických příručkách, časopisech a textech (viz 3.1.2.8.1.1);

Těleso nádoby (pro všechny druhy IBC kromě kompozitních IBC) vlastní nádoba, včetně otvorů a jejich uzávěrů, avšak bez provozní výstroje;

Teplota samourchlující se polymerace (SAPT) nejnižší teplota, při níž může dojít k samourchlující se polymerizaci látky v obalu, IBC nebo cisterně, tak jak je podávána k přepravě. SAPT musí být určena zkušebními postupy stanovenými pro teplotu samourchlujícího se rozkladu pro samovolně se rozkládající látky podle části II, oddílu 28 Příručky zkoušek a kritérií;

Teplota samourchlujícího se rozkladu (SADT) nejnižší teplota, při které může nastat samourchlující se rozklad látky v obalu, IBC nebo cisterně použité při přepravě. SADT musí být určena zkušebními postupy v části II, oddílu 28 Příručky zkoušek a kritérií;

Teplota samovznícení (EN 13237:2011) nejnižší teplota, určená za předepsaných zkušebních podmínek, horkého povrchu, na kterém se vznítí hořlavá látka ve formě směsi plyn/vzduch nebo pára/vzduch;

Teplotní třída rozdělení hořlavých plynů a par hořlavých kapalin podle jejich zápalné teploty a elektrických zařízení určených k používání v odpovídající potenciálně výbušné atmosféře podle jejich nejvyšší teploty povrchu; (viz publikace EN 13237:2011)

Tlaková nádoba viz **Nádoba tlaková**

Tlakový sud svařovaná přemístitelná tlaková nádoba s hydraulickým vnitřním objemem větším než 150 litrů, nejvýše však 1000 litrů (např. válcová nádoba vybavená obručemi pro válení, nádoba na ližinách nebo v rámu);

Tlaky pro tanky jsou všechny druhy tlaků (např. provozní tlak, otevírací tlak vysokorychlostních ventilů, zkušební tlak) vyjádřeny jako přetlaky v kPa (barech); tenze par látek se však vyjadřuje jako absolutní tlak v kPa (barech);

Trubková nádoba viz **Nádoba trubková**

Tuhá látka:

- (a) látka s bodem tání nebo bodem počátku tání vyšším než 20 °C při tlaku 101,3 kPa; nebo
- (b) látka, která není kapalná podle zkušební metody ASTM D 4359-90 nebo která je pastovitá podle kritérií vztahujících se na zkoušku tekutostí (penetrometrická zkouška) popsanou v oddílu 2.3.4;

Tuhá vnitřní nádoba viz **Nádoba tuhá vnitřní**

Typy plavidel

Typ G: tankové plavidlo pro přepravu natlakovaných plynů nebo hluboce zchladených plynů;

Typ C: tankové plavidlo určené pro přepravu kapalin. Plavidlo musí být provedeno jako plavidlo s hladkou palubou / dvojitou obšívkou s dvojitými boky a dvojitým dnem bez mezinástavby. Nákladní tanky mohou být tvořeny trupem plavidla nebo mohou být umístěny jako nezávislé tanky v úložných prostorech;

Typ N: tankové plavidlo určené pro přepravu kapalin.

Typ N, uzavřený: tankové plavidlo určené pro přepravu kapalin v uzavřených nákladních tancích.

Typ N, otevřený, s lapačem plamenů: tankové plavidlo určené pro přepravu kapalin v otevřených nákladních tancích, jejichž otvory do ovzduší jsou vybaveny lapačem plamenů schopným odolat trvalému hoření

Typ N, otevřený: tankové plavidlo určené pro přepravu kapalin v otevřených nákladních tancích.

U

Údržná doba doba, která uplyne od okamžiku dosažení počátečního stavu plnění až do okamžiku, kdy tlak zvyšující se v důsledku přívodu tepla dosáhne nejnižšího nastaveného tlaku omezovače(ů) tlaku cisteren určených pro přepravu hluboce zchladených zkvalněných plynů;

POZNÁMKA: K přemístitelným cisternám viz 6.7.4.1.

UEL viz *Horní mez výbušnosti*

Úložný prostor uzavřená část plavidla, která je vpředu a vzadu ohraničena vodotěsnými přepážkami a která je určena jen k uložení nezávislých nákladních tanků;

UN číslo čtyřmístné identifikační číslo látky nebo předmětu převzaté ze Vzorových předpisů OSN;

UNECE United Nations Economic Commission for Europe (Evropská hospodářská komise OSN) (UNECE, Palais des Nations, 8-14 avenue de la Paix, CH-1211 Geneve 10, Switzerland);

Úniková cesta bezpečná cesta z nebezpečí do bezpečí nebo k jiným evakuačním prostředkům;

Únikové plavidlo speciálně vybavený a přímo přístupný člun, zkonstruovaný pro odolávání všem zjištěným nebezpečím souvisejícím s nákladem a pro evakuaci osob v nebezpečí;

Únikový prostředek (vhodný) dýchací ochranný prostředek zkonstruovaný k zakrytí uživatelských úst, nosu a očí, který je možno snadno nasadit a který slouží k úniku z nebezpečné oblasti. K takovým prostředkům viz například Evropská norma EN 13794:2002, EN 402:2003, EN 403:2004 nebo EN 1146:2005;

Úroveň ochrany zařízení (EPL⁵ (viz IEC 60079-0)) znamená úroveň ochrany přiřazenou zařízení na základě pravděpodobnosti, že se stane zdrojem vznícení.

EPL 'Ga':

Zařízení s „velmi vysokou“ úrovní ochrany. Toto zařízení odpovídá kategorii zařízení I podle Směrnice 2014/34/EU.²

Zařízení s úrovní ochrany 'Ga' je vhodné pro použití v zónách 0, 1 a 2.

EPL 'Gb':

Zařízení s „vysokou“ úrovní ochrany. Toto zařízení odpovídá kategorii zařízení II podle Směrnice 2014/34/EU.²

Zařízení s úrovní ochrany 'Ga' je vhodné pro použití v zónách 1 a 2.

EPL 'Gc':

Zařízení se „zvýšenou“ úrovní ochrany. Toto zařízení odpovídá kategorii zařízení III podle Směrnice 2014/34/EU.²

Zařízení s úrovní ochrany 'Gc' je vhodné pro použití v zóně 2.

Uzávěr zařízení uzavírající otvor v nádobě;

Uzavírající systém pro přepravu radioaktivních látek je konstruktérem specifikovaný a příslušným orgánem uznaný soubor štěpných látek a částí obalů, který je určen pro udržení kritické bezpečnosti;

Uzavřené vozidlo vozidlo s uzavíratelnou nástavbou;

Uzavřený kontejner viz **Kontejner uzavřený**

Uzavřený kontejner pro volně ložené látky viz **Kontejner pro volně ložené látky**;

V

Velitel plavidla osoba odpovídající definici v článku 1.02 Evropských pravidel pro plavbu po vnitrozemských vodních cestách (CEVNI);

Velká nádoba pro volně ložené látky (IBC) viz **IBC**

Velký obal viz **Obal velký**

Velký kontejner viz **Kontejner velký**

⁵ Zkratka EPL znamená: Úroveň ochrany zařízení.

² Úřední věstník Evropské unie č. L 96 z 29.3.2014, str. 309.

Vícečlánkový kontejner na plyn (MEGC) přepravní prostředek obsahující články, které jsou navzájem propojeny spojovacím potrubím a namontovány na rámu. Následující články se považují za články vícečlánkového kontejneru na plyn: láhve, trubkové nádoby, tlakové sudy a svazky lahví, jakož i cisterny pro přepravu plynů, jak jsou definovány v 2.2.2.1.1, s vnitřním objemem větším než 450 litrů;

POZNÁMKA: Pro UN vícečlánkové kontejnery na plyn (MEGC), viz 6.7 ADR.

Vložka hadice nebo pytel vložený do obalu, včetně velkých obalů nebo IBC, které však netvoří jeho nedílnou součást, včetně uzávěrů jeho otvorů;

Vnější obal viz **Obal vnější**

Vnitřní nádoba viz **Nádoba vnitřní**

Vnitřní objem nádrže nebo komory nádrže cisterny celkový vnitřní objem *nádrže* nebo *komory nádrže* vyjádřený v litrech nebo kubických metrech. Nemá-li možno *nádrž* nebo komoru *nádrže* z důvodů jejího tvaru nebo konstrukce zcela naplnit, musí se pro určení stupně plnění a pro značení cisterny použít tento snížený vnitřní objem;

Vnitřní obal viz **Obal vnitřní**

Voda z nádrží voda z nádrží stroje, kolizního prostoru, kofrdamů a dvojitých boků, obsahující olej;

Vodotěsné konstrukční součást nebo zařízení vybavené tak, aby se zamezilo jakémukoli vniknutí vody;

Vodní film vodní vrstva k ochraně proti křehkému lomu;

Vozidlo jakékoli vozidlo spadající pod definici pojmu vozidla (viz *Bateriové vozidlo*, *Uzavřené vozidlo*, *Nekryté vozidlo*, *Vozidlo s plachtou a Cisternové vozidlo*);

Vozidlo s plachtou nekryté vozidlo opatřené plachtou pro ochranu nákladu;

Vozová zásilka každá zásilka od jednoho odesílatele, pro kterou je výlučně vyhrazeno použití vozidla, železničního vozu nebo velkého kontejneru, přičemž všechny úkony spojené s nakládkou a vykládkou se vykonávají podle příkazů odesílatele nebo příjemce;

POZNÁMKA: Odpovídající pojem pro radioaktivní látky je „výlučné použití“

Výbuch je náhlá reakce oxidace nebo rozkladu s nárůstem teploty nebo tlaku nebo obou současně (viz EN 13237:2011);

Výbušná atmosféra směs vzduchu s plyny, parami nebo mlhami hořlavá za atmosférických podmínek, v níž se proces hoření rozšíří po vznícení na celou nespotebovanou směs (viz EN 13237:2011);

Výdejní zařízení (čerpací systém) zařízení pro zásobování (tankování) plavidel kapalnými pohonnými hmotami;

Vykládce podnik, který

- (a) snímá kontejner, kontejner pro volně ložené látky, MEGC, cisternový kontejner nebo přemístitelnou cisternu z dopravního prostředku; nebo
- (b) vykládá balené nebezpečné věci, malé kontejnery nebo přemístitelné cisterny z dopravního prostředku nebo kontejneru; nebo
- (c) vyprazdňuje nebezpečné věci z nákladního tanku, cisternového vozidla, snímatelné cisterny, přemístitelné cisterny nebo cisternového kontejneru; nebo z bateriového železničního vozu, bateriového vozidla, MEMU nebo MEGC; nebo z dopravního prostředku pro přepravu ve volně loženém stavu, velkého kontejneru nebo malého kontejneru pro přepravu ve volně loženém stavu nebo z kontejneru pro volně ložené látky;
- (d) snímá vozidlo nebo vůz z plavidla;

Vykládka všechny činnosti vykonávané vykládcem podle definice vykládce;

Výlučné použití pro přepravu radioaktivních látek je výhradní použití dopravního prostředku nebo velkého kontejneru jediným odesílatelem, přičemž všechny postupy nakládky a vykládky a expedice před přepravou, během přepravy a po přepravě jsou prováděny podle pokynů odesílatele nebo příjemce, kde je to ustanoveními ADN vyžadováno;

Výměnná nástavba viz *Kontejner*

Výpočetní vakuometrického tlaku znamená vakuometrický tlak, na nějž byla vypočten, projektován a vystavěn nákladní tank nebo cisterna pro zůstatky věcí.

Vysokorychlostní ventil pojišťovací přetlakový ventil navržený tak, aby měl nominální rychlosti proudění vyšší než rychlost plamene výbušné směsi, čímž se zabrání prošlehnutí plamene. Pokud seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 obsahuje látky, u nichž se vyžaduje zajištění proti explozi ve sloupci (17) tabulky C kapitoly 3.2, musí být toto pojišťovací přetlakové zařízení testováno v souladu s mezinárodní normou ISO 16852:2016 a musí být doložen doklad o splnění příslušných požadavků (např. postupu o posouzení shody podle směrnice 2014/34/EU², systém IECEx³, ECE/TRADE/391 nebo alespoň jeho ekvivalent);

Vzor pro přepravu radioaktivních látek je popis štěpné látky vyjmuté podle 2.2.7.2.3.5 (f), radioaktivní látky zvláštní formy, nízkodisperzní radioaktivní látky, kusu nebo obalu, který umožňuje jejich úplnou identifikaci. Popis může obsahovat specifikace, konstrukční výkresy, zprávy, ze kterých je zřejmý soulad s právními předpisy, a jinou relevantní dokumentaci;

Vzorové předpisy OSN vzorové předpisy v příloze k dvacátému prvnímu revidovanému vydání Doporučení pro přepravu nebezpečných věcí OSN, vydaného Organizací spojených národů (ST/SG/AC.10/1/Rev.21);

Z

Záchranná tlaková nádoba tlaková nádoba s hydraulickým vnitřním objemem nejvýše 3 000 litrů, do které se ukládají poškozené, vadné nebo netěsnící tlakové nádoby nebo tlakové nádoby neodpovídající předpisům pro jejich přepravu, např. za účelem jejich obnovy nebo likvidace;

Záchranný člun (tj. člun na plavidle) člun na plavidle určený pro plnění dopravních, záchranných, vylovovacích a pracovních povinností;

Záchranný obal viz „*Obal záchranný*“

Záchranný vrátek zařízení pro vyzdvihování osob z prostorů, jako jsou nákladní tanky, kofrdamy a dvojité boky. Zařízení musí být obsluhovatelné jednou osobou.

Zajištění kvality systematický program inspekcí a kontrol uplatňovaný jakoukoli organizací nebo institucí, jehož cílem je poskytnout přiměřenou záruku, že bezpečnostní požadavky ADN jsou v praxi plněny;

Zalisovaná láhev láhev určená k přepravě LPG, o hydraulickém vnitřním objemu nejvýše 13 litrů, vyrobená ze svařované ocelové vnitřní láhve s vnitřním povlakem a opatřená vnějším ochranným pláštěm vyrobeným z pórovitého plastu, který je neodnímatelný a spojený neoddělitelně s vnějším povrchem vnější stěny ocelové láhve;

Záruka plnění předpisů (radioaktivní látky) systematický program opatření uplatňovaných příslušným orgánem, jehož cílem je zajistit plnění požadavků ADN v praxi;

Zařízení pro bezpečné zbavení pnutí v nákladních tancích ručně ovládané nebo dálkově ovládané zařízení, které je instalováno takovým způsobem, aby umožňovalo bezpečné zbavení pnutí nákladních tanků. Pokud seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 obsahuje látky, u nichž se vyžaduje zajištění proti explozi ve sloupci (17) tabulky C kapitoly 3.2, musí být zajištěna ochrana proti prošlehnutí plamene pro nejnebezpečnější látky v seznamu látek. Ochrana proti prošlehnutí plamene musí být testována v souladu s mezinárodní normou ISO 16852:2016⁷ a

² Úřední věstník Evropské unie č. L 96 ze dne 29. března 2014, strana 309.

³ <http://iecex.com/rules>.

musí být doložen doklad o splnění příslušných požadavků (např. postupu o posouzení shody podle směrnice 2014/34/EU,² systém IECEx,³ ECE/TRADE/391⁴ nebo alespoň jeho ekvivalent). Ochrana proti prolehnutí plamene může být zajištěna integrovaným systémem pojistek proti prolehnutí plamene schopných odolávat stálému hoření (ochrana proti prolehnutí plamene);

Zařízení pro kontrolu naložení zařízení, které sestává z počítače (hardware) a počítačového programu (software). Toto zařízení umožňuje zajistit, zda v případě balastování a/nebo nakládky:

- nejsou překročeny dovolené hodnoty týkající se podélné pevnosti a maximálního dovoleného ponoru; a
- stabilita plavidla vyhovuje požadavkům platným pro dané plavidlo. Pro tento účel musí být vypočítána stabilita v nepoškozeném i v poškozeném stavu;

Zařízení pro odběr vzorků uzavřeného typu zařízení, které prochází stěnou nákladního tanku nebo potrubím pro nakládku a vykládku, ale je součástí uzavřeného systému zkonstruovaného tak, aby během odběru vzorků nedocházelo k úniku plynu nebo kapaliny z nákladního tanku. Toto zařízení musí být takového typu, který je schválen kompetentním orgánem pro tyto účely;

Zařízení pro odběr vzorků částečně uzavřeného typu zařízení, které prochází stěnou nákladního tanku nebo potrubím pro nakládku a vykládku a je zkonstruované tak, aby během odběru vzorků uniklo jen malé množství plynného nebo kapalného nákladu do ovzduší. Pokud není toto zařízení používáno, musí být úplně uzavřeno. Toto zařízení musí být takového typu, který je schválen kompetentním orgánem pro tyto účely;

Zařízení pro vyrovnávání tlaku automaticky aktivovaný pojistný ventil, jehož účelem je chránit nákladní tank proti nepřipustnému vnitřnímu přetlaku;

Zařízení určené pro použití v oblastech s rizikem výbuchu elektrická a neelektrická zařízení, kde jsou přijata opatření, která zabraňují tomu, aby se aktivovaly jejich vlastní zdroje vznícení. Takové zařízení musí splňovat požadavky pro použití v příslušné zóně. Musí být testováno v souladu s typem ochrany a musí být doložen doklad o splnění příslušných požadavků (např. postupu o posouzení shody podle směrnice 2014/34/EU,² systému IECEx,³ ECE/TRADE/391⁴ nebo alespoň jeho ekvivalent).

Zařízení (viz směrnice 2014/34/EU²) elektrické nebo neelektrické stroje, přístroje, pevná nebo mobilní zařízení, řídicí komponenty a jejich vybavení a systémy detekce nebo prevence, které jsou, samostatně nebo společně, určeny pro výrobu, přenos, skladování, měření, řízení a přeměnu energie a/nebo zpracování materiálu, a které jsou schopny způsobit výbuch prostřednictvím vlastních potenciálních zdrojů vznícení.

Zařízení a předměty, kterým je přiděleno UN číslo a jsou přepravované jako náklad, nejsou zahrnuty;

Zásilka jakýkoli kus nebo více kusů, nebo náklad nebezpečných věcí předaný odesilatelem k přepravě;

Zásobovací plavidlo tankové plavidlo typu N, otevřené, o nosnosti do 300 tun, zkonstruované a vybavené pro přepravu a zásobování jiných plavidel produkty určenými pro provoz plavidel;

Zásobníkový systém s hydridem kovu samostatný kompletní systém pro akumulaci vodíku, včetně nádob, hydridu kovu, zařízení pro vyrovnávání tlaku, uzavíracího ventilu, provozní výstroje a vnitřních komponentů, používaný pouze pro přepravu vodíku;

Zbytkový náklad kapalný náklad, který zůstává v nákladním tanku nebo v potrubí pro nakládku a vykládku po vykládce bez použití dočerpávacího systému;

Zbytky nákladu kapalný náklad, který nemůže být vyčerpán z nákladních tanků nebo potrubí pomocí dočerpávacího systému;

Zkapalněný ropný plyn (LPG) nízkotlaký zkapalněný plyn složený z jednoho nebo více lehkých uhlovodíků, které jsou přiřazeny jen k UN 1011, UN 1075, UN 1965, UN 1969 nebo UN 1978 a které sestávají hlavně z propanu, propenu, butanu, izomerů butanu, butenu se stopami jiných uhlovodíkových plynů;

POZNÁMKA 1: Hořlavé plyny přiřazené k jiným UN číslům se nepovažují za LPG.

POZNÁMKA 2: K UN 1075 viz POZNÁMKA 2 pod 2F, UN 1965, v tabulce pro zkapalněné plyny ve 2.2.2.3.

Zkapalněný zemní plyn (LNG) zkapalněný plyn tvořený zemním plynem s vysokým obsahem methanu, přiřazený k UN 1972;

Zkušební tlak tlak, kterým musí být vyzkoušen nákladní tank, zbytkový tank, kofrdam nebo potrubí pro nakládku a vykládku před prvním uvedením do provozu a poté pravidelně v předepsaných lhůtách;

POZNÁMKA: K přemístitelným cisternám viz kapitola 6.7.

Ž

Železniční vůz drážní vozidlo bez své vlastní pohonné jednotky, které se pohybuje na svých vlastních kolech na železniční dráze a je používáno pro přepravu věcí (viz také *bateriový železniční vůz, krytý železniční vůz, otevřený železniční vůz, železniční vůz s plachtou a cisternový železniční vůz*);

Železniční vůz s plachtou otevřený vůz s plachtou k ochraně nákladu.

1.2.2 Měrné jednotky

1.2.2.1 V ADN se používá těchto měrných jednotek ^a:

Veličina	Jednotka SI ^b	Přípustná doplňková (vedlejší) jednotka	Vztah mezi jednotkami
Délka	m (metr)	-	-
Plošný obsah	m ² (čtverečný metr)	-	-
Objem	m ³ (krychlový metr)	l ^c (litr)	1 l = 10 ⁻³ m ³
Čas	s (sekunda)	min (minuta)	1 min = 60 s
		h (hodina)	1 h = 3 600 s
		d (den)	1 d = 86 400 s
Hmotnost	kg (kilogram)	g (gram)	1 g = 10 ⁻³ kg
		t (tuna)	1 t = 10 ³ kg
Hustota	kg/m ³	kg/l	1 kg/l = 10 ³ kg/m ³
Teplota	K (kelvin)	°C (stupeň Celsia)	0 °C = 273,15 K
Teplotní rozdíl	K (kelvin)	°C (stupeň Celsia)	1 °C = 1 K
Síla	N (newton)	-	1 N = 1 kg.m/s ²
Tlak	Pa (pascal)	-	1 Pa = 1 N/m ²
		bar (bar)	1 bar = 10 ⁵ Pa
Mechanické napětí	N/m ²	N/mm ²	1 N/mm ² = 1 MPa
Práce	J (joule)	kWh (kilowatthodina)	1 kWh = 3,6 MJ
Energie	J (joule)	-	1 J = 1 N.m = 1 W.s
Teplota	J (joule)	eV (elektronvolt)	1 eV = 0,1602 10 ⁻¹⁸ J
Výkon	W (watt)	-	1 W = 1 J/s = 1 N.m/s
Viskozita kinematická	m ² /s	mm ² /s	1 mm ² /s = 10 ⁻⁶ m ² /s
Viskozita dynamická	Pa.s	mPa.s	1 mPa.s = 10 ⁻³ Pa.s
Aktivita	Bq (becquerel)	-	-
Příkon dávkového ekvivalentu	Sv (sievert)	-	-

^a Pro přepočítání dosud používaných jednotek na jednotky SI platí následující zaokrouhlené hodnoty:

<u>Síla</u>	<u>Napětí</u>
1 kg = 9,807 N	1 kg/mm ² = 9,807 N/mm ²
1 N = 0,102 kg	1 N/mm ² = 0,102 kg/mm ²

<u>Tlak</u>			
1 Pa = 1 N/m ²	= 10 ⁻⁵ bar	= 1,02 x 10 ⁻⁵ kg/cm ²	= 0,75 x 10 ⁻² torr
1 bar = 10 ⁵ Pa	= 1,02 kg/cm ²	= 750 torr	
1 kg/cm ² = 9,807 x 10 ⁴ Pa	= 0,9807 bar	= 736 torr	
1 torr = 1,33 x 10 ² Pa	= 1,33 x 10 ⁻³ bar	= 1,36 x 10 ⁻³ kg/cm ²	

<u>Práce, energie, teplo</u>			
1 J = 1 N.m	= 0,278 x 10 ⁻⁶ kWh	= 0,102 kgm	= 0,239 x 10 ⁻³ kcal
1 kWh = 3,6 x 10 ⁶ J	= 367 x 10 ³ kgm	= 860 kcal	
1 kgm = 9,807 J	= 2,72 x 10 ⁻⁶ kWh	= 2,34 x 10 ⁻³ kcal	
1 kcal = 4,19 x 10 ³ J	= 1,16 x 10 ⁻³ kWh	= 427 kgm	

<u>Výkon</u>		<u>Kinematická viskozita</u>
1 W = 0,102 kgm/s	= 0,86 kcal/h	1 m ² /s = 10 ⁴ St (stoků)
1 kgm/s = 9,807 W	= 8,43 kcal/h	1 St = 10 ⁻⁴ m ² /s
1 kcal/h = 1,16 W	= 0,119 kgm/s	

<u>DYNAMICKÁ VISKOZITA</u>		
1 Pa.s = 1 N.s/m ²	= 10 P (poise)	= 0,102 kg.s/m ²
1 P = 0,1 Pa.s	= 0,1 N.s/m ²	= 1,02 x 10 ⁻² kg.s/m ²
1 kg.s/m ² = 9,807 Pa.s	= 9,807 N.s/m ²	= 98,07 P

^b Mezinárodní soustava měrných jednotek SI je výsledkem usnesení Generální konference pro míry a váhy (Adresa: Pavillon de Breteuil, Parc de St-Cloud, F-92 310 Sèvres).

^c Namísto zkratky "l" pro litr při použití psacího stroje, u něhož není rozdíl mezi písmenem „l“ a číslicí „1“, je dovoleno používat zkratky "L".

Desetinné násobky a díly jednotky mohou být tvořeny těmito předponami nebo značkami umístěnými před názvem nebo před značkou jednotky:

<u>Činitel</u>			<u>Předpona</u>	<u>Značka</u>
1 000 000 000 000 000 000	= 10 ¹⁸	trilion	exa	E
1 000 000 000 000 000	= 10 ¹⁵	biliarda	peta	P
1 000 000 000 000	= 10 ¹²	bilion	tera	T
1 000 000 000	= 10 ⁹	miliarda	giga	G
1 000 000	= 10 ⁶	milion	mega	M
1 000	= 10 ³	tisíc	kilo	K
100	= 10 ²	sto	hekto	H
10	= 10 ¹	deset	deka	da
0.1	= 10 ⁻¹	desetina	deci	d
0.01	= 10 ⁻²	setina	centi	c
0.001	= 10 ⁻³	tisícina	milli	m
0.000 001	= 10 ⁻⁶	miliontina	mikro	μ
0.000 000 001	= 10 ⁻⁹	miliardtina	nano	n
0.000 000 000 001	= 10 ⁻¹²	bilióntina	piko	p
0.000 000 000 000 001	= 10 ⁻¹⁵	biliardtina	femto	f
0.000 000 000 000 000 001	= 10 ⁻¹⁸	trilióntina	atto	a

POZNÁMKA: 10⁹ = 1 bilion je použití násobku měrných jednotek Spojenými národy v angličtině. Analogicky je pak 10⁻⁹ = 1 biliontina.

1.2.2.2 **Není-li výslovně stanoveno jinak, značí znaménko "%" v ADN:**

- (a) u směsí tuhých nebo kapalných látek, jakož i u roztoků a u tuhých látek zvlhčených kapalinou, část hmotnosti z celkové hmotnosti směsi, roztoku nebo zvlhčené látky vyjádřená v procentech;
- (b) u směsí stlačených plynů, jsou-li plněny tlakově, část objemu z celkového objemu plynné směsi vyjádřená v procentech, nebo, jsou-li plněny podle hmotnosti, část hmotnosti z celkové hmotnosti plynné směsi vyjádřená v procentech;
- (c) u směsí zkvapalňovaných plynů a rozpuštěných plynů část hmotnosti z celkové hmotnosti směsi vyjádřená v procentech.

1.2.2.3 Tlaky všeho druhu, týkající se nádob (např. zkušební tlak, vnitřní tlak, tlak, při němž se otevírá pojistný ventil) jsou vždy udány jako přetlak (tlak převyšující atmosférický tlak); naproti tomu tenze par je vždy vyjádřena jako absolutní tlak.

1.2.2.4 Pokud ADN stanoví stupeň plnění nádob, vztahuje se tento stupeň vždy na základní teplotu látek 15 °C, není-li udána jiná teplota.

KAPITOLA 1.3

ŠKOLENÍ OSOB PODÍLEJÍCÍCH SE NA PŘEPRAVĚ NEBEZPEČNÝCH VĚCÍ

1.3.1 Rozsah a uplatnění

Osoby, které jsou zaměstnanci účastníků přepravy nebezpečných věcí uvedených v kapitole 1.4 a jejichž pracovní povinnosti se týkají přepravy nebezpečných věcí, musí být vyškoleny o předpisech pro dopravu takových věcí podle své odpovědnosti a pracovní náplně. Školení se musí zaměřit také na specifická ustanovení vztahující se na bezpečnost při přepravě nebezpečných věcí, uvedená v kapitole 1.10. Zaměstnanci musí být vyškoleni podle 1.3.2 před převzetím odpovědností a smějí vykonávat činnosti, pro které jim dosud nebylo vyžadované školení poskytnuto, pouze pod přímým dohledem vyškolené osoby.

POZNÁMKA 1: O školení bezpečnostního poradce viz oddíl 1.8.3 namísto tohoto oddílu.

POZNÁMKA 2: O školení znalců viz kapitola 8.2 namísto tohoto oddílu.

POZNÁMKA 3: O školení ke třídě 7, viz též 1.7.2.5.

1.3.2 Forma školení

Školení musí mít následující obsah odpovídající odpovědnosti a pracovní činnosti dotyčné osoby.

1.3.2.1 Všeobecné bezpečnostní školení

Personál musí být dobře seznámen se všeobecnými ustanoveními předpisů o přepravě nebezpečných věcí.

1.3.2.2 Specifické školení

1.3.2.2.1 Personál musí být vyškolen přiměřeně ke svým pracovním úkolům a odpovědnostem o ustanoveních předpisů týkajících se dopravy nebezpečných věcí. Pokud je přeprava nebezpečných věcí prováděna kombinovanou (multimodální) dopravou, personál musí být seznámen s předpisy ostatních druhů dopravy zúčastněných na přepravním procesu.

1.3.2.2.2 Posádka musí být seznámena s ovládáním hasicích systémů a hasicích přístrojů.

1.3.2.2.3 Posádka musí být seznámena s ovládáním zvláštní výbavy uvedené v oddílu 8.1.5.

1.3.2.2.4 Osoby používající dýchací přístroj nezávislý na okolním prostředí musí být fyzicky schopné snášet dodatečnou námahu.

Musí být:

- v případě přístrojů pracujících se stlačeným vzduchem, vyškoleny v jejich ovládání a údržbě;
- v případě přístrojů zásobovaných stlačeným vzduchem hadicemi, vyškoleny v jejich ovládání a údržbě. Školení musí být doplněno praktickými cvičeními.

1.3.2.2.5 Velitel plavidla musí seznámit ostatní osoby na palubě s písemnými pokyny uvedenými v 5.4.3 takovým způsobem, aby byly schopny je použít.

1.3.2.3 Bezpečnostní školení

Personál musí být proškolen o rizicích a nebezpečích, které představují nebezpečné věci, přiměřeně stupni rizika zranění nebo expozice při nehodě při přepravě těchto věcí, včetně jejich nakládky a vykládky.

Školení musí být provedeno tak, aby se personál seznámil s bezpečnou manipulací a nouzovými postupy.

1.3.2.4 Školení musí být periodicky doplňováno obnovovacím školením s ohledem na změny předpisů.

1.3.3 Dokumentace

Záznamy o školeních absolvovaných podle této kapitoly musí být uchovávány zaměstnavatelem a musí být na požádání zpřístupněny zaměstnanci nebo příslušnému orgánu. Záznamy musí být zaměstnavatelem uchovávány po dobu stanovenou příslušným orgánem. Záznamy o školeních musí být ověřeny na počátku nového zaměstnání.

KAPITOLA 1.4

POVINNOSTI ÚČASTNÍKŮ PŘEPRAVY Z HLEDISKA BEZPEČNOSTI

1.4.1 Všeobecná bezpečnostní opatření

1.4.1.1 Účastníci přepravy nebezpečných věcí musí učinit přiměřená opatření podle povahy a rozsahu předvídatelných nebezpečí tak, aby se zabránilo vzniku škod nebo zranění a, popřípadě, aby se minimalizovaly jejich následky. Musí však ve všech případech splnit požadavky ADN vztahující se na jejich činnost.

1.4.1.2 Pokud se vyskytuje bezprostřední riziko, že může být přímo ohrožena bezpečnost veřejnosti, účastníci přepravy musí neprodleně uvědomit zásahové jednotky a musí jim sdělit všechny informace potřebné pro jejich činnost.

1.4.1.3 ADN může stanovit určité povinnosti různých účastníků.

Jestliže smluvní strana usoudí, že to nezpůsobí zhoršení bezpečnosti, může ve své vnitrostátní legislativě přesunout povinnosti týkající se jednoho uvedeného účastníka na jednoho nebo několik jiných účastníků, pokud jsou splněny povinnosti uvedené v oddílech 1.4.2 a 1.4.3. Tyto odchylky musí být sděleny smluvní stranou sekretariátu Evropské hospodářské komise Organizace spojených národů, který je dá na vědomí smluvním stranám.

Ustanovení oddílů 1.2.1, 1.4.2 a 1.4.3 týkající se definic účastníků a jejich příslušných povinností se nedotýkají ustanovení vnitrostátních předpisů týkajících se právních důsledků (trestnost, odpovědnost atd.) vznikajících ze skutečnosti, že dotýčný účastník je např. právnická osoba, samostatně výdělečná osoba, zaměstnavatel nebo zaměstnanec.

1.4.2 Povinnosti hlavních účastníků

POZNÁMKA 1: Někteří účastníci, kterým jsou v této kapitole ukládány bezpečnostní povinnosti, mohou být jedním a tímž podnikem. Činnosti a odpovídající bezpečnostní povinnosti účastníka mohou být převzaty také více podniky.

POZNÁMKA 2: K radioaktivním látkám viz též 1.7.6.

1.4.2.1 Odesílatel

1.4.2.1.1 Odesílatel nebezpečných věcí je povinen předat k přepravě jen zásilky, které odpovídají požadavkům ADN. V rámci oddílu 1.4.1 musí zejména:

- (a) přesvědčit se, že nebezpečné věci jsou zařazeny a připuštěny k přepravě podle ADN;
- (b) předat dopravci ve sledovatelné formě informace a údaje a popřípadě požadované přepravní a průvodní doklady (povolení, schválení, oznámení, osvědčení atd.), zejména s ohledem na ustanovení kapitoly 5.4 a tabulek v části 3;
- (c) použít pouze obaly, velké obaly, IBC a cisterny (cisternová vozidla, snímatelné cisterny, bateriová vozidla, MEGC, přemístitelné cisterny, cisternové kontejnery, železniční cisternové a bateriové vozy) schválené a vhodné pro přepravu dotýčných látek a opatřené značkami podle jednoho z mezinárodních předpisů a použít pouze schválená pravidla nebo tanková pravidla vhodná pro přepravu dotýčných věcí;
- (d) splnit požadavky týkající se způsobu odeslání a omezení přepravy;
- (e) zajistit, aby i prázdné nevyčištěné a neodplyněné cisterny (cisternová vozidla, snímatelné cisterny, bateriová vozidla, MEGC, přemístitelné cisterny, cisternové kontejnery, železniční cisternové a bateriové vozy) nebo prázdná nevyčištěná vozidla a prázdné nevyčištěné kontejnery pro volně ložené látky byly opatřeny velkými bezpečnostními značkami, značkami a bezpečnostními značkami podle kapitoly 5.3 a aby prázdné nevyčištěné cisterny byly uzavřeny a poskytovaly stejné záruky těsnosti, jako kdyby byly plné.

1.4.2.1.2 Jestliže odesílatel používá služeb jiných účastníků (balič, nakládky, plnič atd.), musí učinit přiměřená opatření, aby bylo zajištěno, že zásilka splňuje požadavky ADN. Může se však v případech uvedených v 1.4.2.1.1 (a), (b), (c) a (e) spolehnout na informace a údaje poskytnuté mu jinými účastníky.

1.4.2.1.3 Pokud odesílatel jedná z pověření třetí osoby, pak tato osoba musí odesílatele písemně upozornit, že se jedná o nebezpečné věci a poskytnout mu všechny informace a doklady potřebné ke splnění jeho povinností.

1.4.2.2 **Dopravce**

1.4.2.2.1 V souvislosti s oddílem 1.4.1, kde je to vhodné, dopravce musí zejména:

- (a) ověřit si, že nebezpečné věci, které se mají přepravovat, je dovoleno přepravovat podle ADN;
- (b) přesvědčit se, že všechny informace předepsané v ADN ve vztahu k nebezpečným věcem, které se mají přepravovat, byly před přepravou odesílatelem poskytnuty, že je v plavidle předepsaná dokumentace, nebo pokud je namísto papírové dokumentace používán systém elektronického zpracování dat (EDP) nebo systém elektronické výměny dat (EDI), že jsou během přepravy k dispozici údaje způsobem, který je alespoň rovnocenný papírové dokumentaci;
- (c) vizuálně se přesvědčit, že plavidla a náklad jsou bez viditelných závad, netěsností nebo trhlin, že nechybí výbava atd.;
- (d) zajistit, aby byl v případě nouze ze strany plavidla k dispozici druhý evakuační prostředek, pokud není druhým evakuačním prostředkem vybaveno zařízení na břehu;

POZNÁMKA: Před nakládkou nebo vykládkou musí dopravce jednat s provozovatelem zařízení na břehu ohledně dostupnosti evakuačních prostředků.

- (e) přesvědčit se, že plavidla nejsou přetížena;
- (f) zajistit, aby se v oblastech s rizikem výbuchu na palubě plavidla používaly pouze elektrické a neelektrické instalace a zařízení, která splňují požadavky pro použití v příslušné zóně;
- (g) poskytnout veliteli plavidla vyžadované písemné pokyny a ověřit si, že je předepsaná výbava na plavidle;
- (h) přesvědčit se, že byly splněny požadavky na označení plavidla;
- (i) přesvědčit se, že byly během nakládky, přepravy, vykládky a jakékoli manipulace s nebezpečnými věcmi v nákladních prostorech nebo nákladních tancích splněny zvláštní požadavky;
- (j) přesvědčit se, že seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 vyhovuje tabulce C kapitoly 3.2 včetně změn, které v ní byly provedeny;
- (k) před odplynováním prázdných nebo vyložených nákladních tanků a potrubí pro nakládku a vykládku tankového plavidla ve sběrném zařízení vyplní svou část kontrolního listu uvedeného v 7.2.3.7.2.2;
- (l) před nakládkou a vykládkou nákladních tanků tankového plavidla vyplní svou část kontrolního listu uvedeného v 7.2.4.10.

Pokud je to vhodné, toto všechno musí být provedeno na základě přepravních dokladů a průvodních dokladů vizuální prohlídkou plavidla nebo kontejnerů a popřípadě nákladu.

1.4.2.2.2 Dopravce však se může v případech uvedených v 1.4.2.2.1 (a) a (b) spolehnout na informace a údaje poskytnuté mu jinými účastníky. V případě 1.4.2.2.1 (c) se může spolehnout na to, co je uvedeno v „Osvědčení o naložení kontejneru/vozidla nebo železničního vozu“ podle 5.4.2.

1.4.2.2.3 Pokud dopravce zjistí podle 1.4.2.2.1 porušení ustanovení ADN, nesmí přepravit zásilku, pokud nedošlo k odstranění nedostatků.

1.4.2.2.4 (Vyhrazeno)

1.4.2.2.5 (Vyhrazeno)

1.4.2.3 Příjemce

1.4.2.3.1 Příjemce má povinnost nezdržovat bez pádných důvodů převzetí věcí a ověřit před vykládkou, během ní nebo po vykládce, že ustanovení ADN, které se ho týkají, jsou splněna.

V souvislosti s oddílem 1.4.1 musí zejména:

- (a) (Vypuštěno)
- (b) provést v případech stanovených ADN předepsané čištění a dekontaminaci plavidel;
- (c) (Vypuštěno)
- (d) (Vypuštěno)
- (e) (Vypuštěno)
- (f) (Vypuštěno)
- (g) (Vypuštěno)
- (h) (Vypuštěno)

1.4.2.3.2 (Vypuštěno)

1.4.2.3.3 (Vypuštěno)

1.4.3 Povinnosti ostatních účastníků

Nevyčerpávající seznam ostatních účastníků a jejich příslušných povinností je uveden dále. Povinnosti těchto ostatních účastníků vyplývají z oddílu 1.4.1 uvedeného výše, pokud vědí nebo by měli vědět, že jejich činnost tvoří část přepravního procesu podléhajícího ADN.

1.4.3.1 Nakládce

1.4.3.1.1 V souvislosti s oddílem 1.4.1 nakládce má zejména následující povinnosti:

- (a) smí předat nebezpečné věci dopravci pouze tehdy, je-li jejich přeprava podle ADN povolena;
- (b) musí, pokud předává k přepravě balené nebezpečné věci nebo nevyčištěné prázdné obaly, zkontrolovat, zda obal není poškozen. Nesmí předat k přepravě kus, jehož obal je poškozen, zejména není-li těsný, a jsou úniky nebo možnost úniku nebezpečných látek, dokud závada není odstraněna; tato povinnost se vztahuje též na prázdné nevyčištěné obaly;
- (c) musí splnit zvláštní požadavky pro nakládku a manipulaci;
- (d) musí po nakládce nebezpečných věcí do kontejneru splnit požadavky týkající se označení velkými bezpečnostními značkami, značkami a oranžovými tabulkami podle kapitoly 5.3;
- (e) musí při nakládce kusů dodržet zákazy společné nakládky rovněž s přihlédnutím k nebezpečným věcem, které jsou již v plavidle, vozidle, železničním voze nebo velkém kontejneru, jakož i předpisy týkající se oddělení potravin, poživatin nebo krmiv;
- (f) musí zajistit, aby zařízení na břehu bylo vybaveno jedním nebo dvěma prostředky pro evakuaci z plavidla v případě nouze;
- (g) (Vyhrazeno)

1.4.3.1.2 Nakládce se však může v případech uvedených v 1.4.3.1.1 (a), (d) a (e) spolehnout na informace a údaje poskytnuté mu jinými účastníky.

1.4.3.2 Balič

V souvislosti s oddílem 1.4.1 balič musí splnit zejména:

- (a) předpisy týkající se podmínek balení nebo podmínek společného balení; a

- (b) pokud připravuje kusy pro přepravu, předpisy týkající se nápisů a bezpečnostních značek na kusech.

1.4.3.3

Plnič

V souvislosti s oddílem 1.4.1 plnič musí splnit zejména následující povinnosti:

Povinnosti týkající se cisteren (cisternová vozidla, bateriová vozidla, snímatelné cisterny, přemístitelné cisterny, cisternové kontejnery, MEGC, železniční cisternové vozy a železniční bateriové vozy):

- (a) musí ověřit před plněním cisteren, že tyto cisterny a jejich výstroj jsou v dobrém technickém stavu;
- (b) musí se přesvědčit, že neprošlo datum příští inspekce cisteren;
- (c) smí plnit cisterny pouze nebezpečnými věcmi, které je dovoleno v těchto cisternách přepravovat;
- (d) musí při plnění cisterny dodržet ustanovení týkající se nebezpečných věcí v sousedních komorách;
- (e) musí během plnění cisterny dodržet dovolený stupeň plnění nebo dovolenou hmotnost obsahu na litr jejího vnitřního objemu pro plněnou látku;
- (f) musí po naplnění cisterny zajistit, aby všechny uzávěry byly v uzavřené poloze a nedocházelo k žádnému úniku;
- (g) musí zajistit, aby žádné nebezpečné zbytky naplněné látky neulpívaly na vnějším povrchu jím naplněných cisteren;
- (h) musí při přípravě nebezpečných věcí k přepravě zajistit, aby byly velké bezpečnostní značky, značky, oranžové tabulky a bezpečnostní značky umístěny na cisterny, vozidla a kontejnery pro volně ložené látky podle kapitoly 5.3.

Povinnosti týkající se volně ložených tuhých nebezpečných látek ve vozidlech, železničních vozech nebo kontejnerech:

- (i) musí před nakládkou ověřit, že vozidla, železniční vozy a kontejnery, a pokud je to nutné i jejich výstroj, jsou v dobrém technickém stavu a že přeprava dotyčných nebezpečných věcí ve volně loženém stavu je v těchto vozidlech, železničních vozech nebo kontejnerech dovolena;
- (j) musí zajistit, aby po nakládce byly umístěny předepsané oranžové tabulky a velké bezpečnostní značky nebo bezpečnostní značky podle požadavků kapitoly 5.3 vztahujících se na taková vozidla, železniční vozy nebo kontejnery.
- (k) musí zajistit, aby při naplnění vozidel, železničních vozů nebo kontejnerů nebezpečnými věcmi ve volně loženém stavu, byla dodržena příslušná ustanovení kapitoly 7.3 RID nebo ADR.

Povinnosti týkající se plnění nákladních tanků

- (l) (Vyhrazeno);
- (m) musí před nakládkou nákladních tanků tankového plavidla doplnit svou část kontrolního listu uvedeného v 7.2.4.10;
- (n) smí plnit nákladní tanky jen nebezpečnými věcmi, dovolenými v takových tancích;
- (o) je-li to potřebné, musí vydat pokyn pro topení v případě přepravy látek, jejichž bod tání 0 °C nebo vyšší;
- (p) musí se přesvědčit, že během plnění spouštěč automatického zařízení pro zamezení přeplnění vypne elektrické spojení vedené a napájené z břehového zařízení a že může učinit opatření proti přeplnění;
- (q) musí zajistit, aby zařízení na břehu bylo vybaveno jedním nebo dvěma prostředky pro evakuaci z plavidla v případě nouze;

- (r) musí se přesvědčit, že pokud je předepsán v 7.2.4.25.5 a pokud jsou nutná zajištění proti explozi podle sloupce (17) tabulky C kapitoly 3.2, je v plynovém zpětném potrubí nainstalován lapač plamenů, aby chránil plavidlo proti detonacím a prošlehnutí plamene ze břehu;
- (s) musí se přesvědčit, že nakládací výkon při nakládce odpovídá pokynům pro nakládku a vykládku uvedeným v 9.3.2.25.9 nebo 9.3.3.25.9 a že tlak v místě spojení plynového zpětného potrubí a odvětrávacího potrubí není větší než otevírací tlak přetlakového ventilu/vysokorychlostního ventilu;
- (t) musí se přesvědčit, že těsnění, která poskytl pro utěsnění přípojek nakládacích a vykládacích potrubí plavidlo/břeh, jsou z materiálu, který není náchylný k tomu, aby byl poškozen nákladem nebo aby způsobil rozklad nákladu nebo s ním tvořil škodlivé nebo nebezpečné složky;
- (u) musí se přesvědčit, že je během celého trvání nakládky zajištěn trvalý a patřičný dozor.

Povinnosti týkající se volně ložených tuhých nebezpečných látek v plavidlech

- (v) pokud použije zvláštní ustanovení 803, musí zaručit a zdokumentovat, za použití vhodného postupu, že nejvyšší dovolená teplota nákladu není překročena a musí veliteli plavidla poskytnout prokazatelnou formou instrukce;
- (w) smí naložit plavidlo jen nebezpečnými věcmi, jejichž přeprava ve volně loženém stavu je v tomto plavidle dovolena;
- (x) musí zajistit, aby zařízení na břehu bylo vybaveno jedním nebo dvěma prostředky pro evakuaci z plavidla v případě nouze;

1.4.3.4

Provozovatel cisternového kontejneru/přemístitelné cisterny

V souvislosti s oddílem 1.4.1 provozovatel cisternového kontejneru nebo přemístitelné cisterny musí zejména:

- (a) zajistit dodržení předpisů pro konstrukci, výstroj, inspekce, zkoušky a značení;
- (b) zajistit, aby údržba nádrží a jejich výstroje byla prováděna způsobem, který zaručí, že cisternový kontejner nebo přemístitelná cisterna bude za normálních provozních podmínek odpovídat předpisům ADR, RID nebo IMDG Code až do své příští inspekce;
- (c) zajistit provedení mimořádné kontroly, jestliže může být bezpečnost nádrže nebo její výstroje snížena opravou, změnou nebo nehodou.

1.4.3.5

(Vyhrazeno)

1.4.3.6

(Vyhrazeno)

1.4.3.7

Vykládce

1.4.3.7.1

V souvislosti s oddílem 1.4.1 vykládce musí zejména:

- (a) přesvědčit se, že jsou vykládány správné věci srovnáním příslušných informací v přepravním dokladu s informacemi na kusu, kontejneru, cisterně, MEMU, MEGC nebo dopravním prostředku;
- (b) před vykládkou a během ní přezkontrolovat, zda obaly, cisterna, dopravní prostředek nebo kontejner nejsou poškozeny do té míry, že by to ohrozilo vykládku. V tomto případě zajistit, aby se vykládka neprováděla, dokud nebudou učiněna patřičná opatření;
- (c) dodržet všechny příslušné předpisy týkající se vykládky a manipulace;
- (d) ihned po vykládce cisterny, dopravního prostředku nebo kontejneru:
 - (i) zajistit odstranění všech nebezpečných zbytků, které ulpěly na vnější straně cisterny, dopravního prostředku nebo kontejneru během vykládkového procesu; a
 - (ii) při vykládce kusů zajistit uzavření ventilů a otvorů pro prohlídky;
- (e) zajistit, aby bylo provedeno předepsané vyčištění a dekontaminace dopravních prostředků nebo kontejnerů; a

- (f) zajistit, aby kontejnery, vozidla a železniční vozy po jejich úplném vyložení, vyčištění a dekontaminaci už nebyly označeny velkými bezpečnostními značkami, značkami a oranžovými tabulkami, kterými byly označeny podle kapitoly 5.3.
- (g) zajistit, aby zařízení na břehu bylo vybaveno jedním nebo dvěma prostředky pro evakuaci z plavidla v případě nouze;

Dodatečné povinnosti týkající se vykládky nákladních tanků

- (h) před vykládkou nákladních tanků tankového plavidla vyplnit svou část kontrolního listu uvedeného v 7.2.4.10
- (i) zajistit, aby pokud je nutné připojení k odvětrávacímu potrubí, a pokud se vyžaduje zajištění proti explozi ve sloupci (17) tabulky C kapitoly 3.2, byla v plynovém zpětném potrubí pojistka proti prošlehnutí plamene, aby bylo plavidlo chráněno proti detonacím a prošlehnutí plamene ze břehu;
- (j) ujistit se, že vykládka probíhá v souladu s instrukcemi pro nakládku a vykládku uvedenými v 9.3.2.25.9 nebo 9.3.3.25.9 a že tlak v místě spojení plynového zpětného potrubí a odvětrávacího potrubí nepřekračuje otevírací tlak přetlakového ventilu/vysokorychlostního ventilu;
- (k) ujistit se, že těsnění, kterými opatřil spojovací přírubu k napojení potrubí pro nakládku a vykládku mezi plavidlem a břehem, je z materiálu, který nebude poškozen nákladem ani nezpůsobí rozklad nákladu ani s ním nebude vytvářet škodlivé nebo nebezpečné sloučeniny;
- (l) ujistit se, že je během celé doby trvání vykládky zajištěn trvalý a náležitý dozor;
- (m) ujistit se, že je možné během vykládky pomocí čerpadla na plavidle vypnout toto čerpadlo ze břehu;

1.4.3.7.2 Jestliže vykládce používá služeb jiných účastníků (provádějících čištění, dekontaminaci atd.), nebo čerpadel plavidla, přijme vhodná opatření, aby zajistil splnění požadavků ADN.

1.4.3.8 Provozovatel sběrného zařízení

1.4.3.8.1 V kontextu oddílu 1.4.1, provozovatel sběrného zařízení především:

- (a) Před odplynováním prázdných nebo vyložených nákladních tanků a potrubí pro nakládku a vykládku tankového plavidla vyplní svou část kontrolního listu uvedeného v 7.2.3.7.2.2.
- (b) Zajistí, aby, pokud je to stanoveno v 7.2.3.7.2.3, byla v potrubí sběrného zařízení, které je připojené k odplyňovanému plavidlu, pojistka proti prošlehnutí plamene, aby bylo plavidlo chráněno proti detonacím a prošlehnutí plamene ze strany sběrného zařízení.

KAPITOLA 1.5

SPECIÁLNÍ PODMÍNKY, ODCHYLKY

1.5.1 Dvoustranné a mnohostranné dohody

- 1.5.1.1 Podle článku 7, odstavce 1 ADN se mohou příslušné orgány smluvních stran dohodnout přímo mezi sebou, že určité přepravy po jejich území se budou dočasně provádět odchylně od ustanovení ADN, za podmínky, že tím není snížena bezpečnost. Orgán, který byl iniciátorem této dočasné odchyly, musí takové odchyly oznámit sekretariátu Evropské hospodářské komise Organizace spojených národů, který je dá na vědomí smluvním stranám.

POZNÁMKA: „Zvláštní ujednání“ podle oddílu 1.7.4 se nepovažuje za dočasnou odchylku podle tohoto oddílu.

- 1.5.1.2 Doba platnosti dočasné odchyly nesmí být delší než pět let od data jejího vstupu v platnost. Dočasná odchyly automaticky pozbývají platnosti datem vstupu v platnost příslušné změny těchto příložených Pravidel.

- 1.5.1.3 Přepravy na základě těchto dohod jsou přepravami ve smyslu ADN.

1.5.2 Zvláštní povolení pro přepravu v tankových plavidlech

1.5.2.1 Zvláštní povolení

- 1.5.2.1.1 Podle odstavce 2 článku 7 ADN je příslušný orgán oprávněn vydat dopravci nebo odesilateli zvláštní povolení k mezinárodní přepravě v tankových plavidlech těch nebezpečných věcí, včetně směsí, jejichž přeprava v tankových plavidlech není podle těchto Pravidel dovolena, a to podle dále uvedeného postupu.

- 1.5.2.1.2 Zvláštní povolení platí, s omezeními v něm specifikovanými, pro smluvní strany, na jejichž území se přeprava uskutečňuje, po dobu nejvýše dvou let, pokud nebude zrušeno k dřívějšímu datu. Se souhlasem příslušných orgánů těchto smluvních stran může být platnost zvláštního povolení prodloužena na dobu nejvýše jednoho roku.

- 1.5.2.1.3 Zvláštní povolení musí obsahovat prohlášení týkající se jeho zrušení k dřívějšímu datu a musí odpovídat vzoru obsaženému v pododdílu 3.2.4.1.

1.5.2.2 Postup

- 1.5.2.2.1 Dopravce nebo odesílatel musí požádat o vydání zvláštního povolení příslušný orgán smluvní strany, na jejímž území se přeprava uskutečňuje.

Žádost musí odpovídat vzoru obsaženému v pododdílu 3.2.4.2. Žadatel je zodpovědný za správnost těchto údajů.

- 1.5.2.2.2 Příslušný orgán musí posoudit žádost z technického a bezpečnostního hlediska. Pokud nemá žádné výhrady, vystaví zvláštní povolení obsaženém v pododdílu 3.2.4.3. a bezodkladně informuje ostatní příslušné orgány zainteresované na dotyčné přepravě. Zvláštní povolení se vydá jen tehdy, pokud s ním dotčené orgány souhlasí, nebo nevyjádřily svůj nesouhlas ve lhůtě do dvou měsíců po obdržení informace. Žadatel obdrží originál zvláštního povolení a jeho kopii bude mít na palubě plavidla (plavidel) provádějící(ch) dotyčnou přepravu. Příslušné orgány oznámí bezodkladně Administrativnímu výboru žádosti o zvláštní povolení, zamítnuté žádosti a udělená zvláštní povolení.

- 1.5.2.2.3 Jestliže zvláštní povolení nebylo vydáno z důvodů vyjádření pochybností nebo nesouhlasu, může Administrativní výbor rozhodnout o tom, zda vydat nebo nevydat zvláštní povolení.

1.5.2.3 Aktualizace seznamu látek připuštěných k přepravě v tankových plavidlech

1.5.2.3.1 Administrativní výbor posoudí všechna zvláštní povolení a žádosti, které obdržel, a rozhodne, zda má být látka zahrnuta do seznamu látek v těchto Pravidlech, které jsou připuštěny k přepravě v tankových plavidlech.

1.5.2.3.2 Jestliže Administrativní výbor vyjádří technické nebo bezpečnostní výhrady k zahrnutí látky do seznamu látek v těchto Pravidlech, připuštěných k přepravě v tankových plavidlech, nebo k některým podmínkám, musí o tom být informován příslušný orgán. Příslušný orgán bezodkladně stáhne, nebo pokud je to nutné, pozmění zvláštní povolení.

1.5.3 Ekvivalenty a odchylky (článek 7, odstavec 3 ADN)**1.5.3.1 Ekvivalentní postup**

Jestliže ustanovení těchto Pravidel předepisují pro plavidlo používání nebo přítomnost na palubě určitých materiálů, zařízení nebo výbavy nebo aplikaci některých konstrukčních opatření nebo některých pevných příslušenství, může příslušný orgán souhlasit s používáním nebo přítomností na palubě jiných materiálů, zařízení nebo výbavy nebo s aplikací jiných konstrukčních opatření nebo jiných pevných příslušenství pro toto plavidlo, jestliže jsou v souladu s doporučeními stanovenými Administrativním výborem přijaty jako rovnocenné.

1.5.3.2 Odchylky na zkoušku

Příslušný orgán může na základě doporučení Administrativního výboru vydat pokusné schvalovací osvědčení na omezenou dobu pro určité plavidlo, která má technické charakteristiky odchylné od požadavků těchto Pravidel, za podmínky, že jsou tyto charakteristiky dostatečně bezpečné.

1.5.3.3 Záznamy o ekvivalentech a odchylkách

Ekvivalenty a odchylky uvedené v 1.5.3.1 a 1.5.3.2 musí být zaznamenány ve schvalovacím osvědčení.

KAPITOLA 1.6

PŘECHODNÁ USTANOVENÍ

1.6.1 Všeobecná ustanovení

- 1.6.1.1 Pokud není stanoveno jinak, smějí být látky a předměty ADN přepravovány až do 30. června 2021 podle předpisů ADN platných do 31. prosince 2020.
- 1.6.1.2 (Vypuštěno)
- 1.6.1.3 Přejídná ustanovení pododdílů 1.6.1.3 a 1.6.1.4 ADR a RID nebo přejídná ustanovení uvedená v 4.1.5.19 IMDG Code, týkající se balení látek a předmětů třídy 1, platí také pro přepravu podléhající ADN.
- 1.6.1.4 (Vypuštěno)
- 1.6.1.5 (Vyhrazeno)
- 1.6.1.6 (Vyhrazeno)
- 1.6.1.7 (Vyhrazeno)
- 1.6.1.8 Stávající oranžové tabulky, které splňují požadavky pododdílu 5.3.2.2 platné do 31. prosince 2004, smějí být dále používány, pokud jsou splněny požadavky uvedené v 5.3.2.2.1 a 5.3.2.2.2, že tabulka, čísla a písmena musí zůstat upevněny bez ohledu na orientaci vozidla nebo železničního vozu.
- 1.6.1.9 (Vyhrazeno)
- 1.6.1.10 (Vypuštěno)
- 1.6.1.11 (Vyhrazeno)
- 1.6.1.12 (Vyhrazeno)
- 1.6.1.13 (Vypuštěno)
- 1.6.1.14 IBC vyrobené před 1. lednem 2011 a odpovídající konstrukčnímu typu, který neprošel vibrační zkouškou podle 6.5.6.13 ADR, nebo který nemusel splňovat kritéria odstavce 6.5.6.9.5 (d) ADR v době, kdy byl podroben zkoušce volným pádem, smějí být dále používány.
- 1.6.1.15 IBC vyrobené, rekonstruované nebo opravené před 1. lednem 2011 nemusí být označeny nejvyšším dovoleným stohovacím zatížením podle 6.5.2.2.2 ADR. Takové IBC, které nejsou označeny podle 6.5.2.2.2 ADR, smějí být dále používány po 31. prosinci 2010, avšak musí být označeny podle 6.5.2.2.2 ADR, jsou-li rekonstruovány nebo opraveny po tomto datu. IBC vyrobené, rekonstruované nebo opravené mezi 1. lednem 2011 a 31. prosincem 2016 a označené nejvyšším dovoleným stohovacím zatížením podle ustanovení v 6.5.2.2.2 ADR platných do 31. prosince 2014 smějí být dále používány.

- 1.6.1.24 (Vypuštěno)
- 1.6.1.25 (Vypuštěno)
- 1.6.1.26 Velké obaly vyrobené nebo rekonstruované před 1. lednem 2014 a které neodpovídají požadavkům uvedeným v 6.6.3.1 ADR, pokud jde o velikost písmen, číslic a symbolů, platným od 1. ledna 2013, smějí být dále používány. Velké obaly vyrobené nebo rekonstruované před 1. lednem 2015 nemusí být označeny nejvyšší dovolenou stohovací zátěží podle 6.6.3.3 ADR. Takové velké obaly, které nejsou označeny podle 6.6.3.3 ADR, smějí být používány i po 31. prosinci 2014, ale musí být označeny podle 6.6.3.3 ADR, pokud byly rekonstruovány po tomto datu. Velké obaly vyrobené nebo rekonstruované mezi 1. lednem 2011 a 31. prosincem 2016 a označené nejvyšším dovoleným stohovacím zatížením podle ustanovení v 6.6.3.3 ADR platných do 31. prosince 2014 smějí být dále používány.
- 1.6.1.27 Nádrže jako integrální součásti zařízení nebo strojů, obsahující kapalná paliva UN čísel 1202, 1203, 1223, 1268, 1863 a 3475, vyrobené před 1. červencem 2013, které neodpovídají požadavkům odstavce (a) zvláštního ustanovení 363 kapitoly 3.3 platným od 1. ledna 2013, smějí být dále používány.
- 1.6.1.28 (Vypuštěno)
- 1.6.1.29 Lithiové články a baterie vyrobené podle konstrukčního typu splňujícího požadavky pododdílu 38.3 Příručky zkoušek a kritérií, revize 3, změny 1 nebo jakékoli následné revize a změny platné k datu zkoušky konstrukčního typu smějí být dále přepravovány, pokud není v ADN stanoveno jinak.
- Lithiové články a baterie vyrobené před 1. červencem 2003 a splňující požadavky Příručky zkoušek a kritérií, revize 3 smějí být dále přepravovány, pokud jsou dodržena všechna ostatní příslušná ustanovení.
- 1.6.1.30 (Vypuštěno)
- 1.6.1.31 (Vypuštěno)
- 1.6.1.32 (Vypuštěno)
- 1.6.1.33 Elektrické dvouvrstvé kondenzátory UN čísla 3499 vyrobené před 1. lednem 2014 nemusí mít vyznačenu svou kapacitu akumulace energie ve Wh, jak je vyžadováno v pododstavci (e) zvláštního ustanovení 361 kapitoly 3.3.
- 1.6.1.34 Asymetrické kondenzátory UN čísla 3508 vyrobené před 1. lednem 2016 nemusí mít vyznačenu svou kapacitu akumulace energie ve Wh, jak je vyžadováno v pododstavci (c) zvláštního ustanovení 372 kapitoly 3.3.
- 1.6.1.35 (Vyhrazeno)
- 1.6.1.36 (Vyhrazeno)
- 1.6.1.37 (Vyhrazeno)
- 1.6.1.38 Smluvní strany smějí nadále vydávat osvědčení o odborné způsobilosti bezpečnostních poradců pro přepravu nebezpečných věcí podle vzoru platného do 31. prosince 2016, namísto osvědčení odpovídajících požadavkům uvedeným v 1.8.3.18, platným od 1. ledna 2017, až do 31. prosince 2018. Taková osvědčení smějí být dále používána až do konce své pětileté platnosti.
- 1.6.1.39 (Vypuštěno)
- 1.6.1.40 (Vypuštěno)
- 1.6.1.41 Bez ohledu na ustanovení ADN platná od 1. ledna 2017 smějí být velké obaly vyhovující parametrům obalové skupiny III podle zvláštního ustanovení pro balení L2 pokynu pro balení LP02 v 4.1.4.3 ADR platného do 31. prosince 2016 dále používány pro UN číslo 1950 až do 31. prosince 2022.
- 1.6.1.42 (Vypuštěno)

- 1.6.1.43 Vozidla registrovaná nebo poprvé uvedená do provozu před 1. červencem 2017, jak jsou definována ve zvláštních ustanoveních 388 a 669 kapitoly 3.3, a jejich výbava určená k použití během přepravy, která odpovídají požadavkům ADN platným do 31. prosince 2016, avšak obsahující lithiové články a baterie, které neodpovídají ustanovením uvedeným v 2.2.9.1.7, smějí být dále přepravována jako náklad podle požadavků zvláštního ustanovení 666 kapitoly 3.3.
- 1.6.1.44 Podniky, které se podílejí na přepravě nebezpečných věcí pouze jako odesílatelé a které nemusely jmenovat bezpečnostního poradce na základě ustanovení platných do 31. prosince 2018, musí, odchylkou od ustanovení uvedených v 1.8.3.1 platných od 1. ledna 2019, jmenovat bezpečnostního poradce nejpozději do 31. prosince 2022.
- 1.6.1.45 Smluvní strany smějí až do 31. prosince 2020 dále vydávat osvědčení o odborné způsobilosti bezpečnostních poradců pro přepravu nebezpečných věcí podle vzoru platného do 31. prosince 2018, namísto osvědčení odpovídajících požadavkům uvedeným v 1.8.3.18, platným od 1. ledna 2019. Taková osvědčení smějí být dále používána až do konce své pětileté platnosti.
- 1.6.1.46 Přeprava strojů nebo zařízení nevyjmenovaných v této příloze, které mohou obsahovat nebezpečné věci ve své konstrukci nebo provozní výbavě a které jsou tudíž přiřazeny k UN číslům 3363, 3537, 3538, 3539, 3540, 3541, 3542, 3543, 3544, 3545, 3546, 3547 nebo 3548, která byla vyňata z platnosti ustanovení ADR podle 1.1.3.1 (b) platných do 31. prosince 2018, smí být nadále vyňata z platnosti ustanovení ADR až do 31. prosince 2020, pokud byla učiněna opatření k zamezení úniku obsahu za normálních podmínek přepravy.

1.6.1.47 (Vypuštěno)

1.6.2 Tlakové nádoby a nádoby pro třídu 2

Přechodná ustanovení oddílů 1.6.2 ADR a RID platí také pro přepravy podléhající ADN.

1.6.3 Nesnímatelné cisterny (cisternová vozidla a cisternové železniční vozy), snímatelné cisterny, bateriová vozidla a bateriové železniční vozy

Přechodná ustanovení oddílů 1.6.3 ADR a RID platí také pro přepravy podléhající ADN.

1.6.4 Cisternové kontejnery, přemístitelné cisterny a MEGC

Přechodná ustanovení oddílů 1.6.4 ADR a RID nebo oddílu 4.2.0 IMDG Code platí také pro přepravy podléhající ADN.

1.6.5 Vozidla

Přechodná ustanovení oddílu 1.6.5 ADR platí také pro přepravy podléhající ADN.

1.6.6 Třída 7

Přechodná ustanovení oddílů 1.6.6 ADR a RID nebo oddílu 6.4.24 IMDG Code platí také pro přepravy podléhající ADN.

1.6.7 Přechodná ustanovení týkající se plavidel

1.6.7.1 Všeobecně

1.6.7.1.1 Pro účely Článku 8 ADN, oddílu 1.6.7 se stanovují všeobecná přechodná ustanovení v 1.6.7.2 (viz Článek 8, odstavec 1, 2 a 4) a dodatečná přechodná ustanovení v 1.6.7.3 (viz Článek 8, odstavec 3).

1.6.7.1.2 V tomto oddíle:

(a) „Plavidlo v provozu“ znamená:

- plavidlo podle Článku 8, odstavce 2 ADN;
- plavidlo, jemuž již bylo vydáno schvalovací osvědčení podle 8.6.1.1 až 8.6.1.4;

V obou případech musí být plavidla, která budou od 31. prosince 2014 po dobu delší než dvanáct měsíců bez platného schvalovacího osvědčení, vyloučena z provozu;

- (b) „N.R.M.“ znamená, že požadavky nemusí být aplikovány na plavidla v provozu s výjimkou toho, jestliže díly jsou hodnoceny jako nahrazené nebo upravené, tzn., aplikujeme pouze na plavidla, která jsou nová (od určitého data) nebo na díly které jsou vyměněné nebo upravené po datu určení (N.R.M = new replaced modified) rozhodující pro uznání plavidla za nové plavidlo je datum jeho přistavení k první inspekci pro získání schvalovacího osvědčení; kde jsou současně díly vyměněny nebo nahrazeny díly téhož typu a výroby, toto nemusí být považováno za výměnu 'R' jak je definováno tímto přechodným ustanovením.

Úpravy mohou být brány také jako přestavby již existujících typů tankových plavidel, typů nákladních tanků a provozních částí nákladních tanků za jiný typ nebo provozní součást vyššího třídy.

Pokud ve všeobecných přechodných ustanoveních v 1.6.7.2 není za „N.R.M.“ stanoveno datum, rozumí se N.R.M. po 26. květnu 2000. Pokud v dodatečných přechodných ustanoveních v 1.6.7.3 není datum stanoveno, rozumí se N.R.M po 26. květnu 2000.

- (c) „Obnovené schvalovacího osvědčení po...“ znamená, že pokud bylo pro plavidlo využito přechodné opatření v odstavci (b), musí být požadavky splněny v příštím obnověném schvalovacím osvědčení následujícího data určení. Jestliže schvalovacímu osvědčení vyprší platnost během prvního roku po datu uplatnění těchto Pravidel, požadavky musí být závazně splněny až po uplynutí tohoto prvního roku.
- (d) Požadavky kapitoly 1.6.7 vztahující se na plavidla v provozu platí jen v případě, že N.R.M. není použitelné.

1.6.7.2 Všeobecná přechodná ustanovení

1.6.7.2.1 Všeobecná přechodná ustanovení pro plavidla přepravující suché náklady

1.6.7.2.1.1 Plavidla v provozu musí splňovat:

- (a) požadavky ustanovení uvedených v tabulce níže včetně časových období v něm stanovených;
- (b) požadavky ustanovení, které nejsou uvedeny v tabulce níže v době používání těchto Pravidel.

Konstrukce a výbava provozovaných plavidel se musí udržovat minimálně na úrovni předcházejících bezpečnostních norem.

1.6.7.2.1.1 Tabulka všeobecných přechodných ustanovení: Přeprava suchého nákladu		
ustanovení	předmět	platnost a komentář
7.1.2.19.1	Plavidla nezbytná pro zajištění pohonu Přizpůsobení se novým požadavkům v 9.1.0.12.4, 9.1.0.40.2, 9.1.0.51 a 9.1.0.52	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data pro plavidla v provozu platí následující požadavky: V tlačném soulodí nebo v sestavě spřažených plavidel, kde alespoň jedno plavidlo musí být vybaveno schvalovacím osvědčením pro přepravu nebezpečných věcí, musí být všechna plavidla soulodí nebo sestavy spřažených plavidel vybavena příslušným schvalovacím osvědčením. Plavidla, která nepřepavují nebezpečné věci, musí odpovídat požadavkům následujících oddílů, pododdílů a odstavců: 1.16.1.1, 1.16.1.2, 1.16.1.3, 7.1.2.5, 8.1.5, 8.1.6.1, 8.1.6.3, 8.1.7, 9.1.0.0, 9.1.0.12.3, 9.1.0.12.5, 9.1.0.17.2, 9.1.0.17.3, 9.1.0.31, 9.1.0.32, 9.1.0.34, 9.1.0.41, 9.1.0.52.7, 9.1.0.56, 9.1.0.71 9.1.0.74.
7.1.3.41	Kouření	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020

1.6.7.2.1.1 Tabulka všeobecných přechodných ustanovení: Přeprava suchého nákladu		
ustanovení	předmět	platnost a komentář
7.1.3.51.1	Neelektrická zařízení	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2024
7.1.3.51.5	Odpojení červeně označených zařízení	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
7.1.3.51.5	Zařízení generující povrchové teploty vyšší než 200 °C	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
7.1.4.53	Osvětlovací zařízení v prostředí s nebezpečím výbuchu zóny 2	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2022
8.1.2.2 (e) – (h)	Dokumenty, které musí být na plavidle	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
8.6.1.1 8.6.1.2	Změny schvalovacího osvědčení	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.1.0.12.1	Větrání nákladních prostorů	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018 Do tohoto data se následující požadavky vztahují na plavidla v provozu: Každý nákladní prostor musí mít dostatečné přirozené nebo umělé větrání; pro náklad látek ve třídě 4.3 musí být každý nákladní prostor vybaven nuceným větráním. Zařízení, použitá pro tento účel, musejí být konstruována tak, aby do nákladního prostoru nemohla vniknout voda.
9.1.0.12.3	Větrání obytných prostor a kormidelny	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.1.0.12.3	Větrání provozních prostorů	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.1.0.12.3	Zařízení obytných prostor, kormidelny a provozních prostor, kde povrchové teploty mohou být vyšší než teploty uvedené v 9.1.0.51 nebo kde se používají elektrická zařízení, která nespĺňují požadavky 9.1.0.52.1	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.1.0.12.4	Větrací přívody	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.1.0.12.5	Ventilátory používané v chráněných oblastech a ventilátory nákladních prostor, které jsou uspořádány v proudu vzduchu: Teplotní třída a skupina výbušnosti	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.1.0.17.2	Plynotěsné uzavření otvorů nákladních prostorů	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018 Do tohoto data se následující požadavky vztahují na plavidla v provozu: Otvory obytných prostorů, kormidelny a přepravních prostorů musí mít možnost těsného uzavření.

1.6.7.2.1.1 Tabulka všeobecných přechodných ustanovení: Přeprava suchého nákladu		
ustanovení	předmět	platnost a komentář
9.1.0.17.3	Vstupy a otvory v chráněné oblasti	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018 Do tohoto data se následující požadavky vztahují na pravidla v provozu: Otvory motorových a provozních prostorů a přepravních prostorů musí mít možnost těsného uzavření.
9.1.0.31.2	Vstupy vzduchu pro motory	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.1.0.32.2	Otevřené konce vzduchového potrubí ne méně než 0,50 m nad otevřenou palubou	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.1.0.34.1	Umístění výfukových potrubí	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.1.0.35	Dočerpávací čerpadla v chráněné oblasti	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018 Do tohoto data se následující požadavky vztahují na pravidla v provozu: V případě přepravy látek ve třídě 4.1, UN 3175, všech látek ve třídě 4.3 v nákladním prostoru nebo nebalených, a polymerických perel, expandovatelných, ve třídě 9, UN 2211 se musí dočerpání nákladních prostorů provádět výhradně pomocí dočerpávacího zařízení, umístěného v chráněné oblasti. Dočerpávací zařízení, umístěná nad strojovnou, musí být uzavřená.
9.1.0.40.1	Protipožární hasicí přístroje, dvě čerpadla atd.	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.1.0.40.2	Protipožární hasicí systémy, pevně instalované v motorovém prostoru	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.1.0.41 v souvislosti s 7.1.3.41	Oheň a nekryté světlo	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018 Do tohoto data se následující požadavky vztahují na pravidla v provozu: Výstupy komínů musejí být umístěné nejméně 2 m od nejbližšího bodu na poklopových dveřích nákladního prostoru. Topné a kuchyňské systémy se mohou povolovat pouze v kovových obytných prostorech a kormidelnách. Ovšem: - Topná zařízení využívající kapalné palivo s bodem vzplanutí nad 55 °C mohou být povolena ve strojovnách. - Ústřední ohřívací bojler, vyhříváné tuhými palivy, se mohou povolovat v prostorách položených pod palubou a přístupných pouze z paluby.
9.2.0.31.2	Vstupy vzduchu pro motory	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.2.0.34.1	Umístění výfukových potrubí	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018

1.6.7.2.1.1 Tabulka všeobecných přechodných ustanovení: Přeprava suchého nákladu		
ustanovení	předmět	platnost a komentář
9.2.0.41 v souvislosti s 7.1.3.41	Oheň a nekryté světlo	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018 Do tohoto data se následující požadavky vztahují na pravidla v provozu: Výstupy komínů musejí být umístěné nejméně 2 m od nejbližšího bodu na pokloповých dveřích nákladního prostoru. Topné a kuchyňské systémy se mohou povolovat pouze v kovových obytných prostorech a kormidelnách. Ovšem: - Topná zařízení využívající kapalné palivo s bodem vzplanutí nad 55 °C mohou být povolena ve strojovnách. - Ústřední ohřívací bojler, vyhřívané tuhými palivy, se mohou povolovat v prostorech položených pod palubou a přístupných pouze z paluby.
9.1.0.51	Teplota vnějších částí motorů a jejich vstupů vzduchu a výfukových potrubí	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.1.0.52.1	Elektrické instalace, které jsou používány v bezprostřední blízkosti nebo uvnitř určené zóny na břehu	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.1.0.52.1	Elektrické instalace, zařízení a přístroje umístěné mimo chráněnou oblast	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data na palubě plavidel v provozu platí následující požadavky: V chráněné oblasti musí být možné elektrické zařízení odpojit pomocí centrálně umístěných vypínačů s výjimkou případů, kde: – V nákladních prostorech se jedná o zařízení certifikovaného a bezpečného typu, který odpovídá alespoň teplotní třídě T4 a skupině výbušnosti II B; a – V chráněné oblasti na palubě se jedná o zařízení typu s omezeným nebezpečím výbuchu. Odpovídající elektrické obvody musí být vybaveny kontrolními světly, která ukazují, zda obvody jsou nebo nejsou pod napětím. Vypínače musí být chráněny proti neúmyslné neoprávněné manipulaci. Zásuvky používané v této oblasti, musí být provedeny takovým způsobem, aby se zabránilo připojení nebo odpojení s výjimkou případů, kdy nejsou pod napětím. Ponorná čerpadla, která jsou zabudovaná nebo se používají v nákladních prostorech, musí mít prohlášení o shodě minimálně pro teplotní třídu T4 a skupinu výbušnosti II B.
9.1.0.52.2	Červeně označená zařízení	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.1.0.52.5	Výpadek elektrického napájení bezpečnostních a kontrolních zařízení	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2024

ustanovení	předmět	platnost a komentář
9.1.0.53.5	Pohyblivé elektrické kabely (oplaštěné, typ H 07 RN-F)	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data na palubě plavidel v provozu platí následující ustanovení: Do tohoto data musí být pohyblivé elektrické kabely (oplaštěné, typ H 07 RN-F) v souladu s IEC 60245-4:1994
9.1.0.53.6	Neelektrická zařízení v chráněné oblasti	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034

1.6.7.2.1.2 (Vypuštěno)

1.6.7.2.1.3 (Vypuštěno)

1.6.7.2.1.4 Pro plavidla nebo čluny, jejichž kýl byl položen před 1. červencem 2017 a která neodpovídají požadavkům v 9.0.X.1 týkajícím se dokumentace plavidla, musí uchovávat podkladů pro dokumentaci cisterny začít nejdříve při příští obnově platnosti schvalovacího osvědčení.

1.6.7.2.2 Všeobecná přechodná ustanovení pro tanková plavidla.

1.6.7.2.2.1 Provozovaná tanková plavidla musejí splňovat následující požadavky:

- (a) požadavky odstavců uvedených v následujících tabulkách, v rámci zde stanovených termínů
- (b) požadavky odstavců neuvedených v následujících tabulkách, k datu aplikace těchto Pravidel.

Konstrukce a výbava provozovaných plavidel se musí udržovat minimálně na předcházející úrovni bezpečnosti.

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení pro tanková plavidla.

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková plavidla		
ustanovení	předmět	platnost a komentář
1.2.1	Detektor plynu Zkouška podle normy IEC 60079-29-1:2016	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
1.2.1	Elektrická zařízení s omezeným nebezpečím výbuchu	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data se následující požadavky vztahují na plavidla v provozu: Elektrická zařízení s omezeným nebezpečím výbuchu jsou: – Elektrická zařízení, která v průběhu normální činnosti nevytvářejí jiskry nebo nevykazují teploty povrchu překračující 200 °C, nebo – Elektrická zařízení s pouzdem chráněným rozprašovanou vodou, která v průběhu normální činnosti nebo nevykazují teploty povrchu překračující 200 °C.
1.2.1	Měřicí přístroj kyslíku Zkouška podle normy EN 50104:2010	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
1.2.1	Nákladní prostory	N.R.M. pro plavidla typu N otevřená, jejichž nákladní prostory obsahují pomocná zařízení a která přepravují pouze látky třídy 8, s poznámkou 30 ve sloupci (20) tabulky C kapitoly 3.2. Obnovení schvalovacího osvědčení po 31. prosinci 2038.

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
1.2.1	Oblast nákladu Oblast prostoru nad palubou	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data na palubě plavidel v provozu platí následující požadavky: Prostorový rozsah odpovídá obdélníkovému komolému jehlanu s následujícími rozměry: Podlahová plocha: od paluby k palubě a od vnější přepážky kofrdamu k vnější přepážce kofrdamu Úhel sklonu krátkých stran: 45° Úhel sklonu dlouhých stran: 90° Výška: 3,00 m Oblast prostoru zóny 1 odpovídá oblasti nákladu nad palubou
1.2.1	Otvor pro odběr vzorků Ochrana proti prošlehnutí plamene Zkouška podle normy ISO 16852:2016 nebo EN ISO 16852:2016 / Prokázání shody s příslušnými požadavky	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Ochrana proti prošlehnutí plamene otvoru pro odběr vzorků musí být: - Vyzkoušena podle ISO 16852:2010 nebo EN ISO 16852:2010, včetně potvrzení výrobce podle směrnice 94/9/ES nebo ekvivalentní, jestliže otvor pro odběr vzorků byl nahrazen od 1. ledna 2015, nebo je na palubě plavidla postaveného nebo upraveného od 1. ledna 2015. - Vyzkoušena podle EN 12874:2001, včetně potvrzení výrobce podle směrnice 94/9/ES nebo ekvivalentní, jestliže otvor pro odběr vzorků byl nahrazen od 1. ledna 2001, nebo je na palubě plavidla postaveného nebo upraveného od 1. ledna 2001. - Typu schváleného příslušným orgánem pro předepsané použití, jestliže otvor pro odběr vzorků byl nahrazen před 1. lednem 2001, nebo je na palubě plavidla postaveného nebo upraveného před 1. lednem 2001.
1.2.1	Rozdělení zón Zóna 1 Oblast prostoru Zóna 2 Oblast prostoru:	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data na palubě plavidel v provozu platí následující požadavky: oblast prostoru zóny 1 odpovídá obdélníkovému komolému jehlanu s následujícími rozměry: Podlahová plocha: od paluby k palubě a od vnější přepážky kofrdamu k vnější přepážce kofrdamu Úhel sklonu krátkých stran: 45° Úhel sklonu dlouhých stran: 90° Výška: 3,00 m N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
1.2.1	Systém detekce plynů Zkouška podle normy IEC 60079-29-1:2016 a EN 50271:2010	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2024
1.2.1	Systém pro měření kyslíku Zkouška podle normy EN 50104:2010	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
1.2.1	Pojistka proti prošlehnutí plamene Prokázání shody s příslušnými požadavky	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
1.2.1	Pojistka proti prošlehnutí plamene Zkouška podle normy ISO 16852:2016 nebo EN ISO 16852:2016	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data na palubě plavidel v provozu platí následující požadavky: Zachycovače plamene (pojistky proti zpětnému prošlehnutí plamene) musí být: <ul style="list-style-type: none"> – Vyzkoušeny podle ISO 16852:2010 nebo EN ISO 16852:2010, jestliže byly nahrazeny od 1. ledna 2015 nebo jsou na palubách plavidel postavených nebo upravených od 1. ledna 2015; – Vyzkoušeny podle EN 12874:2001, jestliže byly nahrazeny od 1. ledna 2001 nebo jsou na palubách plavidel postavených nebo upravených od 1. ledna 2001; – Typu schváleného příslušným orgánem pro předepsané použití, jestliže byly nahrazeny před 1. lednem 2001, nebo jsou na palubách plavidel postavených nebo upravených před 1. lednem 2001.
1.2.1	Zařízení pro bezpečné zbavení prutu v nákladním tanku Ochrana proti prošlehnutí plamene Zkouška podle ISO 16852:2016/ Důkaz shody s platnými požadavky	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Ochrana proti prošlehnutí plamene musí být zkoušena podle normy EN 12874:2001 včetně potvrzení výrobce podle směrnice 94/9/ES na palubě plavidel postavených nebo upravených od 1. ledna 2001, nebo v případě nahrazení zařízení pro bezpečné snižování tlaku nákladních tanků od 1. ledna 2001. V ostatních případech musí být typu schváleného příslušným orgánem pro předepsané použití.
1.2.1	Vysokorychlostní pojistný ventil Zkouška podle normy EN ISO 16852:2016 nebo EN ISO 16852:2016 / Prokázání shody s příslušnými požadavky	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data na palubě plavidel v provozu platí následující požadavky: Vysokorychlostní pojistné ventily musí být: <ul style="list-style-type: none"> – Vyzkoušeny podle ISO 16852:2010 nebo EN ISO 16852:2010, včetně potvrzení výrobce v souladu se směrnicí 94/9/ES nebo ekvivalentní, jestliže byly nahrazeny od 1. ledna 2015, nebo jsou na palubě plavidel postavených nebo upravených od 1. ledna 2015. – Vyzkoušeny podle EN 12874:2001, včetně potvrzení výrobce v souladu se směrnicí 94/9/ES nebo ekvivalentní, jestliže byly nahrazeny od 1. ledna 2001, nebo jsou na palubě plavidel postavených nebo upravených od 1. ledna 2001. – Typu schváleného příslušným orgánem pro předepsané použití, jestliže byly nahrazeny před 1. lednem 2001, nebo jsou na palubách plavidel postavených nebo upravených před 1. lednem 2001.

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
1.2.1	Podtlakový ventil Ochrana proti prošlehnutí plamene Zkouška podle normy EN ISO 16852:2016 Prokázání shody s příslušnými požadavky	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Ochrana proti prošlehnutí plamene musí být vyzkoušena podle EN 12874:2001 včetně potvrzení výrobce podle směrnice 94/9/EC nebo ekvivalentní na palubě plavidel postavených nebo upravených od 1. ledna 2001 nebo pokud byl podtlakový ventil nahrazen od 1. ledna 2001. V ostatních případech musí být typu schváleného příslušným orgánem pro předepsané použití.
7.2.2.6	Kalibrace systému detekce plynu pro n-hexan	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
7.2.2.19.3	Pravidla používaná pro pohon Přizpůsobení novým ustanovením Ustanovení 9.3.3.12.4, 9.3.3.51 a 9.3.3.52.1 až 9.3.3.52.8	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data platí následující požadavky pro pravidla v provozu: Pravidla pohybuji tlačným soulodím nebo sestavou spřažených plavidel musí odpovídat požadavkům následujících oddílů, pododdílů a odstavců: 1.16.1.1, 1.16.1.2, 1.16.1.3, 7.2.2.5, 8.1.4, 8.1.5, 8.1.6.1, 8.1.6.3, 8.1.7, 9.3.3.0.1, 9.3.3.0.3.1, 9.3.3.0.5, 9.3.3.10.1, 9.3.3.10.4, 9.3.3.12.4 (a) s výjimkou kormidelny, 9.3.3.12.4 (b) kromě doby odezvy t90, 9.3.3.12.4 (c), 9.3.3.12.6, 9.3.3.16, 9.3.3.17.1 to 9.3.3.17.4, 9.3.3.31.1 to 9.3.3.31.5, 9.3.3.32.2, 9.3.3.34.1, 9.3.3.34.2, 9.3.3.40.1 (i když jedno požární nebo balastní čerpadlo stačí), 9.3.3.40.2, 9.3.3.41, 9.3.3.50.1 (c), 9.3.3.50.2, 9.3.3.51, 9.3.3.52.6, 9.3.3.52.7, 9.3.3.52.8, 9.3.3.56.5, 9.3.3.71 a 9.3.3.74, když alespoň jedno plavidlo soulodí nebo sestavě spřažených plavidel přepravuje nebezpečné věci. Požadavek 9.3.3.10.4 lze splnit přípravou svislých ochranných stěn ve výšce větší nebo rovné 0,50 m. Pravidla zabezpečující pohyb pouze otevřených tankových plavidel typu N nemusí splňovat požadavky odstavců 9.3.3.10.1, 9.3.3.10.4 and 9.3.3.12.6. Tyto odchylky musí být uvedeny ve schvalovacím osvědčení nebo prozatímním schvalovacím osvědčení takto: „Povolené odchylky“: „Odchylka od 9.3.3.10.1, 9.3.3.10.4 a 9.3.3.12.6; plavidlo může pohybovat pouze otevřenými tankovými plavidly typu N.“.
7.2.2.19.4	Pravidla sestavy, pro kterou se požaduje ochrana proti explozi	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
7.2.3.20.1	Balastní voda Zákaz plnění kofrdamů vodou	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2038. Do tohoto data se následující požadavky vztahují na pravidla v provozu: Kofrdamy smějí být během vykládky plněny vodou k zajištění stability plavidla a k umožnění dočerpání beze zbytků, pokud je to možné. Během plavby smějí být kofrdamy naplněny balastní vodou, jen jsou-li nákladní tanky prázdné.
7.2.3.20.1	Prokázání stability v případě netěsnosti spojené s balastní vodou	N.R.M. pro pravidla typů G a N. Obnovení schvalovacího osvědčení po 31. prosinci 2044.
7.2.3.31.2	Motorová vozidla pouze mimo oblast nákladu	N.R.M. pro pravidla typu N. Obnovení schvalovacího osvědčení po 31. prosinci 2034. Do tohoto data se následující požadavek vztahuje na pravidla v provozu: vozidlo se nesmí startovat na palubě.

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
7.2.3.41	Kouření	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
7.2.3.51.4	Odpojení červeně označených neelektrických zařízení	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
7.2.3.51.5	Teplota povrchu, kde se požaduje T4, T5 nebo T6	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
7.2.4.22.3	Odběr vzorků z jiných otvorů	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2018. Do tohoto data se na pravidlech v provozu smějí otevírat víka nákladních tanků v průběhu nakládky pro kontrolu a odběr vzorků.
8.1.2.3 (r), (s), (t) (v)	Dokumenty, které musí být na palubě	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020 Do tohoto data se kromě dokumentů požadovaných podle 1.1.4.6 požadují následující dokumenty: (a) Plán označující hranice oblasti nákladu a umístění elektrického zařízení instalovaného v této oblasti; (b) Seznam strojního zařízení, přístrojů nebo jiných elektrických zařízení, uvedených v bodu (a) výše, včetně následujících podrobností: Strojní zařízení nebo přístroje, umístění, druh ochrany, druh ochrany proti výbuchu, zkušebna a schvalovací číslo; (c) Seznam nebo obecný plán označující elektrické zařízení umístěné vně oblasti nákladu, které může být provozováno při nakládání, vykládání nebo uvolňování plynu. Výše uvedené dokumenty musí být opatřeny razítkem příslušného orgánu vydávajícího schvalovací osvědčení.
8.1.2.3 (u)	Dokumenty, které musí být na palubě Plán s rozdělením zón	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
8.1.6.3	Ověření systému pro měření kyslíku	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
8.1.7.2	Označení zařízení, která se mají používat v oblastech s nebezpečím výbuchu, jakož i systémů nezávislé ochrany proti výbuchu	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2024
8.1.7.2	Zařízení a systémy nezávislé ochrany proti výbuchu, testování zařízení a systémy nezávislé ochrany proti výbuchu, jakož i shoda s dokumenty uvedenými v 8.1.2.3 (r) až (v) vzhledem k situaci na palubě	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
8.6.1.3 8.6.1.4	Změna schvalovacího osvědčení	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.2.0.1 (c) 9.3.3.0.1 (c)	Ochrana odvětrávacího potrubí proti korozi.	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.0.3 (d) 9.3.2.0.3 (d) 9.3.3.0.3 (d)	Materiál odolný proti ohni v ubytovacích prostorech a v kormidelně	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
9.3.3.8.1	Pokračování třídy	N.R.M. pro pravidla typu N otevřená s lapači plamene a pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2044. Do tohoto data platí na plavidlech v provozu následující požadavky: Pokud není stanoveno jinak, musí typ konstrukce, pevnost, podřízené dělení, výbava a převody pravidla odpovídat nebo být rovnocenné konstrukčním požadavkům pro klasifikaci v nejvyšší třídě od uznané klasifikační společnosti.
9.3.1.10.1 9.3.2.10.1 9.3.3.10.1	Vniknutí plynů a kapalin do kormidelny Okna, která je možné otevřít	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2024
9.3.1.10.2 9.3.2.10.2 9.3.3.10.2	Výška ochranného sílu	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
9.3.1.10.3 9.3.2.10.3 9.3.3.10.3	Ochranná stěna	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2024
9.3.1.10.4 9.3.2.10.4 9.3.3.10.4	Spodní hrany dveřních otvorů atd.	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data na palubách provozovaných plavidel, s výjimkou plavidel typu N otevřený, platí následující požadavky: Do tohoto data tento požadavek je možné splnit připravením svislých ochranných stěn ve výšce větší nebo rovné 0,50 m. Na palubách provozovaných plavidel o délce pod 50,00 m je možné výšku 0,50 m snížit na 0,30 m u průchodů, vedoucích na palubu.
9.3.1.11.1 (b)	Poměr délky a průměru u tlakových tankových plavidel	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044
9.3.3.11.1 (d)	Omezení délky tankových plavidel	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044
9.3.1.11.2 (a)	Uspořádání nákladních tanků Vzdálenost mezi nákladními tanky a bočními stěnami Výška sedel	N.R.M. pro pravidla typu G, jejichž kóly byly položeny před 1. lednem 1977. Obnovení schvalovacího osvědčení po 31. prosinci 2044.

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
9.3.1.11.2 (a)	<p>Uspořádání nákladních tanků</p> <p>Vzdálenost mezi nákladními tanky a bočními stěnami</p> <p>Výška sedel</p>	<p>N.R.M.</p> <p>Obnovení schvalovacího osvědčení po 31. prosinci 2044</p> <p>Do tohoto data na palubách provozovaných pravidel, jejichž kýl byl položen po 31. prosinci 1976, platí následující požadavky:</p> <p>Pokud je objem nádrže větší než 200 m³, nebo kde je poměr délky k průměru menší než 7 ale větší než 5, tam musí být trup v oblasti nádrže takový, aby v případě kolize zůstala nádrž, pokud to je možné, nepoškozená. Tento požadavek je možné brát jako splněný, pokud pravidlo v prostoru nádrže:</p> <ul style="list-style-type: none"> - má dvojitý trup s odlehlostí nejméně 80 cm mezi bočním pláštěm a podélným pažením lodního prostoru - nebo pokud je pravidlo zkonstruované takto: <ul style="list-style-type: none"> a) Mezi průchozí palubou a horní částí podlažních desek jsou v pravidelných intervalech nepřevyšujících 60 cm umístěné boční podélné nosníky; b) Boční podélné nosníky musejí být podepřené síťovým rámem, s mezerami nepřevyšujícími 2,00 m. Výška síťového rámu nesmí být nižší než 10 % hloubky a v jakémkoliv případě nesmí být menší než 30 cm. Musejí být vybavené čelní deskou z ploché oceli, která má příčný průřez nejméně 15 cm²; c) Boční podélné nosníky podle bodu a) musejí mít stejnou výšku jako síťový rám a musejí být doplněné čelní deskou z ploché oceli, která má příčný průřez nejméně 7,5 cm².
9.3.1.11.2 (a)	Vzdálenost mezi sacími přítoky a podlažními deskami	<p>N.R.M.</p> <p>Obnovení schvalovacího osvědčení po 31. prosinci 2044</p>

9.3.2.11.3 (a) 9.3.3.11.3 (a)	Šířka kofrdamů 0,60 m Volné nákladní prostory s kofrdamy nebo s přepážkami izolovanými izolací „A-60“ Odlehlost o velikosti 0,50 m od nákladních tanků ve volném přepravním prostoru	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044 Do tohoto data na palubách provozovaných pravidel platí následující požadavky: Typ C: minimální šířka kofrdamů je 0,50 m; Typ N: minimální šířka kofrdamů je 0,50 m, na palubách pravidel s vlastní hmotností do 150 t je tato hodnota 0,40 m; Typ N otevřený: kofrdamy se nemusejí vyžadovat při celkové hmotnosti do 150 t. Odlehlost mezi nákladovými nádržemi a koncovými přepážkami nákladového prostoru musí být minimálně 0,40 m.
9.3.3.11.4	Průchody v koncových přepážkách nákladních prostorů	N.R.M. od 1. ledna 2005 pro pravidla typu N otevřená, jejichž kýly byly položeny před 1. lednem 1977. Obnovení schvalovacího osvědčení po 31. prosinci 2044.
9.3.3.11.4	Vzdálenost mezi potrubím a dnem	N.R.M. od 1. ledna 2005 Obnovení schvalovacího osvědčení po 31. prosinci 2038
9.3.3.11.4	Uzavírací zařízení nakládacího a vykládacího potrubí vycházejícího z nákladního tanku	N.R.M. od 1. ledna 2005 Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.3.11.6 (a)	Tvar kofrdamu upraveného jako prostor s čerpadly	N.R.M. pro pravidla typu N, jejichž kýly byly položeny před 1. lednem 1977. Obnovení schvalovacího osvědčení po 31. prosinci 2044.
9.3.3.11.7	Vzdálenost mezi nákladními tanky a vnější stěnou pravidla	N.R.M. od 1. ledna 2001 Obnovení schvalovacího osvědčení po 31. prosinci 2038
9.3.3.11.7	Šířka dvojité obšívky	N.R.M. od 1. ledna 2007 Obnovení schvalovacího osvědčení po 31. prosinci 2038
9.3.3.11.7	Odstup mezi čerpací jímkou nákladního tanku a dnovou výztuhou	N.R.M. od 1. ledna 2003 Obnovení schvalovacího osvědčení po 31. prosinci 2038
9.3.3.11.8	Uspořádání provozních prostorů v oblasti nákladu pod palubou	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2038.
9.3.1.11.8 9.3.3.11.9	Rozměry otvorů pro přístup do prostor v rámci oblasti nákladu	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.1.11.8 9.3.2.11.10 9.3.3.11.9	Interval mezi zesilujícími prvky	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044
9.3.2.12.1 9.3.3.12.1	Větrací otvory v nákladových prostorech	N.R.M. od 1. ledna 2003 Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.1.12.2 9.3.3.12.2	Větrací systémy ve dvojitých prostorech trupu a ve dvojitých spodních prostorech	N.R.M. od 1. ledna 2003 Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.1.12.3 9.3.2.12.3 9.3.3.12.3	Výška vzduchových vstupů nad palubou pro servisní prostory, umístěné pod palubou	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.1.12.4 9.3.2.12.4 9.3.3.12.4	Větrání kormidelny	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2024

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
9.3.1.12.4 9.3.2.12.4 9.3.3.12.4	Zařízení v kormidelně, kde povrchové teploty mohou být vyšší, než je uvedeno v 9.3.x.51 (a), nebo zahrnuje použití elektrického zařízení, která nesplňuje požadavky 9.3.x.52.1	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.12.4 9.3.2.12.4 9.3.3.12.4	Zařízení v obytných prostorech, kormidelně a provozních prostorech, kde povrchové teploty mohou být vyšší, než je uvedeno v 9.3.x.51 (a)	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.12.4 9.3.3.12.4	Elektrická zařízení používaná při nakládání, vykládání, uvolňování plynu a v bezprostřední blízkosti nebo uvnitř určené zóny na břehu	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data, na palubách plavidel typu G a typu N, jejichž kýl byl položen před 1. lednem 1977, všechna elektrická zařízení s výjimkou osvětlovacích zařízení v obytných prostorech, rádio telefonních zařízení v obytných prostorech a v kormidelně a řídicích přístrojích spalovacích motorů, musí splňovat následující požadavky: Generátory, motory, atd.: Stupeň ochrany IP 13 Rozvaděče, vypínače u vchodů do obytných prostor, atd.: Stupeň ochrany IP 23 Přístroje atd.: Stupeň ochrany IP 55
9.3.1.12.4 9.3.2.12.4 9.3.3.12.4	Neelektrická zařízení používaná při nakládání, vykládání, odplynování a v bezprostřední blízkosti nebo uvnitř určené zóny na břehu	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.12.4 (b) 9.3.2.12.4 (b) 9.3.3.12.4 (b)	Systém detekce plynů: Čas T90	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.12.4 9.3.2.12.4 9.3.3.12.4	Alarmy	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2024
9.3.1.12.6 9.3.2.12.6 9.3.3.12.6	Vzdálenost mezi vstupy větracích otvorů v kormidelně a v oblasti nákladu	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.12.6 9.3.2.12.6 9.3.3.12.6	Vzdálenost mezi větracími otvory obytných a provozních prostor a oblastí nákladu	N.R.M. od 1. ledna 2003 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.12.6 9.3.2.12.6 9.3.3.12.6	Trvale zabudovaná zařízení podle 9.3.x.40.2.2 (c)	N.R.M. od 1. ledna 2003 Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.1.13 9.3.3.13	Stabilita (obecně)	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044
9.3.3.13.3 odstavec 2	Stabilita (obecně)	N.R.M. od 1. ledna 2007 Obnovení schvalovacího osvědčení po 31. prosinci 2044
9.3.1.14 9.3.3.14	Stabilita (v nepoškozeném stavu)	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044
9.3.1.15	Stabilita (v případě poškození)	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044
9.3.3.15	Stabilita (v případě poškození)	N.R.M. od 1. ledna 2007 Obnovení schvalovacího osvědčení po 31. prosinci 2044

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
9.3.1.16.1 9.3.3.16.1	Vzdálenost otvorů motorových prostorů od oblasti nákladu	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044
9.3.3.16.1	Motory s vnitřním spalováním mimo oblast nákladu	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2034.
9.3.1.16.2 9.3.3.16.2	Závěsy dveří směřující do oblasti nákladu	N.R.M. pro pravidla, jejichž kýly byly položeny před 1. lednem 1977, kde by změny mohly omezovat jiné hlavní otvory. Obnovení schvalovacího osvědčení po 31. prosinci 2034.
9.3.3.16.2	Prostory strojovny přístupné z paluby	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2034.
9.3.1.17.1 9.3.3.17.1	Obytné prostory a kormidelna mimo oblast nákladu	N.R.M. pro pravidla, jejichž kýly byly položeny před 1. lednem 1977, pokud není spojení mezi kormidelnou a jinými uzavřenými prostory. Obnovení schvalovacího osvědčení po 31. prosinci 2044. Obnovení schvalovacího osvědčení po 31. prosinci 2044 pro pravidla o délce do 50 metrů, jejichž kýly byly položeny před 1. lednem 1977 a jejichž kormidelny jsou umístěny v oblasti nákladu, i když to poskytuje přístup k jiným uzavřeným prostorům, pokud je bezpečnost zajištěna patřičnými provozními požadavky příslušného orgánu.
9.3.3.17.1	Obytné prostory a kormidelna mimo oblast nákladu	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2044.
9.3.1.17.2 9.3.2.17.2 9.3.3.17.2	Uspořádání vstupů a otvorů v nadstavbách	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044
9.3.1.17.2 9.3.2.17.2 9.3.3.17.2	Vstupy směřující do oblasti nákladu	N.R.M. pro pravidla o délce do 50 metrů, jejichž kýly byly položeny před 1. lednem 1977, pokud jsou nainstalovány protiplynové ochrany. Obnovení schvalovacího osvědčení po 31. prosinci 2044.
9.3.3.17.2	Vstupy a otvory	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2044.
9.3.1.17.4 9.3.3.17.4	Vzdálenost otvorů od oblasti nákladu	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044
9.3.3.17.5	Schválení průchodek hřídele a zobrazení pokynů (b), (c)	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2018.
9.3.1.17.6 9.3.2.17.6 9.3.3.17.6	Vzdálenost mezi vstupy větrání v čerpadlových prostorech a kormidelnou	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
9.3.1.17.6 9.3.3.17.6	Čerpadlové prostory pod palubou	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018 Do tohoto data na palubách provozovaných plavidel platí následující požadavky: Čerpadlové prostory pod palubou musejí - splňovat požadavky pro servisní prostory: - pro pravidla typu G: 9.3.1.12.3 - pro pravidla typu N: 9.3.3.12.3; - být vybaveny systémem plynových detektorů podle 9.3.1.17.6 nebo 9.3.3.17.6.
9.3.1.17.6 9.3.2.17.6 9.3.3.17.6	Systém pro měření kyslíku Minimální hodnota pro alarm	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
9.3.1.17.6 9.3.2.17.6 9.3.3.17.6	Alarmy	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2024
9.3.2.20.1 9.3.3.20.1	Přístup do kofrdamů nebo oddělení kofrdamů	N.R.M. od 1. ledna 2015 Obnovení schvalovacího osvědčení po 31. prosinci 2034.
9.3.2.20.2 9.3.3.20.2	Nasávací ventil	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.3.20.2	Plnění kofrdamů pomocí čerpadla	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2018.
9.3.2.20.2 9.3.3.20.2	Plnění kofrdamů v době do 30 minut	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.2.20.4 9.3.3.20.4	Skupina/podskupina výbušnosti	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
9.3.1.21.3 9.3.2.21.3 9.3.3.21.3	Vyznačení všech nejvyšších dovolených úrovní plnění nákladních tanků na ukazateli úrovně hladiny	N.R.M. od 1. ledna 2015 Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.3.21.1 (b)	Ukazatel úrovně hladiny	N.R.M. od 1. ledna 2005 pro pravidla typu N otevřená s lapači plamene a typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2018. Do tohoto data na plavidlech v provozu vybavených otvory pro měření tyto otvory musí: – být umístěny tak, aby stupeň naplnění mohl být měřen pomocí měrné tyče; – být vybaveny automatickým uzávěrem.
9.3.3.21.1 (g)	Otvor pro odběr vzorků	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2018.
9.3.2.21.1 (g) 9.3.3.21.1 (g)	Skupina/podskupina výbušnosti	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2020
9.3.1.21.4 9.3.2.21.4 9.3.3.21.4	Nezávislé výstražné zařízení pro úroveň kapaliny	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018
9.3.1.21.5 (a) 9.3.2.21.5 (a) 9.3.3.21.5 (a)	Zásuvka v blízkosti pobřežních přípojek a odpojení lodního čerpadla	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018

ustanovení	předmět	platnost a komentář
9.3.1.40.2 9.3.2.40.2 9.3.3.40.2	Stacionární protipožární hasicí systém v motorovém prostoru	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.41.1 9.3.3.41.1	Výstupy výfukových potrubí jsou umístěny nejméně 2 m od oblastí nákladu	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2044 pro pravidla, kde byl kýl položen před 1. lednem 1977.
9.3.3.41.1	Výstupy komínů	N.R.M. Obnovení schvalovacího osvědčení nejpozději do 1. ledna 2039 pro kalová pravidla.
9.3.3.42.2	Systém ohřevu nákladu	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2034. Do tohoto data platí na pravidlech v provozu následující požadavky: Toto je možno dodržet pomocí odlučovače kalu namontovaného na zpětnou trubku kondenzované vody.
9.3.1.51 (a) 9.3.2.51 (a) 9.3.3.51 (a)	Povrchová teplota neelektrických zařízení nesmí překročit 200 °C	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.51 (b) 9.3.2.51 (b) 9.3.3.51 (b)	Povrchová teplota vnějších částí motorů a jejich sacích potrubí a výfukových potrubí	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018 Do tohoto data na palubách provozovaných plavidel platí následující požadavky: Teplota vnějších částí nesmí překročit hodnotu 300 °C.
9.3.1.52.1 9.3.2.52.1 9.3.3.52.1	Elektrická zařízení s omezeným nebezpečím výbuchu	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data jsou požadovány následující dokumenty pro elektrická zařízení používaná při nakládání, vykládání a uvolňování plynů u plavidel v provozu, jejichž kýl byl položen po 1. lednu 1995: 9.3.1.52.3, 9.3.2.52.3 a 9.3.3.52.3 verze ADN platné do 31. prosince 2018
9.3.1.52.1 9.3.3.52.1	Elektrická zařízení s omezeným nebezpečím výbuchu	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data, na palubách plavidel, jejichž kýl byl položen před 1. lednem 1977, všechna elektrická zařízení s výjimkou osvětlovacích zařízení v obytných prostorech, rádio telefonních zařízení v obytných prostorech a v kormidelně a řídících přístrojích spalovacích motorů, která se používají při nakládání, vykládání a uvolňování plynů, musí splňovat následující požadavky: Generátory, motory, rozvaděče, osvětlení, atd.: Stupeň ochrany IP 13 Přístroje atd.: Stupeň ochrany IP 55
9.3.3.52.1	Elektrická zařízení v provozu během pobytu v bezprostřední blízkosti nebo uvnitř přiřazené zóny na břehu	N.R.M. od 1. ledna 2019 pro pravidla typu N otevřená Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.3.52.2	Elektrická zařízení/ozvěnové hloubkoměry	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2034.
9.3.3.52.3	Elektrická zařízení: označení červenou barvou	N.R.M. od 1. ledna 2019 pro pravidla typu N otevřená Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.52.3 9.3.2.52.3 9.3.3.52.3 poslední znění	Odpojení těchto instalací z centralizovaného místa	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.51.4 9.3.2.51.4 9.3.3.51.4	Optický a akustický alarm	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.3.52.6	Odpojovač generátoru	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2034.

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
9.3.3.52.9	Trvale připevněné zásuvky	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2034.
9.3.3.52.10	Elektrické akumulátory umístěné mimo oblast nákladu	N.R.M. pro pravidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2034.
9.3.1.53.1 9.3.2.53.1 9.3.3.53.1	Typ a umístění elektrických zařízení určených k použití v oblastech s nebezpečím výbuchu Zóna 0, Zóna 1	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data platí následující požadavky: (a) V nákladních tancích a potrubích pro nakládku a vykládku, je možné instalovat pouze měřicí, regulační a poplachová zařízení s typem ochrany EEx (ia). (b) Elektrická zařízení na palubě v oblasti nákladu a měřicí, regulační a alarmové přístroje, motory pohánějící základní zařízení, jako jsou balastní čerpadla v kofrdamech, oblasti s dvojitým trupem, dvojitá dna, nákladní prostory a provozní prostory pod palubou v oblasti nákladu musí být kontrolovány a schváleny příslušným orgánem s ohledem na bezpečnost provozu v prostředí s nebezpečím výbuchu, například, skutečně bezpečná zařízení, ohnivzdorná zařízení bezpečná proti výbuchu, přístroje chráněné přetlakem, prášková plnicí zařízení, zařízení chráněná zapouzdřením a zařízení se zvýšenou bezpečností. (c) V kofrdamech, prostorech s dvojitým trupem, dvojitým dnem, nákladních prostorech a provozních prostorech pod palubou v oblasti nákladu, musí mít světelné zařízení ochranu typu „nehořlavé pouzdro“ nebo „přístroj chráněný přetlakem“. (d) Řídicí a ochranná zařízení těchto zařízení uvedených v (a), (b) a (c) výše musí být umístěna mimo oblast nákladu, pokud nejsou skutečně bezpečná. Pro výběr elektrických zařízení se musí vzít v úvahu skupiny výbušnosti a teplotní třídy přiřazené látkám uvedeným v seznamu látek (viz sloupce (15) a (16) tabulky C kapitoly 3.2). Do tohoto data na palubě plavidel v provozu, jejichž kýl byl položen po 31. prosinci 1977, platí následující požadavky: Do tohoto data musí být při nakládání, vykládání a uvolňování plynu na plavidlech, které mají neplynotěsné otvory kormidelny (například dveře, okna a podobně) v oblasti nákladu splněny následující podmínky: (a) Všechna elektrická zařízení, které se mají použít v kormidelně, musí být typu s omezeným nebezpečím výbuchu, to jest musí být navržena tak, aby nedocházelo k jiskření a aby teplota jeho vnějšího povrchu nepřekročila 200 °C při normálním provozu, nebo musí být typu chráněného před proudem vody, a musí být navržena takovým způsobem, aby jeho povrchová teplota nemohla přesáhnout 200 °C při normálním provozu. (b) Elektrické zařízení, které nesplňuje požadavky (a) výše, musí být označeny červenou barvou a musí být možné jej vypnout pomocí centrálního vypínače.
9.3.1.53.1 9.3.2.53.1 9.3.3.53.1	Typ a umístění elektrických zařízení určených k použití v oblastech s nebezpečím výbuchu Zóna 2	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034

1.6.7.2.2.2 Tabulka všeobecných přechodných ustanovení: Tanková pravidla		
ustanovení	předmět	platnost a komentář
9.3.1.53.1 9.3.2.53.1 9.3.3.53.1	Teplotní třída a skupina výbušnosti neelektrických zařízení	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.53.1 9.3.2.53.1 9.3.3.53.1	Teplotní třída a skupina výbušnosti elektrických zařízení	N.R.M. Od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034
9.3.1.53.2 9.3.3.53.2	Kovové opláštění pro všechny elektrické kabely v oblasti nákladu	N.R.M. pro pravidla, jejichž kóly byly položeny před 1. lednem 1977. Obnovení schvalovacího osvědčení po 31. prosinci 2034.
9.3.3.53.2	Kovové opláštění pro všechny elektrické kabely v oblasti nákladu	N.R.M. od 1. ledna 2039 nejpozději pro kalová pravidla
9.3.1.53.5 9.3.2.53.5 9.3.3.53.5	Pohyblivé elektrické kabely (opláštěné, typ H 07 RN-F)	N.R.M. od 1. ledna 2019 Obnovení schvalovacího osvědčení po 31. prosinci 2034 Do tohoto data na palubě plavidel v provozu platí následující ustanovení: Do tohoto data musí pohyblivé elektrické kabely (opláštěné, typ H 07 RN-F) splňovat normu IEC 60245-4:1994
9.3.1.60 9.3.2.60 9.3.3.60	Musí být namontován zpětný ventil přidržený pružinou. Voda musí splňovat kvalitu pitné vody na palubě.	N.R.M. Obnovení schvalovacího osvědčení po 31. prosinci 2018

1.6.7.2.2.3 Přechodné ustanovení ve věci aplikace požadavků podle tabulky „C“ v kapitole 3.2, pro přepravu nákladu v tankových plavidlech.

1.6.7.2.2.3.1 (Vypuštěno)

1.6.7.2.2.3.2 (Vypuštěno)

1.6.7.2.2.3.3 (Vypuštěno)

1.6.7.2.2.4 (Vypuštěno)

1.6.7.2.2.5 Pro pravidla nebo čluny, jejichž kóly byl položen před 1. červencem 2017 a která neodpovídají požadavkům v 9.3.X.1 týkajícím se dokumentace plavidla, musí uchování podkladů pro dokumentaci cisterny začít nejpozději při příští obnově platnosti schvalovacího osvědčení.

1.6.7.3 **Náhradní přechodná ustanovení, platná pro specifické vnitrozemské vodní cesty.**

Provozovaná pravidla, na které se aplikují přechodná ustanovení v této podkapitole, musejí splňovat následující podmínky:

- požadavky odstavců a pododstavců, uvedených v následující tabulce a v tabulce všeobecných přechodných ustanovení (viz 1.6.7.2.1.1 a 1.6.7.2.3.1), v rámci zde stanovených termínů;
- požadavky odstavců a pododstavců, neuvedených v následující tabulce nebo v tabulce všeobecných přechodných ustanovení k datu zavedení těchto Pravidel.

Konstrukce a výbava provozovaných plavidel se musí udržovat minimálně na úrovni předcházejících bezpečnostních norem.

Tabulka náhradních přechodných ustanovení		
ustanovení	předmět	platnost a komentář
9.1.0.11.1 (b)	Nákladní prostory, společné přepážky s olejovými palivovými nádržemi.	N.R.M. Na palubách provozovaných plavidel platí následující požadavky: Nákladní prostory mohou sdílet společné přepážky s olejovými palivovými nádržemi, za předpokladu, že náklad nebo jeho obaly nebudou chemicky reagovat s palivem.
9.1.0.92	Nouzový východ.	N.R.M. Na palubách provozovaných plavidel platí následující požadavky: Prostory, jejichž vchody nebo východy se mohou v případě poškození zčásti nebo úplně ponořit, musejí být opatřené nouzovým východem, který bude nejméně 0,075 m nad hladinou vody v případě poškození.
9.1.0.95.1 (c)	Výška východu nad hladinou vody v případě poškození.	N.R.M. Na palubách provozovaných plavidel platí následující požadavky: Dolní hrana všech nevodotěsných otvorů (tedy dveří, oken, jícňů) má být, při konečném stavu zaplavení, nejméně 0,075 m nad hladinou vody v případě poškození.
9.1.0.95.2 9.3.2.15.2	Rozsah diagramu stability (podmínky poškození).	N.R.M. Na palubách provozovaných plavidel platí následující požadavky: Při konečném zaplavení nesmí úhel zadní části kýlu překročit: – 20° před provedením opatření k napravení plavidla, – 12° po provedení opatření k napravení plavidla.
9.3.3.8.1	Klasifikace	N.R.M. pro plavidla typu N otevřená s lapači plamene a plavidla typu N otevřená. Obnovení schvalovacího osvědčení po 31. prosinci 2044.
9.3.1.11.1 (a) 9.3.2.11.1 (a) 9.3.3.11.1 (a)	Maximální kapacita nákladních tanků.	N.R.M. Na palubách provozovaných plavidel platí následující požadavky: Maximální povolená kapacita nákladních tanků musí být 760 m ³ .
9.3.2.11.1 (d)	Délka nákladních tanků.	N.R.M. Na palubách provozovaných plavidel platí následující požadavky: Délka nákladních tanků může překročit 10 m a 0,2 L.
9.3.1.12.3 9.3.2.12.3 9.3.3.12.3	Poloha vstupů vzduchu.	N.R.M. Na palubách provozovaných plavidel platí následující požadavky: Vstupy vzduchu musejí být umístěny nejméně 5,00 m od výstupů bezpečnostních ventilů.

Tabulka náhradních přechodných ustanovení		
ustanovení	předmět	platnost a komentář
9.3.2.15.1 (c)	Výška východu nad hladinou vody v případě poškození.	N.R.M. Na palubách provozovaných plavidel platí následující požadavky: Dolní hrana všech nevodotěsných otvorů (tedy dveří, oken, jícňů) má být, při konečném stavu zaplavení, nejméně 0,075 m nad hladinou vody v případě poškození.
9.3.2.20.2 9.3.3.20.2	Plnění kofrdamů vodou.	N.R.M. Na palubách provozovaných plavidel platí následující požadavky: Kofrdamy musí být doplněné systémem pro plnění vodou nebo inertním plynem.
9.3.1.92 9.3.2.92	Nouzový východ.	N.R.M. Na palubách provozovaných plavidel platí následující požadavky: Prostory, jejichž vchody nebo východy se mohou v případě poškození zčásti nebo úplně ponořit, musejí být opatřené nouzovým východem, který bude nejméně 0,075 m nad hladinou vody v případě poškození.

1.6.7.4 **Přechodná ustanovení týkající se přepravy látek nebezpečných životnímu prostředí nebo zdraví**

1.6.7.4.1 Přechodná ustanovení: plavidla

Zásobovací plavidla a kalová plavidla v provozu 1. ledna 2009 s nosností 1. ledna 2007 nižší než 300 tun smějí nadále přepravovat látky, které jim bylo povoleno přepravovat 31. prosince 2008 až do 31. prosince 2038.

1.6.7.4.2 (Vypuštěno)

1.6.7.5 **Přechodná ustanovení pro úpravu tankových plavidel**

1.6.7.5.1 U plavidel, která měla před 31. prosincem 2018 upravenou oblast nákladu za účelem přestavby na plavidlo s dvojitou obšívkou typu N platí následující podmínky:

- upravená nebo nová oblast nákladu musí splňovat ustanovení těchto předpisů. Přechodná ustanovení uvedená v 1.6.7.2.2 nesmějí být použita pro oblast nákladu;
- části plavidla mimo oblasti nákladu musí splňovat ustanovení těchto předpisů. Avšak přechodná ustanovení v 1.6.7.2.2 pro 1.2.1, 9.3.3.0.3 (d), 9.3.3.51.3, 9.3.3.52.4 poslední věta, použitelná do 31. prosince 2018, může být použita;
- pokud věci, které vyžadují ochranu před explozí, jsou uvedeny v seznamu látek povolených na přepravu v plavidle podle 1.16.1.2.5, obytné prostory a kormidelny musí být vybaveny požárním poplachovým systémem podle 9.3.3.40.2.3;
- použití tohoto pododdílu musí být uvedeno ve schvalovacím osvědčení pod číslem 13 (Dodatečné poznámky).

1.6.7.5.2 Upravená plavidla mohou být provozována i po 31. prosinci 2018. Lhůty stanovené v přechodných ustanoveních v 1.6.7.2.2 pro 1.2.1, 9.3.3.0.3 (d), 9.3.3.51.3, 9.3.3.52.4 poslední věta, použitelné do 31. prosince 2018, musí být splněny.

1.6.7.6 **Přechodná ustanovení o přepravě plynů v tankových plavidlech**

Tanková plavidla v provozu od 1. ledna 2011 s čerpadlovými prostory pod palubou mohou nadále přepravovat látky uvedené v následující tabulce až do obnovení schvalovacího osvědčení po 1. lednu 2045.

Číslo UN nebo číslo látky	Třída a klasifikační kód	Pojmenování a popis
1005	2, 2TC	AMONIAK (ČPAVEK), BEZVODÝ
1010	2, 2F	1,2-BUTADIENY, STABILIZOVANÉ
1010	2, 2F	1,3-BUTADIENY, STABILIZOVANÉ
1010	2, 2F	BUTADIENY, STABILIZOVANÉ nebo BUTADIENY, SMĚS S UHLOVODÍKY, STABILIZOVANÁ, které mají při 70 °C tenzi par nepřesahující 1,1 MPa (11 bar) a jejichž hustota při 50 °C není nižší než 0,525 kg/l
1011	2, 2F	BUTAN
1012	2, 2F	1-BUTEN
1020	2, 2A	CHLORPENTAFLUORETHAN (PLYN JAKO CHLADICÍ PROSTŘEDEK R 115)
1030	2, 2F	1,1-DIFLUORETHAN (PLYN JAKO CHLADICÍ PROSTŘEDEK R 152a)
1033	2, 2F	DIMETHYLETHER
1040	2, 2TF	ETHYLENOXID S DUSÍKEM, až do nejvýše přípustného celkového tlaku 1 MPa (10 bar) při 50 °C
1055	2, 2F	ISOBUTEN
1063	2, 2F	CHLORMETHAN (METHYLCHLORID) (PLYN JAKO CHLADICÍ PROSTŘEDEK R 40)
1077	2, 2F	PROPEN
1083	2, 2F	TRIMETHYLAMIN, BEZVODÝ
1086	2, 2F	VINYLCHLORID, STABILIZOVANÝ
1912	2, 2F	CHLORMETHAN (METHYLCHLORID) A DICHLORMETHAN, SMĚS
1965	2, 2F	UHLOVODÍKY, PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N. (směs A)
1965	2, 2F	UHLOVODÍKY, PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N. (směs A0)
1965	2, 2F	UHLOVODÍKY, PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N. (směs A01)
1965	2, 2F	UHLOVODÍKY, PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N. (směs A02)
1965	2, 2F	UHLOVODÍKY, PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N. (směs A1)
1965	2, 2F	UHLOVODÍKY, PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N. (směs B)
1965	2, 2F	UHLOVODÍKY, PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N. (směs B1)
1965	2, 2F	UHLOVODÍKY, PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N. (směs B2)
1965	2, 2F	UHLOVODÍKY, PLYNNÉ, SMĚS, ZKAPALNĚNÁ, J.N. (směs C)
1969	2, 2F	ISOBUTAN
1978	2, 2F	PROPAN
9000	2, 2F	AMONIAK (ČPAVEK), BEZVODÝ, HLUBOCE ZCHLAZENÝ

1.6.8 Přechodná ustanovení týkající se posádky

1.6.8.1

Odpovědný velitel plavidla a osoba odpovědná za nakládku a vykládku tlačného člunu musí vlastnit osvědčení o zvláštních znalostech se zápisem: „Držitel tohoto osvědčení se zúčastnil 8 hodinového školení o stabilitě“ před 31. prosincem 2019.

Podmínkou pro tento zápis je účast na základním školení vyžadovaném předpisy platnými po 1. lednu 2013 nebo účast na obnovovacím školení, které odchylkou od 8.2.2.5 sestává z 24 vyučovacích hodin po 45 minutách, včetně 8 vyučovacích hodin věnovaných předmětu stability.

Až do 31. prosince 2018 nemusí být odborníkem na přepravu plynů (jak je uvedeno v 8.2.1.5) odpovědný velitel plavidla (jak je uvedeno v 7.2.3.15), ale může to být kterýkoli člen posádky, pokud tankové plavidlo typu G přepravuje pouze UN 1972. V tomto případě musí odpovědný velitel plavidla absolvovat speciální školení pro plyny a musí být také poučen v dodatečném školení o přepravě zkapalněného zemního plynu (LNG) podle 1.3.2.2.

1.6.8.2 Místo vydávání osvědčení o zvláštní znalosti ADN v souladu s 8.2.2.8.2 a 8.6.2 mohou smluvní strany do 31. prosince 2021 vydávat osvědčení podle vzoru platného do 31. prosince 2018. Taková osvědčení budou platná až do uplynutí jejich platnosti pět let.

1.6.9 Přejícná ustanovení týkající se uznávání klasifikačních společností

1.6.9.1 (Vypuštěno)

KAPITOLA 1.7

VŠEOBECNÉ PŘEDPISY PRO RADIOAKTIVNÍ LÁTKY

1.7.1 Rozsah a použití

POZNÁMKA 1: V případě jaderné nebo radiační mimořádné situace v průběhu přepravy radioaktivních látek, musí být dodržována opatření k ochraně osob, majetku a životního prostředí tak jak je stanoveno relevantními národními a/nebo mezinárodními organizacemi. Toto zahrnuje opatření pro připravenost a reakci, vytvořená v souladu s národními a/nebo mezinárodními požadavky a konzistentním a koordinovaným způsobem s národními a/nebo mezinárodními mimořádnými opatřeními.

POZNÁMKA 2: Opatření pro připravenost a reakci musí být založena na odstupňovaném přístupu a zahrnovat identifikovaná rizika a jejich potenciální dopady včetně vzniku dalších nebezpečných látek, které mohou vzniknout reakcí mezi obsahem zásilky a okolím v případě jaderné nebo radiační mimořádné situace. Pokyny pro zavedení takových opatření jsou obsaženy v dokumentech "Preparedness and Response for a Nuclear or Radiological Emergency", Řada bezpečnostních standardů č. GSR, část 7, IAEA, Vídeň (2015); "Criteria for Use in Preparedness and Response for a Nuclear or Radiological Emergency", Řada bezpečnostních standardů č. GSG-2, IAEA, Vídeň (2011); "Arrangements for Preparedness for a Nuclear or Radiological Emergency", Řada bezpečnostních standardů č. GS-G-2.1, IAEA, Vídeň (2007), a "Arrangements for the Termination of a Nuclear or Radiological Emergency", Řada bezpečnostních standardů č. GSG-11, IAEA, Vídeň (2018).

1.7.1.1 ADN stanoví normy bezpečnosti, které obsahují přijatelnou úroveň kontroly záření, kritického stavu a tepelného ohrožení lidí, majetku a životního prostředí, spojených s přepravou radioaktivních látek. Tyto normy jsou založeny na IAEA Pravidlech pro bezpečnou přepravu radioaktivních látek, vydání z roku 2018. Vysvětlující materiál je možné nalézt v Advisory Material for the IAEA Regulations for the Safe Transport of Radioactive Material (vydání 2018) Řada bezpečnostních standardů č. SSG-26 (Rev.1), IAEA, Vídeň (2019).

1.7.1.2 Cílem ADN je stanovit požadavky, které musí být splněny, aby se zajistila bezpečnost a ochrana lidí, majetku a životního prostředí před škodlivými účinky ionizujícího záření při přepravě radioaktivních látek. Těto ochrany se dosahuje těmito požadavky:

- (a) uzavřením radioaktivního obsahu;
- (b) kontrolou vnějších příkonů dávkového ekvivalentu;
- (c) zabráněním kritickému stavu; a
- (d) zamezením škodám způsobeným teplem.

Tyto požadavky se uspokojují za prvé uplatňováním odstupňovaného přístupu k limitům obsahu pro kusy a vozidla a uplatněním norem týkajících se konstrukce kusu v závislosti na riziku, které představuje radioaktivní obsah. Za druhé se uspokojují uplatňováním požadavků na konstrukci a používání kusů a na údržbu obalů s přihlédnutím k povaze radioaktivního obsahu. Za třetí jsou uspokojovány vyžadováním administrativních kontrol a popřípadě schválením příslušnými orgány. Na závěr je další ochrana poskytována prostřednictvím opatření pro plánování a přípravu reakce na mimořádné situace k ochraně lidí, majetku a životního prostředí.

1.7.1.3 ADN se vztahuje na přepravu radioaktivních látek vnitrozemskou vodní dopravou včetně přepravy, která souvisí s používáním radioaktivních látek. Přeprava zahrnuje všechny činnosti a podmínky spojené a vyvolané přemísťováním radioaktivních látek; ty pak zahrnují konstrukci, výrobu, údržbu a opravy obalů a přípravu, odeslání, nakládku, přepravu včetně tranzitního skladování, vykládku a příjem v konečném místě určení nákladů radioaktivních látek a kusů. Aplikuje se odstupňovaný přístup ke stanovení požadavků v ADN, které jsou charakterizovány třemi všeobecnými stupni přísnosti:

- (a) Běžné podmínky přepravy (bez nehod);
- (b) Normální podmínky přepravy (drobné nehody);
- (c) Nehodové podmínky přepravy.

- 1.7.1.4 Ustanovení předepsaná v ADN se neuplatňují ve všech následujících případech:
- (a) Radioaktivní látky, které jsou integrální součástí dopravních prostředků;
 - (b) Radioaktivní látky, které jsou přepravovány uvnitř podniku, kde podléhají příslušným bezpečnostním předpisům platným v tomto podniku a kde přeprava neprobíhá po veřejných komunikacích nebo kolejových cestách;
 - (c) Radioaktivní látky, které jsou implantovány nebo vloženy do organismu osob nebo živých zvířat pro diagnostické nebo terapeutické účely;
 - (d) Radioaktivní látky, které byly náhodně nebo úmyslně vpraveny do těla osoby nebo kterými byla osoba kontaminována a má být z tohoto důvodu přepravována k lékařskému ošetření;
 - (e) Radioaktivní látky ve výrobcích určených ke spotřebě, které obdržely příslušné schválení příslušného orgánu, pokud následuje jejich prodej koncovému uživateli;
 - (f) Přírodní látky a rudy obsahující radionuklidy, které se v přírodě vyskytují (které mohou být zpracovány pro použití těchto radionuklidů), za předpokladu, že specifická aktivita těchto látek nepřekročí desetinasobek hodnot udaných v tabulce 2.2.7.2.2.1, nebo vypočítaných v souladu s 2.2.7.2.2.2 (a) a 2.2.7.2.2.3 až 2.2.7.2.2.6. Pro přírodní látky a rudy obsahující radionuklidy, které se v přírodě vyskytují a které nejsou v trvalé rovnováze, musí být výpočet specifické aktivity proveden v souladu s 2.2.7.2.2.4;
 - (g) Neradioaktivní tuhé předměty s radioaktivními látkami přítomnými na jakémkoli povrchu v množstvích nepřevyšujícím mezní hodnotu stanovenou v definici "kontaminace" v 2.2.7.1.2.

1.7.1.5 **Zvláštní ustanovení pro přepravu vyjmutých kusů**

1.7.1.5.1 Vyjmuté kusy, které smějí obsahovat radioaktivní látky v omezených množstvích, přístroje, výrobky, nebo prázdné obaly, jak jsou specifikovány v 2.2.7.2.4.1, podléhají pouze následujícím ustanovením částí 5 až 7:

- (a) relevantní z ustanovení uvedených v 5.1.2.1, 5.1.3.2, 5.1.5.2.2, 5.1.5.4, 5.2.1.10, 5.4.1.2.5.1 (f) (i) a (ii), 5.4.1.2.5.1 (i), 7.1.4.14.7.3.1, 7.1.4.14.7.4.3, 7.1.4.14.7.5.1 až 7.1.4.14.7.5.4 a 7.1.4.14.7.7; a
- (b) požadavky na vyjmuté kusy, specifikované v ustanoveních 6.4.4 ADR

s výjimkou radioaktivních látek vykazujících další nebezpečné vlastnosti a které proto musí být klasifikovány v jiné třídě, než je třída 7 podle zvláštních ustanovení 290 nebo 369 kapitoly 3.3, kdy ustanovení uvedená v (a) a (b) výše jsou aplikována pouze přiměřeně, a navíc k těm, která se vztahují k hlavní třídě.

1.7.1.5.2 Vyjmuté kusy podléhají relevantním ustanovením všech ostatních částí ADN.

1.7.2 **Program ochrany proti záření**

1.7.2.1 Přeprava radioaktivních látek musí probíhat podle programu ochrany proti záření, který obsahuje systematický soubor ustanovení zaměřených na provádění přiměřených ochranných opatření proti záření.

1.7.2.2 Osobní dávky musí být nižší, než jsou příslušné dávkové limity. Ochrana a bezpečnost musí být optimalizovány tak, aby velikost individuálních dávek, počet osob vystavených záření a pravděpodobnost zdraví škodlivého záření byly udrženy tak nízké, jak je to jen rozumně dosažitelné s přihlédnutím k ekonomickým a sociálním faktorům kromě toho, že individuálně obdržené dávky budou omezeny dávkovými limity. Musí být zvolen strukturalizovaný systematický postup na vztahy mezi přepravou a ostatními činnostmi.

1.7.2.3 Povaha a rozsah měření použité v programu se musí vztahovat k závažnosti a pravděpodobnosti radiačního ozáření. Program musí zahrnovat požadavky uvedené v 1.7.2.2., 1.7.2.4 a 1.7.2.5 a 7.5.11 CV33 (1.1) ADR. Programové dokumenty musí být k dispozici, na požadavek, pro inspekci relevantního příslušného orgánu.

1.7.2.4 Pro profesní vystavení záření vznikající při dopravních činnostech, kde se odhaduje, že efektivní dávka bude:

- (a) bude pravděpodobně mezi 1 mSv a 6 mSv za 1 rok, musí být prováděn program vyhodnocování dávek monitorováním pracovního místa nebo individuálním monitorováním, nebo;

(b) pravděpodobně překročí 6 mSv za 1 rok, musí být prováděno individuální monitorování.

Pokud je prováděno monitorování pracovního místa nebo individuální monitorování, příslušné záznamy musí být uchovávány.

POZNÁMKA: Pro profesní expozici vyplývající z přepravních aktivit, kde se předpokládá, že efektivní dávka pravděpodobně nepřekročí 1 mSv za rok, není požadováno vypracovávání zvláštních pracovních postupů, podrobné monitorování, programy ohodnocování dávek nebo uchovávání individuálních záznamů.

1.7.2.5 Pracovníci (viz. 7.1.4.14.7, Poznámka 3) musí být náležitě vyškolení v radiační ochraně včetně monitorovacích opatření za účelem omezení jejich pracovního ozáření a ozáření jiných osob, které by mohly být dotčeny jejich činností.

1.7.3 Systém řízení

1.7.3.1 Aby bylo zajištěno dodržování relevantních ustanovení ADN, musí být zaveden a využíván pro všechny činnosti v rámci ADN, jak jsou popsány v 1.7.1.3, systém řízení založený na mezinárodních, vnitrostátních, nebo jiných normách, přijatelných pro příslušný orgán. Potvrzení, že specifikace konstrukce byly v plném rozsahu dodrženy, musí být tomuto orgánu k dispozici. Výrobce, odesílatel nebo uživatel musí být připraven:

- (a) poskytnout zařízení pro inspekci během výroby a užívání; a
- (b) prokázat dodržování ADN příslušnému orgánu.

Je-li požadováno schválení od tohoto příslušného orgánu, musí být takové schválení podmíněno adekvátním systémem řízení a přihlížet k němu.

1.7.4 Zvláštní ujednání

1.7.4.1 Zvláštním ujednáním se rozumí taková ustanovení schválená příslušným orgánem, podle nichž mohou být přepravovány, které nesplňují všechny požadavky ADN aplikovatelné na radioaktivní látky.

POZNÁMKA: Zvláštní ujednání se nepovažuje za dočasnou odchylku podle oddílu 1.5.1.

1.7.4.2 Zásilky, pro které je prakticky neproveditelné vyhovět ustanovením vztahujícím se na radioaktivní látky, nesmějí být přepravovány jinak než podle zvláštního ujednání. Pokud je příslušný orgán přesvědčen, že soulad s ustanoveními ADN pro radioaktivní látky je prakticky neproveditelný a že splnění nezbytných bezpečnostních norem předepsaných ADN bylo prokázáno prostředky alternativními k ostatním ustanovením ADN, příslušný orgán může schválit zvláštní ujednání o přepravách pro jednu zásilku nebo plánovanou sérii více zásilek. Celková úroveň bezpečnosti přepravy musí být nejméně rovnocenná úrovni, které by bylo dosaženo při dodržení všech příslušných předpisů ADN. Pro mezinárodní zásilky tohoto typu se požaduje vícestranné schválení.

1.7.5 Radioaktivní látky s dalšími nebezpečnými vlastnostmi

Kromě radioaktivních a štěpných vlastností musí být brány v úvahu v dokladech, při balení, označování bezpečnostními značkami a nápisy, tranzitním skladování, oddělování a přepravě všechna další vedlejší nebezpečí obsahu kusu, jako je výbušnost, hořlavost, samozápalnost, chemická toxicita a žíravost, aby odpovídaly všem příslušným ustanovením ADN pro nebezpečné věci.

1.7.6 Nedodržení limitů

1.7.6.1 V případě nedodržení jakéhokoli limitu v ADN platného pro příkon dávkového ekvivalentu nebo kontaminaci,

- (a) odesílatel, dopravce, příjemce a kterákoliv z organizací zapojených do přepravy, která by mohla být dotčena, musí být informována o nedodržení limitů:
 - (i) dopravcem, pokud se nedodržení zjistí během přepravy; nebo
 - (ii) příjemcem, pokud se nedodržení zjistí při příjmu;
- (b) odesílatel, dopravce, nebo příjemce musí:
 - (i) učinit okamžitá opatření ke zmírnění následků nedodržení;

- (ii) vyšetřit nedodržení a jeho podobné příčiny a okolností a následky;
 - (iii) učinit vhodná opatření k odstranění příčin a okolností, které vedly k nedodržení, a zamezit opakování podobných okolností, které vedly k nedodržení; a
 - (iv) sdělit příslušnému orgánu (příslušným orgánům) příčiny nedodržení a nápravná nebo preventivní opatření, která byla nebo mají být učiněna;
- (c) Informování odesílatele, popřípadě příslušného orgánu (příslušných orgánů) o nedodržení musí být provedeno bezodkladně, a musí být okamžité, jestliže se vyvinula nebo vyvíjí situace kritického ozáření.

KAPITOLA 1.8

KONTROLY A JINÁ PODPŮRNÁ OPATŘENÍ PRO ZAJIŠTĚNÍ PLNĚNÍ BEZPEČNOSTNÍCH POŽADAVKŮ

1.8.1 Monitorování dodržování předpisů

1.8.1.1 *Všeobecně*

1.8.1.1.1 Podle článku 4, odstavce 3 ADN musí smluvní strany zajistit, aby byl reprezentativní podíl zásilek nebezpečných věcí přepravovaných vnitrozemskou vodní dopravou podroben monitoringu podle ustanovení této kapitoly a požadavků pododdílu 1.10.1.5.

1.8.1.1.2 Účastníci přepravy nebezpečných věcí (viz kapitola 1.4) musí bezodkladně v rámci svých příslušných povinností poskytnout příslušným orgánům a jejich pověřeným zástupcům informace nezbytné pro provedení kontrol.

1.8.1.2 *Monitorovací postup*

1.8.1.2.1 Za účelem provádění kontrol stanovených v Článku 4, odstavci 3 ADN musí smluvní strany používat kontrolní listinu vypracovanou Administrativním výborem*. Kopie této kontrolní listiny musí být předána veliteli plavidla. Příslušné orgány jiných smluvních stran smějí rozhodnout o zjednodušení nebo upuštění od následných kontrol, jestliže jim byly předána kopie kontrolní listiny. Tento odstavec se nedotýká práva smluvních stran právo provádět specifická opatření nebo podrobnější kontroly.

1.8.1.2.2 Kontroly musí být namátkové a musí, pokud je to možné, pokrývat rozsáhlou část sítě vnitrozemských vodních cest.

1.8.1.2.3 Při výkonu svého práva monitorovat musí kontrolní orgány vyvinout všemožné úsilí, aby se vyhnuly nepatřičnému zdržování nebo zdržování plavidla.

1.8.1.2.4 Kontrolní listy použité orgány smluvních stran musí být vyhotoveny nejméně v jazyce vydávající země a rovněž, pokud tím jazykem není francouzština, angličtina nebo němčina ve francouzštině, angličtině nebo němčině¹.

1.8.1.3 *Porušení předpisů*

Bez ohledu na jiné sankce, které mohou být uloženy, plavidla, u nichž bylo zjištěno jedno nebo více porušení pravidel pro přepravu nebezpečných věcí vnitrozemskou vodní dopravou, mohou být zadrženy na místě určeném pro tento účel orgány provádějícími kontrolu a může být požadováno odstranění závad před pokračováním jejich plavby, nebo mohou být podrobeny jiným vhodným opatřením, závislým na okolnostech nebo požadavcích bezpečnosti.

1.8.1.4 *Kontroly ve společnostech a na místech nakládky a vykládky*

1.8.1.4.1 Kontroly mohou být prováděny v objektech podniků jako preventivní opatření, nebo když byla během plavby zaznamenána porušení předpisů ohrožující bezpečnost při přepravě nebezpečných věcí.

1.8.1.4.2 Účelem takových kontrol je zajistit, aby bezpečnostní podmínky pro přepravu nebezpečných věcí vnitrozemskou vodní dopravou odpovídaly platným zákonům.

1.8.1.4.3 Odebírání vzorků

V případě, že je to vhodné, a za podmínky, že to nepředstavuje bezpečnostní riziko, mohou být odebrány vzorky přepravovaných věcí pro jejich prozkoumání laboratořemi uznanými příslušným orgánem.

1.8.1.4.4 Spolupráce příslušných orgánů

* *Poznámka sekretariátu: Vzor kontrolní listiny je možno nalézt na webové stránce Evropské hospodářské komise OSN (<http://www.unece.org/trans/danger/danger.html>)*

¹ *Kontrolní list není zahrnut v dokumentech, které musí být na palubě podle 8.1.2.1.*

- 1.8.1.4.4.1 Smluvní strany si vzájemně pomáhají za účelem správné aplikace těchto Pravidel.
- 1.8.1.4.4.2 Závažná nebo opakovaná porušení předpisů ohrožující bezpečnost přepravy nebezpečných věcí spáchaná zahraničním plavidlem nebo podnikem se musí oznámit příslušnému orgánu ve smluvní straně, kde bylo vydáno schvalovacího osvědčení plavidla nebo kde má podnik své sídlo.
- 1.8.1.4.4.3 Příslušný orgán smluvní strany, kde byla zjištěna závažná nebo opakovaná porušení předpisů, může požádat příslušný orgán smluvní strany, kde bylo vydáno schvalovací osvědčení plavidla nebo kde má podnik své sídlo, aby přijal vhodná opatření vůči viníkovi nebo viníkům.
- 1.8.1.4.4.4 Poslední informovaný orgán musí sdělit příslušným orgánům smluvní strany, kde bylo zaznamenáno porušení předpisů, jaká opatření byla učiněna vůči viníkovi nebo viníkům.

1.8.2 Úřední podpora během kontroly zahraničního plavidla

Jestliže nálezy při kontrole zahraničního plavidla poskytují důvody k podezření, že došlo k závažnému nebo opakovanému porušení předpisů, které nemůže být zjištěno v průběhu této kontroly kvůli absenci potřebných údajů, příslušné orgány smluvních stran si musí vzájemně pomoci, aby se situace vyjasnila.

1.8.3 Bezpečnostní poradce

- 1.8.3.1 Každý podnik, jehož činnosti zahrnují odesílání, přepravu, nebo s touto přepravou související operace balení, nakládky, plnění nebo vykládky, nebezpečných věcí vnitrozemskou vodní dopravou, musí jmenovat jednoho nebo více bezpečnostních poradců, dále nazývaných „poradci“ pro přepravu nebezpečných věcí, odpovědných za pomoc při předcházení rizikům při těchto činnostech s ohledem na osoby, majetek a životní prostředí.

POZNÁMKA: Tato povinnost se nevztahuje na provozovatele sběrných zařízení.

- 1.8.3.2 Příslušné orgány smluvních stran mohou stanovit, že se tyto požadavky nevztahují na podniky:

- (a) jejichž činnosti se týkají
- (i) přepravy nebezpečných věcí plně nebo částečně vyňaté podle ustanovení uvedených v 1.7.1.4 nebo v kapitolách 3.3, 3.4 nebo 3.5;
 - (ii) množství na dopravní jednotku, železniční vůz nebo kontejner nepřekračující množství uvedená v 1.1.3.6 ADR nebo RID;
 - (iii) pokud (ii) výše není relevantní, množství na plavidlo nepřekračuje množství uvedená v 1.1.3.6 tohoto předpisu.
- (b) jejichž hlavní nebo vedlejší činnosti nejsou přeprava nebo související balení, plnění, nakládka nebo vykládka nebezpečných věcí, ale které se příležitostně zabývají vnitrostátní přepravou nebo souvisejícím balením, plněním, nakládkou nebo vykládkou nebezpečných věcí představujících jen velmi malé nebezpečí nebo riziko znečištění.

- 1.8.3.3 Hlavním úkolem poradce, při zachování odpovědnosti vedoucího podniku, je snažit se všemi vhodnými prostředky a opatřeními v mezích příslušných činností tohoto podniku usnadnit provádění těchto činností v souladu s platnými předpisy a co nejbezpečnějším způsobem.

S přihlédnutím k činnostem podniku má poradce zejména tyto povinnosti:

- dohlížet na dodržování předpisů pro přepravu nebezpečných věcí;
- radit svému podniku při operacích při přepravě nebezpečných věcí;
- připravit výroční zprávu pro vedení svého podniku nebo popřípadě pro místní orgán veřejné správy, o činnostech podniku týkajících se přepravy nebezpečných věcí. Takové výroční zprávy musí být uchovávány po dobu pěti let a musí být k dispozici národním orgánům na jejich žádost.

Poradce má rovněž za povinnost sledovat zejména tyto činnosti a postupy vztahující se k dotčeným činnostem podniku:

- postupy pro dodržování předpisů upravujících zařazování nebezpečných věcí určených k přepravě;
 - postup podniku při pořizování dopravních prostředků s ohledem na respektování všech zvláštních požadavků souvisejících s nebezpečnými věcmi, které se mají přepravovat;
 - postupy kontrol zařízení užívaného při přepravě, balení, plnění, nakládce nebo vykládce nebezpečných věcí;
 - vlastní školení zaměstnanců podniku, včetně školení o změnách předpisů, a vedení záznamů o takovém školení;
 - uplatňování vhodných nouzových postupů v případě jakékoli nehody nebo mimořádné události, která může nepříznivě ovlivnit bezpečnost přepravy, balení, plnění, nakládky nebo vykládky nebezpečných věcí;
 - analýzy a, pokud je to potřebné, vypracovávání zpráv týkajících se vážných nehod, mimořádných událostí nebo závažných porušení předpisů zjištěných během odesílání, přepravy, balení, plnění, nakládky nebo vykládky nebezpečných věcí;
 - uplatňování vhodných opatření k zamezení opakování nehod, mimořádných událostí nebo závažných porušení předpisů;
 - dodržování právních předpisů a zvláštních požadavků spojených s přepravou nebezpečných věcí, týkajících se volby a využití subdodavatelů nebo jiných třetích osob;
 - ověřování, že zaměstnanci účastníci se přepravy, balení, plnění, nakládky nebo vykládky nebezpečných věcí mají k dispozici podrobné pracovní postupy a pokyny;
 - zavádění opatření ke zvýšení informovanosti o nebezpečích spojených s přepravou, balením, plněním, nakládkou a vykládkou nebezpečných věcí;
 - uplatňování kontrolních postupů s cílem zajistit, aby v dopravních prostředcích byly k dispozici doklady a bezpečnostní výbava, které musí doprovázet přepravu, a aby tyto doklady a výbava byly v souladu s předpisy;
 - uplatňování kontrolních postupů s cílem zajistit dodržování předpisů pro balení, plnění, nakládku a vykládku;
 - existence bezpečnostního plánu uvedeného v pododdílu 1.10.3.2.
- 1.8.3.4 Poradcem může být též vedoucí podniku, osoba s jinými povinnostmi v podniku nebo osoba, která tímto podnikem není přímo zaměstnána, pokud je tato osoba odborně způsobilá pro vykonávání povinností poradce.
- 1.8.3.5 Každý dotčený podnik musí na požádání informovat o totožnosti svého poradce příslušný orgán nebo instituci pověřenou pro tento účel každou smluvní stranou.
- 1.8.3.6 Kdykoli během přepravy, balení, plnění, nakládky nebo vykládky prováděné dotčeným podnikem postihne nehoda osoby, majetek nebo životní prostředí nebo pokud dojde ke škodě na majetku nebo životním prostředí, připraví poradce po shromáždění všech potřebných informací zprávu o nehodě pro vedení podniku nebo popřípadě pro místní orgán veřejné správy. Tato zpráva nesmí nahrazovat žádnou zprávu vypracovanou vedením podniku, která by mohla být požadována jinými mezinárodními nebo vnitrostátními právními předpisy.
- 1.8.3.7 Bezpečnostní poradce musí být držitelem osvědčení o odborné způsobilosti bezpečnostního poradce platného pro přepravu vnitrozemskou vodní dopravou. Toto osvědčení musí být vydáno příslušným orgánem nebo institucí pověřenou pro tento účel každou smluvní stranou.
- 1.8.3.8 K získání osvědčení se musí uchazeč podrobit školení a úspěšně složit zkoušku schválenou příslušným orgánem smluvní strany.
- 1.8.3.9 Hlavním účelem školení je poskytnout uchazečům dostatečné znalosti o nebezpečích při přepravě, balení, plnění, nakládce nebo vykládce nebezpečných věcí, dostatečné znalosti platných právních a správních předpisů, jakož i dostatečné znalosti povinností uvedených v pododdílu 1.8.3.3.

1.8.3.10 Zkouška musí být organizována příslušným orgánem nebo jím pověřenou zkušební institucí. Zkušební orgán nemůže být školící organizací.

Pověření zkušební instituce musí být provedeno písemnou formou. Toto schválení může být časově omezeno a musí být založeno na následujících kritériích:

- způsobilost zkušební instituce;
- specifikace forem zkoušek navržené zkušební institucí, včetně, pokud je to nutné, infrastruktury a organizace elektronických zkoušek podle 1.8.3.12.5, pokud musí být provedeny;
- opatření určená pro zajištění nestrannosti zkoušek;
- nezávislost zkušební instituce na všech fyzických nebo právnických osobách zaměstnávajících poradce.

1.8.3.11 Hlavním účelem zkoušky je zjistit, zda uchazeči mají potřebnou úroveň znalostí potřebných pro výkon funkce bezpečnostního poradce, jak je uvedeno v pododdílu 1.8.3.3, pro získání osvědčení předepsaného v pododdílu 1.8.3.7 a musí zahrnovat nejméně následující témata:

- (a) Znalost druhů následků, které mohou být způsobeny při nehodě s nebezpečnými věcmi a znalost hlavních příčin nehod;
- (b) Ustanovení vnitrostátních předpisů, mezinárodních úmluv a dohod, zejména pokud jde o:
 - klasifikaci nebezpečných věcí (postup při klasifikaci roztoků a směsí, struktura seznamu látek, třídy nebezpečných věcí a zásady jejich klasifikace, povaha přepravovaných nebezpečných věcí, fyzikální, chemické a toxikologické vlastnosti nebezpečných věcí);
 - všeobecná ustanovení o obalech, cisternách a cisternových kontejnerech (druhy, kódování, značení, konstrukce, první a periodické inspekce a zkoušky);
 - nápisy a bezpečnostní značky, označení oranžovými tabulkami (nápisy a bezpečnostní značky na kusech, umístování a odstraňování velkých bezpečnostních značek a oranžových tabulek);
 - údaje v přepravním dokladu (požadované informace);
 - způsob odesílání a omezení při odesílání (vozová zásilka, přeprava volně ložených látek, přeprava v IBC, přeprava v kontejnerech, přeprava v nesnímatelných nebo snímatelných cisternách);
 - přepravu osob;
 - zákazy a bezpečnostní opatření týkající se společné nakládky;
 - vzájemné oddělování věcí;
 - omezení přepravovaných množství a množství vyňatá z platnosti předpisů;
 - manipulaci a uložení (balení, plnění, nakládka a vykládka, stupně plnění, uložení a vzájemné oddělování);
 - čišťení a/nebo odplyňování před balením, plněním, nakládkou a po vykládce;
 - posádku a odborné školení;
 - palubní doklady (přepravní doklady, písemné pokyny, schvalovací osvědčení plavidla, osvědčení o školení k nebezpečným látkám podle ADN, kopie všech odchylek, jiné doklady);
 - písemné pokyny (používání pokynů a ochranné prostředky pro posádku);
 - požadavky na dozor (kotvení);

- pravidla a omezení provozu;
- únik znečišťujících látek během provozu a při nehodách;
- předpisy týkající se zařízení pro lodní dopravu.

1.8.3.12 **Zkoušky**

1.8.3.12.1 Zkouška sestává z písemného testu, který může být doplněn ústní zkouškou.

1.8.3.12.2 Příslušný orgán nebo jím pověřená zkušební organizace musí dohlížet na každou zkoušku. Jakákoli manipulace a podvádění musí být, jak je to jen možné, vyloučeny. Totožnost kandidáta musí být ověřena. Při písemné zkoušce není dovoleno použití žádných jiných dokumentů kromě mezinárodních a vnitrostátních předpisů. Všechny zkušební dokumenty musí být zaregistrovány a uchovány v písemné formě nebo elektronicky jako datový soubor.

1.8.3.12.3 Elektronické prostředky se mohou používat pouze v tom případě, když jsou dány k dispozici zkušebním orgánem. Kandidát nesmí uvádět žádné doplňující údaje do poskytnutých elektronických prostředků; kandidát může pouze odpovídat na zadané otázky.

1.8.3.12.4 Písemný test musí mít dvě části:

(a) Uchazeč obdrží dotazník. Ten musí obsahovat nejméně dvacet otevřených otázek zahrnujících nejméně témata uvedená v seznamu v pododdílu 1.8.3.11. Mohou však být použity také otázky s uvedením několika možných odpovědí. V tomto případě se takové dvě otázky počítají za jednu otevřenou otázku. Zvláštní pozornost musí být věnována těmto tématům:

- všeobecná preventivní a bezpečnostní opatření;
- klasifikace nebezpečných věcí;
- všeobecná ustanovení o balení, včetně cisteren, cisternových kontejnerů, cisternových vozidel atd.;
- značky, velké bezpečnostní značky a bezpečnostní značky;
- údaje v přepravním dokladu;
- manipulace a uložení;
- odborné školení posádky;
- palubní doklady a osvědčení;
- písemné pokyny;
- předpisy týkající se zařízení pro lodní dopravu.

(b) Uchazeči musí vypracovat případovou studii podle povinností poradce uvedených v pododdílu 1.8.3.3, aby prokázali, že mají nezbytnou kvalifikaci pro plnění funkce poradce.

1.8.3.12.5 Písemné zkoušky smějí být prováděny, zcela nebo zčásti, v elektronické formě, kde jsou odpovědi zaznamenávány a vyhodnocovány za použití procesů elektronického zpracování dat (EDP), pokud jsou splněny tyto podmínky:

- (a) Hardware a software musí být zkontrolovány a přijaty příslušným orgánem nebo jím pověřenou zkušební organizací;
- (b) Musí být zajištěna správná technická funkce. Musí být učiněna opatření týkající se možnosti pokračování zkoušky, dojde-li k selhání technických prostředků a aplikací. Na vstupních zařízeních nesmějí být k dispozici žádné pomocné funkce (např. funkce elektronického vyhledávání). Elektronické médium poskytnuté podle 1.8.3.12.3 nesmí dovolit kandidátům komunikovat během zkoušky s jakýmkoli jiným přístrojem;
- (c) Konečná vstupní data každého kandidáta musí být zaznamenána. Vyhodnocení výsledků musí být transparentní.

- 1.8.3.13 Smluvní strany mohou rozhodnout, že uchazeči, kteří hodlají pracovat pro podniky specializované na přepravu určitých druhů nebezpečných věcí mohou být zkoušeni pouze z témat, která jsou spojena s jejich činností. Tyto druhy věcí jsou:
- třída 1;
 - třída 2;
 - třída 7;
 - třídy 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 6.2, 8 a 9;
 - UN čísla 1202, 1203, 1223, 3475 a palivo pro letecké motory zařazené pod UN 1268 nebo UN 1863
- Osvědčení předepsané v pododdílu 1.8.3.7 musí zřetelně uvádět, že je platné pouze pro druhy nebezpečných věcí uvedených v tomto pododdíle a pro které byl poradce zkoušen podle podmínek uvedených v pododdílu 1.8.3.12.
- 1.8.3.14 Příslušný orgán nebo zkušební instituce musí uchovávat seznam zkušebních otázek, které byly použity při zkoušce.
- 1.8.3.15 Osvědčení předepsané v pododdílu 1.8.3.7 musí mít formu podle vzoru uvedeného v pododdílu 1.8.3.18 a musí být uznáváno všemi smluvními stranami.
- 1.8.3.16 *Platnost a prodloužení platnosti osvědčení***
- 1.8.3.16.1 Osvědčení je platné po dobu pěti let. Doba platnosti osvědčení se prodlouží o pět let od data uplynutí jeho platnosti, pokud jeho držitel během posledního roku před uplynutím doby jeho platnosti složil zkoušku. Zkouška musí být schválena příslušným orgánem.
- 1.8.3.16.2 Účelem zkoušky je ověřit, zda má držitel potřebné znalosti k vykonávání povinností uvedených v pododdílu 1.8.3.3. Vyžadované znalosti jsou uvedeny v pododdílu 1.8.3.11 (b) a musí zahrnovat změny předpisů, k nimž došlo od získání posledního osvědčení. Zkouška musí být organizována a dozorována na stejném základě, jak je uvedeno v pododdílech 1.8.3.10 a 1.8.3.12 až 1.8.3.14. Držitel osvědčení však nemusí vypracovat případovou studii podle ustanovení pododdílu 1.8.3.12.4 (b).
- 1.8.3.17 Ustanovení uvedená v pododdílech 1.8.3.1 až 1.8.3.16 se považují za splněná, jestliže byly splněny příslušné podmínky směrnice Rady 96/35/ES ze 3. června 1996 o jmenování a odborné způsobilosti bezpečnostních poradců pro přepravu nebezpečných věcí silniční, železniční a vnitrozemskou vodní dopravou² a směrnice Evropského parlamentu a Rady 2000/18/ES ze dne 17. dubna 2000 o minimálních zkušebních požadavcích na bezpečnostní poradce pro přepravu nebezpečných věcí silniční, železniční nebo vnitrozemskou vodní dopravou³.

² Official Journal of the European Communities, č. L145 z 19. června 1996, strana 10.

³ Official Journal of the European Communities, č. L118 z 19. května 2000, strana 41.

1.8.3.18 Vzor osvědčení**Osvědčení o odborné způsobilosti bezpečnostního poradce pro přepravu nebezpečných věcí**

Platné dopro podniky, které přepravují nebezpečné věci, a pro podniky, které provádějí odesílání, balení, plnění, nakládku nebo vykládku spojenou s touto přepravou:

 silniční dopravou železniční dopravou vnitrozemskou vodní dopravou

Vydáno kým:

Datum:

Podpis:

1.8.3.19 Rozšíření platnosti osvědčení

Jestliže poradce rozšíří rozsah platnosti svého osvědčení během jeho doby platnosti splněním požadavků uvedených v 1.8.3.16.2, zůstane doba platnosti nového osvědčení stejná jako doba platnosti předchozího osvědčení.

1.8.4 Seznam příslušných orgánů a jimi pověřených organizací

Smluvní strany oznámí Sekretariátu Evropské hospodářské komise Organizace spojených národů adresy příslušných orgánů a jimi pověřených organizací, které jsou kompetentní podle vnitrostátních právních předpisů pro uplatňování ADN, přičemž uvedou pro každý případ příslušné ustanovení ADN, jakož i adresy, na které je třeba zasílat příslušné žádosti.

Sekretariát Evropské hospodářské komise Organizace spojených národů pořídí na základě obdržených informací seznam a udržuje jej v aktuálním stavu. Oznamuje tento seznam a jeho změny smluvním stranám.

1.8.5 Hlášení o nehodách a mimořádných událostech při přepravě nebezpečných věcí

1.8.5.1 Dojde-li během nakládky, plnění, přepravy, vykládky nebezpečných věcí nebo odplynování tankových plavidel na území smluvní strany k vážné nehodě nebo mimořádné události, je nakládec, osoba odpovědná za plnění, dopravce, vykládec, příjemce nebo provozovatel sběrného zařízení k hmotným škodám nebo ke škodám na životním prostředí, nebo pokud byly zapojeny orgány (orgány) jeden měsíc po této události předána zpráva podle vzoru předepsaného v 1.8.5.4.

1.8.5.2 Tato smluvní strana zašle, je-li to žádoucí, tuto zprávu Sekretariátu Evropské hospodářské komise Organizace spojených národů za účelem informování ostatních smluvních stran.

1.8.5.3 Událost podléhající povinnosti vypracování zprávy podle pododdlivu 1.8.5.1 je událost, při níž došlo k úniku nebezpečných věcí nebo hrozilo bezprostřední riziko úniku látky, došlo-li ke zranění osob, k hmotným škodám nebo ke škodám na životním prostředí, nebo pokud byly zapojeny orgány (orgány) a je-li splněno alespoň jedno z následujících kritérií:

Zranění osob znamená událost, při níž došlo k usmrcení nebo zranění v přímém vztahu k přepravovaným nebezpečným věcem, přičemž zranění

- (a) vyžaduje intenzivní lékařskou péči;
- (b) vyžaduje nejméně jednodenní pobyt v nemocnici; nebo
- (c) má za následek pracovní neschopnost v trvání nejméně tří po sobě jdoucích dnů.

Únik látky je uniknutí nebezpečných věcí:

- (a) tříd 1 nebo 2 obalové skupiny I nebo jiných nebezpečných věcí nepřifixovaných k žádné obalové skupině v množstvích 50 kg nebo 50 litrů nebo více;
- (b) obalové skupiny II v množstvích 333 kg nebo 333 litrů nebo více; nebo
- (c) obalové skupiny III v množstvích 1000 kg nebo 1000 litrů nebo více.

Kritérium úniku látky platí také v případě bezprostředního rizika úniku látky ve výše uvedených množstvích. Zpravidla se toto riziko musí předpokládat, jestliže z důvodu poškození své konstrukce již dopravní nebo přepravní prostředky nejsou způsobilé pro další přepravu nebo jestliže z nějakého jiného důvodu již nemůže být zajištěna dostatečná úroveň bezpečnosti (např. z důvodu deformace cisteren nebo kontejnerů, převrácení cisterny nebo požáru v bezprostřední blízkosti).

Dojde-li k nehodě nebo mimořádné události při přepravě nebezpečných věcí třídy 6.2, předkládá se zpráva o nehodě vždy, bez ohledu na množství uniklé látky.

Dojde-li k nehodě nebo mimořádné události při přepravě radioaktivních látek jsou kritéria pro únik látky následující:

- (a) jakýkoli únik radioaktivních látek z kusů;
- (b) expozice vedoucí k překročení mezních hodnot stanovených v předpisech pro ochranu pracovníků a veřejnosti proti ionizujícímu záření (Radiation Protection and Safety of Radiation Sources: International Basic Safety Standards, IAEA Řada bezpečnostních standardů č. GSR, část 3, IAEA, Vídeň (2014)); nebo

- (c) je-li důvod předpokládat, že došlo k významnému zhoršení bezpečnostní funkce kusu (kontejnment, stínění, tepelná ochrana nebo kritičnost), které může učinit kus nezpůsobilým pro pokračování přepravy bez dodatečných bezpečnostních opatření.

POZNÁMKA: Viz ustanovení v 7.1.4.14.7.7 k nedoručitelným zásilkám

Hmotné škody nebo škody na životním prostředí znamenají uvolnění nebezpečných věcí, bez ohledu na jejich množství, kdy odhadovaná částka škody překročí 50 000 euro. Škoda na přímo zúčastněných dopravních prostředcích obsahujících nebezpečné věci ani na dopravní infrastruktuře se pro tento účel nebere v úvahu.

Účast orgánů (orgánů) znamená přímé zapojení orgánů nebo nouzových zásahových jednotek během události s nebezpečnými věcmi a evakuaci osob nebo uzavření veřejných dopravních komunikací (silnic/železničních tratí/vnitrozemských vodních cest) na nejméně tři hodiny z důvodu nebezpečí vytvářeného nebezpečnými věcmi.

Pokud je to potřebné, může si příslušný orgán vyžádat další relevantní informace.

1.8.5.4 Vzor zprávy o událostech během přepravy nebezpečných věcí

Zpráva o událostech při přepravě nebezpečných věcí podle ADN, oddílu 1.8.5

Zpráva č.:

Dopravce/Plnič/ Příjemce/Nakládce:

8. Následky událostiPostižení osob v souvislosti s přepravovanými nebezpečnými věcmi:

- Mrtví (počet:)
- Zranění (počet:)

Únik látky:

- Ano
- Ne
- Bezprostřední nebezpečí úniku látky

Hmotné škody/škody na životním prostředí:

- Odhadovaná výše škody \leq 50.000 Euro
- Odhadovaná výše škody $>$ 50.000 Euro

Účast orgánů:

- Ano
 - Evakuace osob trvající nejméně tři hodiny zapříčiněná přepravovanými nebezpečnými věcmi
 - Uzavření veřejných komunikací na dobu nejméně tří hodin zapříčiněné přepravovanými nebezpečnými věcmi
- Ne

Pokud je to nutné, může příslušný orgán vyžadovat další údaje.

KAPITOLA 1.9

DOPRAVNÍ OMEZENÍ STANOVENÁ PŘÍSLUŠNÝMI ORGÁNY

- 1.9.1** Podle článku 6, odstavce 1 ADN může být vstup nebezpečných věcí na území smluvních stran předmětem pravidel nebo zákazů stanovených z jiných důvodů, než je bezpečnost během přepravy. Taková pravidla nebo zákazy musí být zveřejněny vhodnou formou.
- 1.9.2** S výhradou ustanovení oddílu 1.9.3 mohou smluvní strany uplatňovat vůči plavidlům provádějícím mezinárodní přepravu nebezpečných věcí vnitrozemskou vodní dopravou na svém území určitá dodatečná ustanovení, která nejsou obsažena v ADN, pokud tato ustanovení nejsou v rozporu s článkem 4, odstavcem 2 ADN a pokud jsou obsažena v jejich vnitrostátních právních předpisech a vztahují se rovnocenně rovněž na pravidla provádějící vnitrostátní přepravu nebezpečných věcí vnitrozemskou vodní dopravou na území této smluvní strany.
- 1.9.3** Dodatečná ustanovení, která mohou být uplatňována podle výše uvedeného oddílu 1.9.2 jsou tato:
- (a) Dodatečné bezpečnostní požadavky nebo omezení týkající se plavidel užívajících určitou infrastrukturu, jako jsou mosty nebo tunely, nebo plavidel vjíždějících nebo vyjíždějících z přístavů nebo jiných dopravních terminálů;
 - (b) Požadavky, aby plavidla sledovala předepsané dopravní trasy, které se vyhýbají obchodním nebo obytným územím, územím citlivým z hlediska ochrany životního prostředí, průmyslovým zónám s rizikovými zařízeními nebo vnitrozemským vodním cestám s vážnými fyzikálními riziky;
 - (c) Výjimečné požadavky týkající se dopravní trasy nebo kotvení plavidel přepravujících nebezpečné věci, které vyplývají z extrémních povětrnostních podmínek, zemětřesení, nehod, odborářských akcí, občanských nepokojů nebo vojenských konfliktů;
 - (d) Omezení provozu plavidel přepravujících nebezpečné věci v určitých dnech týdne nebo roku.
- 1.9.4** Příslušný orgán smluvní strany uplatňující na svém území jakákoli dodatečná ustanovení uvedená v odstavcích (a) a (d) předchozího oddílu 1.9.3 musí o tom informovat Sekretariát Evropské hospodářské komise Organizace spojených národů, který o nich uvědomí smluvní strany.

KAPITOLA 1.10

BEZPEČNOSTNÍ PŘEDPISY

POZNÁMKA: Pro účely této kapitoly se slovem „bezpečnost“ rozumí opatření nebo preventivní kroky ke snížení nebezpečí odcizení nebo zneužití nebezpečných věcí, v jehož důsledku by mohlo dojít k ohrožení osob, majetku nebo životního prostředí.

1.10.1 Všeobecná ustanovení

- 1.10.1.1 Všechny osoby podílející se na přepravě nebezpečných věcí musí dodržovat bezpečnostní předpisy pro přepravu nebezpečných věcí uvedené v této kapitole v přiměřené míře ke svým odpovědnostem.
- 1.10.1.2 Nebezpečné věci smějí být předány k přepravě pouze dopravcům, jejichž totožnost byla řádně ověřena.
- 1.10.1.3 Kotviště v zónách pro překládání nebezpečných věcí musí být příslušně chráněna, být dobře osvětlena a když je pro to možnost a je to nutné, být nedostupná pro cizí osoby.
- 1.10.1.4 Každý člen posádky plavidla přepravující nebezpečné věci musí mít během přepravy u sebe průkaz totožnosti opatřený fotografií.
- 1.10.1.5 Kontroly bezpečnosti v souladu s oddílem 1.8.1 musí rovněž zahrnovat kontrolu použití příslušných opatření pro zajištění bezpečnosti.
- 1.10.1.6 Příslušný orgán musí vést aktuální soupisy všech platných osvědčení o zvláštních znalostech, předepsaných v 8.2.1 platných osvědčení o zvláštních znalostech.

1.10.2 Školení o obecné bezpečnosti

- 1.10.2.1 Úvodní a obnovovací školení uvedené v kapitole 1.3 musí zahrnovat také prvky poučení o bezpečnosti. Obnovovací školení nemusí být nutně vázáno jen na změny předpisů.
- 1.10.2.2 Školení musí být zaměřeno na povahu bezpečnostních rizik, jejich rozpoznávání a postupy k jejich snížení, jakož i na opatření, která je nutno provést při narušení bezpečnosti. Musí zahrnovat seznámení s příslušnými bezpečnostními plány, v přiměřené míře k odpovědnostem a povinnostem jednotlivých pracovníků a jejich účasti při aplikaci těchto plánů.
- 1.10.2.3 Takové školení musí být poskytnuto při přijímání osob na pracovní místa spojená s přepravou nebezpečných věcí, nebo musí být ověřeno, že takové školení již absolvovaly. Musí být periodicky doplňováno obnovovacím školením.
- 1.10.2.4 Záznamy o všech absolvovaných bezpečnostních školeních musí být uchovávány zaměstnavatelem a musí být na požádání zpřístupněny zaměstnanci nebo příslušnému orgánu. Záznamy musí být uchovávány zaměstnavatelem po dobu stanovenou příslušným orgánem.

1.10.3 Ustanovení pro vysoce rizikové nebezpečné věci

POZNÁMKA: Kromě bezpečnostních předpisů ADN mohou příslušné orgány uplatňovat další bezpečnostní předpisy z jiných důvodů, než je bezpečnost během přepravy (viz též článek 4, odstavec 1 Dohody). Aby nedocházelo při mezinárodní a multimodální přepravě k rozdílnému označování výbušnin, doporučuje se, aby toto označování bylo prováděno v souladu s mezinárodně harmonizovanou normou (např. Směrnici Komise Evropských společenství 2008/43/ES).

1.10.3.1 Definice vysoce rizikových nebezpečných věcí

- 1.10.3.1.1 Vysoce rizikové nebezpečné věci jsou takové nebezpečné věci, které mají potenciál být zneužity při teroristické akci a které mohou, jako výsledek, vyvolat vážné důsledky, jako jsou hromadné oběti na životech, hromadné ničení nebo, zejména pro třídu 7, hromadný socio-ekonomický rozvrat.
- 1.10.3.1.2 Vysoce rizikové nebezpečné věci jiných tříd, než je třída 7, jsou nebezpečné věci uvedené v tabulce 1.10.3.1.2 níže a přepravované v množstvích větších, než jsou množství uvedené v této tabulce.

Tabulka 1.10.3.1.2: Seznam vysoce rizikových nebezpečných věcí

Třída	Podtřída	Látka nebo předmět	Množství		
			Cisterna nebo nákladní tank (l) ^c	Volně ložené*/(kg) ^d	Věci v kusech (kg)
1	1.1	Výbušné látky a předměty	a	a	0
	1.2	Výbušné látky a předměty	a	a	0
	1.3	Výbušné látky a předměty skupiny snášenlivosti C	a	a	0
	1.5	Výbušné látky a předměty	0	a	0
	1.6	Výbušné látky a předměty	a	a	0
1	1.4	Výbušné látky a předměty UN čísel 0104, 0237, 0255, 0267, 0289, 0361, 0365, 0366, 0440, 0441, 0455, 0456, 0500, 0512 a 0513	a	a	0
2		Hořlavé, netoxické plyny (klasifikační kódy zahrnující jen písmena F nebo FC)	3000	a	b
		Toxické plyny (klasifikační kódy zahrnující písmeno(a) T, TF, TC, TO, TFC nebo TOC), s výjimkou aerosolů	0	a	0
3		Hořlavé kapaliny obalových skupin I a II	3000	a	b
		Znecitlivěné výbušné kapaliny	0	a	0
4.1		Znecitlivěné výbušné látky	a	a	0
4.2		Látky obalové skupiny I	3000	a	b
4.3		Látky obalové skupiny I	3000	a	b
5.1		Kapaliny podporující hoření obalové skupiny I	3000	a	b
		Chloristany, dusičnan amonný, hnojiva obsahující dusičnan amonný a emulze nebo suspenze nebo gely obsahující dusičnan amonný	3000	3000	b
6.1		Toxické látky obalové skupiny I	0	a	0
6.2		Infekční látky kategorie A (UN 2814 a UN 2900, kromě materiálu živočišného původu) a odpady medicínské kategorie A (UN 3549)	a	0	0
8		Žíravé látky obalové skupiny I	3000	a	b

* „Volně ložené“ znamená přepravu volně ložených věcí na plavidle nebo ve vozidle nebo kontejneru.

a Nevztahuje se.

b Ustanovení oddílu 1.10.3 neplatí, bez ohledu na množství.

c Hodnota uvedená v tomto sloupci platí pouze tehdy, je-li přeprava v cisternách povolena podle sloupce (10) nebo (12) tabulky A kapitoly 3.2 ADR nebo RID a nebo je-li uvedeno písmeno „T“ v sloupci (8) tabulky A kapitoly 3.2 ADN. Pro látky, které není dovoleno v cisternách přepravovat, instrukce uvedená v tomto sloupci neplatí.

d Hodnota uvedená v tomto sloupci platí pouze tehdy, je-li přeprava ve volně loženém stavu povolena podle sloupce (10) nebo (17) tabulky A kapitoly 3.2 ADR nebo RID, nebo je-li uvedeno písmeno „B“ v sloupci (8) tabulky A v kapitole 3.2 ADN. Pro látky, které není dovoleno ve volně loženém stavu přepravovat, instrukce uvedená v tomto sloupci neplatí.

1.10.3.1.3 Pro třídu 7 jsou vysoce rizikové radioaktivní látky takové látky, které mají úroveň aktivity stejnou nebo vyšší než je práh dopravní bezpečnosti 3 000 A₂ pro jednotlivý kus (viz též 2.2.7.2.2.1), s výjimkou následujících radionuklidů, pro které je práh dopravní bezpečnosti udán v tabulce 1.10.3.1.3 níže.

Tabulka 1.10.3.1.3
Prahy dopravní bezpečnosti pro jednotlivé radionuklidy

<i>Prvek</i>	<i>Radionuklid</i>	<i>Práh dopravní bezpečnosti (TBq)</i>
Americium	Am-241	0,6
Zlato	Au-198	2
Kadmium	Cd-109	200
Kalifornium	Cf-252	0,2
Curium	Cm-244	0,5
Kobalt	Co-57	7
Kobalt	Co-60	0,3
Cesium	Cs-137	1
Železo	Fe-55	8000
Germanium	Ge-68	7
Gadolinium	Gd-153	10
Iridium	Ir-192	0,8
Nikl	Ni-63	600
Paladium	Pd-103	900
Prometium	Pm-147	400
Polonium	Po-210	0,6
Plutonium	Pu-238	0,6
Plutonium	Pu-239	0,6
Radium	Ra-226	0,4
Ruthenium	Ru-106	3
Selen	Se-75	2
Stroncium	Sr-90	10
Thalium	Tl-204	200
Thulium	Tm-170	200
Yterbium	Yb-169	3

- 1.10.3.1.4 Pro směsi radionuklidů může být zjištěno, zda je dosažen nebo překročen práh dopravní bezpečnosti, provedeno výpočtem tak, že se sečte aktivita každého radionuklidu podělená prahem dopravní bezpečnosti pro tento radionuklid. Je-li součet těchto zlomků menší než 1, potom nebyl dosažen ani překročen práh radioaktivity pro směs.

Výpočet může být proveden podle tohoto vzorce:

$$\sum_i \frac{A_i}{T_i} < 1$$

kde:

A_i = aktivita radionuklidu i , který je přítomen v kusu (TBq)

T_i = práh dopravní bezpečnosti pro radionuklid i (TBq)

- 1.10.3.1.5 Pokud má radioaktivní látka vedlejší nebezpečí jiných tříd, musí být vzata v úvahu také kritéria tabulky 1.10.3.1.2 (viz též 1.7.5).

1.10.3.2 **Bezpečnostní plány**

- 1.10.3.2.1 Dopravci, odesílatelé a ostatní účastníci přepravy uvedení v 1.4.2 a 1.4.3, podílející se na přepravě vysoce rizikových nebezpečných věcí (viz tabulku 1.10.3.1.2) nebo vysoce rizikových radioaktivních látek (viz 1.10.3.1.3), musí přijmout, aplikovat a dodržet bezpečnostní plán, který musí obsahovat alespoň součásti uvedené v 1.10.3.2.2.

- 1.10.3.2.2 Bezpečnostní plán musí obsahovat alespoň následující součásti:
- (a) specifické stanovení odpovědností za bezpečnost způsobilým a kvalifikovaným osobám s odpovídající pravomocí k uplatnění svých odpovědností;
 - (b) seznamy dotčených nebezpečných věcí nebo skupin nebezpečných věcí;
 - (c) přehled běžných činností a rozbor bezpečnostních rizik, které z nich vyplývají, včetně všech zastávek nutných při přepravě, přítomnosti nebezpečných věcí v plavidle, cisterně nebo kontejneru před plavbou, během ní a po plavbě a dočasném skladování nebezpečných věcí za účelem jejich intermodální překládky nebo překládky mezi jednotkami;
 - (d) jasná specifikace opatření, která je třeba učinit ke snížení bezpečnostních rizik, přiměřených k odpovědnostem a povinnostem účastníka, včetně:
 - školení;
 - bezpečnostní politiky (např. reakce na podmínky velkého ohrožení, prověření nově přijímaných zaměstnanců nebo zaměstnanců přidělovaných na některá místa atd.);
 - provozní praxe (např. volba nebo používání známých tras, přístup k nebezpečným věcem při jejich dočasném skladování (jak je definováno pod písmenem c), blízkost ohrožitelné infrastruktury atd.);
 - zařízení a zdrojů, které jsou používány ke snížení rizik
 - (e) účinné a moderní postupy pro ohlašování ohrožení, narušení bezpečnosti nebo případů s takovými situacemi souvisejících, a pro jednání v takových situacích;
 - (f) postupy pro posuzování a testování bezpečnostních plánů a postupy pro periodickou revizi a aktualizaci těchto plánů;
 - (g) opatření pro zajištění fyzické bezpečnosti dopravních informací obsažených v bezpečnostním plánu; a
 - (h) opatření pro zajištění toho, aby šíření informací týkajících se přepravy, obsažených v bezpečnostním plánu, bylo omezeno na ty osoby, které je potřebují mít. Tato opatření nesmějí být přitom překážkou sdělování informací vyžadovaných v jiných ustanoveních ADN.

POZNÁMKA: Dopravci, odesílatelé a příjemci by měli spolupracovat mezi sebou a s příslušnými orgány při výměně informací týkajících se případných ohrožení, aplikaci vhodných bezpečnostních opatření a reakci na bezpečnostní incidenty.

- 1.10.3.3 Na plavidlech, kterými jsou přepravovány vysoce rizikové nebezpečné věci (viz tabulku 1.10.3.1.2) nebo vysoce rizikové radioaktivní látky (viz 1.10.3.1.3), musí být používány provozní a technická opatření, směřující k zamezení nežádoucího použití plavidla a nebezpečných věcí.

POZNÁMKA: Pokud je to vhodné a pokud jsou potřebná zařízení již nainstalována, měly by být použity telematické systémy nebo jiné metody nebo přístroje pro sledování vysoce rizikových nebezpečných věcí (viz tabulku 1.10.3.1.2) nebo vysoce rizikových radioaktivních látek (viz 1.10.3.1.3).

- 1.10.4** S výjimkou radioaktivních látek označených UN 2910 a UN 2911, pokud úroveň aktivity (na kus) přesahuje hodnotu A_2 , se ustanovení oddílů 1.10.1, 1.10.2 a 1.10.3 nepoužijí, jestliže množství přepravovaná plavidlem nepřekročí množství uvedená v 1.1.3.6.1. Kromě toho se ustanovení této kapitoly nevztahují na přepravu UN 2912 LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-I) a UN 2913 LÁTKA RADIOAKTIVNÍ, POVRCHOVĚ KONTAMINOVANÉ PŘEDMĚTY (SCO-I).

- 1.10.5** Pro radioaktivní látky se ustanovení této kapitoly považují za splněná, pokud se použije ustanovení Úmluvy o fyzické ochraně jaderných materiálů¹ a oběžníku IAEA „Nuclear Security Recommendations on Physical Protection of Nuclear Material and Nuclear Facilities“².

¹ IAEA/CIRC/274/Rev.1, IAEA, Vídeň (1980).

² INFCIRC/225/Rev.5, IAEA, Vídeň (2011).

KAPITOLA 1.11 AŽ 1.14

(Vyhrazeno)

KAPITOLA 1.15

UZNÁVÁNÍ KLASIFIKAČNÍCH SPOLEČNOSTÍ

1.15.1 Všeobecně

V případě uzavření mezinárodní dohody týkající se všeobecnějších předpisů o plavbě plavidlem po vnitrozemských vodních cestách a obsahující ustanovení vztahující se na celý rozsah činností klasifikačních společností a jejich uznávání bude každé ustanovení této kapitoly, které je v rozporu s jakýmkoli z ustanovení zmíněné mezinárodní dohody, ve vztazích mezi smluvními stranami této dohody, které se staly smluvními stranami mezinárodní dohody, a to od data vstupu v platnost této poslední dohody, automaticky vypuštěno a nahrazeno příslušným ustanovením mezinárodní dohody. Tato kapitola se stane neplatnou, jakmile mezinárodní dohoda vstoupí v platnost, jestliže se všechny smluvní strany této dohody stanou smluvními stranami mezinárodní dohody.

1.15.2 Postup pro uznávání klasifikačních společností

1.15.2.1 Klasifikační organizace, která si přeje být doporučena k uznání podle této dohody, musí podat žádost o uznání podle ustanovení této kapitoly příslušnému orgánu smluvní strany.

Klasifikační společnost musí připravit příslušné informace podle ustanovení této kapitoly. Musí je předložit alespoň v oficiálním jazyce státu, v němž se žádost podává, a v angličtině.

Smluvní strana postoupí žádost Administrativnímu výboru, ledaže podle jejího názoru nebyly zjevně splněny podmínky a kritéria uvedené v 1.15.3.

1.15.2.2 Administrativní výbor jmenuje komisi expertů a stanoví její složení a její procesní pravidla. Komise expertů posoudí návrh; zjistí, zda klasifikační společnost splňuje kritéria uvedená v 1.15.3 a vypracuje doporučení Administrativnímu výboru ve lhůtě do šesti měsíců.

1.15.2.3 Administrativní výbor posoudí zprávu expertů. Podle postupu uvedeného v článku 17, 7 (c) rozhodne nejpozději do jednoho roku, zda doporučit, nebo nedoporučit smluvním stranám, aby uznaly dotyčnou klasifikační společnost. Administrativní výbor sestaví seznam klasifikačních společností doporučených k uznání smluvními stranami.

1.15.2.4 Každá smluvní strana se může nebo nemusí rozhodnout, že uzná dotyčné klasifikační společnosti jen na základě seznamu zmíněného v 1.15.2.3. Smluvní strana musí informovat Administrativní výbor a ostatní smluvní strany o svém rozhodnutí.

Administrativní výbor aktualizuje seznam uznání vydaných smluvními stranami.

1.15.2.5 Jestliže smluvní strana usoudí, že určitá klasifikační společnost již nesplňuje podmínky a kritéria stanovené v 1.15.3 může Administrativnímu výboru podat žádost o její vyškrtnutí ze seznamu doporučených společností. Takový návrh musí být opodstatněn přesvědčivými důkazy o neplnění těchto podmínek a kritérií.

1.15.2.6 Administrativní výbor sestaví novou komisi expertů podle postupu stanoveného v 1.15.2.2, která musí podat zprávu Administrativnímu výboru ve lhůtě do šesti měsíců. Klasifikační společnost musí být informována a vyzvána komisí expertů k vyjádření se k jejím nálezům.

1.15.2.7 Administrativní výbor může rozhodnout v případě, že se nepodaří splnit podmínky a kritéria uvedená v 1.15.3, že klasifikační společnost bude mít příležitost předložit plán k odstranění zjištěného nedostatku (zjištěných nedostatků) ve lhůtě do šesti měsíců a k vyhnutí se jeho (jejich) jakémukoli opakování, nebo podle článku 17, 7 (c) vyškrtnout název dotyčné společnosti ze seznamu společností doporučených k uznání.

1.15.3 Podmínky a kritéria pro uznání klasifikační společnosti žádající o uznání podle této dohody

Klasifikační společnost žádající o uznání podle této dohody musí splnit následující podmínky a kritéria:

- 1.15.3.1 Klasifikační společnost musí být schopna prokázat rozsáhlou znalost a zkušenost v posuzování konstrukce a výroby plavidla pro vnitrozemskou vodní dopravu. Společnost by měla mít obsažná pravidla a předpisy pro konstrukci, výrobu a periodické inspekce plavidla. Tato pravidla a předpisy musí být zveřejněna a průběžně aktualizována a zdokonalována výzkumnými a vývojovými programy.
- 1.15.3.2 Každoročně musí být zveřejněn registr plavidel klasifikovaných klasifikační společností.
- 1.15.3.3 Klasifikační společnost nesmí být řízena vlastníky nebo výrobci plavidel nebo jinými subjekty obchodně zainteresovanými na výrobě, vybavování, opravách nebo provozu plavidel. Klasifikační společnost nesmí být v podstatné míře závislá na jediném obchodním podniku z hlediska svých příjmů.
- 1.15.3.4 Centrála nebo pobočka klasifikační společnosti oprávněná a pověřená řídit a působit ve všech oblastech jí příslušejících podle předpisů pro vnitrozemskou vodní dopravu musí mít své sídlo v jedné ze smluvních stran.
- 1.15.3.5 Klasifikační společnost a její experti musí mít ve vnitrozemské vodní dopravě dobrou pověst; experti musí být schopni prokázat své odborné schopnosti.
- 1.15.3.6 Klasifikační společnost
- musí mít dostatečný odborný personál a inženýry pro technické úkoly monitorování a inspekce a pro úkoly řízení, podpory a výzkumu v poměru k úkolům a počtu klasifikovaných plavidel a dostatečný pro udržování pravidel v aktuálním stavu a pro jejich vývoj ve světle požadavků kvality;
 - musí mít své experty alespoň ve dvou smluvních stranách.
- 1.15.3.7 Klasifikační společnost musí být řízena podle etického kódu.
- 1.15.3.8 Klasifikační společnost musí mít vypracován, zaveden a musí dodržovat účinný systém vnitřní kvality založený na příslušných aspektech mezinárodně uznávaných norem kvality a odpovídající normám EN ISO/IEC 17020:2012 (kromě klauzule 8.1.3) (inspekční organizace) a ISO 9001 nebo EN ISO 9001:2015. Klasifikační společnost podléhá certifikaci svého systému kvality nezávislou institucí auditorů uznanou státní správou státu, v němž má své sídlo.

1.15.4 Povinnosti doporučených klasifikačních společností

- 1.15.4.1 Doporučené klasifikační společnosti se musí zavázat k vzájemné spolupráci, aby byla zaručena rovnocennost z hlediska bezpečnosti jejich technických norem, které jsou důležité pro aplikaci ustanovení této dohody.
- 1.15.4.2 Musejí si vyměňovat zkušenosti na společných zasedáních konaných alespoň jednou za rok. Musejí každoročně podat zprávu Výboru pro bezpečnostní otázky. Sekretariát Výboru pro bezpečnostní otázky musí být o těchto zasedáních informován. Smluvním stranám musí být poskytnuta příležitost se těchto zasedání účastnit jako pozorovatelé.
- 1.15.4.3 Doporučené klasifikační společnosti se musí zavázat, že budou aplikovat stávající a budoucí ustanovení Dohody s ohledem na datum jejich vstupu v platnost. V odpověď na žádost příslušného orgánu musí doporučené klasifikační společnosti poskytnout aktuální informace týkající se jejich technických předpisů.

KAPITOLA 1.16

POSTUP PRO VYDÁVÁNÍ SCHVALOVACÍHO OSVĚDČENÍ

1.16.0 Pro účely této kapitoly znamená pojem „vlastník“ vlastníka nebo jeho ustanoveného zástupce, nebo pokud je plavidlo najato provozovatelem, provozovatele nebo jeho ustanoveného zástupce.

1.16.1 Schvalovací osvědčení

1.16.1.1 Všeobecně

1.16.1.1.1 Plavidla pro přepravu suchých nákladů přepravující nebezpečné věci v množstvích větších, než jsou vyjmutá množství, plavidla popsaná v 7.1.2.19.1, tanková plavidla přepravující nebezpečné věci a plavidla popsaná v 7.2.2.19.3 musí mít příslušné schvalovací osvědčení.

1.16.1.1.2 Schvalovací osvědčení platí nejvýše pět let, s výhradou ustanovení pododdílu 1.16.11.

1.16.1.2 Formulář schvalovacího osvědčení, vyplňované údaje

1.16.1.2.1 Schvalovací osvědčení musí odpovídat vzoru uvedenému v 8.6.1.1 nebo 8.6.1.3, pokud jde o obsah, formu a dispozici, a obsahovat požadované údaje, jak je to patřičné. Musí obsahovat datum vypršení lhůty platnosti.

Jeho rozměry jsou 210 mm x 297 mm (A4). Smějí se používat přední i zadní strany.

Musí být vystaveno v jazyce nebo v jednom z jazyků vydávající země. Pokud tímto jazykem není angličtina, francouzština nebo němčina, musí být záhlaví osvědčení a každý zápis pod body 5, 9 a 10 ve schvalovacím osvědčení plavidel pro přepravu suchých nákladů (8.6.1.1) a pod body 12, 16 a 17 ve schvalovacím osvědčení tankových plavidel (8.6.1.3) provedeny také v angličtině, francouzštině nebo němčině.

1.16.1.2.2 Schvalovací osvědčení musí potvrzovat, že plavidlo bylo podrobeno inspekci a že jeho konstrukce a vybava kompletně splňují příslušná ustanovení těchto Pravidel.

1.16.1.2.3 Všechny údaje o změnách schvalovacího osvědčení předepsaného v těchto Pravidlech a v jiných předpisech vypracovaných na základě vzájemné dohody smluvních stran mohou být zapsány do schvalovacího osvědčení příslušným orgánem.

1.16.1.2.4 Příslušný orgán zapíše do schvalovacího osvědčení plavidel s dvojitou obšívkou splňujících dodatečné požadavky pododdílů 9.1.0.80 až 9.1.0.95 nebo 9.2.0.80 až 9.2.0.95 tento zápis:

„Plavidlo splňuje dodatečné požadavky pro plavidla s dvojitou obšívkou 9.1.0.80 až 9.1.0.95“ nebo „Plavidlo splňuje dodatečné požadavky pro plavidla s dvojitou obšívkou 9.2.0.80 až 9.2.0.95.“

1.16.1.2.5 Pro tanková plavidla musí být schvalovací osvědčení doplněno seznamem všech látek povolených na přepravu v plavidle, sepsaným uznanou klasifikační společností, která klasifikovala plavidlo (povolených na přepravu v plavidle). V rozsahu vyžadovaném pro bezpečnou přepravu musí seznam obsahovat výhrady týkající se určitých nebezpečných věcí s ohledem na:

- kritéria pro pevnost a stabilitu plavidla; a
- kompatibilitu přejímaných nebezpečných věcí s konstrukčními materiály plavidla, včetně instalací a vybavení, které přicházejí do styku s nákladem.

Klasifikační společnosti musí novelizovat seznam látek povolených na přepravu v plavidle při každém prodloužení platnosti třídy plavidla na základě příložených Pravidel platných v té době. Klasifikační společnosti musí informovat vlastníka plavidla o změnách v tabulce C kapitoly 3.2, které vstoupily v mezidobí v platnost. Jestliže tyto změny vyžadují novelizaci seznamu látek povolených na přepravu v plavidle, musí o to vlastníka plavidla požádat uznanou klasifikační společnost. Tento novelizovaný seznam látek povolených na přepravu v plavidle musí být vydán ve lhůtě uvedené v 1.6.1.1.

Celý seznam látek povolených na přepravu v plavidle musí být uznanou klasifikační společností zrušen ve lhůtě uvedené v 1.6.1.1, jestliže v důsledku změn těchto Pravidel nebo v důsledku změn v klasifikaci není již dovoleno věci v něm obsažené v plavidle přepravovat.

Uznaná klasifikační společnost musí bez prodlení, po doručení schvalovacího osvědčení jeho držiteli, předat kopii seznamu látek povolených na přepravu v plavidle orgánu odpovědnému za vydání schvalovacího osvědčení a bez prodlení jej informovat o změnách nebo zrušení.

POZNÁMKA: Pokud je seznam látek k dispozici v elektronické formě, viz 5.4.0.2.

1.16.1.2.6 (Vypuštěno)

1.16.1.3 Prozatímní schvalovací osvědčení

1.16.1.3.1 Pro plavidlo, které nemá schvalovací osvědčení, může být v následujících případech vydáno na omezenou dobu prozatímní schvalovací osvědčení za těchto podmínek:

- (a) Plavidlo splňuje platné požadavky těchto Pravidel, ale normální schvalovací osvědčení nemohlo být vydáno včas. Toto prozatímní schvalovací osvědčení platí na vhodnou dobu, nejvýše však na dobu tří měsíců;
- (b) Plavidlo nespĺňuje všechny příslušné požadavky těchto Pravidel, ale bezpečnost přepravy není podle posouzení příslušného orgánu ohrožena.

Jednorázové prozatímní schvalovací osvědčení je platné na přiměřenou dobu, aby bylo možno uvést plavidlo do souladu s příslušnými ustanoveními, nejvýše však na dobu tří měsíců.

Příslušný orgán může vyžadovat dodatečné zprávy navíc k inspekční zprávě a může vyžadovat dodatečné podmínky.

POZNÁMKA: Pro vydání definitivního schvalovacího osvědčení podle 1.16.1.2 musí být vypracována nová inspekční zpráva podle 1.16.3.1, která potvrzuje soulad také s dosud nespĺněnými požadavky těchto Pravidel.

- (c) Plavidlo nespĺňuje všechna platná ustanovení těchto Pravidel v důsledku svého poškození. V tomto případě platí prozatímní schvalovací osvědčení pouze pro jedinou určenou plavbu a pro určený náklad. Příslušný orgán může stanovit dodatečné podmínky.

1.16.1.3.2 Prozatímní schvalovací osvědčení musí odpovídat vzoru uvedenému v 8.6.1.2 nebo 8.6.1.4 nebo jedinému vzoru osvědčení slučujícímu do jednoho formuláře prozatímní osvědčení o inspekci a prozatímní schvalovací osvědčení, za podmínky, že tento jediný vzor osvědčení obsahuje tytéž informace jako vzor uvedený v 8.6.1.2 nebo 8.6.1.4, pokud jde o obsah, formu a dispozici a je schválen příslušným orgánem.

Jeho rozměry jsou 210 mm x 297 mm (A4). Smějí se používat přední i zadní strany.

Musí být vystaveno v jazyce nebo v jednom z jazyků vydávající země. Pokud tímto jazykem není angličtina, francouzština nebo němčina, musí být záhlaví osvědčení a každý zápis pod bodem 5 v prozatímním schvalovacím osvědčení plavidel pro přepravu suchých nákladů (8.6.1.2) a pod bodem 13 v prozatímním schvalovacím osvědčení tankových plavidel (8.6.1.4) provedeny také v angličtině, francouzštině nebo němčině.

1.16.1.3.3 Pro tanková plavidla musí být ve schvalovacím osvědčení uveden otevírací tlak pojistných ventilů nebo vysokorychlostních ventilů.

Pokud má plavidlo nákladní tanky s různými otevíracími tlaky ventilů, musí být otevírací tlak každého tanku uveden ve schvalovacím osvědčení.

1.16.1.4 Příloha ke schvalovacímu osvědčení

1.16.1.4.1 Schvalovací osvědčení a prozatímní schvalovací osvědčení podle 1.16.1.3.1 (a) musí být doplněny přílohou podle vzoru uvedeného v 8.6.1.5.

1.16.1.4.2 Příloha ke schvalovacímu osvědčení musí obsahovat datum, od něhož smějí být použita přechodná ustanovení podle 1.6.7. Toto datum musí být:

- (a) pro plavidla podle Článku 8, odstavce 2 ADN, u nichž může být prokázáno, že byla již schválena pro přepravu nebezpečných věcí na území smluvní strany před 26. květnem 2000;
- (b) pro plavidla podle Článku 8, odstavce 2 ADN, u nichž nemůže být prokázáno, že byla již schválena pro přepravu nebezpečných věcí na území smluvní strany před 26. květnem 2000, prokázané datum první inspekce pro vydání schválení pro přepravu nebezpečných věcí na

území smluvní strany, nebo pokud toto datum není známo, datum vydání prvního prokázaného schválení pro přepravu nebezpečných věcí na území smluvní strany;

- (c) pro všechna ostatní plavidla prokázané datum první inspekce pro vydání schvalovacího osvědčení ve smyslu ADN, nebo pokud toto datum není známo, datum vydání prvního schvalovacího osvědčení ve smyslu ADN;
- (d) odchylkou od (a) až (c) výše datum nové první inspekce podle 1.16.8, pokud plavidlo po 31. prosinci 2014 více než dvanáct měsíců již nemělo platné schvalovací osvědčení.

1.16.1.4.3 Všechna schválení pro přepravu nebezpečných věcí vydaná na území smluvní strany, která jsou platná od data podle 1.16.1.4.2 a všechna ADN schvalovací osvědčení a prozatímní schvalovací osvědčení podle 1.16.1.3.1 (a) musí být zapsána v příloze ke schvalovacímu osvědčení.

Schvalovací osvědčení vydaná před vydáním přílohy ke schvalovacímu osvědčení musí být zaznamenána příslušným orgánem, který vydává přílohu ke schvalovacímu osvědčení.

1.16.2 Vydávání a uznávání schvalovacího osvědčení

1.16.2.1 Schvalovací osvědčení uvedené v 1.16.1 musí být vydáno příslušným orgánem smluvní strany, kde je plavidlo registrováno, nebo pokud není, smluvní strany, kde má svůj domovský přístav, nebo pokud není, smluvní strany, kde má své sídlo vlastník, nebo pokud není, příslušným orgánem zvoleným vlastníkem.

Ostatní smluvní strany musí uznávat taková schvalovací osvědčení.

Smluvní strany musí sdělit sekretariátu Evropské hospodářské komise Spojených národů (UNECE) kontaktní informace o jimi určených orgánech a organizacích, které jsou oprávněny podle vnitrostátních právních předpisů vydávat schvalovací osvědčení.

Sekretariát UNECE je sdělí smluvním stranám prostřednictvím své webové stránky.

1.16.2.2 Příslušný orgán kterékoli ze smluvních stran může požádat příslušný orgán kterékoli jiné smluvní strany, aby vydal schvalovací osvědčení namísto něho.

1.16.2.3 Příslušný orgán kterékoli ze smluvních stran může přenést oprávnění k vydání schvalovacího osvědčení na inspekční organizaci, jak je definována v 1.16.4.

1.16.2.4 Prozatímní schvalovací osvědčení uvedené v 1.16.1.3 musí být vydáno příslušným orgánem jedné ze smluvních stran v případech a za podmínek uvedených v těchto Pravidlech.

Ostatní smluvní strany musí uznávat taková prozatímní schvalovací osvědčení.

1.16.2.5 Příloha ke schvalovacímu osvědčení musí být vydána příslušným orgánem smluvní strany. Smluvní strany si musí v době vydávání vzájemně pomáhat. Musí uznat tuto přílohu ke schvalovacímu osvědčení. Každé nové schvalovací osvědčení nebo prozatímní schvalovací osvědčení vydané podle 1.16.1.3.1 (a) musí být zaznamenáno do přílohy ke schvalovacímu osvědčení. Pokud by měla být příloha ke schvalovacímu osvědčení nahrazena (např. v případě poškození nebo ztráty), musí být všechny existující zápisy přeneseny.

1.16.2.6 Příloha ke schvalovacímu osvědčení musí být stažena a nová příloha ke schvalovacímu osvědčení musí být vydána, jestliže proběhne nová první inspekce podle 1.16.8, neboť platnost posledního schvalovacího osvědčení vypršela po více než dvanácti měsících od 31. prosince 2014.

Platným datem je datum, kdy příslušný orgán obdržel žádost. V tomto případě musí být zaznamenána jen taková schvalovací osvědčení, která byla vydána po nové první inspekci.

1.16.3 Inspekční postup

1.16.3.1 Příslušný orgán smluvní strany musí dohlížet nad inspekcí plavidla. Podle tohoto postupu může být inspekce provedena inspekční organizací pověřenou smluvní stranou nebo uznanou klasifikační společností podle kapitoly 1.15. Inspekční organizace nebo uznaná klasifikační společnost musí vydat inspekční zprávu osvědčující, že plavidlo odpovídá částečně nebo úplně příslušným požadavkům těchto Pravidel vztahujících se na konstrukci a vybavení plavidla.

1.16.3.2 Tato inspekční zpráva musí obsahovat:

- název a adresu inspekční organizace nebo uznané klasifikační společnosti, která provedla inspekci;
- žadatele o inspekci;
- datum a místo provedení inspekce;
- druh plavidla podrobeného inspekci;
- identifikaci plavidla (název, číslo plavidla, číslo ENI atd.);
- prohlášení, že plavidlo odpovídá částečně nebo úplně příslušným požadavkům ADN na konstrukci a výstavbu plavidla (ve verzi platné k datu inspekce, nebo k očekávanému datu vydání schvalovacího osvědčení, pokud je toto datum pozdější než datum provedení inspekce);
- uvedení všech nedodržených požadavků (seznam, popis a odvolávky na ADN);
- použitá přechodná ustanovení;
- použité ekvivalenty a odchylky od předpisů platných pro plavidlo s odvoláním se na platná doporučení Administrativního výboru ADN;
- datum vydání inspekční zprávy;
- podpis a úřední razítko inspekční organizace nebo uznané klasifikační společnosti.

Pokud inspekční zpráva nezajišťuje, že jsou všechny příslušné požadavky uvedené v 1.16.3.1 splněny, může příslušný orgán vyžadovat jakékoli dodatečné informace k vydání prozatímního schvalovacího osvědčení podle 1.16.1.3.1 (b).

Orgán, který vydává schvalovací osvědčení, může vyžadovat informace týkající se oddělení a inspektora (inspektorů), kteří provedli inspekci včetně e-mailového a telefonního čísla, avšak tyto informace nebudou součástí dokumentace plavidla.

1.16.3.3 Inspekční zpráva musí být sepsána v jazyce přípuštěném příslušným orgánem a musí obsahovat všechny potřebné informace, aby bylo možno vystavit osvědčení.

1.16.3.4 Ustanovení uvedená v 1.16.3.1, 1.16.3.2 na 1.16.3.3 se vztahují na první inspekci zmíněnou v 1.16.8, na zvláštní inspekci zmíněnou v 1.16.9 a na periodickou inspekci zmíněnou v 1.16.10.

1.16.3.5 Je-li inspekční zpráva vydána uznanou klasifikační společností, může inspekční zpráva zahrnovat osvědčení uvedené v 9.1.0.88.1, 9.2.0.88.1, 9.3.1.8.1, 9.3.2.8.1 nebo 9.3.3.8.1.

Přítomnost osvědčení vydaných uznanou klasifikační společností pro účely odstavců 8.1.2.3 (f) a 8.1.2.3 (o) na plavidle zůstává povinnou.

1.16.4 Inspekční organizace

1.16.4.1 Inspekční organizace podléhají uznání státní správou smluvní strany jako expertní organizace pro konstrukci a inspekci plavidel vnitrozemské plavby a jako expertní organizace pro přepravu nebezpečných věcí vnitrozemskou vodní dopravou. Musí splňovat tato kritéria:

- splnění požadavků na nestrannost organizace;
- existence struktury a personálu, které jsou objektivním důkazem o odborné způsobilosti a zkušenosti organizace;
- splnění věcného obsahu normy EN ISO/IEC 17020:2012 (kromě klauzule 8.1.3) podpořeného existencí podrobných inspekčních postupů.

1.16.4.2 Inspekční organizaci mohou pomáhat experti (např. expert na elektrická zařízení) nebo specializované organizace podle platných vnitrostátních předpisů (např. klasifikační společnosti).

1.16.4.3 Administrativní výbor vede aktuální seznam uznaných inspekčních organizací.

1.16.5 Žádost o vydání schvalovacího osvědčení

Vlastník plavidla musí podat žádost o vystavení schvalovacího osvědčení u příslušného orgánu uvedeného v 1.16.2.1. Příslušný orgán musí určit dokumenty, které se mu mají předložit. K získání schvalovacího osvědčení musí být žádost doprovázena alespoň platným lodním osvědčením, inspekční zprávou uvedenou v 1.16.3.1 a osvědčením uvedeným v 9.1.0.88.1, 9.2.0.88.1, 9.3.1.8.1, 9.3.2.8.1 nebo 9.3.3.8.1.

1.16.6 Údaje uváděné ve schvalovacím osvědčení a jejich změny

- 1.16.6.1 Vlastník plavidla musí informovat příslušný orgán o jakékoli změně v názvu plavidla nebo změně úředního čísla nebo registračního čísla a musí mu předat schvalovací osvědčení k zanesení změn(y).
- 1.16.6.2 Všechny změny ve schvalovacím osvědčení předepsaném v těchto Pravidlech a v jiných předpisech vypracovaných po vzájemné dohodě smluvními stranami mohou být do osvědčení zaneseny příslušným orgánem.
- 1.16.6.3 Jestliže má vlastník plavidla plavidlo registrované v jiné smluvní straně, musí požádat o nové schvalovací osvědčení příslušný orgán této smluvní strany. Příslušný orgán může vydat nové osvědčení na zbývající dobu platnosti existujícího osvědčení bez provedení nové inspekce plavidla, za podmínky, že stav a technické specifikace plavidla nedoznaly změny.
- 1.16.6.4 V případech přenesení odpovědnosti na jiný příslušný orgán podle 1.16.6.3 musí příslušný orgán, jemuž bylo poslední schvalovací osvědčení vráceno, na požádání postoupit přílohu ke schvalovacímu osvědčení podle 1.16.1.4 příslušnému orgánu, který vydá nové schvalovací osvědčení.

1.16.7 Přistavení plavidla k inspekci

- 1.16.7.1 Vlastník plavidla musí přistavit k inspekci plavidlo, která je bez nákladu, vyčištěná a vybavena; musí poskytnout takovou pomoc, která je potřebná k provedení inspekce, takovou jako je poskytnutí vhodného člunu a personálu a odkrytí těch částí trupu nebo instalací, které nejsou přímo přístupné nebo viditelné.
- 1.16.7.2 V případě první, zvláštní nebo periodické inspekce může inspekční organizace nebo uznaná klasifikační společnost vyžadovat inspekci na souši.

1.16.8 První inspekce

Jestliže plavidlo ještě nemá schvalovací osvědčení nebo jestliže platnost schvalovacího osvědčení vypršela více než před dvanácti měsíci, plavidlo se musí podrobit první inspekci.

1.16.9 Zvláštní inspekce

Jestliže lodní trup nebo výbava podlehly změnám, které by mohly snížit bezpečnost s ohledem na přepravu nebezpečných věcí, nebo došlo k jejich poškození ovlivňující takovou bezpečnost, musí být plavidlo neprodleně přistaveno vlastníkem k další inspekci.

1.16.10 Periodická inspekce a obnovení platnosti schvalovacího osvědčení

- 1.16.10.1 K obnovení platnosti schvalovacího osvědčení musí vlastník plavidla přistavit plavidlo k periodické inspekci. Vlastník může požádat o inspekci kdykoli.
- 1.16.10.2 Je-li žádost o periodickou inspekci podána během posledního roku předcházejícího vypršení platnosti schvalovacího osvědčení, lhůta platnosti nového osvědčení začíná dnem vypršení platnosti předchozího schvalovacího osvědčení.
- 1.16.10.3 O periodickou inspekci je možno požádat také během období dvanácti měsíců po vypršení platnosti schvalovacího osvědčení. Po tomto časovém období musí být plavidlo podrobena první inspekci podle 1.16.8.
- 1.16.10.4 Příslušný orgán stanoví lhůtu platnosti nového schvalovacího osvědčení na základě výsledků periodické inspekce.

1.16.11 Prodloužení platnosti schvalovacího osvědčení bez inspekce

Odchylkou od oddílu 1.16.10 může příslušný orgán, který vydal schvalovací osvědčení, na základě odůvodněné žádosti vlastníka prodloužit platnost schvalovacího osvědčení o nejvýše jeden rok bez inspekce. Toto prodloužení platnosti musí být uděleno v písemné formě a musí být na palubě plavidla. Takové prodloužení platnosti může být uděleno pouze jedenkrát za každá dvě období platnosti.

1.16.12 Úřední inspekce

- 1.16.12.1 Má-li příslušný orgán smluvní strany důvod předpokládat, že plavidlo, která se nachází na jeho území, může představovat nebezpečí ve vztahu k přepravě nebezpečných věcí pro osoby na palubě nebo pro plavbu nebo pro životní prostředí, může nařídit inspekci plavidla podle 1.16.3.
- 1.16.12.2 Při výkonu tohoto práva inspekce by se měly orgány všemožně snažit, aby se vyhnuly nepatřičnému zadržování nebo zdržování plavidla. Tato dohoda nijak neomezuje práva týkající se náhrady za nepatřičné zadržení nebo zdržení. Ve všech případech údajně nepatřičného zadržování nebo zdržení leží důkazní břemeno na vlastníkově plavidla.

1.16.13 Odebrání, ponechání nebo vrácení schvalovacího osvědčení

- 1.16.13.1 Schvalovací osvědčení může být odebráno, není-li plavidlo správně udržováno nebo jestliže konstrukce nebo výbava plavidla již nesplňují platná ustanovení těchto Pravidel nebo není-li platná nejvyšší třída plavidla podle 9.2.0.88.1, 9.3.1.8.1, 9.3.2.8.1 nebo 9.3.3.8.1.
- 1.16.13.2 Schvalovací osvědčení může být odebráno pouze orgánem, který je vydal.
- Avšak v případech uvedených v 1.16.9 a 1.16.13.1 může příslušný orgán státu, v němž se plavidlo právě nachází, zakázat její použití pro přepravu těch nebezpečných věcí, pro které se vyžaduje osvědčení. Za tímto účelem může odebrat osvědčení až do doby, než bude plavidlo znovu splňovat platná ustanovení těchto Pravidel. V tomto případě musí informovat příslušný orgán, který vydal osvědčení.
- 1.16.13.3 Bez ohledu na ustanovení pododdílu 1.16.2.2 může kterýkoli příslušný orgán odebrat schvalovací osvědčení na žádost vlastníka plavidla, za podmínky, že o tom uvedomí příslušný orgán, který osvědčení vydal.
- 1.16.13.4 Jestliže inspekční organizace nebo uznaná klasifikační společnost během inspekce zjistí, že plavidlo nebo jeho výbava mají vážné závady ve vztahu k nebezpečným věcem, které by mohly ohrozit bezpečnost osob na palubě nebo bezpečnost plavby nebo vytvářejí nebezpečí pro životní prostředí, nebo není-li nejvyšší třída plavidla platná, musí to bezodkladně oznámit příslušnému orgánu, kterému jsou odpovědní, aby mohl učinit rozhodnutí o ponechání osvědčení.
- Jestliže tento orgán, který odebral osvědčení, není orgánem, který toto osvědčení vydal, musí bezodkladně informovat vydávající orgán a, je-li to nutné, vrátit mu osvědčení, pokud předpokládá, že závady nemohou být odstraněny v blízké budoucnosti.
- 1.16.13.5 Jestliže inspekční organizace nebo uznaná klasifikační společnost uvedené v 1.16.13.4 provedením zvláštní inspekce podle 1.16.9 zjistí, že závady byly odstraněny, musí příslušný orgán vrátit schvalovací osvědčení vlastníkově.
- Tato inspekce může být na žádost vlastníka provedena jinou inspekční organizací nebo jinou uznanou klasifikační společností. V tomto případě musí být schvalovací osvědčení vráceno přes příslušný orgán, kterému je inspekční organizace nebo uznaná klasifikační společnost odpovědná.
- 1.16.13.6 Jestliže je plavidlo definitivně vyřazeno z provozu nebo dáno do šrotu, vlastník musí schvalovací osvědčení zaslat příslušnému orgánu, který je vydal.

1.16.14 Duplikát

V případě ztráty, odcizení nebo zničení schvalovacího osvědčení, nebo pokud se stane nepoužitelným z jiných důvodů, musí být příslušnému orgánu, který osvědčení vydal, podána žádost o vystavení duplikátu.

Tento orgán vystaví duplikát schvalovacího osvědčení, který musí být jako takový označen.

1.16.15 Registr schvalovacích osvědčení

- 1.16.15.1 Příslušné orgány musí přidělit osvědčením o schválení, které vydaly, sériové číslo.
- 1.16.15.2 Příslušné orgány musí uchovávat kopie všech osvědčení, které vydaly, jakož i připojených seznamů látek povolených na přepravu v plavidle uznaných klasifikačních společností, a všech změn, zrušení, nových vystavení a rozhodnutí o zrušení těchto dokumentů.

ČÁST 2
KLASIFIKACE

(viz Díl II)

ČÁST 3

SEZNAMY NEBEZPEČNÝCH VĚCÍ, ZVLÁŠTNÍ USTANOVENÍ A VYNĚTÍ Z PLATNOSTI PRO OMEZENÁ A VYŇATÁ MNOŽSTVÍ

KAPITOLA 3.1

VŠEOBECNĚ

(viz Díl II)

KAPITOLA 3.2

SEZNAM NEBEZPEČNÝCH VĚCÍ

3.2.1 Tabulka A: Seznam nebezpečných věcí v číselném pořadí

(viz Díl II)

3.2.2 Tabulka B: Seznam nebezpečných věcí v abecedním pořadí

(viz Díl II)

3.2.3 Tabulka C: Seznam nebezpečných věcí připuštěných k přepravě v tankových plavidlech v číselném pořadí

3.2.3.1 Vysvětlivky k tabulce C:

Každý řádek v tabulce C se týká zpravidla látky (látek), které jsou zahrnuty pod určité UN číslo nebo identifikační číslo. Jestliže však látky, které náležejí ke stejnému UN číslu nebo identifikačnímu číslu, mají rozdílné chemické nebo fyzikální vlastnosti a/nebo přepravní podmínky, může být pro toto UN číslo nebo identifikační číslo použito více po sobě jdoucích řádků.

Každý ze sloupců tabulky C je věnován určitému tématu, jak je uvedeno v následujících vysvětlujících poznámkách. Průsečík sloupců a řádků (buňka) obsahuje informace týkající se tématu, o kterém se v tomto sloupci pojednává, pro látku(y) tohoto řádku:

- první čtyři buňky identifikují látku(y) patřící k tomuto řádku;
- následující buňky udávají platná zvláštní ustanovení, buď ve formě úplné informace, nebo ve formě kódu. Kódy odkazují na detailní informace, které je možno nalézt pod čísly uvedenými v následujících vysvětlujících poznámkách. Prázdná buňka znamená, buď že není žádné zvláštní ustanovení a že platí pouze všeobecná ustanovení, anebo že platí omezení přepravy uvedené v platných vysvětlujících poznámkách;
- jestliže buňka obsahuje hvězdičku, „*“, musí být příslušné požadavky stanoveny podle 3.2.3.3. Stanovení použitelných požadavků podle pododdílu 3.2.3.3 musí mít přednost před použitím údajů pro směsi, pro které nejsou k dispozici dostatečné údaje.

Jednotlivé buňky neobsahují odvolávky na platná všeobecná ustanovení.

Vysvětlující poznámky pro každý sloupec:

Sloupec (1) „UN číslo/identifikační číslo“

Obsahuje UN číslo nebo identifikační číslo:

- nebezpečné látky, jestliže této látce bylo přiděleno vlastní specifické UN číslo nebo identifikační číslo, nebo
- druhové položky nebo j.n. položky, k níž musí být přiřazeny jmenovitě neuvedené nebezpečné látky podle kritérií („rozhodovacích stromů“) části 2.

Sloupec (2) „Pojmenování a popis“

Obsahuje pojmenování látky, napsané velkými písmeny, pokud této látce bylo přiděleno vlastní specifické UN číslo nebo identifikační číslo, nebo pojmenování druhové položky nebo j.n. položky, ke které byly nebezpečné látky přiřazeny podle kritérií („rozhodovacích stromů“) části 2. Toto pojmenování musí být použito jako oficiální pojmenování pro přepravu, popřípadě jako část oficiálního pojmenování pro přepravu (pro další podrobnosti k oficiálnímu pojmenování pro přepravu viz 3.1.2).

Za oficiálním pojmenováním pro přepravu je malými písmeny připojen popisný text k upřesnění rozsahu platnosti položky, pokud mohou být klasifikace a/nebo přepravní podmínky látky za určitých okolností rozdílné.

Sloupec (3a)	„Třída“ Obsahuje číslo třídy, pod jejíž název spadá nebezpečná látka. Toto číslo třídy se přiřazuje podle postupů a kritérií části 2.
Sloupec (3b)	„Klasifikační kód“ Obsahuje klasifikační kód nebezpečné látky. - Pro nebezpečné látky třídy 2 sestává kód z číslice a písmena nebo písmen pro skupinu nebezpečných vlastností, které jsou vysvětleny v 2.2.2.1.2 a 2.2.2.1.3. - Pro nebezpečné látky tříd 3, 4.1, 6.1 a 9 jsou kódy vysvětleny v 2.2.x.1.2 ¹ . - Pro nebezpečné látky a předměty třídy 8, jsou kódy vysvětleny v 2.2.8.1.4.1.
Sloupec (4)	„Obalová skupina“ Obsahuje číslo(a) obalové skupiny (I, II nebo III), která je k nebezpečné látce přiřazena. Tato čísla obalových skupin jsou přiřazena na základě postupů a kritérií uvedených v části 2. Některým látkám není přiřazena žádná obalová skupina.
Sloupec (5)	„Nebezpečí“ Tento sloupec obsahuje informace o nebezpečích, která jsou vlastní nebezpečné látce. Jsou převzaty na základě bezpečnostních značek ve sloupci (5) tabulky A. V případě chemicky nestálé látky je k informaci připojen kód „nest.“ V případě látky nebo směsi s vlastnostmi CMR se doplňuje pro informaci kód „CMR“. CMR se používá k označení látek s dlouhodobými účinky na zdraví (karcinogenní, mutagenní nebo toxické pro reprodukci, kategorie 1A a 1B v souladu s kritérii kapitol 3.5, 3.6 a 3.7 GHS). V případě látky nebo směsi nebezpečné vodnímu prostředí se doplňuje pro informaci kód „N1“, „N2“ nebo „N3“ (Viz 2.2.9.1.10). V případě látky nebo směsi, která plave na vodním povrchu, neodpaňuje se a není snadno rozpustná ve vodě, nebo která klesá ke dnu a není snadno rozpustná se, doplňuje pro informaci kód „F“ (podle anglického slova „Floater“) nebo popřípadě „S“ (podle anglického slova „Sinker“). Tam kde jsou údaje uvedeny v závorkách, musí se použít pouze příslušné kódy pro přepravovanou látku.
Sloupec (6)	„Typ tankového plavidla“ Obsahuje typ tankového plavidla: G, C nebo N.
Sloupec (7)	„Konstrukce nákladního tanku“ Obsahuje informace o konstrukci nákladního tanku: 1 Tlakový tank

¹ x = číslo třídy nebezpečné látky nebo předmětu, popřípadě bez případné interpunkce

- 2 Nákladní tank uzavřený
- 3 Nákladní tank otevřený s pojistkou proti prošlehnutí plamene
- 4 Nákladní tank otevřený
- Sloupec (8) „Typ nákladního tanku“
- Obsahuje informace o typu nákladního tanku:
- 1 Nezávislý nákladní tank
- 2 Integrovaný nákladní tank
- 3 Stěna nákladního tanku není obšívka
- 4 Membránový tank
- Sloupec (9) „Vybavení nákladního tanku“
- Obsahuje informace o vybavení nákladního tanku:
- 1 Chladicí zařízení
- 2 Možnost ohřevu nákladu
- 5 Postřikovací zařízení
- 4 Topné zařízení na plavidle
- Sloupec (10) „Otevírací tlak přetlakového ventilu/vysokorychlostního ventilu v kPa“
- Obsahuje informace týkající se otevíracího tlaku přetlakového ventilu/vysokorychlostního ventilu v kPa.
- Sloupec (11) „Maximální přípustný stupeň plnění v %“
- Obsahuje informace týkající se maximálního přípustného stupně plnění nákladních tanků v procentech.
- Sloupec (12) „Relativní hustota při 20 °C“
- Obsahuje informace týkající se relativní hustoty látky při 20 °C. Údaje o hustotě mají jen informativní charakter.
- Sloupec (13) „Druh zařízení pro odběr vzorků“
- Obsahuje informace k předepsanému druhu zařízení pro odběr vzorků.
- 1 Uzavřené zařízení pro odběr vzorků
- 2 Částečně uzavřené zařízení pro odběr vzorků
- 3 Otevřené zařízení pro odběr vzorků
- Sloupec (14) „Povolený prostor s čerpadly pod palubou“
- Obsahuje vyjádření, zda je povolen prostor s čerpadly pod palubou:
- Ano čerpadlový prostor pod palubou je povolen
- Ne čerpadlový prostor pod palubou není povolen
- Sloupec (15) „Teplotní třída“

- Obsahuje teplotní třídu látky.
- Sloupec (16) „Skupina výbušnosti“
- Obsahuje skupinu výbušnosti látky.
- Údaje v závorkách udávají podskupiny, skupiny výbušnosti II B pro volbu odpovídajících systémů nezávislé ochrany proti výbuchu (zařízení proti prošlehnutí plamene, podtlakové ventily, přetlakové ventily/vysokorychlostní ventily a zařízení pro bezpečné snížení tlaku nákladních tanků s integrovaným svazkem zařízení proti prošlehnutí plamene).
- POZNÁMKA:**
Pokud jsou pro skupinu výbušnosti II B využívány systémy nezávislé ochrany proti výbuchu, smějí být přepravovány produkty ve skupině výbušnosti II A nebo II B, včetně podskupin II B3, II B2 a II B1.
- Pokud jsou pro skupinu výbušnosti II B3 využívány systémy nezávislé ochrany proti výbuchu, smějí být přepravovány produkty v podskupinách výbušnosti II B3, II B2 a II B1 nebo ve skupině výbušnosti II A.*
- Pokud jsou pro skupinu výbušnosti II B2 využívány systémy nezávislé ochrany proti výbuchu, smějí být přepravovány produkty v podskupinách výbušnosti II B2 a II B1 nebo ve skupině výbušnosti II A.*
- Pokud jsou pro skupinu výbušnosti II B1 využívány systémy nezávislé ochrany proti výbuchu, smějí být přepravovány produkty v podskupině výbušnosti II B1 nebo ve skupině výbušnosti II A.*
- Sloupec (17) „Ochrana proti explozi“
- Obsahuje informaci k zajištění ochrany proti explozi.
- Ano zajištění ochrany proti explozi je nutné
- Ne zajištění ochrany proti explozi není nutné
- Sloupec (18) „Zvláštní vybavení“
- Tento sloupec obsahuje alfanumerické kódy pro zvláštní vybavení plavidla vyžadované pro přepravu nebezpečné látky (viz 8.1.5).
- Sloupec (19) „Počet kuželů/světel“
- Tento sloupec obsahuje počet kuželů/ modrých světel, požadovaných na označení plavidla během přepravy této nebezpečné látky.
- Sloupec (20) „Dodatečné požadavky/poznámky“
- Tento sloupec obsahuje dodatečné požadavky/poznámky použitelné na plavidla.
- Dodatečné požadavky nebo poznámky jsou:
- Čpavek bezvodý může v systémech nákladových nádob a procesních systémech, které jsou vyrobeny z uhlíkomanganové nebo niklové oceli, způsobovat koroze trhlin, způsobených pnutí.
- Aby se riziko vzniku koroze trhlin, způsobených pnutí, udrželo, pokud možno co nejmenší, je třeba provést následně uvedená opatření:
- Pokud se používá uhlíkomanganová ocel, je třeba nákladní tanky, procesní tlakové nádoby a potrubní rozvody nákladu

vyrobit z jemnozrné oceli s minimální jmenovitou mezí průtažnosti ne menší než 355 N/mm^2 . Aktuální mez průtažnosti nesmí překročit 440 N/mm^2 . Dále je třeba provést jedno z následujících konstrukčních nebo provozních opatření:

- .1 Je třeba použít materiál s nízkou pevností v tahu ($R_m < 410 \text{ N/mm}^2$); nebo
 - .2 nákladní tanky atd. musí po svařování být podrobeny tepelné úpravě za účelem odstranění pnutí; nebo
 - .3 přepravní teplota musí být zvláště udržována těsně u teploty odpařování nákladu $-33 \text{ }^\circ\text{C}$, ale v žádném případě ne při teplotě vyšší než $-20 \text{ }^\circ\text{C}$; nebo
 - .4 čpavek nesmí obsahovat méně než 0,1 % hm. vody.
- (b) Pokud jsou používány uhlíkomanganové oceli s vyšší mezí průtažnosti, než je uvedeno v bodě a), je třeba vyrobené tanky, části potrubních rozvodů atd. po svařování podrobit tepelné úpravě za účelem snížení pnutí.
 - (c) Procesní tlakové nádoby a potrubní systémy kondenzační části zařízení pro chlazení nákladu, která sestávají z uhlíkomanganových nebo niklových ocelí, je třeba po svařování podrobit tepelné úpravě za účelem odstranění pnutí.
 - (d) Mez průtažnosti a pevnost v tahu u přídatných materiálů pro svařování smějí odpovídající hodnoty materiálu tanků a potrubních systémů překročit jen o nejnižší možnou míru.
 - (e) Niklové oceli s obsahem niklu více než 5 % a uhlíkomanganové oceli, které nesplňují požadavky podle a) a b), nesmí být používány pro nádoby určené pro náklad a systém potrubních rozvodů pro přepravu této látky.
 - (f) Niklové oceli s obsahem niklu ne více než 5 % smějí být používány, pokud přepravní teplota se nachází v rámci v bodě a) uvedených mezí.
 - (g) Obsah kyslíku, rozpuštěného ve čpavku, nesmí překročit hodnotu, uvedenou v tabulce.

Teplota v $^\circ\text{C}$	O_2 v %
- 30 a níže	0,90
- 20	0,50
- 10	0,28
0	0,16
10	0,10
20	0,05
30	0,03

2. Z nákladních tanků a příslušných potrubních rozvodů musí před naložkou být dostatečným způsobem pomocí inertního plynu odstraněn a následně zamezen přístup vzduchu (viz také 7.2.4.18).
3. Je třeba provést opatření k zajištění stavu, že náklad je dostatečně stabilizován, aby se v kterémkoliv okamžiku přepravy zamezilo

vzniku reakce. Přepravní doklad musí obsahovat následující dodatečné údaje:

- (a) Označení a množství přidaného stabilizátoru;
- (b) Datum, kdy byl stabilizátor přimísen, a očekávaná doba účinnosti za normálních podmínek;
- (c) Teplotní hranice, které stabilizátor ovlivňují.

Pokud je stabilizace docílena jen zakrytím inertním plynem, musí být v přepravním dokladu uvedeno jen označení inertního plynu.

Pokud je stabilizace docílena jiným opatřením, např. zvláštní čistotou výrobku, musí toto opatření být v přepravním dokladu uvedeno.

4. Látka nesmí ztuhnout; přepravní teplota musí být udržována nad bodem tání. Pokud je zapotřebí zařízení pro ohřev nákladu, musí toto být provedeno tak, aby v každé části nákladního tanku byla vyloučena možnost polymerizace v důsledku přehřátí. Pokud by teplota parních topných hadů mohla způsobit přehřátí, je třeba zabudovat nepřímé topné systémy s nízkými teplotami.
5. Tato látka může zanášet odvětrávací potrubí a jeho armatury nebo příslušenství nákladních tanků. Musí být zajištěno pečlivé sledování.

Pokud je pro přepravu této látky vyžadováno uzavřené tankové plavidlo a je nutná ochrana před explozí nebo pokud je látka, pro kterou je nutná ochrana před explozí, přepravována v uzavřeném tankovém plavidle, musí být tankové plavidlo v souladu s 9.3.2.22.4. nebo 9.3.3.22.4 nebo musí odvětrávací potrubí odpovídat 9.3.2.22.5 (a) nebo 9.3.2.22.5 (b) nebo 9.3.3.22.5 (a) nebo 9.3.3.22.5 (b).

Tento požadavek neplatí, pokud jsou nákladní tanky a odpovídající potrubí inertizovány v souladu s 7.2.4.18.

6. Při venkovních teplotách nižších nebo rovnajících se teplotám uvedeným ve sloupci (20), smí být látka přepravována pouze v tankových plavidlech vybavených možnostmi ohřevu nákladu.

Navíc v případě přepravy v uzavřeném tankovém plavidle musí být odvětrávací potrubí, pojistné ventily a pojistky proti prošlehnutí plamene ohřívatelny.

Teplota odvětrávacího potrubí, pojistných ventilů a pojistek proti prošlehnutí plamene musí být udržována minimálně nad bodem tání látky.

7. Pokud je pro přepravu této látky zapotřebí uzavřené tankové plavidlo nebo pokud je tato látka v uzavřeném tankovém plavidle přepravována, musí být odvětrávací potrubí, pojistné ventily a pojistky proti prošlehnutí plamene ohřívatelny.

Teplota odvětrávacího potrubí, pojistných ventilů a pojistek proti prošlehnutí plamene musí být udržována minimálně nad bodem tání látky.

8. Dvojitě boky, dvojitá dna a topné hady nesmí obsahovat žádnou vodu.
9. (a) Během plavby je třeba ve zbytkovém volném prostoru nad hladinou kapaliny udržovat vrstvu inertního plynu.

- (b) Nakládací a větrací potrubí musí být nezávislé na nakládacích a větracích potrubích, používaných pro jiné náklady.
 - (c) Bezpečnostní ventily musí být z nekorodující oceli.
10. (Vyhrazeno)
11. (a) Pro nákladní tanky a nakládací a vykládací potrubí nesmějí být používány nekorodující oceli typu 416 a 442 a litina.
- (b) Náklad smí být vykládán pouze ponornými čerpadly nebo tlakovým vyprazdňováním pomocí interního plynu. Každé čerpadlo musí být uzpůsobeno tak, aby se látka nijak významně nezahřála, pokud tlakové potrubí čerpadla je uzavřeno nebo jiným způsobem blokováno.
- (c) Náklad musí být chlazen a udržován při teplotách do 30 °C.
- (d) Bezpečnostní ventily musí být nastaveny na tlak ne méně než 550 kPa (5,5 barů) přetlaku. Maximální nastavený tlak musí být zvláště povolen.
- (e) Během cesty musí volný prostor nad nákladem být zakryt dusíkem. Musí být nainstalován systém automatického zásobení dusíkem, aby vnitřní přetlak v nákladním tanku neklesl pod 7 kPa (0,07 barů), pokud se teplota nákladu vlivem vnějších teplot nebo jiným vlivem sníží. K zabezpečení automatické úpravy tlaku se musí na plavidle nacházet dostatečné množství dusíku. Pro zakrytí nákladu je zapotřebí dusík s obvyklým stupněm čistoty 99,9 obj. %. Baterie lahví s dusíkem, které jsou redukčním tlakovým ventilem spojené s nákladními tanky, lze v této souvislosti považovat za „automatické“.
- Potřebná pokrývka z dusíku musí být provedena tak, že koncentrace dusíku ve vzdušném prostoru nákladního tanku v žádném okamžiku není menší než 45 %.
- (f) Před nakládkou a dokud nákladní tank tuto látku obsahuje v kapalné nebo plynné formě, musí být nákladní tank inertizován dusíkem.
- (g) Postřikové zařízení musí být vybaveno dálkově ovládanými armaturami, které v kormidelně nebo jestliže existuje kontrolní místnost, mohou být z těchto ovládány.
- (h) Musí být zřízeno předávací zařízení, aby se umožnilo nouzové předání oxidu etylénu v případě nekontrolované samovolné reakce.
12. (a) Látky nesmí obsahovat acetylen.
- (b) Dokud nebylo provedeno důkladné vyčištění nákladních tanků, nesmějí tyto látky být přepravovány v nákladních tancích, které jako jeden z předchozích nákladů obsahovaly látky, které jsou známy jako katalyzátory polymerizace, jako:
- .1 anorganické kyseliny (např. kyselina sírová, kyselina solná, kyselina dusičná);
 - .2 organické kyseliny a anhydridy kyselin (např. kyselina mravenčí, kyselina octová);

- .3 kyseliny halogenkarboxylové (např. kyselina chloroctová);
 - .4 kyseliny sulfonové (např. kyselina benzosulfonová);
 - .5 žíravé alkalické sloučeniny (např. hydroxid sodný, hydroxid draselný);
 - .6 čpavek a jeho roztoky;
 - .7 aminy a jejich roztoky;
 - .8 oxidující látky.
- (c) Před naložením musí nákladní tanky být důkladně a účinně vyčištěny, aby se z nákladních tanků a příslušných potrubních rozvodů odstranily všechny předchozí náklady, pokud bezprostředně předtím náklad nesestával z propylenoxidu nebo směsi z etylenoxidu a propylenoxidu. Zvláště pečlivě je třeba postupovat, jestliže byl předtím přepravován čpavek v nákladních tankách z jiných než nekorodujících ocelí.
- (d) Ve všech případech musí být účinnost čistících postupů pro nákladní tanky a příslušné potrubní rozvody zkontrolována vhodným způsobem nebo prohlídkou, aby se zajistilo, že nezbydou žádné stopy látek, obsahujících kyseliny nebo alkalické prvky, které by společně s těmito látkami mohly vést k ohrožení.
- (e) Do nákladních tanků musí být před každým naložením těchto látek vstupeno za účelem kontroly, aby se zajistilo, že nedochází ke kontaminaci, silným usazeninám nebo viditelným strukturálním vadám.
- Jsou-li tyto nákladní tanky namontovány v tankových plavidlech typu C, s konstrukcí nákladního tanku 1 a nákladním tankem typu 1 a jsou-li pro tyto látky v nepřetržitém provozu, musí být tyto inspekce prováděny v intervalech nejvýše dvou a půl roku.
- Jsou-li tyto nákladní tanky namontovány v tankových plavidlech typu G s konstrukcí nákladního tanku 1 a nákladním tankem typu 1 a jsou-li pro tyto látky v nepřetržitém provozu, musí být tyto inspekce prováděny během pravidelných prohlídek za účelem obnovení schvalovacího osvědčení podle 1.16.10.
- (f) Nákladní tanky, které tyto látky obsahovaly, smějí být používány pro jiné náklady teprve po důkladném vyčištění nákladních tanků a příslušných potrubních rozvodů mytím nebo vypláchnutím inertním plynem.
- (g) Tyto náklady musí být naloženy a vykládány tak, aby bylo vyloučeno odvětrání nákladních prostor do atmosféry. Pokud během naložení je prováděno zpětné odvádění plynu směrem k zařízení na břehu, musí systém odvádějící plyn, který je spojen s nákladním tankem, být nezávislý na všech ostatních nákladních tankách.

- (h) Během procesů vykládky musí být v nákladním tanku udržován přetlak ve výši více než 7 kPa (0,07 barů).
- (i) Náklad smí být vykládán pouze prostřednictvím ponorných čerpadel nebo hydraulicky poháněných podvodních čerpadel nebo prostřednictvím tlakového odčerpávání inertním plynem. Každé čerpadlo musí být uzpůsobeno tak, aby se látka význačně nezahřívala, pokud čerpací zařízení je uzavřeno nebo jiným způsobem blokováno.
- (j) Nákladní tanky, ve kterých jsou tyto látky přepravovány, musí být odvětrány zařízením, nezávislým na ostatních nákladních tancích, ve kterých jsou přepravovány jiné látky.
- (k) Soustavy hadic pro nakládku a vykládku musí být označeny následovně:

„Pouze pro překlad alkylenuoxidu“

- (l) *(Vyhrazeno)*
- (m) Je třeba zajistit, aby do nakládacích čerpadel a nakládacích a vykládacích potrubí nemohl vniknout vzduch, pokud systém obsahuje tyto látky.
- (n) Před uvolněním břehových přípojek musí být vhodnými uzavíracími armaturami na břehové přípojce odstraněn tlak v potrubích, kterými se rozvádí kapaliny a plyny. Kapaliny a výpady z těchto potrubí nesmějí uniknout do atmosféry.
- (o) Nakládací a vykládací systém pro nákladní tanky, které mají být naloženy těmito látkami, musí být oddělen od nakládacích a vykládacích systémů jiných nákladních tanků, včetně tanků, které nejsou naloženy. Pokud nakládací a vykládací systém nákladních tanků, které mají být naloženy, není nezávislý, musí požadované oddělení být provedeno vyjmutím mezikusů, uzavíracích armatur nebo jiných částí potrubních systémů a zabudováním záslepek na těchto místech. Potřebné oddělení se týká potrubí, rozvádějících kapaliny a plyny a všech ostatních možných spojení jako např. společného zásobovacího potrubí pro inertní plyn.
- (p) Tyto látky smějí být přepravovány pouze podle plánů nakládky, schválených příslušným úřadem.

Každé plánované uložení nákladu musí být vyznačeno ve zvláštním plánu nakládky. V plánech nakládky musí být uvedeny systémy nakládacích a vykládacích potrubí a místo pro umístění potřebných záslepek, kterými jsou splněny shora uvedené požadavky ohledně oddělení potrubí. Jedno vyhotovení schváleného plánu nakládky se musí nacházet na plavidle. Ve schvalovacím osvědčení musí být odkaz na schválené plány nakládky.

- (q) Před každou nakládkou těchto látek a před každou opětovnou přepravou musí odborník, schválený příslušným úřadem osvědčit, že bylo provedeno potřebné oddělení potrubí; toto osvědčení se musí nacházet na plavidle. Každé spojení mezi záslepkou a přírubou potrubního systému musí být odpovědnou osobou

opatřeno drátkem a plombou, aby nebylo možné neúmyslně záslepku odstranit.

- (r) Během plavby musí volný prostor nad nákladem být zakryt dusíkem. Musí být nainstalován systém automatického zásobení dusíkem, aby vnitřní přetlak v nákladním tanku neklesl pod 7 kPa (0,07 bar), pokud se teplota nákladu vlivem vnějších teplot nebo jiným vlivem sníží. K zabezpečení automatické úpravy tlaku se musí na plavidle nacházet dostatečné množství dusíku. Pro zakrytí nákladu je zapotřebí dusík s obvyklým stupněm čistoty (99,9 obj. %). Baterie lahví s dusíkem, které jsou redukčním tlakovým ventilem spojené s nákladními tanky, lze v této souvislosti považovat za „automatické“.

- (s) Prostor nákladních tanků, ve kterém se nachází výpary, musí před a po každé nakládce být zkontrolován, aby se zajistilo, zda obsah kyslíku činí 2 obj. % nebo méně.

- (t) Nakládací výkon

Nakládací výkon (L_R) nákladního tanku nesmí překročit následující hodnotu:

$$L_R = 3600 \times U/t \text{ (m}^3/\text{h)}$$

Přičemž:

U = volný objem (m^3) při stupni plnění, při kterém sepne pojistka proti přeplnění;

t = doba (s), která je zapotřebí pro sepnutí pojistky proti přeplnění až do úplného ukončení toku nákladu do nákladního tanku;

Doba je sumou jednotlivých časů, které jsou zapotřebí k provedení postupných opatření, např. doba reakce obslužného personálu, doba vypnutí čerpadel a doba uzavření uzavíracích armatur;

Nakládací výkon musí zohlednit také projektový tlak potrubního systému.

13. Pokud nejsou přidávány žádné nebo nedostatečné stabilizátory, nesmí obsah kyslíku v plynné fázi být vyšší než 0,1 %. V nákladních tankách musí být kdykoliv udržován přetlak. To platí také pro jízdu s balastem nebo prázdnou jízdu s nevyčištěnými nákladními tanky.
14. Následující látky nesmějí být přepravovány plavidlem typu N:
- látky, jejichž zápalná teplota je ≤ 200 °C
 - látky s bodem vzplanutí < 23 °C a rozsahem výbušnosti > 15 procentních bodů;
 - směsi, které obsahují halogenované uhlovodíky
 - směsi, které obsahují více než 10 % benzenu
 - látky a směsi, které jsou přepravovány stabilizované.
15. Je třeba zajistit, aby alkalické nebo kyselé látky, jako hydroxid sodný nebo kyselina sírová neznečistily tento náklad.

16. Pokud místním přílišným oteplením nákladu v nákladním tanku nebo příslušném potrubním systému existuje možnost nebezpečné reakce, jako např. polymerizace, rozklad, termická nestabilita nebo vznik plynů, musí být tento náklad nakládán a přepravován dostatečně odděleně od ostatních látek, jejichž teplota stačí k tomu, aby byla takováto reakce vyvolána. Topné hady v nákladních tancích, ve kterých je přepravován tento náklad, musí být zaslepeny přírubou nebo zabezpečeny stejně hodnotným zařízením.
17. Bod tání nákladu musí být uveden v přepravním dokladu.
18. *(Vyhrazeno)*
19. Je třeba zajistit, aby se tento náklad nedostal do styku s vodou. Dále platí tato ustanovení:

Náklad nesmí být přepravován v nákladních tancích, které přiléhají k zbytkovým tankům nebo nákladovým tankům, ve kterých se nachází balastní voda, odpadní voda nebo jiný náklad, obsahující vodu. Čerpadla, potrubní rozvody nebo větrací potrubí, které jsou na takového tanky napojovány, musí být odděleny od odpovídajících zařízení těch nákladních tanků, které tento náklad obsahují. Potrubní rozvody ze zbytkových tanků nebo potrubí pro balastní vodu nesmějí být vedeny nákladními tanky, které tento náklad obsahují, pokud nejsou položeny v potrubní šachtě.
20. Ve sloupci (20) uvedená nejvyšší povolená přepravní teplota nesmí být překročena.
21. *(Vyhrazeno)*
22. Hustota nákladu musí být uvedena v přepravním dokladu.
23. Při vnitřním přetlaku v tanku ve výši 40 kPa (0,4 baru) musí zařízení pro měření přetlaku vyvolat signál tohoto zařízení. Postřikovací zařízení musí být okamžitě uvedeno do provozu a zůstat tak dlouho v činnosti, dokud vnitřní přetlak v tanku neklesne pod 30 kPa (0,3 baru).
24. Látky s bodem vzplanutí nad 60 °C, které jsou předány k přepravě nebo přepravovány zahřáté na mezní oblast 15 K pod bodem vzplanutí, musí být přepravovány za podmínek látky čísla 9001.
25. Pro přepravu těchto látek smí být použit nákladní tank typu 3, jestliže konstrukce byla schválena uznávanou klasifikační společností výslovně pro maximální přepravní teplotu.
26. Pro přepravu těchto látek smí být použit nákladní tank typu 2, jestliže konstrukce byla schválena uznávanou klasifikační společností výslovně pro maximální přepravní teplotu.
27. Platí požadavky v 3.1.2.8.1.
28. (a) Při přepravě UN 2448 SÍRA, ROZTAVENÁ, musí nucené větrání nákladních tanků být uvedeno do provozu nejpozději při koncentraci sirovodíku ve výši 1,0 obj. %.
- (b) Jestliže při přepravě UN 2448 SÍRA, ROZTAVENÁ, koncentrace sirovodíku překročí 1,85 %, musí velitel plavidla neprodleně informovat nejbližší příslušný úřad.

Pokud lze z významného zvýšení koncentrace sirovodíku v úložném prostoru odvodit únik siry, musí být nákladní tanky v co nejkratším termínu vyloženy. Nový náklad smí

- být naložen teprve po opětovné prohlídce orgánem, který vystavil schvalovací osvědčení.
- (c) Při přepravě UN 2448 SÍRA, ROZTAVENÁ musí být měřené koncentrace sirovodíku ve výparech nákladních tanků a koncentrace oxidu siřičitého a sirovodíku v úložných prostorech.
- (d) V odstavci c) požadované měření je třeba provést každých osm hodin. Výsledky těchto měření je třeba zaznamenat v písemně.
29. (Vypuštěno)
30. Při přepravě těchto látek smí být v úložných prostorech plavidla typu N otevřená pomocná zařízení.
31. Při přepravě těchto látek musí být plavidlo vybaveno rychlouzavíracím ventilem přímo na břehové přípojce.
32. Při přepravě této látky platí následné doplňující požadavky:
- (a) Nákladní tanky musí být zvnějšku vybavené obtížně vznítitelnou izolací. Tato izolace musí být dostatečně odolná proti nárazům a ořesům. Na palubě musí tato izolace být chráněna krytem.
- Teplota nesmí na vnější straně izolace překročit 70 °C.
- (b) Úložné prostory musí na větracích otvorech být vybavené přípojkami pro zapojení nuceného větrání.
- (c) Nákladní tanky musí být vybaveny zařízením pro nucené větrání, které během všech přepravních podmínek udržuje koncentraci sirovodíku nad hladinou kapaliny pod 1,85 obj. %.
- Zařízení k větrání musí být uzpůsobena tak, aby se zamezilo usazování přepravovaných látek.
- Odvod větrání musí být uspořádán tak, aby se zamezilo ohrožení osob.
- (d) Nákladní tanky a úložné prostory musí být vybaveny otvory a potrubím pro odběr vzorků plynu.
- (e) Otvory nákladních tanků musí být v takové výši, aby při sklonu plavidla kolem příčné osy o 2° a náklonu plavidla o 10° nemohla uniknout síra. Každý otvor musí být vybavený trvale připevněným uzavíracím zařízením.
- Jedno z těchto uzavíracích zařízení se musí otevřít při nepatrném přetlaku v nákladním tanku.
- (f) Nakládací a vykládací potrubí musí být dostatečně izolované. Musí být možné je vytápět.
- (g) Musí být použita taková kapalina pro přenos tepla, že při jejím úniku do nákladního tanku není žádné riziko nebezpečné reakce se sírou.

33. Při přepravě této látky platí následující dodatečné požadavky:

Stavební předpisy:

- (a) Roztoky peroxidu vodíku smějí být přepravovány pouze v nákladních tancích s ponornými čerpadly.
- (b) Nákladní tanky a příslušná zařízení musí být vyrobeny z masivní nekorodující oceli druhu, který je vhodný pro roztoky peroxidu vodíku (např. 304, 304L, 316, 316L nebo 316 Ti). Všechny nekovové materiály systému nádob pro náklad jednak nesmějí být napadeny roztoky peroxidu vodíku a jednak nesmí podporovat rozklad látky.
- (c) Do nákladních tanků se přímo pod palubu a na dno instalují teplotní čidla. Zařízení dálkové signalizace a stálé kontroly teplot je třeba instalovat v kormidelně.
- (d) Do prázdných prostor, které přiléhají s nákladními tanky, musí být instalovány napevno zařízení, kontrolující obsah kyslíku (nebo potrubí pro odběr vzorků plynů), aby mohly být zjištěny v případě netěsnosti. Je třeba dbát na zvýšené nebezpečí zápalnosti zvyšováním obsahu kyslíku. Přístroje dálkové signalizace, zařízení k neustálé kontrole (pokud jsou používána potrubí pro odběr vzorků plynu, stačí přerušovaná kontrola) jakož optické a akustické signály, podobně jako signály pro měření teploty, je třeba také instalovat v kormidelně. Optické a akustické signály musí být spuštěny, jestliže koncentrace kyslíku v těchto prázdných prostorech překročí 30 obj. %. Je třeba mít k dispozici ještě dva přenosné přístroje k měření kyslíku.
- (e) Větrací zařízení nákladních tanků, vybavené filtry, musí být vybaveny podtlakovými/ přetlakovými ventily pro uzavřené větrání jakož nouzovým odvětrávacím zařízením pro případ, že tlak v nákladním tanku se rychle zvyšuje jako důsledek nekontrolovatelného rozkladu, jak je uvedeno v písm. m). Tyto větrací a odvětrávací systémy je třeba konstrukčně provést tak, aby do nákladních tanků nemohla proniknout voda. Při dimenzování nouzového odvětrávacího zařízení je třeba zohlednit projektový tlak a velikost nákladních tanků.
- (f) Je třeba pamatovat na pevně nainstalované postřikové zařízení, aby bylo možné na palubu vyteklé koncentrované roztoky peroxidu vodíku rozředit a umýt. Plocha, kterou lze proudem vody zasáhnout, musí zahrnovat jak břehové přípojky, tak i palubu nákladních tanků, které jsou určeny pro přepravu roztoků peroxidu vodíku.

Přitom musí být splněny minimálně následující podmínky:

- .1 Musí být možné látku během 5 minut po vytečení na palubu rozředit z původní koncentrace na 35 %.
- .2 Je třeba zjistit množství vytečené látky a odhadnout množství na palubě při zohlednění nejvyššího možného nakládacího a vykládacího množství, doby, která je zapotřebí k zastavení úniku nákladu v případě přeplnění nebo závady v sestavených potrubních systémech nebo soustavách hadic jakož doby, která je zapotřebí,

než se po signalizaci v kontrolní nakládací stanici nebo v kormidelně začne s rozředováním.

- (g) Výstupní otvory přetlakových ventilů se musí nacházet minimálně 2,0 metry nad lávkou, pokud je jejich odstup k lávce menší než 4,0 metry.
- (h) U každého nakládacího čerpadla musí být instalováno teplotní čidlo k monitorování teploty nákladu při vykládce za účelem zjištění přehřátí následkem poruchy čerpadla.

Provozní předpisy:

Dopravce

- (i) Roztoky peroxidu vodíku smějí být přepravovány pouze v nákladních tancích, ze kterých byly v písmenu (j) popsaným postupem pečlivě a účinně odstraněny zbytky předchozích nákladů a jejich výparů nebo balastní vody a nákladní tanky byly pasivovány. Potvrzení o dodržení postupů podle písmene (j) se musí nacházet na plavidle.

Zvláštní péče je v této souvislosti potřebná k zajištění bezpečné přepravy roztoků peroxidu vodíku:

- .1 pokud je přepravován roztok peroxidu vodíku, nesmějí být současně přepravovány jiné náklady.
 - .2 Nákladní tanky, ve kterých byly přepravovány roztoky peroxidu vodíku, smějí po vyčištění k tomuto příslušnými úřady schválenými osobami nebo firmami, být používány pro jiné náklady.
 - .3 Při konstrukci nákladních tanků je třeba dohlédnout na, pokud možno malý počet vestaveb do nákladních tanků, volný odtok, zamezení neprůchozích prostor a dobré možnosti provádění prohlídek.
- (j) Postup pro prohlídku, čištění, pasivaci a nakládku nákladního tanku pro přepravu roztoků peroxidu vodíku v koncentracích 8 až 60 %, ve kterých byly přepravovány jiné látky.

Nákladní tanky, ve kterých byly přepravovány jiné náklady než roztoky peroxidu vodíku, musí před opětovným použitím pro přepravu roztoků peroxidu vodíku být prohlédnuty, vyčištěny a pasivovány. V bodech 1. až 7. popsané postupy pro prohlídku a vyčištění platí pro nákladní tanky z nekorodující oceli. Postupy pro pasivaci nekorodující oceli jsou popsány v bodě 8. Pokud není uvedeno nic jiného, platí opatření pro nákladní tanky a veškeré příslušné vybavení přicházející do kontaktu s jiným nákladem.

 - .1 Po vyložení předchozího nákladu musí nákladní tanky být zbaveny plynu a prohlédnuty ohledně zbytků, okují a rzi.
 - .2 Nákladní tanky a příslušné vybavení musí být umyty čistou, filtrovanou vodou. Použitá voda musí mít kvalitu minimálně pitné vody s nízkým obsahem chlóru.

- .3 Stopy zbytků a výparů předchozího nákladu je třeba odstranit vypařováním nákladních tanků a příslušného zařízení.
 - .4 Nákladní tanky a zařízení je třeba opětovně umýt čistou vodou v kvalitě, uvedené v bodě 2 a vysušit filtrovaným vzduchem bez olejových příměsí.
 - .5 Je třeba odebrat vzorky z atmosféry nákladních tanků, v těchto se zkontrolují organické páry a koncentrace kyslíku.
 - .6 Nákladní prostory se opětovně prohlédnou ohledně zbytků předchozích nákladů, okují a rzi a zápachu po předchozím nákladu.
 - .7 Pokud prohlídka a měření prokáží existenci zbytků předchozích nákladů nebo jejich výparů, musí se postupy dle bodů 2. až 4. opakovat.
 - .8 Nákladní tanky a příslušné vybavení z nerezavějící oceli, které obsahovaly jiný náklad než roztoky peroxidu vodíku nebo byly opravovány, musí být bez ohledu na předchozí pasivaci dle následně uvedeného postupu vyčištěny nebo pasivovány:
 - .8.1 Nové svary a jiné opravené části musí být vyčištěny a opracovány nekorodujícím ocelovým kartáčem, dlátem, smirkovým papírem a leštídem. Drsné povrchy je třeba uhladit; následně vyleštit.
 - .8.2 Mastné a olejové zbytky je třeba odstranit pomocí vhodných organických rozpouštědel nebo roztoků čistících prostředků ve vodě. Je třeba zamezit použití prostředků, obsahujících chlór, protože tyto mohou nebezpečně omezit pasivaci.
 - .8.3 Zbytky odmašťovadel je třeba odstranit a následně umýt vodou.
- (k) Během překlada roztoků peroxidu vodíku je třeba příslušný potrubní systém oddělit od ostatních systémů. Nakládací a vykládací potrubí, které jsou používány pro překlad roztoků peroxidu vodíku, musí být označeny následovně:
- „Pouze pro překlad peroxidu vodíku“
- (l) Pokud teplota v nákladních tankách překročí 35 °C, musí v kormidelně zaznít optické a akustické signály.

Velitel plavidla

- (m) Pokud dojde ke zvýšení teploty o více než 4 °C za 2 hodiny a jestliže teplota v nákladním tanku překročí 40 °C, musí se velitel plavidla spojit přímo s odesílatelem, aby mohl přijmout případná opatření.

Plnič

- (n) Roztoky peroxidu vodíku musí být stabilizovány, aby se zamezilo rozkladu. Výrobce musí vystavit potvrzení o stabilizaci, která se musí nacházet na plavidle, a z kterého vyplývá následující:
- .1 Datum přidání stabilizátoru a doba účinnosti;
 - .2 Opatření pro případ, že se látka během cesty stane nestabilní.
- (o) Smějí být přepravovány pouze takové roztoky peroxidu vodíku, které při 25 °C vykazují stupeň rozkladu nejvýše 1,0 % ročně. Veliteli plavidla musí být předáno potvrzení od plniče, ze kterého vyplývá, že tato látka odpovídá této podmínce a které se musí nacházet na plavidle. Na plavidle se musí nacházet pověřená osoba výrobce, aby dohlédla na nakládku a mohla kontrolovat stabilitu roztoku peroxidu vodíku. Musí veliteli plavidla potvrdit, že náklad byl naložen ve stabilním stavu.
34. V případě přepravy v tankovém plavidle typu N, příruby a ucpávky nakládacího a vykládacího potrubí musí být při přepravách v tankových plavidlech vybaveny ochranou proti postřiku.
35. Pro tuto látku je přípustný pouze nepřímý systém chlazení nákladu. Přímé nebo kombinované systémy nejsou dovoleny.
36. Spojena s poznámkou 35.
37. Při přepravě této látky musí být systém nákladních tanků způsobilý vydržet tlak par nákladu při vyšší teplotě okolního prostředí, nezávisle od toho, jaký systém se použije pro manipulaci s odpařováním.
38. Pro počáteční bod varu nad 60 °C a pod nebo nejvýše 85 °C, jak je určen podle ASTM D 86-01, jsou platné podmínky přepravy totožné s podmínkami přepravy stanovenými pro počáteční bod varu pod nebo nejvýše 60 °C.
39. (a) Těsnění, otvory, uzavírací zařízení a ostatní technické vybavení musí být takového druhu, aby nemohlo dojít k jakémukoliv úniku oxidu uhličitého během normálních přepravních operací (chlazení, štěpení materiálů, zmrazování přípojek, odtokové otvory atd.).
- (b) Nakládací teplota (v nakládací stanici) musí být uvedena v přepravním dokladu.
- (c) Měřicí přístroj kyslíku se musí nacházet na palubě společně s návodem k použití, kterému je schopna porozumět každá osoba na palubě. Měřicí přístroj kyslíku musí být použit jako testovací zařízení, pokud se vstupuje do nákladních prostor, prostor s čerpadly, oblastí nízkou položených a pokud jsou práce prováděny na palubě.
- (d) Při vstupu do obytných prostor a jiných míst, kde se posádka může zdržovat, musí být umístěn měřicí přístroj, který umožňuje signalizaci, pokud úroveň kyslíku je příliš nízká nebo úroveň oxidu uhličitého je příliš vysoká.
- (e) Nakládací teplota (stanovena po nakládce) a maximální doba plavby musí být uvedena v přepravním dokladu.

40. (Vypuštěno)
41. n-BUTYLBENZEN je přiřazen k položce UN 2709 BUTYLBENZENY (n-BUTYLBENZENY).
42. Nakládání hluboce zchlazených zkapalněných plynů musí být prováděno tak, aby nedocházelo k nežádoucím změnám teploty v nákladních tancích, potrubí nebo jakémkoliv přídavném zařízení. Při určování udržovací doby (jak je popsáno v 7.2.4.16.17), by mělo být zajištěno, že stupeň plnění nepřesáhne 98 %, aby se předešlo otevření pojistných ventilů v době, kdy je plyn v plně kapalném stavu. Za použití přepravních podmínek pro hluboce zchlazené zkapalněné plyny v souladu s 9.3.1.24.1 (b) nebo 9.3.1.24.1 (c), se chladicí systém nedoporučuje.
43. Jako preventivní opatření může být, že směs byla klasifikována jako látka plovoucí na hladině, neboť některé z jejích složek splňují platná kritéria.
44. Látka se k této položce přiřadí pouze tehdy, pokud existují naměřené údaje nebo ověřené informace v souladu s normou IEC 60079-20-1 nebo rovnocennou, která umožňuje zařazení do podskupiny II B3, II B2 nebo II B1 skupiny výbušnosti II B nebo skupiny výbušnosti II A .
45. Je-li tato látka přijímána z námořních plavidel jako odpad související s provozem plavidla, musí být na palubě plavidel přijata vhodná opatření, aby se zabránilo nebo v maximální možné míře minimalizovalo vystavení personálu na palubě směsím plynu a vzduchu unikajícím z nákladních tanků přijímajícího plavidla během nakládky a je třeba zajistit ochranu personálu na palubě během těchto činností. Příslušným zaměstnancům musí být dány k dispozici vhodné osobní ochranné prostředky, které musí být použity po celou dobu zvýšené expozice.

Poznámky týkající se Tabulky C:

- 1) Teplota vznícení ještě nebyla stanovena podle standardizovaného postupu stanovení; proto byla prozatímně přiřazena do teplotní skupiny T2, která je považována za bezpečnou.
- 2) Teplota vznícení ještě nebyla stanovena podle standardizovaného postupu stanovení; proto byla prozatímně přiřazena do teplotní skupiny T3, která je považována za bezpečnou.
- 3) Teplota vznícení ještě nebyla stanovena podle standardizovaného postupu stanovení; proto byla prozatímně přiřazena do teplotní skupiny T4, která je považována za bezpečnou.
- 4) Maximální experimentální bezpečná spára (MESG) ještě nebyla změřena podle standardizovaného postupu stanovení; proto byla prozatímně přiřazena do třídy výbušnosti IIB, která je považována za bezpečnou.
- 5) Maximální experimentální bezpečná spára (MESG) ještě nebyla změřena podle standardizovaného postupu stanovení; proto byla prozatímně přiřazena do třídy výbušnosti IIC, která je považována za bezpečnou.
- 6) *(Vypuštěno)*
- 7) Maximální experimentální bezpečná spára (MESG) ještě nebyla změřena podle standardizovaného postupu stanovení; proto byla prozatímně přiřazena do třídy výbušnosti IIC, která je považována za bezpečnou.
- 8) Maximální experimentální bezpečná spára (MESG) ještě nebyla změřena podle standardizovaného postupu stanovení; proto byla prozatímně přiřazena do třídy výbušnosti v souladu s IEC 60079-20-1.
- 9) Přiřazení podle IMO (Mezinárodní kód pro konstrukci a vybavení plavidel převážejících volně ložené nebezpečné chemikálie) (kód IBC)
- 10) Relativní hustota při 15 °C.
- 11) Relativní hustota při 25 °C.
- 12) Tato teplotní třída se nevztahuje na vybraná zařízení a vybavení chráněná proti výbuchu. Povrchová teplota zařízení a vybavení chráněných proti výbuchu nesmí překročit 200 °C.
- 13) *(Vypuštěno)*
- 14) V souladu se standardizovaným postupem nebyla stanovena žádná maximální bezpečná experimentální spára (MESG); látka je proto prozatímně zařazena do skupiny výbušnosti II B3, která je považována za bezpečnou.

3.2.3.3 Postupový diagram, schéma a kritéria pro stanovení příslušných zvláštních ustanovení (sloupců (6) až (20) Tabulky C)

Postupový diagram pro klasifikaci kapalin tříd 3, 6.1, 8 a 9 pro přepravu v tancích ve vnitrozemské vodní dopravě

Zahřáté látky

Bez ohledu na výše uvedené klasifikace se pro látky, které musí být přepravovány v zahřátém stavu, typ nákladního tanku určí na základě přepravní teploty, za použití následující tabulky:

Nejvyšší přepravní teplota teplota T v °C	Typ N	Typ C
T ≤ 80	Integrovaný nákladní tank	Integrovaný nákladní tank
80 < T ≤ 115	Nezávislý nákladní tank, poznámka 25	Nezávislý nákladní tank, poznámka 26
T > 115	Nezávislý nákladní tank	Nezávislý nákladní tank

Poznámka 25 = poznámka č. 25 ve sloupci (20) seznamu látek obsažených v kapitole 3.2, Tabulka C.

Poznámka 26 = poznámka č. 26 ve sloupci (20) seznamu látek obsažených v kapitole 3.2, Tabulka C.

Schéma A: Kritéria pro vybavení nákladních tanků v plavidlech typu C

Zjistěte, které vlastnosti látky / nákladního tanku v prvních třech sloupcích jsou relevantní. Vyberte příslušný řádek v náležitém sloupci. Požadavky na vybavení nákladních tanků pro plavidla typu C jsou poté popsány v tomto řádku ve čtvrtém sloupci.

Vlastnosti látky/nákladního tanku			Vyplývající požadavky
Tenze par při teplotě kapaliny 30 °C a teplotě plynné fáze 37,8 °C > 50 kPa	Tenze par při teplotě kapaliny 30 °C a teplotě plynné fáze 37,8 °C > 50 kPa	Tenze par neznámá v důsledku některých chybějících údajů	Vybavení nákladního tanku
S chlazením			Chladicí zařízení (č. 1 ve sloupci (9))
Bez chlazení	Tenze par při 50 °C > 50 kPa bez postřiku vodou	Bod varu ≤ 60 °C	Tlakový tank (400 kPa)
	Tenze par při 50 °C > 50 kPa s postřikem vodou	60 °C < bod varu ≤ 85 °C	Otevírací tlak přetlakového ventilu/vysokorychlostního ventilu: 50 kPa, s postřikovacím zařízením (č. 3 ve sloupci (9))
	Tenze par při 50 °C ≤ 50 kPa		Otevírací tlak přetlakového ventilu/vysokorychlostního ventilu, jak vypočteno, avšak nejméně 10 kPa
		85 °C < bod varu ≤ 115 °C	Otevírací tlak přetlakového ventilu/vysokorychlostního ventilu: 50 kPa
		Bod varu > 115 °C	Otevírací tlak přetlakového ventilu/vysokorychlostního ventilu: 35 kPa

Schéma B: Kritéria pro vybavení plavidel typu N s uzavřenými nákladními tanky

Zjistěte, které vlastnosti látky / nákladního tanku v prvních třech sloupcích jsou relevantní. Vyberte příslušný řádek v náležitém sloupci. Požadavky na vybavení nákladních tanků pro plavidla typu N s otevřenými nákladními tanky jsou poté popsány v tomto řádku ve čtvrtém sloupci.

Vlastnosti látky			Vyplývající požadavky
Třídy 3 a 9	Hořlavé látky	Žíravé látky	Vybavení nákladního tanku
23 °C ≤ bod vzplanutí ≤ 60 °C	Bod vzplanutí > 60 °C přepravované zahřáté na teplotu ≤ 15 K pod bodem vzplanutí, nebo při nebo nad jejich bodem vzplanutí	Kyseliny, přepravované v zahřátém stavu nebo hořlavé látky	S lapačem plamenů
60 °C < bod vzplanutí ≤ 100 °C nebo zahřáté látky třídy 9		Nehořlavé látky	Bez lapače plamenů

Schéma C: Kritéria pro vybavení plavidel typu N s otevřenými nákladními tanky

Vybavení nákladního tanku	Třídy 3 a 9	Hořlavé látky	Žíravé látky
S lapačem plamenů	60 °C < bod vzplanutí ≤ 100 °C nebo zahřáté látky třídy 9	Bod vzplanutí > 60 °C přepřavované zahřáté na teplotu ≤ 15 K pod bodem vzplanutí, nebo při nebo nad jejich bodem vzplanutí	Hořlavé látky nebo kyseliny, přepřavované v zahřátém stavu
Bez lapače plamenů			Nehořlavé látky

Sloupec (9): Vybavení nákladních tanků pro látky přepřavované v roztaveném stavu**- Možnost ohřevu nákladu (číslice 2 ve sloupci (9))**

Možnost ohřevu nákladu se vyžaduje na plavidle:

- je-li bod tání látky, která se má přepřavovat, + 15 °C nebo vyšší, nebo
- je-li bod tání látky, která se má přepřavovat, vyšší než 0 °C, ale nižší než + 15 °C a vnější teplota je nejméně 4 K nad bodem tání. Ve sloupci (20) musí být odkaz na poznámku 6 s teplotou odvozenou takto: bod tání + 4 K.

- Topné zařízení na plavidle (číslice 4 ve sloupci (9))

Systém pro ohřev nákladu se vyžaduje na plavidle:

- pro látky, kterým nesmí být dovoleno tuhnout z důvodu možnosti nebezpečných reakcí nebo opětovného ohřevu, a
- pro látky, které musí být udržovány na zaručené teplotě nejméně 15 K pod jejich bodem vzplanutí.

Sloupec (10): Určení otevíracího tlaku vysokorychlostního ventilu v kPa

Pro plavidla typu C se otevírací tlak vysokorychlostního ventilu určí na základě vnitřního tlaku tanků, zaokrouhleného na nejbližších 5 kPa.

Pro výpočet vnitřního tlaku se použije tohoto vzorce:

$$P_{\max} = P_{Ob\max} + \frac{k \cdot v_a (P_0 - P_{Da})}{v_a - \alpha \cdot \delta_t + \alpha \cdot \delta_t \cdot v_a} - P_0$$

$$k = \frac{T_{D\max}}{T_a}$$

V tomto vzorci:

- P_{\max} : Nejvyšší vnitřní přetlak v kPa
- $P_{Ob\max}$: Absolutní tenze par při nejvyšší teplotě na povrchu kapaliny v kPa
- P_{Da} : Tenze par při absolutní plnicí teplotě v kPa
- P_0 : Atmosférický tlak v kPa
- V_a : Volný relativní objem při plnicí teplotě ve srovnání s objemem nákladního tanku
- α : Součinitel objemové roztažnosti v K⁻¹
- δ_t : Průměrné zvýšení teploty kapaliny opětovným zahřátím v K
- $T_{D\max}$: Nejvyšší teplota plynné fáze v K
- T_a : Plnicí teplota v K

k : Teplotní korekční činitel
 t_{ob} : Nejvyšší teplota na povrchu kapaliny ve °C

V tomto vzorci se používají následující základní údaje:

P_{Obmax} : Při 50 °C a 30 °C
 P_{Da} : Při 15 °C
 P₀ : 101,3 kPa
 V_a : 5 % = 0.05
 Δt : 5 K
 T_{Dmax} : 323 K a 310,8 K
 T_a : 288 K
 t_{ob} : 50 °C a 30 °C

Sloupec (11): Určení nejvyššího stupně plnění nákladních tanků

Jestliže podle ustanovení pod A výše:

- je vyžadován Typ G: 91 %, avšak v případě hluboce zchlazených látek: 95 %
- je vyžadován Typ C: 95 %
- je vyžadován Typ N: 97 %, avšak v případě látek v roztaveném stavu a hořlavých kapalin s 175 kPa ≤ P_{v50} < 300 kPa: 95 %

Sloupec (12): Relativní hustota látky při 20 °C

Tyto údaje se udávají jen pro informaci.

Sloupec (13): Určení typu zařízení pro odběr vzorků

- 1 = *uzavřené*: - Látky, které se musí přepravovat v tlakových nákladních tankách
 - Látky s písmenem T ve sloupci (3b) a přiřazené k obalové skupině I
 - Stabilizované látky, které se musí přepravovat pod inertním plynem
- 2 = *částečně uzavřené*: - Všechny jiné látky, pro které je vyžadován typ C
- 3 = *otevřené*: - Všechny ostatní látky

Sloupec (14): Určení, zda je dovolen čerpadlový prostor pod palubou

- Ne - Všechny látky s písmenem T ve sloupci (3b), s výjimkou látek třídy 2
 Ano - Všechny ostatní látky

Sloupec (15): Určení teplotní třídy

Hořlavé látky musí být přiřazeny k teplotní třídě na základě svého bodu samovznícení:

Teplotní třída	Teplota samovznícení T hořlavých kapalin a plynů v °C
T1	T > 450
T2	300 < T ≤ 450
T3	200 < T ≤ 300
T4	135 < T ≤ 200
T5	100 < T ≤ 135
T6	85 < T ≤ 100

Je-li vyžadována ochrana proti explozi a teplota samovznícení není známá, musí být uvedena odvolávka na teplotní třídu T4, považovaná za bezpečnou.

Sloupec (16): Určení skupiny výbušnosti

Hořlavé látky musí být přiřazeny ke skupině výbušnosti na základě jejich maximálních experimentálních bezpečnostních spár.

Maximálních experimentálních bezpečnostních spár se určí v souladu s normou IEC 60079-20-1.

Různé skupiny výbušnosti jsou následující:

Skupina výbušnosti	Maximální experimentální bezpečná spára v mm
II A	> 0,9
II B	≥ 0,5 až ≤ 0,9
II C	< 0,5

Kde jsou zavedeny nezávislé systémy ochrany proti výbuchu, různé podskupiny pro skupinu výbušnosti II B jsou následující:

Skupina/podskupina výbušnosti	Maximální experimentální bezpečná spára v mm
II B1	> 0,85 až ≤ 0,9
II B2	> 0,75 až ≤ 0,85
II B3	> 0,65 až ≤ 0,75
II B	≥ 0,5 až ≤ 0,65

Je-li vyžadována ochrana proti explozi a příslušné údaje nejsou k dispozici, musí být odvolávka na skupinu výbušnosti II B, považovaná za bezpečnou.

Sloupec (17): Určení, zda je vyžadována ochrana proti explozi pro elektrickou instalaci a systémy

- Ano
- Pro látky s bodem vzplanutí ≤ 60 °C
 - Pro látky, které musí být přepravovány zahřáté na teplotu méně než 15 °C pod svým bodem vzplanutí
 - Pro látky, které musí být přepravovány zahřáté na teplotu 15 °C nebo více pod svým bodem vzplanutí a kde ve sloupci (9) (vybavení nákladního tanku) je vyžadována pouze možnost ohřevu nákladu (2) a není vyžadováno topné zařízení na plavidle (4)
- Ne
- Pro hořlavé plyny
 - Pro všechny ostatní látky

Sloupec (18): Určení, zda jsou vyžadovány osobní ochranné prostředky, únikové prostředky, přenosné detektory plynů, přenosné detektory toxických plynů nebo dýchací přístroje závislé na vnějším prostředí

- **PP:** Pro všechny látky tříd 1 až 9;
- **EP:** Pro všechny látky
 - třídy 2 s písmenem T nebo písmenem C v klasifikačním kódu uvedeném ve sloupci (3b),
 - třídy 3 s písmenem T nebo písmenem C v klasifikačním kódu uvedeném ve sloupci (3b),
 - třídy 4.1,
 - třídy 6.1, a
 - třídy 8,

- CMR kategorie 1A nebo 1B podle GHS;
- **EX:** Pro všechny látky, pro něž je vyžadována ochrana proti explozi;
- **TOX:** Pro všechny látky třídy 6.1,
Pro všechny látky jiných tříd s písmenem T ve sloupci (3b),
Pro látky CMR kategorie 1A nebo 1B podle GHS;
- **A:** Pro všechny látky, pro něž je vyžadováno EX nebo TOX

Sloupec (19): Určení počtu kuželů nebo modrých světel

Pro všechny látky třídy 2 s písmenem F v klasifikačním kódu uvedeném ve sloupci (3b):	1 kužel/světlo
Pro všechny látky tříd 3 až 9 s písmenem F v klasifikačním kódu uvedeném ve sloupci (3b) a přiřazené k obalové skupině I nebo II:	1 kužel/světlo
Pro všechny látky třídy 2 s písmenem T v klasifikačním kódu uvedeném ve sloupci (3b):	2 kužely/světla
Pro všechny látky tříd 3 až 9 s písmenem T v klasifikačním kódu uvedeném ve sloupci (3b) a přiřazené k obalové skupině I nebo II:	2 kužely/světla

Sloupec (20): Určení dodatečných požadavků a poznámek

- Poznámka 1:** Ve sloupci (20) uvést odvolávku na poznámku 1 pro přepravu UN 1005 AMONIAK (ČPAVEK), BEZVODÝ
- Poznámka 2:** Ve sloupci (20) uvést odvolávku na poznámku 2 týkající se stabilizovaných látek, které reagují s kyslíkem a plynů nebezpečnosti 2.1, jak je zmíněno ve sloupci (5).
- Poznámka 3:** Ve sloupci (20) uvést odvolávku na poznámku 3 pro látky, které musí být stabilizovány.
- Poznámka 4:** Ve sloupci (20) uvést odvolávku na poznámku 4 pro látky, kterým nesmí být dovoleno tuhnout z důvodu možnosti nebezpečných reakcí nebo opětovného zahřátí.
- Poznámka 5:** Ve sloupci (20) uvést odvolávku na poznámku 5 pro látky náchylné k polymerizaci.
- Poznámka 6:** Ve sloupci (20) uvést odvolávku na poznámku 6 pro látky náchylné ke krystalizaci a pro látky, pro něž je vyžadováno ohřevné zařízení nebo možnost ohřevu a jejichž tenze par při 20 °C je vyšší než 0,1 kPa.
- Poznámka 7:** Ve sloupci (20) uvést odvolávku na poznámku 7 pro látky s bodem tání +15 °C nebo vyšším.
- Poznámka 8:** Ve sloupci (20) uvést odvolávku na poznámku 8 pro látky, které reagují nebezpečně s vodou.
- Poznámka 9:** Ve sloupci (20) uvést odvolávku na poznámku 9 pro přepravu UN 1131 SIROUHLÍK.
- Poznámka 10:** Již se nepoužívá.
- Poznámka 11:** Ve sloupci (20) uvést odvolávku na poznámku 11 pro přepravu UN 1040 ETHYLENOXID S DUSÍKEM.
- Poznámka 12:** Ve sloupci (20) uvést odvolávku na poznámku 12 pro přepravu UN 1280 PROPYLENOXID a UN 2983 ETHYLENOXID A PROPYLENOXID, SMĚS.
- Poznámka 13:** Ve sloupci (20) uvést odvolávku na poznámku 13 pro přepravu UN 1086 VINYLCHLORID, STABILIZOVANÝ.

- Poznámka 14:** Ve sloupci (20) uvést odvolávku na poznámku 14 pro směsi nebo J.N. položky, které nejsou jasně definovány a pro něž je typ N určen na základě klasifikačních kritérií.
- Poznámka 15:** Ve sloupci (20) uvést odvolávku na poznámku 15 pro látky, které reagují nebezpečně se zásadami nebo kyselinami, jako jsou hydroxid sodný nebo kyselina sírová.
- Poznámka 16:** Ve sloupci (20) uvést odvolávku na poznámku 16 pro látky, které mohou reagovat nebezpečně na lokální přehřátí.
- Poznámka 17:** Ve sloupci (20) se uvede odkaz na poznámku 17, pokud je uveden odkaz na poznámku 4, 6 nebo 7.
- Poznámka 18:** Již se nepoužívá.
- Poznámka 19:** Ve sloupci (20) uvést odvolávku na poznámku 19 pro látky, které nesmějí za žádných okolností přijít do styku s vodou.
- Poznámka 20:** Ve sloupci (20) uvést odvolávku na poznámku 20 pro látky, jejichž přepravní teplota nesmí překročit nejvyšší teplotu v kombinaci s materiály nákladních tanků. Nejvyšší dovolená teplota musí být uvedena hned za číslem 20.
- Poznámka 21:** Již se nepoužívá.
- Poznámka 22:** Ve sloupci (20) uvést odvolávku na poznámku 22 pro látky, pro něž je ve sloupci (11) uvedeno; rozmezí hodnot nebo není uvedena žádná hodnota.
- Poznámka 23:** Ve sloupci (20) uvést odvolávku na poznámku 23 pro látky, jejichž vnitřní tlak při 30 °C je nižší než 50 kPa a které jsou přepravovány s postřikem vodou.
- Poznámka 24:** Ve sloupci (20) uvést odvolávku na poznámku 24 pro přepravu UN 3257 LÁTKA ZAHŘÁTÁ, KAPALNÁ, J.N.
- Poznámka 25:** Ve sloupci (20) uvést odvolávku na poznámku 25 pro látky, které musí být přepravovány zahřáté v nákladním tanku typu 3.
- Poznámka 26:** Ve sloupci (20) uvést odvolávku na poznámku 26 pro látky, které musí být přepravovány zahřáté v nákladním tanku typu 2.
- Poznámka 27:** Ve sloupci (20) uvést odvolávku na poznámku 27 pro látky, které jsou ve sloupci (2) uvedeny pod J.N. položkou nebo druhovou položkou a pro které pojmenování pro přepravu ještě není doplněno technickým názvem věcí nebo doplňujícími informacemi o obsahu benzenu.
- Poznámka 28:** Ve sloupci (20) uvést odvolávku na poznámku 28 pro přepravu UN 2448 SÍRA, ROZTAVENÁ.
- Poznámka 29:** Již se nepoužívá.
- Poznámka 30:** Ve sloupci (20) uvést odvolávku na poznámku 30 pro přepravu UN čísel 1719, 1794, 1814, 1819, 1824, 1829, 1830, 1832, 1833, 1906, 2240, 2308, 2583, 2584, 2677, 2679, 2681, 2796, 2797, 2837 a 3320 pod položkami, pro které je vyžadován typ N, otevřený.
- Poznámka 31:** Ve sloupci (20) uvést odvolávku na poznámku 31 pro přepravu látek třídy 2 a UN 1280 PROPYLENOXID a UN 2983 ETHYLENOXID A PROPYLENOXID, SMĚS třídy 3.
- Poznámka 32:** Ve sloupci (20) uvést odvolávku na poznámku 32 pro přepravu UN 2448 SÍRA, ROZTAVENÁ třídy 4.1.
- Poznámka 33:** Ve sloupci (20) uvést odvolávku na poznámku 33 pro přepravu UN 2014 a 2984 PEROXID VODÍKU, VODNÝ ROZTOK třídy 5.1.
- Poznámka 34:** Ve sloupci (20) uvést odvolávku na poznámku 34 pro přepravu látek, pro něž je ve sloupci (5) udáno nebezpečí 8 a ve sloupci (6) typ N.

- Poznámka 35:** Ve sloupci (20) uvést odvolávku na poznámku 35 pro látky, pro které může úplné zchlazení vyvolat nebezpečné reakce v případě komprese. Toto platí také, je-li zchlazování částečně prováděno kompresí.
- Poznámka 36:** Již se nepoužívá.
- Poznámka 37:** Ve sloupci (20) uvést odvolávku na poznámku 37 pro látky, pro něž systém uložení nákladu musí být schopen odolat plné tenzi par nákladu na horních mezích výpočtových teplot okolí, bez ohledu na systém zvolený pro zacházení s odpařeným plynem.
- Poznámka 38:** Ve sloupci (20) uvést odvolávku na poznámku 38 pro směsi s počátečním bodem varu nad 60 °C nebo pod nebo nejvýše 85 °C podle ASTM D 86-01.
- Poznámka 39:** Ve sloupci (20) uvést odvolávku na poznámku 39 pro přepravu UN čísla 2187 OXID UHLIČITÝ, HLUBOCE ZCHLAZENÝ, ZKAPALNĚNÝ třídy 2.
- Poznámka 40:** Již se nepoužívá.
- Poznámka 41:** Ve sloupci (20) uvést odvolávku na poznámku 41 k UN číslu 2709 BUTYLBENZENY (n-BUTYLBENZENY).
- Poznámka 42:** Ve sloupci (20) uvést odvolávku na poznámku 42 k UN číslu 1038 ETHYLEN, ZCHLAZENÁ KAPALINA a k UN číslu 1972 METHAN, HLUBOCE ZCHLAZENÝ, KAPALNÝ nebo PLYN ZEMNÍ, HLUBOCE ZCHLAZENÝ, KAPALNÝ, s vysokým obsahem methanu.
- Poznámka 43:** Ve sloupci (20) uvést odvolávku na poznámku 43 pro všechny položky obalové skupiny I s písmenem F (hořlavé) v klasifikačním kódu uvedeném ve sloupci (3b) a s písmenem F (z anglického slova floater) ve sloupci (5) Nebezpečí.

3.2.4 Formy žádosti o zvláštní povolení pro přepravu v tankových plavidlech podle oddílu 1.5.2**3.2.4.1 Vzor zvláštního povolení podle oddílu 1.5.2****Zvláštní povolení
podle 1.5.2 ADN**

Podle 1.5.2 ADN je povolena přeprava v tankových plavidlech látek uvedených v příloze k tomuto zvláštnímu povolení za podmínek v něm uvedených.

Před přepravou látky se bude po dopravci vyžadovat, aby měl tuto látku doplněnou do seznamu uvedeného v 1.16.1.2.5 ADN uznanou klasifikační společností.

Toto zvláštní povolení platí.....
(místa a/nebo trasy platnosti)

Platí dva roky ode dne podpisu, pokud nebude zrušeno k dřívějšímu dni.

Vydávající stát:.....

Příslušný orgán:.....

Datum:.....

Podpis:.....

3.2.4.2 Formulář žádosti o zvláštní povolení podle oddílu 1.5.2

K žádostem o zvláštní povolení odpovězte, prosím, následující otázky a body*. Údaje jsou používány jen pro úřední účely a je s nimi nakládáno důvěrně.

Žadatel

.....
(Jméno) (Společnost)

(.....)

.....
(Adresa)

Obsah žádosti

Povolení pro přepravu v tankových plavidlech..... jako látky třídy.....

Přílohy

(s krátkým popisem)

Žádost zpracována:

V:.....

Datum:.....

Podpis:.....
(osoby zodpovědné za údaje)

1. Všeobecné údaje o nebezpečné látce

1.1 Je to čistá látka , směs , roztok ?

1.2 Technický název (pokud možno podle nomenklatury ADN nebo možno též podle IBC Code).

1.3 Synonymum.

1.4 Obchodní název.

1.5 Strukturní vzorec a, pro směsi, složení a/nebo koncentrace.

1.6 Třída nebezpečnosti a, kde je to aplikovatelné, klasifikační kód, obalová skupina.

1.7 UN číslo, nebo identifikační číslo látky (je-li známo).

2. Fyzikálně-chemické vlastnosti

2.1 Stav během přepravy (např. plyn, kapalina, roztavená...).

2.2 Relativní hustota kapaliny při 20 °C nebo při přepravní teplotě, pokud látka musí být během přepravy zahřátá nebo zchlazená.

2.3 Přepravní teplota (pro látky zahřáté nebo zchlazené během přepravy).

2.4 Bod tání nebo rozmezí..... °C.

* U otázek netýkajících se předmětu žádosti napište „nevztahuje se“.

- 2.5 Bod varu nebo rozmezí..... °C.
- 2.6 Tenze par při 15 °C....., 20 °C....., 30 °C....., 37,8 °C....., 50 °C.....,
(pro zkapalněné plyny tenze par při 70 °C.....), (pro permanentní plyny plnicí tlak při 15 °C.....).
- 2.7 Součinitel objemové roztažnosti.....K⁻¹.
- 2.8 Rozpustnost ve vodě při 20 °C
Koncentrace nasycení.....mg/l
- nebo
- Mísitelnost s vodou při 15 °C
- Úplná částečná žádná
(pokud možno, v případě roztoků a směsí, uveďte koncentraci)
- 2.9 Barva.
- 2.10 Pach.
- 2.11 Viskozita.....mm²/s.
- 2.12 Doba výtoku (ISO 2431-1996).....s.
- 2.13 Zkouška oddělení rozpouštědla.....
- 2.14 pH látky nebo vodného roztoku (uveďte koncentraci).
- 2.15 Jiné informace.

3. Technické bezpečnostní vlastnosti

- 3.1 Teplota samovznícení v souladu s IEC 60079-20-1:2010, EN 14522:2005, DIN 51 794:2003 v °C; kde je aplikovatelná, daná teplotní třída v souladu s IEC 60079-20-1:2010.
- 3.2 Bod vzplanutí

Pro bod vzplanutí do 175 °C

Zkušební metody s uzavřeným kelímkem – nerovnovážený postup

ABEL METODA: EN ISO 13736:2008

ABEL-PENSKY METODA: DIN 51755-1:1974 nebo NF M T60-103:1968

PENSKY-MAERTENS METODA: EN ISO 2719:2012

LUCHAIRE PŘÍSTROJ: Francouzská norma NF T60-103:1968

TAG METODA: ASTM D56-05(2010)

Zkušební metody s uzavřeným kelímkem – rovnovážný postup

Rychlý rovnovážný postup: EN ISO 3679:2004; ASTM D3278-96 (2011)

Rovnovážný postup s uzavřeným kelímkem: EN ISO 1523:2002+AC1:2006; ASTM D3941-90 (2007)

Pro bod vzplanutí nad 175 °C

K výše uvedeným metodám smí být navíc použita následující zkušební metoda s otevřeným kelímkem:

CLEVELAND METODA: EN ISO 2592:2002; ASTM D92-12.

- 3.3 Meze výbušnosti:
Určení dolních a horních mezí výbušnosti podle EN 1839:2012.
- 3.4 Maximální bezpečná spára podle IEC 60079-20-1:2010 v mm.
- 3.5 Je látka během přepravy stabilizovaná? Pokud ano, uveďte údaje o stabilizačním prostředku:
.....
- 3.6 Produkty rozkladu v případě hoření ve styku se vzduchem nebo vlivem vnějšího ohně:
- 3.7 Jde o látku zvyšující intenzitu ohně?
- 3.8 Otěr (koroze).....mm/rok.
- 3.9 Reaguje látka s vodou nebo s vlhkostí vzduchu za uvolňování hořlavých nebo toxických plynů? Ano/ne. Uvolňované plyny:.....
- 3.10 Reaguje látka nebezpečně nějakým jiným způsobem?
- 3.11 Reaguje látka nebezpečně při opětovném zahřátí?
Ano/ne

4. Fyziologická nebezpečí

- 4.1 Hodnota LD₅₀ a/nebo LC₅₀. Hodnota úmrtnosti (kde je to aplikovatelné, jiná kritéria toxicity podle 2.2.61.1 ADN).
Vlastnosti CMR podle kategorií 1A a 1B kapitol 3.5, 3.6 a 3.7 GHS.
- 4.2 Vznikají při rozkladu nebo reakci látky představující fyziologická nebezpečí? (Uveďte, které látky, pokud je to známo).
- 4.3 Vlastnosti ve vztahu k životnímu prostředí (viz 2.4.2.1 ADN).

Akutní toxicita:

LC₅₀ 96 h pro rybymg/l
EC₅₀ 48 h pro koryšemg/l
ErC₅₀ 72 h pro řasy.....mg/l

Chronická toxicita:

NOEC.....mg/l
BCF.....mg/l nebo log K_{ow}
Snadno odbouratelná.....ano/ne

5. Údaje k rizikovému potenciálu

- 5.1 Jaké zvláštní škody je třeba očekávat, jestliže nebezpečné charakteristiky projeví svůj účinek?
- Hoření
 - Zranění
 - Poleptání
 - Intoxikace v případě příjmu pokožkou
 - Intoxikace v případě příjmu vdechnutím
 - Mechanické poškození

- Destrukce
- Požár
- Otěr (koroze kovů)
- Znečištění životního prostředí

6. Údaje k dopravnímu vybavení

6.1 Jsou předpokládány/nutné zvláštní požadavky na nakládku (které jsou to)?

7. Přeprava nebezpečných látek v tancích

7.1 S kterými materiály je látka, která se má přepravovat, snášlivá?

8. Technické bezpečnostní požadavky

8.1 S přihlédnutím k současnému stavu vědy a techniky, jaká bezpečnostní opatření jsou nutná vzhledem k nebezpečím představovaným látkou nebo nebezpečím, která mohou vzniknout během přepravního procesu jako celku?

8.2 Dodatečná bezpečnostní opatření

- Používat stacionární nebo přenosné technické prostředky k měření hořlavých plynů a par hořlavých kapalin;
- Používat stacionární nebo přenosné technické prostředky (toximetry) k měření koncentrací toxických látek.

3.2.4.3 Kritéria pro přiřazování látek

A. Sloupce (6), (7) a (8): Určení typu tankového plavidla

1. Plyny (kritéria podle 2.2.2 ADN)

- Bez chlazení: Typ G tlakový
- S chlazením: Typ G chlazený

2. Halogenované uhlovodíky

Látky, které smějí být přepravovány jen ve stabilizovaném stavu

Toxické látky (viz 2.2.61.1 ADN)

Hořlavé (bod vzplanutí < 23 °C) nebo žíravé látky (viz 2.2.8 ADN)

Látky s teplotou samovznícení ≤ 200 °C

Látky s bodem vzplanutí < 23 °C a rozsahem výbušnosti > 15 % při 20 °C

Benzen a směsi netoxických a nežíravých látek obsahující více než 10 % benzenu

Látky ohrožující životní prostředí, vodní toxicita kategorie Akutní 1 nebo Chronická 1 (skupina N1 podle 2.2.9.1.10.2 ADN) a tenze par při 50 °C ≥ 1 kPa

- Vnitřní tlak nákladního tanku > 50 kPa při těchto teplotách: kapalina 30 °C, plynná fáze 37,8 °C
 - Bez chlazení: Typ C tlakový (400 kPa)
 - S chlazením: Typ C chlazený
- Vnitřní tlak nákladního tanku ≤ 50 kPa při těchto teplotách: kapalina 30 °C, plynná fáze 37,8 °C, avšak s vnitřním tlakem nákladního tanku > 50 kPa při 50 °C
 - Bez postřiku vodou: Typ C tlakový (400 kPa)
 - S postřikem vodou: Typ C s otevíracím tlakem přetlakového ventilu/vysokorychlostního ventilu - 50 kPa
- Vnitřní tlak nákladního tanku ≤ 50 kPa při těchto teplotách: kapalina 30 °C, plynná fáze 37,8 °C s vnitřním tlakem nákladního tanku ≤ 50 kPa při 50 °C
 - Typ C s otevíracím tlakem přetlakového ventilu/vysokorychlostního ventilu podle výpočtu, avšak nejméně 10 kPa

2.1 Směsi, pro něž je vyžadován typ C podle kritérií uvedených v bodě 2 výše, pro které však chybějí některé údaje

V případech, kdy nemůže být vnitřní přetlak tanku vypočten z důvodu nedostatku údajů, smějí se použít následující kritéria:

- Počáteční bod varu ≤ 60 °C Typ C (400 kPa)
- 60 °C < počáteční bod varu ≤ 85 °C Typ C s otevíracím tlakem přetlakového ventilu/vysokorychlostního ventilu 50 kPa a s postřikem vodou
- 85 °C < počáteční bod varu ≤ 115 °C Typ C s otevíracím tlakem přetlakového ventilu/vysokorychlostního ventilu 50 kPa
- 115 °C < počáteční bod varu Typ C s otevíracím tlakem přetlakového ventilu/vysokorychlostního ventilu 35 kPa

3. Látky, které jsou jen hořlavé (viz 2.2.3 ADN)

- Bod vzplanutí < 23 °C
s 175 kPa ≤ Pv 50 < 300 kPa

• Bez chlazení:	uzavřený typ N	tlakový (400 kPa)
• S chlazením:	uzavřený typ N	chlazený otevíracím tlakem přetlakového ventilu/vysokorychlostního ventilu 50 kPa
- Bod vzplanutí < 23 °C s 150 kPa ≤ Pv 50 < 175 kPa:	uzavřený typ N	tlak přetlakového ventilu/vysokorychlostního ventilu 50 kPa
- Bod vzplanutí < 23 °C s 110 kPa ≤ Pv 50 < 150 kPa		
• Bez postřiku vodou:	uzavřený typ N	s otevíracím tlakem přetlakového ventilu/vysokorychlostního ventilu 50 kPa
• S postřikem vodou:	uzavřený typ N	s otevíracím tlakem přetlakového ventilu/vysokorychlostního ventilu 10 kPa
- Bod vzplanutí < 23 °C s Pv 50 < 110 kPa:	uzavřený typ N	s otevíracím tlakem přetlakového ventilu/vysokorychlostního ventilu 10 kPa
- Bod vzplanutí ≥ 23 °C ale ≤ 60 °C:	otevřený typ N	s lapačem plamenů
- Látky s bodem vzplanutí > 60 °C zahřáté na teplotu méně než 15 K od bodu vzplanutí, J.N. (...)	otevřený typ N	s lapačem plamenů
- Látky s bodem vzplanutí > 60 °C zahřáté na teplotu bodu vzplanutí nebo vyšší, J.N. (...)	otevřený typ N	s lapačem plamenů

4. Žiravé látky (viz 2.2.8.1 ADN)

- Žiravé látky náchylné k tvoření žiravých par:		
• Látky přiřazené k obalové skupině I nebo II v seznamu látek a mající tenzi par ² vyšší než 12,5 kPa (125 mbar) při 50 °C nebo	uzavřený typ N	stěny nákladních tanků nesmějí být obšívku; otevírací tlak přetlakového ventilu/vysokorychlostního ventilu/ 10 kPa
• Látky náchylné reagovat nebezpečně s vodou (např. chloridy kyselin)		
• Látky obsahující plyny v roztoku		
- Žiravé kyseliny:		
• Látky přiřazené k obalové skupině I nebo II v seznamu látek a mající tenzi par ² nejvýše 12,5 kPa (125 mbar) při 50 °C nebo	otevřený typ N	stěny nákladních tanků nesmějí být obšívku
• Látky přiřazené k obalové skupině III v seznamu látek a mající tenzi par ² nejméně 6,0 kPa (60 mbar) při 50 °C nebo	otevřený typ N	stěny nákladních tanků nesmějí být obšívku
• Látky přiřazené k obalové skupině III v seznamu látek z důvodu jejich stupně korozivnosti (leptavosti)	otevřený typ N	stěny nákladních tanků nesmějí být obšívku

² Jsou-li k dispozici údaje, smí se použít součet parciálních tlaků nebezpečných látek namísto tenze par.

vůči oceli nebo hliníku nebo

- | | | |
|--|----------------|---|
| • Látky s bodem tání vyšším než 0 °C a přepravované v zahřátém stavu | otevřený typ N | stěny nákladních tanků nesmějí být obšívkou |
| • Hořlavé látky | otevřený typ N | s lapačem plamenů |
| • Zahřáté látky | otevřený typ N | s lapačem plamenů |
| • Nehořlavé látky | otevřený typ N | bez lapače plamenů |
| - Všechny ostatní žíravé látky: | | |
| • Hořlavé látky | otevřený typ N | s lapačem plamenů |
| • Nehořlavé látky | otevřený typ N | bez lapače plamenů |

5. Látky ohrožující životní prostředí (viz 2.2.9.1 ADN)

- | | | |
|--|----------------|---|
| • Vodní toxicita Akutní 1 nebo Chronická 1 (skupina N1 podle 2.2.9.1.10.2) a tenze par pod 1 kPa při 50 °C | uzavřený typ N | stěny nákladních tanků nesmějí být obšívkou |
| • Chronická 2 a 3 (skupina N2 podle 2.2.9.1.10.2) | otevřený typ N | stěny nákladních tanků nesmějí být obšívkou |
| • Akutní 2 a 3 (skupina N3 podle 2.2.9.1.10.2) | otevřený typ N | ----- |

6. Látky třídy 9, UN 3257

otevřený typ N nezávislé nákladní tanky

7. Látky třídy 9, identifikační č. 9003

Bod vzplanutí > 60 °C a ≤ 100 °C otevřený typ N -----

8. Látky, které musí být přepravovány v zahřátém stavu

Pro látky, které musí být přepravovány v zahřátém stavu, se typ nákladního tanku určí na základě přepravní teploty za použití následující tabulky:

Nejvyšší přepravní teplota T v °C	Typ N	Typ C
T ≤ 80	2	2
80 < T ≤ 115	1 + poznámka 25	1 + poznámka 26
T > 115	1	1

1 = typ nákladního tanku: nezávislý tank

2 = typ nákladního tanku: integrální tank

Poznámka 25 = poznámka č. 25 ve sloupci (20) seznamu látek obsaženého v kapitole 3.2, tabulce C.

Poznámka 26 = poznámka č. 26 ve sloupci (20) seznamu látek obsaženého v kapitole 3.2, tabulce C.

9. Látky s dlouhodobými účinky na zdraví – látky CMR (kategorií 1A a 1B podle kritérií kapitol 3.5, 3.6 a 3.7 GHS³), pokud již nejsou přiřazeny ke třídám 2 až 9 na základě jiných kritérií

C karcinogenní

M mutagenní

³ Vzhledem k tomu, že neexistuje žádný oficiální mezinárodní seznam látek CMR kategorií 1A a 1B, dokud nebude k dispozici takový seznam, použije se seznam látek CMR kategorií 1A a 1B uvedený v nařízení Evropského parlamentu a Rady (ES) č. 1272/2008 ve znění pozdějších předpisů.

R toxické pro reprodukci

uzavřený typ N

stěny nákladních tanků nesmějí být obšívkou; otevírací tlak přetlakového ventilu/vysokorychlostního ventilu nejméně 10 kPa, s postřikovacím zařízením, je-li vnitřní přetlak tanku vyšší než 10 kPa (výpočet tenze par podle vzorce pro sloupec 10, s výjimkou toho, že $V_a = 0,03$)

10. Látky, které plavou na vodním povrchu (floaters) nebo klesají ke dnu (sinkers) (kritéria v souladu s 2.2.9.1.10.5), pokud již nejsou přiřazeny ke třídám 3 až 9 a typ N není vyžadován na tomto základě

uzavřený typ N

stěny nákladních tanků nesmějí být obšívkou

B. Sloupec (9): Určení vybavení nákladního tanku

(1) Chladicí zařízení

Stanoveno podle A.

(2) Možnost ohřevu nákladu

Možnost ohřevu nákladu se vyžaduje:

- je-li bod tání látky, která se má přepravovat, + 15 °C nebo vyšší, nebo
- je-li bod tání látky, která se má přepravovat, vyšší než 0 °C, ale nižší než + 15 °C a vnější teplota je nejméně 4 K nad bodem tání. Ve sloupci (20) musí být odkaz na poznámku 6 s teplotou odvozenou takto: bod tání + 4 K.

(3) Postřikovací zařízení

Stanoveno podle A.

(4) Topné zařízení na plavidle:

- pro látky, kterým nesmí být dovoleno tuhnout z důvodu možnosti nebezpečných reakcí nebo opětovného ohřevu, a
- pro látky, které musí být udržovány na zaručené teplotě nejméně 15 K pod jejich bodem vzplanutí.

C. Sloupec (10): Určení otevíracího tlaku vysokorychlostního ventilu v kPa

Pro pravidla typu C se otevírací tlak vysokorychlostního ventilu určí na základě vnitřního tlaku tanků, zaokrouhleného na nejbližších 5 kPa.

Pro výpočet vnitřního tlaku se použije tohoto vzorce:

$$P_{\max} = P_{Ob\max} + \frac{k V_a (P_0 - P_{Da})}{v_a - \alpha \delta_t + \alpha \delta_t v_a} - P_0$$

$$k = \frac{T_{D\max}}{T_a}$$

V tomto vzorci:

P_{\max} : Nejvyšší vnitřní přetlak v kPa

$P_{Ob\max}$: Absolutní tenze par při nejvyšší teplotě na povrchu kapaliny v kPa

P_{Da} : Absolutní tenze par při plnicí teplotě v kPa

P_0 : Atmosférický tlak v kPa

V_a : Volný relativní objem při plnicí teplotě ve srovnání s objemem nákladního tanku

- α : Součinitel objemové roztažnosti v K^{-1}
- δ_t : Průměrné zvýšení teploty kapaliny opětovným zahřátím v K
- T_{Dmax} : Nejvyšší teplota plynné fáze v K
- T_a : Plnicí teplota v K
- k : Teplotní korekční činitel
- t_{ob} : Nejvyšší teplota na povrchu kapaliny ve $^{\circ}C$

V tomto vzorci se používají následující základní údaje:

- P_{Obmax} : Při $50^{\circ}C$ a $30^{\circ}C$
- P_{Da} : Při $15^{\circ}C$
- P_0 : $101,3$ kPa
- V_a : $5\% = 0,05$
- δ_t : 5 K
- T_{Dmax} : 323 K a $310,8$ K
- T_a : 288 K
- t_{ob} : $50^{\circ}C$ a $30^{\circ}C$

D. Sloupec (11): Určení nejvyššího stupně plnění nákladních tanků

Jestliže podle ustanovení pod A výše:

- | | | | |
|---|---------------------|-----|---|
| - | je vyžadován Typ G: | 91% | avšak v případě hluboce zchlazených látek:
95 % |
| - | je vyžadován typ C: | 95% | |
| - | je vyžadován typ N: | 97% | avšak v případě látek v roztaveném stavu a
hořlavých kapalin s $175 \text{ kPa} \leq P_{v50} < 300 \text{ kPa}$:
95 %. |

E. Sloupec (13): Určení druhu zařízení pro odběr vzorků

- | | | |
|------------------------|---|--|
| 1 = uzavřené: | - | Látky, které se musí přepravovat v tlakových nákladních tancích |
| | - | Látky s písmenem T ve sloupci (3b) a přiřazené k obalové skupině I |
| | - | Stabilizované látky, které se musí přepravovat pod inertním plynem |
| 2 = částečně uzavřené: | - | Všechny jiné látky, pro které je vyžadován typ C |
| 3 = otevřené: | - | Všechny ostatní látky |

F. Sloupec (14): Určení, zda je dovolen čerpadlový prostor pod palubou

- | | | |
|-----|---|---|
| Ne | - | Všechny látky s písmenem T v klasifikačním kódu uvedeném ve sloupci (3b),
s výjimkou látek třídy 2 |
| Ano | - | Všechny ostatní látky |

G. Sloupec (15): Určení teplotní třídy

Hořlavé látky musí být přiřazeny k teplotní třídě na základě svého bodu samovznícení:

Teplotní třída	Teplota samovznícení T hořlavých kapalin a plynů ve °C
T1	T > 450
T2	300 < T ≤ 450
T3	200 < T ≤ 300
T4	135 < T ≤ 200
T5	100 < T ≤ 135
T6	85 < T ≤ 100

Je-li vyžadována ochrana proti výbuchu a teplota samovznícení není známá, musí být uvedena odvolávka na teplotní třídu T4, považovanou za bezpečnou.

H. Sloupec (16): Určení skupiny výbušnosti

Hořlavé látky musí být přiřazeny ke skupině výbušnosti na základě jejich maximálních experimentálních bezpečnostních spár.

Maximálních experimentálních bezpečnostních spár se určí v souladu s normou IEC 60079-20-1.

Různé skupiny výbušnosti jsou následující:

Skupina výbušnosti	Maximální experimentální bezpečná spára v mm
II A	> 0,9
II B	≥ 0,5 až ≤ 0,9
II C	< 0,5

Kde jsou zavedeny nezávislé systémy ochrany proti výbuchu, různé podskupiny pro skupinu výbušnosti II B jsou následující:

Skupina/podskupina výbušnosti	Maximální experimentální bezpečná spára v mm
II B1	> 0,85 až ≤ 0,9
II B2	> 0,75 až ≤ 0,85
II B3	> 0,65 až ≤ 0,75
II B	≥ 0,5 až ≤ 0,65

Je-li vyžadována ochrana proti explozi a příslušné údaje nejsou k dispozici, musí být odvolávka na skupinu výbušnosti II B, považovaná za bezpečnou.

I. Sloupec (17): Určení, zda je vyžadována ochrana proti explozi pro elektrickou instalaci a systémy

- Ano
- Pro látky s bodem vzplanutí ≤ 60 °C
 - Pro látky, které musí být přepravovány zahřáté na teplotu méně než 15 °C pod svým bodem vzplanutí
 - Pro látky, které musí být přepravovány zahřáté na teplotu 15 °C nebo více pod svým bodem vzplanutí a kde ve sloupci (9) (vybavení nákladního tanku) je vyžadována pouze možnost ohřevu nákladu (2) a není vyžadováno topné zařízení na plavidle (4)
 - Pro hořlavé plyny
- Ne
- Pro všechny ostatní látky

J. Sloupec (18): Určení, zda jsou vyžadovány osobní ochranné prostředky, únikové prostředky, přenosné detektory plynů, přenosné detektory toxických plynů nebo dýchací přístroje závislé na vnějším prostředí

- PP: Pro všechny látky tříd 1 až 9;
- EP: Pro všechny látky
- třídy 2 s písmenem T nebo písmenem C v klasifikačním kódu uvedeném ve sloupci (3b),
- třídy 3 s písmenem T nebo písmenem C v klasifikačním kódu uvedeném ve sloupci (3b),

- třídy 4.1,
- třídy 6.1,
- třídy 8, a
- CMR kategorie 1A nebo 1B podle kapitol 3.5, 3.6 a 3.7 GHS;
- EX: Pro všechny látky, pro něž je vyžadována ochrana proti explozi;
- TOX: Pro všechny látky třídy 6.1,
Pro všechny látky jiných tříd s písmenem T ve sloupci (3b),
Pro látky CMR kategorie 1A nebo 1B podle kapitol 3.5, 3.6 a 3.7 GHS³
- A: Pro všechny látky, pro něž je vyžadováno EX nebo TOX.

K. Sloupec (19): Určení počtu kuželů nebo modrých světel

Pro všechny látky třídy 2 s písmenem F v klasifikačním kódu uvedeném ve sloupci (3b):	1 kužel/světlo
Pro všechny látky tříd 3 až 9 s písmenem F v klasifikačním kódu uvedeném ve sloupci (3b) a přiřazené k obalové skupině I nebo II:	1 kužel/světlo
Pro všechny látky třídy 2 s písmenem T v klasifikačním kódu uvedeném ve sloupci (3b):	2 kužely/světla
Pro všechny látky tříd 3 až 9 s písmenem T v klasifikačním kódu uvedeném ve sloupci (3b) a přiřazené k obalové skupině I nebo II:	2 kužely/světla

L. Sloupec (20): Určení dodatečných požadavků a poznámek

- Poznámka 1:** Ve sloupci (20) uvést odvolávku na poznámku 1 pro přepravu UN 1005 AMONIAK (ČPAVEK), BEZVODÝ.
- Poznámka 2:** Ve sloupci (20) uvést odvolávku na poznámku 2 týkající se stabilizovaných látek, které reagují s kyslíkem a plynů nebezpečnosti 2.1, jak je zmíněno ve sloupci (5).
- Poznámka 3:** Ve sloupci (20) uvést odvolávku na poznámku 3 pro látky, které musí být stabilizovány.
- Poznámka 4:** Ve sloupci (20) uvést odvolávku na poznámku 4 pro látky, kterým nesmí být dovoleno tuhnout z důvodu možnosti nebezpečných reakcí nebo opětovného zahřátí.
- Poznámka 5:** Ve sloupci (20) uvést odvolávku na poznámku 5 pro látky náchylné k polymerizaci.
- Poznámka 6:** Ve sloupci (20) uvést odvolávku na poznámku 6 pro látky náchylné ke krystalizaci a pro látky, pro něž je vyžadováno ohřevné zařízení nebo možnost ohřevu a jejichž tenze par při 20 °C je vyšší než 0,1 kPa.
- Poznámka 7:** Ve sloupci (20) uvést odvolávku na poznámku 7 pro látky s bodem tání +15 °C nebo vyšším.
- Poznámka 8:** Ve sloupci (20) uvést odvolávku na poznámku 8 pro látky, které reagují nebezpečně s vodou.
- Poznámka 9:** Ve sloupci (20) uvést odvolávku na poznámku 9 pro přepravu UN 1131 SIROUHLÍK.
- Poznámka 10:** Již se nepoužívá.

³ Vzhledem k tomu, že neexistuje žádný oficiální mezinárodní seznam látek CMR kategorií 1A a 1B, dokud nebude k dispozici takový seznam, použije se seznam látek CMR kategorií 1A a 1B uvedený v nařízení Evropského parlamentu a Rady (ES) č. 1272/2008 ve znění pozdějších předpisů.

- Poznámka 11:** Ve sloupci (20) uvést odvolávku na poznámku 11 pro přepravu UN 1040 ETHYLENOXID S DUSÍKEM.
- Poznámka 12:** Ve sloupci (20) uvést odvolávku na poznámku 12 pro přepravu UN 1280 PROPYLENOXID a UN 2983 ETHYLENOXID A PROPYLENOXID, SMĚS.
- Poznámka 13:** Ve sloupci (20) uvést odvolávku na poznámku 13 pro přepravu UN 1086 VINYLCHLORID, STABILIZOVANÝ.
- Poznámka 14:** Ve sloupci (20) uvést odvolávku na poznámku 14 pro směsi nebo J.N. položky, které nejsou jasně definovány a pro něž je typ N určen na základě klasifikačních kritérií.
- Poznámka 15:** Ve sloupci (20) uvést odvolávku na poznámku 15 pro látky, které reagují nebezpečně se zásadami nebo kyselinami, jako jsou hydroxid sodný nebo kyselina sírová.
- Poznámka 16:** Ve sloupci (20) uvést odvolávku na poznámku 16 pro látky, které mohou reagovat nebezpečně na lokální přehřátí.
- Poznámka 17:** Ve sloupci (20) se uvede odkaz na poznámku 17, pokud je uveden odkaz na poznámku 4, 6 nebo 7.
- Poznámka 18:** Již se nepoužívá.
- Poznámka 19:** Ve sloupci (20) uvést odvolávku na poznámku 19 pro látky, které nesmějí za žádných okolností přijít do styku s vodou.
- Poznámka 20:** Ve sloupci (20) uvést odvolávku na poznámku 20 pro látky, jejichž přepravní teplota nesmí překročit nejvyšší teplotu v kombinaci s materiály nákladních tanků. Nejvyšší dovolená teplota musí být uvedena hned za číslem 20.
- Poznámka 21:** Již se nepoužívá.
- Poznámka 22:** Ve sloupci (20) uvést odvolávku na poznámku 22 pro látky, pro něž je ve sloupci (11) uvedeno rozmezí hodnot nebo není uvedena žádná hodnota.
- Poznámka 23:** Ve sloupci (20) uvést odvolávku na poznámku 23 pro látky, jejichž vnitřní tlak při 30 °C je nižší než 50 kPa a které jsou přepravovány s postřikem vodou.
- Poznámka 24:** Ve sloupci (20) uvést odvolávku na poznámku 24 pro přepravu UN 3257 LÁTKA ZAHŘÁTÁ, KAPALNÁ, J.N.
- Poznámka 25:** Ve sloupci (20) uvést odvolávku na poznámku 25 pro látky, které musí být přepravovány zahřáté v nákladním tanku typu 3.
- Poznámka 26:** Ve sloupci (20) uvést odvolávku na poznámku 26 pro látky, které musí být přepravovány zahřáté v nákladním tanku typu 2.
- Poznámka 27:** Ve sloupci (20) uvést odvolávku na poznámku 27 pro látky, které jsou ve sloupci (2) uvedeny pod J.N. položkou nebo druhovou položkou a pro které pojmenování pro přepravu ještě není doplněno technickým názvem věcí nebo doplňujícími informacemi o obsahu benzenu.
- Poznámka 28:** Ve sloupci (20) uvést odvolávku na poznámku 28 pro přepravu UN 2448 SÍRA, ROZTAVENÁ.
- Poznámka 29:** Již se nepoužívá.
- Poznámka 30:** Ve sloupci (20) uvést odvolávku na poznámku 30 pro přepravu UN čísel 1719, 1794, 1814, 1819, 1824, 1829, 1830, 1832, 1833, 1906, 2240, 2308, 2583, 2584, 2677, 2679, 2681, 2796, 2797, 2837 a 3320 pod položkami, pro které je vyžadován typ N, otevřený.
- Poznámka 31:** Ve sloupci (20) uvést odvolávku na poznámku 31 pro přepravu látek třídy 2 a UN 1280 PROPYLENOXID a UN 2983 ETHYLENOXID A PROPYLENOXID, SMĚS třídy 3.
- Poznámka 32:** Ve sloupci (20) uvést odvolávku na poznámku 32 pro přepravu UN 2448 SÍRA, ROZTAVENÁ třídy 4.1.

- Poznámka 33:** Ve sloupci (20) uvést odvolávku na poznámku 33 pro přepravu UN 2014 a 2984 PEROXID VODÍKU, VODNÝ ROZTOK třídy 5.1.
- Poznámka 34:** Ve sloupci (20) uvést odvolávku na poznámku 34 pro přepravu látek, pro něž je ve sloupci (5) udáno nebezpečí 8 a ve sloupci (6) typ N.
- Poznámka 35:** Ve sloupci (20) uvést odvolávku na poznámku 35 pro látky, které nemusí mít přímý systém pro chladicí zařízení.
- Poznámka 36:** Ve sloupci (20) uvést odvolávku na poznámku 36 pro látky, které musí mít nepřímý systém pro chladicí zařízení.
- Poznámka 37:** Ve sloupci (20) uvést odvolávku na poznámku 37 pro látky, pro něž systém uložení nákladu musí být schopen odolat plné tenzi par nákladu na horních mezích výpočtových teplot okolí, bez ohledu na systém zvolený pro zacházení s odpařeným plynem.
- Poznámka 38:** Ve sloupci (20) uvést odvolávku na poznámku 38 pro směsi s počátečním bodem varu nad 60 °C podle ASTM D 86-01.
- Poznámka 39:** Ve sloupci (20) uvést odvolávku na poznámku 39 pro přepravu UN 2187 OXID UHLIČITÝ, HLUBOCE ZCHLAZENÝ, KAPALNÝ třídy 2.
- Poznámka 40:** *Již se nepoužívá.*
- Poznámka 41:** Ve sloupci (20) uvést odvolávku na poznámku 41 k UN číslu 2709 BUTYLBENZENY (n-BUTYLBENZENY).
- Poznámka 42:** Ve sloupci (20) uvést odvolávku na poznámku 42 k UN číslu 1038 ETHYLEN, ZCHLAZENÁ KAPALINA a k UN číslu 1972 METHAN, HLUBOCE ZCHLAZENÝ, KAPALNÝ nebo PLYN ZEMNÍ, HLUBOCE ZCHLAZENÝ, KAPALNÝ, s vysokým obsahem methanu.

ČÁST 4

USTANOVENÍ O POUŽÍVÁNÍ OBALŮ, CISTEREN A NÁKLADNÍCH DOPRAVNÍCH JEDNOTEK S VOLNĚ LOŽENÝMI LÁTKAMI

KAPITOLA 4.1

VŠEOBECNÁ USTANOVENÍ

- 4.1.1** Obaly a cisterny musí být používány v souladu s požadavky jednoho z mezinárodních předpisů s ohledem na údaje uvedené v seznamu látek těchto mezinárodních předpisů, a to:
- pro obaly (včetně IBC a velkých obalů): sloupce (8), (9a) a (9b) kapitoly 3.2, tabulky A RID nebo ADR, nebo seznam látek v kapitole 3.2 IMDG Code nebo Technických instrukcí ICAO;
 - pro přemístitelné cisterny: sloupce (10) a (11) kapitoly 3.2, tabulky A RID nebo ADR, nebo seznam látek v IMDG Code;
 - pro cisterny RID nebo ADR: sloupce (12) a (13) kapitoly 3.2, tabulky A RID nebo ADR.
- 4.1.2** Musí se použít tyto požadavky:
- pro obaly (včetně IBC a velkých obalů): kapitola 4.1 RID, ADR, IMDG Code nebo Technických instrukcí ICAO;
 - pro přemístitelné cisterny: kapitola 4.2 RID, ADR, nebo IMDG Code;
 - pro cisterny RID nebo ADR: kapitola 4.3 RID nebo ADR a, kde je to použitelné, oddíly 4.2.5 nebo 4.2.6 IMDG Code.
 - pro cisterny z vyztužených plastů: kapitola 4.4 ADR;
 - pro cisterny pro podtlakové vyčerpávání odpadů: kapitola 4.5 ADR.
 - pro mobilní jednotky připravující výbušniny (MEMU): kapitola 4.7 ADR.
- 4.1.3** Pro přepravu tuhých látek ve volně loženém stavu ve vozidlech, železničních vozech, kontejnerech nebo kontejnerech pro volně ložené látky musí být dodrženy tyto požadavky mezinárodních předpisů:
- kapitola 4.3 IMDG Code, nebo
 - kapitola 7.3 ADR se zohledněním údajů ve sloupcích (10) nebo (17) tabulky A kapitoly 3.2 ADR, s výjimkou toho, že vozidla a kontejnery s plachtou nejsou dovoleny;
 - kapitola 7.3 RID se zohledněním údajů ve sloupcích (10) nebo (17) tabulky A kapitoly 3.2 RID, s výjimkou toho, že železniční vozy a kontejnery s plachtou nejsou dovoleny.
- 4.1.4** Smějí se používat jen obaly a cisterny, které splňují požadavky části 6 ADR nebo RID.

ČÁST 5
POSTUPY PŘI ODESLÁNÍ

KAPITOLA 5.1

VŠEOBECNÁ USTANOVENÍ

5.1.1 Rozsah použití a všeobecná ustanovení

Tato část obsahuje ustanovení pro odesílání nebezpečných věcí týkající se nápisů, bezpečnostních značek a dokladů a případně povolení pro odeslání a předběžné oznámení.

5.1.2 Používání přepravních obalových souborů

- 5.1.2.1 a) Pokud značky vyžadované podle kapitoly 5.2, kromě 5.2.1.3 až 5.2.1.6, 5.2.1.7.2 až 5.2.1.7.8 a 5.2.1.10 charakterizující všechny nebezpečné věci v přepravním obalovém souboru nezůstanou viditelné, přepravní obalový soubor musí být:
- (i) označen nápisem PŘEPRAVNÍ OBALOVÝ SOUBOR. Výška písmen nápisu musí být alespoň 12 mm. Nápis musí být v úředním jazyce země původu a také, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud případné dohody uzavřené mezi státy dotčenými přepravou nestanoví jinak; a
 - (ii) označen bezpečnostními značkami a UN číslem a dalšími značkami, jak je vyžadováno pro kusy v kapitole 5.2 kromě 5.2.1.3 až 5.2.1.6, 5.2.1.7.2 až 5.2.1.7.8 a 5.2.1.10, pro každou nebezpečnou věc obsaženou v přepravním obalovém souboru. Každá značka může být umístěna pouze jednou.

Značení přepravních obalových souborů obsahujících radioaktivní látky, musí být v souladu s pododílem 5.2.2.1.11.

- b) Orientační šipky znázorněné v 5.2.1.10 musí být umístěny na dvou protilehlých bočních stranách přepravního obalového souboru obsahujícího kusy, které musí být označeny podle 5.2.1.10.1, pokud značky nezůstanou viditelné.

5.1.2.2 Každý kus s nebezpečnými věcmi uložený v přepravním obalovém souboru musí odpovídat všem relevantním ustanovením ADN. Předpokládaná funkce každého kusu nesmí být negativně ovlivněna přepravním obalovým souborem.

5.1.2.3 Každý kus, který je opatřen orientačními šipkami předepsanými v pododíle 5.2.1.10 a který je uložen do přepravního obalového souboru nebo do velkého obalu, musí být orientován v souladu s těmito značkami.

5.1.2.4 Zákazy společné nakládky se vztahují též na tyto přepravní obalové soubory.

5.1.3 Prázdné nevyčištěné obaly (včetně IBC a velkých obalů), cisterny, MEMU, vozidla, železniční vozy a kontejnery pro přepravu volně ložených látek

5.1.3.1 Prázdné nevyčištěné obaly (včetně IBC a velkých obalů), cisterny (včetně cisternových vozidel, cisternových železničních vozů, bateriových vozidel, bateriových železničních vozů, snímatelných cisteren, přemístitelných cisteren, cisternových kontejnerů, MEGC, MEMU), vozidla, železniční vozy a kontejnery pro přepravu ve volně loženém stavu, které obsahovaly nebezpečné látky jiných tříd než třídy 7, musí být označeny nápisy a bezpečnostními značkami, jako kdyby byly plné.

POZNÁMKA: O dokladech viz kapitola 5.4.

5.1.3.2 Kontejnery, cisterny, IBC, jakož i jiné obaly a přepravní obalové soubory, používané pro přepravu radioaktivních látek nesmějí být používány pro skladování nebo přepravu jiných věcí, ledaže by byly dekontaminovány pod úroveň 0,4 Bq/cm² pro beta a gama zářiče, jakož i pro nízkotoxické alfa zářiče a pod úroveň 0,04 Bq/cm² pro všechny ostatní alfa zářiče.

5.1.4 Společné balení

Pokud jsou dvě nebo více nebezpečných věcí zabaleny do téhož vnějšího obalu, musí být tento kus opatřen nápisem a bezpečnostní značkou předepsanou pro každou látku nebo předmět. Jestliže je pro různé věci požadována stejná bezpečnostní značka, může být použita pouze jedna.

5.1.5 Všeobecná ustanovení pro třídu 7

5.1.5.1 *Povolení pro odeslání a oznamování*

5.1.5.1.1 Všeobecně

Kromě schválení konstrukcí kusu popsaného v kapitole 6.4 ADR vyžaduje se též za určitých okolností vícestranné povolení odeslání (5.1.5.1.2 a 5.1.5.1.3). Za některých okolností je též nezbytné informovat příslušné orgány o odeslání (5.1.5.1.4).

5.1.5.1.2 Povolení odeslání

Vícestranné povolení se vyžaduje pro:

- (a) odeslání kusů typu B(M), které nesplňují požadavky uvedené v pododdlílu 6.4.7.5 ADR nebo jsou konstruovány tak, že dovolují řízené občasně odvětrávání;
- (b) odeslání kusů typu B(M) obsahujících radioaktivní látku, jejíž aktivita je větší než 3000 A₁ nebo 3000 A₂, případně 1000 TBq, podle toho, která hodnota je nižší;
- (c) odeslání kusů obsahujících štěpné látky, jestliže součet indexů bezpečné podkritičnosti kusů v jednom plavidle, vozidle, železničním voze nebo kontejneru překročí 50;
- (d) programy ochrany před zářením pro zásilky za speciálního použití plavidel podle 7.1.4.14.7.3.7; a
- (e) odeslání SCO-III.

s výjimkou toho, že příslušný orgán může povolit přepravu do svého státu nebo přes svůj stát bez povolení odeslání podle zvláštního ustanovení ve svém schválení konstrukce (viz 5.1.5.2.1).

5.1.5.1.3 Povolení odeslání podle zvláštního ujednání

Příslušný orgán může schválit ustanovení, podle kterých může být zásilka nesplňující všechny příslušné požadavky ADN přepravena podle zvláštního ujednání (viz 1.7.4).

5.1.5.1.4 Oznamování

Oznámení příslušným orgánům se vyžaduje v následujících případech:

- (a) Před prvním odesláním každého kusu, které vyžaduje povolení příslušného orgánu, musí odesílatel zajistit, aby kopie každého vhodného osvědčení příslušného orgánu, která se týkají konstrukce kusu, byla předložena příslušnému orgánu země původu zásilky a příslušnému orgánu každého státu, kterým nebo do kterého je zásilka přepravována. Odesílatel nemusí vyčkat na potvrzení o příjmu od příslušného orgánu, ani příslušný orgán není povinen vydat potvrzení o příjmu osvědčení;
- (b) Při každém z následujících typů odeslání:
 - (i) kusů typu C obsahujících radioaktivní látku s aktivitou větší než 3000 A₁ nebo popřípadě 3000 A₂, nebo 1000 TBq, podle toho, která hodnota je nižší;
 - (ii) kusů typu B(U) obsahujících radioaktivní látku s aktivitou větší než 3000 A₁ nebo popřípadě 3000 A₂, nebo 1000 TBq podle toho, která hodnota je nižší;
 - (iii) kusů typu B(M);
 - (iv) odeslání podle zvláštního ujednání.

Odesílatel musí zaslat oznámení příslušnému orgánu země původu zásilky a příslušnému orgánu každého státu, do kterého nebo kterým se má zásilka přepravovat. Toto oznámení musí obdržet každý příslušný orgán před začátkem odeslání zásilky a podle možností 7 dnů předem;

- (c) Odesílatel nemusí odeslat samostatné oznámení, pokud jsou požadované informace uvedeny v žádosti o povolení odeslání (viz 6.4.23.2 ADR);
- (d) Oznámení o odeslání zásilky musí obsahovat:
 - (i) dostatečné údaje umožňující identifikaci kusu nebo kusů, včetně všech vhodných čísel osvědčení a identifikačních značek;
 - (ii) údaje o datu odeslání, předpokládaném datu příjezdu a navrhované trase;
 - (iii) pojmenování radioaktivní(ch) látky(ek) nebo nuklidu(ů);
 - (iv) popisy fyzikálního a chemického stavu radioaktivní látky nebo údaje, že se jedná o radioaktivní látku zvláštní formy nebo o nízkodisperzní radioaktivní látku; a
 - (v) nejvyšší aktivitu radioaktivního obsahu během přepravy v becquerelech (Bq) s příslušným symbolem předpony SI (viz 1.2.2.1). U štěpných látek smí být místo aktivity udána hmotnost štěpných látek (nebo každého štěpného nuklidu pro směsi, pokud je to důležité) v gramech (g) nebo jejich násobku.

5.1.5.2 **Osvědčení vydávaná příslušným orgánem**

5.1.5.2.1 Osvědčení vydaná příslušným orgánem se vyžadují pro:

- (a) Konstrukce pro:
 - (i) radioaktivní látky zvláštní formy;
 - (ii) nízkodisperzní radioaktivní látky;
 - (iii) štěpné látky vyjmuté podle 2.2.7.2.3.5 (f);
 - (iv) kusy obsahující 0,1 kg nebo více hexafluoridu uranu;
 - (v) kusy obsahující štěpné látky, pokud nejsou vyňaty podle pododdílu 2.2.7.2.3.5 těchto předpisů nebo 6.4.11.2 nebo 6.4.11.3 ADR;
 - (vi) kusy typu B(U) a kusy typu B(M);
 - (vii) kusy typu C;
- (b) Zvláštní ujednání;
- (c) Určitá odeslání (viz 5.1.5.1.2);
- (d) Stanovení základních hodnot aktivity radionuklidů uvedených v 2.2.7.2.2.1 pro jednotlivé radionuklidy, které nejsou uvedeny v tabulce 2.2.7.2.2.1 (viz 2.2.7.2.2.2 (a));
- (e) Jiné limity aktivity pro vyjmuté zásilky přístrojů nebo výrobků (viz 2.2.7.2.2.2 (b)).

Osvědčení musí potvrzovat, že příslušné požadavky jsou splněny a že pro schválení konstrukce byla konstrukci přidělena identifikační značka.

Osvědčení o schválení konstrukce kusu a osvědčení o povolení odeslání mohou být spojena do jednoho osvědčení.

Osvědčení a žádosti o tato osvědčení musí být v souladu s požadavky uvedenými v oddílu 6.4.23 ADR.

5.1.5.2.2 Odesílatel musí vlastnit kopii každého příslušného osvědčení.

5.1.5.2.3 Pro konstrukci kusu, u které není vyžadováno, aby příslušný orgán vydal osvědčení o schválení, musí odesílatel na požádání předložit příslušnému orgánu ke kontrole dokumentární evidenci o souladu konstrukce kusu se všemi příslušnými požadavky.

5.1.5.3 **Určení přepravního indexu (TI) a indexu bezpečné podkritičnosti (CSI)**

5.1.5.3.1 Přepravní index (TI) pro kus, přepravní obalový soubor nebo kontejner, nebo pro nezabalenu látku LSA-I nebo nezabaleny předmět SCO-I nebo SCO-III je číslo, které se určí tímto postupem:

- (a) Zjistí se nejvyšší příkon dávkového ekvivalentu v jednotkách milisieverty za hodinu (mSv/h) ve vzdálenosti 1 m od vnějších povrchů kusu, přepravního obalového souboru, kontejneru, nebo nezabaleny látek LSA-I a předmětů SCO-I nebo SCO-III. Takto zjištěná hodnota se vynásobí 100. U uranových a thoriových rud a jejich koncentrátů smějí být vzaty následující hodnoty pro nejvyšší dávkovou intenzitu v každém bodě vzdáleném 1 m od vnějšího povrchu nákladu: 0,4 mSv/h pro rudy a fyzikální koncentráty uranu a thoria;

0,3 mSv/h pro chemické koncentráty thoria;
0,02 mSv/h pro chemické koncentráty uranu, kromě hexafluoridu uranu;

- (b) Pro cisterny, kontejnery a nezabalené látky LSA-I a předměty SCO-I a SCO-III musí být hodnota zjištěná v kroku podle (a) výše vynásobena multiplikačním faktorem z tabulky 5.1.5.3.1;
- (c) Hodnota zjištěná v krocích podle (a) a (b) výše se zaokrouhuje nahoru na první desetinné místo (např. z 1,13 bude 1,2), s výjimkou toho, že hodnota 0,05 nebo nižší smí být považována za nulu a výsledné číslo je hodnota přepravního indexu (TI).

Tabulka 5.1.5.3.1: Multiplikační faktory pro cisterny, kontejnery a nebalené LSA-I, SCO-I a SCO-III

Velikost nákladu ^a	Multiplikační faktor
velikost nákladu $\leq 1 \text{ m}^2$	1
$1 \text{ m}^2 < \text{velikost nákladu} \leq 5 \text{ m}^2$	2
$5 \text{ m}^2 < \text{velikost nákladu} \leq 20 \text{ m}^2$	3
$20 \text{ m}^2 < \text{velikost nákladu}$	10

^a největší naměřená plocha příčného průřezu nákladu

- 5.1.5.3.2 Přepravní index pro každý přepravní obalový soubor, plavidlo nebo přepravní dopravní jednotku se určí součtem přepravních indexů všech obsažených kusů. Pro zásilky od jednoho odesilatele může odesílatel určit přepravní index přímým měřením příkonu dávkového ekvivalentu.

Přepravní index pro variabilní přepravní obalový soubor musí být určen pouze součtem přepravních indexů všech obsažených kusů v tomto přepravním obalovém souboru.

- 5.1.5.3.3 Index bezpečné podkritičnosti (CSI) pro každý přepravní obalový soubor, každé plavidlo nebo nákladní přepravní jednotku se určí jako součet CSI všech obsažených kusů. Stejný postup se musí použít pro určení celkového součtu CSI v zásilce nebo ve vozidle.

- 5.1.5.3.4 Kusy, přepravní obalové soubory a kontejnery musí být zařazeny do jedné z kategorií I-BÍLÁ, II-ŽLUTÁ nebo III-ŽLUTÁ v souladu s podmínkami stanovenými v tabulce 5.1.5.3.4 a podle následujících ustanovení:

- (a) Při určení příslušné kategorie pro kus, přepravní obalový soubor nebo kontejner musí být zohledněn jak přepravní index, tak příkon dávkového ekvivalentu na povrchu. Splňuje-li přepravní index podmínky pro jednu kategorii, ale příkon dávkového ekvivalentu na povrchu podmínky pro jinou kategorii, potom se kus, přepravní obalový soubor nebo kontejner zařadí do vyšší kategorie. Pro tento účel se nahlíží na kategorii I-BÍLÁ jako na nejnižší kategorii;
- (b) Přepravní index (TI) se určuje postupy stanovenými v pododdílech 5.1.5.3.1 a 5.1.5.3.2;
- (c) Je-li příkon dávkového ekvivalentu na povrchu větší než 2 mSv/h, musí být kus nebo přepravní obalový soubor přepravován za výlučného použití a podle ustanovení pododdílu 7.1.4.14.7.1.3 a 7.1.4.14.7.3.5 (a), jak je to vhodné;
- (d) Je-li kus přepravován na základě zvláštního ujednání, musí být zařazen do kategorie III-ŽLUTÁ, podle ustanovení uvedených v 5.1.5.3.5;
- (e) Přepravní obalový soubor nebo kontejner, který obsahuje kusy přepravované na základě zvláštního ujednání, musí být zařazen do kategorie III-ŽLUTÁ, podle ustanovení uvedených v 5.1.5.3.5.

Tabulka 5.1.5.3.4: Kategorie kusů, přepravních obalových souborů a kontejnerů

Podmínky		
Přepravní index	Nejvyšší příkon dávkového ekvivalentu v kterémkoli bodě vnějšího povrchu	Kategorie
0 ^a	nejvýše 0,005 mSv/h	I-BÍLÁ
více než 0, avšak nejvýše 1 ^a	více než 0,005 mSv/h, avšak nejvýše 0,5 mSv/h	II-ŽLUTÁ
více než 1, avšak nejvýše 10	více než 0,5 mSv/h, avšak nejvýše 2 mSv/h	III-ŽLUTÁ
více než 10	více než 2 mSv/h, avšak nejvýše 10 mSv/h	III-ŽLUTÁ ^b

- a *Není-li naměřený přepravní index větší než 0,05, smí být jeho hodnota v souladu s 5.1.5.3.1 (c) zaokrouhlena na nulu.*
- b *Musí být přepravován také za výlučného použití s výjimkou kontejnerů (viz tabulka D v 7.1.4.14.7.3.3)*

5.1.5.3.5 Ve všech případech mezinárodní přepravy kusů vyžadujících schválení konstrukčního vzoru kusu nebo povolení odeslání příslušným orgánem, pro něž se používají v různých zemích, jichž se přeprava týká, různé druhy schválení nebo povolení, musí být kategorizace v souladu s osvědčením země původu konstrukčního vzoru kusu.

5.1.5.4 **Zvláštní ustanovení pro vyjmuté kusy s radioaktivními látkami třídy 7**

5.1.5.4.1 Vyjmuté kusy s radioaktivními látkami třídy 7 musí být na vnější straně obalu čitelně a trvanlivě označeny těmito údaji:

- (a) UN číslem s předřazenými písmeny „UN“;
- (b) identifikací buď odesílatele, nebo příjemce, nebo obou; a
- (c) povolenou celkovou (brutto) hmotností, jestliže překračuje 50 kg.

5.1.5.4.2 Požadavky na dokumentaci kapitoly 5.4 se na vyjmuté kusy s radioaktivními látkami třídy 7 nevztahují, kromě toho, že:

- (a) UN číslo s předřazenými písmeny „UN“ a jméno a adresa odesílatele a příjemce a, pokud je to vhodné, také identifikační značka každého schvalovacího osvědčení příslušného orgánu (viz 5.4.1.2.5.1 (g)), musí být uvedeny v přepravním dokladu, jako je nákladní list, letecký nákladní list nebo nákladní list CMR, CIM nebo CMNI;
- (b) pokud je to náležité, platí požadavky uvedené v 5.4.1.2.5.1 (g), 5.4.1.2.5.3 a 5.4.1.2.5.4;
- (c) platí požadavky oddílů 5.4.2 a 5.4.4.

5.1.5.4.3 Pokud je to náležité, platí požadavky uvedené v 5.2.1.7.8 a 5.2.2.1.11.5.

5.1.5.5 **Přehled požadavků na schválení a oznámení před odesláním**

POZNÁMKA 1: Před prvním odesláním každého kusu vyžadujícího schválení konstrukce příslušným orgánem musí odesílatel zajistit, aby kopie schvalovacího osvědčení této konstrukce byla zaslána příslušnému orgánu každého dotyčného státu, jímž bude přeprava probíhat (viz 5.1.5.1.4 (a)).

POZNÁMKA 2: Oznámení se vyžaduje, pokud obsah převyšuje $3 \times 10^3 A_1$ nebo $3 \times 10^3 A_2$ nebo 1000 TBq (viz 5.1.5.1.4 (b)).

POZNÁMKA 3: Vícestranné povolení odeslání se vyžaduje, pokud obsah převyšuje $3 \times 10^3 A_1$ nebo $3 \times 10^3 A_2$ nebo 1000 TBq, nebo jestliže je povoleno občasné řízené odvětrání (viz 5.1.5.1).

POZNÁMKA 4: Viz ustanovení o schválení a oznámení před odesláním vhodného kusu pro přepravu této látky.

- ^c Konstrukce kusů pro štěpné látky mohou též vyžadovat schválení podle jedné z jiných rubrik tabulky.
- ^d Pro odeslání se však mohou vyžadovat schválení podle jedné z jiných rubrik tabulky.

KAPITOLA 5.2

NÁPISY A BEZPEČNOSTNÍ ZNAČKY

5.2.1 Značení kusů

POZNÁMKA 1: Pro značky s ohledem na konstrukci, zkoušení a schvalování obalů, velkých obalů, tlakových nádob a IBC, viz část 6 ADR.

POZNÁMKA 2: V souladu se systémem GHS musí být výstražný symbol GHS, který není vyžadován dohodou ADN uveden pouze jako součást úplného označení GHS a ne samostatně (viz GHS 1.4.10.4.4).

5.2.1.1 Pokud není v ADN jinak předepsáno, musí být každý kus zřetelně a trvanlivě označen UN číslem odpovídajícím obsaženým nebezpečným věcem, kterému jsou předřazena písmena „UN“. UN číslo a písmena „UN“ musí být nejméně 12 mm vysoká, s výjimkou kusů o vnitřním objemu nejvýše 30 l nebo 30 kg nejvyšší čisté (netto) hmotnosti a pro láhve nejvýše 60 l hydraulického vnitřního objemu, kdy musí být nejméně 6 mm vysoká, s výjimkou kusů o vnitřním objemu nejvýše 5 l nebo maximální čisté (netto) hmotnosti 5 kg, kdy musí mít odpovídající velikost.

5.2.1.2 Všechna označení kusů požadovaná touto kapitolou musí být:

- (a) být zřetelně viditelná a čitelná;
- (b) odolná vůči vlivu povětrnosti bez podstatného zhoršení jejich čitelnosti.

5.2.1.3 Záchranné obaly, včetně velkých záchranných obalů a záchranné tlakové nádoby musí být kromě toho opatřeny nápisem „ZÁCHRANNÝ“. Výška písmen nápisu „ZÁCHRANNÝ“ musí být alespoň 12 mm.

5.2.1.4 Velké nádoby pro volně ložené látky (IBC) s vnitřním objemem větším než 450 litrů a velké obaly musí být označeny na dvou protilehlých stranách.

5.2.1.5 **Dodatečná ustanovení pro věci třídy 1**

Kusy s věcmi třídy 1 musí být kromě toho označeny oficiálním pojmenováním pro přepravu podle oddílu 3.1.2. Značka, která musí být dobře čitelná a nesmazatelná, musí být uvedena v jednom nebo více jazycích, z nichž jeden musí být francouzština, němčina nebo angličtina, pokud jiné dohody uzavřené mezi státy zainteresovanými na přepravě nestanoví jinak.

5.2.1.6 **Dodatečná ustanovení pro věci třídy 2**

Opakovaně plnitelné nádoby musí být opatřeny následujícími zřetelně čitelnými a trvanlivými údaji:

- (a) UN číslo a oficiální pojmenování pro přepravu plynu nebo směsi plynů, jak jsou uvedeny v oddílu 3.1.2.

U plynů přiřazených pod j.n. položku musí být dodatečně k UN číslu uveden pouze technický název¹.

U směsí plynů není třeba udávat více než dva komponenty, které představují největší nebezpečí;

¹ Místo technického názvu je dovoleno použít následujících pojmenování:

- Pro UN 1078 chladič plyn, j.n.: směs F1, směs F2, směs F3;
- Pro UN 1060 methylacetylen a propadien, směsi, stabilizované: směs P1, směs P2;
- Pro UN 1965 uhlovodíky plynné, směs, zkapalněná, j.n.: směs A nebo butan, směs A01 nebo butan, směs A02 nebo butan, směs A0 nebo butan, směs A1, směs B1, směs B2, směs B, směs C nebo propan.
- Pro UN 1010 butadieny, stabilizované: 1,2-butadien, stabilizovaný, 1,3-butadien, stabilizovaný.

- (b) u stlačených plynů plněných hmotnostně a u zkvapalněných plynů buď nejvyšší dovolená hmotnost plnění a vlastní hmotnost nádoby, včetně výbavy a příslušenství upevněných v době plnění, nebo celková (brutto) hmotnost;
- (c) datum (rok) příští periodické inspekce.

Tyto údaje mohou být buď vyraženy, nebo uvedeny na trvanlivém štítku nebo bezpečnostní značce upevněných na nádobě nebo uvedeny nalepeným a zřetelně čitelným nápisem, např. vytištěným nebo provedeným jiným rovnocenným způsobem.

POZNÁMKA 1: Viz také 6.2.2.7 ADR.

POZNÁMKA 2: K nádobám pro jedno použití, viz 6.2.2.8 ADR.

5.2.1.7 **Ustanovení o zvláštním značení pro radioaktivní látky**

- 5.2.1.7.1 Každý kus musí být označen na vnější straně obalu čitelně a trvale identifikací buď odesilatele, nebo příjemce, nebo obou. Každý přepravní obalový soubor musí být na své vnější straně čitelně a trvale označen identifikací buď odesilatele, nebo příjemce nebo obou, pokud značky každého kusu z přepravního obalového souboru nejsou jasně viditelná.
- 5.2.1.7.2 Kromě vyjmutých kusů musí být každý kus na vnější straně obalu označen čitelně a trvale UN číslem s předřazenými písmeny „UN“ a oficiálním pojmenováním pro přepravu. Označení vyjmutých kusů musí odpovídat označení vyžadovanému podle 5.1.5.4.1.
- 5.2.1.7.3 Každý kus s celkovou (brutto) hmotností větší než 50 kg musí mít na vnější straně obalu čitelně a trvale uvedenu dovolenou celkovou (brutto) hmotnost.
- 5.2.1.7.4 Každý kus, který odpovídá
 - (a) konstrukci kusu typu IP-1, kusu typu IP-2 nebo kusu typu IP-3, musí být na vnější straně obalu označen čitelně a trvale nápisem „TYP IP-1“, „TYP IP-2“ nebo případně „TYP IP-3“;
 - (b) konstrukci kusu typu A, musí být na vnější straně kusu čitelně a trvale označen nápisem „TYP A“;
 - (c) konstrukci kusu typu IP-2, kusu typu IP-3 nebo kusu typu A, musí být na vnější straně obalu označen čitelně a trvanlivě rozlišovací značkou používanou na vozidlech v mezinárodním silničním provozu² země původu konstrukčního vzoru kusu a buď jménem výrobce, nebo jinou identifikací obalu stanovenou příslušným orgánem země původu konstrukčního vzoru kusu.
- 5.2.1.7.5 Každý kus, který odpovídá konstrukci schválené podle jednoho nebo více odstavců v 5.1.5.2.1 těchto předpisů, 6.4.22.1 až 6.4.22.4, 6.4.23.4 až 6.4.23.7 a 6.4.24.2 ADR, musí být na vnější straně kusu čitelně a trvale označen následujícími údaji:
 - (a) identifikační značkou přidělenou konstrukci příslušným orgánem;
 - (b) sériovým číslem jednoznačně identifikujícím každý obal, který odpovídá této konstrukci;
 - (c) V případě konstrukce kusu typu B(U), typu B(M) nebo typu C, údajem „TYP B(U)“, „TYP B(M)“ nebo „TYP C“;
- 5.2.1.7.6 Každý kus, který odpovídá konstrukci kusu typu B(U), typu B(M) nebo typu C, musí být označen na vnější straně nejzvnějšší nádoby odolné vůči ohni a vodě vyrytím, vyražením nebo jiným způsobem odolným vůči ohni a vodě trojlístkovým symbolem uvedeným na obrázku níže.

² Rozlišovací značka státu registrace používaná na motorových a přípojných vozidlech v mezinárodním silničním provozu, např. podle Ženevské úmluvy o silničním provozu z roku 1949 nebo Vídeňské úmluvy o silničním provozu z roku 1968.

Základní symbol trojlístku s rozměry vycházejícími ze střední kružnice o poloměru X. Nejmenší dovolený rozměr X musí být 4 mm.

Jakákoli značka na kusu vyznačená v souladu s požadavky 5.2.1.7.4 (a) a (b) a 5.2.1.7.5 (c) vztahující se k typu kusu, která nesouvisí s UN číslem a oficiálním pojmenováním pro přepravu přiděleným zásilce, musí být odstraněna nebo zakryta.

- 5.2.1.7.7 Jestliže jsou látky LSA-I nebo SCO-I obsaženy v nádobách nebo obalových materiálech a jsou přepravovány za výlučného použití dovoleného podle 4.1.9.2.4 ADR, vnější povrch těchto nádob nebo obalových materiálů smí být opatřen značkou "RADIOAKTIVNÍ LSA-I" nebo "RADIOAKTIVNÍ SCO-I".
- 5.2.1.7.8 Ve všech případech mezinárodní přepravy kusů vyžadující schválení konstrukčního vzoru kusu nebo povolení odesláním příslušným orgánem, pro které se užívají různé typy schválení nebo povolení v různých zemích, jichž se přeprava týká, musí být označení v souladu s osvědčením země původu konstrukčního vzoru kusu.
- 5.2.1.8 **Ustanovení o zvláštním označení pro látky ohrožující životní prostředí**
- 5.2.1.8.1 Kusy obsahující látky ohrožující životní prostředí splňující kritéria uvedená v 2.2.9.1.10 musí být trvanlivě označeny značkou pro látky ohrožující životní prostředí vyobrazenou v 5.2.1.8.3, s výjimkou samostatných obalů a skupinových obalů, pokud takové samostatné obaly nebo vnitřní obaly takových skupinových obalů mají:
- množství nejvýše 5 litrů pro kapaliny, nebo
 - čistou hmotnost nejvýše 5 kg pro tuhé látky.
- 5.2.1.8.2 Značka pro látky ohrožující životní prostředí musí být umístěna v bezprostřední blízkosti značek vyžadovaných podle 5.2.1.1. Požadavky uvedené v 5.2.1.2 a 5.2.1.4 musí být splněny.
- 5.2.1.8.3 Značka pro látky ohrožující životní prostředí musí odpovídat obrázku 5.2.1.8.3.

Obrázek 5.2.1.8.3

Značka pro látky ohrožující životní prostředí

Značka musí mít tvar čtverce postaveného na vrchol pod úhlem 45° (tvar diamantu). Symbol (ryba a strom) musí být černý na bílém nebo vhodném kontrastním podkladu. Minimální rozměry musí být 100 × 100 mm a minimální šířka čáry tvořící diamant musí být 2 mm. Jestliže to vyžaduje velikost kusu, rozměry/tloušťka čáry mohou být zmenšeny, pokud značky zůstanou jasně viditelné. Tam, kde nejsou udány rozměry, musí všechny prvky proporčně odpovídat uvedenému obrázku.

POZNÁMKA: Ustanovení o označování bezpečnostními značkami v 5.2.2 platí dodatečně k jakémukoli požadavku na označení kusů značkou pro látky ohrožující životní prostředí.

5.2.1.9 Značka pro lithiové baterie

5.2.1.9.1 Kusy, které obsahují lithiové články nebo baterie připravené v souladu se zvláštním ustanovením 188 kapitoly 3.3, musí být označeny tak, jak je znázorněno na obrázku 5.2.1.9.2.

5.2.1.9.2 Značení musí zahrnovat UN číslo s předřazenými písmeny „UN“, tj. UN 3090 pro baterie nebo články lithiové kovové nebo UN 3480 pro baterie nebo články lithium-iontové. V případě, že jsou lithiové články nebo baterie obsaženy nebo zabaleny v zařízení, musí být uvedeno UN číslo s předřazenými písmeny UN, tj. UN 3091 nebo 3481, jak je to vhodné. V případě, že kus obsahuje lithiové články nebo baterie různých UN čísel, musí být na jedné nebo více značkách uvedena všechna použitelná UN čísla.

Obrázek 5.2.1.9.2

Značka pro lithiové baterie

* Místo pro UN číslo(a)
 ** Místo pro telefonní číslo pro dodatečné informace

Značka musí být ve tvaru obdélníku nebo čtverce se šrafovaným okrajem. Značka musí být minimálně 100 mm široká × 100 mm vysoká a minimální šířka šrafování musí být 5 mm. Symbol (skupina baterií, jedna poškozená se šlehajícím plamenem, nad UN číslem pro lithium-iontové nebo lithium-kovové baterie nebo články) musí být černý na bílém nebo vhodně kontrastním podkladu. Šrafování musí být červené. Vyžaduje-li to velikost kusu, rozměry mohou být zmenšeny na nejméně 100 mm šířky × 70 mm výšky. Tam, kde rozměry nejsou uvedeny, musí všechny prvky proporčně odpovídat uvedenému obrázku.

5.2.1.10 **Orientační šipky**

5.2.1.10.1 S výjimkou ustanovení v 5.2.1.10.2:

- skupinové obaly s vnitřními obaly obsahujícími kapaliny;
- samostatné obaly opatřené odvětrávacími otvory;
- kryogenní nádoby určené k přepravě hluboce zchlazených zkapalněných plynů a
- stroje nebo přístroje obsahující kapalné nebezpečné věci, pokud je nutné zajistit, aby kapalné nebezpečné věci zůstaly v požadované poloze (viz zvláštní ustanovení 301 kapitoly 3.3),

musí být zřetelně označeny orientačními šipkami, které jsou podobné vyobrazením uvedeným níže nebo které odpovídají specifikacím v normě ISO 780:1997. Orientační šipky musí být umístěny na dvou protilehlých svislých stranách kusu se šipkami směřujícími správně směrem nahoru. Musí být pravouhlé a velikosti, která je zřetelně viditelná s ohledem na velikost kusu. Vyznačení pravouhlého orámování kolem šipek je nepovinné.

Obrázek 5.2.1.10.1.1

Obrázek 5.2.1.10.1.2

nebo

Dvě černé nebo červené šipky na bílém nebo vhodném kontrastním podkladu.
Pravouhlé orámování není povinné.

Všechny prvky musí být v proporcích přibližně odpovídajících zobrazeným rozměrům.

5.2.1.10.2 Orientační šipky se nevyžadují:

- (a) na vnějších obalech obsahujících tlakové nádoby, s výjimkou kryogenních nádob;
- (b) na vnějších obalech obsahujících nebezpečné věci ve vnitřních obalech, z nichž každý obsahuje nejvýše 120 ml, s dostatečným množstvím absorpčního materiálu mezi vnitřními a vnějšími obaly, aby zcela pohltil kapalný obsah;
- (c) na vnějších obalech obsahujících infekční látky třídy 6.2 v primárních nádobách, z nichž každá obsahuje nejvýše 50 ml;
- (d) na kusech typu IP-2, IP-3, Typu A, Typu B(U), Typu B(M) nebo Typu C obsahujících radioaktivní látky třídy 7;
- (e) na vnějších obalech obsahujících předměty, které jsou těsné v každé poloze (např. alkohol nebo rtuť v teploměrech, aerosoly atd.); nebo
- (f) na vnějších obalech obsahujících nebezpečné věci v hermeticky uzavřených vnitřních obalech, z nichž každý obsahuje nejvýše 500 ml.

5.2.1.10.3

Orientační šipky pro jiné účely, než pro udání správné orientace kusu nesmějí být na kuse označeném podle tohoto pododdílu použity.

5.2.2 Označování kusů

5.2.2.1 Ustanovení o označování bezpečnostními značkami

5.2.2.1.1 Pro každý předmět nebo látku uvedené v tabulce A kapitoly 3.2 musí být pro označení použity bezpečnostní značky uvedené ve sloupci (5), pokud není stanoveno jinak zvláštním ustanovením uvedeným ve sloupci (6).

5.2.2.1.2 Místo bezpečnostních značek mohou být použity nesmazatelné značky nebezpečí odpovídající přesně předepsaným vzorům bezpečnostních značek.

5.2.2.1.3 až 5.2.2.1.5 (Vyhrazeno)

5.2.2.1.6 S výhradou ustanovení uvedených v 5.2.2.1.2, musí být každá bezpečnostní značka:

- (a) umístěna na tentýž povrch kusu, pokud to dovolují rozměry kusu; u kusů třídy 1 a 7 musí být v blízkosti oficiálního pojmenování pro přepravu;
- (b) umístěna na kusu tak, aby ji nezakrývala nebo nezastiňovala jiná část nebo příslušenství obalu nebo jiná bezpečnostní značka nebo nápis;
- (c) umístěna přímo jedna vedle druhé, pokud se vyžaduje více než jedna bezpečnostní značka.

Jestliže je kus nepravidelného tvaru nebo je malých rozměrů, takže bezpečnostní značka nemůže být umístěna uspokojivým způsobem, může být bezpečnostní značka bezpečně připevněna např. provázkem nebo jiným vhodným prostředkem.

5.2.2.1.7 IBC s vnitřním objemem větším než 450 litrů a velké obaly musí být opatřeny bezpečnostními značkami na dvou protilehlých stranách.

5.2.2.1.8 (Vyhrazeno)

5.2.2.1.9 *Zvláštní ustanovení pro označování samovolně se rozkládajících látek a organických peroxidů bezpečnostními značkami*

- (a) Bezpečnostní značka podle vzoru č. 4.1 také ukazuje, že produkt může být hořlavý, a proto se nevyžaduje žádná bezpečnostní značka podle vzoru č. 3. Kromě toho musí být použita bezpečnostní značka podle vzoru č. 1 pro samovolně se rozkládající látky typu B, ledaže příslušný orgán povolil nepoužití této bezpečnostní značky vzhledem ke zvláštnímu obalu, protože zkušební výsledky prokázaly, že samovolně se rozkládající látka v takovém obalu nevykazuje výbušnou vlastnost.
- (b) Bezpečnostní značka podle vzoru č. 5.2 ukazuje také, že produkt může být hořlavý, a proto se nevyžaduje žádná bezpečnostní značka podle vzoru č. 3. Kromě toho se musí použít následující bezpečnostní značky:
 - (i) bezpečnostní značka podle vzoru č. 1 pro organické peroxidy typu B, ledaže příslušný orgán povolil nepoužití této bezpečnostní značky vzhledem ke zvláštnímu obalu, protože zkušební výsledky prokázaly, že organický peroxid v takovém obalu nevykazuje výbušnou vlastnost.
 - (ii) bezpečnostní značka podle vzoru č. 8 se vyžaduje, pokud jsou splněna kritéria pro obalovou skupinu I nebo II třídy 8.

Bezpečnostní značky, které musí být použity pro jmenovitě uvedené samovolně se rozkládající látky a organické peroxidy, jsou uvedeny v seznamu v pododdílu 2.2.41.4, popřípadě 2.2.52.4.

5.2.2.1.10 Zvláštní ustanovení pro označování kusů obsahujících infekční látky bezpečnostními značkami

Kromě bezpečnostní značky podle vzoru č. 6.2 musí být kusy obsahující infekční látky označeny jakoukoli jinou požadovanou bezpečnostní značkou podle povahy jejich obsahu.

5.2.2.1.11 Zvláštní ustanovení pro označování kusů obsahujících radioaktivní látky bezpečnostními značkami

5.2.2.1.11.1 S výjimkou případů, kdy jsou použity zvětšené bezpečnostní značky podle 5.3.1.1.3, každý kus, přepravní obalový soubor a kontejner obsahující radioaktivní látku, musí být opatřen bezpečnostními značkami odpovídajícími vzorům č. 7A, 7B nebo 7C podle příslušné kategorie. Bezpečnostní značky musí být umístěny vně na dvě protilehlé strany kusu nebo přepravního obalového souboru nebo na

všechny čtyři strany kontejneru nebo cisterny. Kromě toho každý kus, přepravní obalový soubor a kontejner obsahující štěpnou látku, jinou než štěpnou látku vyjmutou podle ustanovení v 2.2.7.2.3.5, musí být opatřeny navíc bezpečnostními značkami podle vzoru č. 7E; pokud jsou nutné, musí být tyto bezpečnostní značky umístěny bezprostředně vedle bezpečnostních značek odpovídajících příslušnému vzoru č. 7A, 7B nebo 7C. Bezpečnostní značky nesmějí zakrývat značky uvedené v oddílu 5.2.1. Všechny bezpečnostní značky, které se nevztahují k obsahu, se musí odstranit nebo zakrýt.

5.2.2.1.11.2 Každá bezpečnostní značka podle příslušného vzoru č. 7A, 7B nebo 7C musí být doplněna následujícími údaji:

(a) **Obsah:**

(i) Kromě látek LSA-I pojmenování radionuklidu(ů) převzatých z tabulky 2.2.7.2.2.1 s použitím symbolů v ní předepsaných. Pro směsi radionuklidů musí být uvedeny nuklidy s nejomezenější hodnotou, pokud to dovoluje místo v řádku. Za pojmenováním radionuklidu(ů) musí být uvedena skupina LSA nebo SCO. Pro tento účel se musí použít označení "LSA-II", "LSA-III", "SCO-I" a "SCO-II".

(ii) Pro látky LSA-I je nezbytné jen označení "LSA-I"; pojmenování radionuklidu není nutné.

(b) **Aktivita:** Maximální aktivita radioaktivního obsahu během přepravy vyjádřená v becquerelech (Bq) s příslušným symbolem SI předpony (viz 1.2.2.1). U štěpných látek může být udána místo aktivity celková hmotnost štěpných nuklidů v gramech (g) nebo jejich násobcích.

(c) U přepravních obalových souborů a kontejnerů musí být údaje "Obsah" a "Aktivita" požadované v odstavcích (a) a (b) výše uvedeny na bezpečnostní značce, přičemž celkový obsah přepravního obalového souboru nebo kontejneru se sčítá; výjimkou jsou bezpečnostní značky pro přepravní obalové soubory nebo kontejnery obsahující smíšené náklady kusů s různými radionuklidy, jejichž údaje mohou znít "Viz přepravní doklady".

(d) **Přepravní index (TI):** viz 5.1.5.3.1 a 5.1.5.3.2 (kromě kategorie I-BÍLÁ).

5.2.2.1.11.3 Každá bezpečnostní značka podle vzoru č. 7E musí být doplněna indexem bezpečné podkritičnosti (CSI), jak je uvedeno v osvědčení o schválení platném v zemích, přes které nebo do kterých je zásilka přepravovaná, a vydaném příslušným orgánem nebo jak je uvedeno v 6.4.11.2 nebo 6.4.11.3 ADR.

5.2.2.1.11.4 U přepravních obalových souborů a kontejnerů musí být na bezpečnostní značce č. 7E uveden součet indexů bezpečné podkritičnosti všech kusů obsažených uvnitř.

5.2.2.1.11.5 Ve všech případech mezinárodní přepravy kusů vyžadující schválení konstrukčního vzoru kusu nebo povolení odeslání příslušným orgánem, pro které se užívají různé typy schválení nebo povolení v různých zemích, jichž se přeprava týká, musí být označení bezpečnostními značkami v souladu s osvědčením země původu konstrukčního vzoru kusu.

5.2.2.1.12 Zvláštní ustanovení pro označování předmětů obsahujících nebezpečné věci přepravované pod UN čísla 3537, 3538, 3539, 3540, 3541, 3542, 3543, 3544, 3545, 3546, 3547 a 3548.

5.2.2.1.12.1 Kusy obsahující předměty nebo nebalené předměty musí být opatřeny bezpečnostními značkami podle 5.2.2.1, které zahrnují nebezpečí stanovená podle oddílu 2.1.5 s tím rozdílem, že u předmětů, které navíc obsahují lithiové baterie, není vyžadována značka lithiové baterie nebo bezpečnostní značka podle vzoru 9A.

5.2.2.1.12.2 Je-li vyžadováno, aby předměty obsahující kapalné nebezpečné věci zůstaly v požadované orientaci, musí být na nejméně dvou protilehlých svislých stranách obalu nebo nebaleného předmětu umístěny směrové šipky, které splňují požadavky pododdílu 5.2.1.10.1, pokud je to možné, šipky směřují správně směrem nahoru.

5.2.2.2 **Ustanovení o bezpečnostních značkách**

5.2.2.2.1 Bezpečnostní značky musí splňovat dále uvedená ustanovení a odpovídat barvami, symboly a tvarem vzorům uvedeným v 5.2.2.2.2. Odpovídající vzory vyžadované pro jiné druhy dopravy, s menšími modifikacemi, které neovlivňují zřejmý význam bezpečnostní značky, jsou také dovoleny.

POZNAMKA: V určitých případech jsou bezpečnostní značky v odstavci 5.2.2.2.2 znázorněny s vytečkovaným vnějším orámováním dle odstavce 5.2.2.2.1.1. Toto se nevyžaduje, je-li bezpečnostní značka umístěna na podkladu v kontrastní barvě.

5.2.2.2.1.1 Bezpečnostní značky musí odpovídat obrázku 5.2.2.2.1.1

- * V dolním rohu musí být uvedeno číslo třídy nebo, pro třídy 4.1, 4.2 a 4.3, číslice „4“ nebo, pro třídy 6.1 a 6.2, číslice „6“.
- ** V dolní polovině musí být (pokud je to povinné) nebo smí být (pokud je to nepovinné) uveden dodatečný text/číslo/symbol /písmena.
- *** V horní polovině musí být uveden symbol třídy nebo, pro podtřídy 1.4, 1.5 a 1.6, číslo podtřídy a pro vzor č. 7E nápis „FISSILE“.

5.2.2.2.1.1.1 Bezpečnostní značky musí být umístěny na podkladu v kontrastní barvě, nebo musí být orámovány buď vytečkovanou, nebo plnou čarou.

5.2.2.2.1.1.2 Bezpečnostní značka musí mít tvar čtverce postaveného na vrchol pod úhlem 45° (tvar diamantu). Minimální rozměry musí být 100 × 100 mm. Uvnitř hrany musí být čára tvořící diamant, která musí být rovnoběžná s vnějším okrajem a přibližně 5 mm od vnější strany této čáry k okraji bezpečnostní značky. V horní polovině bezpečnostní značky musí mít vnitřní čára stejnou barvu jako symbol a v dolní polovině musí mít stejnou barvu jako číslo třídy nebo podtřídy v dolním rohu. Tam, kde nejsou udány rozměry, musí všechny prvky proporcčně odpovídat uvedenému obrázku.

5.2.2.2.1.1.3 Jestliže to vyžaduje velikost kusu, smějí být rozměry bezpečnostní značky proporcčně zmenšeny, pokud zůstanou symboly a další prvky bezpečnostní značky zřetelně viditelné. Rozměry bezpečnostních značek pro láhve musí být v souladu s pododdílem 5.2.2.2.1.2.

5.2.2.2.1.2 Plynové láhve pro třídu 2 mohou být vzhledem ke svému tvaru, pozici a fixačním systémům pro přepravu, opatřeny bezpečnostními značkami podobnými těm, které jsou předepsány v tomto oddílu a bezpečnostními značkami pro látky ohrožující životní prostředí, je-li to nutné, ale s rozměry zmenšenými podle normy ISO 7225:2005 "Gas cylinders - Precautionary labels" (Plynové lahve - Výstražné bezpečnostní značky), aby mohly být umístěny na necylindrickou část (hrdla) takových lahví.

POZNÁMKA: Je-li průměr lahve příliš malý, aby bylo označení uvedená možné umístit bezpečnostní značky zmenšené velikosti na necylindrickou horní část lahve, mohou být zmenšené bezpečnostní značky umístěny na válcové části

Bez ohledu na ustanovení v 5.2.2.1.6 se bezpečnostní značky a značka pro látky ohrožující životní prostředí (viz 5.2.1.8.3) mohou překrývat v rozsahu stanoveném normou ISO 7225:2005. Avšak ve všech případech bezpečnostní značka hlavního nebezpečí a číslice uvedené na jakékoli bezpečnostní značce musí zůstat plně viditelné a symboly rozeznatelné.

Prázdné nevyčištěné tlakové nádoby pro plyny třídy 2 mohou být přepravovány se zastaralými nebo poškozenými bezpečnostními značkami za účelem nového naplnění, popřípadě prohlídky a umístění nové bezpečnostní značky v souladu s platnými předpisy, nebo likvidace tlakové nádoby.

5.2.2.2.1.3 S výjimkou bezpečnostních značek pro podtřídy 1.4, 1.5 a 1.6 třídy 1 musí horní polovina bezpečnostní značky obsahovat obrazový symbol a dolní polovina musí obsahovat:

- (a) pro třídy 1, 2, 3, 5.1, 5.2, 7, 8 a 9 číslo třídy;
- (b) pro třídy 4.1, 4.2 a 4.3 číslici „4“;
- (c) pro třídy 6.1 a 6.2 číslici „6“.

Avšak v případě bezpečnostní značky č. 9A, musí horní polovina značky obsahovat pouze sedm svislých pruhů a dolní polovina symbol skupiny baterií a číslo třídy.

S výjimkou bezpečnostní značky č. 9A, bezpečnostní značky smějí obsahovat text, jako je UN číslo nebo slova popisující nebezpečí (např. „hořlavý“) podle 5.2.2.2.1.5, pokud tento text nezakrývá nebo nesnižuje význam jiných informací, které musí být na bezpečnostní značce.

5.2.2.2.1.4 Kromě toho musí být na bezpečnostních značkách pro třídu 1, s výjimkou podtříd 1.4, 1.5 a 1.6, uvedeno v jejich dolní polovině, nad číslem třídy, číslo podtřídy a písmeno skupiny snášenlivosti pro látku nebo předmět. Na bezpečnostních značkách pro podtřídy 1.4, 1.5 a 1.6 musí být v jejich horní polovině uvedeno číslo podtřídy a v dolní polovině číslo třídy a písmeno skupiny snášenlivosti.

5.2.2.2.1.5 Na bezpečnostních značkách, s výjimkou bezpečnostních značek pro třídu 7, musí být uveden jakéhokoli případného textu (jiného než číslo třídy) v prostoru pod symbolem omezeno na údaje o povaze nebezpečí a o bezpečnostních opatřeních při manipulaci.

5.2.2.2.1.6 Symboly, text a čísla musí být dobře čitelné a nesmazatelné a na všech bezpečnostních značkách musí být uvedeny v černé barvě, kromě:

- (a) bezpečnostní značky třídy 8, na které jsou eventuální text a číslo třídy uvedeny v barvě bílé;
- (b) bezpečnostních značek s plným zeleným, červeným nebo modrým podkladem, na kterých symboly, text čísla mohou být uvedeny v barvě bílé.
- (c) bezpečnostní značky třídy 5.2, na které smí být symbol v bílé barvě; a
- (d) bezpečnostní značky podle vzoru č. 2.1 umístěné na lahve a malé nádoby obsahující zkapalněné ropné plyny, kde mohou být uvedeny na podkladové barvě nádoby, jestliže je zajištěn jejich dostatečný kontrast.

5.2.2.2.1.7 Všechny bezpečnostní značky musí být schopné odolat povětrnostním účinkům bez podstatného snížení jejich čitelnosti.

5.2.2.2.2 Vzory bezpečnostních značek

Bezpečnostní značka	Podtřída nebo kategorie	Symbol a barva symbolu	Podklad	Číslice ve spodním rohu (a barva číslice)	Vzory bezpečnostních značek	Poznámka
1	Podtřída 1.1, 1.2, 1.3	Vybuchující puma: černá	oranžový	1 (černá)		** Podtřída – neudává se, je-li výbušnost vedlejší * Skupina snášlivosti – neudává se, je-li výbušnost vedlejší
1.4	Podtřída 1.4	Výška číslic musí být přibližně 30 mm a Tloušťka čáry přibližně 5 mm (u bezpečnostní značky o rozměrech 100 mm x 100 mm)	oranžový	1 (černá)		* Skupina snášlivosti
1.5	Podtřída 1.5	Výška číslic musí být přibližně 30 mm a Tloušťka čáry přibližně 5 mm (u bezpečnostní značky o rozměrech 100 mm x 100 mm)	oranžový	1 (černá)		* Skupina snášlivosti
1.6	Podtřída 1.6	Výška číslic musí být přibližně 30 mm a Tloušťka čáry přibližně 5 mm (u bezpečnostní značky o rozměrech 100 mm x 100 mm)	oranžový	1 (černá)		* Skupina snášlivosti

Bezpečnostní značka	Podtřída nebo kategorie	Symbol a barva symbolu	Podklad	Číslice ve spodním rohu (a barva číslice)	Vzory bezpečnostních značek	Poznámka
Nebezpečí třídy 2: Plyny						
2.1	Hořlavé plyny	Plamen: černý nebo bílý (s výjimkou případů uvedených v 5.2.2.2.1.6 (d))	Červený	2 (černá nebo bílá) (s výjimkou případů uvedených v 5.2.2.2.1.6 (d))		-
2.2	Nehořlavé, netoxické plyny	Plynová láhev: černá nebo bílá	Zelený	2 (černá nebo bílá)		-
2.3	Toxické plyny	Lebka na zkřížených kostech: černá	Bílý	2 (černá)		-
Nebezpečí třídy 3: Hořlavé kapaliny

KAPITOLA 5.3

OZNAČOVÁNÍ KONTEJNERŮ, KONTEJNERŮ PRO VOLNĚ LOŽENÉ LÁTKY, MEGC, MEMU, CISTERNOVÝCH KONTEJNERŮ, PŘEMÍSTITELNÝCH CISTEREN, VOZIDEL A ŽELEZNIČNÍCH VOZŮ VELKÝMI BEZPEČNOSTNÍMI ZNAČKAMI A NÁPISY

POZNÁMKA 1: K označování kontejnerů, kontejnerů pro volně ložené látky, MEGC, cisternových kontejnerů a přemístitelných cisteren nápisy a velkými bezpečnostními značkami pro přepravu v přepravním řetězci zahrnujícím námořní dopravu viz též 1.1.4.2.1. Jestliže se použijí ustanovení 1.1.4.2.1 (c), smí se použít pouze ustanovení 5.3.1.3 a 5.3.2.1.1 této kapitoly.

POZNÁMKA 2: V souladu se systémem GHS smí být výstražný symbol GHS, který není vyžadován dohodou ADN uveden pouze jako součást úplného označení GHS a ne samostatně (viz GHS 1.4.10.4.4).

5.3.1 Označování velkými bezpečnostními značkami

5.3.1.1 Všeobecná ustanovení

5.3.1.1.1 Pokud to vyžadují ustanovení tohoto oddílu, musí být velké bezpečnostní značky umístěny na vnější povrch kontejnerů, kontejnerů pro volně ložené látky, MEGC, MEMU, cisternových kontejnerů, přemístitelných cisteren, vozidel a železničních vozů. Velké bezpečnostní značky musí odpovídat bezpečnostním značkám požadovaným ve sloupci (5) a popřípadě sloupci (6) tabulky A kapitoly 3.2 pro nebezpečné věci obsažené v kontejneru, kontejneru pro volně ložené látky, MEGC, MEMU, cisternovém kontejneru, přemístitelné cisterně, vozidle nebo železničním voze a současně odpovídat specifikacím uvedeným v pododdílu 5.3.1.7. Velké bezpečnostní značky musí být umístěny na podkladu v kontrastní barvě, nebo musí být ohraničeny buď vytečkovanou, nebo plnou čarou. Velké bezpečnostní značky musí být odolné proti povětrnostním podmínkám a musí zaručovat trvanlivé označení po celou dobu přepravy.

5.3.1.1.2 Pro třídu 1 nesmí být na velkých bezpečnostních značkách uvedeny skupiny snášenlivosti, pokud vozidlo nebo železniční vůz nebo kontejner nebo zvláštní komory MEMU přepravují látky nebo předměty spadající do dvou nebo více skupin snášenlivosti. Vozidla nebo železniční vozy nebo kontejnery nebo zvláštní komory MEMU přepravující látky nebo předměty různých podtříd musí být označeny pouze velkými bezpečnostními značkami odpovídajícími vzoru nejnebezpečnější podtřídy v tomto pořadí:

1.1 (nejnebezpečnější), 1.5, 1.2, 1.3, 1.6, 1.4 (nejméně nebezpečné).

Jsou-li látky klasifikačního kódu 1.5 D přepravovány s látkami nebo předměty podtřídy 1.2, musí být vozidlo, železniční vůz nebo kontejner označeny velkou bezpečnostní značkou pro podtřídu 1.1.

Velké bezpečnostní značky se nevyžadují pro přepravu výbušných látek a předmětů podtřídy 1.4, skupiny snášenlivosti S.

5.3.1.1.3 Pro třídu 7 musí velká bezpečnostní značka pro hlavní nebezpečí odpovídat vzoru č. 7D popsanému v 5.3.1.7.2. Tato velká bezpečnostní značka se nevyžaduje pro vozidla, železniční vozy nebo kontejnery přepravující vyjmuté kusy a pro malé kontejnery.

Pokud je předepsáno pro třídu 7 umístění jak bezpečnostních značek, tak také velkých bezpečnostních značek na vozidla, železniční vozy, kontejnery, MEGC, cisternové kontejnery nebo přemístitelné cisterny, mohou být označeny zvětšenou bezpečnostní značkou odpovídající požadované bezpečnostní značce podle vzoru č. 7A, 7B nebo 7C namísto velké bezpečnostní značky podle vzoru č. 7D, aby se splnily oba účely. V tomto případě nesmějí být rozměry menší než 250 × 250 mm.

5.3.1.1.4 Pro třídu 9 musí velká bezpečnostní značka pro označování vozidel odpovídat vzoru bezpečnostní značky č. 9, jak je uvedeno v pododdílu 5.2.2.2.2; Bezpečnostní značka podle vzoru č. 9A nesmí být použita pro účely označování vozidel.

- 5.3.1.1.5 Kontejnery, MEGC, MEMU, cisternové kontejnery, přemístitelné cisterny, vozidla nebo železniční vozy, které obsahují věci více tříd, nemusí být opatřeny velkou bezpečnostní značkou pro vedlejší nebezpečí, jestliže nebezpečí označené touto velkou bezpečnostní značkou je již uvedeno velkou bezpečnostní značkou pro hlavní nebo vedlejší nebezpečí.
- 5.3.1.1.6 Velké bezpečnostní značky, která se nevztahují na přepravované nebezpečné věci nebo jejich zbytky, musí být odstraněny nebo zakryty.
- 5.3.1.1.7 Jsou-li velké bezpečnostní značky připevněny na sklopných panelech, musí být konstruovány a zajištěny tak, aby se nemohly rozevřít nebo se uvolnit z držáku během přepravy (zejména jako výsledek rázů nebo neúmyslných činností).

5.3.1.2 Umístění velkých bezpečnostních značek na kontejnery, kontejnery pro volně ložené látky, MEGC, cisternové kontejnery a přemístitelné cisterny

POZNÁMKA: Tento pododdíl se nevztahuje na výměnné nástavby, kromě cisternových výměnných nástaveb přepravovaných na vozidlech s oranžovým označením uvedeným v 5.3.2.

Velké bezpečnostní značky se umísťují na obě podélné strany a na každý konec kontejneru, kontejneru pro volně ložené látky, MEGC, cisternového kontejneru nebo přemístitelné cisterny a na dvě protilehlé strany v případě flexibilních kontejnerů pro volně ložené látky.

Vícekomorový cisternový kontejner nebo vícekomorová přemístitelná cisterna, kterými se přepravují dvě nebo více nebezpečných látek, musí být opatřeny příslušnými velkými bezpečnostními značkami na obou bočních stranách příslušných komor a na obou koncích velkou bezpečnostní značkou každého vzoru, jímž jsou opatřeny jednotlivé komory na bocích. V případě, že všechny komory musí být označeny stejnými velkými bezpečnostními značkami, tyto velké bezpečnostní značky mohou být umístěny pouze jednou po obou stranách a na obou koncích cisternového kontejneru nebo přemístitelné cisterny.

5.3.1.3 Umístění velkých bezpečnostních značek na vozidla a železniční vozy přepravující kontejnery, kontejnery pro volně ložené látky, MEGC, cisternové kontejnery a přemístitelné cisterny

POZNÁMKA: Tento pododdíl se nevztahuje na výměnné nástavby, kromě cisternových výměnných nástaveb přepravovaných na vozidlech s oranžovým označením uvedeným v 5.3.2.

Pokud velké bezpečnostní značky umístěné na kontejnerech, kontejnerech pro volně ložené látky, MEGC, cisternových kontejnerech nebo na přemístitelných cisternách nejsou viditelné zvnějšku je přepravujících vozidel nebo železničních vozů, tytéž velké bezpečnostní značky musí být umístěny na obou bočních stranách a na zadní straně vozidla nebo železničního vozu. Jinak nemusí být na nosném vozidle nebo železničním voze žádná velká bezpečnostní značka.

5.3.1.4 Umístění velkých bezpečnostních značek na vozidla a železniční vozy pro přepravu volně ložených látek, na cisternová vozidla, cisternové vozy, bateriová vozidla, bateriové vozy, MEMU, na vozidla a železniční vozy se snímatelnými cisternami

- 5.3.1.4.1 Velké bezpečnostní značky musí být umístěny na obou bočních stranách a na zadní straně vozidla, nebo pro železniční vozy, na obou bočních stranách.

Pokud má cisternové vozidlo, cisternový vůz, snímatelná cisterna přepravovaná na vozidle nebo snímatelná cisterna přepravovaná na železničním voze více komor, kterými se přepravují dvě nebo více nebezpečných látek, musí být opatřeny příslušnými velkými bezpečnostními značkami na každé straně příslušné komory a (jen vozidla) na zadní straně vozidla velkou bezpečnostní značkou každého vzoru, jímž jsou opatřeny jednotlivé komory na bocích. V případě, že všechny komory musí být označeny stejnými velkými bezpečnostními značkami, tyto velké bezpečnostní značky mohou být umístěny pouze po jedné na každé boční straně a (jen vozidla) na zadní straně vozidla.

Pokud je požadováno více než jedna velká bezpečnostní značka na jednu a tutéž komoru, musí být tyto velké bezpečnostní značky umístěny bezprostředně vedle sebe.

POZNÁMKA: Pokud je cisternový návěs odpojen od svého tahače pro naložení na námořní nebo vnitrozemské plavidlo, velké bezpečnostní značky musí být umístěny též na přední straně návěsu.

- 5.3.1.4.2 MEMU s cisternami a kontejnery pro volně ložené látky musí být opatřeny velkými bezpečnostními značkami podle 5.3.1.4.1 pro látky, které obsahují. Pro cisterny o vnitřním objemu menším než 1 000 litrů směji být velké bezpečnostní značky nahrazeny bezpečnostními značkami podle 5.2.2.2.
- 5.3.1.4.3 Na MEMU přepravujících kusy obsahující látky nebo předměty třídy 1 (kromě podtřídy 1.4, skupiny snášenlivosti S) musí být velké bezpečnostní značky umístěny na obou bočních stranách a na zadní straně MEMU.
- Zvláštní komory pro výbušniny musí být označeny velkými bezpečnostními značkami podle ustanovení v 5.3.1.1.2. Poslední věta v 5.3.1.1.2 se nepoužije.
- 5.3.1.5 *Umístění velkých bezpečnostních značek na vozidla přepravující pouze kusy***
- POZNÁMKA:*** Tento pododdíl se vztahuje též na vozidla nebo železniční vozy přepravující výměnné nástavby naložené kusy.
- 5.3.1.5.1 Na vozidlech přepravujících kusy obsahující látky nebo předměty třídy 1 (jiné než látky nebo předměty podtřídy 1.4, skupiny snášenlivosti S) musí být velké bezpečnostní značky umístěny na obou bočních stranách a na zadní straně vozidla.
- 5.3.1.5.2 Na vozidlech přepravujících radioaktivní látky třídy 7 v kusech nebo IBC (kromě vyjmutých kusů) musí být velké bezpečnostní značky umístěny na obou bočních stranách a na zadní straně vozidla.
- POZNÁMKA:*** Jestliže je vozidlo přepravující kusy s nebezpečnými věcmi tříd jiných než tříd 1 a 7 naloženo na plavidlo pro přepravu podle ADN předcházející plavbě po moři, velké bezpečnostní značky musí být umístěny na obou bočních stranách a na zadní straně vozidla. Takové velké bezpečnostní značky mohou zůstat umístěny na vozidle pro přepravu podle ADN následující po plavbě po moři.
- 5.3.1.5.3 U železničních vozů přepravujících kusy musí být velké bezpečnostní značky odpovídající přepravovaným věcem umístěny na obou bočních stranách.
- 5.3.1.6 *Umístění velkých bezpečnostních značek na prázdná(é) cisternová vozidla, cisternové vozy, vozidla se snímatelnými cisternami, železniční vozy se snímatelnými cisternami, bateriová vozidla, bateriové vozy, MEGC, MEMU, cisternové kontejnery, přemístitelné cisterny a prázdná(é) vozidla, železniční vozy a kontejnery pro přepravu volně ložených látek***
- 5.3.1.6.1 Cisternová vozidla, cisternové vozy, vozidla se snímatelnými cisternami, železniční vozy se snímatelnými cisternami, bateriová vozidla, bateriové vozy, MEGC, MEMU, cisternové kontejnery a přemístitelné cisterny, vesměs prázdné, nevyčištěné a neodplynované, jakož i vozidla, železniční vozy a kontejnery pro přepravu volně ložených látek, prázdné a nevyčištěné, musí být označena(y) velkými bezpečnostními značkami vyžadovanými pro předchozí náklad.
- 5.3.1.7 *Specifikace velkých bezpečnostních značek***
- 5.3.1.7.1 Kromě velké bezpečnostní značky pro třídu 7 specifikované v 5.3.1.7.2 a značky pro látky ohrožující životní prostředí specifikované v 5.3.6.2, musí velká bezpečnostní značka odpovídat obrázku 5.3.1.7.1.

Obrázek 5.3.1.7.1

Velká bezpečnostní značka (kromě třídy 7)

Velká bezpečnostní značka musí mít tvar čtverce postaveného na vrchol pod úhlem 45° (tvar diamantu). Minimální rozměry musí být 250 × 250 mm (k okraji značky). Vnitřní čára značky musí být rovnoběžná s vnějším okrajem a musí od něj být vzdálena 12,5 mm. Symbol a vnitřní čára musí odpovídat barvě bezpečnostní značky pro příslušnou třídu nebo podtřídu nebezpečných věcí. Symbol/číslo třídy nebo podtřídy musí být umístěny a dimenzovány v rozměrech dle 5.2.2.2 pro odpovídající třídu nebo podtřídu příslušných nebezpečných věcí. Na velké bezpečnostní značce musí být číslo třídy nebo podtřídy (a pro věci třídy 1, písmeno skupiny snášenlivosti) příslušných nebezpečných věcí způsobem předepsaným v 5.2.2.2 pro odpovídající bezpečnostní značku, s výškou písma nejméně 25 mm. Tam, kde nejsou udány rozměry, musí všechny prvky proporčně odpovídat uvedenému obrázku.

5.3.1.7.2

Velká bezpečnostní značka pro třídu 7 nesmí být menší než 250 mm × 250 mm a černá čára, která probíhá paralelně s okraji uvnitř, musí být od okraje ve vzdálenosti 5 mm; jinak musí velká bezpečnostní značka odpovídat níže uvedenému vyobrazení (vzor č. 7D). Číslice „7“ musí mít výšku nejméně 25 mm. Podkladová barva horní poloviny velké bezpečnostní značky musí být žlutá a spodní polovina bílá, barva trojlístku a nápisu musí být černá. Použití výrazu „RADIOACTIVE“ ve spodní polovině je dobrovolné, aby bylo možno použít toto místo k uvedení příslušného UN čísla zásilky.

Velká bezpečnostní značka pro radioaktivní látky třídy 7

(č. 7 D)

Symbol (trojlístek): černý; Podklad: horní polovina žlutá s bílým okrajem, spodní polovina bílá; Ve spodní polovině musí být uvedeno slovo „RADIOACTIVE“ nebo alternativně, příslušné UN číslo a číslice „7“ v dolním rohu.

5.3.1.7.3 Pro cisterny s vnitřním objemem nejvýše 3 m³ a pro malé kontejnery mohou být velké bezpečnostní značky nahrazeny bezpečnostními značkami odpovídajícími pododdílu 5.2.2.2. Nejsou-li tyto bezpečnostní značky zvnějšku nosného vozidla nebo železničního vozu viditelné, musí být na obou bočních stranách železničního vozu a na obou bočních stranách a na zadní straně vozidla umístěny také velké bezpečnostní značky podle 5.3.1.7.1.

5.3.1.7.4 Pro třídy 1 a 7, jsou-li rozměry a konstrukce vozidla takové, že disponibilní plocha povrchu je nedostačující pro umístění předepsaných velkých bezpečnostních značek, jejich rozměry mohou být zmenšeny až na 100 mm na každé straně. Rozměry velkých bezpečnostních značek pro železniční vozy smějí být zmenšeny na 150 mm × 150 mm. V tomto případě ostatní rozměry předepsané pro trojlístek, čáry, číslice a písmena neplatí.

5.3.2 Označování oranžovými tabulkami

5.3.2.1 Všeobecná ustanovení pro označování oranžovými tabulkami

5.3.2.1.1 Dopravní jednotky přepravující nebezpečné věci musí být opatřeny dvěma pravoúhlými oranžovými tabulkami odpovídajícími ustanovením v 5.3.2.2.1, umístěnými ve svislé rovině. Musí být umístěny jedna na přední a druhá na zadní straně dopravní jednotky, obě kolmo k podélné ose dopravní jednotky. Musí být zřetelně viditelné.

Je-li přípojné vozidlo obsahující nebezpečné věci během přepravy odpojeno od svého motorového vozidla, musí oranžová tabulka zůstat umístěna na zadní straně přípojného vozidla. Pokud jsou cisterny označeny podle 5.3.2.1.3, musí oranžová tabulka odpovídat nejvíce nebezpečné látce přepravované v cisterně.

5.3.2.1.2 Pokud je ve sloupci (20) tabulky A kapitoly 3.2 ADR uvedeno identifikační číslo nebezpečnosti, cisternová vozidla, bateriová vozidla nebo dopravní jednotky s jednou nebo více cisternami přepravující nebezpečné věci musí být kromě toho opatřeny na obou bočních stranách každé cisterny nebo každé komory cisterny nebo každého článku bateriových vozidel zřetelně viditelnými a rovnoběžně s podélnou osou vozidla umístěnými oranžovými tabulkami předepsanými v 5.3.2.1.1. Na těchto oranžových tabulkách musí být uvedeno identifikační číslo nebezpečnosti a UN číslo předepsané ve sloupcích (20), popřípadě (1) tabulky A kapitoly 3.2 ADR pro každou z látek přepravovaných v cisterně, v komoře cisterny nebo v článku bateriového vozidla.

Ustanovení tohoto odstavce se vztahují rovněž na cisternové vozy, bateriové vozy a železniční vozy s mobilními cisternami. V tomto posledním případě je identifikačním číslem nebezpečnosti, které je nutno použít, číslo, které je uvedeno ve sloupci (20) tabulky A kapitoly 3.2 RID. Pro MEMU se tyto požadavky vztahují jen na cisterny o vnitřním objemu 1000 litrů nebo větším a na kontejnery pro volně ložené látky.

5.3.2.1.3 Na cisternových vozidlech nebo dopravních jednotkách s jednou nebo více cisternami přepravujících látky UN čísel 1202, 1203 nebo 1223 nebo letecké palivo zařazené pod UN čísla 1268 nebo 1863, ale ne jinou nebezpečnou látku, oranžové tabulky předepsané v 5.3.2.1.2 nemusí být umístěny, jestliže je tabulkách umístěných vpředu a vzadu podle 5.3.2.1.1 uvedeno identifikační čísla nebezpečnosti a UN číslo předepsané pro nejnebezpečnější přepravovanou látku, tj. látku s nejnižším bodem vzplanutí.

5.3.2.1.4 Pokud je ve sloupci (20) tabulky A kapitoly 3.2 ADR uvedeno identifikační číslo nebezpečnosti, vozidla, kontejnery a kontejnery pro volně ložené látky přepravující nebalené tuhé látky nebo předměty nebo balenou radioaktivní látku s jediným UN číslem vyžadujícím přepravu za výlučného použití a žádné jiné nebezpečné věci, musí být kromě toho opatřeny na obou bočních stranách každého vozidla kontejneru nebo kontejneru pro volně ložené látky zřetelně viditelnými a rovnoběžně s podélnou osou vozidla umístěnými oranžovými tabulkami předepsanými v 5.3.2.1.1. Na těchto oranžových tabulkách musí být uvedeno identifikační číslo nebezpečnosti a UN číslo předepsané ve sloupcích (20), popřípadě (1) tabulky A kapitoly 3.2 ADR pro každou z látek ve volně loženém stavu nebo pro balenou radioaktivní látku, vyžaduje-li přepravu za výlučného použití, přepravovaných ve vozidle, v kontejneru nebo kontejneru pro volně ložené látky.

Ustanovení tohoto odstavce se vztahují rovněž na železniční vozy pro přepravu volně ložených látek a na vozové zásilky kusů obsahujících pouze jednu látku. V posledním případě musí být použito identifikační číslo nebezpečnosti uvedené ve sloupci (20) tabulky A kapitoly 3.2 RID.

5.3.2.1.5 Pokud oranžové tabulky předepsané v 5.3.2.1.2 a 5.3.2.1.4, umístěné na kontejnerech, kontejnerech pro volně ložené látky, cisternových kontejnerech, MEGC nebo na přemístitelných cisternách nejsou dobře viditelné zvnějšku je přepravujícího vozidla, musí být tytéž tabulky umístěny na obou bočních stranách vozidla.

POZNÁMKA: Tento odstavec se nemusí použít pro označování oranžovými tabulkami, jde-li o uzavřená vozidla nebo vozidla s plachtou přepravující cisterny o nejvyšším vnitřním objemu 3000 litrů.

- 5.3.2.1.6 Pro dopravní jednotky přepravující pouze jednu nebezpečnou látku a žádnou látku, která není nebezpečná, nejsou oranžové tabulky předepsané v 5.3.2.1.2, 5.3.2.1.4 a 5.3.2.1.5 nezbytné, pokud je na oranžových tabulkách umístěných vpředu a vzadu podle 5.3.2.1.1 uvedeno identifikační číslo nebezpečnosti a UN číslo pro tuto látku předepsané ve sloupcích (20), popřípadě (1) tabulky A kapitoly 3.2 ADR.
- 5.3.2.1.7 Požadavky uvedené v 5.3.2.1.1 až 5.3.2.1.5 se vztahují také na nesnímatelné nebo snímatelné cisterny, bateriová vozidla, cisternové kontejnery, přemístitelné cisterny, MEGC, cisternové vozy, bateriové vozy a železniční vozy se snímatelnými cisternami, vesměs prázdné, nevyčištěné, neodplyněné nebo nedekontaminované, MEMU, nevyčištěné jakož i na vozidla a kontejnery pro přepravu volně ložených látek, vesměs prázdné, nevyčištěné nebo nedekontaminované.
- 5.3.2.1.8 Oranžové tabulky, které se nevztahují na přepravované nebezpečné věci nebo jejich zbytky, musí být odstraněny nebo zakryty. Pokud jsou oranžové tabulky zakryty, jejich kryty musí být celistvé a musí zůstat účinné po 15 minutách přímého působení ohně.

5.3.2.2 Specifikace oranžových tabulek

- 5.3.2.2.1 Oranžové tabulky musí být reflexivní a musí být 40 cm široké a 30 cm vysoké; musí mít černý okraj 15 mm široký. Použitý materiál musí být odolný proti povětrnosti a musí zaručovat trvanlivé označení. Tabulka se nesmí uvolnit ze svého držáku po 15 minutách přímého působení ohně. Musí zůstat upevněna bez ohledu na orientaci vozidla nebo železničního vozu. Tyto oranžové tabulky mohou být ve středu rozděleny vodorovnou černou čarou o tloušťce 15 mm.

Jestliže rozměry a konstrukce vozidla jsou takové, že disponibilní povrch je nedostačující pro umístění těchto oranžových tabulek, jejich rozměry mohou být zmenšeny na minimální šířku 300 mm, výšku 120 mm a šířku černého okraje 10 mm. V takovém případě smíjí mít dvě oranžové tabulky popsané v 5.3.2.1.1 různé rozměry v předepsaných mezích.

V případě použití zmenšených oranžových tabulek pro balenou radioaktivní látku přepravovanou za výlučného použití se vyžaduje jen UN číslo a velikost číslic předepsaných v 5.3.2.2.2 smí být zmenšena na 65 mm výšky a 10 mm tloušťky čáry.

Pro železniční vozy je povolena nereflexní barva.

Na kontejnerech přepravujících nebezpečné tuhé látky ve volně loženém stavu a na cisternových kontejnerech, MEGC a přemístitelných cisternách mohou být oranžové tabulky předepsané v 5.3.2.1.2, 5.3.2.1.4 a 5.3.2.1.5 nahrazeny samolepicí fólií, barevným nátěrem nebo jakýmkoli jiným rovnocenným způsobem.

Toto alternativní označení musí odpovídat specifikacím uvedeným v tomto pododdlílu, s výjimkou ustanovení týkajících se odolnosti proti ohni uvedených v 5.3.2.2.1 a 5.3.2.2.2.

POZNÁMKA: Barva oranžových tabulek v podmínkách normálního užívání musí mít souřadnice barevnosti ležící uvnitř plochy diagramu barevnosti vytvořeného spojením následujících souřadnic:

Souřadnice barevnosti bodů v rozích plochy diagramu barevnosti				
X	0,52	0,52	0,578	0,618
Y	0,38	0,40	0,422	0,38

Koeficient jasů odrážející (reflexní) barvy: $\beta > 0,12$.

Koeficient jasů nereflexní barvy (železniční vozy): $\beta \geq 0,22$.

Vztažný střed E, standardní světelný zdroj C, normální dopad 45° pod zorným úhlem 0°.

Koeficient odrazové svítivosti při úhlu osvětlení 5° pod zorným úhlem 0,2°: nejméně 20 candel na lux a m² (nevýžaduje se pro železniční vozy).

5.3.2.2.2 Identifikační číslo nebezpečnosti a UN číslo sestávají z černých číslic o výšce 100 mm a tloušťce čáry 15 mm. Identifikační číslo nebezpečnosti musí být uvedeno v horní části tabulky a UN číslo v dolní části; obě čísla musí být od sebe oddělena vodorovnou černou čarou o tloušťce 15 mm, vedenou v polovině výšky tabulky od jednoho jejího okraje k druhému (viz 5.3.2.2.3). Identifikační číslo nebezpečnosti a UN číslo musí být nesmazatelná a musí zůstat čitelná po 15 minutách přímého působení ohně. Vyměnitelná čísla a písmena na tabulkách představující identifikační číslo nebezpečnosti a UN číslo musí zůstat na místě během přepravy a bez ohledu na orientaci železničního vozu nebo vozidla.

5.3.2.2.3 Příklad oranžové tabulky s identifikačním číslem nebezpečnosti a UN číslem

Podklad oranžový.
Okraj, vodorovná čára a číslice černé, tloušťka 15 mm.

5.3.2.2.4 Dovolené tolerance pro rozměry stanovené v tomto pododdílu jsou $\pm 10\%$.

5.3.2.2.5 Jsou-li oranžové tabulky připevněny na sklopných panelech, musí být konstruovány a zajištěny tak, aby se nemohly rozevřít nebo se uvolnit z držáku během přepravy (zejména jako výsledek rázů nebo neúmyslných činností).

5.3.2.3 Význam identifikačních čísel nebezpečnosti

5.3.2.3.1 Identifikační číslo nebezpečnosti sestává ze dvou nebo třech číslic. Obecně označují číslice tato nebezpečí:

- 2 Únik plynu tlakem nebo chemickou reakcí
- 3 Hořlavost kapalin (par) a plynů nebo kapalin schopných samoohřevu
- 4 Hořlavost tuhých látek nebo tuhých látek schopných samoohřevu
- 5 Podpora hoření
- 6 Toxicita nebo nebezpečí infekce
- 7 Radioaktivita
- 8 Žíravost
- 9 Nebezpečí prudké samovolné reakce

POZNÁMKA: *Nebezpečí prudké samovolné reakce ve významu číslice 9 zahrnuje z povahy látky vyplývající možnost nebezpečí výbuchu, rozpadu nebo polymerační reakce za uvolňování značného tepla nebo hořlavých a/nebo toxických plynů.*

Zdvojení číslice označuje zvýšení příslušného nebezpečí.

Postačuje-li k označení nebezpečnosti látky jediná číslice, doplní se tato číslice na druhém místě nulou.

Následující kombinace číslic však mají zvláštní význam: 22, 323, 333, 362, 382, 423, 44, 446, 462, 482, 539, 606, 623, 642, 823, 842, 90 a 99 (viz 5.3.2.3.2 dále).

Pokud je před identifikačním číslem nebezpečnosti uvedeno písmeno „X“, znamená to, že látka reaguje nebezpečně s vodou. Pro takové látky smí být použita voda pouze po schválení znalci.

Pro látky třídy 1 se jako identifikační číslo nebezpečnosti použije klasifikační kód podle sloupce (3b) tabulky A kapitoly 3.2. Klasifikační kód sestává z:

- čísla podtřídy podle 2.2.1.1.5; a
- písmene skupiny snášenlivosti podle 2.2.1.1.6.

5.3.2.3.2

Identifikační čísla nebezpečnosti uvedená ve sloupci (20) tabulky A kapitoly 3.2 ADR nebo RID mají tento význam:

20	dusivý plyn nebo plyn bez vedlejšího nebezpečí
22	hluboce zchlazený zkapalněný plyn; dusivý
223	hluboce zchlazený zkapalněný plyn, hořlavý
225	hluboce zchlazený zkapalněný plyn, podporující hoření
23	hořlavý plyn
238	hořlavý plyn, žíravý
239	hořlavý plyn, který může vyvolat samovolně prudkou reakci
25	plyn podporující hoření
26	toxický plyn
263	toxický plyn, hořlavý
265	toxický plyn, podporující hoření
268	toxický plyn, žíravý
28	žíravý plyn
285	žíravý plyn, podporující hoření
30	hořlavá kapalina (bod vzplanutí od 23 °C do 60 °C včetně) nebo hořlavá kapalina nebo tuhá látka v roztaveném stavu s bodem vzplanutí vyšším než 60 °C, ohřátá na teplotu rovnou nebo vyšší než její bod vzplanutí, nebo kapalina schopná samoohřevu
323	hořlavá kapalina reagující s vodou a vyvíjející hořlavé plyny
X323	hořlavá kapalina reagující nebezpečně s vodou a vyvíjející hořlavé plyny ¹
33	velmi hořlavá kapalina (bod vzplanutí pod 23 °C)
333	pyroforní kapalina
X333	pyroforní kapalina reagující nebezpečně s vodou ¹

¹ Voda nesmí být použita bez schválení znalci

- 336 velmi hořlavá kapalina, toxická
- 338 velmi hořlavá kapalina, žíravá
- X338 velmi hořlavá kapalina, žíravá, reagující nebezpečně s vodou¹
- 339 velmi hořlavá kapalina, která může vyvolat samovolně prudkou reakci
- 36 hořlavá kapalina (bod vzplanutí od 23 °C do 60 °C včetně), slabě toxická nebo kapalina schopná samoohřevu, toxická
- 362 hořlavá kapalina, toxická, reagující s vodou, vyvíjející hořlavé plyny
- X362 hořlavá kapalina, toxická, reagující nebezpečně s vodou, vyvíjející hořlavé plyny²¹
- 368 hořlavá kapalina, toxická, žíravá
- 38 hořlavá kapalina (bod vzplanutí od 23 °C do 60 °C včetně), slabě žíravá, nebo kapalina schopná samoohřevu, žíravá
- 382 hořlavá kapalina, žíravá, reagující s vodou, vyvíjející hořlavé plyny
- X382 hořlavá kapalina, žíravá, reagující nebezpečně s vodou, vyvíjející hořlavé plyny¹
- 39 hořlavá kapalina, která může vyvolat samovolně prudkou reakci
- 40 hořlavá tuhá látka nebo samovolně se rozkládající látka nebo látka schopná samoohřevu, nebo polymerizující látka
- 423 tuhá látka, reagující s vodou, vyvíjející hořlavé plyny nebo hořlavá tuhá látka, reagující s vodou, vyvíjející hořlavé plyny nebo tuhá látka schopná samoohřevu, reagující s vodou, vyvíjející hořlavé plyny
- X423 tuhá látka, reagující nebezpečně s vodou, vyvíjející hořlavé plyny nebo hořlavá tuhá látka, reagující nebezpečně s vodou, vyvíjející hořlavé plyny nebo tuhá látka schopná samoohřevu, reagující nebezpečně s vodou, vyvíjející hořlavé plyny¹
- 43 samozápalná (pyroforní) tuhá látka
- X432 samozápalná (pyroforní) tuhá látka, reagující nebezpečně s vodou, vyvíjející hořlavé plyny¹
- 44 hořlavá tuhá látka, která je při zvýšené teplotě v roztaveném stavu
- 446 hořlavá tuhá látka, toxická, která je při zvýšené teplotě v roztaveném stavu
- 46 hořlavá tuhá látka nebo tuhá látka schopná samoohřevu, toxická
- 462 toxická tuhá látka, reagující s vodou, vyvíjející hořlavé plyny
- X462 tuhá látka, nebezpečně reagující s vodou, vyvíjející toxické plyny¹
- 48 hořlavá tuhá látka nebo tuhá látka schopná samoohřevu, žíravá
- 482 žíravá tuhá látka, reagující s vodou, vyvíjející hořlavé plyny
- X482 tuhá látka, nebezpečně reagující s vodou, vyvíjející hořlavé plyny¹
- 50 látka podporující hoření
- 539 hořlavý organický peroxid
- 55 látka silně podporující hoření
- 556 látka silně podporující hoření, toxická
- 558 látka silně podporující hoření, žíravá
- 559 látka silně podporující hoření, která může vyvolat samovolně prudkou reakci

¹ Voda nesmí být použita bez schválení znalci

- 56 látka podporující hoření, toxická
- 568 látka podporující hoření, toxická, žíravá
- 58 látka podporující hoření, žíravá
- 59 látka podporující hoření, která může vyvolat samovolně prudkou reakci
- 60 toxická nebo slabě toxická látka
- 606 infekční látka
- 623 toxická kapalina, reagující s vodou, vyvíjející hořlavé plyny
- 63 toxická látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně)
- 638 toxická látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně), žíravá
- 639 toxická látka, hořlavá (s bodem vzplanutí nejvýše 60 °C), která může vyvolat samovolně prudkou reakci
- 64 toxická tuhá látka, hořlavá nebo schopná samoohřevu
- 642 toxická tuhá látka, reagující s vodou, vyvíjející hořlavé plyny
- 65 toxická látka, podporující hoření
- 66 velmi toxická látka
- 663 velmi toxická látka, hořlavá (s bodem vzplanutí nejvýše 60 °C)
- 664 velmi toxická tuhá látka, hořlavá nebo schopná samoohřevu
- 665 velmi toxická látka, podporující hoření
- 668 velmi toxická látka, žíravá
- X668 velmi toxická látka, žíravá, která reaguje nebezpečně s vodou¹
- 669 velmi toxická látka, která může vyvolat samovolně prudkou reakci
- 68 toxická látka, žíravá
- 687 toxická látka, žíravá, radioaktivní
- 69 toxická nebo slabě toxická látka, která může vyvolat samovolně prudkou reakci
- 70 radioaktivní látka
- 768 radioaktivní látka, toxická, žíravá
- 78 radioaktivní látka, žíravá
- 80 žíravá nebo slabě žíravá látka
- X80 žíravá nebo slabě žíravá látka, která nebezpečně reaguje s vodou¹
- 823 žíravá kapalina, reagující s vodou, vyvíjející hořlavé plyny
- 83 žíravá nebo slabě žíravá látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně)
- X83 žíravá nebo slabě žíravá látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně), nebezpečně reagující s vodou¹
- 836 žíravá nebo slabě žíravá látka, hořlavá (bod vzplanutí 23 °C až 60 °C včetně) a toxická
- 839 žíravá nebo slabě žíravá látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně), která může vyvolat samovolně prudkou reakci
- X839 žíravá nebo slabě žíravá látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně), která může vyvolat samovolně prudkou reakci a nebezpečně reagující s vodou¹

¹ Voda nesmí být použita bez schválení znalci.

- 84 žíravá tuhá látka, hořlavá nebo schopná samoohřevu
- 842 žíravá tuhá látka, která reaguje s vodou, vyvíjející hořlavé plyny
- 85 žíravá nebo slabě žíravá látka, podporující hoření
- 856 žíravá nebo slabě žíravá látka, podporující hoření a toxická
- 86 žíravá nebo slabě žíravá látka, toxická
- 88 silně žíravá látka
- X88 silně žíravá látka, která nebezpečně reaguje s vodou¹
- 883 silně žíravá látka, hořlavá (bod vzplanutí od 23 °C do 60 °C včetně)
- 884 silně žíravá tuhá látka, hořlavá nebo schopná samoohřevu
- 885 silně žíravá látka, podporující hoření
- 886 silně žíravá látka, toxická
- X886 silně žíravá látka, toxická, nebezpečně reagující s vodou³¹
- 89 žíravá nebo slabě žíravá látka, která může vyvolat samovolně prudkou reakci
- 90 látka ohrožující životní prostředí; jiné nebezpečné látky
- 99 jiné nebezpečné látky přepravované v zahřátém stavu.

5.3.3 Značka pro zahřáté látky

Cisternová vozidla, cisternové železniční vozy, cisternové kontejnery, přemístitelné cisterny, speciální vozidla, speciální železniční vozy nebo speciální kontejnery nebo speciálně vybavená vozidla, speciálně vybavené železniční vozy nebo speciálně vybavené kontejnery obsahující látku, která je přepravována nebo podávána k přepravě v kapalném stavu při teplotě 100 °C nebo vyšší nebo v pevném stavu při teplotě 240 °C nebo vyšší, musí být opatřeny na obou bočních stranách pro železniční vozy, na obou bočních stranách a na zadní straně pro vozidla a na obou bočních stranách a na obou koncích pro kontejnery, cisternové kontejnery a přemístitelné cisterny značkou uvedenou na obrázku 5.3.3.

Obrázek 5.3.3

Značka pro přepravu zahřátých látek

Značka musí mít tvar rovnostranného trojúhelníka. Barva značky musí být červená. Minimální rozměry stran musí být 250 mm. Tam, kde nejsou udány rozměry, musí všechny prvky proporčně odpovídat uvedenému obrázku. Pro cisternové kontejnery nebo přemístitelné cisterny s vnitřním objemem nejvýše 3 000 litrů, kde je disponibilní plocha povrchu nedostačující pro umístění předepsaných

¹ Voda nesmí být použita bez schválení znalci

značek, mohou být minimální rozměry stran zmenšeny na 100 mm. Značka musí být odolná proti povětrnostním podmínkám a musí zaručovat trvanlivé označení po celou dobu přepravy.

5.3.4 Označování pro přepravu v přepravním řetězci zahrnujícím námořní dopravu

5.3.4.1 Pro přepravu v přepravním řetězci zahrnujícím námořní dopravu nemusí být kontejnery, přemístitelné cisterny a MEGC označeny oranžovými tabulkami podle oddílu 5.3.2, pokud mají označení předepsané v oddílu 5.3.2 IMDG Code, kde:

- (a) oficiální pojmenování pro přepravu obsahu je trvale vyznačeno alespoň na dvou stranách:
- přemístitelných cisteren a MEGC,
 - kontejnerů pro volně ložené látky,
 - kontejnerů obsahujících nebezpečné věci v kusech jen s jedinou látkou, pro kterou IMDG Code nevyžaduje velkou bezpečnostní značku nebo značku pro látky znečišťující moře;
- (b) UN číslo pro věci je uvedeno černými číslicemi o výšce nejméně 65 mm:
- buď na bílém podkladu v dolní polovině velkých bezpečnostních značek umístěných na nákladní dopravní jednotce;
 - nebo na oranžové pravoúhlé tabulce o výšce nejméně 120 mm a šířce nejméně 300 mm, s černým lemem o šířce 10 mm, která musí být umístěna bezprostředně vedle velkých bezpečnostních značek nebo značek pro látky znečišťující moře podle IMDG Code, nebo pokud není velká bezpečnostní značka nebo značka pro látky znečišťující moře předepsána, vedle oficiálního pojmenování pro přepravu.

Příklad označení přemístitelné cisterny přepravující acetal, třídy 3, UN 1088 podle IMDG Code

PRVNÍ VARIANTA

černý plamen na
červeném podkladu

DRUHÁ VARIANTA

černý plamen na
červeném podkladu

oranžový podklad,
lem a číslice černé

5.3.4.2 Jestliže jsou přemístitelné cisterny, MEGC nebo kontejnery označené podle 5.3.4.1 přepravovány pravidlem naložené na vozidlech, vztahuje se na nosná vozidla pouze pododíl 5.3.2.1.1.

- 5.3.4.3** Navíc k velkým bezpečnostním značkám, oranžovým tabulkám a značkám předepsaným nebo dovoleným ADN mohou být nákladní dopravní jednotky opatřeny dodatečnými značkami (nápis), velkými bezpečnostními značkami a jiným označeními předepsanými, kde je to vhodné, podle IMDG Code, například značkou pro látky znečišťující moře nebo nápisem „LIMITED QUANTITIES“.
- 5.3.5** (Vyhrazeno)
- 5.3.6 Značka pro látky ohrožující životní prostředí**
- 5.3.6.1** Je-li podle ustanovení oddílu 5.3.1 vyžadováno umístění velké bezpečnostní značky, musí být kontejnery, kontejnery pro volně ložené látky, MEGC, cisternové kontejnery, přemístitelné cisterny a vozidla obsahující látky ohrožující životní prostředí splňující kritéria uvedená v 2.2.9.1.10 označeny značkou pro látky ohrožující životní prostředí vyobrazenou v 5.2.1.8.3. Nevztahuje se na výjimky uvedené v 5.2.1.8.1.
- 5.3.6.2** Značka pro látky ohrožující životní prostředí pro kontejnery, kontejnery pro volně ložené látky, MEGC, cisternové kontejnery, přemístitelné cisterny, železniční vozy a vozidla musí odpovídat popisu v 5.2.1.8.3 a Obrázku 5.2.1.8.3, kromě požadavků na rozměry, které musí být minimálně 250 × 250 mm. Pro cisternové kontejnery nebo přemístitelné cisterny s vnitřním objemem nejvýše 3 000 litrů, kde je disponibilní plocha povrchu nedostačující pro umístění předepsaných značek, mohou být minimální rozměry zmenšeny na 100 mm × 100 mm. Ostatní ustanovení oddílu 5.3.1 týkající se velkých bezpečnostních značek se vztahují s patřičnými změnami na tuto značku.

KAPITOLA 5.4

PRŮVODNÍ DOKLADY

5.4.0 Všeobecně

5.4.0.1 Pokud není stanoveno jinak, musí být každá přeprava věcí podléhající ADN doprovázena doklady předepsanými v této kapitole, jak je to náležité.

POZNÁMKA: Seznam dokladů, které musí být na plavidle, viz 8.1.2.

5.4.0.2 Použití technik elektronického zpracování dat (EDP) nebo elektronické výměny dat (EDI) jako pomůcky nebo místo papírových dokladů je dovoleno, pokud tyto postupy používané pro sběr, uchování a zpracování elektronických dat splňují legislativní požadavky z hlediska průkaznosti a přístupnosti dat během přepravy způsobem nejméně rovnocenným s papírovými doklady.

5.4.0.3 Jsou-li informace o nebezpečných věcech poskytovány dopravci technikami EDP nebo EDI, musí být odesílatel schopen dodat tyto informace dopravci v papírové formě s údaji uvedenými v pořadí vyžadovaném touto kapitolou.

5.4.1 Přepravní doklad pro nebezpečné věci a předepsané údaje

5.4.1.1 Všeobecné údaje předepsané pro přepravní doklad

5.4.1.1.1 Všeobecné údaje předepsané pro přepravní doklad při přepravě ve volně loženém stavu nebo v kusech

Přepravní doklad(y) musí obsahovat dále uvedené údaje pro každou nebezpečnou látku, materiál nebo předmět podaný k přepravě:

- (a) UN číslo s předřazenými písmeny „UN“ nebo identifikační číslo látky;
- (b) oficiální pojmenování pro přepravu případně doplněné (viz 3.1.2.8.1) technickým názvem v závorkách (viz 3.1.2.8.1.1), jak je uvedeno v oddílu 3.1.2;
- (c) - pro látky a předměty třídy 1: klasifikační kód uvedený ve sloupci (3b) tabulky A kapitoly 3.2;

Pokud jsou ve sloupci (5) tabulky A kapitoly 3.2 uvedena čísla vzorů bezpečnostních značek jiná než 1, 1.4, 1.5 a 1.6, musí být tato čísla vzorů bezpečnostních značek uvedena v závorkách za klasifikačním kódem;

- pro radioaktivní látky třídy 7: číslo třídy „7“;

POZNÁMKA: K radioaktivním látkám s vedlejším nebezpečím viz též zvláštní ustanovení 172 v kapitole 3.3.

- pro lithiové baterie UN čísel 3090, 3091, 3480 a 3481: číslo třídy „9“;
- pro jiné látky a předměty: čísla vzorů bezpečnostních značek uvedená ve sloupci (5) tabulky A kapitoly 3.2 nebo vyžadovaná podle zvláštního ustanovení uvedeného ve sloupci (6). Pokud je uvedeno více čísel vzorů bezpečnostních značek, čísla následující za prvním číslem musí být uvedena v závorkách. Pro látky a předměty, pro které nejsou ve sloupci (5) tabulky A kapitoly 3.2 uvedeny žádné vzory bezpečnostních značek, musí být místo nich uvedena jejich třída podle sloupce (3a);

- (d) kde je to stanoveno, obalová skupina pro látku, které mohou předcházet písmena „OS“ (např. „OS II“) nebo počáteční písmena odpovídající slovům „Obalová skupina“ v jazycích používaných podle 5.4.1.4.1;

POZNÁMKA: Pro radioaktivní látky třídy 7 s vedlejším nebezpečím, viz zvláštní ustanovení 172 (d) v kapitole 3.3.

- (e) počet a popis kusů, pokud je to aplikovatelné. UN kódy obalů smějí být použity pouze k doplnění popisu druhu kusu (např. jedna bedna (4G));

POZNÁMKA: Počet, druh a vnitřní objem každého vnitřního obalu ve vnějším obalu skupinového obalu není nutno uvádět.

- (f) celkové množství každé položky nebezpečných věcí označené různým UN číslem, oficiálním pojmenováním pro přepravu [jako objem nebo celková (brutto) hmotnost, nebo případně jako čistá (netto) hmotnost];

POZNÁMKA: Pro nebezpečné věci ve strojích nebo zařízeních specifikovaných v těchto Pravidlech musí být uvedené množství celkové množství nebezpečných věcí, které jsou v nich obsaženy, v kilogramech nebo litrech, jak je to náležité.

- (g) jméno a adresa odesilatele;
 (h) jméno a adresa příjemce(ů);
 (i) prohlášení vyžadované podmínkami případné zvláštní dohody.

Umístění a pořadí předepsaných údajů v přepravním dokladu je libovolné, kromě údajů uvedených výše pod písmeny (a), (b), (c) a (d), které musí být uvedeny v tom pořadí, v jakém jsou uváděny výše (tj. (a), (b), (c), (d)) s žádnými vloženými údaji, kromě dovolených podle ADN.

Příklady takových dovolených zápisů nebezpečných věcí jsou:

„UN 1098 ALLYLALKOHOL, 6.1 (3), I“ nebo
 „UN 1098 ALLYLALKOHOL, 6.1 (3), OS I“

Údaje vyžadované v přepravním dokladu musí být čitelné.

Ačkoli jsou velká písmena používána v kapitole 3.1 a v tabulce A kapitoly 3.2 pro uvedení údajů, které musí být součástí oficiálního pojmenování pro přepravu, a ačkoli jsou velká a malá písmena používána v této kapitole pro uvedení údajů požadovaných v přepravním dokladu, je použití velkých a malých písmen pro uvedení údajů v přepravním dokladu libovolné.

5.4.1.1.2

Všeobecné údaje předepsané pro přepravní doklad při přepravě v tankových plavidlech

Přepravní doklad(y) musí obsahovat dále uvedené údaje pro každou nebezpečnou látku nebo předmět podaný k přepravě:

- (a) UN číslo s předřazenými písmeny „UN“ nebo identifikační číslo látky;
 (b) oficiální pojmenování pro přepravu uvedené ve sloupci (2) tabulky C kapitoly 3.2, případně doplněné technickým názvem v závorkách;
 (c) údaje uvedené ve sloupci (5) tabulky C kapitoly 3.2. Je-li v ní uvedeno více než jen jedno číslo, musí být čísla za prvním číslem uvedena v závorkách. Pro látky jmenovitě neuvedené v tabulce C (přiřazené pod druhovou položku nebo J.N. položku, a pro které je použitelný postupový diagram v 3.2.3.3) musí být uvedeny pouze příslušné nebezpečné vlastnosti látky.
 (d) kde je to stanoveno, obalová skupina pro látku, které mohou předcházet písmena „OS“ (např. „OS II“) nebo počáteční písmena odpovídající slovům „Obalová skupina“ v jazycích používaných podle 5.4.1.4.1;
 (e) hmotnost v tunách;
 (f) jméno a adresa odesilatele;
 (g) jméno a adresa příjemce(ů).

Umístění a pořadí předepsaných údajů v přepravním dokladu je libovolné, kromě údajů uvedených výše pod písmeny (a), (b), (c) a (d), které musí být uvedeny v tom pořadí, v jakém

jsou uváděny výše (tj. (a), (b), (c), (d)) s žádnými vloženými údaji, kromě dovolených podle ADN.

Příklady takových dovolených zápisů nebezpečných věcí jsou:

„UN 1203 BENZÍN, 3 (N2, CMR, F), II“ nebo
„UN 1203, BENZÍN, 3 (N2, CMR, F), OS II“

Údaje vyžadované v přepravním dokladu musí být čitelné.

Ačkoli jsou velká písmena používána v kapitole 3.1 a v tabulce C kapitoly 3.2 pro uvedení údajů, které musí být součástí oficiálního pojmenování pro přepravu, a ačkoli jsou velká a malá písmena používána v této kapitole pro uvedení údajů požadovaných v přepravním dokladu, je použití velkých a malých písmen pro uvedení údajů v přepravním dokladu libovolné.

5.4.1.1.3 Zvláštní ustanovení pro odpady

Jsou-li přepravovány odpady obsahující nebezpečné látky (kromě radioaktivních odpadů), musí být před oficiálním pojmenováním pro přepravu uvedeno slovo „ODPAD“, pokud toto slovo není již částí oficiálního pojmenování pro přepravu, např.

„UN 1230 ODPAD METHANOL, 3 (6.1), II,“ nebo
„UN 1230 ODPAD METHANOL, 3 (6.1), OS II nebo
„UN 1993 ODPAD LÁTKA HOŘLAVÁ, KAPALNÁ, J.N., (toluen a ethylalkohol), 3, II,“ nebo
„UN 1993 ODPAD LÁTKA HOŘLAVÁ, KAPALNÁ, J.N., (toluen a ethylalkohol), 3, OS II“.

Je-li použito ustanovení pro odpady uvedené v 2.1.3.5.5, musí se za popis nebezpečných věcí vyžadovaný v 5.4.1.1.1 (a) až (d) a (k) doplnit:

„ODPAD PODLE 2.1.3.5.5“ (např. „UN 3264 LÁTKA ŽÍRAVÁ, KAPALNÁ, KYSELÁ, ANORGANICKÁ, J.N., 8, II ODPAD PODLE 2.1.3.5.5“).

Technický název, jak je předepsán v kapitole 3.3 zvláštním ustanovením 274, nemusí být doplněn.

5.4.1.1.4 (Vypuštěno)

5.4.1.1.5 Zvláštní ustanovení pro záchranné obaly, včetně velkých záchranných obalů a záchranné tlakové nádoby

Jsou-li nebezpečné věci přepravovány v záchranném obalu, včetně velkého záchranného obalu, nebo v záchranné tlakové nádobě, musí být v přepravním dokladu za popisem věcí uvedena slova „ZÁCHRANNÝ OBAL“ nebo „ZÁCHRANNÁ TLAKOVÁ NÁDOBA“.

5.4.1.1.6 Zvláštní ustanovení pro prázdné nevyčištěné obalové, přepravní, dopravní prostředky a pro prázdné nevyčištěné nákladní tanky tankových plavidel

5.4.1.1.6.1 Pro prázdné nevyčištěné obalové, přepravní a dopravní prostředky, které obsahují zbytky nebezpečných věcí jiných tříd než třídy 7, musí mít před nebo za popisem nebezpečných věcí stanoveným v 5.4.1.1.1 (a) až (d), uvedena slova „PRÁZDNÝ, NEVYČIŠTĚNÝ“ nebo „ZBYTEK, POSLEDNÍ OBSAH“. Kromě toho 5.4.1.1.1 (f) neplatí.

5.4.1.1.6.2 Zvláštní ustanovení 5.4.1.1.6.1 může být nahrazeno ustanoveními v 5.4.1.1.6.2.1, 5.4.1.1.6.2.2 nebo popřípadě 5.4.1.1.6.2.3.

5.4.1.1.6.2.1 Pro prázdné nevyčištěné obaly, které obsahují zbytky nebezpečných věcí jiných tříd než třídy 7, včetně prázdných nevyčištěných nádob na plyny s vnitřním objemem nejvýše 1000 litrů, jsou údaje podle odstavce 5.4.1.1.1 (a), (b), (c), (d), (e) a (f) nahrazeny zápisem „PRÁZDNÝ OBAL“, „PRÁZDNÁ NÁDOBA“, „PRÁZDNÁ IBC“ nebo popřípadě „PRÁZDNÝ VELKÝ OBAL“, následovaným údajem o posledně naložených nebezpečných věcech, jak je předepsáno v 5.4.1.1.1 (c).

Viz například:

„PRÁZDNÝ OBAL, 6.1 (3)“.

Kromě toho mohou být:

- (a) v případě, že jsou posledními naloženými věcmi věci třídy 2, informace předepsané v odstavci 5.4.1.1.1 (c) nahrazeny číslem třídy „2“.
- (b) v případě, že jsou posledními naloženými věcmi věci tříd 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 8 nebo 9, informace o naposledy naložených věcech, jak je předepsáno v 5.4.1.1.1 (c) nahrazeny slovy „SE ZBYTKY [...]“ následované třídou(ami) a vedlejším(i) nebezpečím(i) odpovídající různým zbytkům, v pořadí číslování tříd.

Příklad: Prázdné nevyčištěné obaly, které obsahovaly látky třídy 3 přepravované společně s prázdnými nevyčištěnými obaly, které obsahovaly látky třídy 8 s vedlejším nebezpečím látek třídy 6.1, mohou být uvedeny v přepravním dokladu jako:

„PRÁZDNÉ OBALY, SE ZBYTKY 3, 6.1, 8“.

- 5.4.1.1.6.2.2 Pro prázdné nevyčištěné přepravní a dopravní prostředky jiné než obaly, které obsahují zbytky nebezpečných věcí jiných tříd než třídy 7, a pro prázdné nevyčištěné nádoby na plyny s vnitřním objemem větším než 1000 litrů je před údaje podle 5.4.1.1.1 (a) až (d) předřazen zápis „PRÁZDNÝ CISTERNOVÝ VŮZ“, „PRÁZDNÉ CISTERNOVÉ VOZIDLO“, „PRÁZDNÁ SNÍMATELNÁ CISTERNA“, „PRÁZDNÝ CISTERNOVÝ KONTEJNER“, „PRÁZDNÁ PŘEMÍSTITELNÁ CISTERNA“, „PRÁZDNÝ BATERIOVÝ VŮZ“, „PRÁZDNÉ BATERIOVÉ VOZIDLO“, „PRÁZDNÝ MEGC“, „PRÁZDNÝ VŮZ“, „PRÁZDNÉ VOZIDLO“, „PRÁZDNÝ KONTEJNER“ nebo „PRÁZDNÁ NÁDOBA“, následované slovy „POSLEDNÍ NÁKLAD“. Kromě toho odstavec 5.4.1.1.1 (f) neplatí

Viz například:

„PRÁZDNÝ CISTERNOVÝ KONTEJNER, POSLEDNÍ NÁKLAD: UN 1098 ALLYLALKOHOL, 6.1 (3), I“ nebo
„PRÁZDNÝ CISTERNOVÝ KONTEJNER, POSLEDNÍ NÁKLAD: UN 1098 ALLYLALKOHOL, 6.1 (3), OS I“.

- 5.4.1.1.6.2.3 Jestliže se prázdné nevyčištěné obaly, přepravní nebo dopravní prostředky, které obsahují zbytky nebezpečných věcí jiných tříd než třídy 7, vracejí odeslateli, mohou se použít také přepravní doklady vystavené pro přepravu s nákladem těchto nebezpečných věcí. V takových případech je třeba údaj o množství odstranit (jeho vymazáním, škrtnutím nebo jiným způsobem) a nahradit jej slovy „PRÁZDNÝ, NEVYČIŠTĚNÝ ZPĚT“.
- 5.4.1.1.6.3 (a) Jsou-li prázdné nevyčištěné cisterny, bateriová vozidla, bateriové železniční vozy a MEGC přepravovány do nejbližšího místa, kde může být provedeno vyčištění nebo oprava podle ustanovení uvedených v 4.3.2.4.3 ADR nebo RID, musí být v přepravním dokladu uveden tento dodatečný zápis: **„Přeprava podle 4.3.2.4.3 ADR (nebo RID)“**.
- (b) Jsou-li prázdná nevyčištěná vozidla, železniční vozy a kontejnery přepravovány do nejbližšího místa, kde může být provedeno vyčištění nebo oprava podle ustanovení uvedených v 7.5.8.1 ADR nebo RID, musí být v přepravním dokladu uveden tento dodatečný zápis: **„Přeprava podle 7.5.8.1 ADR (nebo RID)“**.
- 5.4.1.1.6.4 Pro přepravu cisternových železničních vozů, nesnímatelných cisteren (cisternových vozidel), železničních vozů se snímatelnými cisternami, vozidel se snímatelnými cisternami, bateriových železničních vozů, bateriových vozidel, cisternových kontejnerů a MEGC za podmínek uvedených v 4.3.2.4.4 ADR nebo RID musí být v přepravním dokladu uveden tento zápis: „Přeprava podle 4.3.2.4.4 ADR (nebo RID)“, jak je to náležité.
- 5.4.1.1.6.5 Pro tanková plavidla s prázdnými nákladními tanky nebo nákladními tanky, které byly vyprázdněny, se pro účely požadovaných přepravních dokladů považuje velitel plavidla za odesílatele. V tomto případě musí být v přepravním dokladu uvedeny pro každý prázdný nákladní tank nebo nákladní tank, který byl vyprázdněn, tyto údaje:
- (a) číslo nákladního tanku;
 - (b) UN číslo s předřazenými písmeny „UN“ nebo identifikační číslo látky;

- (c) oficiální pojmenování pro přepravu poslední přepravované látky, třída a popřípadě obalová skupina podle 5.4.1.1.2.

5.4.1.1.7 *Zvláštní ustanovení pro přepravu v přepravním řetězci s námořní, silniční, železniční nebo leteckou dopravou*

Při přepravě podle 1.1.4.2.1 musí být v přepravním dokladu uveden tento zápis: „**Přeprava podle 1.1.4.2.1**“.

5.4.1.1.8 *(Vyhrazeno)*

5.4.1.1.9 *(Vyhrazeno)*

5.4.1.1.10 *(Vypuštěno)*

5.4.1.1.11 *Zvláštní ustanovení pro přepravu IBC, cisteren, bateriových vozidel, přemístitelných cisteren a MEGC po uplynutí data platnosti poslední periodické zkoušky nebo inspekce*

Pro přepravu podle 4.1.2.2 (b), 4.3.2.3.7 (b), 6.7.2.19.6 (b), 6.7.3.15.6 (b) nebo 6.7.4.14.6 (b) ADR (nebo RID) musí být v tomto smyslu uveden v přepravním dokladu tento zápis:

„PŘEPRAVA PODLE 4.1.2.2 (b) ADR (nebo RID)“,
 „PŘEPRAVA PODLE 4.3.2.3.7 (b) ADR (nebo RID)“,
 „PŘEPRAVA PODLE 6.7.2.19.6 (b) ADR (nebo RID)“,
 „PŘEPRAVA PODLE 6.7.3.15.6 (b) ADR (nebo RID)“, nebo
 „PŘEPRAVA PODLE 6.7.4.14.6 (b) ADR (nebo RID)“, jak je to náležité.

5.4.1.1.12 *(Vyhrazeno)*

5.4.1.1.13 *(Vyhrazeno)*

5.4.1.1.14 *Zvláštní ustanovení pro přepravu zahřátých látek*

Pokud oficiální pojmenování pro přepravu látky, která je přepravována nebo předávána k přepravě v kapalném stavu při teplotě rovné nebo vyšší než 100 °C, nebo v tuhém stavu při teplotě rovné nebo vyšší než 240 °C, neobsahuje podmínku zvýšené teploty (např. použitím termínu „**ROZTAVENÁ**“ nebo „**V ZAHŘÁTÉM STAVU**“ jako součásti oficiálního pojmenování pro přepravu), musí být slovo „**ZAHŘÁTÁ**“ uvedeno bezprostředně před oficiálním pojmenováním pro přepravu.

5.4.1.1.15 *Zvláštní ustanovení pro přepravu látek stabilizovaných řízením teploty*

Pokud je slovo „STABILIZOVANÁ“ součástí oficiálního pojmenování pro přepravu (viz též 3.1.2.6), je-li stabilizace dosažena řízenou teplotou, musí být řízená teplota a kritická teplota (viz 7.1.7) uvedeny v přepravním dokladu takto:

„**Řízená teplota: °C Kritická teplota: °C**“

5.4.1.1.16 *Informace vyžadované podle zvláštního ustanovení 640 v kapitole 3.3*

Pokud je to vyžadováno zvláštním ustanovením 640 kapitoly 3.3, musí být v přepravním dokladu uveden zápis „**Zvláštní ustanovení 640X**“, kde „X“ je velké písmeno uvedené za příslušným odkazem na zvláštní ustanovení 640 ve sloupci (6) tabulky A kapitoly 3.2.

5.4.1.1.17 *Zvláštní ustanovení pro přepravu tuhých látek v kontejnerech pro volně ložené látky odpovídajících oddílů 6.11.4 ADR*

Jestliže jsou tuhé látky přepravovány v kontejnerech pro volně ložené látky odpovídajících oddílů 6.11.4, musí být v přepravním dokladu uveden tento zápis (viz POZNÁMKA na začátku oddílu 6.11.4 ADR):

“Kontejner pro volně ložené látky BK(x)¹ schválený příslušným orgánem”

¹ (x) musí být nahrazeno číslem „1“ nebo „2“, jak je to vhodné.

5.4.1.1.18 *Zvláštní ustanovení pro přepravu látek ohrožujících životní prostředí (vodní prostředí)*

Jestliže látka spadající do jedné ze tříd 1 až 9 splňuje kritéria uvedená v 2.2.9.1.10, musí být v přepravním dokladu uveden doplňkový zápis „OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ“ nebo „LÁTKA ZNEČIŠŤUJÍCÍ MOŘE/OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ“. Tento dodatečný požadavek se nevztahuje na UN čísla 3077 a 3082 a na výjimky uvedené v 5.2.1.8.1.

Zápis „MARINE POLLUTANT“ („LÁTKA ZNEČIŠŤUJÍCÍ MOŘE“) (podle 5.4.1.4.3 IMDG Codu) je dovolen pro přepravu v přepravním řetězci zahrnujícím námořní dopravu.

5.4.1.1.19 *Zvláštní ustanovení pro přepravu vyřazených, prázdných, nevyčištěných obalů (UN 3059)*

Pro vyřazené, prázdné, nevyčištěné obaly musí být oficiální pojmenování pro přepravu uvedené v 5.4.1.1.1 (b) doplněno slovy „(SE ZBYTKY [...])“ následované uvedením tříd(y) a vedlejšího(ch) nebezpečí odpovídajících zbytkům v pořadí tříd. Kromě toho se nepoužije 5.4.1.1.1 (f).

Příklad: Pro vyřazené, prázdné, nevyčištěné obaly, které obsahovaly věci třídy 4.1 zabalené společně s vyřazenými, prázdnými, nevyčištěnými obaly, které obsahovaly látky třídy 3 s vedlejším nebezpečím třídy 6.1, bude v přepravním dokladu uvedeno:

„UN 3509 OBALY, VYŘAZENÉ, PRÁZDNÉ, NEVYČIŠTĚNÉ (SE ZBYTKY 3, 4.1 a 6.1), 9“.

5.4.1.1.20 *Zvláštní ustanovení pro přepravu látek klasifikovaných v souladu s pododílem 2.1.2.8*

Pro přepravu v souladu s 2.1.2.8 musí být v přepravním dokladu uveden tento zápis „Klasifikováno v souladu s 2.1.2.8.“

5.4.1.1.21 *Zvláštní ustanovení pro přepravu UN čísel 3528, 3529 a 3530*

Pokud je to vyžadováno podle zvláštního ustanovení 363 kapitoly 3.3, musí přepravní doklad v případě přepravy UN čísel 3528, 3529 a 3530 obsahovat následující dodatečný zápis „Přeprava podle zvláštního ustanovení 363“.

5.4.1.1.22 *Zvláštní ustanovení pro přepravu v kalových plavidlech a zásobovacích plavidlech*

Ustanovení 5.4.1.1.2 a 5.4.1.1.6.5 se nevztahují na kalová plavidla a zásobovací plavidla.

5.4.1.2 *Dodatečné nebo zvláštní údaje vyžadované pro určité třídy*

5.4.1.2.1 *Zvláštní ustanovení pro třídu 1*

(a) V přepravním dokladu musí být, dodatečně k požadavkům uvedeným v 5.4.1.1.1 (f), uvedeno:

- celková čistá hmotnost výbušného obsahu² pro každou látku nebo předmět označené svým UN číslem, v kg;
- celková čistá hmotnost výbušného obsahu² všech látek a předmětů uvedených v přepravním dokladu, v kg.

(b) Pro společné balení dvou různých věcí musí popis věcí v přepravním dokladu obsahovat UN čísla a oficiální pojmenování vytištěná velkými písmeny ve sloupcích (1) a (2) tabulky A kapitoly 3.2 obou látek nebo předmětů. Jestliže jsou obsaženy v jednom kusu více než dvě různé věci v souladu se zvláštními ustanoveními MP1, MP2 a MP20 až MP24 uvedenými v ustanoveních o společném balení v oddílu 4.1.10 ADR, musí být v přepravním dokladu uvedena v popise věci UN čísla všech látek a předmětů obsažených v kusu touto formou „**Věci UN čísel ...**“.

(c) Při přepravě látek a předmětů přiřazených k j.n. položce nebo k položce „0190 VZORKY, VÝBUŠNÉ“, nebo balených podle pokynu pro balení P101 uvedeného v 4.1.4.1 ADR musí být připojena k přepravnímu dokladu kopie schválení příslušného orgánu s podmínkami pro přepravu. Musí být v úředním jazyce odesílající země a též, jestliže tento jazyk není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud případně dohody uzavřené mezi státy zainteresovanými na přepravě nestanoví jinak.

(d) Pokud jsou kusy obsahující látky a předměty skupin snášenlivosti B a D naloženy společně do jednoho vozidla nebo železničního vozu podle požadavků uvedených v 7.5.2.2 ADR nebo RID,

² Pro předměty se pojmem „výbušný obsah“ rozumí výbušná látka obsažená v předmětu.

musí být k přepravnímu dokladu připojeno osvědčení o schválení ochranné komory nebo kontejmentového systému podle 7.5.2.2 poznámky ^a pod tabulkou ADR nebo RID. Musí být vystaveno v úředním jazyce odesílající země a též, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud případné dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

- (e) Pokud jsou výbušné látky nebo předměty přepravovány v obalech podle pokynu pro balení P101 ADR, musí být v přepravním dokladu uveden zápis „**Obal schválen příslušným orgánem.....**“ (viz 4.1.1.1, pokyn pro balení P101).
- (f) (Vyhrazeno)
- (g) Pokud jsou přepravovány výrobky zábavné pyrotechniky UN čísel 0333, 0334, 0335, 0336 a 0337, v přepravním dokladu musí být uveden zápis:

„Klasifikace zábavné pyrotechniky příslušným orgánem XX s osvědčením zábavné pyrotechniky XX/YYZZZZ“.

Osvědčení o schválení klasifikace nemusí doprovázet zásilku, ale odesílatel musí být schopen je poskytnout dopravci nebo příslušnému orgánu ke kontrolním účelům. Osvědčení o schválení klasifikace nebo jeho kopie musí být v oficiálním jazyce země odeslání, a pokud tímto jazykem není němčina, angličtina nebo francouzština, též v němčině, angličtině nebo francouzštině.

POZNÁMKA 1: V přepravním dokladu může být uveden obchodní nebo technický název věci dodatečně k oficiálnímu pojmenování pro přepravu.

POZNÁMKA 2: Číslo osvědčení o klasifikaci musí sestávat ze smluvní strany ADN, v níž byl schválen klasifikační kód podle zvláštního ustanovení 645 oddílu 3.3.1, uvedené rozlišovací značkou používanou na vozidlech v mezinárodním silničním provozu (XX)³, z identifikace příslušného orgánu (YY) a z jediného sériového čísla jednacím (ZZZZ). Příklady takových čísel osvědčení o klasifikaci jsou:

GB/HSE123456
D/BAM1234.

5.4.1.2.2 *Dodatečná ustanovení pro třídu 2*

- (a) Při přepravě směsí (viz 2.2.2.1.1) v cisternách (snímatelných cisternách, nesnímatelných cisternách, cisternových železničních vozech, přemístitelných cisternách, cisternových kontejnerech nebo člancích bateriových vozidel nebo bateriových vozů nebo MEGC), musí být uvedeno složení směsi v % obj. nebo % hm. Složky o obsahu nižším než 1 % nemusí být uváděny (viz též 3.1.2.8.1.2). Složení směsi nemusí být uvedeno, jsou-li použity jako doplněk k oficiálnímu pojmenování pro přepravu technické názvy dovolené podle zvláštních ustanovení 581, 582 nebo 583;
- (b) Při přepravě lahví, trubkových nádob, tlakových sudů, kryogenních nádob a svazků lahví podle podmínek uvedených v 4.1.6.10 ADR, musí být v přepravním dokladu uveden tento zápis: „**Přeprava podle 4.1.6.10 ADR**“.
- (c) Vyhrazeno
- (d) V případě cisternových vozů, cisternových kontejnerů nebo přemístitelných cisteren pro přepravu hluboce zchlazených zkapalněných plynů musí odesílatel uvést do přepravního dokladu datum, ke kterému skončí skutečná doba naplnění, v následujícím formátu:

„Konec údržné doby: (DD/MM/RRRR)“.

5.4.1.2.3 *Dodatečná ustanovení pro samovolně se rozkládající látky a polymerizující látky třídy 4.1 a organické peroxidy třídy 5.2*

5.4.1.2.3.1 Při přepravě samovolně se rozkládajících látek nebo polymerizujících látek třídy 4.1 a organických peroxidů třídy 5.2, které vyžadují řízení teploty během přepravy (pro samovolně se rozkládající látky

³ Rozlišovací značka státu registrace používaná na motorových a přípojných vozidlech v mezinárodním silničním provozu, např. podle Ženevské úmluvy o silničním provozu z roku 1949 nebo Vídeňské úmluvy o silničním provozu z roku 1968.

viz 2.2.41.1.17; pro organické peroxidy viz 2.2.52.1.15, pro polymerizující látky viz 2.2.41.1.21), musí být v přepravním dokladu uvedeny řízená teplota a kritická teplota takto:

„Řízená teplota: °C“

„Kritická teplota: °C“.

5.4.1.2.3.2 Pokud pro určité samovolně se rozkládající látky třídy 4.1 a určité organické peroxidy třídy 5.2 příslušný orgán povolil, aby nebyla použita bezpečnostní značka podle vzoru č. 1 pro zvláštní obal (viz 5.2.2.1.9), musí o tom být v přepravním dokladu uveden tento zápis: „**Bezpečnostní značka podle vzoru č. 1 není vyžadována**“.

5.4.1.2.3.3 Pokud jsou organické peroxidy a samovolně se rozkládající látky přepravovány za podmínek, kdy se vyžaduje schválení (pro organické peroxidy viz 2.2.52.1.8, 4.1.7.2.2 a zvláštní ustanovení TA2 uvedené v 6.8.4 ADR; pro samovolně se rozkládající látky viz 2.2.41.1.13 a 4.1.7.2.2 ADR), v přepravním dokladu o tom musí být uvedena poznámka, např. „**Přeprava podle 2.2.52.1.8**“. Musí být vystaveno v úředním jazyce odesílající země a též, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud případné dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

K přepravnímu dokladu musí být připojena kopie schválení příslušného orgánu s podmínkami pro přepravu.

5.4.1.2.3.4 Pokud je přepravován vzorek organického peroxidu (viz 2.2.52.1.9) nebo samovolně se rozkládající látky (viz 2.2.41.1.15), v přepravním dokladu o tom musí být uvedena poznámka, např. „**Přeprava podle 2.2.52.1.9**“.

5.4.1.2.3.5 Pokud jsou přepravovány samovolně se rozkládající látky typu G (viz Příručka zkoušek a kritérií, část II, odst. 20.4.2 (g)), v přepravním dokladu o tom musí být uvedena poznámka: „**Není látkou samovolně se rozkládající třídy 4.1**“.

Pokud jsou přepravovány organické peroxidy typu G (viz Příručka zkoušek a kritérií, část II, odst. 20.4.3 (g)), v přepravním dokladu o tom musí být uvedena poznámka: „**Není látkou třídy 5.2**“.

5.4.1.2.4 *Dodatečná ustanovení pro třídu 6.2*

Kromě údajů o příjemci (viz 5.4.1.1.1 (h)) musí být uvedeno jméno a telefonní číslo odpovědné osoby.

5.4.1.2.5 *Dodatečná ustanovení pro třídu 7*

5.4.1.2.5.1 V přepravním dokladu musí být pro každou zásilku látek třídy 7 uvedeny, pokud je to vhodné, v uvedeném pořadí a bezprostředně po údajích předepsaných v 5. 4. 1.1.1 (a) až (c) tyto údaje:

- (a) název nebo symbol každého radionuklidu nebo, pro směsi radionuklidů, vhodný všeobecný popis nebo seznam nejvíce omezujících nuklidů;
- (b) popis fyzikálního a chemického stavu látky, nebo údaj o tom, že látka je zvláštní formou radioaktivní látky nebo nízkodisperzní radioaktivní látkou. Druhový chemický popis se připoustí pro chemický stav. Pro radioaktivní látky s vedlejším nebezpečím viz pododstavec (c) zvláštního ustanovení 172 kapitoly 3.3;
- (c) nejvyšší aktivita radioaktivního obsahu během přepravy vyjádřená v becquerelech (Bq) s příslušným symbolem předpony SI (viz 1.2.2.1). U štěpných látek smí být místo aktivity udána hmotnost štěpných látek (nebo hmotnost každého štěpného nuklidu pro směsi, pokud je to nutné) v gramech (g) nebo jejich vhodném násobku;
- (d) kategorie kusu, přepravního obalového souboru nebo kontejneru přiřazené podle 5.1.5.3.4, t.j. I-BÍLÁ, II-ŽLUTÁ, III- ŽLUTÁ;
- (e) přepravní index určený podle 5.1.5.3.1 a 5.1.5.3.2 (kromě kategorie I- BÍLÁ);
- (f) pro štěpné látky:
 - (i) odesílané podle jednoho z vyjmutí dle 2.2.7.2.3.5 (a) až (f), odkaz na tento odstavec;
 - (ii) odesílané podle 2.2.7.2.3.5 (c) až (e), celková hmotnost štěpných nuklidů;
 - (iii) obsažené v kusu, pro který platí jeden z odstavců 6.4.11.2 (a) až (c) nebo 6.4.11.3 ADR, odkaz na tento odstavec;
 - (iv) kde je to nutné, index bezpečné podkritičnosti;

- (g) identifikační značka každého schvalovacího osvědčení příslušného orgánu (zvláštní forma radioaktivní látky, nízkodisperzní radioaktivní látka, štěpná látka vyjmutá podle 2.2.7.2.3.5 (f), zvláštní ujednání, konstrukce kusu nebo odeslání) vztahující se na zásilku;
- (h) pro zásilky více než jednoho kusu údaje požadované v 5.4.1.1.1 a v (a) až (g) musí být uvedeny pro každý kus. Pro kusy v přepravním obalovém souboru, kontejneru nebo dopravním prostředku musí zahrnovat podrobný popis obsahu každého kusu uvnitř přepravního obalového souboru, kontejneru nebo dopravního prostředku, a pokud je to vhodné, každého přepravního obalového souboru, kontejneru nebo dopravního prostředku. Jestliže kusy mají být vyjmuty z přepravního obalového souboru, z kontejneru nebo z dopravního prostředku v místě jejich překládky, musí být k dispozici příslušné přepravní doklady;
- (i) pokud se vyžaduje, aby zásilka byla odeslána za vylučného použití, poznámka „ODESLÁNÍ ZA VÝLUČNÉHO POUŽITÍ“; a
- (j) pro látky LSA-II a LSA-III, SCO-I, SCO-II a SCO-III celková aktivita zásilky jako násobek A_2 . Pro radioaktivní látky, pro něž je hodnota A_2 neomezena, musí být násobek A_2 nula.

5.4.1.2.5.2 Odesílatel musí uvést v přepravních dokladech prohlášení týkající se případných činností, které jsou požadovány od dopravce. Prohlášení musí být v jazycích považovaných dopravcem nebo zainteresovanými orgány za nezbytné, a musí obsahovat nejméně následující údaje:

- (a) dodatečné požadavky na nakládku, uložení, přepravu, manipulaci a vykládku kusu, přepravního obalového souboru nebo kontejneru včetně ustanovení o zvláštním uložení pro bezpečný odvod tepla (viz 7.1.4.14.7.3.2), nebo prohlášení, že takové požadavky nejsou nezbytné;
- (b) omezení z hlediska způsobu přepravy nebo vozidla nebo železničního vozu a všechny nezbytné údaje o dopravní cestě;
- (c) nouzová opatření vhodná pro zásilku.

5.4.1.2.5.3 Ve všech případech mezinárodní přepravy kusů vyžadující schválení konstrukčního vzoru kusu nebo povolení odeslání příslušným orgánem, pro než se používají v různých zemích, jichž se přeprava týká, různé druhy schválení nebo povolení, musí být UN číslo a oficiální pojmenování pro přepravu, vyžadované v 5.4.1.1.1, v souladu s osvědčením země původu konstrukčního vzoru kusu.

5.4.1.2.5.4 Příslušná osvědčení příslušného orgánu nemusí nutně doprovázet zásilku. Odesílatel je musí dát k dispozici dopravci(ům) před nakládkou a vykládkou.

5.4.1.3 (Vyhrazeno)

5.4.1.4 Formát a jazyk

5.4.1.4.1 Doklad obsahující údaje uvedené v pododdílech 5.4.1.1 a 5.4.1.2 může být takový, jaký je již vyžadován jinými platnými předpisy pro přepravu jiným druhem dopravy. V případě více příjemců jméno a adresa příjemců a dodávaná množství umožňující kdykoli vyhodnotit povahu a přepravované množství, mohou být uvedeny v jiných dokladech, které jsou používány nebo v jiných povinných dokladech předepsaných jinými zvláštními předpisy a které musí být během přepravy na plavidle.

Údaje uvedené v dokladu musí být v úředním jazyce odesílající země a též, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

5.4.1.4.2 Jestliže z důvodu rozměru nákladu nemůže být celá zásilka naložena do jedné dopravní jednotky, musí být vyhotoveno nejméně tolik oddělených přepravních dokladů nebo kopií jednoho přepravního dokladu, kolik je naložených dopravních jednotek. Kromě toho ve všech případech musí být vyhotoveny přepravní doklady pro zásilky nebo části zásilek, které nemohou být naloženy společně do jednoho vozidla z důvodů zákazů uvedených v oddílu 7.5.2 ADR.

Údaje týkající se rizik přepravovaných věcí (jak je uvedeno v 5.4.1.1) mohou být zapsány nebo kombinovány s údaji v existujícím přepravním nebo nákladním dokladu. Uvedení údajů v dokladu (nebo pokyn pro přenos odpovídajících dat systémem elektronického zpracování dat (EDP) nebo systémem elektronické výměny dat (EDI)) musí být provedeno podle 5.4.1.1.1 nebo popřípadě 5.4.1.1.2.

Pokud existující přepravní doklad nebo nákladní doklad nemůže být použit jako doklad o nebezpečných věcech pro multimodální dopravu, je považováno za vhodné použití dokladů odpovídajících příkladu uvedenému v 5.4.5⁴.

5.4.1.5 **Věci nepovažované za nebezpečné**

Pokud věci uvedené jmenovitě v tabulce A kapitoly 3.2 nepodléhají ADN, protože nejsou považovány za nebezpečné podle části 2, odesílatel může uvést v přepravním dokladu zápis v tomto smyslu, např. „**Věci nespádající do třídy ...**“.

POZNÁMKA: *Toto ustanovení může být použito zejména tehdy, jestliže odesílatel usoudí, že vzhledem k chemické povaze přepravovaných věcí (např. roztoky nebo směsi) nebo vzhledem ke skutečnosti, že takové věci jsou považovány za nebezpečné podle jiných předpisů, by zásilka mohla být podrobena kontrole během přepravy.*

⁴ Pokud je tento způsob použit, je možno získat informace z příslušných doporučení Střediska OSN pro zjednodušení formalit v mezinárodním obchodu (UN/CEFACT), zejména Doporučení č.1 (United Nations Layout Key for Trade Documents - Dispoziční klíč pro obchodní dokumenty Spojených národů) (ECE/TRADE/137, vydání 81.3), UN Layout Key for Trade Documents – Guidelines for Applications (Dispoziční klíč pro obchodní dokumenty Spojených národů – Směrnice pro aplikaci) (ECE/TRADE 270, vydání 2002), Doporučení č. 11 (Documentary Aspects of the International Transport of Dangerous Goods - Aspekty dokumentace mezinárodní přepravy nebezpečných věcí) (ECE/TRADE/204, vydání 96.1- nyní v revizi) a Doporučení č. 22 (Layout Key for Standard Consignment Instructions - Dispoziční klíč pro standardní pokyny pro zásilky) (ECE/TRADE/168, vydání 1989). Viz též UN/CEFACT Summary of Trade Facilitation Recommendations (Přehled doporučení pro usnadnění obchodu) (ECE/TRADE/346, vydání 2006) a United Nations Trade Data Elements Directory (UNTDDED) (Seznam prvků obchodních údajů) (ECE/TRADE/362, vydání 2005).

5.4.2 Osvědčení o naložení kontejneru, vozidla nebo železničního vozu

Poznámka: Pro účely tohoto oddílu zahrnuje termín "vozidlo" také železniční vůz.

Jestliže přeprava nebezpečných věcí v kontejneru předchází přepravě po moři, musí být přepravní doklad⁵ doprovázen osvědčením o naložení kontejneru/vozidla odpovídajícím oddílu 5.4.2 IMDG Code⁶.

Formuláře přepravního dokladu požadovaného v oddílu 5.4.1 a osvědčení o naložení kontejneru/vozidla mohou být spojeny do jednoho dokladu; pokud tomu tak není, musí být tyto doklady připojeny. Jestliže jsou tyto formuláře spojeny do jednoho dokladu, vložení poznámky, že naložení kontejneru nebo vozidla bylo provedeno podle příslušných modálních předpisů s uvedením osoby odpovědné za osvědčení o naložení kontejneru, musí být dostatečné.

POZNÁMKA: Osvědčení o naložení kontejneru/vozidla se nepožaduje pro přemístitelné cisterny, cisternové kontejnery a MEGC.

Jestliže přeprava nebezpečných věcí ve vozidle předchází přepravě po moři, může být přepravní doklad doprovázen „osvědčením o naložení kontejneru/vozidla“ podle oddílu 5.4.2 IMDG Code^{5,6}

⁵ Pokyny pro použití v praxi a při školení o nakládání věcí do dopravních jednotek byly zpracovány též Mezinárodní námořní organizací (IMO), Mezinárodní organizací práce (ILO) a Evropskou hospodářskou komisí Organizace spojených národů (EHK OSN) a byly uveřejněny IMO („IMO/ILO/UNECE Praktická instrukce pro nakládání nákladních dopravních jednotek (CTU Code).

⁶ Oddíl 5.4.2 IMDG Code vyžaduje následující:

5.4.2 Osvědčení o naložení kontejneru/vozidla

5.4.2.1 Jestliže jsou nebezpečné věci baleny nebo naloženy do kontejneru nebo vozidla, musí osoby odpovědné za naložení kontejneru nebo vozidla vystavit „osvědčení o naložení kontejneru/vozidla“ uvádějící identifikační číslo(a) kontejneru/vozidla a osvědčující, že operace byly provedeny podle následujících podmínek:

- .1 Kontejner/vozidlo byl(o) čistý(é), suchý(é) a prokazatelně připraven(o) pro uložení věci;
- .2 Kusy, které je třeba oddělit podle příslušných požadavků na oddělené uložení, nesmějí být společně naloženy na nebo do jednoho kontejneru/vozidla [pokud to není schváleno příslušným orgánem podle 7.3.4.1 (IMDG Code)];
- .3 Všechny kusy byly zvnějšku prohlédnuty na poškození a byly naloženy pouze nepoškozené kusy;
- .4 Sudy byly uloženy nastojato, ledaže by bylo schváleno příslušným orgánem, a všechny věci byly správně naloženy a, pokud je to nezbytné, přiměřeně fixovány zajišťujícím materiálem vyhovujícím druhu(ům) dopravy po zamýšlené přepravní trase;
- .5 Věci naložené jako volně ložené látky musí být rovnoměrně rozloženy v kontejneru/vozidle;
- .6 Pro zásilky obsahující věci třídy 1, kromě podtřídy 1.4 je kontejner/vozidlo konstrukčně provozuschopné podle 7.1.2 (IMDG Code) (Změna 39-18);
- .7 Kontejner/vozidlo a kusy byly správně popsány, označeny bezpečnostními značkami a popřípadě velkými bezpečnostními značkami;
- .8 Pokud jsou pro účely chlazení nebo kondicionování použity látky představující riziko udušení (jako např. suchý led (UN 1845) nebo dusík, hluboce zchlazený, kapalný (UN 1977) nebo argon, hluboce zchlazený, kapalný (UN 1951)), kontejner/vozidlo je zvnějšku označen(o) v souladu s 5.5.3.6 (IMDG Code); a
- .9 Přepravní doklad pro nebezpečné věci, předepsaný v 5.4.1 (IMDG Code), byl obdržen pro každou zásilku nebezpečných věcí naložených v kontejneru/vozidle.

POZNÁMKA: Osvědčení o naložení kontejneru/vozidla se nevyžaduje pro přemístitelné cisterny.

5.4.2.2 Údaje požadované v přepravním dokladu pro nebezpečné věci a v osvědčení o naložení kontejneru/vozidla mohou být spojeny do jednoho dokladu; pokud tomu tak není, musí být tyto doklady připojeny jeden k druhému. Jestliže tyto údaje jsou spojeny do jednoho dokladu, doklad musí obsahovat podepsané prohlášení takové jako „Prohlašuji se, že naložení věcí do kontejneru/vozidla bylo provedeno podle příslušných ustanovení“. V dokladu musí být uvedeno datum a identifikace osoby, která prohlášení podepsala. Faksimile podpisů jsou přípustné, pokud příslušné právní předpisy uznávají legální platnost faksimilí podpisů.

5.4.2.3 Je-li osvědčení o naložení kontejneru/vozidla předáváno dopravci pomocí techniky přenosu dat v systému EDP nebo EDI, smí (smějí) být elektronické podpis(y) nahrazen(y) jménem (jmény) (velkými písmeny) osob(y) oprávněné (oprávněných) k podpisu.

5.4.2.4 Je-li osvědčení o naložení kontejneru/vozidla předáváno dopravci pomocí techniky přenosu dat v systému EDP nebo EDI a následně jsou nebezpečné věci předány dopravci, který požaduje osvědčení o naložení kontejneru/vozidla, v papírové formě, musí tento dopravce zajistit, aby papírový doklad obsahoval zápis „Originál obdržen elektronicky“ a jméno podpisu musí být uvedeno velkými písmeny.

5.4.3 Písemné pokyny

- 5.4.3.1** Jako pomoc během nehodové nouzové situace, k níž může dojít nebo která může vzniknout během přepravy, musí být písemné pokyny ve formě stanovené v 5.4.3.4 při přepravě v kormidelně a musí být snadno přístupné.
- 5.4.3.2** Tyto pokyny musí dopravce poskytnout před nakládkou veliteli plavidla v jazyce (jazycích), ve kterém (kterých) jsou velitel plavidla a odborník schopni je přečíst a porozumět jim. Velitel plavidla musí zajistit, aby každý dotčený člen posádky a jakákoliv další osoba na palubě pokynům porozuměl(a) a byl(a) schopen (schopna) podle nich správně postupovat.
- 5.4.3.3** Před nakládkou se musí členové posádky informovat o nebezpečných věcech, které se mají nakládat, a nahlédnout do písemných pokynů k podrobnostem o činnostech, které je třeba vykonat v případě nehody nebo nouzové situace.
- 5.4.3.4** Pokyny musí odpovídat následujícímu čtyřstránkovému vzoru, jak pokud jde o jejich formu, tak i obsah.

PÍSEMNÉ POKYNY PODLE ADN**Činnosti v případě nehody nebo mimořádné události**

V případě nehody nebo mimořádné události, k níž může dojít během přepravy, musí členové posádky plavidla učinit následující opatření, pokud je lze bezpečně a prakticky provést:

- Informovat všechny ostatní osoby na plavidle o mimořádné události a nepouštět je, pokud je to možné, do nebezpečné zóny. Varovat jiná plavidla v blízkosti;
- Vyloučit zápalné zdroje, zejména nekouřit, nepoužívat elektronické cigarety nebo podobná zařízení a nezapínat nebo nevypínat žádné elektrické zařízení, které nesplňuje požadavky pro použití v zóně 1 (tj. žádná zařízení nebo vybavení označená červeně podle 9.1.0.52.1, 9.3.1.52.2, 9.3.2.52.2 nebo 9.3.3.52.2) a není určeno pro použití v nouzových situacích;
- Informovat příslušné orgány a poskytnout jim co možno nejvíce informací o nehodě nebo mimořádné události a o příslušných látkách;
- Uchovávat přepravní doklady a plán uložení nákladu snadno přístupné pro zásahové jednotky při jejich příjezdu;
- Nešlapat do vytekých nebo vysypaných látek, ani se jich nedotýkat, a vyhnout se vdechnutí výparů, kouře, prachu a par zdržováním se na návětrné straně;
- Kde je to vhodné a bezpečné hasit malé/začínající požáry;
- Kde je to vhodné a bezpečné, použít vybavu plavidla k zamezení úniků do vodního prostředí a k zadržení – zachycení uniklých látek
- Kde je to nutné a bezpečné, zajistit plavidlo proti vybočení;
- Kde je to vhodné, vzdálit se z blízkosti místa nehody nebo mimořádné události, upozornit jiné osoby, aby se vzdálily, a řídit se pokyny příslušného orgánu;
- Odložit všechno kontaminované oblečení a použité kontaminované ochranné prostředky, bezpečně je zlikvidovat a umýt si tělo vhodnými prostředky;
- Řídit se dodatečnými pokyny odpovídajícími danému nebezpečí všech dotčených věcí uvedených v následující tabulce. Pro přepravu v kusech nebo ve volně loženém stavu odpovídají nebezpečí číslu vzoru bezpečnostní značky; pro přepravu v tankových plavidlech údajům podle 5.4.1.1.2 (c).

Dodatečné poučení pro členy posádky o nebezpečných vlastnostech nebezpečných věcí podle tříd a o činnostech za obvyklých okolností, které je třeba vykonat

Bezpečnostní značky a velké bezpečnostní značky, popis nebezpečí	Charakteristiky nebezpečí	Dodatečné opatření
(1)	(2)	(3)
Látky podporující hoření  5.1	Nebezpečí prudké reakce, vznícení a výbuchu ve styku se zápalnými nebo hořlavými látkami.	Vyvarovat se smíchání s hořlavými nebo zápalnými látkami (např. pílínami).
Organické peroxidy  5.2	Nebezpečí exotermického rozkladu při zvýšených teplotách, styku s jinými látkami (jako jsou kyseliny, sloučeniny těžkých kovů nebo aminy), tření nebo otřesu. Toto může vést k vyvíjení škodlivých a hořlavých plynů nebo par nebo samovznícení.	Vyvarovat se smíchání s hořlavými nebo zápalnými látkami (např. pílínami).
Toxické látky  6.1	Nebezpečí otravy vdechnutím, dotykem s pokožkou nebo požitím. Nebezpečí pro vodní prostředí a kanalizační systém.	Použít únikový prostředek.
Infekční látky  6.2	Nebezpečí infekce. Mohou způsobit vážnou nemoc u lidí nebo zvířat. Nebezpečí pro vodní prostředí a kanalizační systém.	
Radioaktivní látky  7A 7B 7C 7D	Nebezpečí absorpce a vnějšího ozáření.	Omezit dobu expozice.
Štěpné látky  7E	Nebezpečí jaderné řetězové reakce.	
Žíravé látky  8	Nebezpečí popálenin poleptáním. Mohou prudce reagovat spolu vzájemně, s vodou a s jinými látkami. Rozlité nebo rozsypaná látka může vyvíjet žíravé páry. Nebezpečí pro vodní prostředí.	
Jiné nebezpečné látky a předměty  9 9A	Nebezpečí popálenin. Nebezpečí ohně. Nebezpečí výbuchu. Nebezpečí pro vodní prostředí.	

POZNÁMKA:

1. Pro nebezpečné věci s více nebezpečími a pro smíšené náklady se musí dodržet každá aplikovatelná položka.
2. Dodatečné poučení uvedené v tabulce ve sloupci (3) smí být přizpůsobeno tak, aby odráželo třídy nebezpečných věcí, které se mají přepravovat, a jejich dopravní prostředky.
3. K nebezpečím viz rovněž zápisy v přepravním dokladu, jakož i kapitolu 3.2, tabulku C, sloupec (5).

Dodatečné poučení pro členy posádky o nebezpečných vlastnostech nebezpečných věcí, naznačených značkami, a o činnostech, které je třeba vykonat za obvyklých okolností		
Značka	Charakteristiky nebezpečí	Dodatečná opatření
(1)	(2)	(3)
Látky ohrožující životní prostředí 	Nebezpečí pro vodní prostředí.	
Zahřáté látky 	Nebezpečí popálenin horkem.	Vyvarovat se kontaktu s horkými částmi dopravní jednotky a s rozlitou nebo rozsypanou látkou.

Výbava pro osobní a obecnou ochranu při provádění všeobecných činností a specifických nouzových činností s ohledem na nebezpečí, která musí být při přepravě na plavidle podle oddílu 8.1.5 ADN

Výbava vyžadovaná podle kapitoly 3.2, tabulky A, sloupce (9) a tabulky C, sloupce (18) musí být při přepravě na plavidle pro všechna nebezpečí uvedená v přepravním dokladu.

5.4.3.5

Smluvní strany poskytnou sekretariátu OSN oficiální překlad písemných pokynů ve svém úředním jazyku (jazycích) podle tohoto oddílu. Sekretariát OSN dá národní verze písemných pokynů, které obdržel, k dispozici všem smluvním stranám.

5.4.4 Uchování informací o přepravě nebezpečných věcí

5.4.4.1 Odesílatel a dopravce musí uchovávat kopii přepravního dokladu k nebezpečným věcem a dodatečné informace a dokumentaci, jak je uvedena v ADN, po dobu nejméně tří měsíců.

5.4.4.2 Jsou-li dokumenty uchovávány v elektronické formě nebo v počítačovém systému, musí být odesílatel a dopravce schopni je reprodukovat v tištěné formě.

5.4.5 Příklad formuláře pro multimodální přepravu nebezpečných věcí

Příklad vzorového formuláře, který může být použit zároveň jako deklarace nebezpečných věcí a zároveň jako osvědčení o naložení kontejneru pro multimodální přepravu nebezpečných věcí.

<p>* PRO NEBEZPEČNÉ VĚCI: Udává se: oficiální pojmenování; třída nebezpečnosti, UN číslo, obalová skupina (pokud je určena) a všechny ostatní informace, které jsou předepsány platnými národními nebo mezinárodními předpisy.</p>				

KAPITOLA 5.5

ZVLÁŠTNÍ USTANOVENÍ

- 5.5.1** (Vypuštěno)
- 5.5.2** **Zvláštní ustanovení pro zaplynované nákladní (přepravní) dopravní jednotky (UN 3359)**
- 5.5.2.1** **Všeobecně**
- 5.5.2.1.1 Zaplynované nákladní dopravní (přepravní) jednotky (UN 3359), které neobsahují žádné jiné nebezpečné věci, nepodléhají žádným jiným ustanovením ADN, než jsou ustanovení tohoto oddílu.
- 5.5.2.1.2 Jsou-li zaplynované nákladní dopravní (přepravní) jednotky naloženy nebezpečnými věcmi, navíc k zaplynovacímu prostředku, použijí se všechna ustanovení ADN týkající se těchto věcí (včetně označování velkými bezpečnostními značkami, značení a dokumentace) navíc k ustanovením tohoto oddílu.
- 5.5.2.1.3 Pro přepravu nákladu pod zaplynováním se musí použít pouze nákladní dopravní (přepravní) jednotky, které mohou být uzavřeny takovým způsobem, že je únik plynu omezen na minimum.
- 5.5.2.2** **Školení**
- Osoby zabývající se manipulací se zaplynovanými nákladními dopravními (přepravními) jednotkami musí být vyškoleny přiměřeně ke svým odpovědnostem.
- 5.5.2.3** **Označování**
- 5.5.2.3.1 Zaplynovaná nákladní dopravní (přepravní) jednotka musí být označena výstražnou značkou uvedenou v 5.5.2.3.2, na každém přístupovém místě tam, kde bude snadno viditelné osobami otevírajícími nákladní dopravní (přepravní) jednotku nebo do ní vstupujícími. Tato značka musí zůstat na nákladní dopravní (přepravní) jednotce, dokud nebyla provedena následující opatření:
- (a) zaplynovaná nákladní dopravní (přepravní) jednotka byla vyvětrána, aby se odstranily škodlivé koncentrace zaplynovacího plynu; a
 - (b) zaplynované věci nebo materiály byly vyloženy.

5.5.2.3.2 Výstražná značka pro zaplynovanou jednotku musí odpovídat obrázku 5.5.2.3.2

Značka musí být pravouhlá. Musí být minimálně 400 mm široká a 300 mm vysoká a šířka vnější čáry musí být minimálně 2 mm. Nápis musí být černé barvy na bílém podkladu s písmeny nejméně 25 mm vysokými. Tam, kde nejsou udány rozměry, musí všechny prvky proporčně odpovídat uvedenému obrázku.

5.5.2.3.3 Jestliže byla zaplynovaná nákladní dopravní (přepravní) jednotka úplně vyvětrána buď otevřením dveří jednotky, nebo mechanickou ventilací po zaplynování, musí být datum vyvětrání vyznačeno na výstražné značce pro zaplynovanou jednotku.

5.5.2.3.4 Jestliže byla zaplynovaná nákladní dopravní (přepravní) jednotka vyvětrána a vyložena, musí být výstražná značka pro zaplynovanou jednotku odstraněna.

5.5.2.3.5 Na zaplynovanou nákladní dopravní (přepravní) jednotku se nemusí umístit velké bezpečnostní značky podle vzoru č. 9 (viz 5.2.2.2.2), pokud nejsou vyžadovány pro jiné látky nebo předměty třídy 9, které jsou v této jednotce naloženy.

5.5.2.4 **Dokumentace**

5.5.2.4.1 Doklady spojené s přepravou nákladních dopravních (přepravních) jednotek, které byly zaplynovány a nebyly úplně vyvětrány před přepravou, musí obsahovat následující informace:

- „UN 3359, zaplynovaná nákladní dopravní (přepravní) jednotka, 9“, nebo „UN 3359, zaplynovaná nákladní dopravní (přepravní) jednotka, třída 9“;

- datum a čas zaplynování; a

- druh a množství použitého zaplynovacího prostředku.

Tyto údaje musí být napsány v oficiálním jazyce země odeslání, a pokud tímto jazykem není angličtina, francouzština nebo němčina, též v angličtině, francouzštině nebo němčině, pokud případné dohody uzavřené mezi zeměmi, jichž se přeprava týká, nestanoví jinak.

5.5.2.4.2 Doklady směřjí být v jakékoli formě za podmínky, že obsahují informace vyžadované v 5.5.2.4.1. Tyto informace musí být snadno identifikovatelné, čitelné a trvalé.

5.5.2.4.3 Musí být vypracovány pokyny pro likvidaci jakéhokoli zbytkového zaplynovacího prostředku včetně zaplynovacích zařízení (pokud jsou používána).

5.5.2.4.4 Doklad se nevyžaduje, jestliže byla zaplynovaná nákladní dopravní (přepravní) jednotka úplně vyvětrána a datum vyvětrání bylo vyznačeno na výstražné značce (viz 5.5.2.3.3 a 5.5.2.3.4).

5.5.3 **Zvláštní ustanovení platná pro přepravu suchého ledu (UN 1845) a pro kusy a vozidla a kontejnery obsahující látky představující riziko udušení, jsou-li používány pro účely chlazení nebo kondicionování (jako jsou suchý led (UN 1845), nebo dusík, hluboce zchlazený, kapalný (UN 1977) nebo argon, hluboce zchlazený, kapalný (UN 1951) nebo dusík)**

POZNÁMKA: V kontextu tohoto oddílu může být termín „kondicionování“ použit v širším rozsahu a zahrnuje ochranu.

5.5.3.1 **Rozsah platnosti**

5.5.3.1.1 Tento oddíl se nevztahuje na látky, které mohou být použity pro účely chlazení nebo kondicionování, jsou-li přepravovány jako zásilka nebezpečných věcí, s výjimkou přepravy suchého ledu (UN 1845). Jsou-li přepravovány jako zásilka, musí být tyto látky přepravovány pod příslušnou položkou tabulky A kapitoly 3.2 podle s ní spojených podmínek přepravy.

Pro UN 1845 platí přepravní podmínky stanovené v tomto oddílu, s výjimkou 5.5.3.3.1, pro všechny druhy přepravy, ať už je přepravován jako chladivo, kondicionér, nebo jako zásilka. Pro přepravu UN 1845 neplatí žádné jiné ustanovení ADN.

5.5.3.1.2 Tento oddíl se nevztahuje na plyny v chladicích okruzích.

5.5.3.1.3 Nebezpečné věci používané pro chlazení nebo kondicionování cisteren nebo MEGC během přepravy nepodléhají ustanovením tohoto oddílu.

5.5.3.1.4 Vozidla, železniční vozy a kontejnery obsahující látky pro účely chlazení nebo kondicionování zahrnují vozidla, železniční vozy a kontejnery obsahující látky používané pro účely chlazení nebo kondicionování uvnitř kusů, jakož i vozidla, železniční vozy a kontejnery s nebalenými látkami používanými pro účely chlazení nebo kondicionování.

5.5.3.1.5 Pododdíly 5.5.3.6 a 5.5.3.7 platí pouze tehdy, pokud existuje skutečné riziko udušení ve vozidle, železničním voze nebo kontejneru. Dotčení účastníci musí vyhodnotit toto riziko s ohledem na nebezpečí, které představují látky používané pro chlazení nebo kondicionování, množství přepravované látky, dobu trvání přepravy, použitého způsobu balení a mezní hodnoty koncentrace plynu uvedené v poznámce k 5.5.3.3.3.

5.5.3.2 **Všeobecně**

5.5.3.2.1 Vozidla, železniční vozy a kontejnery, ve kterých je suchý led (UN 1845) přepravován nebo obsahující látky používané pro účely chlazení nebo kondicionování (jiné než zaplynování) během přepravy nepodléhají žádným jiným ustanovením ADN, než jsou ustanovení tohoto oddílu.

5.5.3.2.2 Jsou-li nebezpečné věci naloženy ve vozidlech, železničních vozech nebo kontejnerech obsahujících látky používané pro účely chlazení nebo kondicionování, použijí se všechna ostatní ustanovení ADN vztahující se na tyto nebezpečné věci, navíc k ustanovením tohoto oddílu.

5.5.3.2.3 *(Vyhrazeno)*

5.5.3.2.4 Osoby zabývající se manipulací nebo přepravou vozidel, železničních vozů a kontejnerů, ve kterých je suchý led (UN 1845) přepravován nebo obsahující látky používané pro účely chlazení nebo kondicionování, musí být vyškoleny přiměřeně ke svým odpovědnostem.

5.5.3.3 **Kusy obsahující suchý led (UN 1845) nebo chladivo nebo kondicionér**

5.5.3.3.1 Balené nebezpečné věci vyžadující chlazení nebo kondicionování, přiřazené k pokynům pro balení P203, P620, P650, P800, P901 nebo P904 pododdílu 4.1.4.1 ADR, musí splňovat příslušné požadavky tohoto pokynu pro balení.

5.5.3.3.2 Pro balené nebezpečné věci vyžadující chlazení nebo kondicionování, přiřazené k jiným pokynům pro balení, musí být kusy schopny snášet velmi nízké teploty a nesmějí být poškozovány ani významně zeslabovány chladivem nebo kondicionérem. Kusy musí být konstruovány a vyrobeny tak, aby dovozovaly uvolnění plynu k zamezení nárůstu tlaku, který by mohl protrhnout obal. Nebezpečné věci

musí být zabaleny takovým způsobem, aby se zamezilo pohybu po rozptýlení chladiva nebo kondicionéru.

5.5.3.3.3 Kusy obsahující suchý led (UN 1845) nebo chladivo nebo kondicionér musí být přepravovány v dobře větraných vozidlech a kontejnerech. Značení podle 5.5.3.6 se v tomto případě nevyžaduje.

5.5.3.3.4 Větrání není nutné, a označení podle 5.5.3.6 je nutné, je-li:

- zabráněno výměně plynů mezi nákladovým prostorem a kabinou řidiče; nebo
- nákladový prostor izotermické, chlazené nebo chladicí a mrazicí zařízení, například jak je stanoveno v Dohodě o mezinárodní přepravě zkazitelných potravin a o specializovaných prostředcích určených pro tyto přepravy (ATP), kde je tato podmínka splněna.

POZNÁMKA: V této souvislosti znamená "dobře větrané" atmosféru, kde je koncentrace oxidu uhličitého nižší než 0,5% obj. a koncentrace kyslíku vyšší než 19,5% obj.

5.5.3.4 Označování kusů obsahujících suchý led (UN 1845) nebo chladivo nebo kondicionér

5.5.3.4.1 Kusy obsahující suchý led (UN 1845) jako zásilku se označí „OXID UHLIČITÝ, TUHÝ“ nebo „SUCHÝ LED“; kusy obsahující nebezpečné věci používané pro chlazení nebo kondicionování musí být označeny pojmenováním těchto nebezpečných věcí uvedených ve sloupci (2) tabulky A kapitoly 3.2, následovaným slovy „JAKO CHLADIVO“ nebo „JAKO KONDICIONÉR“, jak je to náležité, v úředním jazyce země původu a též, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

5.5.3.4.2 Značky musí být trvanlivé, čitelné a umístěné na takovém místě a takové velikosti v poměru ke kusu, aby byly snadno viditelné.

5.5.3.5 Vozidla, železniční vozy a kontejnery obsahující nebalený suchý led

5.5.3.5.1 Je-li suchý led použit v nebalené formě, nesmí přijít do přímého styku s kovovou konstrukcí vozidla nebo kontejneru, aby se zamezilo zkrhnutí kovu. Musí být učiněna opatření k zajištění přiměřené izolace mezi suchým ledem a vozidlem nebo kontejnerem jejich oddělením mezerou o šířce nejméně 30 mm (např. použitím vhodných materiálů s nízkou tepelnou vodivostí, jako jsou dřevěná prkna, palety atd.).

5.5.3.5.2 Pokud je suchý uložen okolo kusů, musí být učiněna opatření k zajištění toho, že kusy zůstanou během přepravy v původní poloze poté, co se suchý let rozptýlí.

5.5.3.6 Označování vozidel, železničních vozů a kontejnerů

5.5.3.6.1 Vozidla a kontejnery obsahující suchý led (UN 1845) nebo nebezpečné věci používané pro účely chlazení nebo kondicionování, které nejsou dobře větrané, musí být označeny výstražnou značkou uvedenou v 5.5.3.6.2, umístěnou na každém přístupovém místě tam, kde bude snadno viditelná osobami otevírajícími vozidlo nebo kontejner nebo do nich vstupujícími. Tato značka musí zůstat na vozidle nebo kontejneru, dokud nebyla provedena následující opatření:

- (a) vozidlo nebo kontejner byl(o) dobře odvětrán(o), aby se odstranily škodlivé koncentrace suchého ledu (UN 1845) nebo chladiva nebo kondicionéru; a
- (b) suchý led (UN 1845) nebo chlazené nebo kondicionované věci byly vyloženy.

Dokud je vozidlo nebo kontejner označeno, musí být přijata nezbytná bezpečnostní opatření před vstupem do něj. Nutnost vyvětrání prostřednictvím nákladových dveří nebo jiným způsobem (např. nucenou ventilací) je třeba vyhodnotit a zařadit do školení osob zúčastněných na přepravě.

5.5.3.6.2 Výstražná značka musí odpovídat obrázku 5.5.3.6.2.

Obrázek 5.5.3.6.2

Výstražná značka udušení pro vozidla, železniční vozy a kontejnery

- * Vložit pojmenování nebo název dusivého plynu použitého jako chladivo/kondicionér uvedené ve sloupci (2) tabulky A, kapitoly 3.2. Nápisy musí být velkými písmeny o výšce nejméně 25 mm, vše musí být na jednom řádku. V případě, že je oficiální pojmenování pro přepravu příliš dlouhé, aby se vešlo do vymezeného prostoru, může být písmo zmenšeno na maximální možnou velikost. Příklad: „OXID UHLIČITÝ, TUHÝ“. Mohou být přidány další informace jako „JAKO CHLADIVO“ nebo „JAKO KONDICIONÉR“.

Výstražná značka musí být pravoúhlá. Musí být nejméně 150 mm široká a nejméně 250 mm vysoká. Slovo "POZOR" musí být v červené nebo bílé barvě s písmeny o výšce nejméně 25 mm. Tam, kde nejsou udány rozměry, musí všechny prvky proporčně odpovídat uvedenému obrázku.

Slovo „POZOR“ a slova „JAKO CHLADIVO“ nebo „JAKO KONDICIONÉR“, jak je to náležité, musí být uvedeny v úředním jazyce země původu, a pokud tímto jazykem není angličtina, francouzština nebo němčina, také v angličtině, francouzštině nebo němčině, pokud dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

5.5.3.7 Dokumentace

5.5.3.7.1 Doklady (jako nákladový list, konosament, nebo nákladní list CMR/CIM/CMNI) spojené s přepravou vozidel, železničních vozů nebo kontejnerů, obsahující nebo které obsahovaly suchý led (UN 1845) nebo látky pro účely chlazení nebo kondicionování a které nebyly úplně vyvětrány před přepravou, musí obsahovat následující informace:

- (a) UN číslo s předřazenými písmeny „UN“; a
- (b) pojmenování uvedené ve sloupci (2) tabulky A kapitoly 3.2, následované, kde je to vhodné slovy „JAKO CHLADIVO“ nebo „JAKO KONDICIONÉR“, v úředním jazyce země původu a též, pokud tímto jazykem není angličtina, francouzština nebo němčina, v angličtině, francouzštině nebo němčině, pokud dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

Například: UN 1845 OXID UHLIČITÝ, TUHÝ, JAKO CHLADIVO.

5.5.3.7.2 Přepravní doklad smí být v jakékoli formě za podmínky, že obsahuje informace vyžadované v 5.5.3.7.1. Tyto informace musí být snadno identifikovatelné, čitelné a trvalé.

5.5.4 Nebezpečné věci obsažené v zařízení používaném nebo určeném k použití během přepravy, připojené nebo obsažené v kusech, přepravních obalových souborech, kontejnerech nebo nákladových prostorech

5.5.4.1 Na nebezpečné věci (např. lithiové baterie, zásobníky do palivových článků) obsažené v zařízeních jako záznamníky dat a zařízeních pro sledování nákladu připojené nebo obsažené v kusech, přepravních obalových souborech, kontejnerech nebo nákladových prostorech se nevztahují žádné požadavky ADN, kromě následujících:

- (a) zařízení musí být používáno nebo určeno k použití během přepravy;
- (b) obsažené nebezpečné věci (např. lithiové baterie, zásobníky do palivových článků) musí splňovat příslušné konstrukční a zkušební požadavky uvedené v ADN; a
- (c) zařízení musí být schopno odolat nárazům a zatížením, které se běžně vyskytují během přepravy a musí být bezpečné pro použití v nebezpečném prostředí, kterému může být vystaveno.

5.5.4.2 Pokud se takové zařízení obsahující nebezpečné věci přepravuje jako zásilka, použije se příslušná položka v tabulce A kapitoly 3.2 a použijí se všechna příslušná ustanovení ADN.

ČÁST 6

POŽADAVKY NA KONSTRUKCI A TESTOVÁNÍ OBALŮ, IBC, VELKÝCH OBALŮ, CISTEREN A KONTEJNERŮ PRO VOLNĚ LOŽENÉ LÁTKY

KAPITOLA 6.1

VŠEOBECNÁ USTANOVENÍ

- 6.1.1** Obaly (včetně IBC a velkých obalů) a cisterny musí splňovat následující požadavky ADR z hlediska konstrukce a zkoušení:
- Kapitola 6.1: Požadavky na konstrukci a zkoušení obalů;
- Kapitola 6.2: Požadavky na konstrukci a zkoušení tlakových nádob, aerosolových rozprašovačů a malých nádobek obsahujících plyn (plynových kartuší) a zásobníků do palivových článků obsahujících zkapalněný hořlavý plyn;
- Kapitola 6.3: Požadavky na konstrukci a zkoušení obalů pro infekční látky kategorie A třídy 6.2;
- Kapitola 6.4: Požadavky na konstrukci, zkoušení a schvalování kusů a látek třídy 7;
- Kapitola 6.5: Požadavky na konstrukci a zkoušení velkých nádob pro volně ložené látky (IBC);
- Kapitola 6.6: Požadavky na konstrukci a zkoušení velkých obalů;
- Kapitola 6.7: Požadavky na konstrukci, výrobu, inspekce a zkoušení přemístitelných cisteren a UN vícečlánkových kontejnerů na plyny (MEGC);
- Kapitola 6.8: Požadavky na konstrukci, výstroj, schvalování typu, inspekce a zkoušky a značení nesnímatelných cisteren (cisternových vozidel), snímatelných cisteren a cisternových kontejnerů a cisternových výměnných nástaveb s nádržemi vyrobenými z kovových materiálů a bateriových vozidel a vícečlánkových kontejnerů na plyny (MEGC);
- Kapitola 6.9: Požadavky na konstrukci, výrobu, výstroj, schvalování typu, zkoušení a značení nesnímatelných cisteren (cisternových vozidel), snímatelných cisteren, cisternových kontejnerů a cisternových výměnných nástaveb z vyztužených platů (FRP);
- Kapitola 6.10: Požadavky na konstrukci, výstroj, schvalování typu, inspekce a značení cisteren pro podtlakové vyčerpávání odpadů;
- Kapitola 6.11: Požadavky na konstrukci, výrobu, inspekce a zkoušení kontejnerů pro volně ložené látky.
- Kapitola 6.12: Požadavky na výrobu, výstroj, schvalování typu, inspekce a zkoušení a značení cisteren, kontejnerů pro volně ložené látky a zvláštních komor pro výbušniny mobilních jednotek připravujících výbušniny (MEMU)
- 6.1.2** Přemístitelné cisterny mohou splňovat rovněž požadavky kapitoly 6.7, nebo popřípadě kapitoly 6.9 IMDG Code.
- 6.1.3** Cisternová vozidla mohou splňovat rovněž požadavky kapitoly 6.8 IMDG Code.
- 6.1.4** Cisternové železniční vozy s nesnímatelnými nebo snímatelnými cisternami a bateriové železniční vozy musí splňovat požadavky kapitoly 6.8 RID.
- 6.1.5** Nástavby vozidel pro přepravu volně ložených látek musí, pokud je to vhodné, splňovat požadavky kapitoly 6.11 nebo kapitoly 9.5 ADR.
- 6.1.6** Jestliže se použijí ustanovení 7.3.1.1 (a) RID nebo ADR, musí kontejnery pro volně ložené látky splňovat požadavky kapitoly 6.11 RID nebo ADR.

ČÁST 7

POŽADAVKY PRO NAKLÁDKU, PŘEPRAVU, VYKLÁDKU A OSTATNÍ MANIPULACI S NÁKLADEM

KAPITOLA 7.1

PLAVIDLA PŘEPRAVUJÍCÍ SUCHÝ NÁKLAD

7.1.0 Všeobecné předpisy

7.1.0.1 Předpisy 7.1.0 až 7.1.7 platí pro plavidla přepravující suchý náklad.

7.1.0.2 -
7.1.0.99 (Vyhrazeno)

7.1.1 Způsob přepravy

7.1.1.1 -
7.1.1.9 (Vyhrazeno)

7.1.1.10 *Přeprava kusů*

V předpisech o přepravě kusů, pokud není stanoveno jinak, je uváděna celková (brutto) hmotnost. Pokud jsou kusy přepravovány v kontejnerech nebo vozidlech, nepatří hmotnost kontejneru nebo vozidla k celkové (brutto) hmotnosti těchto kusů.

7.1.1.11 *Přeprava ve volně loženém stavu*

Je zakázáno přepravovat nebezpečné věci ve volně loženém stavu, s výjimkou případů když je to povoleno v sloupci (8) tabulky A kapitoly 3.2. V tomto sloupci je pak uvedeno "B".

7.1.1.12 *Větrání*

Větrání nákladních prostor je nutné pouze, jestliže je to předepsáno v 7.1.4.12 nebo v sloupci (10) tabulky A kapitoly 3.2. V tomto sloupci je pak uvedeno "VE".

7.1.1.13 *Opatření před nakládkou*

Před nakládkou jsou zapotřebí dodatečná opatření pouze v případech, kdy je to předepsáno v 7.1.4.13 nebo v sloupci (11) tabulky A kapitoly 3.2. V tomto sloupci je pak uvedeno "LO".

7.1.1.14 *Manipulace a uložení nákladu*

Během manipulace a uložení nákladu jsou zapotřebí dodatečná opatření pouze v případě, jestliže to je předepsáno v 7.1.4.14 nebo v sloupci (11) tabulky A kapitoly 3.2. V tomto sloupci je pak uvedeno "HA".

7.1.1.15 (Vyhrazeno)

7.1.1.16 *Opatření během nakládky, přepravy, vykládky a manipulace s nákladem*

Během nakládky, přepravy, vykládky a manipulace s nákladem jsou potřebná dodatečná opatření pouze, pokud to je předepsáno v 7.1.4.16 nebo v sloupci (11) tabulky A kapitoly 3.2. V tomto sloupci je pak uvedeno "IN".

7.1.1.17 (Vyhrazeno)

7.1.1.18 *Přeprava v kontejnerech, kontejnerech pro volně ložené látky, v IBC a ve velkých obalech, v MEGC, v přemístitelných cisternách a v cisternových kontejnerech*

Přeprava kontejnerů, kontejnerů pro volně ložené látky, IBC, velkých obalů, MEGC, přemístitelných cisteren a cisternových kontejnerů musí odpovídat předpisům o přepravě kusů.

7.1.1.19 Silniční vozidla a železniční vozy

Přeprava dopravních jednotek a vozů musí odpovídat předpisům o přepravě kusů.

7.1.1.20 (Vyhrazeno)

7.1.1.21 Přeprava v nákladních tancích

Je zakázáno přepravovat nebezpečné věci v nákladních tancích na plavidlech pro přepravu suchých nákladů.

7.1.1.22 -
7.1.1.99 (Vyhrazeno)

7.1.2 Požadavky na plavidla**7.1.2.1 Povolení plavidel**

7.1.2.0.1 Nebezpečné věci smějí být přepravovány v množstvích nepřesahující množství uvedená v 7.1.4.1.4, nebo popřípadě v 7.1.4.1.1.2 nebo 7.1.4.1.1.3:

- v plavidlech pro suchý náklad, odpovídajících příslušným konstrukčním požadavkům, uvedeným v 9.1.0.0 až 9.1.0.79; nebo
- v námořních plavidlech odpovídajících příslušným konstrukčním požadavkům, uvedeným v 9.1.0.0 až 9.1.0.79, nebo jinak požadavkům uvedeným v 9.2.0 až 9.2.0.79.

7.1.2.0.2 Nebezpečné věci tříd 2, 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 7, 8 nebo 9, s výjimkou těch nebezpečných věcí, pro které se vyžaduje ve sloupci 5 tabulky A kapitoly 3.2 bezpečnostní značka podle vzoru č. 1, smějí být přepravovány v množství vyšších, než jsou množství uvedená v 7.1.4.1.1.2, 7.1.4.1.1.3 a 7.1.4.1.4:

- v plavidlech s dvojitou obšívku pro suchý náklad, odpovídajících příslušným konstrukčním požadavkům, uvedeným v 9.1.0.80 až 9.1.0.95; nebo
- v námořních plavidlech s dvojitou obšívku, odpovídajících příslušným konstrukčním požadavkům, uvedeným v 9.1.0.80 až 9.1.0.95, nebo jinak požadavkům uvedeným v 9.2.0 až 9.2.0.95.

7.1.2.2 (Vyhrazeno)

7.1.2.4 (Vyhrazeno)

7.1.2.5 Návod k použití přístrojů a zařízení

Jestliže pro používání nějakého přístroje nebo nějakého zařízení jsou zapotřebí zvláštní bezpečnostní předpisy, musí se návod k použití přístroje nebo zařízení nacházet na plavidle na vhodném místě a v jazyce na plavidle obvyklém a také, pokud tímto jazykem není angličtina, francouzština nebo němčina, tak v angličtině, francouzštině nebo němčině, pokud dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

7.1.2.6 -
7.1.2.18 (Vyhrazeno)

7.1.2.19 Tlačná soulodí a sestavy spřažených plavidel

7.1.2.19.1 Pokud v tlačném soulodí nebo v sestavě spřažených plavidel alespoň jedno plavidlo musí být vybaveno schvalovacím osvědčením pro přepravu nebezpečných věcí, musí všechna plavidla této sestavy být vybavena pro ně vystaveným vhodným schvalovacím osvědčením.

Plavidla, která nepřevážejí nebezpečné věci, musí odpovídat požadavkům následně uvedeným pododdílům:

1.16.1.1, 1.16.1.2, 1.16.1.3, 1.16.1.4, 7.1.2.5, 8.1.4, 8.1.5, 8.1.6.1, 8.1.6.3, 8.1.7, 8.3.5, 9.1.0.0, 9.1.0.12.3, 9.1.0.12.4, 9.1.0.17.2, 9.1.0.17.3, 9.1.0.31, 9.1.0.32.2, 9.1.0.34, 9.1.0.40.2, 9.1.0.41, 9.1.0.51, 9.1.0.52, 9.1.0.71 a 9.1.0.74.

7.1.2.19.2 Pro účely aplikace ustanovení této části, s výjimkou 1.4.1.1.2, 7.1.4.1.1.3 a 7.1.4.1.4, se tlačné soulodí nebo sestava spřažených plavidel posuzuje jako jedno jediné plavidlo.

7.1.2.20 -
7.1.2.99 (Vyhrazeno)

7.1.3 Všeobecné provozní předpisy

7.1.3.1 Vstup do nákladních prostor, dvojitých boků a dvojitého dna; kontroly

7.1.3.1.1 Vstup do nákladních prostor je povolen pouze k nakládce a vykládce, provedení kontrol a za účelem čistících prací.

7.1.3.1.2 Do dvojitých boků a dvojitého dna se během plavby nesmí vstupovat.

7.1.3.1.3 Pokud je nutné před vstupem do nákladního prostoru, dvojitých boků nebo dvojitého dna změřit v těchto prostorách koncentraci plynů nebo par, uvolňovaných nákladem, nebo obsah kyslíku ve vzduchu, musí se výsledky takovýchto měření zaznamenávat písemně. Měření směji provádět pouze osoby, uvedené v 8.2.1.2, které jsou vybavené vhodným dýchacím přístrojem pro přepravovanou látku.

Do kontrolovaných prostor se za účelem měření nesmí vstupovat.

7.1.3.1.4 Přeprava nákladu ve volně loženém stavu nebo bez obalu

Pokud plavidlo přepravuje v nákladním prostoru ve volně loženém stavu nebo bez obalu nebezpečné věci, které mají ve sloupci (9) tabulky A kapitoly 3.2 uvedeno EX a/nebo TOX, tak před vstupem kohokoliv do těchto nákladních prostor musí být změřena koncentrace hořlavých a/nebo toxických plynů a par uvolňovaných nákladem v těchto nákladních prostorech, a rovněž v sousedících nákladních prostorech.

7.1.3.1.5 V případě přepravy nebezpečných věcí ve volně loženém stavu nebo bez obalu je vstup do nákladních prostor, dvojitých boků nebo dvojitého dna povolen pouze v případě, když:

- koncentrace hořlavých plynů a par, uvolňovaných nákladem, v nákladním prostoru, dvojitých bocích nebo dvojitém dně je menší než 10 % spodní hranice výbušnosti, koncentrace toxických plynů a par, uvolňovaných nákladem, je nižší než národně přípustná úroveň expozice, a procentuální obsah kyslíku je mezi 20 - 23,5 % obj.; nebo
- koncentrace hořlavých plynů a par uvolňovaných nákladem představuje méně než 10 % spodní hranice výbušnosti a osoba, vstupující do takového prostoru, používá nezávislý dýchací přístroj a jiné potřebné ochranné a záchranné vybavení, a je jištěna pomocí lana. Vstupovat do takových prostor se povoluje pouze pod dohledem druhé osoby, která má k dispozici stejné vybavení. Další dvě osoby, které jsou schopné poskytnout pomoc v mimořádné situaci, se musí nacházet na plavidle ve slyšitelné vzdálenosti.

Na rozdíl od pododdílu 1.1.4.6 má přísnější národní legislativa, týkající se vstupu do nákladního prostoru, přednost před ADN.

7.1.3.1.6 Přeprava v obalech

Je-li podezření na poškození obalů, tak před vstupem jakékoli osoby do nákladního prostoru, obsahujícího nebezpečné věci tříd 2, 3, 4.3, 5.2, 6.1 a 8, u kterých je ve sloupci (9) tabulky A kapitoly 3.2 uvedeno EX a/nebo TOX, musí být změřena koncentrace hořlavých a/nebo toxických plynů, uvolňovaných nákladem, v těchto prostorách.

7.1.3.1.7 Je-li podezření při přepravě nebezpečných věcí tříd 2, 3, 4.3, 5.2, 6.1 a 8 na poškození obalů, tak se vstup do nákladních prostor a rovněž dvojitých boků a nebo dvojitého dna povoluje pouze v případě, když:

- koncentrace hořlavých plynů a par, vylučovaných nákladem, v nákladním prostoru, dvojitých bocích nebo dvojitém dně je menší než 10 % spodní hranice výbušnosti, koncentrace toxických plynů a par, uvolňovaných nákladem, je nižší než národně přípustná úroveň expozice a procentuální obsah kyslíku je mezi 20 - 23,5 % obj.; nebo
- koncentrace hořlavých plynů a par, uvolňovaných nákladem, představuje méně než 10 % spodní hranice výbušnosti a osoba, vstupující do těchto prostor používá nezávislý dýchací přístroj a jiné potřebné ochranné a záchranné vybavení a je jištěna pomocí lana. Vstupovat do takových prostor se povoluje pouze pod dohledem druhé osoby, která má k dispozici stejné vybavení. Další dvě osoby, které jsou schopné poskytnout pomoc v mimořádné situaci, se musí nacházet na plavidle ve slyšitelné vzdálenosti.

Na rozdíl od pododdílu 1.1.4.6 má přísnější národní legislativa, týkající se vstupu do nákladního prostoru, přednost před ADN.

7.1.3.2 -

7.1.3.14 (Vyhrazeno)

7.1.3.15 **Odborník na plavidle**

Jsou-li přepravovány nebezpečné věci, musí být odpovědný velitel plavidla zároveň odborníkem podle 8.2.1.2.

POZNÁMKA: *Který z velitelů posádky plavidla je odpovědným velitelem plavidla, musí být určeno a dokumentováno na plavidle dopravcem. Pokud neexistuje takové určení, vztahuje se tento požadavek na každého velitele plavidla.*

Odchylkou od tohoto ustanovení je pro nakládku a vykládku nebezpečných věcí v tlačném člunu dostačující, aby osoba, která je odpovědná za nakládku a vykládku a za balastování tlačného člunu, měla odbornou kvalifikaci vyžadovanou podle 8.2.1.2.

7.1.3.16 Všechna měření na palubě plavidla musí být prováděna odborníkem uváděným v 8.2.1.2, jestliže v Předpisech příložených k dohodě ADN není uvedeno jinak. Výsledky měření musí být zaznamenány v knize kontrol podle 8.1.2.1 (g).

7.1.3.17 -

7.1.3.19 (Vyhrazeno)

7.1.3.20 **Balastní voda**

Dvojitě boky a dvojitá dna se smí využívat pro balastní vodu.

7.1.3.21 (Vyhrazeno)

7.1.3.22 **Otvírání nákladních prostor**

7.1.3.22.1 Nebezpečné věci musí být chráněny proti vlivům počasí a proti stříkající vodě kromě nakládky a vykládky nebo během kontroly.

Toto ustanovení neplatí, jsou-li nebezpečné věci uloženy v kontejnerech odolných proti postřiku, IBC nebo velkých obalech, nebo v MEGC, přemístitelných cisternách, cisternových kontejnerech, uzavřených vozidlech nebo krytých železničních vozech, nebo ve vozidlech nebo železničních vozech s plachtou.

7.1.3.22.2 Při přepravě nebezpečných věcí ve volně loženém stavu musí nákladní prostor být uzavřen kryty nákladních prostor.

7.1.3.23 -

7.1.3.30 (Vyhrazeno)

7.1.3.31 **Motory**

Je zakázáno používat motory poháněné palivou, jejichž bod vzplanutí je rovný nebo nižší 55 °C (např. benzinové motory). Toto ustanovení se nepoužije u:

- závěsných benzinových motorů záchranných člunů;
- pracovních a záchranných člunů, které odpovídají požadavkům Kapitoly 30 a Oddílu 1 Přílohy 8 Evropské normy stanovující technické požadavky pro vnitrozemská plavidla (ES-TRIN), v platném znění¹.

Když se látka přepravuje ve volně loženém stavu a ve sloupci (9) tabulky A kapitoly 3.2 je uvedeno EX, pak:

- závěsné motory a jejich palivové nádrže se musí převážet na palubě pouze mimo chráněnou oblast; a
- mechanická nafukovací zařízení, závěsné motory a jejich elektrozařízení se musí používat pouze mimo chráněnou oblast.

¹ Nacházejí se na webu Evropského výboru pro rozpracování norem v oblasti vnitrozemské plavby CESNI, <https://www.cesni.eu/en/documents/es-trin/>.

7.1.3.32 Nádrže na pohonné hmoty

Dvojitá dna o výšce minimálně 0,60 m mohou být použita jako palivové nádrže, pokud byla postavena podle předpisů části 9, kapitoly 9.1 nebo 9.2.

7.1.3.33

-

7.1.3.40

(Vyhrazeno)

7.1.3.41 Kouření, používání ohně a otevřeného světla

7.1.3.41.1

Kouření, včetně elektronických cigaret a jiných obdobných zařízení, používání ohně a otevřeného světla na plavidle je zakázáno.

Tabule oznamující tento zákaz musí být umístěny na vhodných místech.

Tento zákaz se nevztahuje na obytné prostory nebo kormidelnu pokud jsou jejich okna, dveře, světlíky a poklopy jsou uzavřeny nebo je-li ventilační systém je seřízen tak, aby zajišťoval přetlak nejméně 0,1 kPa.

7.1.3.41.2

Topné, varné a chladicí přístroje nesmí být provozovány ani kapalnými pohonnými hmotami, zkapalněnými plyny, ani pevnými hořlavými látkami.

Varná a chladicí zařízení jsou povolena pouze v obytných prostorech a v kormidelně.

7.1.3.41.3

Pokud jsou topné přístroje nebo topné kotle umístěny do strojoven nebo do prostor, které jsou pro to zvláště vhodné, smí být provozovány kapalnými pohonnými hmotami, avšak s bodem vzplanutí vyšším než 55 °C.

7.1.3.42 Vytápění nákladních prostor

Je zakázáno vytápět nákladní prostory nebo v nich používat topná zařízení.

7.1.3.43

(Vyhrazeno)

7.1.3.44 Čistící práce

Je zakázáno provádět čistící práce kapalinami, jejichž bod vzplanutí je nižší než 55 °C.

7.1.3.45

-

7.1.3.50

(Vyhrazeno)

7.1.3.51 Elektrická a neelektrická vybavení a zařízení

7.1.3.51.1

Elektrická a neelektrická vybavení a zařízení musí být udržována v bezvadném stavu.

7.1.3.51.2

V chráněné oblasti je zakázáno používat přenosné elektrické kabely. Tento požadavek se nevztahuje na elektrické kabely uváděné v 9.1.0.53.5.

Přenosné elektrické kabely musí podléhat kontrole před každým použitím. Musí být instalovány tak, aby byla vyloučena možnost jejich poškození. Spoje musí být umístěny mimo chráněnou oblast.

Používání přenosných kabelů pro propojení lodní elektrické sítě k pobřežní elektrické síti se nepovoluje:

- během nakládky a vykládky látek, pro které v sloupci (9) tabulky A kapitoly 3.2 uvedeno EX; nebo
- když se plavidlo nachází v bezprostřední blízkosti označené zóny na břehu nebo v její oblasti.

7.1.3.51.3

Zásuvky pro připojení signálního osvětlení a osvětlení lávky na břeh a pro připojení kontejnerů, ponorných čerpadel, pojezdů krytů nákladních prostor nebo ventilátorů nákladních prostor, smějí být pod napětím pouze tehdy, jestliže signální osvětlení a osvětlení lávky, kontejnery, ponorná čerpadla, pojezdy krytů nákladních prostor nebo ventilátory nákladních prostor jsou v provozu. Připojení a odpojení se mohou provádět pouze v případě, že se zásuvka nenachází pod proudem.

7.1.3.51.4

Elektrická vybavení a zařízení v nákladních prostorech musí být vypnuta a chráněna před náhodným zapnutím.

Toto ustanovení se nepoužije u pevně instalovaných elektrických kabelů, procházejících přes nákladní prostory, u přenosných elektrických kabelů propojujících kontejnery, které jsou uloženy v souladu s 7.1.4.4.4 a elektrickým vybavením a zařízením, odpovídajícím požadavkům pro použití v zóně 1.

7.1.3.51.5 Během setrvávání v bezprostřední blízkosti u vyznačené zóny na břehu nebo v její oblasti elektrická a neelektrická vybavení a zařízení, která neodpovídají požadavkům dle 9.1.0.52.1, nebo mající teplotu povrchu větší než 200 °C (červené označení dle 9.1.0.51 a 9.1.0.52.2) musí být vypnuta a jejich teplota povrchu musí klesnout pod 200 °C, nebo musí být přijata opatření uvedená v 7.1.3.51.6.

7.1.3.51.6 7.1.3.51.5 se nepoužije ve vztahu k obytným prostorám, kormidelně a provozním prostorám umístěných za hranicí chráněné oblasti, v případě, že:

- (a) ventilační systém je seřízen tak, aby zajišťoval přetlak alespoň 0,1 kPa; a
- (b) systém pro detekci plynů je zapnutý a nepřetržitě provádí měření.

7.1.3.51.7 Vybavení a zařízení uvedená v 7.1.3.51.5, která byla vypnuta během nakládky nebo vykládky, nebo když se naházela v bezprostřední blízkosti vyznačené zóny na břehu nebo v její oblasti, mohou být znovu zapnuta pouze v případě, když:

- (a) plavidlo se už nenachází v blízkosti zóny na břehu nebo v její oblasti; nebo
- (b) koncentrace n-hexanu v kormidelně, obytných prostorách a provozních prostorách, umístěných mimo chráněnou oblast, představuje méně než 10 % spodní hranice výbušnosti.

Výsledky měření se musí zaznamenávat.

7.1.3.51.8 Nejsou-li plavidla schopna splnit požadavky uvedené v 7.1.3.51.5 a 7.1.3.51.6, není jim dovoleno zdržovat se v bezprostřední blízkosti vyznačené zóny na břehu nebo v její oblasti. Příslušný orgán může povolit výjimky v jednotlivých případech.

7.1.3.52

–

7.1.3.69

(Vyhrazeno)

7.1.3.70

Antény, hromosvody, dráty, stožáry

7.1.3.70.1

Žádná část antén elektronických zařízení, žádný hromosvod a žádné dráty se nesmí nacházet nad nákladními prostory.

7.1.3.70.2

Žádná část antén radiostanic se nesmí nacházet v okruhu 2,00 m kolem látek a předmětů třídy 1.

7.1.3.71

–

7.1.3.99

(Vyhrazeno)

7.1.4 Doplnňkové předpisy pro nakládku, přepravu, vykládku a ostatní manipulaci s nákladem

7.1.4.1 Omezení přepravovaného množství

7.1.4.1.1 Jednoplášťová plavidla mohou přepravovat věci tříd 1, 2, 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 7, 8 a 9 pouze v omezených množstvích uvedených v 7.1.4.1.4. Toto ustanovení se vztahuje také na tlačné čluny a plavidla s dvojitou obšívkou, která nesplňují dodatečná pravidla pro stavbu v 9.1.0.88 až 9.1.0.95 nebo 9.2.0.88 až 9.2.0.95.

7.1.4.1.1.1 Pokud jsou látky a předměty různých podtříd třídy 1 naloženy do jednoho plavidla v souladu s ustanoveními o zákazu společné nakládky podle 7.1.4.3.3 nebo 7.1.4.3.4, nesmí celý náklad překročit nejmenší uvedenou maximální hmotnost v 7.1.4.1.4 níže pro naložené věci nejnebezpečnější podtřídy v pořadí 1.1, 1.5, 1.2, 1.3, 1.6, 1.4.

7.1.4.1.1.2 U tlačných sestav a sestav spřažených plavidel se množstevní limity uvedené v 7.1.4.1.4 vztahují na každou jednotku těchto sestav. Je povoleno nejvýše 1 100 000 kg pro každou jednotku.

7.1.4.1.1.3 Pokud plavidlo přepravuje několik druhů nebezpečných věcí, celkové množství nesmí překročit 1 100 000 kg.

7.1.4.1.2 Plavidla s dvojitou obšívkou splňující dodatečná pravidla pro stavbu v 9.1.0.88 až 9.1.0.95 nebo 9.2.0.88 až 9.2.0.95 mohou přepravovat věci bez omezení přepravovaného množství, s výjimkou:

- věcí třídy 1, a
- věcí tříd 2, 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 7, 8 a 9, pro které se ve sloupci (5) tabulky A kapitoly 3.2 vyžaduje bezpečnostní značka vzoru č. 1, na které se vztahují limity stanovené v 7.1.4.1.1 a 7.1.4.1.1.1 až 7.1.4.1.1.3.

7.1.4.1.3 Pro limity aktivity, limity přepravního indexu (TI) a indexu bezpečné podkritičnosti (CSI) v případě přepravy radioaktivních látek viz 7.1.4.14.7.

7.1.4.1.5 (Vypuštěno)

7.1.4.2 Zákaz společné nakládky (volně ložené látky)

Na plavidlech s látkami třídy 5.1 ve volně loženém stavu se nesmějí přepravovat žádné jiné věci.

7.1.4.3 Zákaz společné nakládky (kusy v nákladních prostorech)

7.1.4.3.1 Věci různých tříd musí být od sebe odděleny horizontálně minimálně 3,00 m. Nesmějí být ukládány na sobě.

7.1.4.3.2 Nezávisle na množství nesmějí být nebezpečné věci, u kterých je ve sloupci (12) tabulky A v kapitole 3.2 předepsáno označení dvěma modrými kužely nebo dvěma modrými světly, uloženy do stejného nákladního prostoru s hořlavými látkami, u kterých je v sloupci (12) tabulky A v kapitole 3.2 předepsáno označení jedním modrým kuželem nebo jedním modrým světlem.

7.1.4.3.3 Kusy s látkami a předměty třídy 1 a kusy s látkami třídy 4.1 a 5.2, u kterých je ve sloupci (12) tabulky A v kapitole 3.2 předepsáno označení třemi modrými kužely nebo třemi modrými světly, musí být odděleny od všech ostatních tříd vzdáleností minimálně 12 m.

7.1.4.3.4 Látky a předměty třídy 1 smějí být uloženy ve stejném nákladním prostoru jen tehdy, jestliže toto vyplývá z následující tabulky:

Skupina snášenlivosti	A	B	C	D	E	F	G	H	J	L	N	S
A	X	-	-	-	-	-	-	-	-	-	-	-
B	-	X	-	<u>1</u>	-	-	-	-	-	-	-	X
C	-	-	X	X	X	-	X	-	-	-	<u>2,3</u>	X
D	-	<u>1</u>	X	X	X	-	X	-	-	-	<u>2,3</u>	X
E	-	-	X	X	X	-	X	-	-	-	<u>2,3</u>	X
F	-	-	-	-	-	X	-	-	-	-	-	X
G	-	-	X	X	X	-	X	-	-	-	-	X
H	-	-	-	-	-	-	-	X	-	-	-	X
J	-	-	-	-	-	-	-	-	X	-	-	X
L	-	-	-	-	-	-	-	-	-	<u>4</u>	-	-
N	-	-	<u>2,3</u>	<u>2,3</u>	<u>2,3</u>	-	-	-	-	-	<u>2</u>	X
S	-	X	X	X	X	X	X	X	X	-	X	X

„X“: uvádí, že látky a předměty odpovídajících skupin snášenlivosti podle ADN smějí být uloženy ve stejném nákladním prostoru.

1: Kusy obsahující předměty přiřazené ke skupině snášenlivosti B nebo látky nebo předměty přiřazené ke skupině snášenlivosti D smějí být uloženy společně v jednom nákladním prostoru, pokud jsou přepravovány v uzavřených kontejnerech, vozidlech nebo železničních vozech.

2: Různé druhy předmětů klasifikace 1.6 N smějí být přepravovány pouze jako předměty klasifikace 1.6 N dohromady, jestliže kontrolami nebo analogickým závěrem je prokázáno, že mezi předměty

neexistuje žádné dodatečné nebezpečí výbuchu přenosem. V jiném případě je třeba s nimi zacházet jako s předměty podtřídy 1.1.

^{3/} *Jestliže předměty skupiny snášenlivosti "N" jsou nakládány dohromady s látkami nebo předměty skupiny snášenlivosti "C", "D" nebo "E", musí se s předměty skupiny snášenlivosti "N" zacházet tak, jako by měly vlastnosti skupiny snášenlivosti "D".*

^{4/} *Kusy s látkami a předměty skupiny snášenlivosti "L" smějí být nakládány do společného nákladního prostoru s kusy obsahujícími stejný druh látek nebo předmětů této skupiny snášenlivosti.*

7.1.4.3.5 Při přepravě látek třídy 7 (UN 2916, 2917, 3323, 3328, 3329 a 3330) v kusech typu B(U), nebo typu B(M) nebo typu C je třeba splnit kontroly, omezení a předpisy, uvedené v povolení příslušného orgánu.

7.1.4.3.6 Při přepravě látek třídy 7 na základě zvláštní dohody (UN 2919 a UN 3331), je třeba splnit zvláštní předpisy, stanovené příslušným orgánem. Zvláště společná nakládka je povolena jen tehdy, jestliže ji příslušný orgán schválil.

7.1.4.4 Zákaz společné nakládky (kontejnery, silniční vozidla, železniční vozy)

7.1.4.4.1 7.1.4.3 neplatí pro kusy v kontejneru, vozidle nebo železničním voze, které jsou uloženy podle jedné z mezinárodních úprav.

7.1.4.4.2 7.1.4.3 neplatí pro:

- uzavřené kontejnery;
- uzavřená vozidla a uzavřené železniční vozy;
- cisternové kontejnery, přemístitelné cisterny a MEGC;
- cisternová vozidla a cisternové vozy.

7.1.4.4.3 U ostatních kontejnerů, jiných než jsou uvedené v 7.1.4.4.1 a 7.1.4.4.2, může být odstup podle 7.1.4.3.1 snížen na 2,40 m (šířka jednoho kontejneru).

7.1.4.4.4 Elektrické instalace a zařízení nainstalované na vnější straně uzavřeného kontejneru, mohou být spojeny s pohyblivými elektrickými kabely podle ustanovení uvedených v 9.1.0.53.5, nebo mohou být uvedeny do provozu za těchto podmínek:

- (a) elektrické instalace a zařízení jsou vhodné alespoň pro použití v zóně 1 a splňují požadavky pro teplotní třídu T4 a skupinu výbušnosti II B; nebo
- (b) elektrické instalace a zařízení nesplňují požadavky uvedené v pododstavci (a), ale jsou dostatečně odděleny od jiných kontejnerů obsahujících látky:
 - třídy 2, pro které je ve sloupci (5) tabulky A kapitoly 3.2 vyžadována bezpečnostní značka č. 2.1;
 - třídy 3, obalové skupiny I nebo II;
 - třídy 4.3;
 - třídy 6.1, obalové skupiny I nebo II, s vedlejším nebezpečím třídy 4.3;
 - třídy 8, obalové skupiny I, s vedlejším nebezpečím třídy 3; a
 - třídy 8, obalové skupiny I nebo II, s vedlejším nebezpečím třídy 4.3.

Tato podmínka se považuje za splněnou, jestliže žádný kontejner obsahující výše uvedené látky není uložen v prostoru válcovitého tvaru o poloměru 2,4 m kolem elektrických instalací a zařízení a s neomezeným vertikálním rozměrem.

Požadavky pododstavců (a) a (b) nemusí být splněny, jsou-li kontejnery s elektrickými instalacemi nebo zařízeními, které nesplňují požadavky pro použití v oblastech s nebezpečím výbuchu, a kontejnery obsahující výše uvedené látky uloženy v oddělených nákladních prostorech.

Příklady uložení a oddělení kontejnerů

Vysvětlivky

- R Kontejner (např. chladírenský) s elektrickým zařízením, které není typu „potvrzená bezpečnost“.
- Z Elektrické zařízení, které není typu „potvrzená bezpečnost“.
- X Kontejner není dovolen, jestliže obsahuje nebezpečné látky, pro které se vyžaduje dostatečná separace.

Čelní pohled

Čelní pohled

7.1.4.4.5

Elektrické instalace a zařízení namontované na nekrytém kontejneru nesmějí být spojeny s pohyblivými elektrickými kabely podle ustanovení uvedených v 9.1.0.53.5, nebo být použity, ledaže jsou vhodné alespoň pro použití v zóně 1 a splňují požadavky pro teplotní třídu T4 a skupinu výbušnosti II B, nebo je-li kontejner uložen v nákladním prostoru, který neobsahuje kontejnery s látkami uvedenými v 1.7.4.4.4 (b).

7.1.4.5 Zákaz společné nakládky (námořní plavidla; vnitrozemská plavidla přepravující kontejnery)

Pro námořní plavidla a vnitrozemská plavidla přepravující kontejnery se považuje zákaz společné nakládky za dodržení, jestliže jsou splněny předpisy uložené a oddělení dle IMDG Code.

7.1.4.6 (Vyhrazeno)**7.1.4.7 Místa nakládky a vykládky**

7.1.4.7.1 Nebezpečné věci musí být nakládány nebo vykládány jen na místech určených nebo schválených pro tento účel příslušným orgánem. Na těchto místech musí být k dispozici evakuační prostředky uvedené v 7.1.4.77. Jinak je překládka povolena jen se souhlasem příslušného orgánu.

7.1.4.7.2 Jestliže jsou na plavidle látky a předměty třídy 1 a látky třídy 4.1 nebo 5.2, u kterých je ve sloupci (12) tabulky A kapitoly 3.2 předepsáno označení třemi modrými kužely nebo třemi modrými světly, nakládka nebo vykládka jakéhokoliv nákladu je povolena pouze na místech označených příslušným orgánem nebo k tomu účelu schválených.

7.1.4.7.3 Je-li na břehu pro místo nakládky a vykládky vymezena zóna, je plavidlu dovoleno stát v její bezprostřední blízkosti nebo uvnitř této zóny jen pokud splňuje požadavky uvedené v 9.1.0.12.3 (b) nebo (c), 9.1.0.51, 9.1.0.52.1 a 9.1.0.52.2. Příslušný orgán může povolit výjimky v jednotlivých případech.

7.1.4.8 Okamžik a doba trvání prací nakládky a vykládky

7.1.4.8.1 Nakládka a vykládka látek a předmětů třídy 1 a látek třídy 4.1 nebo 5.2, u kterých je v sloupci (12) tabulky A kapitoly 3.2 předepsáno označení třemi modrými kužely nebo třemi modrými světly, nesmí započít bez písemného povolení příslušného orgánu. To platí také pro nakládku a vykládku jiných věcí, jestliže se na plavidle nachází látky a předměty třídy 1 a látky třídy 4.1 nebo 5.2, u kterých je v sloupci (12) tabulky A kapitoly 3.2 předepsáno označení třemi modrými kužely nebo třemi modrými světly.

7.1.4.8.2 Nakládka a vykládka u látek a předmětů třídy 1 a látek třídy 4.1 nebo 5.2, u kterých je ve sloupci (12) tabulky A kapitoly 3.2, je předepsáno označení třemi modrými kužely nebo třemi modrými světly, musí být pozastavena v případě bouřky.

7.1.4.9 Překládka

Je zakázáno, bez povolení místně příslušného orgánu, překládat zcela nebo částečně náklad mimo k tomu schválené překladiště.

POZNÁMKA: K překládce na dopravní prostředky jiného druhu dopravy viz 7.1.4.7.1.

7.1.4.10 Preventivní opatření se zřetelem na potraviny, poživatiny a krmiva

7.1.4.10.1 Pokud je ve sloupci 6 tabulky A kapitoly 3.2 u nějaké látky nebo předmětu uvedeno zvláštní ustanovení 802, musí být dodržena následující preventivní opatření se zřetelem na potraviny, poživatiny a krmiva.

Kusy, jakož i nevyčištěné prázdné obaly, včetně velkých obalů a IBC, označené bezpečnostními značkami podle vzorů č. 6.1 nebo 6.2 a ty, které jsou označené bezpečnostními značkami podle vzoru č. 9 a obsahují látky třídy 9 UN čísel 2212, 2315, 2590, 3151, 3152 nebo 3245 nesmějí být v nákladních prostorách a na místech nakládky, vykládky nebo překládky ukládány na kusy nebo do bezprostřední blízkosti kusů, o kterých je známo, že obsahují potraviny, poživatiny a krmiva.

Pokud se tyto kusy s uvedenými bezpečnostními značkami nakládají v bezprostřední blízkosti kusů, o kterých je známo, že obsahují potraviny, poživatiny nebo krmiva, musí být od těchto odděleny:

(a) plnostěnnými přepážkami, které musí být tak vysoké, jako kusy označené uvedenými bezpečnostními značkami, nebo

- (b) kusy neoznačenými bezpečnostními značkami podle vzorů 6.1, 6.2 nebo 9, nebo kusy označenými bezpečnostními značkami podle vzoru č. 9, ale neobsahujícími žádné látky UN čísel 2212, 2315, 2590, 3151, 3152 a 3245, nebo
- (c) volným prostorem minimálně 0,80 m,
pokud tyto kusy označené uvedenými bezpečnostními značkami nejsou přepravovány v dodatečném obalu nebo nejsou úplně zakryty (např. fólií, lepenkovým krytem nebo jiným způsobem).

7.1.4.11 Plán uložení nákladu

- 7.1.4.11.1 Velitel plavidla musí do plánu uložení nákladu uvést, jaké nebezpečné věci jsou uloženy v jednotlivých nákladních prostorech nebo na palubě. Věci se musí uvést podle přepravního dokladu v souladu s 5.4.1.1.1 (a), (b), (c) a (d).
- 7.1.4.11.2 Při přepravě nebezpečných věcí v kontejnerech stačí číslo kontejneru. V tomto případě musí plánu uložení nákladu v příloze obsahovat seznam všech kontejnerů s jejich čísly a popisem věcí v nich uložených v souladu s 5.4.1.1.1 (a), (b), (c) a (d).

7.1.4.12 Větrání

- 7.1.4.12.1 Při nakládce a vykládce nákladních prostor plavidel typu Ro-Ro silničními vozidly, musí být obnoven vzduch minimálně pětkrát každou hodinu. Přitom je třeba počítat s objemem prázdného nákladního prostoru.
- 7.1.4.12.2 Na plavidlech, která přepravují nebezpečné látky v kontejnerech v otevřených nákladních prostorech, nemusí být zabudované žádné ventilátory, musí se však nacházet na plavidle. Při podezření na poškození kontejneru nebo při podezření, že se obsah uvolnil uvnitř kontejneru, musí být nákladní prostory větrány tak, aby se koncentrace hořlavých plynů a par pocházejících z nákladu snížila pod 10 % dolní meze výbušnosti, nebo v případě toxických plynů a par pod úroveň expozice přijatelné podle vnitrostátních předpisů.
- 7.1.4.12.3 Pokud se cisternové kontejnery, přemístitelné cisterny, MEGC, cisternová vozidla nebo cisternové vozy přepravují v uzavřených nákladních prostorech, musí být v těchto prostorech neustále měněn vzduch, aby byla zajištěna jeho výměna pětkrát za hodinu.

7.1.4.13 Opatření před nakládkou

Nákladní prostory a plochy musí být před nakládkou vyčištěny. Nákladní prostory musí být větrány.

7.1.4.14 Manipulace a uložení nákladu

- 7.1.4.14.1 Jednotlivé části nákladu musí být uloženy tak, aby nemohly změnit svou pozici navzájem a vůči plavidlu a nemohly být poškozeny ostatním nákladem.
- 7.1.4.14.1.1 Kusy obsahující nebezpečné věci a nebalené nebezpečné předměty musí být ve vozidle nebo v kontejneru zajištěny vhodnými prostředky schopnými zadržet věci (jako jsou upínací pásy, posuvné přepážky, stavitelné opěrky) takovým způsobem, aby se zabránilo jakémukoli pohybu během přepravy, který by mohl změnit orientaci kusů nebo je poškodit. Jsou-li nebezpečné věci přepravovány s jinými věcmi (např. těžkými stroji nebo laťovými bednami), musí být všechny věci bezpečně uloženy a upevněny ve vozidlech nebo kontejnerech, aby se zabránilo uvolnění nebezpečných věcí. Pohybu kusů může být zabráněno také vyplněním všech mezer za použití zaklíňovacích nebo blokačních a fixačních prostředků. Pokud se používají zadržovací prostředky, jako pásy nebo popruhy, nesmějí být tyto prostředky příliš utaženy, aby nezpůsobily poškození nebo deformaci kusu. Flexibilní kontejnery pro volně ložené látky musí být v nákladním prostoru uloženy takovým způsobem, aby mezi nimi nebyly prázdné prostory. Pokud flexibilní kontejnery pro volně ložené látky nevyplňují zcela nákladní prostor, musí být učiněna přiměřená opatření proti posouvání nákladu.
- 7.1.4.14.1.2 Kusy se nesmějí stohovat, pokud nejsou pro tento účel konstruovány. Mají-li se společně nakládat různé druhy kusů konstruovaných pro stohování, je třeba vzít v úvahu jejich kompatibilitu z hlediska stohování. Je-li to nutné, musí se zabránit poškození spodních kusů použitím nosných prostředků. Flexibilní kontejnery pro volně ložené látky mohou být v nákladních prostorech stohovány na sebe, pokud stohovací výška nepřesáhne výšku tří kontejnerů. Jsou-li flexibilní kontejnery pro volně ložené

látky vybaveny odvětrávacími zařízeními, nesmí stohování flexibilních kontejnerů pro volně ložené látky bránit jejich funkci.

- 7.1.4.14.1.3 Během nakládky a vykládky musí být kusy obsahující nebezpečné věci chráněny před poškozením.
POZNÁMKA: *Zvláštní pozornost musí být věnována manipulaci s kusy během jejich přípravy k přepravě, druhu vozidla nebo kontejneru, v němž se mají přepravovat a způsobu nakládky nebo vykládky tak, aby nedošlo k poškození kusů jejich vlečením po zemi nebo nesprávným zacházením.*
- 7.1.4.14.1.4 Je-li vyžadováno značení kusů a přepravních obalových souborů orientačními šipkami, musí být uloženy v souladu s tímto označením.
POZNÁMKA: *Kapalné nebezpečné věci se musí, když je to prakticky možné, ukládat pod suchými nebezpečnými věcmi.*
- 7.1.4.14.2 Nebezpečné věci musí být uloženy minimálně 1,00 m od obytných prostor, strojoven, kormidelny nebo zdrojů tepla.
Pokud se obytné prostory nebo kormidelna nachází nad nákladním prostorem, nesmí být nebezpečné věci uloženy pod těmito obytnými prostory nebo kormidelnou.
- 7.1.4.14.3 Kusy musí být chráněny před teplem, slunečními paprsky, povětrnostními vlivy. To neplatí pro vozidla, vozy, cisternové kontejnery, přemístitelné cisterny, MEGC a kontejnery.
Kusy na palubě, které nejsou uloženy ve vozidlech, vozech nebo kontejnerech, musí být zakryté obtížně zápalnými plachtami.
Nesmí být omezeno větrání.
- 7.1.4.14.4 Nebezpečné látky musí být uloženy uvnitř nákladních prostor, ale látky v:
 - uzavřených kontejnerech;
 - MEGC;
 - silničních vozidlech s plachtou nebo železničních vozech s plachtou;
 - cisternové kontejnery nebo přemístitelné cisterny;
 - cisternová vozidla nebo cisternové vozy;
smějí být přepravovány také mimo nákladní prostory v chráněné oblasti.
- 7.1.4.14.5 Kusy s látkami tříd 3, 4.1, 4.2, 5.1 a 8 mohou být uloženy na palubě v chráněné oblasti, jestliže jsou v sudech, plnostěnných kontejnerech nebo plnostěnných vozidlech nebo vozech. Látky třídy 2 smějí být uloženy na palubě v chráněné oblasti, jestliže jsou v lahvích.
- 7.1.4.14.6 Pro námořní plavidla platí předpisy o uložení podle 7.1.4.14.1 až 7.1.4.14.5 a 7.1.4.14.7 za dodržení, jestliže jsou splněné předpisy IMDG Code a v případě přepravy nebezpečných věcí volně ložených předpisy uložení kapitoly 9.3 kódu IMSBC.
- 7.1.4.14.7 Manipulace a uložení radioaktivních látek
POZNÁMKA 1: *“Kritická skupina” je skupina veřejnosti, která je s ohledem na svou expozici vůči existujícímu zdroji záření a existující expoziční stezku dostatečně homogenní a která je charakteristická pro jednotlivé osoby, které existující expoziční stezkou od zdroje záření získají nejvyšší efektivní dávku.*
POZNÁMKA 2: *“Veřejnost” jsou obecně všechny jednotlivé osoby z obyvatelstva vyjma těch, které jsou z pracovních nebo zdravotních důvodů vystaveny záření.*
POZNÁMKA 3: *“Pracovníci” jsou jakékoliv osoby, které pracují plně, částečně nebo příležitostně pro zaměstnavatele a které mají právo a povinnost na ochranu proti záření v zaměstnání.*
- 7.1.4.14.7.1 Oddělení
- 7.1.4.14.7.1.1 Kusy, přepravní obalové soubory, kontejnery, cisterny, vozidla a železniční vozy obsahující radioaktivní látky a nebalené radioaktivní látky musí být během přepravy odděleny:
 - (a) od pracovníků řádně zaměstnaných v pracovních prostorech buď:
 - (i) podle tabulky A níže; nebo

- (ii) vzdálenostmi vypočtenými použitím dávkového limitu 5 mSv za rok při konzervativních parametrech výpočtového modelu;

POZNÁMKA: Pracovníci podléhající individuálnímu monitorování za účelem radiační ochrany nesmějí být bráni v úvahu za účelem oddělování.

- (b) od členů kritické skupiny obyvatelstva v prostorech veřejně přístupných:

- (i) podle tabulky A níže; nebo

- (ii) vzdálenostmi vypočtenými použitím dávkového limitu 1 mSv za rok při konzervativních parametrech výpočtového modelu;

- (c) od nevyvolaných fotografických filmů a poštovních pytlů:

- (i) podle tabulky B níže; nebo

- (ii) vzdálenostmi vypočtenými použitím dávkového limitu působení přepravy radioaktivních látek na nevyvolané fotografické filmy dávkou 0,1 mSv na zásilku takových filmů; a

POZNÁMKA: U poštovních pytlů se musí předpokládat, že obsahují nevyvolané filmy a desky, a proto musí být odděleny od radioaktivních látek tímtéž způsobem.

- (d) od ostatních nebezpečných věcí v souladu s oddílem 7.1.4.3.

Tabulka A: Minimální odstupy mezi kusy kategorie II-ŽLUTÁ nebo III-ŽLUTÁ a osobami

Součet přepravních indexů nejvýše	Doba expozice za rok (v hodinách)			
	Prostory normálně veřejně přístupné		Normálně obsazované pracovní prostory	
	50	250	50	250
	Vzdálenost oddělení v metrech, žádný stínící materiál, od:			
2	1	3	0,5	1
4	1,5	4	0,5	1,5
8	2,5	6	1,0	2,5

20	4	9,5	1,5	4
30	5	12	2	5
40	5,5	13,5	2,5	5,5
50	6,5	15,5	3	6,5

Tabulka B: Minimální odstupy mezi kusy kategorie II-ŽLUTÁ nebo III-ŽLUTÁ a kusy s nápisem „FOTO“ nebo poštovními pytlí

Celkový počet kusů nejvýše		Součet přepravních indexů nejvýše	Doba trvání přepravy nebo skladování v hodinách							
			1	2	4	10	24	48	120	240
Kategorie			Nejmenší vzdálenost, v metrech							
III-žlutá	II-žlutá		0,2	0,5	0,5	0,5	0,5	1	1	2
		0,5	0,5	0,5	0,5	1	1	2	3	5
	1	1	0,5	0,5	1	1	2	3	5	7
	2	2	0,5	1	1	1,5	3	4	7	9
	4	4	1	1	1,5	3	4	6	9	13
	8	8	1	1,5	2	4	6	8	13	18
1	10	10	1	2	3	4	7	9	14	20
2	20	20	1,5	3	4	6	9	13	20	30
3	30	30	2	3	5	7	11	16	25	35
4	40	40	3	4	5	8	13	18	30	40
5	50	50	3	4	6	9	14	20	32	45

- 7.1.4.14.7.1.2 Kusy nebo přepravní obalové soubory kategorie II-ŽLUTÁ nebo III-ŽLUTÁ nesmějí být přepravovány v odděleních obsazenými cestujícími; kromě oddělení výlučně vyhrazených pro průvodce zvlášť pověřené doprovázet takové kusy nebo přepravní obalové soubory.
- 7.1.4.14.7.1.3 Kromě velitele plavidla nebo řidiče vozidla, osob, které jsou na palubě ze provozních důvodů a ostatních členů posádky není na plavidlech přepravujících kusy, přepravní obalové soubory nebo kontejnery označené bezpečnostními značkami kategorie II-ŽLUTÁ nebo III-ŽLUTÁ povolena přítomnost žádných jiných osob.
- 7.1.4.14.7.2 Mezní hodnoty aktivity
 Celková aktivita v jednom nákladním prostoru nebo jedné části plavidla nebo v jiném dopravním prostředku k přepravě látek LSA nebo předmětů SCO v průmyslových kusech typu 1 (typ IP-1), typu 2 (typ IP-2), typu 3 (typ IP-3) nebo nebalených nesmí překročit mezní hodnoty, uvedené v tabulce C. U SCO-III mohou být překročeny limity uvedené v tabulce C za předpokladu, že plán přepravy obsahuje preventivní opatření, která je třeba použít během přepravy, aby se dosáhlo celkové úrovně bezpečnosti přinejmenším rovnocenné úrovni, která by byla poskytnuta, kdyby byly limity použity.

Tabulka C: Mezní hodnoty aktivity na každý dopravní prostředek pro LSA a předměty SCO v průmyslových kusech nebo nebalené

Druh látky nebo předmětu	Mezní hodnoty aktivity pro jiné dopravní prostředky než plavidla	Mezní hodnoty aktivity pro jeden nákladní prostor nebo jedno oddělení plavidla
LSA-I	žádné omezení	žádné omezení
LSA-II a LSA-III Nehořlavé tuhé látky	žádné omezení	100 A ₂
LSA-II a LSA-III Hořlavé tuhé látky a všechny kapaliny a plyny	100 A ₂	10 A ₂
SCO	100 A ₂	10 A ₂

- 7.1.4.14.7.3 Uložení za účelem přepravy a mezikladování
- 7.1.4.14.7.3.1 Zásilky musejí být bezpečně uloženy.
- 7.1.4.14.7.3.2 Pokud střední tepelný tok na vnějším povrchu nepřekročí 15 W/m² a pokud v bezprostřední blízkosti nejsou balené v pytlích, smí být kus nebo přepravní obalový soubor přepravován nebo skladován společně s jinými balenými věcmi bez zvláštních předpisů o uložení, pokud povolení příslušného orgánu výslovně nestanoví něco jiného.
- 7.1.4.14.7.3.3 Nakládka kontejnerů a shromažďování kusů, přepravních obalových souborů a kontejnerů se řídí těmito předpisy:
- Kromě přepravy za podmínek výlučného použití a pro zásilky látek LSA-I, celkový počet kusů, přepravních obalových souborů a kontejnerů v jednom dopravním prostředku musí být omezen tak, aby součet přepravních indexů v dopravním prostředku nepřekročil hodnoty uvedené v tabulce D dále;
 - Příkon dávkového ekvivalentu za běžných podmínek přepravy nesmí překročit 2 mSv/h v žádném bodě na vnějším povrchu vozidel, vozů nebo kontejnerů a 0,1 mSv/h ve vzdálenost 2 m od vnějšího povrchu vozidel, vozů nebo kontejnerů, s výjimkou kusů přepravovaných podle výlučného použití, pro něž jsou limity příkonu dávkového ekvivalentu kolem vozidel, nebo vozů stanoveny v 7.1.4.14.7.3.5 (b) a (c);
 - Celkový součet indexů bezpečné podkritičnosti v kontejneru a v jednom dopravním prostředku nesmí překročit hodnoty v tabulce E dále.

Tabulka D: Mezní hodnoty přepravních indexů pro kontejnery a přepravní prostředky bez výlučného použití

Druh kontejneru nebo přepravního prostředku	Meze součtů přepravních indexů v jednom kontejneru nebo v ložném prostoru přepravního prostředku
Malý kontejner	50
Velký kontejner	50
Silniční vozidlo nebo železniční vůz	50
Plavidlo	50

Tabulka E: Mezní hodnoty indexů bezpečné podkritičnosti pro kontejnery, vozidla nebo vozy se štěpnými látkami

Druh kontejneru nebo přepravního prostředku	Meze součtů indexů bezpečné podkritičnosti	
	bez výlučného použití	pod výlučným použitím
Malý kontejner	50	bezpředmětné
Velký kontejner	50	100
Silniční vozidlo nebo železniční vůz	50	100
Plavidlo	50	100

- 7.1.4.14.7.3.4 Jakýkoliv kus nebo přepravní obalový soubor s přepravním indexem vyšším než 10 nebo jakákoliv zásilka s indexem bezpečné podkritičnosti vyšším než 50 musí být přepravena pouze pod výlučným použitím.
- 7.1.4.14.7.3.5 Pro zásilky pod výlučným použitím ve vozidlech nebo vozech nesmějí meze příkonu dávkového ekvivalentu překročit:
- (a) 10 mSv/h v jakémkoli místě vnějšího povrchu jakéhokoli kusu nebo přepravního obalového souboru a smějí překročit 2 mSv/h jen pokud:
 - (i) vozidlo nebo vůz je vybaveno uzávěrem, který během běžných podmínek přepravy zabraňuje přístupu nepovolaných osob do vnitřku pod uzávěr, a
 - (ii) jsou učiněna opatření, která zabezpečují kus nebo přepravní obalový soubor tak, že jejich poloha na plavidle zůstává nezměněna během běžných podmínek přepravy, a
 - (iii) není žádná nakládká nebo vykládká během přepravy;
 - (b) 2 mSv/h v jakémkoli místě vnějšího povrchu vozidla nebo vozu, včetně horních a spodních povrchů, nebo, v případě nekrytého vozidla nebo vozu v jakémkoli místě na svislých rovinách promítnutých z vnějších hran vozidla nebo vozu, na vnějším místě povrchu nákladu a na spodním vnějším povrchu vozidla nebo vozu; a
 - (c) 0,1 mSv/h v jakémkoli místě vzdáleném 2 m od svislých rovin tvořených vnějšími podélnými povrchy vozidla nebo vozu nebo, jestliže je náklad přepravován v nekrytém vozidle nebo voze, v jakémkoli místě vzdáleném 2 m od svislých rovin promítnutých z vnějších hran vozidla nebo vozu.
- 7.1.4.14.7.3.6 Kusy nebo přepravní obalové soubory s příkonem dávkového ekvivalentu na povrchu vyšším než 2 mSv/h smějí být přepravovány v plavidlech pouze na základě zvláštní dohody vyjma případů, kdy jsou přepravovány v silničním vozidle nebo v železničním voze pod výlučným použitím.
- 7.1.4.14.7.3.7 Přeprava kusů speciálním plavidlem, které na základě své konstrukce nebo na základě smluv je výlučně určena k přepravě radioaktivních látek, je vyjmuta z požadavků v 7.1.4.14.7.3.3, za předpokladu, že jsou splněny následující podmínky:

- (a) pro přepravu musí být příslušným orgánem vlajkového státu plavidla schválen program ochrany před zářením, a na požádání musí být schválen příslušným orgánem najížděného přístavu tranzitních států;
- (b) pro celou trasu cesty musí být předem vypracován plán uložení nákladu, který obsahuje veškeré doklady v najížděných přístavech po cestě; a
- (c) nakládka, přeprava a vykládka kusů musí být dozorována osobami, které jsou kvalifikované k přepravě radioaktivních látek.

7.1.4.14.7.4 Oddělení kusů se štěpnými látkami během přepravy a meziskladování

7.1.4.14.7.4.1 Počet kusů, přepravních obalových souborů a kontejnerů obsahujících štěpné látky uložené při tranzitu v jakémkoli skladovacím prostoru musí být tak omezen, aby součet indexů bezpečné podkritičnosti v jakékoli skupině takových kusů, přepravních obalových souborů nebo kontejnerů nepřekročil 50. Takové skupiny musí být skladovány tak, aby byl udržen prostor nejméně 6 m od ostatních skupin.

7.1.4.14.7.4.2 Pokud celkový součet indexů bezpečné podkritičnosti v jednom vozidle, železničním voze nebo kontejneru podle tabulky E je větší než 50, musí být skladování provedeno tak, že od jiných skupin kusů, přepravních obalových souborů nebo kontejnerů se štěpnými látkami nebo od jiných vozidel nebo železničních vozů s radioaktivními látkami je udržován minimální odstup 6,00 m. Meziprostor mezi skupinami může být využit pro jiné nebezpečné látky podle ADN. Přeprava jiných věcí se zásilkami pod výlučným použitím je povolena za předpokladu, že opatření, která byla k tomu výlučně provedena odesílatelem, nejsou pro přepravu na základě jiných předpisů zakázána.

7.1.4.14.7.4.3 Štěpné látky splňující jedno z ustanovení (a) až (f) 2.2.7.2.3.5 musí splňovat následující požadavky:

- (a) Pouze jedno z ustanovení (a) až (f) 2.2.7.2.3.5 je dovoleno na zásilku;
- (b) Pouze jedna schválená štěpná látka v kusech klasifikovaná podle 2.2.7.2.3.5 (f) je dovolena na zásilku, pokud není v osvědčení o schválení povoleno více látek;
- (c) Štěpné látky v kusech klasifikované podle 2.2.7.2.3.5 (c) musí být přepravovány v zásilce s nejvýše 45 g štěpných nuklidů;
- (d) Štěpné látky v kusech klasifikované podle 2.2.7.2.3.5 (d) musí být přepravovány v zásilce s nejvýše 15 g štěpných nuklidů;
- (e) Nezabalené nebo zabalené štěpné látky klasifikované podle 2.2.7.2.3.5 (e) musí být přepravovány za výlučného použití ve vozidle s nejvýše 45 g štěpných nuklidů.

7.1.4.14.7.5 Poškozené nebo netěsné kusy, kontaminované obaly

7.1.4.14.7.5.1 Pokud je kus zjevně poškozen nebo netěsný nebo pokud je podezření, že kus byl poškozen nebo je netěsný, je třeba omezit přístup k tomuto kusu a kvalifikovaná osoba musí co možno nejdříve odhadnout rozsah kontaminace a výsledný příkon dávkového ekvivalentu kusu. Rozsah odhadu se musí vztahovat na kus, silniční vozidlo, železniční vůz, plavidlo, navazující oblasti nakládky a vykládky a případně také na všechny v plavidle přepravované náklady. Pokud je to nutné, je za účelem ochrany lidí, majetku a životního prostředí ve shodě s ustanoveními, stanovenými příslušným orgánem, nutné přijmout další opatření, aby následky takovýchto netěsností nebo poškození byly odstraněny a zůstaly co nejmenší.

7.1.4.14.7.5.2 Kusy, které jsou poškozené nebo ze kterých unikl radioaktivní obsah nad mezní hodnoty, povolené pro normální přepravní podmínky, smějí být pod dozorem přepraveny k přijatelnému meziskladu, ale dále přepravovány teprve poté, co byly opraveny nebo obnoveny a dekontaminovány.

7.1.4.14.7.5.3 Silniční vozidla, železniční vozy, plavidla a výstroj, které jsou pravidelně používány pro přepravu radioaktivních látek, musí být opakovaně kontrolovány pro stanovení úrovně kontaminace. Četnost takovýchto kontrol se řídí podle pravděpodobnosti kontaminace a podle objemu, ve kterém jsou radioaktivní látky přepravovány.

7.1.4.14.7.5.4 Pokud v 7.1.4.14.7.5.6 není uvedeno jinak, musí všechna plavidla nebo výstroje nebo jejich části, které byly během přepravy radioaktivních látek kontaminovány nad mezní hodnoty, stanovené v 7.1.4.14.7.5.5 nebo na povrchu byl příkon dávkového ekvivalentu více než 5 $\mu\text{Sv/h}$, co nejrychleji dekontaminovány kvalifikovanou osobou a nesmějí být znovu používány, pokud nejsou splněny následující podmínky:

- (a) nefixovaná kontaminace nesmí překročit mezní hodnoty stanovené v 4.1.9.1.2 ADR;
- (b) příkon dávkového ekvivalentu následkem fixované kontaminace nesmí překročit 5 $\mu\text{Sv/h}$ na povrchu.

7.1.4.14.7.5.5 Pro užití pododdílu 7.1.4.14.7.5.4 nesmí nefixovaná kontaminace překročit následující mezní hodnoty:

- 4 Bq/cm² u beta a gama zářičů jakož alfa zářičů nízké toxicity;
- 0,4 Bq/cm² u všech ostatních alfa zářičů.

Tyto mezní hodnoty jsou střední hodnoty na každou plochu 300 cm² každé jedné části plochy.

7.1.4.14.7.5.6 Plavidla, používaná pro přepravu radioaktivních látek s výlučným použitím, jsou vyjmuta z předpisů podle 7.1.4.14.7.5.4 pouze ohledně vnitřních ploch, dokud je zachováno výlučné použití.

7.1.4.14.7.6 Omezení tepelné účinnosti

7.1.4.14.7.6.1 Pokud teplota na přístupných vnějších plochách kusu typ-B (U) nebo typ-B (M) ve stínu může přesáhnout 50 °C, smí být přeprava provedena jen pod výlučným použitím. Pokud je to možné, je třeba teplotu vnějších ploch omezit na 85 °C. Přitom mohou být zohledněny uzavírky a dělicí přepážky, které jsou rozmístěny k ochraně členů osádky, aniž by tyto uzavírky nebo dělicí přepážky podléhaly kontrole.

7.1.4.14.7.6.2 Pokud střední tepelný tok na vnějším povrchu kusu typ B (U)- nebo B (M)-překročí 15 W/m², musí být dodrženy zvláštní předpisy pro uložení, které jsou uvedeny příslušným orgánem v osvědčení o schválení typu kusu.

7.1.4.14.7.7 Ostatní předpisy

Pokud ani odesílatel ani příjemce nejsou identifikovatelní, nebo zásilka nemůže být doručena příjemci, a dopravce nemá žádné pokyny od odesílatele zásilka se musí skladovat na bezpečném místě. Je třeba co nejdříve informovat příslušný orgán a vyžádat si instrukce ohledně dalšího postupu.

7.1.4.15 Opatření po vykládce

7.1.4.15.1 Po vykládce musí být nákladní prostory zkontrolovány a v případě potřeby vyčištěny. Tento požadavek neplatí při přepravě volně ložených věcí, jestliže nový náklad sestává ze stejných věcí, jako ten předchozí.

7.1.4.15.2 U látek třídy 7 viz také 7.1.4.14.7.5.

7.1.4.15.3 Nákladní dopravní jednotka nebo nákladní prostor, které byly použity pro přepravu infekčních látek, musí být zkontrolovány před novým použitím na případný únik látky za účelem zjištění, zda během přepravy nedošlo k úniku infekčních látek. Pokud k úniku došlo, musí být nákladní dopravní jednotka nebo nákladní prostor dekontaminovány před jejich novým použitím. Dekontaminace musí být dosaženo prostředky, které účinně deaktivují uniklé infekční látky.

7.1.4.16 Opatření při nakládce, přepravě, vykládce a ostatní manipulaci s nákladem

Bez povolení příslušného orgánu je plnění nebo vyprazdňování nádob, cisternových vozidel, cisternových železničních vozů, IBC, velkých obalů, MEGC, přemístitelných cisteren nebo cisternových kontejnerů na plavidle zakázáno.

7.1.4.17 –

7.1.4.40 (Vyhrazeno)

7.1.4.41 Oheň a otevřené světlo

Je zakázáno používat oheň nebo otevřené světlo, jestliže na plavidle jsou látky a předměty třídy 1, podtřídy 1.1, 1.2, 1.3, 1.5 nebo 1.6 a nákladní prostory jsou otevřené, nebo jestliže látky, které se mají nakládat, se nachází ve vzdálenosti do 50 m od plavidla.

7.1.4.42 –

7.1.4.50 (Vyhrazeno)

7.1.4.51 Elektrická zařízení

Během nakládky a vykládky látek a předmětů třídy 1, podtřídy 1.1, 1.2, 1.3, 1.5 nebo 1.6 se nesmí používat žádné rádiové nebo radarové vysílače.

To neplatí pro vysílače VHF na plavidle, jeřáběch nebo v blízkosti plavidla, pokud výkon vysílače VHF nepřekročí 25 W a žádná část antény se nenachází v odstupu do 2,00 m od shora uvedených látek.

7.1.4.52 (Vyhrazeno)**7.1.4.53 Osvětlení**

Pro nakládku a vykládku během noci nebo při špatné viditelnosti musí být zajištěno účinné osvětlení.

Pokud osvětlení je prováděno z plavidla, musí se použít dobře upevněné elektrické lampy, které jsou upevněné tak, aby nemohly být poškozeny.

Pokud jsou tyto lampy umístěny na palubě v zóně 2, musí odpovídat požadavkům pro použití v zóně 2.

7.1.4.54 –**7.1.4.74** (Vyhrazeno)**7.1.4.75 Nebezpečí vzniku jisker**

Všechna elektricky vodivá spojení mezi plavidlem a břehem musí být konstruována tak, aby nepředstavovala zápalný zdroj. Jsou-li přepravovány látky, které mají ve sloupci (9) tabulky A kapitoly 3.2 uveden zápis „EX“, musí být svlékání oděvů, které nejsou dostatečně antistatické, v chráněné oblasti zakázáno.

7.1.4.76 Plastová lana

Během nakládky a vykládky smí být plavidlo uvázáno plastovými lany jen tehdy, jestliže je posun plavidla znemožněn ocelovými lany.

Ocelová lana ovinutá plastem nebo přírodními vlákny jsou považována za ekvivalentní, pokud je minimální pevnosti v tahu vyžadované podle předpisů uvedených v 1.1.4.6 dosaženo ocelovými prameny lana.

Při nakládce nebo vykládce kontejnerů však smějí plavidla být uvázána plastovými lany.

7.1.4.77 **Možné evakuační prostředky v případě nouze**

		Suchý náklad ve volně loženém stavu (plavidlo a nákladní člun)		Kontejner (plavidlo a nákladní člun) a balené věci
		Třída		Třída
		4.1, 4.2, 4.3	5.1, 6.1, 7, 8, 9	Všechny třídy
1	Dvě únikové cesty uvnitř nebo mimo chráněnou oblast v opačných směrech	•	•	•
2	Jedna úniková cesta mimo chráněnou oblast a jedno bezpečné útočiště mimo plavidlo včetně únikové cesty k němu na opačném konci	•	•	•
3	Jedna úniková cesta mimo chráněnou oblast a jedno bezpečné útočiště na plavidle na opačném konci	•	•	•
4	Jedna úniková cesta mimo chráněnou oblast a jeden záchranný člun na opačném konci	•	•	•
5	Jedna úniková cesta mimo chráněnou oblast nákladu a jedno únikové plavidlo na opačném konci	•	•	•
6	Jedna úniková cesta uvnitř chráněné oblasti a jedna úniková cesta mimo oblast nákladu na opačném konci	•	•	•
7	Jedna úniková cesta uvnitř chráněné oblasti a jedno bezpečné útočiště mimo plavidlo v opačném směru	•	•	•
8	Jedna úniková cesta uvnitř chráněné oblasti a jedno bezpečné útočiště na plavidle v opačném směru	•	•	•
9	Jedna úniková cesta uvnitř chráněné oblasti nákladu a jeden záchranný člun na opačném konci	•	•	•
10	Jedna úniková cesta uvnitř chráněné oblasti a jedno únikové plavidlo na opačném konci	•	•	•

19	Jedno nebo více evakuačních plavidel		•	•

• = Možná volba

Založeno na místních okolnostech, příslušné orgány mohou předepsat dodatečné požadavky na dostupnost evakuačních prostředků.

7.1.4.78

–

7.1.4.99

(Vyhrazeno)

7.1.5

Doplňkové předpisy pro provoz plavidel

7.1.5.0

Označení

7.1.5.0.1

Plavidla, která přepravují nebezpečné věci uvedené v tabulce A kapitoly 3.2, musí mít v souladu s kapitolou 3 Evropského předpisu pro vnitrozemské vodní cesty (CEVNI) označení předepsané ve sloupci (12) v této tabulce.

7.1.5.0.2

Plavidla, která přepravují nebezpečné věci, uvedené v tabulce A kapitoly 3.2, v kusech uložených výlučně v kontejnerech, musí být označené modrými kužely nebo světly v počtu uvedeném ve sloupci (12) tabulky A kapitoly 3.2, kde:

- je požadováno označení třemi modrými kužely nebo třemi modrými světly, nebo
- je požadováno označení dvěma modrými kužely nebo dvěma modrými světly, jde o látku třídy 2 nebo o látku, která má uvedenou ve sloupci (4) tabulky A kapitoly 3.2 obalovou skupinu I a celková (brutto) hmotnost těchto nebezpečných věcí přesahuje 30 000 kg, nebo
- je požadován jeden modrý kužel nebo jedno modré světlo, jde o látku třídy 2 nebo o látku, která má uvedenou ve sloupci (4) tabulky A kapitoly 3.2 obalovou skupinu I a celková (brutto) hmotnost těchto nebezpečných věcí přesahuje 130 000 kg.

7.1.5.0.3

Plavidla přepravující prázdné nevyčištěné cisterny, bateriová vozidla, bateriové železniční vozy nebo MEGC musí mít označení uvedené ve sloupci (12) tabulky A kapitoly 3.2, pokud tyto nákladní dopravní jednotky obsahovaly nebezpečné věci, pro které tato tabulka předepisuje označení.

7.1.5.0.4

Pokud se na plavidlo vztahuje více požadavků než jedno označení, použije se pouze označení, které vyžaduje nejvyšší počet modrých kuželů nebo modrých světel podle následujícího pořadí:

- tři modré kužely nebo tři modrá světla;
- dva modré kužely nebo dvě modrá světla;
- jeden modrý kužel nebo jedno modré světlo.

7.1.5.0.5

Odchytkou od ustanovení odstavce 7.1.5.0.1 a v souladu s poznámkou k článku 3.14 Evropského předpisu pro vnitrozemské vodní cesty (CEVNI), může příslušný orgán smluvní strany povolit námořním plavidlům dočasně operujícím v oblasti vnitrozemské plavby na území této smluvní strany použití denních a nočních signálů předepsaných v doporučeních pro bezpečnou přepravu nebezpečných nákladů a s nimi spojených činností v přístavních zónách, přijatých Výborem pro bezpečnost na moři mezinárodní námořní organizace (v noci červeným světlem umístěným po celém obvodu a ve dne vlajkou "B" Mezinárodního signálního kódu), namísto signálů předepsaných v 7.1.5.0.1. Smluvní strana, která iniciovala dočasnou odchylku takto schválenou, o tom informuje výkonného tajemníka UNECE, který o této odchylce uvědomí administrativní výbor.

7.1.5.1 Způsob přepravy

7.1.5.1.1 Příslušné orgány mohou uložit restrikce, pokud jde o včlenění plavidel přepravujících nebezpečné věci do tlačných soulodí velkých rozměrů.

7.1.5.1.2 Pokud plavidla přepravují látky nebo předměty třídy 1, nebo látky třídy 4.1 nebo 5.2, pro které je ve sloupci (12) tabulky A kapitoly 3.2 předepsáno označení třemi modrými kužely nebo třemi modrými světly, nebo látky třídy 7 (UN čísel 2912, 2913, 2915, 2916, 2917, 2919, 2977, 2978 nebo 3321 až 3333), může příslušný orgán omezit rozměry tlačných soulodí nebo sestav spřažených plavidel. Avšak použití motorových plavidel pro dočasné vlečení je dovoleno.

7.1.5.2 Plavba plavidel

Plavidla, přepravující látky a předměty třídy 1 a látky třídy 4.1 nebo 5.2, u kterých je ve sloupci (12) tabulky A kapitoly 3.2 předepsáno označení třemi modrými kužely nebo třemi modrými světly, musí během plavby, pokud je to možné, udržovat odstup od každého jiného plavidla minimálně 50 m.

7.1.5.3 Vyzvání

Plavidla musí být pevně vyvázána, ale takovým způsobem, aby mohla být v případě nouze rychle odvázána a aby elektrické kabely nebyly stlačeny, přehnuty nebo podléhaly tahové deformaci.

7.1.5.4 Kotvení

7.1.5.4.1 Plavidla, která přepravují nebezpečné věci, nesmějí kotvit v menší vzdálenosti od jiných plavidel, než je vzdálenost předepsaná v předpisech uvedených v 1.1.4.6.

7.1.5.4.2 Na palubě kotvicích plavidel, která musí být označena podle sloupce (12) tabulky A kapitoly 3.2, se musí stále nacházet odborník podle 8.2.1.2.

Místně příslušný orgán však může od této povinnosti osvobodit plavidla, která kotví v přístavním bazénu nebo na místech, která jsou k tomu schválena.

7.1.5.4.3 Mimo kotviště, která jsou schválena příslušným orgánem, nesmí být při kotvení odstup menší než:

- 100 m od obytných sídel, občanského vybavení a skladovacích nádrží, jestliže plavidlo musí být podle sloupce (12) tabulky A kapitoly 3.2 označeno jedním modrým kuželem nebo jedním modrým světlem,
- 100 m od občanského vybavení a skladovacích nádrží a 300 m od obytných sídel, jestliže plavidlo musí podle 3 sloupce (12) tabulky A kapitoly 3.2 označeno dvěma modrými kužely nebo dvěma modrými světly,
- 500 m od obytných sídel, občanského vybavení a skladovacích nádrží obsahujících plyn nebo hořlavé kapaliny, jestliže plavidlo podle sloupce (12) tabulky A kapitoly 3.2 musí být označeno třemi modrými kužely nebo třemi modrými světly.

Během čekání před plavebními komorami nebo mosty je přípustné dodržovat menší odstupy. V těchto případech však platí minimální odstup 100 m.

7.1.5.4.4 Místně příslušný orgán může při zohlednění místních poměrů povolit menší odstupy, než jaké jsou uvedené v 7.1.5.4.3.

7.1.5.5 Zastavení plavidel

Jestliže při plavbě plavidla, které přepravuje látky a předměty třídy 1 a látky třídy 4.1 nebo 5.2, u kterých je v sloupci (12) tabulky A kapitoly 3.2 předepsáno označení třemi modrými kužely nebo třemi modrými světly hrozí nebezpečí:

- v důsledku vnějších vlivů (nepříznivé povětrnostní podmínky, nepříznivé podmínky na vodní cestě, atd.),
- v důsledku okolností, souvisejících s plavidlem samotným (nehoda nebo událost),

musí plavidlo, bez ohledu na ustanovení v 7.1.5.4, zastavit na vhodném místě, které je co nejvíce vzdálené o obytných sídel, přístavů, občanského vybavení nebo skladovacích nádrží plynů nebo hořlavých kapalin.

Místně příslušný orgán musí být neprodleně informován.

7.1.5.6

-

7.1.5.7

(Vyhrazeno)

7.1.5.8**Ohlašovací povinnost**

7.1.5.8.1

Ve státech, kde platí ohlašovací povinnost, musí velitel plavidla poskytnout informace podle odstavce 1.1.4.6.1.

7.1.5.8.2

(Vypuštěno)

7.1.5.8.3

(Vypuštěno)

7.1.5.8.4

7.1.6**Doplňkové požadavky****7.1.6.1**

-

7.1.6.10

(Vyhrazeno)

7.1.6.11**Volně ložené nebezpečné věci**

Následující doplňkové požadavky musí být splněny, jestliže jsou uvedeny ve sloupci (11) tabulky A kapitoly 3.2:

CO01: Vnitřní plochy nákladních prostor musí být natřené nebo ošetřené tak, aby byly obtížně zápalné a bylo vyloučeno prosáknutí nákladu.

CO02: Všechny části nákladních prostor a kryty nákladních prostor, které mohou přijít do styku s těmito látkami, musí být vyrobené z kovu nebo dřeva se specifickou hustotou minimálně 750 kg/m³ (suché na vzduchu).

CO03: Vnitřní plochy nákladních prostor musí být ošetřené nebo natřené tak, aby byla vyloučena koroze.

ST01: Tato látka musí být stabilizovaná a tato stabilizace musí odpovídat předpisům kódu IMSBC, týkajících se hnojiv, obsahující dusičnany amonné. Provedená stabilizace musí být potvrzena odesilatelem v přepravním dokladu.

Ve státech, ve kterých je toto požadováno, je přeprava této látky ve volně loženém stavu přípustná pouze se souhlasem příslušného orgánu.

ST02: Přeprava těchto látek ve volně loženém stavu je přípustná pouze tehdy, jestliže pomocí testu „trough“ pododdílu 38.2 *Příručky zkoušek a kritérií* bylo zjištěno, že rychlost samovolného rozkladu nečiní více než 25 cm/h.

RA01: Přeprava těchto látek ve volně loženém stavu je přípustná pouze tehdy, jestliže:

- (a) u všech látek, s výjimkou přírodních rud, je prováděna přeprava pod výlučným použitím a za normálních přepravních podmínek nemůže dojít k úniku obsahu a na plavidle nemůže dojít ke ztrátě odstínění; nebo
- (b) u přírodních rud je prováděna přeprava pod výlučným použitím.

RA02: Přeprava těchto látek ve volně loženém stavu je přípustná pouze tehdy, jestliže:

- (a) jsou přepravovány v plavidle tak, že za normálních přepravních podmínek nemůže dojít k úniku obsahu nebo ke ztrátě odstínění;
- (b) jsou přepravovány pod výlučným použitím, jestliže na přístupných a nepřístupných plochách povrchu překročí kontaminace 4 Bq/cm² (10⁻⁴ μCi/cm²) pro beta a gama zářiče a nízkou toxickou alfa zářiče nebo pro všechny ostatní alfa zářiče 0,4 Bq/cm² (10⁻⁵ μCi/cm²);

- (c) jsou přijata opatření, aby se zajistilo, že radioaktivní látka se neuvolní do plavidla, jestliže existuje podezření, že nefixovaná kontaminace na nepřístupných plochách povrchu překročí 4 Bq/cm^2 ($10^{-4} \text{ } \mu\text{Ci/cm}^2$) pro beta a gama zářiče a nízkotoxické alfa zářiče nebo pro všechny ostatní alfa zářiče $0,4 \text{ Bq/cm}^2$ ($10^{-5} \text{ } \mu\text{Ci/cm}^2$).

Povrchově kontaminované předměty skupiny SCO-II nesmějí být přepravovány ve volně loženém stavu.

RA03: *Spojeno s RA02.*

7.1.6.12 **Větrání**

Musí být splněny následující doplňkové požadavky, jestliže jsou uvedeny ve sloupci (10) tabulky A kapitoly 3.2.

VE01: Nákladní prostory, které tyto látky obsahují, musí být větrány na plný výkon ventilátorů, jestliže se po měření zjistí, že koncentrace hořlavých plynů a par, pocházejících z nákladu, překračuje 10 % dolní meze výbušnosti. Toto měření musí být provedeno okamžitě po nakládce. Kontrolní měření musí být opakováno za hodinu. Tyto výsledky měření musí být zaznamenány písemně.

VE02: Nákladní prostory, které tyto látky obsahují, musí být větrány na plný výkon ventilátorů, jestliže se po měření zjistí, že nákladní prostory obsahují toxické plyny a páry, pocházející z nákladu. Toto měření musí být provedeno okamžitě po nakládce. Kontrolní měření musí být opakováno za hodinu. Tyto výsledky měření musí být zaznamenány písemně. Alternativně na plavidlech obsahujících tyto látky jen v kontejnerech v otevřených nákladních prostorech, smějí být nákladní prostory obsahující takové kontejnery větrány na plný výkon ventilátorů jen tehdy, pokud je podezření, že nákladní prostory nejsou zbaveny toxických plynů a par pocházejících z nákladu. Před vykládkou musí být vykládce informován o tomto podezření.

VE03: Prostory jako nákladní prostory, ubytovací prostory a prostory strojovny, které přiléhají k nákladnímu prostoru, který tyto látky obsahuje, musí být větrány.

Nákladní prostory, které obsahují tyto látky, musí být po vykládce nuceně větrány.

Po větrání musí být v těchto nákladních prostorech změřena koncentrace hořlavých nebo toxických plynů a par pocházejících z nákladu.

Tyto výsledky měření musí být zaznamenány písemně.

VE04: Při přepravě aerosolů za účelem recyklace nebo likvidace v souladu se zvláštním ustanovením 327 kapitoly 3.3, se používá ustanovení VE01 a V02.

7.1.6.13 **Opatření před nakládkou**

Musí být splněny následující doplňkové požadavky, jestliže jsou uvedeny ve sloupci (11) tabulky A kapitoly 3.2:

LO01: Před nakládkou těchto látek nebo předmětů musí být zajištěno, že uvnitř nákladních prostorů se nenachází žádné kovové předměty, které nejsou integrovanou součástí plavidla.

LO02: Nakládka těchto látek ve volně loženém stavu smí být provedena jen tehdy, jestliže jejich teplota není vyšší než $55 \text{ }^\circ\text{C}$.

LO03: Před nakládkou těchto látek ve volně loženém stavu nebo nebalených musí být zajištěno, že nákladní prostory jsou co nejsušší.

LO04: Před nakládkou těchto látek ve volně loženém stavu musí být zajištěno, že se v nákladních prostorech se nenachází žádné volné organické látky.

LO05: Před přepravou tlakových nádob je třeba zajistit, že se vlivem potenciální tvorby vodíku nezvýší tlak.

7.1.6.14 Manipulace a ukládání nákladu

Musí být splněny následující doplňkové požadavky, jestliže jsou uvedeny ve sloupci (11) tabulky A kapitoly 3.2:

HA01: Tyto látky nebo předměty musí být ukládány minimálně 3,00 m od obytných prostor, strojoven, kormidelny a zdrojů tepla.

HA02: Tyto látky nebo předměty musí být ukládány minimálně 2,00 m od vertikálních rovin, které lícují s boky plavidla.

HA03: Při manipulaci s těmito látkami nebo předměty musí být zamezeno tření, nárazům, ořesům, převržení nebo pádu.

Všechny kusy, které se nachází ve stejném nákladním prostoru, musí být uloženy a zajištěny tak, aby během přepravy byly vyloučeny ořesy a tření.

Stohování věcí, které nejsou nebezpečné, na kusy obsahující tyto látky nebo předměty, je zakázáno.

Jsou-li tyto látky nebo předměty nakládány společně s jinými věcmi do téhož nákladního prostoru, musí být tyto látky nebo předměty nakládány po a vykládány před všemi ostatními věcmi.

Není nutno nakládat tyto látky nebo předměty po a vykládat před všemi ostatními věcmi, pokud jsou tyto látky nebo předměty uloženy v kontejnerech.

V době, kdy jsou tyto látky nebo předměty nakládány nebo vykládány, nesmějí probíhat žádné nakládací nebo vykládací operace v ostatních nákladních prostorech a není dovoleno žádné plnění nebo vyprazdňování palivových tanků. Příslušný orgán však může udělit výjimky z tohoto ustanovení.

HA04: *Spojeno s HA03*

HA05: *Spojeno s HA03*

HA06: *Spojeno s HA03*

HA07: Je zakázáno, tyto látky nakládat nebo vykládat ve volně loženém stavu nebo nebalené, jestliže existuje nebezpečí, že tyto látky mohou namoknout povětrnostními podmínkami.

HA08: Pokud kusy s těmito látkami nejsou v kontejneru, musí být uloženy na laťkových rostech a zakryté nepromokavými plachtami, které jsou upevněny tak, aby voda odtékala ven a nebylo omezeno větrání.

HA09: Při přepravě těchto látek ve volně loženém stavu nesmějí být ve stejném nákladním prostoru uloženy žádné hořlavé látky.

HA10: Tato látka musí být uložena na palubě v chráněné oblasti.
Pro námořní plavidla platí tyto předpisy o uložení nákladu za dodržené, jestliže jsou splněny předpisy IMDG Code.

7.1.6.15 (Vyhrazeno)**7.1.6.16 Opatření během nakládky, přepravy, vykládky a manipulace s nákladem**

Musí být splněny následující doplňkové požadavky, jestliže jsou uvedeny ve sloupci (11) tabulky A kapitoly 3.2:

IN01: Po nakládce a vykládce těchto látek ve volně loženém stavu nebo nebalených věcí a před opuštěním překladiště musí nakládač nebo vykládač nebo odborník podle 8.2.1.2 změřit přístrojem pro detekci plynů koncentraci hořlavých plynů a par pocházejících z nákladu v obytných prostorech, strojovnách a přilehlých nákladních prostorech. Výsledky měření musí být zaznamenány písemně.

Dříve než do nákladního prostoru vstoupí kterákoli osoba a před vykládkou, musí vykládce nákladu nebo odborník podle 8.2.1.2 změřit koncentraci hořlavých plynů a par pocházejících z nákladu. Výsledky měření musí být zaznamenány písemně.

Do nákladního prostoru se nesmí vstoupit ani započít s vykládkou dříve, než je koncentrace hořlavých plynů a par pocházejících z nákladu ve volném prostoru nad nákladem pod 50 % dolní meze výbušnosti.

Nejsou-li koncentrace hořlavých plynů a par pocházejících z nákladu pod 50 % dolní meze výbušnosti, musí nakládece, vykládce nebo odpovědný velitel plavidla provést ihned bezpečnostní opatření.

IN02: Pokud nákladní prostor obsahuje tyto látky ve volně loženém stavu nebo nebalené, musí se ve všech ostatních prostorách, do kterých vstupuje posádka, měřit koncentrace toxických plynů a par pocházejících z nákladu minimálně každých osm hodin pomocí detektoru toxických plynů. Výsledky měření se musí zaznamenat písemně.

IN03: Pokud nákladní prostor obsahuje tyto látky ve volně loženém stavu nebo nebalené, musí se velitel plavidla denně přesvědčit, kontrolou drenážní jímky nákladního prostoru nebo čerpadlového potrubí o tom, že se do drenážní jímky nedostala žádná voda.

Pokud se do drenážní jímky nákladního prostoru dostala voda, musí být neprodleně odstraněna.

7.1.6.17

-

7.1.6.99

(Vyhrazeno)

7.1.7

Zvláštní ustanovení použitelná pro přepravu samovolně se rozkládajících látek třídy 4.1, organických peroxidů třídy 5.2 a látek stabilizovaných řízenou teplotou (jiných než samovolně se rozkládajících látky a organických peroxidů)

7.1.7.1

Všechny samovolně se rozkládající látky, organické peroxidy a polymerizující látky musí být chráněny před přímým slunečním zářením, všemi zdroji tepla a umístěny v přiměřeně větraných prostorách.

7.1.7.2

Pokud je v kontejneru nebo v uzavřeném vozidle shromážděno několik kusů, nesmí celkové množství látky, typ a počet kusů a stohování způsobit nebezpečí výbuchu.

7.1.7.3

Ustanovení pro řízení teploty

7.1.7.3.1

Tato ustanovení se vztahují na některé samovolně se rozkládající látky, pokud je to vyžadováno v 2.2.41.1.17, a na některé organické peroxidy, pokud je to vyžadováno v 2.2.52.1.15, a na některé polymerizující látky, pokud je to vyžadováno v 2.2.41.1.21, nebo ve zvláštním ustanovení 386 kapitoly 3.3, které mohou být přepravovány pouze za podmínek řízené teploty.

7.1.7.3.2

Tato ustanovení se rovněž vztahují na přepravu látek, pro které:

- (a) oficiální pojmenování pro přepravu, jak je uvedeno ve sloupci (2) tabulky A kapitoly 3.2 nebo souladu s 3.1.2.6, obsahuje slovo „STABILIZOVANÝ“; a
- (b) jsou teploty SADT nebo SAPT určené pro látku (s nebo bez chemické stabilizace) jak je podávána k přepravě:
 - (i) 50 °C nebo méně pro jednotlivé kusy a IBC; nebo
 - (ii) 45 °C nebo méně pro cisterny.

Není-li ke stabilizaci reaktivní látky, která může za normálních podmínek přepravy generovat nebezpečné množství tepla a plynu nebo par, použita chemická inhibice, musí být tato látka přepravována při řízené teplotě. Tato ustanovení se nevztahují na látky, které jsou stabilizovány přidáním chemických inhibitorů tak, aby SADT nebo SAPT byly vyšší, než je předepsáno v písmenech b (i) nebo (ii) výše.

- 7.1.7.3.3 Kromě toho, pokud samovolně se rozkládající látka nebo organický peroxid nebo látka, jejíž oficiální pojmenování pro přepravu obsahuje slovo „STABILIZOVANÝ“ a které nemusí být přepravovány za podmínek řízení teploty, jsou přepravovány za podmínek, kdy teplota může překročit 55 °C, může se vyžadovat řízení teploty.
- 7.1.7.3.4 „Řízenou teplotou“ se rozumí nejvyšší teplota, při které může být látka bezpečně přepravována. Předpokládá se, že teplota bezprostředního okolí kusu nepřesáhne během přepravy hodnotu 55 °C a dosahuje této hodnoty pouze na relativně krátkou dobu za 24-hodinový časový interval. V případě výpadku systému řízení teploty, může být nutné provést nouzová opatření. „Kritická teplota“ je teplota, při níž musí být provedena nouzová opatření.

- 7.1.7.3.5 Odvození řízených a kritických teplot

Druh nádoby	SADT ^a /SATP ^a	Řízená teplota	Kritická teplota
Samostatné obaly a IBC	20 °C a méně	o 20 °C nižší než SADT/SATP	o 10 °C nižší než SADT/SATP
	20 °C až 35 °C	o 15 °C nižší než SADT/SATP	o 10 °C nižší než SADT/SATP
	Více než 35 °C	o 10 °C nižší než SADT/SATP	o 5 °C nižší než SADT/SATP
Cisterny	≤ 50 °C	o 10 °C nižší než SADT/SATP	o 5 °C nižší než SADT/SATP

^a tj. SADT / SATP látky zabalené pro přepravu.

- 7.1.7.3.6 Řízené a kritické teploty se odvozují za použití tabulky v 7.1.7.3.5 z SADT nebo z SATP, které jsou definovány jako nejnižší teploty, při nichž může u přepravované látky v obalu, IBC nebo cisterně docházet k samourychlujícímu se rozkladu nebo k samourychlující se polymerizaci. SADT nebo SATP musí být stanovena za účelem rozhodnutí, zda látka musí být přepravována při řízené teplotě. Předpisy pro stanovení SADT a SATP jsou uvedeny v části II oddílu 28 Příručky zkoušek a kritérií.
- 7.1.7.3.7 Řízené a kritické teploty jsou uvedeny pro již zařazené samovolně se rozkládající látky v pododdílu 2.2.41.4 a pro již zařazené přípravky organického peroxidu v pododdílu 2.2.52.4.
- 7.1.7.3.8 Skutečná teplota při přepravě smí být nižší než řízená teplota, avšak musí být zvolena tak, aby nedošlo k nebezpečnému oddělování fází.

7.1.7.4 Přeprava při řízené teplotě

- 7.1.7.4.1 Udržování předepsané teploty je základním rysem bezpečné přepravy látek stabilizovaných řízenou teplotou. Všeobecně musí být zajištěno:
- provedení důkladné kontroly nákladní dopravní jednotky před nakládkou;
 - poučení pro dopravce o provozu chladicího systému včetně seznamu možných dodavatelů chladicí látky na trase;
 - postupy v případě poruchy řízení teploty;
 - pravidelné monitorování provozních teplot; a
 - zajištění záložního chladicího systému nebo náhradních dílů.
- 7.1.7.4.2 Veškeré ovládací prvky a teplotní čidla v chladicím systému musí být snadno přístupné a všechna elektrická spojení musí být odolná proti povětrnostním vlivům. Teplota vzduchu uvnitř dopravní jednotky musí být snímána dvěma nezávislými čidly a výstupy musí být zaznamenávány tak, aby bylo možné snadno detekovat jakoukoliv teplotní změnu. Teplota musí být kontrolována každé čtyři až šest hodin a zaznamenána. Při přepravě látek s řízenou teplotou nižší než + 25 °C musí být dopravní jednotka vybavena vizuálním a akustickým poplachovým zařízením napájeným nezávisle na chladicím systému a seřízeným tak, aby fungovalo při teplotě rovnající se řízené teplotě nebo nižší.
- 7.1.7.4.3 Je-li během přepravy překročena řízená teplota, musí být učiněna pohotovostní opatření zahrnující veškeré nezbytné opravy chladicího zařízení nebo zvýšení chladicí kapacity (např. doplněním kapalné nebo tuhé chladicí látky). Musí být rovněž často kontrolována teplota a musí být provedeny přípravy na zahájení nouzových postupů. Jestliže je dosaženo kritické teploty, musí být zahájeny nouzové postupy.

- 7.1.7.4.4 Vhodnost konkrétních prostředků pro řízení teploty pro přepravu závisí na řadě faktorů. Mezi faktory, které je nutné zvažovat patří:
- (a) řízená(é) teplota(y) přepravované(ých) látky(ek);
 - (b) rozdíl mezi řízenou teplotou a předpokládanou teplotou okolí;
 - (c) účinnost tepelné izolace
 - (d) doba trvání přepravy; a
 - (e) míra bezpečnosti s ohledem na zpoždění během přepravy.
- 7.1.7.4.5 Vhodné metody pro prevenci překročení řízené teploty v posloupném pořadí podle jejich účinnosti jsou uvedeny dále:
- (a) tepelná izolace za předpokladu, že počáteční teplota přepravované látky je dostatečně nižší než řízená teplota;
 - (b) tepelná izolace a chladicí systém za předpokladu, že:
 - (i) je přepravováno dostatečné množství nehořlavé chladicí látky (např. kapalného dusíku nebo tuhého oxidu uhličitého) dovolující rozumnou míru bezpečnosti s ohledem na zdržení během přepravy, nebo je zajištěn způsob jejího doplnění
 - (ii) jako chladivo nejsou použity kyslík nebo zkapalněný vzduch;
 - (iii) účinek chladicího systému je stálý, dokonce, i když je většina chladiva spotřebována; a
 - (iv) potřeba větrání dopravní jednotky před vstupem do ní je jasně uvedena ve varovném upozornění na dveřích dopravní jednotky
 - (c) tepelná izolace a jedno strojní chlazení, pokud pro látky s bodem vzplanutí nižším, než je kritická teplota zvýšená o 5 °C, je v chlazeném prostoru použito nevybušné elektrické příslušenství EEx IIB T3, aby se předešlo nebezpečí vznícení hořlavých par látek;
 - (d) tepelná izolace a kombinovaný strojní chladicí systém a systém s chladicí látkou, pokud:
 - (i) oba systémy jsou na sobě nezávislé;
 - (ii) jsou dodržována ustanovení uvedená v písmenech (b) a (c);
 - (e) tepelná izolace a dvojitý strojní chladicí systém; za předpokladu, že:
 - (i) nehledě na integrální pohonnou jednotku jsou tyto dva systémy na sobě nezávislé;
 - (ii) každý systém sám je schopen udržovat náležitou řízenou teplotu; a
 - (iii) pro látky s bodem vzplanutí nižším, než je kritická teplota zvýšená o 5 °C, je v chlazeném prostoru použito nevybušné elektrické příslušenství EEx IIB T3, aby se předešlo nebezpečí vznícení hořlavých par látek.
- 7.1.7.4.6 Metody popsané v 7.1.7.4.5 (d) a (e) mohou být použity pro všechny organické peroxidy a samovolně se rozkládající látky a polymerizující látky.
- Metoda popsaná v 7.1.7.4.5 (c) může být použita pro organické peroxidy a samovolně se rozkládající látky typů C, D, E a F a, pokud nejvyšší teplota okolí očekávaná během přepravy nepřekročí řízenou teplotu o více než 10 °C, pro organické peroxidy a samovolně se rozkládající látky typu B a polymerizující látky.
- Metoda popsaná v 7.1.7.4.5 (b) může být použita pro organické peroxidy a samovolně se rozkládající látky typů C, D, E a F a polymerizující látky, pokud nejvyšší teplota okolí očekávaná během přepravy nepřekročí řízenou teplotu o více než 30 °C.
- Metoda popsaná v 7.1.7.4.5 (a) může být použita pro organické peroxidy a samovolně se rozkládající látky typů C, D, E a F a polymerizující látky, pokud nejvyšší teplota okolí očekávaná během přepravy je nejméně o 10 °C nižší než řízená teplota.
- 7.1.7.4.7 Pokud látky vyžadují přepravu v izotermických, chlazených nebo chladicích a mrazicích vozidlech nebo kontejnerech, tato vozidla nebo kontejnery musí splňovat ustanovení kapitoly 9.6 ADR.
- 7.1.7.4.8 Jestliže jsou látky obsaženy v ochranných obalech naplněných chladicí látkou, musí být přepravovány v uzavřených vozidlech nebo vozidlech s plachtou, nebo v uzavřených kontejnerech nebo

kontejnerech s plachtou. Pokud jsou používána uzavřená vozidla nebo kontejnery, musí být přiměřeně větrány. Vozidla a kontejnery s plachtou musí být vybaveny bočnicemi a zadním čelem. Plachty těchto vozidel a kontejnerů musí být z nepromokavých a těžko hořlavých materiálů.

7.1.7.5

7.1.9.99

(Vyhrazeno)

KAPITOLA 7.2

TANKOVÁ PRAVIDLA

7.2.0 Všeobecné předpisy

7.2.0.1 Předpisy 7.2.0 až 7.2.5 platí pro tanková pravidla.

7.2.0.2 -

7.2.0.99 (Vyhrazeno)

7.2.1 Způsob přepravy

7.2.1.1 -

7.2.1.20 (Vyhrazeno)

7.2.1.21 *Přeprava v nákladních tancích*

7.2.1.21.1 Látky, jejich přiřazení k jednotlivým typům pravidel a zvláštní podmínky, za kterých tyto smějí být přepravovány v tankových pravidlech, jsou uvedeny v tabulce C kapitoly 3.2.

7.2.1.21.2 Látky, které podle sloupce (6) tabulky C kapitoly 3.2 musí být přepravovány v pravidle typu N otevřené s pojistkou proti prošlehnutí plamenů, smí být přepravovány také v pravidle typu N uzavřené, C nebo G, pokud jsou dodrženy minimálně podmínky přepravy předepsaného typu N a také všechny ostatní podmínky přepravy pro tuto látku podle tabulky C kapitoly 3.2.

7.2.1.21.3 Látky, které podle sloupce (6) tabulky C kapitoly 3.2 musí být přepravovány v pravidle typu N s pojistkou proti prošlehnutí plamenů, smí být přepravovány také v pravidle typu N uzavřené, C nebo G, pokud jsou dodrženy minimálně podmínky přepravy předepsaného typu N a také všechny ostatní podmínky přepravy pro tuto látku podle tabulky C kapitoly 3.2.

7.2.1.21.4 Látky, které podle sloupce (6) tabulky C kapitoly 3.2 musí být přepravovány v pravidle typu N uzavřené, smí být přepravovány také v pravidlech typu C nebo G, pokud jsou dodrženy minimálně podmínky přepravy předepsaného typu N a také všechny ostatní podmínky přepravy pro tuto látku podle tabulky C kapitoly 3.2.

7.2.1.21.5 Látky, které podle sloupce (6) tabulky C kapitoly 3.2 musí být přepravovány v pravidle typu C uzavřené, smí být přepravovány také v pravidle typu G, pokud jsou dodrženy minimálně podmínky přepravy předepsaného typu C a také všechny ostatní podmínky přepravy pro tuto látku podle tabulky C kapitoly 3.2.

7.2.1.21.6 Lodní provozní odpady, obsahující oleje a maziva, smějí být přepravovány pouze v ohnivzdorných nádobách s krytem nebo v nákladních tancích.

7.2.1.21.7 Látky, které musí být podle sloupce (8) tabulky C kapitoly 3.2 přepravovány v nákladním tanku typu 2 (integrováný nákladní tank), smí být přepravovány také v nákladním tanku typu 1 (nezávislý nákladní tank) nebo v nákladním tanku typu 3 (stěna nákladního tanku není obšívka) typu pravidla předepsaného v tabulce C nebo typu pravidla předepsaného v 7.2.1.21.2 až 7.2.1.21.5, pokud jsou splněny všechny ostatní podmínky přepravy vyžadované pro tuto látku tabulkou C kapitoly 3.2.

7.2.1.21.8 Látky, které musí být podle sloupce (8) tabulky C kapitoly 3.2 přepravovány v nákladním tanku typu 3 (stěna nákladního tanku není obšívka), smí být přepravovány také v nákladním tanku typu 1 (nezávislý nákladní tank) typu pravidla předepsaného v tabulce C nebo typu pravidla předepsaného v 7.2.1.21.2 až 7.2.1.21.5 nebo v pravidle typu C s nákladním tankem typu 2 (integrováný nákladní tank), pokud jsou splněny alespoň podmínky přepravy týkající se předepsaného typu N a jsou splněny všechny ostatní podmínky přepravy vyžadované pro tuto látku tabulkou C kapitoly 3.2 nebo 7.2.1.21.2 až 7.2.1.21.5.

7.2.1.22 -

7.2.1.99 (Vyhrazeno)

7.2.2 Požadavky na plavidla

7.2.2.0 Povolená plavidla

POZNÁMKA 1: Otevírací tlak pojistných ventilů musí být uveden ve schvalovacím osvědčení (viz 8.6.1.3).

POZNÁMKA 2: Konstrukční tlak a zkušební tlak nákladních tanků musí být uveden v osvědčení o třídě vydaným uznanou klasifikační společností předepsaném v 9.3.1.8.1 nebo 9.3.2.8.1 nebo 9.3.3.8.1.

POZNÁMKA 3: Jestliže plavidlo přepravuje nákladní tanky s různými tlaky pro otevření ventilů, musí být otevírací tlak každého tanku uveden ve schvalovacím osvědčení a konstrukční a výpočtové tlaky každého tanku musí být uvedeny v osvědčení o třídě vydaném uznanou klasifikační společností.

7.2.2.0.1 Nebezpečné věci smějí být přepravovány v tankových plavidlech typů N, C nebo G podle požadavků kapitol 9.3.1, 9.3.2 nebo 9.3.3 resp. Typ tankového plavidla, které se má použít je uveden ve sloupci (6) tabulky C kapitoly 3.2 a v 7.2.1.21.

POZNÁMKA: Látky připuštěné k přepravě v konkrétním plavidle jsou uvedeny v seznamu látek pro plavidlo zpracovaném uznanou klasifikační společností (viz 1.16.1.2.5).

7.2.2.1

-

7.2.2.4

(Vyhrazeno)

7.2.2.5

Návody k použití pro přístroje a zařízení

Jestliže jsou pro používání nějakého přístroje nebo zařízení zapotřebí zvláštní bezpečnostní předpisy, musí se návod k použití přístroje nebo zařízení nacházet na plavidle na vhodném místě a v jazyce na plavidle obvyklém a také, pokud tímto jazykem není angličtina, francouzština nebo němčina, tak v angličtině, francouzštině nebo němčině, pokud dohody uzavřené mezi zeměmi zainteresovanými na přepravě nestanoví jinak.

7.2.2.6

Systém pro detekci plynů

Pokud seznam látek pro plavidlo podle 1.16.1.2.5 obsahuje látky, pro které není n-hexan reprezentativní, musí být systém pro detekci plynů navíc kalibrován na nejkritičtější dolní mez výbušnosti látek připuštěných k přepravě na plavidle.

7.2.2.7

-

7.2.2.18

(Vyhrazeno)

7.2.2.19

Tlačná soulodí a sestavy spřažených plavidel

7.2.2.19.1

Pokud musí být v tlačném soulodí nebo v sestavě spřažených plavidel alespoň jedno plavidlo vybaveno schvalovacím osvědčením pro přepravu nebezpečných věcí, musí být všechna plavidla této sestavy vybavena pro ně vystaveným schvalovacím osvědčením.

Plavidla, která nepřepravují nebezpečné zboží, musí odpovídat předpisům 7.1.2.19.

7.2.2.19.2

Pro účely této části se tlačné soulodí nebo sestava spřažených plavidel posuzuje jako jedno jediné plavidlo.

7.2.2.19.3

Pokud tlačné soulodí nebo sestava spřažených plavidel zahrnuje tankové plavidlo přepravující nebezpečné věci, musí plavidla používaná pro pohon splňovat podmínky následujících ustanovení:

1.16.1.1, 1.16.1.2, 1.16.1.3, 1.16.1.4, 7.2.2.5, 8.1.4, 8.1.5, 8.1.6.1, 8.1.6.3, 8.1.7, 8.3.5, 9.3.3.0.1, 9.3.3.0.3.1, 9.3.3.0.5, 9.3.3.10.1, 9.3.3.10.4, 9.3.3.12.4, 9.3.3.12.6, 9.3.3.16.1, 9.3.3.16.2, 9.3.3.17.1 až 9.3.3.17.4, 9.3.3.31.1 až 9.3.3.31.5, 9.3.3.32.2, 9.3.3.34.1, 9.3.3.34.2, 9.3.3.40.1 (avšak jedno požární nebo balastní čerpadlo je dostačující), 9.3.3.40.2, 9.3.3.41, 9.3.3.51, 9.3.3.52.1 až 9.3.3.52.8, 9.3.3.71 a 9.3.3.74.

Plavidla používaná jen pro pohon tankových plavidel, jejichž seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 obsahuje pouze látky, pro které se nevyžaduje ochrana proti explozi,

nemusí splňovat požadavky uvedené v 9.3.3.10.1, 9.3.3.10.4, 9.3.3.12.6, 9.3.3.51 a 9.3.3.52.1. V tomto případě musí být ve schvalovacím osvědčení nebo prozatímním schvalovacím osvědčení pod číslem 5, povolené odchylky, uveden tento zápis: „Odchylka od 9.3.3.10.1, 9.3.3.10.4, 9.3.3.12.6, 9.3.3.51 a 9.3.3.52.1; plavidlo smí pohánět jen tanková plavidla, jejichž seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 obsahuje pouze látky, pro které se nevyžaduje ochrana proti explozi“.

7.2.2.19.4 Během nakládky a vykládky látek, pro které je ve sloupci (17) tabulky C kapitoly 3.2 vyžadována ochrana proti explozi, smějí být na palubě jiných plavidel sestavy plavidel použity pouze instalace a zařízení, které splňují požadavky uvedené v 9.3.3.53. Tato podmínka neplatí pro:

- (a) instalace a zařízení připojené vpředu nebo vzadu na plavidle, které je nakládáno nebo vykládáno, jestliže je tankové plavidlo, které je nakládáno nebo vykládáno, vybaveno ochrannou stěnou na příslušné straně oblasti nákladu nebo umístěnou ve vzdálenosti nejméně 12,0 m od hraniční roviny oblasti nákladu plavidla, které je nakládáno nebo vykládáno;
- (b) instalace a zařízení tankových plavidel spojených bočně s plavidlem, které je nakládáno nebo vykládáno, jestliže jsou takové instalace nebo zařízení umístěny za ochrannou stěnou podle 9.3.3.10.3 a tato ochranná stěna není umístěna vedle oblasti nákladu plavidla, které je nakládáno nebo vykládáno, nebo umístěna ve vzdálenosti nejméně 12,0 m od hraniční roviny oblasti nákladu plavidla, které je nakládáno nebo vykládáno.

7.2.2.20 (Vyhrazeno)

7.2.2.21 **Bezpečnostní a kontrolní zařízení**

Při nakládce nebo vykládce látek třídy 2 nebo třídy 3, UN 1280 a 2983 musí být na dvou místech na plavidle (vpředu a vzadu) a na dvou místech na břehu (přímo u vstupu na plavidlo a v odpovídající vzdálenosti) možné procesy nakládky/vykládky přerušit vypínačem, tzn. rychlouzavírací ventil přímo na pohyblivém potrubním spojení mezi plavidlem a břehem musí být možné zavřít.

Systém odpojení musí být zkonstruován v souladu s uzavřeným oběhovým principem.

7.2.2.22 (Vypuštěno)

7.2.2.23 -

7.2.2.99 (Vyhrazeno)

7.2.3 **Všeobecné provozní předpisy**

7.2.3.1 **Vstup do nákladních tanků, zbytkových tanků, prostor s čerpadly pod palubou, kofrdamů, dvojitých boků a nákladních prostor; kontroly**

7.2.3.1.1 Kofrdamy musí být prázdné. Denně se musí zkontrolovat, zda jsou kofrdamy suché (vyjma kondenzované vody).

7.2.3.1.2 Vstup do nákladních tanků, zbytkových tanků, kofrdamů, dvojitých boků, dvojitého dna a nákladních prostor je povolen pouze za účelem provedení kontrol a čistících prací.

7.2.3.1.3 Do dvojitých boků a dvojitého dna se během plavby nesmí vstupovat.

7.2.3.1.4 Jestliže před vstupem do nákladních tanků, zbytkových tanků, prostor s čerpadly pod palubou, kofrdamů, dvojitých boků, dvojitého dna nebo nákladních prostor musí být změřena koncentrace hořlavých nebo toxických plynů a par pocházejících z nákladu nebo obsah kyslíku, tyto údaje o měření musí být písemně zaznamenány.

Měření smí být prováděno pouze odborníkem podle 8.2.1.2, který je vybaven vhodným dýchacím přístrojem pro přepravovanou látku.

Do kontrolovaných prostor se při měření nesmí vstupovat.

7.2.3.1.5 Dříve než kterákoliv osoba vstoupí do nákladních tanků, zbytkových tanků, prostorů s čerpadly pod palubou, kofrdamů, dvojitých boků, dvojitých den, nákladních prostorů nebo jiných uzavřených prostorů:

- (a) pokud plavidlo přepravuje nebezpečné látky tříd 2, 3, 4.1, 6.1, 8 nebo 9, pro které je ve sloupci (18) tabulky C kapitoly 3.2 vyžadován přístroj pro detekci plynů, musí být pomocí tohoto přístroje zjištěno, že koncentrace hořlavých plynů a par pocházejících z nákladu v těchto nákladních tancích, zbytkových tancích, prostorech s čerpadly pod palubou, kofrdamech, dvojitých bocích, dvojitých dnech nebo nákladních prostorech není vyšší než 50 % dolní meze výbušnosti. Pro prostory s čerpadly pod palubou se toto smí zjistit pomocí trvale instalovaného systému pro detekci plynů.
- (b) pokud plavidlo přepravuje nebezpečné látky tříd 2, 3, 4.1, 6.1, 8 nebo 9, pro které je ve sloupci (18) tabulky C kapitoly 3.2 vyžadován detektor toxických plynů, musí být pomocí tohoto přístroje zjištěno, že nákladní tanky, zbytkové tanky, prostory s čerpadly pod palubou, kofrdamy, dvojitě boky, dvojitá dna nebo nákladní prostory neobsahují koncentraci toxických plynů a par pocházejících z nákladu, která překračuje národně schválené expoziční limity.

Odchytkou od 1.1.4.6 mají přísnější vnitrostátní právní předpisy pro vstup do nákladních prostorů přednost před ustanoveními ADN.

7.2.3.1.6

Vstup do prázdných nákladních tanků, zbytkových tanků, prostorů s čerpadly pod palubou, kofrdamů, dvojitých boků, dvojitých dnů, nákladních prostorů nebo jiných uzavřených prostorů je dovolen pouze tehdy, jestliže:

- koncentrace hořlavých plynů a par pocházejících z nákladu v nákladních tancích, zbytkových tancích, prostorech s čerpadly pod palubou, kofrdamech, dvojitých bocích, dvojitých dnech, nákladních prostorech nebo jiných uzavřených prostorech je nižší než 10 % dolní meze výbušnosti, koncentrace toxických plynů a par pocházejících z nákladu je nižší než úroveň národně schválených expozičních limitů a procento kyslíku je mezi 20 a 23,5 % obj.; nebo
- koncentrace hořlavých plynů a par pocházejících z nákladu v nákladních tancích, zbytkových tancích, prostorech s čerpadly pod palubou, kofrdamech, dvojitých bocích, dvojitých dnech, nákladních prostorech nebo jiných uzavřených prostorech je nižší než 10 % dolní meze výbušnosti a osoba vstupující do těchto prostorů je vybavena dýchacím přístrojem nezávislým na okolním prostředí, jakož i jiným nezbytným ochranným a záchranným vybavením, a je zajištěna pomocí lana. Vstup do těchto prostorů je dovolen jen pod dohledem druhé osoby, pro kterou je připraveno k okamžitému použití stejné vybavení. Další dvě osoby, které jsou schopné v případě nouze poskytnout pomoc, musí být na plavidle ve slyšitelné vzdálenosti. Pokud je k dispozici záchranný vrátek, je dostačující jedna další osoba.

V případě nouze nebo mechanických problémů je dovoleno vstoupit do tanku, je-li koncentrace hořlavých plynů a par pocházejících z nákladu mezi 10 a 50 % dolní meze výbušnosti. Použitý dýchací přístroj (nezávislý) musí být zkonstruován tak, aby nemohl způsobit vznik jisker.

Odchytkou od 1.1.4.6 mají přísnější vnitrostátní právní předpisy pro vstup do nákladních tanků přednost před ustanoveními ADN.

7.2.3.2 **Prostory s čerpadly pod palubou**

7.2.3.2.1

Prostory s čerpadly pod palubou musí být při přepravě látek třídy 3, 4.1, 6.1, 8 nebo 9 jednou denně kontrolovány, zda nedochází k únikům. Nákladní prostory a kalové jímky nesmí obsahovat žádnou látku.

7.2.3.2.2

Při aktivování výstražného signálu systému pro detekci plynů, musí být okamžitě zastaven proces nakládky nebo vykládky. Je třeba uzavřít všechny uzavírací armatury a okamžitě opustit prostory s čerpadly. Všechny přístupové otvory musí být zavřené. Nakládky nebo vykládky smí pokračovat teprve po odstranění poruchy nebo závady.

7.2.3.3 (Vyhrazeno)

7.2.3.4 (Vyhrazeno)

7.2.3.5 (Vyhrazeno)

7.2.3.6 *Systém pro detekci plynů*

Systém pro detekci plynů musí být udržován a kalibrován vyškolenými a kvalifikovanými pracovníky podle pokynů výrobce.

7.2.3.7 *Odplynování prázdných nebo vyložených nákladních tanků a nakládacího a vykládacího potrubí*

7.2.3.7.0 Odplynování prázdných nebo vyložených nákladních tanků a nakládacího a vykládacího potrubí do ovzduší nebo do sběrných zařízení je dovoleno za následujících podmínek, avšak pouze tehdy, jestliže to není zakázáno na základě jiných právních předpisů.

7.2.3.7.1 Odplynování prázdných nebo vyložených nákladních tanků a nakládacího a vykládacího potrubí do ovzduší.

7.2.3.7.1.1 Prázdné nebo vyložené nákladní tanky, které předtím obsahovaly nebezpečné látky:

- třídy 2 nebo třídy 3 s klasifikačním kódem zahrnujícím písmeno „T“ ve sloupci (3b) tabulky C kapitoly 3.2;
- třídy 6.1; nebo
- obalové skupiny I třídy 8

smějí být odplynovány pouze odborníkem podle 8.2.1.2. Toto smí být prováděno jen na místech schválených příslušným orgánem.

7.2.3.7.1.2 Pokud není odplynování nákladních tanků, které předtím obsahovaly nebezpečné věci uvedené v 7.2.3.7.1.1 výše, proveditelné na místech schválených pro tento účel příslušným orgánem, smí být odplynování provedeno během plavby, jestliže:

- požadavky prvního odstavce 7.2.3.7.1.3 jsou splněny; koncentrace hořlavých plynů a par pocházejících z nákladu však nesmí být v odvětrávané směsi na výstupu vyšší než 10 % dolní meze výbušnosti;
- posádka není vystavena působení koncentrace plynů a par, která překračují úroveň národně schválených expozičních limitů.
- všechny přístupy a otvory prostor spojených s volným okolím jsou uzavřeny. To neplatí pro otvory pro přívod vzduchu do strojovny a otvory přetlakových větracích systémů;
- členové posádek, pracující na palubě, musí mít vhodnou ochrannou výstroj;
- toto se neprovádí v oblasti plavebních komor včetně příjezdových prostor ke komorám, pod mosty nebo v hustě osídlených oblastech.

7.2.3.7.1.3 Odplynování prázdných nebo vyložených nákladních tanků, které obsahovaly jiné nebezpečné věci než ty, které jsou uvedené v 7.2.3.7.1.1, pokud je koncentrace hořlavých plynů a par pocházejících z nákladu 10 % dolní meze výbušnosti nebo vyšší, smí být prováděno během plavby, nebo na místech schválených příslušným orgánem, pomocí vhodných větracích zařízení s uzavřenými kryty nákladních tanků a s odvodem směsi plyn/vzduch přes pojistky proti prošlehnutí plamene, schopné odolat trvalému ohni (skupina výbušnosti/podskupina podle sloupce (16) tabulky C kapitoly 3.2). Koncentrace hořlavých plynů a par v odvětrávané směsi na výstupu musí být nižší než 50 % dolní meze výbušnosti. Vhodná větrací zařízení smějí být používána pro odplynování sáním, jen pokud je pojistka proti prošlehnutí plamene umístěna bezprostředně před větrákem na sací straně (skupina výbušnosti/podskupina podle sloupce (16) tabulky C kapitoly 3.2). Koncentrace hořlavých plynů a par musí být měřena jednou za hodinu během prvních dvou hodin po započítání odplynování pomocí nucené ventilace nebo sání odborníkem podle 8.2.1.2. Výsledky těchto měření musí být zaznamenány písemně.

Odplynování je však zakázáno v oblasti plavebních komor, včetně jejich příjezdových prostor, pod mosty nebo v hustě osídlených oblastech.

Odplynování prázdných nebo vyložených nákladních tanků, které obsahovaly jiné nebezpečné věci než ty, které jsou uvedené v 7.2.3.7.1.1, je-li koncentrace plynů a par pocházejících z nákladu nižší než 10 % dolní meze výbušnosti, je dovoleno a také je dovoleno, aby byly otevřeny další otvory nákladního tanku, pokud posádka není vystavena působení koncentrace plynů a par, které přesahují

úrovně národně schválených expozičních limitů. Rovněž není povinné použití pojistky proti prošlehnutí plamene.

Odplynování je však zakázáno v oblasti plavebních komor, včetně jejich příjezdových prostor, pod mosty nebo v hustě osídlených oblastech.

- 7.2.3.7.1.4 Odplynování musí být přerušeno během bouřky, nebo pokud lze vzhledem k nepříznivým povětrnostním podmínkám očekávat mimo oblast nákladu před obytným prostorem, kormidelnou a provozními prostory nebezpečné koncentrace hořlavých nebo toxických plynů a par. Kritického stavu je dosaženo, jestliže měřením pomocí přenosných měřících přístrojů v těchto místech je koncentrace hořlavých plynů a par pocházející z nákladu vyšší než 20 % dolní meze výbušnosti, nebo koncentrace toxických plynů a par překračuje úroveň národně schválených expozičních limitů.
- 7.2.3.7.1.5 Označení předepsaná v 7.2.5.0.1 směji být na pokyn velitele plavidla odstraněna, jestliže bylo po odplynování nákladních tanků ověřeno, za použití vybavení uvedeného ve sloupci (18) tabulky C kapitoly 3.2, že žádný z nákladních tanků neobsahuje koncentrace hořlavých plynů a par vyšší než 20 % dolní meze výbušnosti, nebo neobsahuje koncentrace toxických plynů a par překračující úroveň národně schválených expozičních limitů. Výsledky měření musí být zaznamenány písemně.
- 7.2.3.7.1.6 Před zahájením prací, které by mohly vyvolat nebezpečí jak je popsáno v 8.3.5, musí být všechny nákladní tanky a potrubí v oblasti nákladu odplynovány. Toto musí být zdokumentováno v osvědčení o odplynování, platném v den započítání prací. Stav, že je odplynováno, smí být prohlášen a osvědčen pouze osobou schválenou příslušným orgánem.
- 7.2.3.7.2 ***Odplynování prázdných nebo vyložených nákladních tanků a nakládacího a vykládacího potrubí do sběrných zařízení***
- 7.2.3.7.2.1 Prázdné nebo vyložené nákladní tanky směji být odplynovány pouze odborníkem podle 8.2.1.2. Pokud je to vyžadováno mezinárodními nebo vnitrostátními právními předpisy, smí být toto prováděno jen na místech schválených příslušným orgánem. Odplynování do mobilního sběrného zařízení během plavby je zakázáno. Odplynování do mobilního sběrného zařízení je zakázáno, jestliže už jiné plavidlo provádí odplynování do tohoto zařízení. Odplynování do mobilního sběrného zařízení na plavidle je zakázáno.
- 7.2.3.7.2.2 Před započítáním procesu odplynování musí být odplynované plavidlo uzemněno. Velitel odplynovaného plavidla nebo jím pověřený odborník podle 8.2.1.2 a provozovatel sběrného zařízení musí vyplnit a podepsat kontrolní list podle 8.6.4 ADN.
- Kontrolní list musí být vytištěn alespoň v jazycích, kterým rozumějí velitel nebo odborník a provozovatel sběrného zařízení.
- Jestliže není možná kladná odpověď na všechny otázky, je odplynování v sběrném zařízení dovoleno jen se souhlasem příslušného orgánu.
- 7.2.3.7.2.3 Odplynování v sběrných zařízeních smí být prováděno za použití nakládacího a vykládacího potrubí nebo odvětrávacího potrubí k odvodu plynů a par z nákladních tanků za případného použití jiného potrubí k zamezení překročení maximálního dovoleného přetlaku nebo podtlaku v nákladních tankách.
- Potrubí musí být součástí uzavřeného systému, nebo pokud je použito k zamezení překročení maximálního dovoleného podtlaku v nákladních tankách, musí být vybaveno trvale instalovaným nebo přenosným pružinovým nízkotlakým ventilem s pojistkou proti prošlehnutí plamene (skupina výbušnosti/podskupina podle sloupce (16) tabulky C kapitoly 3.2), je-li vyžadována ochrana proti explozi (sloupec (17) tabulky C kapitoly 3.2). Tento nízkotlaký ventil musí být nainstalován tak, aby se za normálních pracovních podmínek podtlakový ventil neaktivoval. Trvale nainstalovaný ventil nebo otvor, ke kterému je připojen přenosný ventil, musí zůstat zaslepený, není-li plavidlo odplynováno v sběrném zařízení.
- Všechna potrubí mezi odplynovaným plavidlem a sběrným zařízením musí být vybavena vhodnou pojistkou proti prošlehnutí plamene, je-li vyžadována ochrana proti explozi ve sloupci (17) tabulky C kapitoly 3.2. Požadavky na potrubí na plavidle jsou: Skupina výbušnosti/podskupina podle sloupce (16) tabulky C kapitoly 3.2.
- 7.2.3.7.2.4 Musí být možné přerušit proces odplynování pomocí vypínačů instalovaných na dvou místech na plavidle (vpředu a vzadu) a na dvou místech sběrného zařízení (přímo na přístupu k plavidlu a na místě, odkud je sběrné zařízení řízeno). Přerušování odplynování musí být provedeno pomocí

rychlouzavíracího ventilu, který musí být namontován přímo na spojení mezi odplynovaným plavidlem a sběrným zařízením. Rozpojovací systém musí být koncipován na principu uzavřeného okruhu a smí být integrován do nouzového vypínacího systému nákladních čerpadel a ochrany proti přeplnění, předepsaných v 9.3.1.21.5, 9.3.2.21.5 a 9.3.3.21.5.

Odplynování musí být přerušeno během bouřky.

7.2.3.7.2.5 Označení předepsaná ve sloupci (19) tabulky C kapitoly 3.2 smějí být na pokyn velitele plavidla odstraněna, jestliže bylo po odplynování nákladních tanků ověřeno, za použití vybavení udaného ve sloupci (18) tabulky C kapitoly 3.2, že žádný z nákladních tanků neobsahuje hořlavé plyny a páry v koncentraci vyšší než 20 % dolní meze výbušnosti, nebo neobsahuje koncentrace toxických plynů a par, které překračují úroveň národně schválených expozičních limitů. Výsledky měření musí být zaznamenány písemně.

7.2.3.7.2.6 Před zahájením prací, které by mohly vyvolat nebezpečí, jak je popsáno v 8.3.5, musí být všechny nákladní tanky a potrubí v oblasti nákladu odplynovány. Toto musí být zdokumentováno v osvědčení o odplynování, platném v den započítání prací. Stav, že je odplynováno, smí být prohlášen a osvědčen pouze osobou schválenou příslušným orgánem.

7.2.3.7.3 -

7.2.3.7.6 (Vypuštěno)

7.2.3.8 -

7.2.3.11 (Vyhrazeno)

7.2.3.12 **Větrání**

7.2.3.12.1 Pokud jsou strojní zařízení v provozních prostorech v provozu, musí být prodlužovací potrubí větracích otvorů, jestliže takové existují, ve vertikální poloze. Jinak musí být otvory zavřené. To neplatí pro větrací přívody u provozních místností mimo oblast nákladu, jestliže je otvor bez prodlužovacího potrubí umístěn minimálně 0,50 m nad palubou.

7.2.3.12.2 Větrání prostor s čerpadly musí být v provozu

- minimálně 30 minut před vstupem jakož během celé doby pobytu;
- během nakládky, vykládky a odplynování; a
- po aktivaci systému pro detekci plynů.

7.2.3.13 (Vyhrazeno)

7.2.3.14 (Vyhrazeno)

7.2.3.15 **Odborník na plavidle**

Jsou-li přepravovány nebezpečné věci, musí být odpovědný velitel plavidla zároveň odborníkem podle 8.2.1.2. Kromě toho musí být tento odborník:

- odborníkem, jak je uvedeno v 8.2.1.5, jsou-li přepravovány nebezpečné věci, pro které je ve sloupci (6) tabulky C kapitoly 3.2 předepsáno tankové plavidlo typu G; a
- odborníkem, jak je uvedeno v 8.2.1.7, jsou-li přepravovány nebezpečné věci, pro které je ve sloupci (6) tabulky C kapitoly 3.2 předepsáno tankové plavidlo typu C.

POZNÁMKA: Který z velitelů posádky plavidla je odpovědným velitelem plavidla, musí být určeno a dokumentováno na plavidle dopravcem. Pokud neexistuje takové určení, vztahuje se tento požadavek na každého velitele plavidla.

Odchylkou od tohoto ustanovení je pro nakládku a vykládku nebezpečných věcí v tankovém tlačném člunu dostačující, aby osoba, která je odpovědná za nakládku a vykládku a za balastování tankového tlačného člunu, měla odbornou kvalifikaci vyžadovanou podle 8.2.1.2.

Při přepravě látek, pro které ve sloupci (6) tabulky C kapitoly 3.2 je předepsáno tankové plavidlo typu C, a ve sloupci (7) konstrukce nákladního tanku 1, stačí přítomnost na palubě odborníka, podle 8.2.1.5 pro přepravu tankovými plavidly typu G.

7.2.3.16 Všechna měření na plavidle musí být prováděna odborníkem podle 8.2.1.2, pokud není stanoveno jinak v Předpisech přiložených k ADN. Výsledky měření musí být zaznamenány písemně do knihy kontrol podle 8.1.2.1 (g).

7.2.3.17

7.2.3.20

Balastní voda

7.2.3.20.1

Kofrdamy a nákladní prostory, které obsahují izolované nákladní tanky, nesmějí být plněny vodou. Dvojitě boky, dvojitá dna a nákladní prostory, které neobsahují izolované nákladní tanky, smějí být plněny balastní vodou za podmínky, že:

- tato skutečnost byla zohledněna při výpočtech stability v nepoškozeném a poškozeném stavu; a
- plnění není zakázáno ve sloupci (20) tabulky C kapitoly 3.2.

Jestliže voda v balastních nádržích a prostorech způsobuje, že plavidlo již nesplňuje kritéria stability:

- musí být instalovány stacionární ukazatele výšky úrovně hladiny; nebo
- úroveň hladiny naplnění v balastních nádržích a prostorech musí být denně kontrolována před vyplutím a během operací.

V případě existence ukazatelů úrovně hladiny smějí být balastní tanky naplněny také jen částečně. Jinak musí být zcela plné nebo prázdné.

7.2.3.20.2

(Vypuštěno)

7.2.3.21

(Vyhrazeno)

7.2.3.22

Přístupové otvory do nákladních prostor, prostor s čerpadly pod palubou a kofrdamů, otvory nákladních tanků, zbytkových tanků; uzavírací zařízení

Otvory nákladních tanků, zbytkových tanků a přístupové otvory od prostor s čerpadly pod palubou, kofrdamy a nákladní prostory musí zůstat zavřené, vyjma prostor s čerpadly na palubě odkalovacích člunů a zásobovacích plavidel jakož další v této části povolené výjimky.

7.2.3.23

(Vyhrazeno)

7.2.3.24

(Vyhrazeno)

7.2.3.25

Spojení mezi potrubními

7.2.3.25.1

Je zakázáno vytvářet spojení mezi dvěma nebo více potrubními následujících skupin:

- (a) potrubí pro nakládku a vykládku;
- (b) potrubí pro balastování a dočerpání nákladních tanků, vyprázdnění kofrdamů, nákladních prostor, dvojitých boků a dvojitého dna;
- (c) potrubí, které se nachází mimo oblast nákladu.

7.2.3.25.2

Ustanovení 7.2.3.25.1 neplatí pro odnímatelné spojení potrubí kofrdamů:

- potrubí pro nakládku a vykládku;
- potrubí, které se nachází mimo oblast nákladu, pokud v případě naléhavé potřeby musí být kofrdamy naplněny vodou.

V těchto případech musí být spojení provedeno tak, aby z nákladních prostor nemohla být nasáta žádná voda. Vyčerpání kofrdamů smí být prováděno jen pomocí ejektorů nebo nezávislého zařízení v oblastí nákladu.

- 7.2.3.25.3 Ustanovení 7.2.3.25.1 (b) a (c) neplatí pro:
- potrubí pro balastování a vyčerpání dvojitých boků a dvojitého dna, jestliže nemají společnou stěnu s nákladními tanky;
 - potrubí pro balastování dvojitých boků, dvojitého dna a nákladních prostor, jestliže toto je prováděno požárním potrubím umístěným v oblasti nákladu. Vyčerpání dvojitých boků a dvojitého dna a nákladních prostor smí být prováděno jen pomocí ejektorů nebo nezávislého zařízení v oblasti nákladu.
- 7.2.3.26** (Vyhrazeno)
7.2.3.27 (Vyhrazeno)
- 7.2.3.28** ***Pokyny k maximální teplotě nakládky***
- V případě přepravy chlazených látek se musí na palubě nacházet návod, ve kterém musí být uvedena maximálně přípustná teplota nakládky s ohledem na izolaci konstrukce nákladních tanků a pokud je na palubě, kapacitu systému chlazení.
- 7.2.3.29** ***Záchranné čluny***
- 7.2.3.29.1 Záchranný člun vyžadovaný podle předpisů uvedených v 1.1.4.6 se musí uložit mimo oblast nákladu. Smí však být uložen v oblasti nákladu, jestliže se v oblasti obytných prostor nachází lehce dostupný kolektivní záchranný prostředek podle předpisů uvedených v 1.1.4.6. Jestliže seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 obsahuje látky, pro které se vyžaduje ochrana proti explozi ve sloupci (17) tabulky C kapitoly 3.2,
- závěsné motory a jejich palivové nádrže musí být na plavidle přepravovány pouze mimo oblast nákladu; a
 - mechanická nafukovací zařízení, závěsné motory a jejich elektrické instalace smějí být uvedeny do činnosti pouze mimo oblast nákladu.
- 7.2.3.29.2 Ustanovení 7.2.3.29.1 neplatí pro kalová plavidla a zásobovací plavidla.
- 7.2.3.30** (Vyhrazeno)
- 7.2.3.31** ***Motory***
- 7.2.3.31.1 Je zakázáno používat motory poháněné palivou s bodem vzplanutí 55 °C nebo nižším (např. benzinové motory). Toto ustanovení se nevztahuje na:
- benzinové závěsné motory záchranných člunů;
 - pohonné a přídavné systémy, které splňují požadavky kapitoly 30 a přílohy 8, oddílu 1 Evropské normy stanovící technické požadavky na plavidla pro vnitrozemskou dopravu (ES-TRIN), se změnami².
- 7.2.3.31.2 Je zakázáno v oblasti nákladu přepravovat motorové dopravní prostředky jako osobní automobily a motorové čluny.
- 7.2.3.32** ***Nádrže na pohonné hmoty***
- Dvojitá dna o výšce minimálně 0,60 m mohou být použita jako palivové nádrže, pokud byla postavena podle předpisů části 9.
- 7.2.3.33** -
7.2.3.40 (Vyhrazeno)
- 7.2.3.41** ***Kouření, oheň nebo otevřené světlo***

²

Jak je dostupná na webové stránce Evropského výboru pro vypracování norem pro vnitrozemskou plavbu – CESNI, <https://www.cesni.eu/en/documents/es-trin/>.

7.2.3.41.1 Kouření, včetně elektronických cigaret a jiných obdobných zařízení, používání ohně a otevřeného světla je na plavidle zakázáno.

Tabule oznamující tento zákaz musí být umístěny na vhodných místech.

Tento zákaz se nevztahuje na obytné prostory nebo kormidelnu, pokud jsou jejich okna, dveře, světlíky a poklopy uzavřeny, nebo je-li větrací systém nastaven tak, aby zajišťoval přetlak nejméně 0,1 kPa.

7.2.3.41.2 Topné, varné a chladicí přístroje nesmí být provozovány ani kapalnými pohonnými hmotami, zkapalněnými plyny, ani pevnými hořlavými látkami.

Varná a chladicí zařízení jsou povolena pouze v obytných prostorech a v kormidelně.

7.2.3.41.3 Pokud jsou topné přístroje nebo topné kotle umístěny do strojoven nebo do prostor, které jsou pro to zvláště vhodné, smí být provozovány kapalnými pohonnými hmotami, avšak s bodem vzplanutí vyšším než 55 °C.

7.2.3.42 Zařízení pro ohřev nákladu

7.2.3.42.1 Ohřev nákladu je povolen jen tehdy, jestliže existuje nebezpečí ztuhnutí nákladu nebo z důvodu viskozity nákladu není možná normální vykládka.

Obecně nesmí být ohřívána kapalina nad svůj bod vzplanutí.

Zvláštní ustanovení jsou uvedena ve sloupci (20) tabulky C kapitoly 3.2.

7.2.3.42.2 Nákladní tanky musí být při přepravě látek, které jsou přepravovány zahřívání, vybaveny zařízením k měření teploty nákladu.

7.2.3.42.3 Během vykládky smí být zařízení pro ohřev nákladu používáno, jestliže prostor, ve kterém je zařízení umístěno, zcela odpovídá požadavkům v 9.3.2.52.3 nebo 9.3.3.52.3.

7.2.3.42.4 Požadavky 7.2.3.42.3 nemusí být splněny, jestliže zařízení pro ohřev nákladu je ze běhu zásobeno parou a v provozu je jen oběhové čerpadlo, jakož při vykládce látek s bodem vzplanutím rovným nebo vyšším než 60 °C.

7.2.3.43 (Vyhrazeno)

7.2.3.44 Čistící práce

Čistící práce kapalinami, jejichž bod vzplanutí je menší než 55 °C, smějí být prováděny pouze v oblasti s nebezpečím výbuchu.

7.2.3.45 -

7.2.3.50 (Vyhrazeno)

7.2.3.51 Elektrické a neelektrické instalace a zařízení

7.2.3.51.1 Elektrické a neelektrické instalace a zařízení musí být udržovány v bezvadném stavu.

7.2.3.51.2 Použití pohyblivých elektrických kabelů je zakázáno v oblasti s nebezpečím výbuchu. Toto ustanovení neplatí pro pohyblivé elektrické kabely uvedené v 9.3.1.53.3, 9.3.2.53.3 a 9.3.3.53.3.

Pohyblivé elektrické kabely musí být podrobeny vizuální kontrole vždy před použitím. Musí být instalovány takovým způsobem, aby se zajistilo, že nebudou vystaveny riziku poškození. Konektory musí být umístěny mimo oblast s nebezpečím výbuchu.

Použití elektrických kabelů pro napojení elektrické sítě plavidla na elektrickou síť na břehu není dovoleno:

- během nakládky nebo vykládky látek, pro které je vyžadována ochrana proti explozi ve sloupci (17) tabulky C kapitoly 3.2; nebo
- jestliže se plavidlo nachází bezprostředně vedle nebo uvnitř určené zóny na břehu.

- 7.2.3.51.3 Zásuvky pro připojení signálního osvětlení a osvětlení lávky na břeh a pro připojení signálního osvětlení a osvětlení lávky nebo ponorných čerpadel u odkalovacích člunů smějí být pod napětím pouze tehdy, jestliže signální osvětlení a osvětlení lávky nebo ponorná čerpadla u odkalovacích člunů jsou v provozu.
- Spojení a rozpojení připojení v oblasti nákladu smí být možné pouze ve stavu, kdy zásuvky jsou bez napětí.
- 7.2.3.51.4 Během stání v bezprostřední blízkosti nebo uvnitř určené zóny na břehu musí být elektrické a neelektrické instalace a zařízení nesplňující požadavky uvedené v 9.3.x.51 (a), 9.3.x.51 (b), 9.3.x.51 (c) nebo 9.3.x.52.1 (označené červeně podle 9.3.x.51 a 9.3.x.52.3) vypnuty, zchlazeny pod teplotu uvedenou v 9.3.x.51 (a) nebo 9.3.x.51 (b), nebo musí být provedena opatření uvedená v 7.2.3.51.6.
- Jestliže seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 obsahuje látky, pro které je vyžadována ochrana proti explozi ve sloupci (17) tabulky C kapitoly 3.2, platí toto ustanovení také během nakládky a vykládky a odplynování během stání.
- 7.2.3.51.5 Jestliže seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 obsahuje látky, pro které jsou ve sloupci (15) tabulky C kapitoly 3.2 udány teplotní třídy T4, T5 nebo T6, nesmí příslušné povrchové teploty uvnitř určených zón překročit 135 °C (T4), 100 °C (T5), popřípadě 85 °C (T6).
- 7.2.3.51.6 7.2.3.51.4 a 7.2.3.51.5 neplatí v obytných prostorech, kormidelně nebo provozních prostorech situovaných mimo oblast nákladu, pokud
- (a) větrací systém je nastaven tak, aby zaručil přetlak nejméně 0,1 kPa; a
- (b) systém pro detekci plynů je zapnutý a kontinuálně měřící.
- 7.2.3.51.7 Instalace a zařízení podle 7.2.3.51.4, které byly vypnuty během nakládky a vykládky, odplynování během stání nebo při stání v blízkosti nebo uvnitř určené zóny na břehu, smějí být opět zapnuty, pouze v případě že:
- plavidlo již není v blízkosti nebo uvnitř určené zóny na břehu; nebo
 - v kormidelně, obytných a provozních prostorech situovaných mimo oblast nákladu byly naměřeny hodnoty 10 % dolní meze výbušnosti n-hexanu nebo 10 % dolní meze výbušnosti nákladu, podle toho, která z nich je kritičtější.
- Výsledky měření musí být zaznamenány písemně.
- 7.2.3.51.8 Jestliže plavidla nejsou schopna splnit požadavky uvedené v 7.2.3.51.4 a 7.2.3.51.6 nesmějí zůstat v bezprostřední blízkosti nebo uvnitř určené zóny na břehu.

7.2.3.52**7.2.3.99**

-
(Vyhrazeno)

7.2.4 Doplnkové předpisy pro nakládku, přepravu, vykládku a ostatní manipulaci s nákladem**7.2.4.1 Omezení přepravovaných množství**

7.2.4.1.1 Je zakázáno, v oblasti nákladu přepravovat kusy, vyjma:

- zbytkového nákladu, mycí vody, zbytků nákladu a kalů obsažených v nejvýše šesti schválených nádobách na zbytkové produkty a nádobách na kaly o maximálním celkovém vnitřním objemu nejvýše 12 m³. Nádoby na zbytkové produkty a nádoby na kaly musí být řádně zajištěny v oblasti nákladu, být umístěny v minimální vzdálenosti od trupu rovnající se jedné čtvrtině šířky plavidla a splňovat ustanovení uvedená v 9.3.2.26.3 nebo 9.3.3.26.3, která se jich týkají.
- maximálně 30 vzorků nákladu látek, které smějí být v tankovém plavidle přepravovány, s maximálním obsahem 500 ml/nádobu. Nádoby musí odpovídat předpisům o obalech v části 4 ADR a musí být na plavidle uchovávány na určitém místě v rámci oblasti nákladu a uloženy tak, aby při normálních přepravních podmínkách se nemohly rozbít nebo proděravět nebo jejich obsah se nemohl dostat do volného prostoru. Křehké lahve se vzorky musí být uloženy ve vhodných obalech.

- 7.2.4.1.2 Na odkalovacích člunech smějí být nádoby na lodní provozní odpady, obsahující oleje a mazadla v objemu maximálně 2,00 m³ přepravovány v oblasti nákladu, jestliže jsou uloženy bezpečným způsobem.
- 7.2.4.1.3 Na zásobovacích plavidlech nebo jiných plavidlech, které zásobují plavidla produkty pro jejich provoz, smějí být kusy s nebezpečnými věcmi nebo kusy s věcmi, které nejsou nebezpečné, o celkové (brutto) hmotnosti do 5 000 kg přepravovány v oblasti nákladu, pokud ve schvalovacím osvědčení je toto zaznamenáno. Kusy musí být bezpečně uloženy a chráněny před teplem, slunečním zářením a povětrnostními podmínkami.
- 7.2.4.1.4 Na zásobovacích plavidlech a jiných plavidlech, která předávají lodní pohonné hmoty, smí být počet vzorků nákladu podle 7.2.4.1.1 zvýšen z 30 na maximálně 500.
- 7.2.4.2 *Přejímka lodních provozních odpadů, obsahující olejové látky a mazadla a předání lodních pohonných hmot***
- 7.2.4.2.1 Přejímka nebalených tekutých lodních provozních odpadů, obsahujících olejové látky a mazadla z plavidel vnitrozemské plavby smí být prováděna pouze odsáváním, přejímka z námořních plavidel může být prováděna natlakováním za předpokladu:
- množství, které má být převedeno, a maximální nakládací výkon jsou stanoveny a dohodnuty mezi námořním plavidlem a plavidlem vnitrozemské plavby;
 - je-li to možné, lze tlakové čerpadlo na námořním plavidle vypnout z přijímajícího plavidla vnitrozemské plavby;
 - nad činností je stálý a nepřetržitý dohled z obou plavidel; a
 - zajištěna komunikace mezi oběma plavidly po celou dobu činnosti.
- 7.2.4.2.2 Vyvázání a přejímka lodních provozních odpadů, obsahujících olejové látky a mazadla, nesmí být prováděna během nakládky a vykládky látek, u kterých podle sloupce (17) tabulky C kapitoly 3.2, je potřebná ochrana proti explozi, jakož během odplynování tankových plavidel. To neplatí pro odkalovací plavidla, pokud jsou alespoň dodržena ustanovení o ochraně proti explozi pro nebezpečnou látku.
- 7.2.4.2.3 Vyvázání a předání lodních pohonných hmot nesmí být prováděno během nakládky a vykládky látek, u kterých je podle sloupce (17) tabulky C kapitoly 3.2 potřebná ochrana proti explozi, a během odplynování tankových plavidel. To neplatí pro zásobovací plavidla, pokud jsou alespoň dodržena ustanovení o ochraně proti explozi pro nebezpečnou látku.
- 7.2.4.2.4 Místně příslušný orgán může povolit odchylky od 7.2.4.2.1 a 7.2.4.2.2; během vykládky také od 7.2.4.2.3.
- 7.2.4.3** -
- 7.2.4.6** (Vyhrazeno)
- 7.2.4.7 *Místa nakládky a vykládky***
- 7.2.4.7.1 Tanková plavidla smějí být nakládána nebo vykládána pouze na místech, označených místně příslušným orgánem nebo za tímto účelem schválených. Je-li místem pro nakládku a vykládku určena zóna na břehu, smí plavidlo stát v bezprostřední blízkosti nebo uvnitř této zóny, jen pokud splňuje požadavky uvedené v 9.3.x.12.4 (b) nebo (c), 9.3.x.51, 9.3.x.52.1 a 9.3.x.52.3. Příslušný orgán může povolit výjimky v jednotlivých případech.
- 7.2.4.7.2 Přejímka nebalených olejovitých a mastných kapalných odpadů pocházejících z provozu plavidel od jiných plavidel a předání produktů pro provoz plavidel do zásobníků jiných plavidel se nepovažuje za nakládku nebo vykládku ve smyslu odstavce 7.2.4.7.1 výše, ani za překládku ve smyslu pododdílu 7.2.4.9.
- 7.2.4.8** (Vyhrazeno)

7.2.4.9 Překládka

Je zakázáno, bez povolení místně příslušného orgánu náklad zcela nebo zčásti překládat do jiného pravidla mimo k tomu schválené místo překládky.

POZNÁMKA 1: K překládce na dopravní prostředky jiného druhu dopravy viz 7.2.4.7.1.

POZNÁMKA 2: Tento zákaz se vztahuje také na překládku mezi zásobovacími pravidly.

7.2.4.10 Kontrolní list

7.2.4.10.1 S nakládkou nebo vykládkou se nesmí začít, dokud nebyl pro dotýčný náklad vyplněn kontrolní list podle oddílu 8.6.3 ADN a otázky 1 až 19 listu nebyly k potvrzení označeny „x“. Nehodící se otázky je třeba přeškrtnout. Seznam musí být vyplněn před začátkem nakládky nebo vykládky po připojení potrubí určeného pro překládku ve dvojím vyhotovení a podepsán velitelem pravidla nebo osobou jím pověřenou a osobou odpovědnou za překládku v zařízení na břehu. Pokud není možné na všechny otázky odpovědět kladně, je nakládka nebo vykládka dovolena jen s předchozím souhlasem příslušného orgánu.

7.2.4.10.2 Kontrolní list musí odpovídat vzoru podle 8.6.3.

7.2.4.10.3 Kontrolní list musí být vytištěn v jazyce srozumitelnému pro velitele pravidla a osobě, která je odpovědná za překládku na břehu.

7.2.4.10.4 7.2.4.10.1 až 7.2.4.10.3 neplatí při přejímce lodních provozních odpadů, obsahujících olejové látky a mazadla do odkalovacích člunů a při předání lodních pohonných hmot pomocí zásobovacích pravidel.

7.2.4.11 Plán uložení nákladu

7.2.4.11.1 (Vypuštěno)

7.2.4.11.2 Velitel pravidla musí do plánu uložení nákladu uvést, které látky jsou uloženy v jednotlivých nákladních tancích. Látky musí být uvedeny podle přepravního dokladu (údaje podle 5.4.1.1.2 (a) až (d)).

7.2.4.12 Registrace operací během plavby

V deníku registrace operací podle oddílu 8.1.11 se musí neprodleně zapsat následující informace:

Nakládka: Místo a stanoviště nakládky, datum a čas, UN číslo nebo identifikační číslo látky, oficiální pojmenování pro přepravu látky, třída a obalová skupina, pokud je;
Vykládka: Místo a přístav vykládky, datum a čas;

Odplynování po přepravě UN 1203 benzínu: Místo a systém nebo sektor odplynování, datum a čas.

Tyto údaje musí být uvedeny pro každý nákladní tank.

7.2.4.13 Opatření před nakládkou

7.2.4.13.1 Pokud by zbytky předchozího nákladu mohly vyvolat nebezpečné reakce s předpokládaným nákladem, musí být všechny tyto zbytky dostatečným způsobem odstraněny.

Jestliže nebezpečné látky reagují nebezpečně s jinými nebezpečnými látkami, musí být odděleny kofrdamem, prázdným prostorem, prostorem s čerpadlem, prázdným nákladním tankem nebo nákladním tankem, který je naložen látkou, která s nákladem nereaguje.

Pokud je nákladní tank prázdný a nevyčištěný nebo obsahuje zbytky předchozího nákladu, která může reagovat nebezpečně s jinou nebezpečnou látkou, není toto oddělení zapotřebí, jestliže velitel pravidla provedl vhodná opatření, aby se nebezpečné reakci zamezilo.

Pokud je pravidlo vybaveno nakládacím a vykládacím potrubím pod palubou, které je vedeno přes

nákladní tanky, nesmějí být látky, které spolu nebezpečně reagují, společně nakládány nebo přepravovány.

7.2.4.13.2 Před začátkem nakládky musí v rozsahu, jak je to jen možné, být překontrolována všechna předepsaná bezpečnostní a kontrolní zařízení jakož předměty výstroje, musí být zkontrolována jejich funkčnost.

7.2.4.13.3 Před začátkem nakládky musí být snímač mezních hodnot pro spuštění pojistky proti přeplnění napojen na zařízení na běhu.

7.2.4.14 Manipulace a uložení nákladu

Nebezpečné věci musí být uloženy v oblasti nákladu v nákladních tancích, zbytkových tancích nebo v kusech, povolených v 7.2.4.1.1.

7.2.4.15 Opatření, která je třeba učinit po vykládce (dočerpávací systém)

7.2.4.15.1 Jestliže ustanovení uvedená v 1.1.4.6.1 předvídají použití dočerpávacího systému, musí být nákladní tanky a potrubí pro nakládku a vykládku po každé vykládce vyprázdněny pomocí dočerpávacího systému podle podmínek stanovených ve zkušebním postupu. Toto ustanovení nemusí být dodrženo, jestliže je nový náklad stejný jako předchozí náklad, nebo jde-li o rozdílný náklad, jehož přeprava nevyžaduje předchozí vyčištění nákladních tanků.

Zbytkový náklad musí být vyložen na břeh pomocí zařízení pro tento účel (článek 7.04 č. 1 a dodatek II vzor 1 CDNI) nebo musí být skladován ve vlastním tanku plavidla na zbytkové produkty nebo v nádobách na zbytkové produkty podle 7.2.4.1.1.

7.2.4.15.2 Během plnění zbytkových tanků a nádob na zbytkové produkty musí být uvolněné plyny bezpečně odváděny. Musí být připojeny k odvětrávacímu potrubí jen po dobu potřebnou k jejich naplnění.

Prostředky umožňující shromažďovat uniklé kapaliny musí být umístěny pod přípojkami používanými během plnění.

7.2.4.15.3 Odplynování nákladních tanků a potrubí pro nakládku a vykládku musí být prováděno podle podmínek uvedených v 7.2.3.7.

7.2.4.16 Opatření během nakládky, přepravy, vykládky a manipulace s nákladem

7.2.4.16.1 Nakládací množství jakož maximální tlak čerpadel musí být odsouhlaseny s překladištěm.

7.2.4.16.2 Všechna předepsaná bezpečnostní a kontrolní zařízení v nákladních tancích musí být v provozu. Během přepravy toto platí jen pro zařízení, uvedená v 9.3.1.21.1 (e) a (f), 9.3.2.21.1 (e) a (f) nebo 9.3.3.21.1 (e) a (f).

Při výpadku bezpečnostních a kontrolních zařízení musí být nakládka nebo vykládka okamžitě přerušena.

Pokud je prostor s čerpadly umístěný v prostoru pod palubou, musí být stále v provozu předepsaná bezpečnostní a kontrolní zařízení.

Výpadek systému pro detekci plynů musí být okamžitě opticky a akusticky hlášen do kormidelní a na palubě.

7.2.4.16.3 Uzavírací armatury nakládacího a vykládacího potrubí pokud je k dispozici, jakož i potrubí dočerpávacího systému, musí, kromě během nakládky, vykládky, dočerpávání, čištění nebo odplynování, být uzavřené.

7.2.4.16.4 (Vypuštěno)

7.2.4.16.5 Pod břehovými přípojkami, používanými k nakládce nebo vykládce, musí být umístěny prostředky, které eventuálně jsou schopné pojmout uniklé kapaliny. Před připojením a po odpojení přípojek a mezi těmito operacemi, pokud je to nutné, musí být nádoby vyprázdněny. Tyto požadavky neplatí pro přepravu látek třídy 2.

- 7.2.4.16.6 Při zpětném chodu směsi plyn/vzduch ze břehu nesmí tlak v místě spojení plynového zpětného potrubí a odvětrávacího potrubí překročit otevírací tlak zařízení pro snižování tlaku/vysokorychlostního ventilu.
- 7.2.4.16.7 Pokud tanková plavidla odpovídají požadavkům uvedeným v 9.3.2.22.4 (b) nebo 9.3.3.22.4 (b), musí být jednotlivé nákladní tanky během přepravy uzavřeny a během nakládky, vykládky a odplynování otevřeny.
- 7.2.4.16.8 Osoby, které během nakládky a vykládky vstupují do prostor pod palubou v oblasti nákladu, musí mít ochrannou výstroj PP uvedenou v 8.1.5, pokud je požadována ve sloupci (18) tabulky C v kapitole 3.2.
- Osoby, které spojují nebo rozpojují nakládací a vykládací potrubí nebo odvětrávací potrubí, snižují tlak v nákladních tancích, odebírají vzorky, provádějí měření nebo čištění nebo výměnu součástky pojistky proti prošlehnutí plamene (viz 7.2.4.22), musí mít na sobě ochrannou výstroj PP uvedenou v 8.1.5, je-li toto vybavení předepsáno ve sloupci (18) tabulky C kapitoly 3.2; musí mít také ochrannou výstroj A, je-li ve sloupci (18) tabulky C kapitoly 3.2 předepsán detektor toxických plynů (TOX).
- 7.2.4.16.9 (a) Během nakládky nebo vykládky látek do/z uzavřeného tankového plavidla, pro něž je podle sloupců (6) a (7) tabulky C kapitoly 3.2 dostačující otevřený typ N plavidla s pojistkou proti zpětnému prošlehnutí plamenů, smějí být nákladní tanky otevírány za použití bezpečného zařízení pro vyrovnávání tlaku uvedeného v 9.3.2.22.4 (a) nebo 9.3.3.22.4 (a).
- (b) Během nakládky nebo vykládky látek do/z uzavřeného tankového plavidla, pro něž je podle sloupců (6) a (7) tabulky C kapitoly 3.2 dostačující otevřený typ N plavidla, smějí být nákladní tanky otevírány za použití bezpečného zařízení pro vyrovnávání tlaku uvedeného v 9.3.2.22.4 (a) nebo 9.3.3.22.4 (a) nebo za použití jiného vhodného otvoru v odvětrávacím potrubí, pokud je zamezeno jakékoli akumulaci vody a jejímu proniknutí do nákladních tanků a otvor je po nakládce nebo vykládce opět řádně uzavřen.
- 7.2.4.16.10 7.2.4.16.9 neplatí, jestliže nákladní tanky obsahují plyny nebo výpary látek, u kterých je ve sloupci (7) tabulky C kapitoly 3.2 požadováno uzavřené tankové plavidlo.
- 7.2.4.16.11 Uzavírací zařízení uvedené v 9.3.1.21.1 (g), 9.3.2.21.1 (g) nebo 9.3.3.21.1 (g) se musí otevřít až po provedení plynotěsného připojení odběrného zařízení k uzavřenému nebo částečně uzavřenému odběrnému zařízení.
- 7.2.4.16.12 Pro látky u kterých je v sloupci (17) tabulky C kapitoly 3.2 předepsaná ochrana proti explozi, musí být spojení mezi odvětrávacím potrubím a zařízením na břehu provedeno tak, aby plavidlo bylo chráněno před detonací a průnikem plamenů ze břehu (skupina výbušnosti/podskupina podle sloupce (16) tabulky C kapitoly 3.2). Ochrana plavidla před detonací a průnikem plamenů ze břehu není potřebná, jestliže nákladní tanky jsou inertizovány podle 7.2.4.18.
- 7.2.4.16.13 Pro přepravu látek UN čísla 2448 nebo věcí třídy 5.1 nebo 8 nesmějí být otvory ve štítnici, lištách atd. zavřeny. Nesmějí být zavřeny ani během plavby v případě přepravy jiných nebezpečných věcí.
- 7.2.4.16.14 Pokud je u látek třídy 2 nebo 6.1 v sloupci 20 tabulka C kapitoly 3.2 požadován dozor, musí nakládka a vykládka být prováděna pod dozorem osoby, která k tomu byla odesilatelem nebo příjemcem zmocněna a která nepatří k posádce.
- 7.2.4.16.15 V instrukci k nakládce musí být při začátku nakládky množství nakládky takové, aby byl vyloučen elektrostatický náboj.
- 7.2.4.16.16 Opatření, která je třeba učinit před nakládkou hluboce zchladených zkapalněných plynů
- Pokud není teplota nákladu kontrolována podle ustanovení v 9.3.1.24.1 (a) nebo 9.3.1.24.1 (c) zaručujících využití maximálního odparu (boil-off) ve všech provozních podmínkách, musí být před nakládkou velitelem plavidla nebo jinou osobou v jeho zastoupení určena udržovací doba a tato musí být během nakládky velitelem plavidla nebo jinou osobou v jeho zastoupení vyhodnocována a na plavidle dokumentována.
- 7.2.4.16.17 Určení udržovací doby
- Tabulka, schválená uznanou klasifikační společností, která certifikovala plavidlo, udávající relaci mezi udržovací dobou a plnicími podmínkami, která obsahuje parametry uvedené dále, musí být na plavidle.
- Udržovací doba nákladu musí být určena na základě následujících parametrů:

- Součinitel prostupu tepla, jak je definován v 9.3.1.27.9;
- Nastavený tlak pojistných ventilů;
- Počáteční plnicí podmínky (teplota nákladu během plnění a stupeň plnění);
- Okolní teploty, jak je uvedeno v 9.3.1.24.2;
- Při využití plynů z odparu (boil-off) může být vzato v úvahu minimální garantované využití plynů z odparu (tj. množství plynů z odparu využité za jakýchkoli provozních podmínek).

Přiměřená míra bezpečnosti

K zajištění přiměřené míry bezpečnosti je udržovací doba nejméně třikrát delší než očekávaná doba plavby plavidla, včetně následujících podmínek:

- K zajištění bezpečnosti pro krátké plavby (jak se očekává) v trvání nejvýše 5 dní je minimální udržovací doba pro jakékoli plavidlo s hluboce zchlazenými zkapalněnými plyny 15 dní.
- Pro dlouhé plavby (jak se očekává) v trvání více než 10 dní musí být minimální udržovací doba 30 dní, přičemž se přidávají dva dny za každý den, o který doba plavby přesáhne 10 dní.

Jakmile se stane zřejmým, že náklad nebude vyložen v udržovací době, musí velitel plavidla informovat nejbližší zásahové jednotky podle 1.4.1.2.

7.2.4.17 Zavírání oken a dveří

7.2.4.17.1 Během nakládky, vykládky a odplynování, nebo stání v blízkosti nebo uvnitř určené zóny na břehu, musí všechny přístupy nebo otvory prostorů, které jsou přístupné z paluby, a všechny otvory prostorů směřující do volného okolí zůstat uzavřeny.

To neplatí pro:

- sací otvory motorů v provozu;
- větrací otvory strojoven, jestliže motory jsou v provozu;
- větrací otvory větracího zařízení podle 9.3.1.12.4, 9.3.2.12.4 nebo 9.3.3.12.4;
- přívody vzduchu klimatizačních zařízení, pokud jsou tyto otvory vybaveny systémy pro detekci plynů podle 9.3.1.12.4, 9.3.2.12.4 nebo 9.3.3.12.4.

Přístupy a otvory smějí být otevřeny, jen pokud je to nutné, po krátkou dobu a se svolením velitele plavidla.

7.2.4.17.2 Po nakládce, vykládce a odplynování musí být prostory přístupné z paluby vyvětrány.

7.2.4.17.3 Ustanovení 7.2.4.17.1 a 7.2.4.17.2 neplatí při převzetí lodních provozních odpadů, obsahujících olejové látky a maziva a při předání lodních pohonných hmot. Ustanovení 7.2.4.17.1 a 7.2.4.17.2 se však vztahují na předávání zkapalněného zemního plynu (LNG) pro provoz plavidel.

7.2.4.18 Zakrytí nákladu a inertizace

7.2.4.18.1 V nákladních tancích a příslušném potrubí může být nutná inertizace plynových prostorů nebo zakrytí nákladu. Inertizace a zakrytí nákladu jsou definovány následovně:

- Inertizace: nákladní tanky a příslušné potrubí a jiné prostory, pro které je tento proces předepsán ve sloupci (20) tabulky C kapitoly 3.2, jsou naplněny plynem nebo parami, které zabraňují hoření, nereagují s nákladem a tento stav udržují;
- Zakrytí nákladu: prostory v nákladních tancích nad nákladem a příslušné potrubí jsou naplněny kapalinou, plynem nebo parou, čímž je náklad oddělen od vzduchu a tento stav je udržován.

7.2.4.18.2 Pro určité látky jsou požadavky na inertizaci a zakrytí nákladu v nákladních tancích, v příslušném potrubí a v přilehlých prázdných prostorech udány ve sloupci (20) tabulky C, kapitoly 3.2.

7.2.4.18.3 *(Vyhrazeno)*

7.2.4.18.4 Inertizace nebo zakrytí hořlavých nákladů musí být prováděno takovým způsobem, aby se při čerpání inertizační látky omezil elektrostatický náboj, jak je to jen možné.

7.2.4.19

-

7.2.4.20

(Vyhrazeno)

7.2.4.21

Plnění nákladních tanků

7.2.4.21.1

Stupeň plnění udaný ve sloupci (11) tabulky C kapitoly 3.2 nebo vypočtený podle 7.2.4.21.3 pro jednotlivý nákladní tank nesmí být překročen.

7.2.4.21.2

Ustanovení 7.2.4.21.1 neplatí pro nákladní tanky, jejichž obsah během přepravy je pomocí topného zařízení udržován na teplotě jako při plnění. V tomto případě musí být stupeň plnění určen na začátku přepravy a teplota kontrolována tak, aby nebyl překročen předepsaný stupeň plnění.

7.2.4.21.3

Pro přepravu látek, které mají relativní hustotu vyšší, než jaká je uvedena ve schvalovacím osvědčení, musí být maximální přípustný stupeň plnění nákladních tanků vypočten podle následujícího vzorce:

maximální přípustný stupeň plnění (%) = $a * 100/b$

a = relativní hustota uvedená ve schvalovacím osvědčení,

b = relativní hustota látky.

Stupeň plnění udaný ve sloupci (11) tabulky C kapitoly 3.2 však nesmí být překročen.

POZNÁMKA: Při plnění nákladních tanků musí být dále dodrženy požadavky týkající se stability, podélné síly (pevnosti) a nejhlubšího přípustného ponoru plavidla.

7.2.4.21.4

V případě eventuálního překročení stupně plnění 97,5 % musí být pomocí technického zařízení možné odčerpání přeplnění. Během tohoto postupu musí být automaticky na palubě vyvolán optický poplach.

7.2.4.22

Otevření otvorů nákladního tanku

7.2.4.22.1

Otevření otvorů nákladních tanků smí být provedeno pouze tehdy, jestliže odpovídající nákladní tanky byly zbaveny pnutí.

Snižování tlaku v nákladních tankách je dovoleno jen za použití zařízení pro bezpečné snížení tlaku předepsaného v 9.3.2.22.4 (a) a 9.3.2.22.4 (b) nebo 9.3.3.22.4 (a) a 9.3.3.22.4 (b). Je-li ve sloupci (17) tabulky C kapitoly 3.2 vyžadována ochrana proti explozi, je otevření krytů nákladních tanků dovoleno jen tehdy, pokud byly dotyčné nákladní tanky odplynovány a koncentrace hořlavých plynů v tankách je nižší 10 % dolní meze výbušnosti nákladu/předchozího nákladu. Výsledky měření musí být zaznamenány písemně. Vstup do těchto nákladních tanků za účelem měření není dovolen.

7.2.4.22.2

Otevření otvorů pro odběr vzorků je dovoleno pouze pro odběr vzorků a pro kontrolu nebo čištění prázdných nákladních tanků.

7.2.4.22.3

Odběr vzorku je povolen jen zařízením k odběru vzorků, uvedeným ve sloupci (13) tabulky C kapitoly 3.2 nebo zařízením zajišťujícím vyšší úroveň bezpečnosti.

Otevření otvorů k odběru vzorků je u nákladních tanků, naložených nebezpečnými látkami, u kterých je ve sloupci (19) tabulky C kapitoly 3.2 předepsáno označení jedním nebo dvěma modrými kužely nebo jedním nebo dvěma modrými světly, povoleno jen tehdy, jestliže nakládka je minimálně 10 minut přerušena.

7.2.4.22.4

Nádoby pro odebrané vzorky včetně všech částí těchto nádob, jako např. lana, atd. musí být z elektrostaticky vodivých materiálů a při odběru vzorků musí být vodivě spojeny s trupem plavidla.

7.2.4.22.5

Otevření pláště pojistky proti prošlehnutí plamene je dovoleno jen pro vyčištění součástky pojistky proti prošlehnutí plamene nebo náhradu součástky pojistky proti prošlehnutí plamene jinou součástkou téže konstrukce.

Otevření je dovoleno, jen jsou-li dotyčné nákladní tanky prázdné a koncentrace hořlavých plynů v nákladním tanku je nižší než 10 % dolní meze výbušnosti nákladu/předchozího nákladu.

Výsledky měření musí být zaznamenány písemně.

Čištění a náhrada součástky pojistky proti prošlehnutí plamene musí být prováděna pouze vyškolenými a kvalifikovanými pracovníky.

- 7.2.4.22.6 K úkonům uvedeným v 7.2.4.22.4 a 7.2.4.22.5 musí být použito jen málo jiskřivé ruční nářadí (např. chrom vanadiové ocelové šroubováky a klíče).
- 7.2.4.22.7 Doba otevření musí být omezena na dobu nezbytnou pro kontrolu, čištění, náhradu pojistky proti prošlehnutí plamene nebo odebrání vzorku.
- 7.2.4.22.8 Ustanovení uvedená v 7.2.4.22.1 až 7.2.4.22.7 výše se nevztahují na kalová plavidla ani zásobovací plavidla.

7.2.4.23 (Vyhrazeno)

7.2.4.24 ***Současná nakládka a vykládka***

Během nakládky nebo vykládky nákladních tanků se nesmí nakládat nebo vykládat nic jiného. Příslušný orgán může během vykládky povolit výjimku.

7.2.4.25 ***Nakládací a vykládací potrubí a odvětrávací potrubí***

- 7.2.4.25.1 Nakládka a vykládka jakož dočerpávání musí být provedeny pevně zabudovaným potrubím plavidla. Kovové armatury spojovacích hadic k potrubnímu zařízení na břehu musí být uzemněny tak, aby se zamezilo elektrostatickému náboji.
- 7.2.4.25.2 Nakládací a vykládací potrubí nesmí být prodlužováno pevným potrubím nebo soustavami hadic nad kofrdamy směrem dopředu nebo dozadu.
- To neplatí pro soustavy hadic, které se používají při přejímce lodních provozních odpadů, obsahujících olejové látky a mazadla nebo při předání lodních pohonných hmot.

7.2.4.25.3 (Vypuštěno)

7.2.4.25.4 Kapalina, která v potrubí zůstane, musí pokud možno celá odtéct do nákladních tanků anebo být bezpečně odstraněna. To neplatí pro zásobovací plavidla.

7.2.4.25.5 Směsi plyn/vzduch, které se uvolňují během nakládky, musí být odváděny pomocí plynového zpětného potrubí zpět na břeh jestliže:

- uzavřený nákladní tank je vyžadován podle sloupce (7) tabulky C kapitoly 3.2; nebo
- uzavřený nákladní tank byl vyžadován pro přechozí náklad podle sloupce (7) tabulky C kapitoly 3.2 a před nakládkou je koncentrace hořlavých plynů předchozího nákladu v nákladním tanku vyšší než 10 % dolní meze výbušnosti, nebo nákladní tank obsahuje toxické plyny, žíravé plyny (obalová skupina I nebo II) nebo plyny s charakteristikami CMR (kategorie 1A nebo 1B) v koncentraci nad úrovněmi expozice přijatelnými podle vnitrostátních předpisů; Pokud tyto podmínky nejsou splněny a plynové zpětné potrubí není použito, musí být naměřené koncentrace zaznamenány písemně.

Pokud látka, která se má nakládat, vyžaduje ochranu proti explozi podle sloupce (17) tabulky C kapitoly 3.2 a je předepsáno použití plynového zpětného potrubí, musí být připojení plynového zpětného potrubí konstruováno tak, aby plavidlo bylo chráněno proti výbuchům a prošlehnutí plamenů ze břehu. Ochrana plavidla proti výbuchům a prošlehnutí plamenů ze břehu se nevyžaduje, jsou-li nákladní tanky inertizovány podle 7.2.4.18.

7.2.4.25.6 Při přepravě látek třídy 2 platí podmínka v 7.2.4.25.4 za splněnou, jestliže nakládací nebo vykládací potrubí bylo protlačeno vlastním plynem nebo dusíkem.

7.2.4.25.7 Pro připojení nebo odpojení potrubí pro nakládku nebo vykládku a odvětrávacího potrubí musí být použito jen málo jiskřivé ruční nářadí (např. chrom vanadiové ocelové šroubováky a klíče).

7.2.4.26 (Vyhrazeno)

7.2.4.27 (Vyhrazeno)

7.2.4.28 Postřikové zařízení

7.2.4.28.1 Pokud je ve sloupci (9) tabulky C kapitoly 3.2 požadováno postřikové zařízení pro kropení plynů nebo par, musí být toto zařízení během nakládky, vykládky a přepravy připraveno k provozu. Pokud je požadováno postřikové zařízení k chlazení paluby nákladního prostoru, musí být toto zařízení připraveno k provozu během přepravy.

7.2.4.28.2 Pokud je ve sloupci (9) tabulky C kapitoly 3.2 vyžadováno postřikování, musí velitel plavidla, jestliže u přetlaku uvnitř tanku hrozí dosažení 80 % otevíracího tlaku zařízení pro snižování tlaku/vysokorychlostního ventilu, provést všechna opatření, která jsou nezbytná v souladu s bezpečností, aby se zabránilo tomu, že dojde ke vzniku tohoto přetlaku uvnitř tanků. Musí zvláště uvést do provozu postřikové zařízení.

7.2.4.28.3 Pokud u látek, u kterých v 3.2 Tabulka C, sloupec (9) je požadováno postřikování, ve sloupci (20) je uvedena položka 23 a je dosažen vnitřní přetlak tanků 40 kPa (0,4 baru), musí zařízení k měření vnitřního přetlaku tanků spustit výstražný signál. Postřikové zařízení musí být okamžitě spuštěno a zůstat tak dlouho v provozu, dokud se vnitřní přetlak tanku nesníží pod 30 kPa (0,3 baru).

7.2.4.29 Přeprava hluboce zchlazených zkapalněných plynů

Během nakládky nebo vykládky musí být pod spojení potrubí pro nakládku a vykládku s břehem umístěna záchytná vana uvedená v 9.3.1.21.11 a vodní film uvedený v 9.3.1.21.11 musí být aktivován.

7.2.4.30 -

7.2.4.39 (Vyhrazeno)

7.2.4.40 Hasicí zařízení

Během nakládky a vykládky musí být na palubě v oblasti nákladu připravena k použití hasicí zařízení, požární rozvody připojené na hydrant spojené s proudnicemi/rozstřikovacími hubicemi nebo soustavami hadic se spojkami s proudnicemi/rozstřikovacími hubicemi a hasicími hadicemi.

Musí být zamezeno zamrznutí požárních rozvodů a hydrantů.

7.2.4.41 Kouření, oheň nebo otevřené světlo

Během nakládky, vykládky nebo odplynování je na plavidle zakázáno používat oheň nebo otevřené světlo a kouřit.

Jsou však použitelná ustanovení 7.2.3.42.3 a 7.2.3.42.4.

7.2.4.42 Zařízení pro ohřev nákladu

Nesmí být překročena nejvýše přípustná přepravní teplota nákladu, uvedená ve sloupci (20) tabulky C kapitoly 3.2.

7.2.4.43 -

7.2.4.50 (Vyhrazeno)

7.2.4.51 Elektrické instalace a zařízení

7.2.4.51.1 (Vypuštěno)

7.2.4.51.2 (Vypuštěno)

7.2.4.51.3 Zařízení katodové ochrany před korozí vnějším proudem musí být vypnuto před přistáním a může být nejdříve zapnuto pouze po odplutí plavidla od pobřeží.

7.2.4.52 (Vyhrazeno)

7.2.4.53 Osvětlení

Pro nakládku nebo vykládku během noci nebo při špatné viditelnosti musí být zajištěno účinné osvětlení. Pokud je osvětlení prováděno z plavidla, musí se použít dobře upevněné elektrické osvětlovací prostředky, které jsou upevněné tak, aby nemohly být poškozeny.

7.2.4.54

-

7.2.4.59

(Vyhrazeno)

7.2.4.60

Zvláštní vybavení

Ve stavebních předpisech předepsaná sprcha a umyvadlo pro oči a obličej musí být za všech povětrnostních podmínek během nakládky, vykládky a překládky pomocí čerpadel připravené k použití.

7.2.4.61

-

7.2.4.73

(Vyhrazeno)

7.2.4.74

(Vypuštěno)

7.2.4.75

Nebezpečí vzniku jisker

Všechna elektricky vodivá spojení mezi plavidlem a břehem musí být konstruována tak, aby nepředstavovala zápalný zdroj. Jestliže seznam látek povolených na přepravu v plavidle podle 1.16.1.2.5 zahrnuje látky, které vyžadují ochranu proti explozi podle sloupce (17) tabulky C kapitoly 3.2, musí být svlékání oděvů, které nejsou dostatečně antistatické, v zóně 1 zakázáno.

7.2.4.76

Plastová lana

Během nakládky a vykládky smí být plavidlo uvázáno plastovými lany jen tehdy, jestliže je posun plavidla znemožněn ocelovými lany.

Ocelová lana ovinutá plastem nebo přírodními vlákny jsou považována za ekvivalentní, pokud je minimální pevnosti v tahu vyžadované podle předpisů uvedených v 1.1.4.6 dosaženo ocelovými prameny lana.

Kalová plavidla během přijímání lodních provozních odpadů, obsahujících oleje a mastnoty, a zásobovací plavidla a jiná plavidla během zásobení produkty pro provoz plavidel však smějí být uvázány vhodnými plastovými lany.

12	Jedna úniková cesta uvnitř nebo mimo oblast nákladu a dvě bezpečné zóny na plavidle na opačných koncích	•	•	•**	•	•
13	Jedna úniková cesta mimo oblast nákladu		•		•*	•
14	Jedna úniková cesta uvnitř oblasti nákladu		•		•*	•
15	Jedno nebo více bezpečných útočišť mimo plavidlo, včetně únikové cesty k němu	•	•	•	•*	•

• = Možná volba

* = Nepřípustné v případě klasifikačních kódů TFC, CF nebo CFT.

** = Nepřípustné, je-li nebezpečí, že látky podporující hoření v kombinaci s hořlavými kapalinami mohou vyvolat explozi.

Založeno na místních okolnostech, příslušné orgány mohou předepsat dodatečné požadavky na dostupnost evakuačních prostředků.

7.2.4.78

-

7.2.4.99

(Vyhrazeno)

7.2.5 Doplnkové předpisy pro provoz plavidel

7.2.5.0 Označení

7.2.5.0.1 Plavidla, která přepravují látky, uvedené v tabulce C kapitoly 3.2, musí být označena počtem modrých kuželů, uvedeným ve sloupci (19) nebo modrým světlem v souladu s Evropskými pravidly pro plavbu po vnitrozemských vodních cestách (CEVNI). I když pro přepravovaný náklad není předepsáno označení modrými kuželi nebo modrými světly, avšak koncentrace hořlavých nebo toxických plynů a par v nákladních tancích, pocházejících z posledního nákladu, pro který je toto označení vyžadováno, je vyšší než 20 %, nebo překračuje úroveň národně schválených expozičních limitů, je počet modrých kuželů nebo modrých světél určen posledním nákladem, pro který bylo toto označení vyžadováno.

7.2.5.0.2 Pokud by plavidlo mělo být označeno více než jen jedním označením, musí být označeno tím, které je uvedeno níže jako první:

- dva modré kužely nebo dvě modrá světla;
- jeden modrý kužel nebo jedno modré světlo.

7.2.5.0.3 Odchytkou od ustanovení odstavce 7.2.5.0.1 a v souladu s poznámkou k článku 3.14 Evropských pravidel pro plavbu po vnitrozemských vodních cestách (CEVNI), může příslušný orgán smluvní strany povolit námořním plavidlům dočasně operujícím v oblasti vnitrozemské plavby na území této smluvní strany použití denních a nočních signálů předepsaných v doporučeních pro bezpečnou přepravu nebezpečných nákladů a s nimi spojených činností v přístavních zónách, přijatých Výborem pro bezpečnost na moři mezinárodní námořní organizace (v noci červeným světlem umístěným po celém obvodu a ve dne vlajkou "B" Mezinárodního signálního kódu), namísto signálů předepsaných v 7.2.5.0.1. Smluvní strana, která iniciovala dočasnou odchylku takto schválenou, o tom informuje výkonného tajemníka „UNECE“, který o této odchylce uvedomí administrativní výbor.

7.2.5.1 Způsob přepravy

Příslušné orgány, mohou uložit restrikce, pokud jde o včlenění tankových plavidel do tlačných soulodí, velkých rozměrů.

7.2.5.2 (Vyhrazeno)

7.2.5.3 Vyvázání

Plavidla musí být vyvázána bezpečně, avšak takovým způsobem, aby mohla být rychle odvázána v případě nouze a aby elektrické kabely a soustavy hadic nebyly stlačeny, přehnuty nebo podléhaly tahové deformaci.

7.2.5.4 Kotvení

7.2.5.4.1 Vzdálenosti od jiných plavidel, které musí udržovat kotvící plavidla přepravující nebezpečné věci, nesmí být menší než vzdálenosti předepsané předpisy uvedených v 1.1.4.6.

7.2.5.4.2 Na palubě kotvících plavidel se musí neustále zdržovat odborník podle 7.2.3.15. Místně příslušný orgán však může od této povinnosti osvobodit plavidla, která kotví v přístavním bazénu nebo na k těmto účelům povolených místech.

7.2.5.4.3 Mimo kotviště, která jsou schválena příslušným orgánem, nesmí být při kotvení odstup menší než:

- 100 m od obytných sídel, občanského vybavení a skladovacích nádrží, jestliže plavidlo musí být označeno podle sloupce (19) tabulky C v kapitole 3.2, jedním modrým kuželem nebo jedním modrým světlem;
- 100 m od občanského vybavení a skladovacích nádrží a 300 m od obytných sídel, jestliže plavidlo musí být označeno podle sloupce (19) tabulky C v kapitole 3.2 dvěma modrými kužely nebo dvěma modrými světly.

Během čekání před plavebními komorami nebo mosty je přípustné, udržovat menší odstup. V těchto případech však platí minimální odstup 100 m.

- 7.2.5.4.4 Příslušný orgán může při zohlednění místních poměrů povolit odstupy menší, než jaké jsou uvedeny v 7.2.5.4.3.
- 7.2.5.5** (Vyhrazeno)
- 7.2.5.6** (Vyhrazeno)
- 7.2.5.7** (Vyhrazeno)
- 7.2.5.8** **Ohlašovací povinnost**
- 7.2.5.8.1 Ve státech, kde platí ohlašovací povinnost, musí velitel plavidla poskytnout informace podle odstavce 1.1.4.6.1.
- 7.2.5.8.2 (Vypuštěno)
- 7.2.5.8.3 (Vypuštěno)
- 7.2.5.8.4 (Vypuštěno)
- 7.2.5.9** -
- 7.2.5.99** (Vyhrazeno)

ČÁST 8

PŘEDPISY PRO POSÁDKY, VYBAVENÍ, PROVOZ PLAVIDEL A DOKUMENTACI

KAPITOLA 8.1

VŠEOBECNÉ PŘEDPISY PRO PLAVIDLA A VYBAVENÍ

8.1.1 (Vyhrazeno)

8.1.2 Doklady

8.1.2.1 Kromě dokladů, potřebných podle jiných předpisů, se musí na plavidle nacházet následující doklady:

- (a) schvalovací osvědčení plavidla uvedené v 1.16.1.1 nebo prozatímní schvalovací osvědčení plavidla uvedené v 1.16.1.3 a příloha uvedená v 1.16.1.4;
- (b) přepravní doklady, předepsané podle 5.4.1 pro všechny nebezpečné věci přepravované jako náklad a případně osvědčení o naložení velkého kontejneru, vozidla nebo železničního vozu (viz 5.4.2);
- (c) písemné pokyny, předepsané v 5.4.3;
- (d) výtisk ADN v aktuálním znění s přílohami, kdykoliv může být přístupný výtisk v elektronické podobě;
- (e) osvědčení o kontrole izolačních odporů elektrických zařízení předepsaných v 8.1.7.1 a certifikátů předepsaných v 8.1.7.2, které se týkají kontroly všech zařízení, vybavení a systémů nezávislých ochrany proti výbuchu a shody dokumentů požadovaných v 8.1.2.2 (e) až (h) a 8.1.2.3 písm. (r) až (v) odpovídající podmínkám na palubě plavidla;
- (f) osvědčení o inspekci hasicích hadic předepsané v 8.1.6.1 a osvědčení o kontrole zvláštního vybavení předepsaného v 8.1.6.3;
- (g) kniha kontrol, do které jsou zaznamenávány všechny požadované výsledky měření;
- (h) kopii podstatného textu zvláštních ustanovení podle 1.5, pokud je přeprava prováděna na základě zvláštních ustanovení;
- (i) průkaz s fotografií každého člena posádky, předepsaný v 1.10.1.4;
- (j) (Vypuštěno);
- (k) u plavidel, která přepravují soustavu hadic používaných pro nakládku, vykládku nebo zásobování zkapalněného zemního plynu pro provoz plavidla, osvědčení o inspekci a dokumentace vypočítaného maximálního zatížení předepsaného v 8.1.6.2.

8.1.2.2 Kromě dokladů, potřebných podle 8.1.2.1 se musí na plavidlech přepravujících suchý náklad nacházet ještě následující doklady:

- (a) plán uložení nákladu, předepsaný v 7.1.4.11;
- (b) osvědčení o zvláštních znalostech ADN, předepsané v 8.2.1.2;
- (c) u plavidel, která odpovídají doplňkovým požadavkům pro plavidla s dvojitou obšívkou:
 - bezpečnostní plán v případě zajištění stability v poškozeném stavu;
 - dokumenty pro výpočet stability nepoškozeného plavidla jakož všechny podmínky nepoškozeného plavidla, které jsou zohledněny při výpočtu stability ve formě, která je pro velitele plavidla srozumitelná;
 - osvědčení uznané klasifikační společností (viz 9.1.0.88 nebo 9.2.0.88);
- (d) inspekční osvědčení pevně instalovaných hasicích systémů předepsaných v 9.1.0.40.2.9.
- (e) seznam nebo obecný plán označující pevně instalovaná zařízení a vybavení vhodné pro použití alespoň v zóně 1 a zařízení a vybavení splňující požadavky pododdílu 9.1.0.51.
- (f) seznam nebo obecný plán označující pevně instalovaná zařízení a vybavení, které nejsou povoleny pro použití při nakládce a vykládce, během pobytu v blízkosti nebo v určené zóně na břehu (označené červeně podle 9.1.0.52.2);

- (g) plán označující hranice zón a umístění elektrických a neelektrických zařízení instalovaných v příslušných zónách určených pro použití v prostředí s nebezpečím výbuchu;
- (h) seznam zařízení a vybavení uvedených pod písmenem (g) s následujícími údaji:
 - zařízení/vybavení, umístění, označení (úroveň ochrany před výbuchem dle IEC 60079-0, kategorie zařízení podle směrnice 2014/34/EU¹ nebo ekvivalentní úroveň ochrany, skupina výbušnosti, teplotní třída, typ ochrany, zkušební těleso) v případě elektrických zařízení pro použití v zóně 1 (nebo kopie certifikátu shody podle Směrnice 2014/34/EU¹);
 - zařízení/vybavení, umístění, označení (úroveň ochrany před výbuchem dle IEC 60079-0, kategorie zařízení podle směrnice 2014/34/EU¹ nebo ekvivalentní úroveň ochrany včetně skupiny výbušnosti, teplotní třídy, typu ochrany, identifikačního čísla) v případě elektrických zařízení pro použití v zóně 2 a v případě neelektrických zařízení pro použití v zóně 1 a zóně 2 (nebo kopie certifikátu shody podle Směrnice 2014/34/EU¹);

Dokumenty uvedené v odstavcích (e) až (h) musí být opatřeny razítkem příslušného orgánu vydávajícího schvalovací osvědčení.

8.1.2.3

Kromě dokladů potřebných podle 8.1.2.1 se musí na tankových plavidlech nacházet ještě následující doklady:

- (a) plán uložení nákladu, předepsaný v 7.2.4.11.2;
- (b) osvědčení o zvláštních znalostech ADN, předepsané v pododdílu 8.2.1.2;
- (c) u plavidel, která musí odpovídat požadavkům pro zajištění stability v poškozeném stavu (viz 9.3.1.15, 9.3.2.15 nebo 9.3.315)
 - bezpečnostní plán v případě zajištění stability poškozeného plavidla;
 - dokumenty pro výpočet stability nepoškozeného plavidla jakož všechny podmínky nepoškozeného plavidla, které jsou zohledněny při výpočtu stability; ve formě, která je pro velitele plavidla srozumitelná; příručka stability a důkaz, že zařízení pro kontrolu naložení bylo schváleno uznanou klasifikační společností;
- (d) (Vypuštěno);
- (e) osvědčení třídy plavidla vydané uznanou klasifikační společností předepsané v 9.3.1.8.1, 9.3.2.8.1 nebo 9.3.3.8.1;
- (f) osvědčení o kontrole systémů pro detekci plynů a systému pro měření kyslíku předepsané v 8.1.6.3;
- (g) seznam látek povolených na přepravu v plavidle předepsaný v 1.16.1.2.5;
- (h) osvědčení o kontrole soustav hadic pro nakládku a vykládku předepsané v 8.1.6.2;
- (i) instrukce pro výkon nakládky a vykládky předepsané v 9.3.2.25.9 nebo 9.3.3.25.9;
- (j) osvědčení o kontrole prostorů s čerpadly předepsané v 8.1.8;
- (k) instrukce pro vytápění při přepravě látek s bodem tání ≥ 0 °C;
- (l) (Vypuštěno);
- (m) deník registrace operací během plavby podle 8.1.11;
- (n) v případě přepravy chlazených látek, instrukce požadovaná v pododdílu 7.2.3.28;
- (o) osvědčení týkající se chladicího systému předepsané v 9.3.1.27.10, 9.3.2.27.10 nebo 9.3.3.27.10;
- (p) osvědčení o kontrole pevně instalovaných hasicích systémů předepsané v 9.3.1.40.2.9, 9.3.2.40.2.9 nebo 9.3.3.40.2.9;
- (q) v případě přepravy hluboce zchlazených zkapalněných plynů, kdy se teplota podle 9.3.1.24.1 (a) a 9.3.1.24.1 (c) nekontroluje, určení udržovací doby (7.2.4.16.16, 7.2.4.16.17) a záznam o součiniteli prostupu tepla;

¹ Úřední věstník Evropské unie č. L 96 z 29 března 2014, str. 309.

- (r) seznam nebo obecný plán označující pevně instalovaná zařízení a vybavení vhodné pro použití alespoň v zóně 1 a zařízení a vybavení splňující požadavky pododdílů 9.3.x.51;
- (s) seznam nebo obecný plán označující pevně instalovaná zařízení a vybavení, které nejsou povoleny pro použití při nakládce, vykládce, odplynování nebo během pobytu v blízkosti nebo v určené zóně na břehu (označené červeně 9.3.1.52.3, 9.3.2.52.3 nebo 9.3.3.52.3);
- (t) plán schválený uznanou klasifikační společností označující hranice zón a umístění elektrických a neelektrických zařízení instalovaných v příslušné zóně určené pro použití v prostředí s nebezpečím výbuchu, jakož i nezávislých ochranných systémů;
- (u) seznam zařízení a vybavení uvedených pod písmenem (t) a systémů nezávislé ochrany proti výbuchu s následujícími údaji:
 - zařízení/vybavení, umístění, označení (úroveň ochrany před výbuchem dle IEC 60079-0, kategorie zařízení podle směrnice 2014/34/EU¹ nebo ekvivalentní úroveň ochrany, včetně skupiny výbušnosti, teplotní třídy, typu ochrany, zkušebního tělesa) v případě elektrických zařízení pro použití v zóně 0 nebo v zóně 1 a v případě neelektrických zařízení pro použití v zóně 0 (nebo kopie certifikátu shody podle směrnice 2014/34/EU¹);
 - zařízení/vybavení, umístění, označení (úroveň ochrany před výbuchem dle IEC 60079-0, kategorie zařízení podle směrnice 2014/34/EU¹ nebo ekvivalentní úroveň ochrany včetně skupiny výbušnosti, teplotní třídy, typu ochrany, identifikačního čísla) v případě elektrických zařízení pro použití v zóně 2 a v případě neelektrických zařízení pro použití v zóně 1 a zóně 2 (nebo kopie certifikátu shody podle směrnice 2014/34/EU¹);
 - systém vlastní ochrany, umístění, označení (skupina/podskupina výbušnosti);
- (v) seznam nebo obecný plán označující pevně instalovaná zařízení a vybavení instalované mimo prostory s nebezpečím výbuchu, které mohou být použity při nakládce, vykládce, odplynování, kotvení nebo během pobytu v bezprostřední blízkosti nebo v určené zóně na břehu, pokud nejsou uvedeny v písmenech (r) a (u).
Doklady uvedené v písmenech (r) až (v) musí být opatřeny razítkem příslušného orgánu vydávajícího schvalovací osvědčení.
- (w) osvědčení požadovaná v 3.2.3.1, Vysvětlivky k tabulce C, vysvětlivka ke sloupci (20), poznámka 12 pododstavce (p) a (q), pokud je to vhodné;
- (x) osvědčení požadovaná v 3.2.3.1, Vysvětlivky k tabulce C, vysvětlivka ke sloupci (20), poznámka 33 pododstavce (i), (n) a (o), pokud je to vhodné.

8.1.2.4 Písemné pokyny podle 5.4.3 musí být veliteli plavidla předány před nakládkou. Musí být uchovávány v kormidelně, aby byly snadno dostupné.

Přepravní doklady musí být předány veliteli plavidla na plavidlech pro přepravu suchého nákladu před nakládkou, v případě tankových plavidlech po nakládce před začátkem cesty.

8.1.2.5 (Vyhrazeno)

8.1.2.6 Tlačné čluny pro přepravu suchých nákladů, které nepřevážejí žádné nebezpečné látky, nemusí mít na palubě schvalovací osvědčení, postačuje tabulka podle CEVNI se stejnými popisky, doplněná následujícími údaji:

Číslo schvalovacího osvědčení: ...
Vystaveno kým: ...
Platné do: ...

Schvalovací osvědčení a přílohu uvedenou v 1.16.1.4 v tomto případě uchovává majitel tlačného člunu.

Shoda údajů na tabulce s údaji ve schvalovacím osvědčení musí být zjištěna kontrolní komisí a tato musí na tabuli vyrazit svou značku.

8.1.2.7 Tlačné čluny pro přepravu suchých nákladů nebo tankové tlačné čluny, které přepravují nebezpečné látky, nemusí mít na palubě schvalovací osvědčení, pokud tabulka podle CEVNI je doplněna další kovovou nebo plastovou tabulkou odpovídající fotokopii celého schvalovacího osvědčení. Fotokopie přílohy podle 1.16.1.4 se nevyžaduje.

Schvalovací osvědčení a příloha podle 1.16.1.4 musí být nadále uloženy u majitele člunu.

Shoda údajů na tabulce s údaji ve schvalovacím osvědčení musí být zjištěna příslušným orgánem, který musí na tabuli vyrazit svou značku.

8.1.2.8 Všechny dokumenty musí být na palubě v jazyce, který je velitel schopen přečíst a rozumět mu. Jestliže tímto jazykem není angličtina, francouzština nebo němčina, všechny dokumenty, kromě kopie ADN s příloženými předpisy a těmi, pro které předpisy zahrnují zvláštní ustanovení týkající se jazyků, musí být na palubě také v angličtině, francouzštině nebo němčině, pokud dohody uzavřené mezi zeměmi zapojenými do dopravního provozu nestanoví jinak.

8.1.2.9 8.1.2.1 (b), 8.1.2.1 (g), 8.1.2.4 a 8.1.2.5 neplatí pro odkalovací čluny a zásobovací plavidla. 8.1.2.1 (c) neplatí pro odkalovací čluny.

8.1.3 (Vyhrazeno)

8.1.4 Zařízení k hašení požárů

Každé plavidlo musí být vybaveno kromě hasicích přístrojů, předepsaných v předpisech uvedených v 1.1.4.6, ještě minimálně dvěma dalšími ručními hasicími přístroji stejné kapacity. Hasivo obsažené v těchto dodatečných ručních hasicích přístrojích musí být vhodné pro hašení požárů přepravovaných nebezpečných věcí.

8.1.5 Zvláštní vybavení

8.1.5.1 Pokud je to vyžadováno v tabulce A nebo C kapitoly 3.2, musí se na plavidle nacházet následující vybavení:

PP: pro každého člena posádky ochranné brýle, pár ochranných rukavic, jeden ochranný oděv a pár vhodných ochranných bot (příp. ochranných holínek). Na tankových plavidlech v každém případě ochranné holínky;

EP: vhodný únikový prostředek pro každou osobu, která se nachází na plavidle;

EX: přístroj pro detekci plynů jakož i návod na použití tohoto přístroje;

TOX: detektor toxických plynů pro aktuální a předchozí náklad jakož i příslušenství a návod na použití tohoto přístroje;

A: vhodný dýchací přístroj, závislý na okolním vzduchu.

8.1.5.2 Pro operace prováděné v prostorách s nebezpečím výbuchu nebo během pobytu v blízkosti nebo v určené zóně na břehu, musí být používány pouze málo jiskřivé nástroje (např. šroubováky a klíče z chrom-vanadové oceli).

8.1.5.3 U tlačných soulodí nebo spřažených sestav za jízdy však postačuje, jestliže se výstroj uváděná v 8.1.5.1, pokud je v tabulce A nebo C kapitoly 3.2 předepsána, nachází na tlačném remorkéru nebo na plavidle, které zabezpečuje pohyb sestavy.

8.1.6 Kontrola a inspekce výbavy

8.1.6.1 Ruční hasicí přístroje a hasicí hadice musí být kontrolovány nejméně jednou každé dva roky osobami autorizovanými pro tento účel příslušným orgánem. Důkaz o kontrole musí být upevněn na ručních hasicích přístrojích. Osvědčení o kontrole požárních hadic musí být uloženo na palubě plavidla.

8.1.6.2 Soustavy hadic používané pro nakládku, vykládku nebo zásobování produkty pro provoz plavidla (jiné než zkapalněný zemní plyn) a zbytkový náklad musí splňovat Evropskou normu EN 12115:2011-04 (Pryžové a termoplastické hadice a soustavy hadic) nebo EN 13765:2010-08 (Termoplastické

vícevrstvé (nevulkanizované) hadice a soustavy hadic) nebo EN ISO 10380:2003-10 (Vlinité kovové hadice a soustavy hadic). Musí být kontrolovány podle tabulky A.1 normy EN 12115:2011-04 nebo tabulky K.1 normy EN 13765:2010-08 nebo odstavce 7 normy EN ISO 10380:2003-10 nejméně jednou za rok, podle pokynů výrobce osobami autorizovanými pro tento účel příslušným orgánem. Osvědčení o této inspekci musí být k dispozici na palubě.

Soustavy hadic používané pro nakládku, vykládku nebo zásobování zkapalněného zemního plynu pro provoz plavidla musí být v souladu s částí 5.5.2 normy ISO 20519: 2017 (Lodě a lodní technika - Specifikace pro doplňování paliva plavidlům poháněným na zkapalněný zemní plyn) a musí být prováděny kontroly a zkoušky nejméně jednou ročně podle pokynů výrobce. Na palubě musí být osvědčení týkající se této zkoušky a dokumentace vypočítaného maximálního zátěžového napětí.

- 8.1.6.3 Správná funkce zvláštního vybavení uvedeného v 8.1.5.1, systémů pro detekci plynů uvedených v pododdílech 9.3.1.12.4, 9.3.2.12.4 a 9.3.3.12.4 a systému pro měření kyslíku podle pododílů 9.3.1.17. 6, 9.3.2.17.6 a 9.3.3.17.6 musí být zkontrolována v souladu s pokyny výrobce osobami oprávněnými k tomuto účelu výrobcem. Na palubě se musí nacházet osvědčení o poslední prohlídce zvláštního vybavení. Osvědčení musí obsahovat podrobnosti o výsledku a datum kontrol.

Systémy pro detekci plynu a systémy pro měření kyslíku musí rovněž kontrolovat uznávaná klasifikační společnost, kdykoli se obnoví schvalovací osvědčení a během třetího roku platnosti osvědčení. Tato kontrola musí zahrnovat alespoň celkovou vizuální kontrolu vybavení a potvrzení, že byly provedeny kontroly uvedené v předchozí větě.

Osvědčení o kontrole vydané uznávanou klasifikační společností týkající se poslední provedené kontroly se musí nacházet na palubě. Všechna osvědčení o kontrole musí obsahovat alespoň výše uvedené údaje týkající se kontroly, jejich výsledky a data, kdy byla provedena.

- 8.1.6.4 Měřicí přístroje, předepsané v 8.1.5.1, musí být před každým použitím zkontrolovány odborníkem podle jejich návodu k použití.

- 8.1.6.5 (Vypuštěno)

- 8.1.6.6 (Vypuštěno)

8.1.7 Zařízení, vybavení a systémy nezávislé ochrany proti výbuchu

8.1.7.1 *Elektrické zařízení a vybavení*

Izolační odpory pevně instalovaných elektrických zařízení a vybavení a jejich uzemnění musí být zkontrolován při každém obnovení schvalovacího osvědčení a kromě toho do tří let ode dne vydání schvalovacího osvědčení osobou oprávněnou k tomuto účelu příslušným orgánem.

Osvědčení o této kontrole se musí nacházet na palubě.

8.1.7.2 **Zařízení a vybavení určené pro použití v prostředí s nebezpečím výbuchu, zařízení „s omezeným nebezpečím výbuchu“, zařízení a vybavení vyhovující požadavkům 9.3.1.51, 9.3.2.51 a 9.3.3.51 a systémy nezávislé ochrany proti výbuchu**

Tato zařízení, vybavení a nezávislé systémy ochrany proti výbuchu a jejich soulad s dokumenty uvedenými v pododdílech 8.1.2.2 písm. (e) až (h) nebo 8.1.2.3 písm. (r) až (v) s ohledem na podmínky na palubě, musí být kontrolováno při každém obnovení schvalovacího osvědčení a kromě toho do tří let ode dne vydání schvalovacího osvědčení klasifikační společností, která plavidlo klasifikovala, nebo osobou oprávněnou k tomuto účelu příslušným orgánem. Osvědčení o této kontrole se musí nacházet na palubě.

Značení na zařízení a vybavení určených pro použití v prostorách s nebezpečím výbuchu, která prokazují, že jsou vhodné pro použití v prostředí s nebezpečím výbuchu, a označení na systémech nezávislé ochrany proti výbuchu s podmínkami jejich použití by mělo zůstat v platnosti po celou dobu používání na palubě.

Pokyny výrobce týkající se zařízení proti prošlehnutí plamene, přetlakových ventilů/vysokorychlostních ventilů mohou vyžadovat pravidelnější kontrolu

8.1.7.3 **Oprava zařízení a vybavení chráněných proti výbuchu a nezávislých systémů ochrany proti výbuchu**

Opravy zařízení a vybavení chráněných proti výbuchu a nezávislých systémů ochrany proti výbuchu povoluje pouze odborník specializované firmy. Po opravách musí být vydáno osvědčení zajišťující jejich opakované použití v prostředí s nebezpečím výbuchu. Osvědčení musí být k dispozici na palubě.

8.1.8 **Kontrola prostorů s čerpadly u tankových plavidel**

Prostor s nakládacími čerpadly musí být zkontrolován uznávanou klasifikační společností při každém obnovení platnosti schvalovacího osvědčení a během třetího roku platnosti osvědčení.

Kontrola musí zahrnovat alespoň následující body:

- Kontrola celého systému se zaměřením na jeho stav, korozi, netěsnosti a případné neoprávněné úpravy;
- Obecná vizuální kontrola stavu systému detekce plynu v prostoru s čerpadly;
- Potvrzení přítomnosti osvědčení uvedeného v 8.1.6.3 vydaného výrobcem nebo oprávněnou osobou.

Osvědčení o kontrole podepsané uznávanou klasifikační společností týkající se kontroly prostoru s čerpadly musí být na palubě a musí obsahovat alespoň výše uvedené údaje týkající se kontroly, jejích výsledků a data, kdy byla provedena.

8.1.9 (Vypuštěno)

8.1.10 (Vypuštěno)

8.1.11 **Deník registrace operací během přepravy UN 1203**

Na palubě tankových plavidel pro přepravu UN 1203 BENZIN, se musí nacházet deník registrace operací, prováděných během přepravy. Tento deník se může skládat z jiných dokumentů, obsahujících požadovanou informaci. Tento deník nebo tyto jiné dokumenty se musí uchovávat na palubě plavidla během nejméně tří měsíců a obsahovat nejméně poslední tři náklady.

KAPITOLA 8.2

PŘEDPISY PRO VÝCVIK ODBORNÍKŮ

8.2.1 Všeobecné předpisy pro výcvik odborníků

- 8.2.1.1 Odborníkovi musí být minimálně 18 let.
- 8.2.1.2 Odborník je osoba, která vlastní osvědčení o zvláštních znalostech ADN. Na důkaz zvláštních znalostí je vydáváno osvědčení příslušným orgánem nebo jím pověřenou organizací.
- Toto osvědčení musí být vydáno osobám, které po školení úspěšně složí závěrečnou zkoušku ADN.
- 8.2.1.3 Odborníci podle 8.2.1.2 musí absolvovat základní školení. Školení musí proběhnout v rámci příslušným orgánem uznávaného učebního kursu. Nejdůležitějším cílem školení je ozřejmit odborníkům nebezpečí, která jsou spojena s přepravou nebezpečných věcí a zprostředkovat jim základní znalosti, které jsou potřebné k tomu, aby se na nejmenší míru omezilo nebezpečí nehody a, pokud k nehodě dojde, umožnit jim provedení nezbytných opatření k zajištění jejich vlastní bezpečnosti, bezpečnosti veřejnosti a ochranu životního prostředí a omezit následky nehody. Toto školení, ke kterému musí patřit praktická cvičení, proběhne jako základní školení a musí obsahovat minimálně cíle uvedené v 8.2.2.3.1.1 a 8.2.2.3.1.2 nebo 8.2.2.3.1.3.
- 8.2.1.4 Po pěti letech musí být platnost osvědčení prodloužena příslušným orgánem nebo jím pověřenou organizací, jestliže odborník prokáže, že úspěšně absolvoval obnovovací kurz, formou relevantních údajů uvedených v osvědčení příslušným orgánem nebo jím pověřenou organizací úspěšné absolvování obnovovacího kurzu v posledním roce před uplynutím platnosti osvědčení zahrnujícím nejméně cíle uvedené v 8.2.2.3.1.1 a 8.2.2.3.1.2 nebo 8.2.2.3.1.3 a zahrnující zejména současný nový rozvoj. Obnovovací kurz musí být považován za úspěšně zakončený, jestliže byl složen závěrečný písemný test vytvořený organizátorem kurzu podle 8.2.2.2. Test může být opakován dvakrát během platnosti osvědčení. Není-li zkouška složena poté co byla opakována dvakrát, může být v průběhu doby platnosti osvědčení znovu provedeno obnovovací školení.
- 8.2.1.5 Odborníci pro přepravu plynů se musí zúčastnit specializovaných školení, ve kterém jsou probírány alespoň cíle uvedené v 8.2.2.3.3.1. Školení musí probíhat v rámci kurzů schválených příslušným orgánem. Po provedeném školení a úspěšně složené zkoušce o přepravě plynů a prokázání minimálně jednoho roku práce na plavidle typu G je vystaveno osvědčení. Práce na plavidle musí být absolvována během dvou let před nebo nejpozději během dvou let po odborné zkoušce.
- 8.2.1.6 Po pěti letech musí být platnost osvědčení prodloužena příslušným orgánem nebo jím pověřenou organizací, jestliže odborník na přepravu plynů prokáže:
- během posledního roku před uplynutím platnosti svého osvědčení úspěšně absolvoval školení, které navazuje na cíle, stanovené v 8.2.2.3.3.1 a zvláště obsahuje novinky, nebo
 - během posledních dvou let minimálně rok pracoval na tankovém plavidle typu G.
- 8.2.1.7 Odborníci pro přepravu chemikálií musí absolvovat specializované školení, ve kterém jsou probírány alespoň cíle uvedené v bodě 8.2.2.3.3.2. Školení musí probíhat v rámci kurzů schválených příslušným orgánem. Osvědčení je vystaveno po absolvovaném školení a úspěšném složení zkoušky o přepravě chemikálií po prokázání minimálně jednoho roku práce na plavidle typu C. Práce na plavidle musí být provedena během dvou let před nebo nejpozději během dvou let po složení odborné zkoušky.
- 8.2.1.8 Po pěti letech musí být platnost osvědčení prodloužena příslušným orgánem nebo jím pověřenou organizací, jestliže odborník na přepravu chemikálií prokáže:

- během posledního roku před uplynutím platnosti jeho osvědčení úspěšně absolvoval školení, které navazuje na témata, stanovená v 8.2.2.3.3.2 a zvláště obsahuje novinky, nebo
- během posledních dvou let minimálně jeden rok pracoval na tankovém plavidle typu C.

8.2.1.9 Potvrzení o absolvování školení a zkušenosti v souladu s požadavky kapitoly V Mezinárodní úmluvy o normách výcviku, kvalifikace a strážní služby námořníků ze dne 7. července 1978 (Úmluva STCW), ve znění pozdějších předpisů; na plynových tankových plavidlech musí být rovnocenné osvědčení uvedenému v 8.2.1.5, pokud bylo uznáno příslušným orgánem. Vystavení a prodloužení platnosti tohoto dokladu muselo proběhnout před méně než pěti lety.

8.2.1.10 Potvrzení o absolvování školení a zkušenosti v souladu s požadavky kapitoly V Mezinárodní úmluvy o normách výcviku, kvalifikace a strážní služby námořníků ze dne 7. července 1978 (Úmluva STCW), ve znění pozdějších předpisů; na tankových plavidlech pro chemikálie musí být rovnocenné osvědčení uvedenému v 8.2.1.7, pokud bylo uznáno příslušným orgánem. Vystavení a prodloužení platnosti tohoto dokladu muselo proběhnout před méně než pěti lety.

8.2.1.11 (Vypuštěno)

8.2.2 Zvláštní předpisy pro výcvik odborníků

8.2.2.1 Potřebné teoretické znalosti a praktické dovednosti musí být zprostředkovány teoretickým školením a praktickým výcvikem. Teoretické znalosti musí být prokázány zkouškou. Během obnovovacího školení musí být pomocí cvičení a testů zajištěno, že se účastník na školení aktivně podílí.

8.2.2.2 Organizátor školení musí zabezpečit dobré znalosti školitelů a zohlednění posledních změn předpisů a požadavků na školení při přepravě nebezpečných věcí. Výuka musí odpovídat praxi. Učební osnova musí být sestavena podle uznávání na podkladě cílů, stanovených v 8.2.2.3.1.1 až 8.2.2.3.1.3 a 8.2.2.3.3.1 nebo 8.2.2.3.3.2. Základní školení a jejich přeškolení musí zahrnovat praktická cvičení. (viz 8.2.2.3.1.1).

8.2.2.3 Struktura školení

První a obnovovací školení se prování v rámci základních školení (viz 8.2.2.3.1) a případně specializovaných školení (viz 8.2.2.3.3). Školení podle 8.2.2.3.1 mohou být nabízeny ve třech variantách: přeprava suchých nákladů, přeprava tankovými plavidly a kombinace přeprava suchých nákladů / přeprava tankovými plavidly.

8.2.2.3.1 Základní školení

Základní školení pro přepravu suchých nákladů

Předchozí vzdělání: žádné
 Znalosti: ADN všeobecně s výjimkou 3.2 (tabulka C), 7.2 a 9.3
 Oprávnění: plavidla přepravující suché náklady
 Výcvik: všeobecně 8.2.2.3.1.1 a plavidla přepravující suché náklady 8.2.2.3.1.2

Základní školení pro přepravu tankovými plavidly

Předchozí vzdělání: žádné
 Znalosti: ADN všeobecně s výjimkou kapitoly 3.2, tabulka A, kapitol 7.1, 9.1 a 9.2
 Oprávnění: tanková plavidla, určená pro přepravu látek, pro které je předepsáno tankové plavidlo typu N
 Výcvik: všeobecně 8.2.2.3.1.1 a tanková plavidla 8.2.2.3.1.3

Základní školení kombinované pro přepravu suchých nákladů a přepravu tankovými plavidly

Předchozí vzdělání: žádné
 Znalosti: ADN všeobecně

Oprávnění: plavidla pro přepravu suchých nákladů a přeprava látek, pro které je předepsáno tankové plavidlo typu N
Výcvik: všeobecně 8.2.2.3.1.1, plavidla pro přepravu suchých nákladů 8.2.2.3.1.2 a tanková plavidla 8.2.2.3.1.

8.2.2.3.1.1 Obecná část základního školení musí zahrnovat minimálně následující cíle:

Obecně:

- Cíle a struktura ADN

Konstrukce a vybavení:

- konstrukce a vybavení plavidla ADN

Měřicí technika:

- měření toxicity, obsahu kyslíku a koncentrace hořlavých plynů.

Znalosti o látkách:

- klasifikace nebezpečných věcí a nebezpečné vlastnosti.

Nakládka, vykládka a přeprava:

- nakládka, vykládka, všeobecné provozní předpisy a předpisy pro přepravu.

Doklady:

- doklady, které se během přepravy musí nacházet na plavidle.

Nebezpečí a preventivní opatření:

- všeobecná bezpečnostní opatření.

Praktická cvičení:

- praktická cvičení, zvláště vstup do prostor, používání hasicích přístrojů, zařízení k hašení požárů, osobních ochranných pomůcek jakož detekčních přístrojů pro plyny, přístrojů měřících obsah kyslíku a detektorů toxických plynů.

Stabilita:

- parametry týkající se stability;
- momenty náklonu;
- vzorové výpočty;
- stabilita v poškozeném stavu, mezilehlé stavy a konečný stav zaplavení;
- vliv volných povrchů;
- výpočet stability na základě existujících kritérií stability (text předpisů);
- výpočet stability v nepoškozeném stavu pomocí průběhu křivky ramen;
- používaná zařízení pro kontrolu naložení;
- používání zařízení pro kontrolu naložení;
- použití příručky stability podle 9.3.13.3.

Základy ochrany před explozí:

- podle definice „ochrana před explozí“;
- výběr vhodných zařízení a vybavení.

8.2.2.3.1.2 Část základního školení, týkající se plavidel pro přepravu suchých nákladů musí zahrnovat minimálně následující cíle:

Konstrukce a vybavení:

- konstrukce a vybavení plavidel pro přepravu suchého nákladu.

Péče o nákladní prostory a přilehlé prostory:

- odplynování, vyčištění a údržba,
- větrání nákladních prostor a prostor mimo chráněné oblasti.

Nakládka, vykládka a přeprava:

- nakládka a vykládka, všeobecné provozní a přepravní předpisy,
- označení kusů.

Doklady:

- doklady, které se během přepravy musí nacházet na plavidle.

Nebezpečí a preventivní opatření:

- prevence a všeobecná bezpečnostní opatření,
- osobní ochranné a bezpečnostní vybavení.

8.2.2.3.1.3 Část základního školení, zabývající se tankovými plavidly, musí zahrnovat minimálně následující cíle:

Konstrukce a vybavení:

- konstrukce a vybavení tankových plavidel,
- větrací a odvětrávací systémy,
- systémy nakládky a vykládky.

Péče o nákladní tanky a navazující prostory:

- odplynování do atmosféry a do sběrných zařízení, čištění, údržba,
- vytápění a chlazení nákladu,
- manipulace s nádobami pro zbytkové produkty.

Měřicí technika a odběr vzorků:

- měření toxicity, obsah kyslíku a koncentrace výbušných plynů,
- odběr vzorků.

Nakládka, vykládka a přeprava:

- nakládka a vykládka, všeobecné provozní a přepravní předpisy.

Doklady:

- doklady, které se musí během přepravy nacházet na plavidle.

Nebezpečí a preventivní opatření:

- prevence a všeobecná bezpečnostní opatření,
- tvorba jisker,
- osobní ochranné a bezpečnostní vybavení,
- požár a hašení požáru.

8.2.2.3.2 Obnovovací školení

Obnovovací školení pro přepravu suchých nákladů

Předpoklady: platné osvědčení ADN na přepravu suchých nákladů nebo kombinace přeprava suchých nákladů a přeprava tankovými plavidly
 Znalosti: ADN všeobecně s výjimkou 3.2 (tabulka C), kapitoly 7.2 a 9.3
 Oprávnění: plavidla přepravující suché náklady
 Výcvik: všeobecně 8.2.2.3.1.1 a plavidla pro přepravu suchých nákladů 8.2.2.3.1.2

Obnovovací školení pro přepravu v tankových plavidlech

Předpoklady: platné osvědčení ADN na přepravu tankovými plavidly nebo kombinace přeprava suchých nákladů a přeprava tankovými plavidly
 Znalosti: ADN všeobecně s výjimkou kapitoly 3.2, tabulka A, kapitol 7.1, 9.1 a 9.2
 Oprávnění: tanková plavidla, určená pro přepravu látek, pro které je předepsáno tankové plavidlo typu N
 Výcvik: všeobecně 8.2.2.3.1.1 a tanková plavidla 8.2.2.3.1.3

Obnovovací školení kombinované pro přepravu suchých nákladů a přepravu tankovými plavidly

Předpoklady:	platné osvědčení ADN kombinované na přepravu suchých nákladů a přepravu tankovými plavidly
Znalosti:	ADN všeobecně
Oprávnění:	pravidla pro přepravu suchých nákladů a přeprava látek, pro které je předepsáno tankové plavidlo typu N
Výcvik:	všeobecně 8.2.2.3.1.1, Pravidla pro přepravu suchých nákladů 8.2.2.3.1.2 a tanková pravidla 8.2.2.3.1.3

8.2.2.3.3 Specializované školení

Specializované školení pro plyny

Předpoklady:	platné osvědčení ADN na přepravu tankovými plavidly nebo kombinace přeprava suchých nákladů a přeprava tankovými plavidly
Znalosti:	ADN zvláště znalosti ohledně nakládky, přepravy, vykládky a manipulace s plyny
Oprávnění:	tanková pravidla, určená pro přepravu látek, které vyžadují tanková pravidla typu G a přeprava látek tankovými plavidly typu G, které vyžadují tanková pravidla typu C s konstrukcí nákladního tanku 1 podle sloupce (7) tabulky C kapitoly 3.2.
Výcvik:	plyny 8.2.2.3.3.1

Specializované školení pro chemikálie

Předpoklady:	platné osvědčení ADN na přepravu tankovými plavidly nebo kombinace přeprava suchých nákladů a přeprava tankovými plavidly
Znalosti:	ADN zvláště znalosti ohledně nakládky, přepravy, vykládky a manipulace s chemikáliemi
Oprávnění:	tanková pravidla, určená pro přepravu látek, které vyžadují tanková pravidla typu C.
Výcvik:	chemie 8.2.2.3.3.2

8.2.2.3.3.1 Specializovaný kurs pro plyny musí zahrnovat minimálně následující cíle:

Fyzikální a chemické znalosti:

- zákony o plynech, např. Boyleův, Gay-Lussacův a obecný zákon o plynu
- parciální tlaky a plynové směsi, jako např. vymezení pojmů a jednoduché výpočty, zvýšení tlaku a vyfukování nákladních tanků
- Avogadrova konstanta a výpočet hmotnosti ideálního plynu a použití hmotnostního vzorce
- hustota, relativní hustota a objem kapaliny, např. hustota, relativní hustota, objem při zvyšování teploty a maximální stupeň plnění
- kritický tlak a kritická teplota
- polymerizace, např. teoretické otázky, praktické otázky a přepravní podmínky
- odpařování a kondenzace, např. vymezení pojmů, kvantitativní nasycení tlaku páry
- směsi, např. tlak páry, složení a nebezpečné vlastnosti
- sloučeniny a chemické vzorce.

Praxe:

- vypláchnutí nákladních tanků, např. vypláchnutí při změně nákladu, vypláchnutí vzduchu kolem nákladu a metody výplachu a vypláchnutí před vstupem do nákladních tanků
- odběr vzorků
- nebezpečí výbuchu
- zdravotní rizika
- měření koncentrace plynů, jako např., které přístroje se musí použít a jak
- kontrola a vstup do uzavřených prostor
- potvrzení o nepřítomnosti plynu a povolené práce

- stupeň plnění a přeplnění
- bezpečnostní zařízení
- čerpadla a kompresory
- nakládání s hluboce zchlazenými zkapalněnými plyny

Opatření v nouzových případech:

- zranění osob, např. látky na kůži, vdechnutí plynu a všeobecné poskytnutí pomoci
- nepravidelnosti v souvislosti s nákladem, jako např. stabilita příruby, přeplnění, polymerizace a nebezpečí v okolí plavidla

8.2.2.3.3.2 Specializovaný kurs pro chemikálie musí zahrnovat minimálně následující cíle:

Znalosti fyziky a chemie:

- chemikálie, např. molekuly, atomy, stav skupenství, kyseliny a louhy, oxidace
- hustota, relativní hustota, tlak a objem kapalin, jako např. hustota, relativní hustota, objem a tlak při zvýšení teploty a maximální stupně plnění
- kritická teplota
- polymerizace, např. otázky z teorie, praxe a podmínky přepravy
- směsi, např. tlak páry, složení a nebezpečné vlastnosti
- chemické vazby a chemické vzorce.

Praxe:

- čištění nákladních tanků, např. odplynování, mytí, zbytky nákladů a nádoby pro zbytky produktů
- nakládka a vykládka, např. sběrné plynové potrubí, rychlouzavírací systémy a vliv teplot
- odběry vzorků
- nebezpečí výbuchu
- zdravotní rizika
- měření koncentrace plynu, např. které přístroje se musí použít a jak
- kontrola a vstup do uzavřených prostor
- potvrzení o nepřítomnosti plynu a povolené práce
- stupeň plnění a přeplnění
- bezpečnostní zařízení
- čerpadla a kompresory.

Opatření v nouzových případech:

- zranění osob jako např. kontakt s látkami, vdechnutí par a obecné poskytnutí pomoci
- nepravidelnosti v souvislosti s nákladem, jako např. stabilita příruby, přeplnění, polymerizace a nebezpečí v okolí plavidla.

8.2.2.3.4 Obnovovací školení

Obnovovací školení pro plyny

Předpoklady:	platné osvědčení ADN na přepravu plynů a na přepravu tankovými plavidly nebo kombinace na přepravu suchých nákladů a tankovými plavidly
Znalosti:	ADN zvláštní znalosti ohledně nakládky, přepravy, vykládky a manipulace s plyny
Oprávnění:	tanková plavidla, určená pro přepravu látek, které vyžadují tanková plavidla typu G a přeprava látek tankovými plavidly typu G, které vyžadují tanková plavidla typu C s konstrukcí nákladního tanku 1 podle sloupce (7) tabulky C kapitoly 3.2.
Výuka:	plyny dle 8.2.2.3.3.1.

Obnovovací školení pro chemikálie

Předpoklady:	platné osvědčení ADN na přepravu chemikálií a na přepravu tankovými plavidly nebo kombinace osvědčení na přepravu suchých nákladů a tankovými plavidly.
Znalosti:	ADN zvláštní znalosti ohledně nakládky, přepravy, vykládky a manipulace s chemikáliemi
Oprávnění:	tanková plavidla určená pro přepravu látek, pro které se vyžaduje tankové plavidlo typu C
Výuka:	chemikálie 8.2.2.3.3.2.

8.2.2.4 **Učební osnova pro obnovovací a specializovaná školení**

Jako základ jsou stanoveny minimálně následující doby trvání školení:

Základní školení pro přepravu suchých nákladů	32 vyučovacích hodin po 45 minutách
Základní školení pro přepravu tankovými plavidly	32 vyučovacích hodin po 45 minutách
Základní školení kombinovaný	40 vyučovacích hodin po 45 minutách
Specializované školení pro přepravu plynů	16 vyučovacích hodin po 45 minutách
Specializované školení pro přepravu chemických látek	16 vyučovacích hodin po 45 minutách

V jednom vyučovacím dni smí být absolvováno nejvýše 8 vyučovacích hodin.

Pokud teoretické školení je prováděno dálkovou formou, musí jako základ být stanoveny ekvivalentní vyučovací hodiny. Dálkové vyučování musí být provedeno během 9 měsíců.

Podíl praktických cvičení na základním školení musí činit zhruba 30 %. Praktická cvičení musí, pokud je to možné, být provedena během teoretického školení; v každém případě musí být ukončena nejpozději 3 měsíce po ukončení teoretického školení.

8.2.2.5 **Učební osnova pro obnovovací školení**

Obnovovací školení musí být absolvována před uplynutím lhůty, uvedené v 8.2.1.4, 8.2.1.6 nebo 8.2.1.8.

Jako základ jsou stanoveny následující doby trvání školení:

Základní obnovovací školení:	
- pro přepravu suchých nákladů	16 vyučovacích hodin po 45 minutách
- pro přepravu tankovými plavidly	16 vyučovacích hodin po 45 minutách
- pro kombinovanou přepravu suchých nákladů a přepravu tankovými plavidly	16 vyučovacích hodin po 45 minutách
Specializované obnovovací školení pro plyny	8 vyučovacích hodin po 45 minutách
Specializované obnovovací školení pro chemikálie	8 vyučovacích hodin po 45 minutách

V jednom vyučovacím dni smí být absolvováno nejvýše 8 vyučovacích hodin.

Podíl praktických cvičení na obnovovacím školení musí činit zhruba 30 %. Praktická cvičení mají mít, pokud možno časovou souvislost s teoretickým školením; musí být, ale provedena nejpozději 3 měsíce po uplynutí teoretického školení. Rozsah školení stability v obnovovacím kurzu musí být nejméně 2 vyučovací hodiny.

8.2.2.6 **Uznávání školení**

8.2.2.6.1 Školení musí být uznávána příslušným orgánem.

8.2.2.6.2 Toto uznání se udělí pouze na základě písemné žádosti.

8.2.2.6.3 K žádosti o uznání se připojí následující podklady:

- Podrobná učební osnova s uvedením probírané látky a časového plánu předpokládaných výukových metod;
- Kvalifikace a oblasti působnosti školících instruktorů;

- (c) Údaje o školicích prostorách a pomůckách jakož o zařízeních, poskytnutých pro praktická cvičení;
- (d) Podmínky pro účast na školení, jako např. počet účastníků;
- (e) Podrobný plán pro závěrečné testy včetně, pokud je to nutné, infrastruktury a organizace elektronických zkoušek podle 8.2.2.7.1.7, pokud se tyto zkoušky mají provádět.
- 8.2.2.6.4 Příslušnému orgánu přísluší dozor nad školeními a zkouškami.
- 8.2.2.6.5 Uznávání obsahuje minimálně následující podmínky:
- (a) Školení budou prováděna v souladu s podklady, připojenými k žádosti;
- (b) Příslušný orgán je oprávněn, vysílat na školení a zkoušky pověřené osoby;
- (c) Příslušnému orgánu bude včas sdělen přesný termín a místo každého konání školení. Schválení musí být potvrzeno písemně pro omezené období. Může být odejmuto, pokud nejsou dodrženy podmínky pro uznání.
- 8.2.2.6.6 Z uznání musí být zřejmé, zda se u školení jedná o základní nebo specializované či obnovovací školení.
- 8.2.2.6.7 Pokud organizátor školení po udělení povolení chce provést změny v bodech, které jsou pro udělení uznání významné, pak musí předtím od příslušného orgánu k tomu získat souhlas. To platí zvláště pro změny učební osnovy.
- 8.2.2.6.8 Školení musí odpovídat aktuálnímu stavu vývoje v jednotlivých oblastech školení. Organizátor školení nese odpovědnost za to, že vývoj v oblastech, které jsou předmětem školení, bude školící instruktor zohledňovat a ovládat.
- 8.2.2.7 **Zkoušky a závěrečné testy**
- 8.2.2.7.0 Zkouška je pořádána příslušným orgánem nebo jím pověřenou zkušební organizací. Zkušební organizace nesmí být školící organizací.
- Určení zkušební organizace se provádí písemnou formou. Toto určení může mít časově omezenou dobu a musí se zakládat na následujících kritériích:
- kompetentnosti zkušební organizace;
 - popisu formy zkoušek navrhované zkušební organizací včetně, pokud je to nutné, infrastruktury a organizace elektronických zkoušek podle 8.2.2.7.1.7, pokud se tyto zkoušky mají provádět.
 - opatření směřující na zajištění objektivnosti zkoušek;
 - nezávislosti organizace ve vztahu ke všem právnickým či fyzickým osobám, které najímají experty ADN.
- 8.2.2.7.1 Zkoušky ze základního školení
- 8.2.2.7.1.1 Po ukončení základního školení musí být složena zkouška. Tato může být provedena buď bezprostředně po školení, nebo do šesti měsíců po ukončení školení.
- 8.2.2.7.1.2 Kandidát musí u zkoušky prokázat, jak se v základním školení předpokládá, že ovládá znalosti, chápe a má schopnosti, které jsou pro odborníka na plavidlech potřebné.
- 8.2.2.7.1.3 Administrativní výbor sestaví katalog otázek, který zahrnuje cíle zkoušky, uvedené v 8.2.2.3.1.1 až 8.2.2.3.1.3 a Směrnice na využití katalogu otázek¹. Otázky, které jsou v průběhu zkoušky položeny, se vybírají z tohoto katalogu. Před zkouškou kandidáti otázky, zvolené z katalogu otázek, nesmějí vědět.

¹ Poznámka sekretariátu: Katalog otázek a směrnice pro jejich aplikaci jsou uvedeny na webové stránce Sekretariátu EHK OSN (<http://www.unecce.org/trans/damger/danger/htm>).

- 8.2.2.7.1.4 Formuláře, připojené ke směrnici na použití katalogu otázek, se použijí při sestavování zkušebních otázek.
- 8.2.2.7.1.5 Zkouška je prováděna písemnou formou. Kandidátům se položí 30 otázek. Doba trvání zkoušky činí 60 minut. Zkouška je úspěšně složena, jestliže je minimálně 25 z 30 otázek zodpovězeno správně.
- 8.2.2.7.1.6 Příslušný orgán nebo zkušební organizace určená příslušným orgánem musí dozorovat každou zkoušku. Jakákoli manipulace a podvádění musí být, jak je to jen možné, vyloučeny. Totožnost kandidáta musí být ověřena.
- Při písemném testu není dovoleno používat žádné dokumenty s výjimkou předpisů pro nebezpečné věci, CEVNI a příslušných policejních předpisů. Neprogramovatelné kapesní kalkulátory je dovoleno používat během specializovaných kursů a musí být poskytnuty příslušným orgánem nebo zkušební organizací určenou příslušným orgánem.
- Všechny zkušební dokumenty (otázky a odpovědi) musí být zaregistrovány a uchovány v písemné formě nebo elektronicky jako datový soubor.
- 8.2.2.7.1.7 Písemné zkoušky smějí být prováděny, zcela nebo zčásti, v elektronické formě, kde jsou odpovědi zaznamenávány a vyhodnocovány za použití procesů elektronického zpracování dat (EDP), pokud jsou splněny tyto podmínky:
- Hardware a software musí být zkontrolovány a přijaty příslušným orgánem nebo zkušební organizací určenou příslušným orgánem;
 - Elektronická media smějí být používána pouze tehdy, pokud byla poskytnuta příslušným orgánem nebo zkušební organizací určenou příslušným orgánem.
 - Musí být zajištěna správná technická funkce. Musí být učiněna opatření týkající se možnosti pokračování zkoušky, dojde-li k selhání technických prostředků a aplikací. Na vstupních zařízeních nesmějí být k dispozici žádné pomocné funkce (např. funkce elektronického vyhledávání). Poskytnuté elektronické medium nesmí dovolit kandidátům komunikovat během zkoušky s jakýmkoli jiným přístrojem.
 - Kandidát nesmí mít v žádném případě možnost vkládat další data do poskytnutého elektronického media; kandidát smí odpovídat pouze na položené otázky.
 - Konečná vstupní data každého kandidáta musí být zaznamenána. Vyhodnocení výsledků musí být transparentní.
- 8.2.2.7.2 Zkoušky ze specializovaných školení pro plyny a chemikálie
- 8.2.2.7.2.1 Kandidáti, kteří uspěli při zkoušce ze základního školení ADN, mohou požádat o zařazení do specializovaného kurzu „plyny“ a/nebo „chemikálie“, po němž následuje zkouška. Zkouška musí být založena na seznamu otázek Administrativního výboru.
- 8.2.2.7.2.2 Kandidát musí u zkoušky prokázat, jak je plánováno v nastavbovém školení, že má znalosti, chápání a schopnosti, které jsou u odborníka na plavidlech při přepravách plynů, resp. chemikálií vyžadovány.
- 8.2.2.7.2.3 Administrativní výbor sestaví katalog otázek, který zahrnuje cíle zkoušky, uvedené v 8.2.2.3.3.1 nebo 8.2.2.3.3.2 a Směrnice na využití katalogu otázek¹. Otázky, které jsou v průběhu zkoušky položeny, se vybírají z tohoto katalogu. Před zkouškou kandidáti otázky, zvolené z katalogu otázek, nesmějí vědět.
- 8.2.2.7.2.4 Vzor přiložený ke směrnici na použití katalogu otázek musí být použit při sestavování zkušebních otázek.
- 8.2.2.7.2.5 Zkouška je prováděna písemnou formou.
- Kandidáti obdrží jednotlivě 30 otázek s výběrem správného řešení a jednu otázku se zadáním případu k řešení. Zkouška trvá celkem 150 minut, ze kterých 60 minut připadá na otázky s výběrem správného řešení a 90 minut na otázku se zadáním případu k řešení.
- Při vyhodnocení se hodnotí celá zkouška pomocí 60 bodů, 30 bodů za otázky typu výběr správného

¹ Poznámka sekretariátu: Katalog otázek a směrnice pro jejich aplikaci jsou uvedeny na webové stránce Sekretariátu EHK OSN (<http://www.unece.org/trans/damger/danger/htm>).

řešení, každá otázka jeden bod, a 30 bodů za otázku s případem k řešení. Rozdělení bodů na prvky případu k řešení posoudí příslušný orgán. Zkouška je úspěšně složena, jestliže je celkem dosaženo minimálně 44 bodů. Přitom však musí být v každé části zkoušky dosaženo minimálně 20 bodů. Pokud kandidát dosáhne 44 bodů, ale v jedné části nedosáhne 20 bodů, smí dotyčnou část jednou opakovat. Ustanovení uvedená v 8.2.2.7.1.6 a 8.2.2.7.1.7 se použijí obdobně.

8.2.2.7.3 Obnovovací kurz

8.2.2.7.3.1 Nakonec obnovovacího kurzu podle odstavce 8.2.1.4 musí organizátor kurzu zadat test.

8.2.2.7.3.2 Test musí být písemný. Kandidátům musí být uloženo 20 výběrových otázek. Na závěr každého obnovovacího kurzu musí být připraven nový dotazník. Test trvá 40 minut. Za úspěšné absolvování se považuje, pokud nejméně 16 z 20 otázek bylo zodpovězeno správně.

8.2.2.7.3.3 Ustanovení uvedená v 8.2.2.7.1.2, 8.2.2.7.1.3, 8.2.2.7.1.6 a 8.2.2.7.1.7 musí být použita při administraci testů (mimo rámec ustanovení směrnice na použití katalogu otázek pro zkušební orgány a organizace).

8.2.2.7.3.4 Organizátor kurzu předá úspěšným kandidátům písemné osvědčení pro předložení příslušnému orgánu podle odstavce 8.2.2.8.

8.2.2.7.3.5 Organizátor kurzu musí uchovávat písemné testy kandidátů po dobu pěti let od data testu.

8.2.2.8 **Osvědčení o zvláštních znalostech ADN**

8.2.2.8.1 Za vydání a obnovení osvědčení o zvláštních znalostech ADN, které odpovídá vzoru podle 8.6.2, odpovídá příslušný orgán nebo jím pověřená organizace.

8.2.2.8.2 Rozměry osvědčení musí být v souladu s normou ISO/IEC 7810:2003, velikost karty ID-1 a musí být vyrobeno z plastu. Barva osvědčení musí být bílá, s černým písmem. Osvědčení musí obsahovat další bezpečnostní prvek jako je hologram, UV tisk nebo ryté vzory. Jeho znění musí být v jazyce (jazycích) nebo v jednom z jazyků státu, jehož příslušný orgán jej vydal. Pokud žádný z těchto jazyků není angličtina, francouzština nebo němčina, název osvědčení, název položky 8 a nadpisy na zadní straně a případně dodatky pod „tanková pravidla“ nebo „pravidla pro suchý náklad“ musí být také uvedeny v angličtině, francouzštině nebo němčině.

8.2.2.8.3 Osvědčení se vydává:

- (a) uchazečům, kteří splnili podmínky uvedené v druhé větě pododdlů 8.2.1.2 a 8.2.1.3 (základní školení); je platné po dobu pěti let ode dne, kdy byla složena zkouška ze základního školení.
- (b) Uchazečům, kteří splnili podmínky uvedené v 8.2.1.5 nebo 8.2.1.7 (specializované školení pro „plyny“ nebo „chemikálie“); v tomto případě bude vydáno nové osvědčení obsahující osvědčení pro základní a specializované přípravné školení. Nově vydané osvědčení je platné po dobu pěti let ode dne, kdy byla složena zkouška ze základního školení.

8.2.2.8.4 Osvědčení musí být obnoveno:

- (a) je-li k dispozici důkaz požadovaný podle 8.2.1.4 (základní školení), nová doba platnosti začíná dnem uplynutí platnosti předchozího osvědčení. Pokud byla zkouška provedena více než jeden rok před uplynutím doby platnosti osvědčení, začíná dnem potvrzení o účasti na školení
- (b) je-li k dispozici důkaz požadovaný podle 8.2.1.6 a 8.2.1.8 (specializované školení pro „plyny“ nebo „chemikálie“). V tomto případě bude vydáno nové osvědčení obsahující všechna osvědčení týkající se základního školení a specializovaných školení. Nově vydané osvědčení má dobu platnosti pět let ode dne úspěšně ukončeného obnovovacího základního školení. Pokud se obnovovací školení koná v roce předcházejícím datu ukončení platnosti osvědčení, nová doba platnosti začíná dnem uplynutí platnosti předchozího osvědčení; jinak začíná dnem potvrzení o účasti na školení.

8.2.2.8.5 Pokud nebylo obnovovací školení pro obnovení osvědčení plně a úspěšně dokončeno před uplynutím doby platnosti osvědčení, nebo pokud práce na palubě pravidla po dobu jednoho roku nebyla ověřena

během dvou let předcházejících uplynutí doby platnosti osvědčení, vydá se nové osvědčení, pro které se vyžaduje účast na dalším úvodním základním školení a zkoušce podle pododdílu 8.2.2.7.

- 8.2.2.8.6 Pokud je nové osvědčení vydáno v souladu s pododdílem 8.2.2.8.3 (b) nebo je osvědčení obnoveno v souladu s pododdílem 8.2.2.8.4 a předchozí osvědčení bylo vydáno jiným orgánem nebo orgánem k tomu pověřeným, orgán, vydávající orgán nebo organizace schválená tímto orgánem, který vydal předchozí osvědčení, musí být neprodleně informován.
- 8.2.2.8.7 Smluvní strany poskytnou sekretariátu EHK OSN příklad národního vzoru pro jakékoli osvědčení určeného k vystavení v souladu s tímto oddílem. Smluvní strany rovněž poskytnou vysvětlující poznámky, které umožní ověření shody certifikátů s poskytnutými příklady. Sekretariát tyto informace zpřístupní na své webové stránce.

KAPITOLA 8.3

DALŠÍ PŘEDPISY, KTERÉ MUSÍ PLNIT OSÁDKA PLAVIDLA

8.3.1 Osoby na plavidle

8.3.1.1 Pokud není v Části 7 stanoveno jinak, na plavidle se smějí zdržovat jen:

- (a) členové posádky;
- (b) osoby nepatřící k posádce, které ale normálně na plavidle žijí;
- (c) osoby, které se na plavidle nachází ze služebních důvodů.

8.3.1.2 V chráněné oblasti na plavidlech přepravujících suchý náklad a v oblasti nákladu tankových plavidel se osoby uváděné pod bodem 8.3.1.1 (b), smějí nacházet jen krátkodobě.

8.3.1.3 Pokud plavidlo musí být označeno dvěma modrými kužely nebo dvěma modrými světly v souladu se sloupcem (19) tabulky C kapitoly 3.2, tak se na jeho palubě nesmí nacházet osoby mladší 14 let.

8.3.2 Přenosná osvětlovací zařízení

Na plavidlech jsou v prostorách s nebezpečím výbuchu povolena pouze přenosná osvětlovací zařízení s vlastním zdrojem proudu.

V prostorách s nebezpečím výbuchu musí splňovat alespoň požadavky pro použití v příslušné zóně.

8.3.3 Vstup na plavidlo

Nepovoláním je vstup na plavidlo zakázán. Tento zákaz musí být umístěn na vhodných místech pomocí tabulek.

8.3.4 Zákaz kouření, zákaz ohně a otevřeného světla

Na plavidle je zakázáno kouření, včetně kouření elektronických cigaret a podobných prostředků, použití ohně a otevřeného světla. Platí však ustanovení pododdílů 7.1.3.41.1 a 7.2.3.41.1.

Na vhodných místech je třeba umístit tabulky s tímto zákazem.

Zákaz se nevztahuje na obytné prostory nebo kormidelny za předpokladu, že jejich okna, dveře, světlíky a poklopy jsou zavřené nebo je systém ventilace nastaven tak, aby zaručoval přetlak alespoň 0,1 kPa.

8.3.5 Práce na palubě plavidla

Na palubě nesmí být prováděny žádné práce vyžadující použití otevřeného plamene nebo elektrického proudu nebo práce způsobující jiskry.

Toto ustanovení se nepoužije

- při kotvicích operacích;
- na provozní prostory mimo chráněnou oblast nebo oblast nákladu za předpokladu, že dveře a otvory v těchto prostorách jsou po celou dobu prací uzavřeny a na plavidle se neprovádí nakládka, vykládka nebo proces odplynování; nebo

- Pokud se plavidlo nenachází v blízkosti nebo v určené zóně na břehu a v případě tankového plavidla, má osvědčení o odplynování plavidla v souladu s pododdílem 7.2.3.7.6 nebo povolení od příslušného orgánu nebo v případě plavidla pro suchý náklad, má osvědčení o odplynování chráněné oblasti nebo povolení příslušného orgánu.

Je povoleno použití ručních nástrojů s nízkým jiskřením (šroubováky a klíče z chrom-vanadiové oceli nebo šroubováky a klíče z rovnocenného materiálu z hlediska tvorby jisker) a vhodné vybavení alespoň pro danou zónu.

Poznámka: *Kromě toho musí být dodržovány všechny ostatní platné předpisy týkající se bezpečnosti na pracovišti a bezpečnosti provozu.*

² Pokud není jednotný typ nákladních tanků: viz strana 3

³ Místo "x", uveďte příslušný údaj

POZNÁMKA: Toto vzorové prozatímní schvalovací osvědčení může být nahrazeno jediným vzorem osvědčení kombinujícím prozatímní osvědčení o inspekci a prozatímní schvalovací osvědčení za podmínky, že tento jediný vzor osvědčení obsahuje tytéž údaje jako vzor uvedený výše a je schválen příslušnými orgány.

3													
Jestliže nejsou všechny nákladní tanky plavidla jednoho typu nebo nemají stejnou konstrukci nebo jestli jejich zařízení nejsou shodná, pak jejich typ, konstrukce a zařízení musí být uvedeno níže:													
1	Číslo tanku	1	2	3	4	5	6	7	8	9	10	11	12
2	Tlakový tank												
3	Nákladní tank uzavřený												
4	Nákladní tank otevřený s lapačem plamenů												
5	Nákladní tank otevřený												
6	Nezávislý nákladní tank												
7	Integrovaný nákladní tank												
8	Stěna nákladního tanku není obšívka												
9	Membránový tank												
10	Otevírací tlak přetlakového ventilu /vysokorychlostního ventilu v kPa												
11	Připojení pro zařízení pro odběr vzorků												
12	Otvor pro odběr vzorků												
13	Postřikovací zařízení												
14	Tlakové poplašné zařízení 40 kPa												
15	Možnost vytápění ze břehu												
16	Topné zařízení na plavidle												
17	Chladicí zařízení												
18	Zařízení pro plnění inertního plynu												
19	Odvětrávací potrubí a vyhřívací zařízení												
20	Odpovídá pravidlům pro stavbu, vyplývajícím z připomínky (připomínek)..... ve sloupci (20) tabulky C kapitoly 3.2

Bude nakládací potrubí začistiště po nakládce nebo vykládce dočerpáním nebo vytlačením zbytků do zařízení na břehu / do plavidla?*

vytlačením *

dočerpáním *

Pokud vytlačením, pak jakým způsobem?

.....

(např. vzduchem, inertním plynem, hadicí)

.....kPa
(nejvyšší přípustný tlak v nákladním tanku)

.....litrů
(odhadované zbytkové množství)

Otázky pro velitele plavidla nebo jím pověřenou osobu na plavidle a odpovědnou osobu zařízení pro nakládku / vykládku na břehu.

S nakládkou nebo vykládkou je možné začít pouze tehdy, pokud jsou všechny následující otázky kontrolního listu překontrolovány a označeny písmenem "X", tj. zodpovězeny slovem "ano" a list je podepsán oběma osobami.

Nehodící se otázky se škrtnou.

Jestliže všechny otázky nemohou být zodpovězeny "ANO", může být nakládka/vykládka provedena pouze se souhlasem příslušného orgánu.

* Nehodící se škrtněte.

** Oficiální pojmenování pro přepravu uvedené ve sloupci (2) tabulky C kapitoly 3.2, doplněné, pokud je to vhodné, technickým názvem v závorkách.

	Plavidlo	Místo nakládky/ vykládky ³
1. Je plavidlo schváleno pro přepravu tohoto nákladu?	O*	O*
2. (Vyhrazeno)		
3. Je plavidlo dobře uvázáno vzhledem k místním poměrům?	O	–
4. Je plavidlo vybaveno vhodnými prostředky podle 7.2.4.77 pro opuštění plavidla, i v případech nouzové situace?	O	O
5. Je zajištěno účinné osvětlení místa nakládky/vykládky a únikových cest?	O	O
6. Spojení plavidlo /pevnina		
6.1 Je potrubí pro nakládku a vykládku mezi plavidlem a břehem ve vyhovujícím stavu?	–	O
Je správně připojeno?	–	O
6.2 Jsou všechny spojovací příruby opatřeny vhodným těsněním?	–	O
6.3 Jsou všechny spojovací šrouby nasazeny a přitáhnuty?	O	O
6.4 Jsou všechna kolena kloubů volně pohyblivá ve všech směrech a mají soustavy hadic dostatek prostoru pro snadný pohyb?	–	O
7. Jsou všechny nepoužívané přípojky nakládacího/vykládacího potrubí a odvětrávacího potrubí řádně zaslepeny přírubou?	O	O
8.1. Jsou pod používanými přípojkovými přírubami vhodné prostředky pro sběr odkapu a jsou prázdné?	O	O
8.2 Je aktivován systém vodní clony, jak je uvedeno v 9.3.1.21.11?	O	O
9. Jsou odstraněna všechna odnímatelná spojení jak mezi balastním a drenážním potrubím, tak mezi nakládacím/vykládacím potrubím?	O	–
10. Je po celou dobu nakládky/vykládky zajištěn nepřetržitý a účinný dozor?	O	O
11. Je zajištěno dorozumívání mezi plavidlem a pevninou?	O	O
12.1 Je odvětrávací potrubí během nakládky napojeno na plynové zpětné potrubí na pevninu - je-li to vyžadováno resp. existuje-li?	O	O
12.2 Je zařízením na pevnině zajištěno tak, aby v místě předání tlak nepřesáhl otevírací tlak přetlakového ventilu/vysokorychlostního ventilu (tlak v místě propojení plynového zpětného potrubí a odvětrávacího potrubí _____ kPa)?	–	O*
12.3 Pokud je podle sloupce (17) tabulky C kapitoly 3.2 vyžadována ochrana proti explozi, zajišťuje zařízení na břehu, že jeho plynové zpětné potrubí je takové, že je plavidlo chráněno proti detonacím a prošlehnutím plamene ze břehu?	–	O
13. Jsou známá opatření týkající se zastavení v případě "nouze" nebo "poplach"?	O	O

* Vyplňuje se pouze v případě, že má být plavidlo naloženo

		Plavidlo	Překladiště ⁴
14.	Kontrola nejdůležitějších provozních předpisů: - Jsou předepsaná hasicí zařízení a hasicí přístroje provozuschopná? - Byly všechny ventily a jiná uzávěrová zařízení zkontrolována z hlediska správné polohy otevřeno-zavřeno? - Je nařízen všeobecný zákaz kouření? - Jsou topná zařízení s otevřeným plamenem vypnuta? - Jsou radarové přístroje bez napětí? - Jsou všechna elektrická zařízení s červeným označením odpojena? - Jsou zavřené všechny dveře a okna?	 <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/>	 <input type="radio"/> <input type="radio"/> <input type="radio"/> - - - -
15.1	Je výstupní tlak vykládacího čerpadla na plavidle nastaven na přípustný provozní tlak zařízení na břehu? (odsouhlasený tlak ___kPa)	<input type="radio"/>	-
15.2	Je výstupní tlak nakládacího čerpadla na břehu nastaven na povolený provozní tlak zařízení na plavidle? (odsouhlasený tlak ___kPa)	-	<input type="radio"/>
16.	Je zapojen výstražný přístroj úrovně hladiny?	<input type="radio"/>	-
17.	Je následující systém zapojený, provozuschopný a zkontrolovaný? Zařízení proti přeplnění <input type="checkbox"/> v případě nakládky <input type="checkbox"/> v případě vykládky Zařízení pro vypnutí čerpadla na plavidle ze zařízení na břehu (pouze v případě vykládky plavidla)	 <input type="radio"/> <input type="radio"/>	 <input type="radio"/> <input type="radio"/>

		Plavidlo	Překladiště ⁵
18.	Vyplnit jen v případě, že se nakládá nebo vykládá látka, pro kterou je vyžadovaná přeprava v uzavřeném tankovém plavidle nebo v otevřeném tankovém plavidle, které má zařízení proti prošlehnutí plamene: Jsou kryty nákladních tanků, kontrolní otvory a otvory pro odběr vzorků uzavřeny nebo chráněny pojistkami proti prošlehnutí plamene splňující požadavky ve sloupci (16) Tabulky C kapitoly 3.2?	O	–
19.	Při přepravě hluboce zchlazených zkaplenných plynů byla v souladu s 7.2.4.16.16 určena udržovací doba, je známa a uvedena v dokumentaci na palubě.	O**	O**
20.	Je teplota nakládky v rozmezí maximální přípustné teploty předepsané v 7.2.3.28?	O**	O**
Přezkoušeno, vyplněno a podepsáno Za plavidlo: (jméno velkými písmeny) (podpis)		Za místo nakládky/vykládky: (jméno velkými písmeny) (podpis)	
** Vyplňuje se pouze v případě, že má být plavidlo naloženo			

Vysvětlivky:**Otázka 3:**

Pod pojmem "dobře uvázaná" se rozumí, že plavidlo je k přistavnímu molu nebo k překladní rampě připevněno takovým způsobem, že bez nadměrného působení třetích osob nemůže provést žádný pohyb v žádném směru, který by mohl přetížit překladkové zařízení. Přitom je zapotřebí počítat s pohyby vodní hladiny na tomto místě a se zvláštnostmi překládky.

Otázka 4:

Musí být možno bezpečně uniknout z plavidla v kterémkoliv okamžiku. Není-li k dispozici žádná nebo pouze jedna úniková cesta na břeh pro rychlý únik z plavidla v případě nouze, má být plavidlo opatřeno vhodnými únikovými prostředky, jestli to je vyžadováno podle 7.2.4.77.

Otázka 6:

Platné inspekční osvědčení pro soustavy hadic musí být k dispozici na palubě. Materiál potrubí pro nakládku a vykládku musí být schopen odolat očekávaným zatížením a být vhodný pro překladku příslušných látek. Potrubí pro nakládku a vykládku mezi plavidlem a břehem musí být umístěno tak, že nemůže být poškozeno při obvyklých pohybech plavidla během nakládacího a vykládacího procesu nebo při změně výšky hladiny vody. Kromě toho všechny přírubové spoje musí být opatřeny vhodnými těsněními a dostatečnými šroubovými spoji, aby se vyloučila možnost úniku.

Otázka 10:

Nakládku/vykládku musí být na plavidle a na pevnině dozorována takovým způsobem, aby byla ihned rozeznána nebezpečí v oblasti potrubí pro nakládku a vykládku mezi plavidlem a břehem. Pokud je dozor prováděn pomocí technických prostředků, musí mezi zařízením na břehu a plavidlem být dohodnuto, jakým způsobem je dozor zajištěn.

Otázka 11:

Pro bezpečný proces nakládky/vykládky je potřebné dobré dorozumění mezi plavidlem a břehem. K tomuto účelu se smí telefon a rádiová vysílačka použít jen v tom případě, když jsou dobře jištěny a jsou-li umístěny v dosahu osoby, která koná dozor.

Otázka 13:

Před začátkem naložky/vykládky se musí zástupce zařízení na břehu a velitel plavidla nebo jím pověřená osoba dohodnout ohledně přijatých postupů. Je zapotřebí počítat se zvláštními vlastnostmi látky, která má být naložena / vykládána.

Otázka 17:

K zabránění zpětného proudu ze zařízení na břehu, je také nutné zapnout jistící zařízení pro zamezení přeplnění na palubě plavidla během vykládky. Zapnutí tohoto zařízení je povinným během naložky a možné během vykládky. Vypustit tuto otázku, když zapnutí daného zařízení není během vykládky nutné.

8.6.4 Kontrolní list odplynování do sběrných zařízení

10.	Jsou otvory nákladních tanků a kontrolní, měřicí a otvory pro odběr vzorků uzavřeny nebo chráněny pojistkami proti prošlehnutí plamene v dobrém stavu?	<input type="radio"/>	–
Zkontrolováno, vyplněno a podepsáno za plavidlo: (jméno hůlkovým písmem) (podpis)		Za sběrné zařízení: (jméno hůlkovým písmem) (podpis)	

Vysvětlivky

Otázka 1:

„Dobře ukotvené“ znamená, že plavidlo je připevněno k molu nebo sběrnému zařízení takovým způsobem, že bez zásahu třetí osoby bude zabráněno pohybu plavidla v jakémkoli směru, který by mohl bránit odplynění. Je třeba vzít v úvahu stanovené nebo předvídatelné pohyby hladiny vody v daném místě a zvláštní okolnosti.

Otázka 2:

Materiál potrubí musí být schopen odolat očekávaným rychlostem a být vhodný pro odplynění. Potrubí mezi plavidlem a sběrným zařízením musí být umístěno tak, aby nemohlo být poškozeno běžnými pohyby plavidla během procesu odplyňování nebo změnami vody.

Otázka 4:

Odplynění musí být pod dohledem na palubě i v sběrném zařízení, aby bylo možné okamžitě rozpoznat nebezpečí, která se mohou objevit v blízkosti potrubí mezi plavidlem a sběrným zařízením. Pokud je dohled prováděn dodatečnými technickými prostředky, musí být mezi sběrným zařízením a plavidlem dohodnuto, jak bude zajištěn.

Otázka 5:

Pro bezpečný proces odplyňování je nutná dobrá komunikace mezi plavidlem a sběrným zařízením. Pro tento účel mohou být telefonní a rádiová zařízení používána pouze v případě, že jsou chráněna před výbuchem a umístěna v dosahu dozoru.

Otázka 7:

Před zahájením odplynění se musí zástupce sběrného zařízení a velitel plavidla nebo jím pověřená osoba dohodnout na použitelném postupu. Je třeba vzít v úvahu specifické vlastnosti látek, které mají být odplyněny.

ČÁST 9
PŘEDPISY PRO STAVBU PLAVIDEL

KAPITOLA 9.1

PŘEDPISY PRO STAVBU PLAVIDEL PŘEPRAVUJÍCÍ SUCHÝ NÁKLAD

9.1.0 Předpisy pro stavbu plavidel přepravujících suchý náklad

Předpisy 9.1.0.0 až 9.1.0.79 platí pro plavidla přepravující suchý náklad.

9.1.0.0 *Stavební materiály*

Trup musí být postaven z lodní oceli nebo z jiného přinejmenším rovnocenného kovu, přičemž tato rovnocennost se týká mechanických vlastností a odolnosti proti vlivu teploty a ohně.

9.1.0.1 *Dokumentace plavidla*

POZNÁMKA: Pro účely tohoto odstavce má pojem „vlastník“ stejný význam jako v 1.16.0.

Dokumentace plavidla musí být uchovávána vlastníkem, který musí být schopen poskytnout tuto dokumentaci na požádání příslušného orgánu a uznané klasifikační společnosti.

Dokumentace plavidla musí být udržována a aktualizována po celou dobu životnosti plavidla a musí být uchována ještě po dobu 6 měsíců po vyřazení plavidla z provozu.

Pokud by došlo během životnosti plavidla ke změně vlastníka, musí být dokumentace plavidla předána novému vlastníkovi.

Kopie dokumentace plavidla nebo všech potřebných dokumentů musí být na požádání poskytnuta příslušnému orgánu pro vydání schvalovacího osvědčení a uznané klasifikační společnosti nebo inspekční organizaci pro první inspekci, periodickou inspekci, zvláštní inspekci nebo mimořádné kontroly.

9.1.0.2

-

9.1.0.10 *(Vyhrazeno)*

9.1.0.11 *Nákladní prostory*

9.1.0.11.1 (a) Každý nákladní prostor musí být vpředu a vzadu ohraničen vodotěsnými kovovými přepážkami.

(b) Nákladní prostory nesmí mít žádnou společnou přepážku s palivovými tanky.

9.1.0.11.2 Podlaha nákladních prostor musí být vyrobena takovým způsobem, aby ji bylo možné čistit a vysoušet.

9.1.0.11.3 Kryty jícňů nákladních prostor musí být odolné proti stříkající vodě a odolné proti povětrnostním vlivům nebo musí být zakryté vodotěsnou plachtou.

Plachty, které se používají k zakrytí nákladních prostor, musí být těžko zápalné.

9.1.0.11.4 V nákladních prostorech nesmí být umístěno žádné topné zařízení.

9.1.0.12 *Větrání*

9.1.0.12.1 Každý nákladní prostor musí být větrán dvěma na sobě nezávislými sacími ventilátory. Kapacita těchto ventilátorů musí být stanovena takovým způsobem, aby mohl být obsah vzduchu nákladního prostoru zcela vyměněn nejméně pětkrát za hodinu. Odsávací šachty musí být vedeny ve vzdálenosti 50 mm od podlahy nákladního prostoru a nacházet se na jejich nejkrajnějších koncích. Proudění plynů a výparů k odsávací šachtě musí být zabezpečeno i při přepravě nákladů ve volně loženém stavu.

Pokud jsou odsávací šachty odnímatelné, musí být vhodné pro sestavení s ventilátorem a musí být možné je bezpečně upevnit. Musí být zajištěna ochrana před povětrnostními vlivy a stříkající vodou. Během ventilace musí být zabezpečen přívod vzduchu.

9.1.0.12.2 Větrací zařízení v nákladním prostoru musí být umístěno takovým způsobem, aby nebezpečné plyny nemohly proniknout do obytných prostor, kormidelny nebo do prostor strojovny.

- 9.1.0.12.3 (a) Obytné prostory, kormidelná a provozní prostory musí být vybaveny větráním.
- (b) Systém větrání v takových prostorách musí splňovat následující požadavky:
- (i) Nasávání vzduchu větracího systému musí být umístěno co nejdále, a minimálně 6,00 m od chráněné oblasti, a minimálně 2,00 m nad palubu;
- (ii) V prostorách se může udržovat přetlak nejméně 0,1 kPa (0,001 baru);
- (iii) Je zabudováno poplachové zařízení pro případ poruchy;
- (iv) Větrací systém, včetně poplachového zařízení pro případ poruchy, musí být minimálně typ „omezené riziko výbuchu“;
- (v) Systém detekování plynu odpovídající níže uvedeným podmínkám 1 až 4 je připojen na větrací systém:
1. Je vhodný pro použití minimálně v zóně 1, skupiny výbušnosti IIC a teplotní třídě T6;
 2. Je vybaven čidly:
 - Na sacích otvorech větracího systému; a
 - Přímo pod vrchní hranou prahu vstupních dveří;
 3. Jeho čas t_{90} je nižší nebo se rovná 4 s;
 4. Měření musí být neustálé;
- (vi) V provozních prostorách je větrací systém napojen na nouzové osvětlení, které musí být minimálně typ „omezené riziko výbuchu“;
- Toto nouzové osvětlení není nutné, pokud je osvětlení v provozních prostorách minimálně typu „omezené riziko výbuchu“;
- (vii) Sání větracího systému, instalací a zařízení, která nesplňují požadavky 9.1.0.51 a 9.1.0.52.1 musí být uzavřeno, pokud je dosaženo koncentrace, která se rovná 20% dolní meze výbušnosti n-hexanu;
- Při vypnutí musí být v obytných prostorách a v prostoru kormidelny aktivována zvuková a světelná signalizace;
- (viii) V případě selhání větracího systému nebo instalací detekce plynu v obytných prostorách, instalace a zařízení v obytných prostorách, které nesplňují požadavky 9.1.0.51 a 9.1.0.52.1 musí být vypnuty;
- Vypínání musí být v obytných prostorách, v prostoru kormidelny a na palubě viditelně a slyšitelně signalizováno;
- (ix) V případě selhání větracího systému nebo instalací detekce plynu v kormidelně nebo provozních prostorách, instalace a zařízení v těchto prostorách, které nesplňují požadavky 9.1.0.51 a 9.1.0.52.1 musí být vypnuta;
- Vypínání musí být v v prostoru kormidelny a na palubě viditelně a slyšitelně signalizováno; Pokud se poplach nevykpe, musí být automaticky předán do obytných prostor;
- (x) Jakékoli vypnutí musí nastat okamžitě a automaticky a, je-li to nutné, musí zapnout nouzové osvětlení;
- Zařízení automatického vypínání musí být nastaveno tak, aby po dobu plavby automatické vypnutí nebylo možné;
- (c) Pokud v prostoru není větrací systém nebo větrací systém prostoru nesplňuje požadavky uvedené výše v bodě (b), musí existovat možnost vypnout všechny zařízení a přístroje, které se nenacházejí tomto prostoru, které svojí činností mohou přesáhnout povrchové teploty uvedené v 9.1.0.51 (a) a (b), nebo které nesplňují požadavky uvedené v 9.1.0.52.1.
- 9.1.0.12.4 Na větracích otvorech musí být umístěny štítky uvádějící podmínky, za nichž mají být otvory uzavřeny. Všechny větrací otvory obytných prostor, kormidelny a provozních prostor, které vedou ven mimo chráněnou oblast musí být umístěny minimálně 2,00 m od chráněné oblasti.
- Všechny větrací otvory musí být vybaveny pevně instalovaným zařízením v souladu s 9.1.0.40.2.2 (c), které umožní jejich rychlé uzavření. Musí být zřejmé, zda jsou otevřené nebo zavřené.
- 9.1.0.12.5 Ventilátory včetně motorů, které se používají uvnitř chráněné oblasti a motory pro ventilátory nákladového prostoru, které jsou uspořádané pro použití v zóně 1. Musí splňovat minimálně požadavky na teplotní třídu T4 a skupinu výbušnosti II B.

9.1.0.12.6 Požadavky 9.1.0.12.3 (b) nebo (c) musí být splněny pouze, pokud se plavidlo nachází uvnitř nebo v bezprostřední blízkosti vyznačené pobřežní zóny.

9.1.0.13

-

9.1.0.16

(Vyhrazeno)

9.1.0.17

Obytné a provozní prostory

9.1.0.17.1 Obytné prostory musí být od nákladních prostor odděleny kovovými přepážkami bez otvorů.

9.1.0.17.2 Otvory obytných prostor a kormidelny, které jsou nasměrovány k nákladním prostorům, musí být možné plynotěsně uzavřít.

9.1.0.17.3 Přístupy a otvory do strojoven a provozních prostor nesmí být nasměrovány směrem k chráněné oblasti.

9.1.0.18

(Vyhrazeno)

9.1.0.19

(Vyhrazeno)

9.1.0.20

Balastní voda

Dvojitě boky a dvojitě dno smí být zařízení pro příjem balastní vody.

9.1.0.21

-

9.1.0.30

(Vyhrazeno)

9.1.0.31

Motory

9.1.0.31.1 Smějí být instalovány pouze spalovací motory, které jsou provozovány palivem, které má bod vzplanutí vyšší než 55 °C. Toto ustanovení neplatí pro motory s vnitřním spalováním, které jsou součástí pohonných a pomocných systémů. Tyto systémy musí splňovat požadavky Kapitoly 30 a Přílohy 8, oddílu 1 Evropské Normy, která stanoví Technické požadavky pro plavidla vnitrozemské plavby (ES-TRIN) ve znění pozdějších předpisů¹.

9.1.0.31.2 Větrací otvory strojoven a sací otvory motorů, jestliže tyto nenasávají vzduch přímo ze strojovny, musí být vzdáleně minimálně 2,00 m od chráněné oblasti.

9.1.0.31.3 V chráněné oblasti musí být vyloučen vznik jisker.

9.1.0.32

Palivové tanky

9.1.0.32.1 Dvojitá dna v oblasti nákladu mohou být použita jako palivové tanky, pokud je jejich výška minimálně 0,60 m. Rozvody paliva a otvory těchto tanků v nákladních prostorech jsou zakázány.

9.1.0.32.2 Odvětrávací potrubí všech palivových tanků musí být vyvedeny minimálně 0,50 m nad otevřenou palubou. Tyto otvory a vývody přepadových trubek, které vedou na palubu, musí být chráněny mřížkou nebo děrovanou destičkou.

9.1.0.33

(Vyhrazeno)

9.1.0.34

Výfuková potrubí

9.1.0.34.1 Výfukové plyny musí být odváděny do volného prostoru výfukovým potrubím skrz bok trupu. Výstupní otvor musí být vzdálen minimálně 2,00 m od otvorů nákladních prostor. Výfuková potrubí z motorů musí být vedena tak, aby se výfukové plyny vzdálily od plavidla. Výfukové potrubí nesmí být umístěno do chráněné oblasti.

9.1.0.34.2

Výfukové potrubí musí být opatřeno ochranou proti úniku jisker, např. lapačem jisker.

9.1.0.35

Dočerpávací zařízení

Dočerpávací čerpadla pro nákladní prostory musí být umístěna v chráněné oblasti. To neplatí, jestliže dočerpání je prováděno ejektory.

¹ Jak je přístupná na webových stránkách Comité Européen pour l'Élaboration de Standards dans le Domaine de Navigation Intérieure – CESNI, <https://www.cesni.eu/en/documents/es-trin/>.

9.1.0.36

9.1.0.39

(Vyhrazeno)

9.1.0.40

Hasicí zařízení

9.1.0.40.1

Na plavidle musí být instalován hasicí systém. Tento systém musí splňovat následující požadavky:

- Musí být zásobován dvěma nezávislými požárními nebo balastovacími čerpadly, z nichž jedno musí být připraveno kdykoliv k použití. Tato čerpadla a rovněž jejich napájení a elektrická zařízení, se nesmí instalovat v jednom a tom samém prostoru;
- Musí být vybaven vodním potrubím s nejméně třemi hydranty v chráněné oblasti nad palubou. Musí mít tři vhodné a dostatečně dlouhé hadice s proudnicemi/rozstřikovacími hubicemi o průměru nejméně 12 mm. Alternativně jedna nebo více soustav hadic může být nahrazena směrovými proudnicemi/rozstřikovacími hubicemi o průměru nejméně 12 mm. Musí být možno dosáhnout kteréhokoli bodu paluby v chráněné oblasti současně nejméně dvěma proudy vody, které nevycházejí z téhož hydrantu. Pružinový nevratný ventil musí zabránit tomu, aby plyny mohly vniknout hasicím systémem do obytných nebo provozních prostorů mimo chráněnou oblast;
- Kapacita systému musí být nejméně dostačující k tomu, aby proud vody dosáhl do vzdálenosti rovnající se nejméně šířce z kteréhokoli místa na palubě při současném použití dvou rozprašujících trysek.
- Systém dodávky vody musí být schopen uvedení do provozu z kormidelny a z paluby;
- Musí být provedena opatření proti zamrznutí hasicích prostředků a hydrantů.

Na tlačných člunech bez vlastního pohonu je dostačující jedno požární nebo balastovací čerpadlo.

9.1.0.40.2

Vedle toho musí být strojovny vybaveny pevně instalovaným hasicím systémem splňujícím následující požadavky:

9.1.0.40.2.1

Hasiva

K ochraně prostorů ve strojovnách, kotelnách a prostorech s čerpadly jsou dovoleny jen pevně instalované hasicí systémy používající následující hasiva:

- (a) CO₂ (oxid uhličitý);
- (b) HFC 227 ea (heptafluorpropan);
- (c) IG-541 (52 % dusíku, 40 % argonu, 8 % oxidu uhličitého);
- (d) FK-5-1-12 (dodecaflor-2-methylpentan-3-on);
- (e) (Vyhrazeno);
- (f) K₂CO₃ (uhličitán draselný).

Jiná hasiva jsou povolena jen na základě doporučení Administrativního výboru.

9.1.0.40.2.2

Větrání, odsávání vzduchu

- (a) Spalovací vzduch potřebný pro spalovací motory zajišťující pohon by se neměl dostat z prostorů chráněných pevně instalovanými hasicími systémy. Tento požadavek není povinný, pokud má plavidlo dvě nezávislé hlavní strojovny, plynotěsně oddělené, nebo pokud má kromě hlavní strojovny oddělenou strojovnu, v níž je instalován předřadové dokormidlovací zařízení, které může samo zajistit pohon v případě požáru v hlavní strojovně.
- (b) Všechny větrací systémy s nuceným větráním v prostoru, který se má chránit, se musí automaticky vypnout, jakmile se spustí hasicí systém.
- (c) Všechny otvory v prostoru, který se má chránit, umožňující vnikání vzduchu nebo unikání plynu musí být vybaveny prostředky, které je dovolí rychle uzavřít. Musí být jasné, zda jsou otevřené, nebo uzavřené.
- (d) Vzduch unikající z ventilů pro vyrovnávání tlaku tanků s tlakovým vzduchem, instalovaných ve strojovnách, musí být odváděn do ovzduší.
- (e) Přetlak nebo podtlak způsobený rozptýlením hasiva nesmí zničit podstatné části prostoru, který se má chránit. Musí být možno zajistit bezpečné vyrovnání tlaku.
- (f) Chráněné prostory musí být opatřeny prostředky pro odsávání hasiva a spalin. Tyto prostředky musí být ovladatelné z míst mimo chráněný prostor a takových, která nemohou být z nepřístupněna požárem v těchto prostorech. Jsou-li instalována odsávací zařízení, nesmí být možno je spustit během hašení.

9.1.0.40.2.3 Požární poplachový systém

Prostor, který se má chránit, musí být monitorován vhodným požárním poplachovým systémem. Poplachový signál musí být slyšitelný v kormidelně, obytných prostorech a v prostoru, který se má chránit.

9.1.0.40.2.4 Potrubní systém

- (a) Hasivo musí být vedeno do prostoru, který se má chránit, a v něm rozváděno pomocí trvalého potrubního systému. Potrubí instalované v prostoru, který se má chránit, a armatury, které jsou jeho součástí, musí být vyrobeny z oceli. Toto neplatí pro spojovací nástavce tanků a kompenzátory, za podmínky, že použité materiály mají rovnocenné ohnivzdorné vlastnosti. Potrubí musí být zevnitř i zevnějšku chráněno proti korozi.
- (b) Výpustné hubice musí být upraveny tak, aby zajistily rovnoměrné rozptýlení hasiva. Zejména látka dusící plameny musí rovněž být účinná pod podlahou.

9.1.0.40.2.5 Spouštěcí zařízení

- (a) Hasicí systémy uváděné do činnosti automaticky nejsou dovoleny.
- (b) Musí být možno uvést hasicí systém do činnosti z vhodného místa nacházejícího se vně prostoru, který se má chránit.
- (c) Spouštěcí zařízení musí být instalována tak, aby mohla být uvedena do činnosti v případě požáru, a tak, aby riziko jejich poruchy v případě požáru nebo výbuchu v prostoru, který se má chránit, bylo zmenšeno na nejmenší možnou míru.

Systémy, které nejsou uváděny do činnosti mechanicky, musí být napájeny ze dvou navzájem nezávislých energetických zdrojů. Tyto energetické zdroje musí být umístěny vně prostoru, který se má chránit. Ovládací vedení umístěné v prostoru, který se má chránit, musí být zkonstruováno tak, aby zůstalo ve funkčním stavu v případě požáru trvajícím nejméně 30 minut. Elektrické instalace se považují za vyhovující tomuto požadavku, pokud odpovídají normě IEC 60331-21:1999.

Jsou-li spouštěcí zařízení umístěna tak, že nejsou viditelná, musí být na součásti, která je zakrývá, umístěn symbol „hasicího systému“ o stranách nejméně 10 cm s následujícím nápisem provedeným červenými písmeny na bílém podkladu:

Hasicí systém

- (d) Je-li hasicí systém určen k ochraně více prostorů, musí zahrnovat oddělené a jasně označené spouštěcí zařízení pro každý prostor.
- (e) každého spouštěcího zařízení musí být umístěny pokyny, které musí být jasně viditelné a nesmazatelné. Pokyny musí být v jazyce, který velitel plavidla umí číst a rozumí mu a, pokud tímto jazykem není angličtina, francouzština nebo němčina, musí být v angličtině, francouzštině nebo němčině. Musí obsahovat tyto informace:
 - (i) spouštění hasicího systému;
 - (ii) nutnost přesvědčit se, že všechny osoby opustily prostor, který se má chránit;
 - (iii) činnosti posádky při zapnutí systému a při vchodu do chráněného prostoru po zapnutí systému nebo zaplnění hasicí látkou, zejména s ohledem na možnou přítomnost nebezpečných látek;
 - (iv) správné chování se posádky v případě, že hasicí systém správně nefunguje.
- (f) V pokynech musí být uvedeno, že se před uvedením hasicího systému do činnosti musí vypnout spalovací motory umístěné v prostoru nebo nasávající vzduch z prostoru, který se má chránit.

9.1.0.40.2.6 Poplachové zařízení

- (a) Pevně instalované hasicí systémy musí být vybaveny opticko-akustickým poplachovým zařízením.
- (b) Poplachové zařízení se musí spustit automaticky, jakmile se hasicí systém uvede poprvé do činnosti. Poplachové zařízení musí fungovat po vhodnou dobu předtím, než dojde k vypuštění hasiva; nesmí být možné je vypnout.
- (c) Poplachové signály musí být jasně viditelné v prostorech, které se mají chránit, a na přístupových místech k nim a musí být zřetelně slyšitelné za provozních podmínek

odpovídajících nejvyšší možné hladině hluku. Musí být možno je zřetelně rozlišit od všech ostatních zvuků a vizuálních signálů v prostoru, který se má chránit.

- (d) Zvukové poplachy musí být zřetelně slyšitelné také v přilehlých prostorech se zavřenými spojovacími dveřmi a za provozních podmínek odpovídajících nejvyšší možné hladině hluku.
- (e) Pokud není poplachové zařízení samo o sobě chráněno proti zkratům, přerušným vodičům a poklesům napětí, musí být možno monitorovat jeho činnost.
- (f) U vstupu do každého prostoru, kam může dosáhnout hasivo, musí být umístěna tabulka s následujícím nápisem provedeným červenými písmeny na bílém podkladu:

**POZOR, HASICÍ SYSTÉM!
OPUSŤTE TENTO PROSTOR IHNEDE PO (popis) SIGNÁLU!**

9.1.0.40.2.7 *Tlakové tanky, armatury a potrubí*

- (a) Tlakové tanky, armatury a potrubí musí odpovídat požadavkům příslušného orgánu nebo, pokud nejsou takové požadavky, požadavkům uznané klasifikační společnosti.
- (b) Tlakové tanky musí být instalovány podle pokynů výrobce.
- (c) Tlakové tanky, armatury a potrubí nesmějí být instalovány v obytných prostorech.
- (d) Teplota skříní a úložných prostorů pro tlakové tanky nesmí překročit 50 °C.
- (e) Skříně a úložné prostory na palubě musí být bezpečně uloženy a musí mít odvětrávací otvory umístěny tak, aby v případě, že tlakový tank není plynotěsný, nemohl unikající plyn vniknout do plavidla. Přímé spojení s jinými prostory není dovoleno.

9.1.0.40.2.8 *Množství hasiva*

Je-li množství hasiva určeno pro více než jeden prostor, nemusí být disponibilní množství hasiva větší, než je množství vyžadované pro největší z takto chráněných prostorů.

9.1.0.40.2.9 *Instalace, údržba, kontrola a dokumentace*

- (a) Montáž nebo úprava systému smí být prováděna pouze společností specializovanou na hasicí systémy. Je nutno se řídit pokyny (technický list výrobku, bezpečnostní list) poskytnutými výrobcem hasiva nebo systému.
- (b) Systém musí být podroben inspekci provedené znalcem:
 - (i) před uvedením do provozu;
 - (ii) pokaždé, kdy se uvádí zpět do provozu po své aktivaci;
 - (iii) po každé úpravě nebo opravě;
 - (iv) pravidelně, nejméně každé dva roky.
- (c) Během inspekce musí znalec zkontrolovat, zda systém odpovídá požadavkům v 9.1.0.40.2.
- (d) Inspekce musí zahrnovat alespoň:
 - (i) vnější kontrolu celého systému;
 - (ii) kontrolu těsnosti potrubí;
 - (iii) kontrolu dobré funkce ovládacích a aktivačních systémů;
 - (iv) kontrolu tlaku a obsahu tanků;
 - (v) kontrolu těsnosti uzavíracích zařízení prostoru, který se má chránit;
 - (vi) kontrolu požárního poplachového systému;
 - (vii) kontrolu poplachového zařízení.
- (e) Osoba provádějící inspekci musí vystavit, podepsat a opatřit datem osvědčení o inspekci.
- (f) V osvědčení o inspekci musí být uveden počet pevně instalovaných hasicích systémů.

9.1.0.40.2.10 *Hasicí systém s CO₂*

Kromě požadavků uvedených v 9.1.0.40.2.1 až 9.1.0.40.2.9 musí hasicí systémy používající jako hasivo CO₂ odpovídat následujícím ustanovením:

- (a) Tanky s CO₂ musí být uloženy v plynotěsném prostoru nebo skříní, které jsou odděleny od jiných prostorů. Dveře takových úložných prostorů a skříní se musí otevírat směrem ven; musí být možno je uzamknout a musí být na vnější straně opatřeny symbolem „Pozor, obecné nebezpečí“, nejméně 5 cm vysokým a „CO₂“ v téže barvě a téže velikosti;
- (b) Úložné skříně nebo prostory pro tanky s CO₂ umístěné pod palubou musí být přístupné pouze zvenku. Tyto prostory musí mít uměle vytvořený větrací systém s odsávacími kryty a musí být zcela nezávislé na ostatních větracích systémech nacházejících se na plavidle;

- (c) Stupeň plnění tanků s CO₂ nesmí překročit 0,75 kg/l. Pro objem stlačeného CO₂ se bere hodnota 0,56 m³/kg;
- (d) Koncentrace CO₂ v prostoru, který se má chránit, nesmí být menší než 40 % celkového objemu prostoru. Toto množství musí být vypuštěno do 120 sekund. Musí být možno kontrolovat, zda probíhá správně rozstřikování;
- (e) Otevírání ventilů tanku a ovládání rozstřikovacího ventilu musí odpovídat dvěma různým operacím;
- (f) Vhodná doba uvedená v 9.1.0.40.2.6 (b) nesmí být menší než 20 sekund. Spolehlivé zařízení musí zajistit načasování rozstřikování CO₂.

9.1.0.40.2.11 *Hasicí systém s HFC-227 ea (heptafluoropropanem)*

Kromě požadavků uvedených v 9.1.0.40.2.1 až 9.1.0.40.2.9 musí hasicí systémy používající jako hasivo HFC-227 ea odpovídat následujícím ustanovením:

- (a) Tam, kde je více prostorů s rozdílnými celkovými objemy, musí být každý prostor vybaven svým vlastním hasicím systémem;
- (b) Každý tank obsahující HFC-227 ea, umístěný v prostoru, který se má chránit, musí být vybaven zařízením k zamezení nadměrnému tlaku. Toto zařízení musí zajistit bezpečně rozptýlení obsahu tanku v prostoru, který se má chránit, jestliže je tank zachvácen požárem, když hasicí systém ještě nebyl uveden do provozu;
- (c) Každý tank musí být vybaven zařízením dovolujícím kontrolovat tlak plynu;
- (d) Stupeň plnění tanků nesmí překročit 1,15 kg/l. Pro měrný objem stlačeného HFC 227 ea se bere hodnota 0,1374 m³/kg;
- (e) Koncentrace HFC-227 ea v prostoru, který se má chránit, nesmí být menší než 8 % celkového objemu prostoru. Toto množství musí být vypuštěno do 10 sekund;
- (f) Tanky s HFC-227 ea musí být vybaveny zařízením kontroly tlaku, které spustí slyšitelný a viditelný poplach v kormidelně v případě mimořádné ztráty hnacího plynu. Pokud plavidlo nemá kormidelnu, musí být poplach spuštěn vně prostoru, který se má chránit;
- (g) Po vypuštění nesmí koncentrace v prostoru, který se má chránit, překročit 10,5 % (objemu);
- (h) Hasicí systém nesmí zahrnovat hliníkové součásti.

9.1.0.40.2.12 *Hasicí systém s IG-541*

Kromě požadavků uvedených v 9.1.0.40.2.1 až 9.1.0.40.2.9 musí hasicí systémy používající jako hasivo IG-541 odpovídat následujícím ustanovením:

- (a) Tam, kde je více prostorů s rozdílnými celkovými objemy, musí být každý prostor vybaven svým vlastním hasicím systémem;
- (b) Každý tank obsahující IG-541 ea, umístěný v prostoru, který se má chránit, musí být vybaven zařízením k zamezení nadměrnému tlaku. Toto zařízení musí zajistit bezpečně rozptýlení obsahu tanku v prostoru, který se má chránit, jestliže je tank zachvácen požárem, když hasicí systém ještě nebyl uveden do provozu;
- (c) Každý tank musí být vybaven zařízením dovolujícím kontrolovat obsah;
- (d) Plnicí tlak tanků nesmí překročit 200 barů při teplotě +15 °C;
- (e) Koncentrace IG-541 v prostoru, který se má chránit, musí být nejméně 44 % a nejvýše 50 % celkového objemu prostoru. Toto množství musí být vypuštěno do 120 sekund;

9.1.0.40.2.13 *Hasicí systémy používající FK-5-1-12*

Mimo požadavků uvedených v 9.1.0.40.2.1 až 9.1.0.40.2.9 musí hasicí systémy využívající FK-5-1-12 jako hasivo, odpovídat těmto předpisům:

- (a) Pro případ několika prostor majících různý celkový objem, musí být každý prostor vybaven vlastním hasicím systémem;
- (b) Každá nádrž s FK-5-1-12 umístěná v chráněném prostoru, musí být vybavena zařízením zabraňujícím vytváření přetlaku. Toto zařízení musí bezpečným způsobem zajišťovat rozptýlení obsahu nádrže v chráněném prostoru v případě, když uvedená nádrž je pod vlivem ohně v době, kdy hasicí systém není uveden do činnosti;
- (c) Každá nádrž musí být vybavena zařízením, umožňujícím kontrolovat tlak plynu;
- (d) Úroveň naplnění nádrže nesmí přesahovat 1,0 kg/l. Za specifický objem FK-1-12, který není pod tlakem, se považuje veličina, která se rovná 0,0719 m³/kg;
- (e) Objem FK-5-1-12, podávaný do chráněného prostoru, musí dosahovat nejméně 5,5 % celkového objemu daného prostoru, Vypouštění tohoto množství se musí provádět do 10 vteřin;

- (f) Nádrž s FK-5-1-12 musí být vybavena kontrolním zařízením, tlaku, dávajícím opticko-akustický poplachový signál do kormidelny v případě nadměrné ztráty hasicí látky. Není-li kormidelna, je nutno tento poplachový signál vně chráněného prostoru;
- (g) Po rozptýlení koncentrace v chráněném prostoru tato nesmí přesáhnout 10,0 %.

9.1.0.40.2.14 (Vyhrazeno)

9.1.0.40.2.15 *Hasicí systémy používající jako hasivo K₂CO₃.*

Vedle požadavků uvedených v 9.1.0.40.2.1 až 9.1.0.40.2.3, 9.1.0.40.2.5, 9.1.0.40.2.6, a 9.1.0.40.2.9, hasicí systémy používající jako hasivo K₂CO₃, musí splňovat následující ustanovení:

- (a) Hasicí systém musí být typu schváleného v souladu se Směrnicí 2014/90/EU² nebo MSC/Circ. 1270³;
- (b) Každý prostor musí být vybaven vlastním hasicím systémem;
- (c) Hasivo musí být uskladněno ve k tomu určených nepřetlakových tancích v prostoru, který má chránit. Tyto tanky musí být konstruovány tak, aby se hasivo v prostoru rozptýlilo rovnoměrně. Hasivo musí především působit také pod palubními deskami.
- (d) Každý tank je samostatně napojen na spouštěcí zařízení.
- (e) Množství hasiva, které vytváří suchý aerosol, musí být v poměru k chráněnému prostoru minimálně 120 g na m³ čistého objemu tohoto prostoru. Tento čistý objem se počítá podle Směrnice 2014/90/EU² nebo podle MSC/Circ. 1270³. Musí být možné dodat hasivo do 120 vteřin.

9.1.0.40.2.16 *Stacionární hasicí systém pro fyzickou ochranu*

K zajištění fyzické ochrany ve strojovnách, kotelnách a prostorech s čerpadly jsou dovoleny stacionární hasicí systémy jen na základě doporučení Administrativního výboru.

9.1.0.40.3 Dva ruční hasicí přístroje zmíněné v 8.1.4 musí být umístěny v chráněné oblasti.

9.1.0.40.4 Hasivo v pevně instalovaném hasicím systému musí být vhodné a v dostatečném množství pro zdoání požárů.

9.1.0.41 **Oheň a otevřené světlo**

9.1.0.41.1 Vyústění komínů se musí nacházet v minimální vzdálenosti 2,00 m od otvorů nákladních prostor. Musí existovat zařízení, která zabrání úniku jisker a průniku vody.

9.1.0.41.2 Topné, varné a chladicí přístroje nesmí být provozovány ani kapalnými pohonnými hmotami, zkapalněnými plyny, ani pevnými hořlavými hmotami. Pokud jsou topné přístroje nebo topné kotle umístěny do strojoven nebo do prostor, které jsou pro to zvláště vhodné, smí být provozovány kapalnými pohonnými hmotami, avšak s bodem vzplanutí vyšším než 55 °C.

Zařízení na vaření a chlazení je povoleno jen v kormidelně s kovovou spodní částí a v obytných prostorech.

9.1.0.41.3 Mimo obytné prostory a kormidelnu jsou povolena pouze elektrická osvětlovací zařízení.

9.1.0.42 –

9.1.0.50 (Vyhrazeno)

9.1.0.51 **Povrchová teplota elektrických a neelektrických instalací a zařízení**

- (a) Povrchové teploty elektrických a neelektrických instalací a zařízení i vnějších částí motorů a jejich přívodů a výfuků nesmí překročit 200 °C;
- (b) Z výše uvedeného ustanovení je vyňato:
 - Obytné prostory, kormidelna a provozní prostory, kde povrchové teploty překračují 200 °C, které jsou vybaveny větracím systémem podle 9.1.0.12.3; nebo
 - Instalace a zařízení, která generují povrchové teploty vyšší než 200 °C a která lze vypnout. Takové instalace a zařízení musí být označeny červeně.
- (c) V chráněné oblasti platí 9.1.0.53.1;

² Úřední věstník Evropské unie č. L 257 z 28.8. 2014, str.146.

³ Oběžník Mezinárodní námořní organizace MSC/Circ. 1270 a opravy — Revidované pokyny pro schválení stabilních aerosolových hasicích systémů odpovídajících stabilním plynovým hasicím systémům, jak je uvedeno v úmluvě SOLAS 1974, pro strojovny — přijaté 4.6.2008.

- (d) Požadavky 9.1.0.51 (a) nebo (b) musí být splněny pouze pokud se plavidlo nachází uvnitř nebo v bezprostřední blízkosti vyznačené pobřežní zóny.

9.1.0.52 Typ a umístění elektrických instalací a zařízení

9.1.0.52.1 Elektrické instalace a zařízení mimo chráněné místnosti musí být minimálně typ „omezené riziko výbuchu“; Toto ustanovení se neuplatňuje u:

- (a) Instalací osvětlení v obytných prostorech a kormidelně, s výjimkou spínačů umístěných v blízkosti vchodů;
- (b) Mobilních telefonů, stabilních telefonních instalací a stacionárních a přenosných počítačů v obytných prostorech nebo kormidelně;
- (c) Elektrické instalace a zařízení, která během pobytu v bezprostřední blízkosti nebo ve vyznačené pobřežní oblasti, jsou:
 - Nezapojená, bez napětí; nebo
 - Instalována v prostorech, které jsou vybaveny větracím systémem podle 9.1.0.12.3;
- (d) Radiotelefonní zařízení a stanice vnitrozemského systému AIS (systémy automatické identifikace) v obytných prostorech a kormidelně, pokud se žádná část antény pro radiotelefonní zařízení nebo stanice AIS nenachází nad nebo do 2,00 m od chráněné oblasti.

9.1.0.52.2 Pevné elektrické instalace a zařízení, která nespĺňují požadavky stanovené v 9.1.0.52.1 a jejich spínače, musí být označeny červeně. Odpojení těchto zařízení musí být řízeno z centrálního místa na palubě.

9.1.0.52.3 Zásuvky pro zapojení signálního osvětlení a osvětlení lávky musí být pevně instalovány na plavidle v bezprostřední blízkosti signálního stožáru nebo lodní lávky. Zásuvky pro připojení ponorných čerpadel, kontejnerů a ventilátorů nákladních prostor musí být pevně instalovány v bezprostřední blízkosti otvorů do nákladních prostor. Zásuvky musí být provedeny tak, aby bylo možné je připojit nebo odpojit pouze tehdy, když nejsou pod napětím.

9.1.0.52.4 Akumulátory se musí nacházet mimo chráněnou oblast.

9.1.0.52.5 Porucha napájecího zdroje bezpečnostního a kontrolního zařízení musí být okamžitě signalizována optickými a akustickými signály v kormidelně a na palubě. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor.

9.1.0.52.6 Elektrické spínače, zásuvky a kabely na palubě musí být chráněny proti mechanickému poškození.

9.1.0.52.7 Požadavky 9.1.0.52.1 nebo 9.1.0.52.2 musí být splněny pouze, pokud se plavidlo nachází uvnitř nebo v bezprostřední blízkosti vyznačené pobřežní zóny.

9.1.0.53 Typ a umístění elektrických instalací a zařízení určených pro použití v chráněné oblasti

9.1.0.53.1 Elektrické instalace a zařízení v chráněné oblasti musí být možné vypnout pomocí centrálně umístěných izolačních spínačů s výjimkou případů, kdy:

- V úložných prostorech, jsou vhodné alespoň pro použití v zóně 1, pro teplotní třídu T4 a skupinu výbušnosti II B; a
- V chráněné oblasti na palubě, jsou typu „omezené riziko výbuchu“.

Odpovídající elektrické obvody musí mít kontrolky, které indikují, zda jsou obvody pod napětím.

Izolační spínače musí být chráněny proti neúmyslnému zapnutí. Ponorná čerpadla instalovaná nebo používaná v nákladních prostorech musí být vhodné alespoň pro použití v zóně 1, pro teplotní třídu T4 a skupinu výbušnosti II B.

9.1.0.53.2 Zásuvky používané v chráněné oblasti musí být provedeny tak, aby nebylo možné připojení nebo odpojení, s výjimkou případů, kdy nejsou pod napětím.

9.1.0.53.3 S výjimkou optických vláken musí být elektrické kabely v chráněné oblasti pancéřovány nebo umístěny v kovovém plášti nebo v ochranných trubkách.

9.1.0.53.4 Pohyblivé elektrické kabely jsou v chráněné oblasti zakázány, s výjimkou elektrických kabelů pro jiskrově bezpečné elektrické obvody nebo těch pro připojení:

- (a) signální světla a osvětlení lávek, pokud je spojovací bod (například zásuvka) trvale zabudován v plavidle v blízkosti signálního stožáru nebo lávky;
- (b) kontejnerů;

- (c) elektricky ovládaných pojezdů krytů nákladních prostor;
- (d) ponorných čerpadel;
- (e) ventilátorů nákladního prostoru;
- (f) elektrické sítě na plavidle do pozemní elektrické sítě; pokud:
 - elektrické kabely a napájecí jednotka odpovídají platné normě (například EN 15869-03:2010);
 - jsou napájecí jednotka a konektory umístěny mimo chráněnou oblast.

Je připojování a odpojování zásuvek/konektorů možné pouze tehdy, když nejsou pod napětím.

9.1.0.53.5 Pro pohyblivé elektrické kabely povolené v souladu s 9.1.0.53.4 se smí používat pouze elektrické kabely s pryžovým pláštěm typu H07 RN-F v souladu s IEC-60245-4:2011⁴ nebo elektrické kabely přinejmenším srovnatelného provedení s vodiči o průřezu minimálně 1,5 mm².

9.1.0.53.6 Neelektrické instalace a zařízení v chráněné oblasti, která jsou určena pro použití při nakládce a vykládce nebo pobytu v bezprostřední blízkosti nebo ve vyznačené pobřežní oblasti musí splňovat alespoň požadavky pro použití v dotyčné oblasti. Musí splňovat alespoň požadavky na teplotní třídu T4 a skupinu výbušnosti II B.

⁴ Identická s EN 50525-2-21: 2011

9.1.0.88 Klasifikace

9.1.0.88.1 Plavidla s dvojitou obšivkou, která jsou určena pro přepravu nebezpečných věcí tříd 2, 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 7, 8 nebo 9, vyjma těch s bezpečnostní značkou vzoru č. 1 ve sloupci (5) tabulky A kapitoly 3.2, ve větších množstvích, než je uvedeno v 7.1.4.1.4, musí být postavena nebo přestavována pod dohledem uznané klasifikační společnosti pro jejich nejvyšší třídu. Toto musí být potvrzeno osvědčením klasifikační společnosti.

9.1.0.88.2 Pokračování třídy není vyžadováno.

9.1.0.88.3 Pozdější přestavby a velké opravy trupu plavidel musí být prováděny pod dohledem klasifikační společnosti.

9.1.0.89

-

9.1.0.90 (Vyhrazeno)**9.1.0.91 Nákladní prostory**

9.1.0.91.1 Plavidlo musí být v chráněné oblasti provedeno jako plavidlo s dvojitou obšivkou s dvojitými boky a dvojitým dnem.

9.1.0.91.2 Vzdálenost mezi boční stěnou plavidla a boční stěnou nákladního prostoru musí být minimálně 0,80 m. Bez ohledu na předpisy, týkající se šířky přechodů na palubě plavidla, je povoleno zmenšení této vzdálenosti na 0,60 m, pokud vzhledem k předpisům o dimenzování dle stavebního předpisu uznané klasifikační společnosti existuje následující zesílení:

(a) Při podélném vyztužení boku plavidla nesmí být rozteč žebor větší než 0,60 m.
Při podélném systému vyztužení boků musí být podélné výztuhy uchyceny v rámových žebrech s odlehčujícími otvory podobně jako ve dvojitém dně a vzdálenost mezi rámovými žebry nesmí být větší jak 1,80 m. Tyto vzdálenosti mohou být zvýšeny, když je konstrukce příslušným způsobem zesílena;

(b) Při provedení boku plavidla pomocí příčného vyztužení, musí být umístěny buď:
- dvě podélné boční výztuhy. Vzdálenost podélných bočních výztuh navzájem a od ochozu nesmí být větší než 0,80 m. Výztuhy musí mít minimálně stejnou výšku jako příčné výztuhy a jejich příčný průřez nesmí být menší než 15 cm².

Podélné výztuhy jsou uchyceny v rámových žebrech, které jsou podobné dnovým nosníkům s odlehčujícími otvory, vzdálenost rámových žebor je maximálně 3,60 m. Boční příčné žebro a vzpěry přepážek nákladních prostor musí být na outoru spojeny pomocí stykového rohového plechu s minimální výškou 0,90 m a tloušťkou odpovídající tloušťce dnové příčky; nebo:

- na každém žeboru musí být rámová konstrukce, podobná dnovým žebřům s odlehčujícími otvory.

(c) Ochozy musí být navzájem spojeny ve vzdálenosti nejvýše 32,00 m příčnou přepážkou nebo vzpěrnou trubkou.

Namísto podmínky, uvedené v (c), stačí výpočetní důkaz uznané klasifikační společnosti, že uspořádáním doplňujících výztuh v dvojitých bocích je dána dostatečná příčná pevnost.

9.1.0.91.3 Výška prostoru dvojitého dna musí být nejméně 0,50 m. Pod drenážními jímkami může být přítom snížena, na vzdálenost mezi dnem jímky a obšivkou dna plavidla nesmí být menší než 0,40 m. V případě vzdálenosti od 0,40 do 0,49 m plocha příčného průřezu jímky nesmí převýšit 0,50 m².

Kapacita jímek nesmí přesahovat 0,120 m³.

9.1.0.92 Nouzový východ

Prostory, jejichž vstupy nebo výstupy se v případě poškození plavidla zcela nebo částečně ponoří, musí být opatřeny nouzovým východem, který se nachází nejméně 0,10 m nad vodoryskou. To neplatí pro přední a zadní kolizní prostor.

9.1.0.93 Stabilita (obecně)

9.1.0.93.1 Musí být prokázána dostatečná stabilita včetně stability v poškozeném stavu.

9.1.0.93.2 Základní hodnoty pro výpočet stability – hmotnost prázdného plavidla a poloha těžiště hmotnosti – musí být určeny buď pomocí nakláněcího pokusu nebo detailním výpočtem hmotnosti. Přitom se musí ověřit hmotnost prázdného plavidla měřením ponoru, přičemž se vypočtená hmotnost nesmí lišit více než o $\pm 5\%$ od hodnoty hmotnostního výtlačku určené ze změřeného ponoru.

9.1.0.93.3 Musí být prokázána dostatečná stabilita v nepoškozeném stavu pro všechna stádia nakládky a vykládky a pro konečný stav naložení.

Musí být prokázána plovatelnost v poškozeném stavu pro nejnepříznivější stav naložení. Přitom musí být předložen důkaz dostatečné stability pro kritické mezistavy a konečný stav zaplavení. Pokud se při mezistavech vyskytnou negativní parametry stability, mohou být akceptovány, pokud další průběh křivky ramen stability prokazuje dostatečné kladné hodnoty stability.

9.1.0.94 **Stabilita (v nepoškozeném stavu)**

9.1.0.94.1 Požadavky na stabilitu v nepoškozeném stavu, vyplývající z výpočtu zaplavení, nesmí být překročeny.

9.1.0.94.2 Při přepravě nákladu v kontejnerech musí nadto být dokázána dostatečná stabilita podle Pravidel uvedených v 1.1.4.6.

9.1.0.94.3 Pro plavidlo je rozhodující přísnější z požadavků v 9.1.0.94.1 a 9.1.0.94.2.

9.1.0.95 **Stabilita (v případě poškození)**

9.1.0.95.1 V případě poškození je třeba zohlednit následující:

- (a) rozsah poškození na jednom boku plavidla:
- podélný rozsah: nejméně 0,10 L, avšak ne méně než 5,00 m;
 - příčný rozsah: 0,59 m dovnitř od boku plavidla, kolmo k podélné ose plavidla na úrovni roviny ponoru při maximálním ponoru;
 - svislý rozsah: neohraničený od základní roviny vzhůru;
- (b) rozsah poškození dna:
- podélný rozsah: minimálně 0,10 L, avšak ne méně než 5,00 m;
 - příčný rozsah: 3,00 m;
 - svislý rozsah: 0,49 m vzhůru od základny kromě sacích jímek;
- (c) Všechny přepážky, spadající do oblasti poškození, se považují za prorazené, to znamená, že dělení přepážkami na úseky musí být voleno tak, aby bylo plavidlo plavby schopné i po zaplavení dvou nebo více přímo za sebou ležících úseků.

Přitom se musí dbát na následující:

- při poškození dna se považují za zaplavené i úseky, ležící vedle sebe napříč plavidla;
- spodní hrany vodotěsně uzavíratelných otvorů (např. dveří, oken, palubních poklopů), musí v konečné fázi zaplavení ležet nejméně 0,10 m nad rovinou ponoru;
- všeobecně se musí počítat s 95 % rozsahem zatopení. Je-li výpočtem prokázáno, že střední zaplavení v kterémkoli prostoru je menší než 95 %, může být dosazena vypočtená hodnota.

Dosazují se však následující minimální hodnoty:

- Strojovna: 85 %
- Prostory pro posádku: 95 %
- Dvojitě dno, palivové tanky, balastní nádrže atd. podle toho, zda je dle jejich určení lze považovat při maximálním ponoru za plné nebo prázdné: 0 nebo 95%

Pro hlavní strojovnu stačí prokázat schopnost plavby jen pro stav zaplavení jednoho úseku, tj. konečné přepážky strojovny se nepovažují za poškozené.

9.1.0.95.2 Náklon plavidla v rovnovážné poloze (konečném stadiu zaplavení) nesmí přesahovat 12°. Otvory, které nejsou vodotěsně uzavíratelné, se mohou zanořovat teprve až po dosažení rovnovážné polohy. Pokud se zanořují dříve, považují se k nim příslušné prostory při poškození za zaplavené.

Nad rovnovážnou polohu musí pozitivní oblast křivky vztyčeného ramene stability vykazovat $\geq 0,05$ m ve spojení s plochou $\geq 0,0065$ m.rad. Tyto minimální hodnoty stability musí být dodrženy až do zanoření prvních otvorů, které nejsou uzavřené tak, aby odolávaly vlivům počasí, avšak před úhlem

náklonu $\leq 27^\circ$. Zanoří-li se tyto otvory dřívě, je třeba k nim náležící prostory při výpočtu považovat za zatopené.

9.1.0.95.3

Vnitrozemská plavidla s nezajištěným nákladem kontejnerů musí dodržet následující kritéria stability při poškození:

Náklon plavidla v rovnovážné poloze (konečném stadiu zaplavení) nesmí přesáhnout 5° . Otvory, které nejsou vodotěsně uzavřené, se smí zanořit teprve po dosažení rovnovážné polohy. Pokud se takovéto otvory zanoří dřívě, považují se k nim náležící prostory za zatopené.

Nad rovnovážnou polohu musí pozitivní oblast křivky vztyčného ramene stability vykazovat plochu $\geq 0,0065$ m . rad. Minimální hodnoty stability musí být dodrženy až do zanoření prvních otvorů, které nejsou uzavřeny tak, aby odolávaly vlivům počasí, avšak před úhlem náklonu $\leq 10^\circ$. Zanoří-li se tyto otvory dřívě, je třeba k nim náležící prostory při výpočtu považovat za zatopené.

9.1.0.95.4

Pokud otvory, jimiž mohou být dodatečně zaplaveny nepoškozené prostory, mohou být vodotěsně uzavřeny, musí uzavírací zařízení být odpovídajícím způsobem označena.

9.1.0.95.5

Pokud jsou provedeny otvory pro přepouštění nebo zatopení pro snížení asymetrie, musí dojít k vyrovnání během 15 minut, pokud se v mezistavech prokáží dostatečné hodnoty stability v poškozeném stavu.

9.1.0.96

-

9.1.0.99

(Vyhrazeno)

KAPITOLA 9.2

PŘEDPISY PRO STAVBU NÁMOŘNÍCH PLAVIDEL, KTERÁ ODPOVÍDAJÍ PŘEDPISŮM SOLAS 74 KAPITOLA II-2, PRAVIDLO 19 NEBO SOLAS 74, KAPITOLA II-2 PRAVIDLO 54

9.2.0 Požadavky v 9.2.0.0 až 9.2.0.79 platí pro námořní plavidla, která odpovídají následujícím předpisům:

- SOLAS 74 kapitola II-2 pravidlo 19 ve změněném znění; nebo
- SOLAS 74 kapitola II-2 pravidlo 54 ve změněném znění podle kapitoly II-2, pravidlo 1, paragraf 2.1, uvedených použitelných usnesení, plavidel stanovených před 1. červencem 2002.

Námořní plavidla, které neodpovídají předpisům SOLAS 74, musí odpovídat požadavkům v 9.1.0.0 až 9.1.0.79.

9.2.0.0 *Stavební materiály*

Trup plavidel musí být postaven z lodní oceli nebo z jiného přinejmenším rovnocenného kovu, přičemž tato rovnocennost se týká mechanických vlastností a odolnosti proti vlivu teploty a ohně.

9.2.0.1

-

9.2.0.19

(Vyhrazeno)

9.2.0.20

Balastní voda

Dvojitě boky a dvojitá dna smějí být zařízeny tak, aby mohly přijímat balastní vodu.

9.2.0.21

-

9.2.0.30

(Vyhrazeno)

9.2.0.31

Motory

9.2.0.31.1

Smějí být instalovány pouze spalovací motory, které jsou provozovány palivem, jehož bod vzplanutí je vyšší než 60 °C.

9.2.0.31.2

Ventilační vchodové otvory strojního oddělení a vzduchové otvory motorů, které neodebírají vzduch bezprostředně ze strojního oddělení, musí být umístěny ve vzdálenosti nejméně 2 m od chráněné oblasti.

9.2.0.31.3

V chráněné oblasti musí být vyloučen vznik jisker.

9.2.0.32

-

9.2.0.33

(Vyhrazeno)

9.2.0.34

Výfuková potrubí

9.2.0.34.1

Výfukové plyny musí být odváděny výfukovým potrubím vzhůru nebo skrze bok do volného prostoru. Výstupní otvor musí být vzdálen minimálně 2,00 m od otvorů nákladních prostor. Výfukové potrubí z motorů musí být vedeno tak, aby se výfukové plyny co nejrychleji vzdálily od plavidla. Výfukové potrubí nesmí být umístěno do chráněné oblasti.

9.2.0.34.2

Výfuková potrubí musí být opatřena ochranou proti úniku jisker, např. lapačem jisker.

9.2.0.35

-

9.2.0.40

(Vyhrazeno)

9.2.0.41

Oheň a otevřené světlo

9.2.0.41.1

Vyústění komínů se musí nacházet v minimální vzdálenosti 2,00 m od otvorů nákladních prostor. Musí existovat zařízení, která zabrání úniku jisker a průniku vody.

9.2.0.41.2

Topné, varné a chladičové přístroje nesmí být provozovány ani kapalnými pohonnými hmotami, zkapalněnými plyny, ani pevnými hořlavými hmotami. Pokud jsou topné přístroje nebo topné kotle

umístěny do strojoven nebo do prostor, které jsou pro to zvláště vhodné, smí být provozovány kapalnými pohonnými hmotami, avšak s bodem vzplanutí vyšším než 55 °C.

Zařízení na vaření a chlazení je povoleno jen v kormidelně s kovovou spodní částí a v obytných prostorech.

9.2.0.41.3 Mimo obytné prostory a kormidelnu jsou povoleny pouze elektrická zařízení.

9.2.0.42

-

9.2.0.70

(Vyhrazeno)

9.2.0.71

Vstup na plavidlo

Tabule označující zákaz vstupu podle 8.3.3 musí být dobře čitelné z obou boků plavidla.

9.2.0.87

(Vyhrazeno)

9.2.0.88

Klasifikace

9.2.0.88.1

Námořní plavidla s dvojitou obšívkou, která jsou určena k přepravě nebezpečných věcí tříd 2, 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 7, 8 nebo 9, vyjma těch s bezpečnostní značkou vzoru č. 1 ve sloupci (5) tabulky A kapitoly 3.2, ve větším množství, než je uvedeno v 7.1.4.1.4, musí být stavěny nebo přestavovány pod dohledem uznané klasifikační společnosti. Toto musí být potvrzeno osvědčením klasifikační společnosti.

9.2.0.88.2

Vyžaduje se zachování vyšší třídy plavidla.

9.2.0.89

-

9.2.0.90

(Vyhrazeno)

9.2.0.91

Nákladní prostory

9.2.0.91.1

Plavidlo musí být v chráněné oblasti provedena jako plavidlo s dvojitou obšívkou, dvojitými boky a dvojitým dnem.

9.2.0.91.2

Vzdálenost mezi boční stěnou plavidla a boční stěnou nákladního prostoru musí činit minimálně 0,80 m. Na koncích plavidla je povoleno lokální zmenšení, aniž by však nejmenší rozměr mezi stěnami činil méně než 0,60 m (měřeno svisle). Dostačující pevnost spojů (podélná a příčná pevnost a také místní pevnost) má být prokázána předložením osvědčení třídy.

9.2.0.91.3

Výška dvojitého dna musí být minimálně 0,50 m.

Výška pod drenážními jímkami však může být lokálně snížena na 0,40 m za podmínky, že drenážní jímka nemá kapacitu větší než 0,03 m³.

9.2.0.92

(Vyhrazeno)

9.2.0.93 Stabilita (obecně)

9.2.0.93.1 Musí být prokázána dostatečná stabilita včetně stability v poškozeném stavu.

9.2.0.93.2 Základní hodnoty pro výpočet stability – hmotnost prázdného plavidla a poloha těžiště hmotnosti – musí být určeny buď pomocí naklánečního pokusu, nebo detailním výpočtem hmotnosti. Přitom se musí ověřit hmotnost prázdného plavidla měřením ponoru, přičemž se vypočtená hmotnost nesmí lišit více než o ± 5 % od hodnoty hmotnostního výtaku určené ze změřeného ponoru.

9.2.0.93.3 Musí být prokázána dostatečná stabilita v nepoškozeném stavu pro všechna stádia nakládky a vykládky a pro konečný stav naložení.

Musí být prokázána plovatelnost v poškozeném stavu pro nejnepříznivější stav naložení. Přitom musí být předložen důkaz dostatečné stability pro kritické mezistavy a konečný stav zaplavení. Pokud se při mezistavech vyskytnou negativní parametry stability, mohou být akceptovány, pokud další průběh křivky ramen stability prokazuje dostatečné kladné hodnoty stability.

9.2.0.94 Stabilita (v nepoškozeném stavu)

9.2.0.94.1 Požadavky na stabilitu v nepoškozeném stavu, vyplývající z výpočtu zaplavení, nesmí být překročeny.

9.2.0.94.2 Při přepravě nákladu v kontejnerech musí být provedena dodatečná zkouška dostatečné stability podle ustanovení Pravidel uvedených v 1.1.4.6.

9.2.0.94.3 Pro plavidlo je rozhodující přísnější požadavek z 9.2.0.94.1 a 9.2.0.94.2.

9.2.0.94.4 Pro námořní plavidla se mohou ustanovení 9.2.0.94.2, uvedená výše, považovat za splněná, jestliže stabilita odpovídá Rezoluci A.749 (18) Mezinárodní námořní organizace a doklady o stabilitě byly zkontrolovány příslušným orgánem. Toto platí jen tehdy, pokud jsou všechny kontejnery na námořních plavidlech zajištěny obvyklým způsobem a pokud byl příslušný doklad o stabilitě schválen příslušným orgánem.

9.2.0.95 Stabilita (v případě poškození)

9.2.0.95.1 V případě poškození je třeba zohlednit následující:

- (a) rozsah poškození na jednom boku plavidla:
- podélný rozsah: nejméně 0,10 L, avšak ne méně než 5,00 m,
 - příčný rozsah: 0,59 m dovnitř od boku plavidla kolmo k podélné ose plavidla na úrovni roviny ponoru při maximálním ponoru;
 - svislý rozsah: neohraničený od základní roviny vzhůru.
- (b) rozsah poškození dna:
- podélný rozsah: minimálně 0,10 L, avšak ne méně než 5,00 m,
 - příčný rozsah: 3,00 m,
 - svislý rozsah: 0,49 m vzhůru od základny kromě sacích jímek.
- (c) Všechny přepážky, spadající do oblasti poškození, se považují za proražené, to znamená, že dělení přepážkami na úseky musí být voleno tak, aby bylo plavidlo plavby schopné i po zaplavení dvou nebo více přímo za sebou ležících úseků.

Přitom se musí dbát na následující:

- při poškození dna se považují za zaplavené i úseky, ležící vedle sebe napříč plavidla;
- spodní hrany vodotěsně neuzavíratelných otvorů (např. dveří, oken, palubních poklopů), musí v konečné fázi zaplavení ležet nejméně 0,10 m nad rovinou ponoru;
- všeobecně se musí počítat s 95 % rozsahem zatopení. Je-li výpočtem prokázáno, že střední zaplavení v kterémkoli prostoru je menší než 95 %, může být dosazena vypočtená hodnota.

Dosazují se však následující minimální hodnoty:

- strojovna 85 %
- prostory pro posádku 95 %
- Dvojitě dno, palivové tanky, balastní nádrže,

atd. podle toho, zda je dle jejich určení lze považovat při maximálním ponoru za plné nebo prázdné

0 nebo 95 %.

Pro hlavní strojovnu stačí prokázat schopnost plavby jen pro stav zaplavení jednoho úseku, tj. konečné přepážky strojovny se nepovažují za poškozené.

9.2.0.95.2

Náklon plavidla v rovnovážné poloze (konečném stadiu zaplavení) nesmí přesahovat 12° . Otvory, které nejsou vodotěsně uzavíratelné, se mohou zanořovat teprve až po dosažení rovnovážné polohy. Pokud se zanořují dříve, považují se k nim náležící prostory při poškození za zaplavené.

Nad rovnovážnou polohu musí pozitivní oblast křivky vztyčeného ramene stability vykazovat $\geq 0,05$ m ve spojení s plochou $\geq 0,0065$ m. rad. Minimální hodnoty stability musí být dodrženy až do zanoření prvních otvorů, které nejsou uzavřené tak, aby odolávaly vlivům počasí, avšak před úhlem náklonu $\leq 27^\circ$. Zanoří-li se tyto otvory dříve, je třeba k nim náležící prostory při výpočtu považovat za zatopené.

9.2.0.95.3

Pokud otvory, jimiž mohou být dodatečně zaplaveny nepoškozené prostory, mohou být vodotěsně uzavřeny, musí tato uzavírací zařízení být odpovídajícím způsobem označena.

9.2.0.95.4

Pokud jsou provedeny otvory pro přepouštění nebo zatopení pro snížení asymetrie, musí dojít k vyrovnání během 15 minut, pokud se v mezistavech prokáží dostatečné hodnoty stability v poškozeném stavu.

9.2.0.96

9.2.0.99

(Vyhrazeno)

KAPITOLA 9.3

PŘEDPISY PRO STAVBU TANKOVÝCH PLAVIDEL

9.3.1 Předpisy pro stavbu tankových plavidel typu G

Předpisy pro stavbu podle 9.3.1.0 až 9.3.1.99 platí pro tanková plavidla typu G.

9.3.1.0 **Stavební materiály**

- 9.3.1.0.1 (a) Trup plavidla a nákladní tanky musí být postaveny z lodní oceli nebo z jiného, přinejmenším rovnocenného kovu.

Nezávislé nákladní tanky a membránové tanky mohou být postaveny z jiných materiálů za předpokladu, že mají alespoň rovnocennou mechanickou sílu a odolnost vůči vlivům teploty a ohně.

U membránových tanků se rovnocennost pro odolnost vůči vlivům teploty a ohně považuje za prokázanou, pokud materiály membránových tanků splňují následující požadavky:

- odolávají rozmezí mezi maximální teplotou v provozu a 5 °C pod minimální konstrukční teplotou, ale nesmí být nižší než -196 °C; a
- jsou ohnivzdorné nebo chráněné vhodným systémem, jako je prostředí s permanentním inertním plynem, nebo opatřeny ohnivzdornou bariérou.

- (b) Všechny části plavidla včetně zařízení a vybavení, které se dostanou do styku s nákladem, musí být z takových materiálů, které nemohou být nákladem naleptány nebo nezpůsobí rozklad nákladu a ani s ním nemohou vytvořit nebezpečné a škodlivé sloučeniny. V případě že je nebylo možné vyzkoušet během klasifikace a inspekce plavidla, musí být uvedena relevantní výhrada v seznamu látek připuštěných k přepravě v plavidle podle 1.16.1.2.5.

- 9.3.1.0.2 Používání dřeva, hliníkových slitin, plastů nebo pryže v oblasti nákladu je zakázáno, pokud to není výslovně povoleno v odstavci 9.3.1.0.3 nebo ve schvalovacím osvědčení.

- 9.3.1.0.3 Použití dřeva, slitin hliníku, plastů nebo pryže v oblasti nákladu je povoleno, jak je uvedeno v následující tabulce:

Použití dřeva, slitin hliníku, plastů nebo pryže je povoleno pouze pro:	(X značí povoleno)			
	Dřevo	Slitiny hliníku	Plasty	Pryž
Lávky	X	X	X	X
Vnější žebříky a průchody (lávky) *		X	X	X
Úklidové prostředky, např. košťata	X		X	X
Pohyblivá zařízení, např. hasicí přístroje, přenosné detektory plynu, záchranné vrátky		X	X	X
Oděrky, Odrazníky	X		X	X
Vyvazovací lana a lanové odrazníky (fendry)			X	
Vybavení pro zajištění nákladních tanků nezávislých na trupu plavidla a zajištění zařízení a vybavení	X		X	
Stožáry a podobné kulatiny	X	X	X	
Části motoru		X	X	
Ochranné krytí motorů a čerpadel			X	
Části elektrických instalací		X	X	
Části nakládacího a vykládacího zařízení, např. těsnění		X	X	X
Boxy, skříňky nebo jiné nádoby umístěné na palubě pro skladování vybavení pro likvidaci úniků, čisticí prostředky, hasicí přístroje, požární hadice, odpady atd.		X	X	
Jakékoli podpěry a zarážky	X		X	
Ventilátory, včetně soustav hadic pro větrání		X	X	

Použití dřeva, slitin hliníku, plastů nebo pryže je povoleno pouze pro:	(X značí povoleno)			
	Dřevo	Slitiny hliníku	Plasty	Pryž
Části postřikovacího zařízení, sprchy, oční a obličejové lázně		X	X	
Izolace nákladních tanků a potrubí pro nakládku a vykládku, odplynovacích potrubí a potrubí pro ohřev nákladu			X	X
Povrchová úprava nákladních tanků a potrubí pro nakládku a vykládku		X	X	X
Všechny druhy těsnění (např. pro kryty kupolí nebo poklopů)			X	X
Kabely elektrických zařízení			X	X
Rohož pod soustavou hadic pro nakládací a vykládací potrubí			X	X
Požární hadice, vzduchové hadice, hadice pro čištění paluby atd.			X	X
Vybavení a lahve k odběru vzorků			X	
Fotokopie schvalovacího osvědčení o podle 8.1.2.6 nebo 8.1.2.7 a osvědčení plavidla, cejchovní průkaz a osvědčení o členství v plavbě na Rýně		X	X	
Záchytné nádoby na úkapy			X	
(*) Zohledněte 9.3.1.0.5, 9.3.2.0.5 nebo 9.3.3.0.5, podle okolností				
Hliníkové měřicí tyče jsou povoleny, pokud jsou opatřeny mosaznými patkami nebo jiným způsobem chráněny proti jiskření.				

Všechny trvale upevněné materiály v obytném prostoru nebo kormidelně, s výjimkou nábytku, musí být z těžko hořlavého materiálu. Pokud nastane požár, nesmí uvolňovat výpary nebo toxické plyny v nebezpečných množstvích.

9.3.1.0.4

Barva použitá v oblasti nákladu, nesmí při nárazu nebo při podobném namáhání zapříčinit vznik jisker.

9.3.1.0.5

Záchranné čluny z plastů je povoleno použít pouze v případě, že jsou vyrobené z těžko hořlavého materiálu.

Použití slitin hliníku nebo plastů pro průchody (lávky) v oblasti nákladu je povoleno pouze v případě, že jsou z těžko hořlavého materiálu nebo elektricky nevodivého materiálu.

9.3.1.1

Dokumentace plavidla

POZNÁMKA: Pro účely tohoto odstavce má pojem „vlastník“ stejný význam jako v 1.16.0.

Dokumentace plavidla musí být uchovávána vlastníkem, který musí být schopen poskytnout tuto dokumentaci na požádání příslušného orgánu a uznané klasifikační společnosti.

Dokumentace plavidla musí být udržována a aktualizována po celou dobu životnosti plavidla a musí být uchována ještě po dobu 6 měsíců po vyřazení plavidla z provozu.

Pokud by došlo během životnosti plavidla ke změně vlastníka, musí být dokumentace plavidla předána novému vlastníkovi.

Kopie dokumentace plavidla nebo všech potřebných dokumentů musí být na požádání poskytnuta příslušnému orgánu pro vydání schvalovacího osvědčení a uznané klasifikační společnosti nebo inspekční organizaci pro první inspekci, periodickou inspekci, zvláštní inspekci nebo mimořádné kontroly.

9.3.1.2

-

9.3.1.7

(Vyhrazeno)

9.3.1.8 Klasifikace

9.3.1.8.1 Tankové plavidlo musí být stavěno pod dohledem uznané klasifikační společnosti pro jeho nejvyšší třídu a tankové plavidlo musí být zatříděno odpovídajícím způsobem.

Vyžaduje se zachování vyšší třídy plavidla. Toto musí být potvrzeno náležitým osvědčením vydaným uznanou klasifikační společností (osvědčení třídy).

Výpočtový tlak a zkušební tlak nákladních tanků musí být uvedeny v osvědčení.

Jestliže má plavidlo nákladní tanky s rozdílnými tlaky pro otevření ventilů, musí být v osvědčení uvedeny výpočtové a zkušební tlaky každého tanku.

Uznaná klasifikační společnost vystaví osvědčení, v němž uvede všechny nebezpečné věci připuštěné k přepravě tímto plavidlem (viz též 1.16.1.2.5).

Osvědčení třídy musí potvrdit, že plavidlo odpovídá svým vlastním dodatečným pravidlům a předpisům, které jsou platné pro předpokládané použití plavidla.

9.3.1.8.2 (Vypuštěno)

9.3.1.8.3 (Vypuštěno)

9.3.1.8.4 (Vypuštěno)

9.3.1.9 (Vyhrazeno)

9.3.1.10 Ochrana proti průniku nebezpečných plynů a šíření nebezpečných kapalin

9.3.1.10.1 Plavidlo musí být postaveno tak, aby se zamezilo vniknutí nebezpečných plynů a kapalin do obytných prostor, kormidelny a provozních prostor. Žádné z oken v těchto prostorech nesmí být možné otevřít, pokud není zamýšleno jako nouzový východ a jako takové označeno.

9.3.1.10.2 Ve výšce vnějších přepážek nákladních tanků musí být na palubě namontován vodotěsný ochranný sil, a to v maximální vzdálenosti 0,60 m od vnějších přepážek kofrdamu nebo přepážek na konci nákladního prostoru. Ochranný sil musí být umístěn buď po celé šířce plavidla, nebo musí být upevněn mezi podélnými jímacími silami, aby se zabránilo vniknutí kapalin do předního i zadního kolizního prostoru. Výška ochranných a jímacích silů musí být minimálně 0,075 m. Ochranný sil může odpovídat ochranné stěně předepsané v 9.3.1.10.3, pokud ochranná stěna stojí po celé šířce plavidla.

9.3.1.10.3 Pokud seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 bude zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, pak není povoleno použití instalací a zařízení, která nejsou alespoň typu „omezené riziko výbuchu“, během nakládky a vykládky v částech paluby mimo oblast nákladu, pokud tyto části nejsou chráněny proti vniknutí plynů plyno a vodotěsnou stěnou. Stěna musí buď probíhat od jedné strany plavidla k druhé, nebo obklopovat oblasti, které mají být chráněny, ve tvaru písmene U. Stěna musí pokrýt celou šířku chráněné oblasti a nejméně 1,00 m ve směru opačném k oblasti nákladu (viz schema Rozdělení zón). Výška stěny musí být nejméně 1,00 m nad přilehlým prostorem nad palubou v oblasti nákladu. Vnější stěna a boční stěny obytného prostoru lze považovat za ochrannou stěnu, pokud v nich nejsou otvory a pokud jsou dodrženy rozměry.

Ochranná stěna není nutná tam, kde je vzdálenost mezi oblastmi, které mají být chráněny, a pojistným ventilem, pobřežním připojením nakládacích a vykládacích rozvodů a odvětrávacím potrubím, kompresorem na palubě a otevíráním nejbližších tlakových nádob minimálně 12,00 m.

9.3.1.10.4 Na palubě musí mít spodní hrany dveřních otvorů v bočních stěnách nástavby a silů, vstupních otvorů a větracích otvorů prostorů umístěných pod palubou výšku nejméně 0,50 m nad palubou.

Tento požadavek se nevztahuje na přístupové otvory do prostor dvojitého trupu a dvojitých dnů.

9.3.1.10.5 Štítnice, okopnice, paty zábradlí atd. musí být vybaveny dostatečně velkými otvory umístěnými přímo nad palubou.

9.3.1.11 Úložné prostory a nákladní tanky

9.3.1.11.1 (a) Nejvyšší přípustný obsah nákladního tanku lze zjistit z následující tabulky:

L x B x H (m ³)	Nejvyšší přípustný obsah jednoho nákladního tanku (m ³)
< 600	L x B x H x 0,3
600 - 3 750	180 + (L x B x H - 600) x 0,0635
> 3 750	380

Připouštějí se alternativní varianty stavby podle 9.3.4.

V předchozí tabulce je L x B x H násobkem hlavních rozměrů tankového plavidla v metrech (podle cejchovního průkazu). Je to:

L = největší délka trupu plavidla v m;

B = největší šířka trupu plavidla v m;

H = nejmenší kolmá vzdálenost mezi spodní hranou lodního kýlu a nejnižším bodem paluby na straně plavidla (boční výška) v oblasti nákladu v m;

kde:

U tankových plavidel se zvýšenou palubou se H nahradí H', kde H' vyplývá z následujícího vzorce:

$$H' = H + \left(ht \times \frac{bt}{B} \times \frac{lt}{L} \right)$$

kde:

ht = výška zvýšení paluby (vzdálenost mezi zvýšenou palubou a hlavní palubou na straně zvýšení na L/2) v m;

bt = šířka zvýšení v m;

lt = délka zvýšení v m;

(b) Jsou zakázány tanky, které mají poměr vztahu délky k průměru větší než 7.

(c) Tanky musí být uzpůsobeny pro teplotu nákladu od + 40 °C.

9.3.1.11.2 (a) Trup plavidla musí být v oblasti nákladu vyroben následujícím způsobem¹:

- jako plavidlo s dvojitou obšívku s dvojitými boky a dvojitým dnem. Vzdálenost mezi boční stěnou plavidla a podélnou přepážkou musí činit minimálně 0,80 m. Výška dvojitého dna musí činit nejméně 0,60 m. Nákladní tanky musí být uloženy do sedel, která jsou alespoň 20° vytažena nad horizontální osu nákladního tanku.

Chlazené nákladní tanky a nákladní tanky používané pro přepravu zchlazených stlačených plynů smí být umístěny v úložném prostoru, který je vytvořen dvojitými boky a dvojitým dnem. Uložení musí odpovídat předpisům uznané klasifikační společnosti; nebo

- jako jednoplášťové plavidlo, přičemž bok plavidla je mezi palubním ochozem a vrchní hranou prazce opatřen bočními výtuhami, které jsou rozmístěny pravidelně ve vzdálenosti nejvýše 0,60 m a vzájemně podepřeny pomocí rámových žebor ve vzdálenosti maximálně 2,00 m. Boční výtuhy a rámová žebra musí být minimálně 10% výšky boční stěny, avšak nesmí to být více než 0,30 m. Boční výtuhy a rámová žebra musí být opatřeny pásem z ploché ocele, který má minimálně 7,50 cm², resp. 15,00 cm².

¹ Jiné stavební provedení trupu plavidla v oblasti nákladu předpokládá početní důkaz, že při přímém čelním nájezdu jiná plavidla s rovnou přídělí, může být absorbována energie 22 milionů Nm, aniž by se nákladní tanky protrhly nebo aniž by se roztrhly potrubní rozvody, které vedou k těmto nákladním tankům. Připouštějí se alternativní varianty stavby v souladu s oddílem 9.3.4.

Vzdálenost mezi bokem plavidla a nákladním tankem musí být minimálně 0,80 m a mezi dnem plavidla a nákladním tankem minimálně 0,60 m. Pod jímkami čerpadel může být tato výška zmenšena na 0,50 m.

Boční vzdálenost mezi jímkami čerpadel nákladního tanku a spoji dna musí být minimálně 0,10 m.

Nákladní tanky musí být uloženy v sedlech, které sahají pod úhlem nejméně 10° pod horizontální osu.

- (b) Nákladní tanky musí být zajištěny proti vyplavání.
 - (c) Jímka čerpadla nesmí mít obsah větší než 0,10 m³. U tlakových tanků však může mít obsah 0,20 m³.
 - (d) Podpěry, které spojují nosné části bočních stěn plavidla s nosnými částmi podélné přepážky, nebo podpěry, které spojují nosné části dna plavidla s dnem nákladního tanku nejsou přípustné.
 - (e) Nákladní tanky, určené pro látky při teplotě nižší než -10 °C, musí být příslušným způsobem izolovány, aby teplota konstrukce plavidla nebyla nižší než minimální přípustná výpočetní teplota materiálu. Izolační látka musí být odolná proti šíření plamenů.
- 9.3.1.11.3
- (a) Nákladové prostory musí být odděleny od obytných prostor, strojoven a provozních prostor mimo oblast nákladu pod palubou přepážkami třídy „A-60“ podle SOLAS 74, Kapitoly II-2, Ustanovení 3. Nákladní tanky musí být od konců přepážky úložných prostor vzdáleny minimálně 0,20 m. U rovných koncových přepážek nákladových tanků musí tato vzdálenost činit alespoň 0,50 m.
 - (b) V úložných prostorech a nákladových tancích musí být zabezpečena možnost prohlídky.
 - (c) Ve všech prostorách v oblasti nákladu musí být možné větrání. Musí být možné zjistit, zda neobsahují plyny.
- 9.3.1.11.4
- Přepážky, které ohraničují úložné prostory, musí být vodotěsné. Nákladní tanky a koncové přepážky úložných prostor a také přepážky ohraničující oblast nákladu, nesmí mít žádné otvory nebo průchody pod palubou.
- V přepážkách mezi dvěma úložnými prostory smí být vzájemná propojení. V přepážce mezi strojovnou a provozními prostory v oblasti nákladu smí být průchody, pokud odpovídají požadavkům uvedeným v 9.3.1.17.5.
- 9.3.1.11.5
- Dvojitě boky a dvojitě dna smí být v oblasti nákladu zřízeny pouze pro příjem balastní vody. Dvojitě dna smí být zařízena jako palivové tanky, pouze pokud splňují požadavky v 9.3.1.32.
- 9.3.1.11.6
- (a) Prostor, který se nachází pod palubou v oblasti nákladu, smí být zařízen jako provozní prostor, pokud jsou stěny, které provozní prostor ohraničují, vedeny kolmo až na dno a pokud přepážka, odvrácená od oblasti nákladu, je uspořádána v jedné rovině se žebrem od jednoho okraje paluby k druhému. Tento provozní prostor smí být přístupný jen z paluby.
 - (b) Takovýto provozní prostor musí být s výjimkou přístupových a větracích otvorů vodotěsný.
 - (c) V provozním prostoru, uvedeném v bodě a), nesmí být žádné nakládací ani vykládací potrubí.
- V prostoru s čerpadly pod palubou smí být nakládací a vykládací potrubí, pokud prostor s čerpadly plně odpovídá ustanovením v 9.3.1.17.6.
- 9.3.1.11.7
- Provozní prostory pod palubou v oblasti nákladu musí být uspořádány takovým způsobem, aby byly dobře přístupné a aby v nich se nacházející provozní zařízení mohla být bezpečně obsluhována osobami, které mají osobní ochranné vybavení. Musí být postaveny takovým způsobem, aby z nich bylo možné bez zvláštních potíží vyprostit zraněné osoby a osoby v bezvědomí, případně s pomocí pevně zabudovaných zařízení.
- 9.3.1.11.8
- Úložné prostory a jiné prostory, do kterých lze v oblasti nákladu vstoupit, musí být uspořádány takovým způsobem, aby je bylo možné přiměřeně a kompletně čistit a kontrolovat. S výjimkou dvojitých boků a dvojitě dna, pokud nemají společnou stěnu s nákladními tanky, musí mít vstupní otvory takové rozměry, aby osoba s dýchacím přístrojem mohla bez omezení do nich vstoupit nebo tyto opustit. Minimální rozměr otvoru: 0,36 m²; nejmenší délka strany: 0,50 m. Vstupní otvory musí být provedeny takovým způsobem, aby z nich bylo možné bez zvláštních potíží vyprostit zraněné osoby a osoby v bezvědomí, případně s pomocí pevně zabudovaných zařízení. Odstup mezi zesílením ve shora

vedených prostorech nesmí být menší než 0,50 m. Ve dvojitěm dně smí tento odstup být zmenšen na 0,45 m.

Nákladní tanky smí být opatřeny kulatým otvorem s minimálním průměrem 0,68 m.

- 9.3.1.11.9 V případě, že plavidlo má izolované nákladní tanky, tak nákladní prostory musí obsahovat pouze suchý vzduch pro ochranu izolace nákladních tanků před vlhkostí.

9.3.1.12 **Větrání**

- 9.3.1.12.1 V každém úložném prostoru musí být dva otvory, jejichž rozměr a uspořádání jsou takové, aby větrání na každém místě prostoru bylo účinné. Pokud tyto otvory neexistují, musí být možné úložné prostory inertizovat nebo plnit suchým vzduchem.

- 9.3.1.12.2 Dvojitě boky a dvojitě dno v oblasti nákladu, které nejsou zřízeny za účelem balastování a eventuální existující kofrdamy musí být větratelné pomocí zařízení.

- 9.3.1.12.3 (a) Provozní prostor umístěný v oblasti nákladu pod palubou musí být vybaven systémem ventilace. Kapacita větráků musí být dostatečná pro zajištění 20 kompletních výměn vzduchu za hodinu na základě objemu provozního prostoru.

Ventilační odsávací šachty musí sahát až do výšky 50 mm nad podlahou provozního prostoru. Vzduch musí být přiváděn šachtou v horní části provozního prostoru.

- (b) Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, musí být přívody vzduchu umístěny nejméně 2,00 m nad palubou, ve vzdálenosti nejméně 2,00 m od otvorů tanku a 6,00 m od výpustí pojistných ventilů.

Prodlužovací potrubí, které může být nezbytné, může být zavěšené. Obytné a provozní prostory musí být větratelné.

- 9.3.1.12.4 (a) Obytné prostory, kormidelná a provozní prostory musí být vybaveny větráním.
- (b) Systém větrání v takových prostorech musí splňovat následující požadavky:
- Sací otvory musí být umístěny co nejdále, a minimálně 6,00 m od chráněné oblasti, a minimálně 2,00 m nad palubou;
 - V prostorech se může udržovat přetlak nejméně 0,1 kPa (0,001 bar);
 - Je zabudováno poplachové zařízení pro případ poruchy;
 - Větrací systém, včetně poplachového zařízení pro případ poruchy, musí být minimálně typ „omezené riziko výbuchu“;
 - Systém detekování plynu odpovídající níže uvedeným podmínkám 1 až 4 je připojen na větrací systém:
 - Je vhodný pro použití minimálně v zóně 1, výbušné skupině IIC a teplotní třídě T6;
 - Je vybaven čidly:
 - Na sacích otvorech větracího systému; a
 - Přímo pod vrchní hranou prahu vstupních dveří;
 - Jeho čas t_{90} je nižší nebo se rovná 4 s;
 - Měření musí být neustálé;
 - V provozních prostorách je větrací systém napojen na nouzové osvětlení, které musí být minimálně typ „omezené riziko výbuchu“;

Toto nouzové osvětlení není nutné, pokud je osvětlení v provozních prostorách minimálně typu „omezené riziko výbuchu“;
 - Sání větracího systému a instalací a zařízení, která nesplňují požadavky uvedené v 9.3.1.51 (a) a (b) a 9.3.1.52.1 musí být uzavřeno, pokud je dosaženo koncentrace, která se rovná 20% dolní meze výbušnosti n-Hexanu;

Při vypnutí musí být v obytných prostorách a v prostoru kormidelny aktivována zvuková a světelná signalizace;
 - V případě selhání větracího systému nebo instalací detekce plynu v obytných prostorách, musí být vypnuty instalace a zařízení v obytných prostorách, které nesplňují požadavky uvedené v 9.3.1.51 (a) a (b) a 9.3.1.52.1;

Porucha musí být signalizována v obytných prostorech, kormidelně a na palubě optickými a akustickými signály;

- (ix) V případě selhání větracího systému nebo instalací detekce plynu v kormidelně nebo provozních prostorech, musí být vypnuty instalace a zařízení v těchto prostorech, které nesplňují požadavky uvedené v 9.3.1.51 (a) a (b) a 9.3.1.52.1;

Porucha musí být viditelně a slyšitelně signalizována v prostoru kormidelny a na palubě; Pokud se poplach nevypne, musí být automaticky předán do obytných prostor;

- (x) Jakékoli vypnutí musí nastat okamžitě a automaticky a, je-li to nutné, musí aktivovat nouzové osvětlení;

Zařízení automatického vypínání musí být nastaveno tak, aby po dobu plavby automatické vypnutí nebylo možné;

- (c) Pokud v prostoru není větrací systém nebo větrací systém prostoru nesplňuje všechny požadavky uvedené výše v (b), musí existovat možnost vypnout všechny zařízení a přístroje, které se nenacházejí tomto prostoru, které svojí činností mohou přesáhnout povrchové teploty uvedené v 9.1.0.51 (a) a (b), nebo které nesplňují požadavky uvedené v 9.1.0.52.1.

9.3.1.12.5 (Vypuštěno)

9.3.1.12.6 Na větracích otvorech musí být umístěny tabulky uvádějící podmínky, za nichž mají být otvory uzavřeny. Všechny větrací otvory obytných prostor, kormidelny a provozní prostor vedoucí do venkovního prostoru mimo oblast nákladu musí být vybaveny zařízeními trvale upevněnými podle 9.3.1.40.2.2 (c), která umožňují jejich rychlé uzavření. Musí být jasné, zda jsou otevřené nebo zavřené.

Tyto větrací otvory musí být umístěny nejméně 2,00 m od oblasti nákladu.

V této oblasti mohou být umístěny větrací otvory provozních prostor v oblasti nákladu.

9.3.1.13 **Stabilita (obecně)**

9.3.1.13.1 Musí být prokázána dostatečná stabilita včetně stability v poškozeném stavu.

9.3.1.13.2 Základní hodnoty pro výpočet stability – hmotnost prázdného plavidla a poloha těžiště hmotnosti – musí být určeny buď pomocí nakláněcího pokusu, nebo detailním výpočtem hmotnosti. Přitom se musí ověřit hmotnost prázdného plavidla měřením ponoru, přičemž se vypočtená hmotnost nesmí lišit více než o $\pm 5\%$ od hodnoty hmotnostního výtlaku určené ze změřeného ponoru.

9.3.1.13.3 Musí být prokázána dostatečná stabilita v nepoškozeném stavu pro všechna stádia nakládky a vykládky a pro konečný stav naložení pro všechny relativní hustoty přepravovaných látek uvedených v seznamu látek přípuštěných k přepravě v plavidle podle 1.16.1.2.5.

Pro každou nakládací operaci je třeba vzít v úvahu skutečná plnění a zaplavení nákladních cisteren, balastních nádrží a komor, nádrží na pitnou vodu a na odpad a nádrží obsahujících produkty pro provoz plavidla, plavidlo musí splňovat požadavky na nepoškozenou a poškozenou stabilitu.

Mezistavy během operací musí být též vzaty v úvahu.

Musí být prokázána dostatečná stabilita pro každou provozní, nakládací a balastní podmínku v příručce stability schválená uznanou klasifikační společností, která zařadila plavidlo. Jestli je to nepraktické pro předběžnou kalkulaci provozních, nakládacích a balastních podmínek, zařízení pro kontrolu naložené schválené uznanou klasifikační společností, která klasifikuje plavidlo, musí být instalováno a použito, které je uvedeno v příručce stability.

POZNÁMKA: *Knižka stability musí být ve formě srozumitelné pro odpovědného velitele a obsahovat následující údaje:*

Všeobecný popis plavidla:

- *Všeobecné uspořádání a plány kapacity udávající schválené použití oddílů a prostor (nákladní nádrže, sklady, ubytování atd.);*
- *Nákres uvádějící polohu značek ponoru ve vztahu ke kolmicím plavidla;*
- *Schéma podpalubních balastních čerpacích a ochranných systémů zaplavení;*
- *Hydrostatické křivky nebo tabulky odpovídající konstrukčnímu vyvážení, a pokud se významné vyvažovací úhly předpokládají během normálního provozu plavidla, křivky nebo tabulky odpovídající takovému stupni vyvážení musí být uvedeny;*
- *Příčné křivky nebo tabulky stability vypočtené na volném vyvažovacím základě, pro stupně*

přemístění a vyvážení předvídané v normálních provozních podmínkách, s uvedením objemu, který byl uvažován pro výtlač;

- *Cisternové tabulky nebo křivky ukazující kapacity, těžiště a údaj o volném prostoru všech nákladních nádrží, balastních nádrží a komor, nádrží na pitnou vodu a odpadní vodu a nádrží obsahující produkty pro provoz plavidla;*
- *Nezbytné údaje (hmotnost a těžiště) vycházející z odchýlné zkoušky nebo měření vlastní hmotnosti v kombinaci dílčím vážením hmotnosti nebo jinými přípustnými měřeními. Kde jsou výše uvedené informace odvozeny ze sesterského plavidla, odvolávka na sesterské plavidlo musí být jasně uvedena a kopie zprávy o schválené odchýlné zkoušce relevantního sesterského plavidla musí být zahrnuta;*
- *Kopie zprávy o schválené zkoušce musí být zahrnuta do knížky stability;*
- *Provozní nakládací podmínky s relevantními podrobnými údaji, jako:*
 - *Nezbytné údaje, plnění nádrží, sklady, posádka a jiné relevantní části na palubě (hmotnost a těžiště každé relevantní části na palubě, momenty volného povrchu pro kapalné náklady);*
 - *Ponory středu plavidla a při kolmicích;*
 - *Metacentrická výška korigovaná pro účinek volných povrchů;*
 - *Hodnoty směrové páky a křivka;*
 - *Podélné ohybové momenty a smykové síly na čitelných bodech;*
 - *Informace o otvorech (umístění, typ těsnosti, prostředky uzávěrů); a*
 - *Informace pro velitele.*
- *Výpočet vlivu balastní vody na stabilitu s informací, jestli pevně zabudované hladinoměry pro balastní nádrže a prostory musí být instalovány nebo jestli balastní nádrže nebo prostory musí být úplně plné nebo úplně prázdné, pokud je to jinak.*

9.3.1.13.4 Plovatelnost v poškozeném stavu musí být prokázána pro nejnepříznivější stav naložení. K tomuto účelu musí být předložen vypočtený důkaz dostatečné stability pro kritické mezistavy a pro konečný stav zaplavení.

9.3.1.14 Stabilita (v nepoškozeném stavu)

9.3.1.14.1 Požadavky na stabilitu v nepoškozeném stavu, vyplývající z výpočtu zaplavení, nesmí být překročeny.

9.3.1.14.2 Pro plavidla s nákladními tanky o šířce větší než 0.70 B musí být podán důkaz, že byly dodrženy následující požadavky na stabilitu:

- (a) V pozitivní ploše křivky ramene stability až do zanoření prvního nevodotěsného otvoru musí být rameno stability (GZ) nejméně 0,10 m;
- (b) Obsah pozitivní plochy křivky ramene stability až do zanoření prvního nevodotěsného otvoru a v každém případě až do úhlu náklonu $< 27^\circ$ musí být nejméně 0,024 m.rad;
- (c) Výška metacentra (GM) musí být nejméně 0,10 m.

Tyto podmínky musí být splněny, přičemž je nutno pamatovat na vliv všech volných hladin v tancích pro všechny fáze nakládky a vykládky.

9.3.1.14.3 Rozhodující pro plavidlo je nej přísnější z požadavků uvedených v 9.3.1.14.1 a 9.3.1.14.2.

9.3.1.15 Stabilita (v případě poškození)

9.3.1.15.1 Pro případ poškození je třeba zohlednit následující:

- (a) rozsah poškození na jednom boku plavidla:

podélný rozsah:	nejméně 0,10 L, avšak ne méně než 5,00 m;
příčný rozsah:	0,79 dovnitř od boku plavidla kolmo k podélné ose plavidla na úrovni roviny ponoru při maximálním ponoru nebo, pokud je to vhodné, vzdálenost povolenou oddílem 9.3.4, sníženou o 0,01 m; neohraničený od základní roviny vzhůru.
svíslý rozsah:	
- (b) rozsah poškození dna:

podélný rozsah:	minimálně 0,10 L, avšak ne méně než 5,00 m;
příčný rozsah:	3,00 m;
svíslý rozsah:	0,59 m vzhůru od základny kromě sacích jímk.

- (c) Všechny přepážky, spadající do oblasti poškození, se považují za proražené, to znamená, že dělení přepážkami na úseky musí být voleno tak, aby bylo plavidlo plavby schopné i po zaplavení dvou nebo více přímo za sebou ležících úseků.

Přitom se musí dbát na následující:

- při poškození dna se považují za zaplavené i úseky, ležící vedle sebe napříč plavidla;
- spodní hrany vodotěsně neuzavíratelných otvorů (např. dveří, oken, palubních poklopů), musí v konečné fázi zaplavení ležet nejméně 0,10 m nad rovinou ponoru;
- všeobecně se musí počítat s 95 % rozsahem zatopení. Je-li výpočtem prokázáno, že střední zaplavení v kterémkoli prostoru je menší než 95 %, může být dosazena vypočtená hodnota.

Dosazují se však následující minimální hodnoty:

- | | |
|---|--------------|
| - strojovna | 85 % |
| - prostory pro posádku | 95 % |
| - dvojitě dno, olejové nádrže, balastní nádrže, atd. podle toho, zda podle jejich určení lze považovat při maximálním ponoru za plné nebo prázdné | 0 nebo 95 %. |

Pro hlavní strojovnu stačí prokázat schopnost plavby jen pro stav zaplavení jednoho úseku, tj. konečné přepážky strojovny se nepovažují za poškozené.

9.3.1.15.2

Pro mezistav zaplavení musí být splněna následující kritéria:

$$GZ \geq 0.03 \text{ m}$$

Rozsah pozitivních hodnot GZ: 5°.

Náklon plavidla v rovnovážné poloze (konečný sklon plavidla) nesmí přesahovat 12°. Otvory, které nejsou vodotěsně uzavíratelné, se mohou zanořovat teprve až po dosažení rovnovážné polohy. Pokud se zanořují dřívě, považují se k nim příslušné prostory při poškození za zaplavené.

Nad rovnovážnou polohu musí pozitivní oblast křivky vztyčeného ramene stability vykazovat $\geq 0,05 \text{ m}$ ve spojení s plochou $\geq 0,0065 \text{ m} \cdot \text{rad}$. Minimální hodnoty stability musí být dodrženy až do zanoření prvních otvorů, které nejsou uzavřeny tak, aby odolávaly vlivům počasí, avšak před úhlem náklonu $\leq 27^\circ$. Zanoří-li se tyto otvory dřívě, je třeba k nim náležící prostory při výpočtu považovat za zatopené.

9.3.1.15.3

Pokud otvory, jimiž mohou být dodatečně zaplaveny nepoškozené prostory, mohou být vodotěsně uzavřeny, musí tato uzavírací zařízení být odpovídajícím způsobem označena.

9.3.1.15.4 Pokud jsou provedeny otvory pro přepouštění nebo zatopení pro snížení asymetrie, musí dojít k vyrovnání během 15 minut, pokud se v mezistavech prokáží dostatečné hodnoty stability v poškozeném stavu.

9.3.1.16 Prostory strojovny

9.3.1.16.1 Spalovací motory pro provoz plavidla jakož i spalovací motory pomocných strojů, musí být umístěny mimo oblast nákladu. Přístup a další otvory do těchto prostor musí být umístěny v minimální vzdálenosti 2,00 m od oblasti nákladu.

9.3.1.16.2 Strojovny musí být přístupné z paluby plavidla. Přístupy nesmí být nasměrovány k oblasti nákladu. Pokud nejsou dveře umístěny do výklenku, jehož hloubka odpovídá alespoň šířce dveří, musí být závěsy dveří obráceny k oblasti nákladu.

9.3.1.17 Obytné a provozní prostory

9.3.1.17.1 Obytné prostory a kormidelna se musí nacházet mimo oblast nákladu před první kolmou rovinou vpředu nebo za nejzazší kolmou rovinou pod palubou se nacházející částí oblasti nákladu. Okna kormidelny, která jsou umístěna minimálně 1,00 m nad podlahou kormidelny, smí být nakloněna dopředu.

9.3.1.17.2 Přístupy k prostorám a otvorům v nástavbách nesmí být nasměrovány k oblasti nákladu. Závěsy dveří, které se otevírají směrem ven a nejsou umístěny ve výklenku, jehož hloubka odpovídá alespoň šířce dveří, musí být obráceny k oblasti nákladu.

9.3.1.17.3 Přístupy z paluby a otvory prostor do volného prostoru musí být možné uzavírat. Na přístupu do těchto prostor musí být připevněno následující upozornění:

**BĚHEM NAKLÁDKY, VYKLÁDKY A ODPLYNOVÁNÍ
NEOTEVÍRAT BEZ SVOLENÍ VELITELE PLAVIDLA.
OKAMŽITĚ OPĚT ZAVŘÍT.**

9.3.1.17.4 Vstupy a otevíratelná okna nástaveb a obytných prostor a také jiné otvory k těmto prostorám musí být vzdáleny minimálně 2,00 m od oblasti nákladu. Okna a dveře kormidelny smí být v rámci těchto 2,00 m umístěny jenom tehdy, pokud neexistuje přímé spojení mezi kormidelnou a obytnými prostory.

9.3.1.17.5 (a) Hnací hřídele drenážních a balastních čerpadel v oblasti nákladu smí být vedeny skrze přepážku mezi provozním prostorem a strojovnou, pokud uspořádání provozního prostoru odpovídá požadavkům v 9.3.1.11.6.

(b) Vedení hřídele přepážkou musí být provedeno plynotěsně a schváleno uznanou klasifikační společností.

(c) Připojení musí obsahovat potřebné provozní pokyny.

(d) V přepážce mezi strojovnou a provozním prostorem v oblasti nákladu a mezi strojovnou a úložným prostorem smí být umístěna vedení elektrických kabelů, vedení hydrauliky a potrubí pro měřicí, řídicí a signální zařízení, pokud jsou provedeny plynotěsně a schváleny uznanou klasifikační společností. Vedení přepážkou, která je opatřena protipožární izolací „A-60“ podle SOLAS 74, kapitola II-2, pravidlo 3, musí mít stejně hodnotnou protipožární izolaci.

(e) Přepážkou mezi strojovnou a provozním prostorem v oblasti nákladu smí být vedeny potrubní rozvody, pokud se přitom jedná o rozvody mezi strojním zařízením ve strojovně a v provozním prostoru, které nemají ve strojovně žádné otvory.

(f) Bez ohledu na 9.3.1.11.4 smějí potrubí ze strojovny procházet provozním prostorem v oblasti nákladu nebo kofrdamem nebo úložným prostorem nebo prostorem dvojitých boků ven do volného prostoru za podmínky, že jsou tato potrubí uvnitř provozního prostoru nebo kofrdamu nebo úložného prostoru nebo prostoru dvojitých boků tlustostěnného typu a nemají žádné slepé příruby ani otvory.

(g) Pokud hnací hřídel pomocného stroje vede skrze stěnu, která je nad palubou, musí být toto vedení provedeno jako plynotěsné.

9.3.1.17.6 Provozní prostor, který se nachází pod palubou v oblasti nákladu, se nesmí používat jako prostor s čerpadly pro umístění vlastního systému plavidla pro vypouštění plynů, jako např. kompresoru nebo kombinovaného kompresoru-výměníku tepla-čerpadla, s výjimkou případů, kdy:

– Je místnost s čerpadly oddělená od strojovny nebo provozních prostor mimo oblast nákladu kofrdamem nebo přepážkou s izolací Třídy „A-60“, jak je popsáno v SOLAS 74, Kapitoly II-2, Ustanovení 3, nebo provozním nebo nákladovým prostorem;

- Výše požadovaná přepážka „A-60“ nemá prolomení podle 9.3.1.17.5 (a);
- Výstupní otvory větrání jsou rozmístěny minimálně 6,00 m od vstupů a otvorů obytných prostor, kormidelny a provozních prostor mimo oblast nákladu;
- Vstupní poklopy a větrací otvory jsou uzavíratelné zvenčí;
- Všechny nakládací a vykládací rozvody (sací a tlakové) jsou vedeny přes palubu nad prostorem s čerpadly. Požadovaná obsluha ovládacích zařízení v prostoru s čerpadly, spuštění čerpadel nebo kompresorů a regulace proudu tekutiny musí probíhat z paluby;
- Systém je plně integrován do systému potrubních rozvodů plynů a kapalin;
- Prostor s čerpadly je opatřen vestavěným zařízením pro detekci kyslíku, které automaticky ukazuje množství kyslíku, a které při dosažení koncentrace kyslíku 19,5 % spustí viditelný a slyšitelný poplach. Čidla tohoto systému musí být umístěna ve vhodných polohách na podlaze a ve výšce 2,00 m. Měření musí probíhat nepřetržitě a musí být zobrazeno v blízkosti vchodu. Akustická a optická poplachová zařízení musí být instalovány v kormidelně a v prostoru s čerpadlem a při spuštění alarmu musí být systém nakládky a vykládky odstaven;
- Porucha systému pro měření kyslíku musí spustit optický a akustický poplach v kormidelně a na palubě. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor;
- Ventilací systém předepsaný v 9.3.1.12.3 má dostatečnou kapacitu, aby zajistil minimálně 30 výměn vzduchu za hodinu na základě celkového objemu provozního prostoru.

Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, musí být místnost s čerpadlem také vybavena vestavěným systémem detekce plynů, který automaticky ukazuje přítomnost hořlavých plynů a aktivuje optický a akustický alarm, když koncentrace plynu dosáhne 20 % dolní meze výbušnosti nákladu nebo 20 % hodnoty dolní meze výbušnosti n-hexanu, podle toho, která hodnota je kritičtější.

Čidla tohoto systému detekce plynu musí být umístěna ve vhodných polohách ve spodní části a přímo pod palubou.

Měření musí probíhat nepřetržitě a musí být zobrazeno v blízkosti vchodu.

Akustická a optická poplachová zařízení musí být instalována v kormidelně a v prostoru s čerpadlem a při spuštění alarmu musí být odstaven systém nakládky a vykládky.

Jakákoliv porucha systému detekce plynu musí být okamžitě signalizována v kormidelně a na palubě optickým a akustickým varováním. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor.

9.3.1.17.7

Na vstupu do prostoru s čerpadly musí být připevněn následující nápis:

**PŘED VSTUPEM DO PROSTORU S ČERPADLY PŘEZKOUŠET NEPŘÍTOMNOST PLYNŮ
A TAKÉ DOSTATEK KYSLÍKU.
DVEŘE A VSTUPNÍ OTVORY NEOTEVÍRAT BEZ SVOLENÍ VELITELE PLAVIDLA.
PŘI SIGNÁLU IHNEDE OPUSTIT PROSTOR.**

9.3.1.18

Zařízení pro plnění inertního plynu

9.3.1.18.1

V případě předepsaného vytvoření inertního prostředí nebo polštáře musí být na plavidle zařízení pro plnění inertním plynem.

Toto zařízení musí být schopno udržovat trvale minimální tlak 7 kPa (0,07 bar) v prostorech, ve kterých musí být vytvořeno inertní prostředí. Mimo to, činnost zařízení pro plnění inertním plynem nesmí vést ke zvyšování tlaku v nákladním tanku nad tlak, pro který jsou nastaveny ventily zvýšení tlaku. Tlak, pro který je nastaven vakuový ventil, musí být 3,5 kPa (0,035 bar).

Množství inertního plynu, nutného pro nakládku nebo vykládku, se musí přepravovat nebo vyrábět na palubě plavidla, pokud není možnost jeho obdržení ze břehu. Mimo to, na palubě plavidla se musí nacházet dostatečné množství inertního plynu pro doplnění běžných ztrát, ke kterým dochází během přepravy.

Prostory, ve kterých musí být vytvořeno inertní prostředí, musí být vybaveny přípojkami pro plnění inertním plynem a kontrolními zařízeními, zajišťujícím stálou kontrolu potřebného prostředí.

Když tlak nebo koncentrace inertního plynu v plynné fázi se snižují pod zadanou hodnotu, musí kontrolní zařízení dávat do kormidelny světelný a zvukový signál. Když v kormidelně není nikdo přítomen, poplachový signál musí, mimo to, být k dispozici v místě, kde je přítomen jeden ze členů posádky.

9.3.1.18.2 Plavidla s membránovými tanky musí mít systém pro plnění inertního plynu schopný plnit inertní plyn do všech samostatných prostor tanků.

Systém musí být schopen trvale udržovat minimální tlak nad atmosférickým tlakem v prostorech, ve kterých musí být vytvořeno inertní prostředí.

Inertní plyn se musí vyrábět na palubě nebo přepravovat v množství, které je dostatečné pro celou udržovací dobu, jak je stanoveno v souladu s 7.2.4.16.16 a 7.2.4.16.17. Cirkulace inertního plynu v prostorech, ve kterých musí být vytvořeno inertní prostředí, musí být dostatečná, aby umožňovala účinné prostředky detekce plynů.

Prostory, ve kterých musí být vytvořeno inertní prostředí, musí být vybaveny přípojkami pro plnění inertním plynem a kontrolním zařízením, zajišťujícím stálou kontrolu požadované atmosféry v prostoru.

Pokud se tlak, teplota nebo koncentrace inertního plynu sníží pod zadanou hodnotu, musí kontrolní zařízení v kormidelně aktivovat akustické a optické poplachové zařízení. Pokud v kormidelně není nikdo přítomen, poplachové zařízení musí být také rozpoznatelné v místě, kde je přítomen člen posádky.

9.3.1.19

-

9.3.1.20

(Vyhrazeno)

9.3.1.21

Bezpečnostní a kontrolní zařízení

9.3.1.21.1

Každý nákladní tank musí být opatřen:

- (a) (Vyhrazeno)
- (b) přístrojem, který ukazuje úroveň hladiny;
- (c) přístrojem, který upozorňuje na úroveň hladiny nejpozději při naplnění na 86 %;
- (d) čidlem mezní hodnoty, které spustí bezpečnostní pojistku proti přeplnění nejpozději při naplnění na 97,5 %;
- (e) zařízením na měření tlaku plynné fáze v nákladním tanku;
- (f) zařízením na měření teploty nákladu;
- (g) přípojkou pro připojení zařízení pro odběr vzorků uzavřeného typu. Přípojka musí být vybavena uzavíracím zařízením odolným vůči vnitřnímu tlaku v připojení.

9.3.1.21.2

Stupeň plnění v % musí být zjistitelný s přesností na 0,5 %. Vztahuje se na obsah celého nákladního tanku včetně expanzní šachty.

9.3.1.21.3

Přístroj, který ukazuje úroveň hladiny, musí být možné sledovat z místa obsluhy uzavíracích prvků příslušného nákladního tanku. Maximálně přípustné hladiny naplnění 91 %, 95 % a 97 %, uvedené v seznamu látek, musí být vyznačeny na každém ukazateli úrovně.

Hodnoty přetlaku a vakua musí být viditelné v jakoukoliv dobu z toho místa, odkud je možné přerušit nákladku nebo vykládku. Maximálně přípustná hodnota přetlaku nebo vakua musí být vyznačena na každém ukazateli.

Údaje přístrojů musí být viditelné při každých povětrnostních podmínkách.

9.3.1.21.4

Signální přístroj úrovně hladiny musí na plavidle spustit akustický a optický signál a musí být nezávislý na přístroji, který ukazuje úroveň hladiny.

9.3.1.21.5

- (a) Čidlo mezních hodnot podle 9.3.1.21.1 (d) musí na plavidle spustit akustický a optický signál a zároveň aktivuje elektrický kontakt, který v podobě binárního signálu přeruší tok proudu z břehového zařízení a na břehu může zavést opatření proti přetečení při nakládce.

Signál musí být možné předat na břeh pomocí dvoupólového vodotěsného přístrojového konektoru zařízení, které zapojuje spoje, podle normy EN 60309-2:1999+A1:2007+A2:2012 pro stejnosměrný proud 40 až 50 V, barva označení bílá, poloha pomocného nosu šroubu 10 h.

Zásuvka musí být připevněna v bezprostřední blízkosti břehového zapojení nakládacího a vykládacího potrubí na plavidle.

Čidlo mezních hodnot musí být také schopné vypnout vlastní vykládací čerpadlo.

Čidlo mezních hodnot musí být nezávislé na přístroji, který upozorňuje na úroveň hladiny, smí však být spojeno s přístrojem, který ukazuje úroveň hladiny.

- (b) Během vykládky pomocí čerpadla na plavidle musí být možno čerpadlo vypnout z břehového objektu. K tomuto účelu musí být nezávislé, samo o sobě bezpečné silnoproudé vedení, napájené plavidlem, vypnuto z břehového objektu pomocí elektrického kontaktu.

Musí být možné přenést binární signál z břehového objektu pomocí vodotěsné dvoupólové zásuvky nebo konektorového zařízení podle normy EN 60309-2:1999+A1:2007+A2:2012, pro stejnosměrný proud 40 až 50 V, identifikační barva bílá, poloha pomocného nosu šroubu 10 h.

Tato zásuvka musí být trvale namontována na plavidle v blízkosti napojení vykládacích potrubí.

- 9.3.1.21.6 Optické a akustické signály přístroje, který upozorňuje na úroveň hladiny a čidla mezních hodnot se od sebe musí zřetelně odlišovat.

Optické signály musí být vidět na každém obslužném místě uzavíracích armatur nákladních tanků. Funkce měřicího čidla a elektrického obvodu musí být lehce kontrolovatelná nebo musí stačit provedení "failsafe".

- 9.3.1.21.7 Zařízení k měření tlaku a teploty nákladu musí při překročení předepsaného tlaku nebo předepsané teploty spustit optický a akustický signál v kormidelně. Pokud kormidelna není obsazena, musí být signál zaznamenaný též z místa, které je obsazeno členem posádky.

Při nakládce a vykládce musí toto zařízení při dosažení jedné ze zadaných hodnot okamžitě spustit elektrický kontakt, který může pomocí konektoru, popsaného v odstavci 9.3.1.21.5, zahájit opatření, kterým lze přerušit nakládku nebo vykládku. Při používání vlastního čerpadla plavidla musí být toto automaticky vypnuto. Sensory pro alarmy uvedeny výše mohou být připojeny k instalaci alarmu.

- 9.3.1.21.8 Pokud se ovládací prvky uzavíracích armatur nákladních tanků nachází v řídicím prostoru, musí být možné odpojení nákladních čerpadel z tohoto místa řízení, údaje ukazatele úrovně musí být viditelné na místě řízení a světelné a zvukové poplachové signály, které podává havarijně-poplachový signál úrovně čidlem vysoké úrovně podle 9.3.1.21.1 (d), a přístroje pro měření tlaku a teploty nákladu, musí být vidět a slyšet na místě řízení a na palubě.

Musí být zajištěn dohled nad oblastí nákladu z kontrolního prostoru.

- 9.3.1.21.9 Plavidlo musí být vybaveno tak, aby bylo možné proces nakládky/vykládky přerušit vypínačem, tzn. vysokorychlostní ventil musí být možné napojit přímo na pohyblivé vedení mezi plavidlem a břehem. Tyto vypínače musí být na plavidle umístěny na dvou místech (vpředu a vzadu).

Přerušovací systém musí být zkonstruován na principu ve stavu bez proudu.

- 9.3.1.21.10 V případě přepravy chlazených látek tlak spuštění poplachového systému se určuje podle konstrukce nákladních tanků. V případě přepravy látek, které se musí přepravovat v chlazeném stavu, tlak spuštění poplachového systému musí přesahovat nejméně o 25 kPa (0,25 bar) vypočtený maximální tlak v souladu s pododílem 9.3.1.27.

- 9.3.1.21.11 Na plavidlech, schválených pro přepravu hluboce zchlazených zkvapalněných plynů musí být v oblasti nákladu zajištěna následující ochranná opatření:

- Pod armaturou pro připojení s břehovým nakládacím/vykládacím potrubím, kterým se provádí nakládka/vykládka, se umísťují nádoby. Tyto musí být zhotoveny z materiálů, schopných snášet teplotu nákladu a být izolovány od paluby. Musí mít dostatečný objem a musí být vybaveny nátrubkem pro odtok mimo palubu.
- Vodní systém pro kropení, aby obsáhl:
 1. nechráněné otvory nákladních tanků;
 2. nechráněné nádrže na palubě pro hořlavé nebo toxické látky;
 3. části palubního nákladního prostoru, kde se může vyskytnout prosakování.

Kapacita vodního systému pro kropení musí být taková, aby při činnosti všech rozprašovacích trysek byl výstřik 300 l na čtvereční metr plochy nákladní paluby za hodinu. Systém musí být možno uvést do činnosti z kormidelny i z paluby;

- Systém vodní clony okolo spojovací armatury s břehem u používaného nakládacího/vykládacího potrubí, určený pro ochranu paluby a boku plavidla v případě armatury pro spojení s břehem u používaného nakládacího/vykládacího potrubí během

připojování a odpojování nakládacího ohebného spojení nebo hadice. Systém vodní clony musí mít dostatečnou kapacitu. Tento systém musí být možno uvádět do činnosti z kormidelny i z paluby.

- 9.3.1.21.12 Za účelem zamezení poškození nákladních tanků během nakládky a nakládacího/vykládacího potrubí během nakládky a vykládky na plavidlech, přepravujících hluboce zchladené zkapalněné plyny, musí být písemné pokyny pro předběžné ochlazení. Tyto pokyny se musí používat před uvedením plavidla do provozu a po dlouhé technické údržbě.

9.3.1.22 **Otvory nákladních tanků**

- 9.3.1.22.1 (a) Otvory nákladních tanků se musí nacházet na palubě v oblasti nákladu.
(b) Otvory nákladních tanků s příčnou plochou více než 0,10 m² musí být umístěny ve vzdálenosti nejméně 0,50 m nad úroveň paluby.
- 9.3.1.22.2 Otvory nákladních tanků musí být opatřeny plynotěsnými uzavěry, které odpovídají příslušným ustanovením v 9.3.1.23.1.
- 9.3.1.22.3 Výstupní otvory pro plyny z přetlakových ventilů musí být umístěny minimálně 2,00 m nad palubou plavidla a minimálně 6,00 m od obytných prostor jakož 6,00 m od provozních prostor ležících mimo oblast nákladu. Tato výška může být snížena, pokud bezprostředně kolem výstupního otvoru přetlakového ventilu v okolí 1,00 m nejsou žádná obslužná zařízení a tato oblast je označena jako oblast nebezpečí.
- 9.3.1.22.4 Uzavěry, které se normálně používají během nakládky a vykládky, nesmějí při používání způsobovat vznik jisker.
- 9.3.1.22.5 Každý tank, ve kterém se přepravují chlazené látky, musí být vybaven ochranným systémem, zamezující vytvoření nepřijatelného snížení nebo zvýšení tlaku.

9.3.1.23 **Tlaková zkouška**

- 9.3.1.23.1 Nákladní tanky a nakládací a vykládací potrubí musí odpovídat předpisům pro tlakové nádoby, které jsou pro přepravované látky vydány příslušným orgánem nebo uznanou klasifikační společností.
- 9.3.1.23.2 Kofrdamy, pokud existují, musí být přezkoušeny nejprve před uvedením do provozu a dále pak pravidelně v rámci předepsaných lhůt.
Zkušební tlak musí být minimálně 10 kPa (0,10 barů) přetlaku.
- 9.3.1.23.3 Maximální lhůta pro opakované přezkoušení podle 9.3.1.23.2 činí jedenáct let.

9.3.1.24 **Regulace tlaku a teploty nákladu**

- 9.3.1.24.1 V případě, že celý systém zachování nákladu není uzpůsoben na to, aby vydržel plný efektivní tlak par nákladu při vrchních hodnotách okolních výpočtových teplot, tak tlak v tancích musí se udržovat na úrovni nižší maximálně přípustného tlaku účinnosti pojistných ventilů za pomoci jednoho nebo několika následujících prostředků:
- (a) systém regulace tlaku nákladních tanků, využívající mechanické ochlazování;
- (b) systém umožňující stlačený plyn nahřát a zvýšit svůj tlak. Izolace a výpočetní tlak nákladního tanku, nebo souhrn těchto dvou elementů, musí být takovým, aby zůstávala dostatečná pevnostní vůle s ohledem na dobu služby a předpokládaných teplot; v každém případě tento systém se musí považovat za přijatelný uznanou klasifikační společností a zajišťovat bezpečnost během doby přesahující nejméně trojnásobek lhůty životnosti;
- (c) pouze pro UN 1972, systém pro regulaci tlaku v nákladním tanku, přičemž se výpary z varu využívají jako palivo;
- (d) jiný systém, které se považují za přijatelné uznanými klasifikačními společnostmi.
- 9.3.1.24.2 Systémy, předepsané v 9.3.1.24.1, musí být zhotoveny, umístěny a prověřeny tak, aby toto uznaná klasifikační společnost. Materiály použité při jejich konstrukci, musí být v souladu s přepravovaným nákladem. V běžných podmínkách provozu horní limity výpočtu okolních teplot musí představovat:
- vzduch: + 30 °C;
voda: + 20 °C.
- 9.3.1.24.3 Systém uložení nákladu musí být způsobilý vydržet plný tlak par nákladu při horních mezích vypočtených okolních teplot, nezávisle na systému, vybraného pro vypařovaných plynů. Tento předpis je uveden výše formou poznámky 37 ve sloupci (20) tabulky C kapitoly 3.2.

9.3.1.25 Čerpadla a potrubí

9.3.1.25.1 Čerpadla, kompresory a příslušná zařízení nakládky a vykládky musí být umístěny v oblasti nákladu. Nakládací čerpadla a kompresory musí být navíc možné vypínat z oblasti nákladu a dále z místa mimo tuto oblast. Nakládací čerpadla a kompresory musí být umístěny minimálně 6,00 m od přístupů nebo otvorů obytných a provozních prostor, které jsou umístěny mimo oblast nákladu.

9.3.1.25.2 (a) Nakládací a vykládací potrubí musí být nezávislé na jakýchkoli jiných potrubích na plavidle. Pod palubou, s výjimkou vnitřku nákladních tanků a provozních prostor, které jsou určeny pro instalování vlastních odplynovacích zařízení, nesmí být žádné potrubí, určené pro náklad.

(b) *(Vyhrazeno)*

(c) Nakládací a vykládací potrubí se od ostatních musí odlišovat, například barevným označením.

(d) Nakládací a vykládací potrubí na palubě a odvětrávací potrubí, s výjimkou břehové přípojky, avšak včetně pojistných ventilů, se musí nacházet s příslušnými oddělujícími šoupaty a ventily uvnitř vnějšího ohraničení dómů, podélně procházejícího plavidlem a minimálně v odstupu jedné čtvrtiny šířky plavidla k obšívce. To neplatí pro odlehčující potrubí za bezpečnostními ventily. Jestliže však příčně plavidlem probíhá jen jeden tankový dóm, musí se potrubí s příslušnými oddělujícími šoupaty a ventily nacházet v odstupu minimálně 2,70 m od obšívky.

U vedle sebe uspořádaných nákladních tanků je třeba všechny přípojky k tankovým dómům uspořádat na prostředek plavidla se nacházející stranu tankových dómů. Přitom smějí vnější přípojky ležet na střední linii, která vede paralelně ke střední ose plavidla skrz tankové domy. Uzavírací armatury se musí nacházet, pokud možno blízko nebo přímo na dómu tanku. Uzavírací zařízení nakládacích a vykládacích potrubí musí být duplikována, přičemž jedno ze zařízení je tvořeno rychlouzavíracím ventilem. Při vnitřním průměru < 50 mm smí uzavírací armatura být provedena jako pojistka při prasknutí potrubí.

(e) Břehové přípojky musí být od přístupů a otvorů obytných a také provozních prostor, ležících v oblasti nákladu, vzdáleny minimálně 6,00 m.

(f) Všechny břehové přípojky odvětrávacího potrubí a nakládacích a vykládacích potrubí, kterými se nakládá a vykládá, musí být opatřeny uzavírací armaturou a rychlouzavíracím ventilem. Všechny břehové přípojky musí, pokud nejsou v provozu, být zaslepeny přírubou.

(g) Nakládací a vykládací potrubí a rovněž odvětrávací potrubí nesmí mít ohebná spojení s pohyblivými přípojkami.

Pro přepravu hluboce zchlazených zkapalněných plynů:

(h) Nakládací a vykládací potrubí a nákladní tanky musí být chráněny před přílišným zatížením v důsledku tepelných deformací a před pohybem konstrukcí tanků a trupu.

(i) V případě nutnosti musí být zajištěna tepelná izolace nakládacího/vykládacího potrubí před okolní konstrukcí trupu s cílem zabránit snížení teploty trupu pod vypočtenou teplotou tohoto materiálu.

(j) Veškeré nakládací a vykládací potrubí, které je možno na každém konci zaslepovat, obsahuje-li kapalinu (zbytek), musí být vybaveno pojistnými ventily. Tyto pojistné ventily musí ústít do nákladních tanků a být chráněny před náhodným uzavřením.

9.3.1.25.3 (Vypuštěno)

9.3.1.25.4 Všechny jednotlivé součásti nakládacích a vykládacích potrubí musí být spojeny elektrickým vodičem s trupem plavidla.

9.3.1.25.5 Musí být patrné, zda uzavírací armatury nebo jiná uzavírací zařízení nakládacích a vykládacích potrubí jsou zavřené nebo otevřené.

9.3.1.25.6 Nakládací a vykládací potrubí musí při zkušebním tlaku vykazovat potřebnou elasticitu, nepropustnost a odolnost.

9.3.1.25.7 Vykládací potrubí musí být na vstupech a výstupech čerpadel opatřeno zařízeními pro měření tlaku.

Naměřené hodnoty musí být možné přečíst v každém okamžiku ze stanoviště obsluhy vlastního hasicího zařízení. Nejvyšší přípustný přetlak a podtlak musí být označen na stupnici manometru červeně.

Odečtení naměřených hodnot musí být možné za jakýchkoliv povětrnostních podmínek.

9.3.1.25.8 Nakládací a vykládací potrubí nesmí být použito pro účely balastování.

- 9.3.1.25.9 (Vyhrazeno)
- 9.3.1.25.10 Stlačený vzduch produkovaný mimo oblast nákladu může být používán v oblasti nákladu, pokud je nainstalován pružinový zpětný uzávěr, aby se zajistilo, že žádné plyny nemohou uniknout z oblasti nákladu prostřednictvím systému stlačeného vzduchu do obytných prostor, kormidelny nebo provozních prostorů mimo oblast nákladu.
- 9.3.1.26 (Vyhrazeno)
- 9.3.1.27 Chladicí systém**
- 9.3.1.27.1 Chladicí systém podle 9.3.1.24.1 (a) musí sestávat z jednoho nebo několika bloků, způsobilých udržovat na předepsaném úrovní tlak a teplotu nákladu při horních hodnotách vypočtených okolních teplot. Jestliže se nepředpokládají jakékoliv jiné prostředky pro regulování tlaku a teploty nákladu, které se považují za dostatečné uznanou klasifikační společností, musí být zajištěn jeden nebo několik rezervních bloků s kapacitou, která přinejmenším je rovná kapacitě největšího předepsaného bloku. Rezervní blok musí obsahovat kompresor, jehož motor, řídicí zařízení a všechny pomocné mechanismy, potřebné pro to, aby umožnily jeho funkci nezávisle od bloků, používaných při normálních podmínkách. Musí být k dispozici rezervní výměník tepla, když pouze nadbytečná kapacita běžného výměníku tepla tohoto systému nepředstavuje nejméně 25 % nejvyšší předepsané kapacity. Není nutno umísťovat zvláštní potrubí.
- Nákladní tanky, potrubí a pomocná zařízení musí být utěsněny tak, aby v případě výpadku všech systémů chlazení celý náklad zůstal při teplotě nezpůsobující otevření pojistných ventilů nejméně po dobu 52 hodin.
- 9.3.1.27.2 Bezpečnostní zařízení a spojovací potrubí chladicího zařízení musí být připojeny k nákladním tankům nad kapalnou fází nákladu při nejvyšším možném stupni plnění. Musí se také nacházet nad plynnou fází, jestliže úhel náklonu plavidla je 12°.
- 9.3.1.27.3 Pokud se spolu přepravuje více chlazených nákladů, které spolu mohou chemicky vytvořit nebezpečnou reakci, systému chlazení je třeba věnovat zvláštní pozornost, aby se předešlo možnému smíchání nákladů. V případě přepravy těchto nákladů musí být pro každý náklad k dispozici různý druh chladicího systému a každý z nich musí obsahovat plný rezervní blok podle 9.3.1.27.1. Přitom, když je chlazení zabezpečeno ne přímo, ale smíšeným systémem a když úniky v tepelných výměnících v žádné předpokládané situaci nemůže způsobit smíchání nákladu, tak není nutno používat různé bloky chlazení pro různý náklad.
- 9.3.1.27.4 Pokud více chlazených nákladů za podmínek přepravy nejsou vzájemně rozpustné tak, že jejich tlaky páry se při smísení sčítají, je třeba při dimenzování chladicího zařízení dbát na to, že se náklady nemohou smísit.
- 9.3.1.27.5 V těch případech, kdy chladicí systémy vyžadují vodu pro chlazení, musí se dodávat v dostatečném množství s pomocí čerpadla nebo čerpadel, používaných výhradně k těmto účelům. Čerpadlo nebo čerpadla musí mít nejméně dvě sací trubice, připojené, ke dvou vodovodním kohoutům-z levoboku a z pravoboku. Musí být k dispozici rezervní čerpadlo s dostatečnou kapacitou; toto čerpadlo se může používat i pro jiné účely s podmínkou, že jeho použití za účelem dodávky vody pro chlazení nepřekáží žádné jiné hlavní činnosti.
- 9.3.1.27.6 Chladicí systém může mít jednu z následujících forem:
- Přímý systém: Páry nákladu se stlačují, kondenzují a vrací do nákladních tanků. V případě několika nákladů, uvedených v tabulce C kapitoly 3.2, tento systém se nesmí použít. Tento předpis je uveden jako poznámka 35 ve sloupci (20) tabulky C kapitoly 3.2.
 - Nepřímý systém: Náklad nebo páry nákladu se ochlazují nebo kondenzují za pomoci chladicího media, ale nestlačují se.
 - Smíšený systém: Páry nákladu se stlačují a kondenzují ve výměníku tepla náklad/chladicí medium a vrací se do nákladních tanků. V případě některých nákladů, uvedených v tabulce C kapitoly 3.2, tento systém se nesmí použít. Tento předpis je uveden jako poznámka 36 ve sloupci (20) tabulky C kapitoly 3.2.
- 9.3.1.27.7 Všechny prvotní a druhotná chladicí media musí být slučitelné jedno s druhým, při vzájemném kontaktu. Výměna tepla může se uskutečňovat buď v určité vzdálenosti od nákladního tanku, nebo za pomoci chladicího šneku, umístěného uvnitř nebo vně nákladního tanku.
- 9.3.1.27.8 V případech, kdy je systém chlazení umístěn v odděleném provozním prostoru, musí tento provozní prostor odpovídat požadavkům v 9.3.1.17.6.

- 9.3.1.27.9 Pro všechny nákladní systémy se součinitel prostupu tepla, používaný k určení udržovací teploty (7.2.4.16.16 a 7.2.4.16.17), určuje formou výpočtu. Po ukončení stavby plavidla se správnost výpočtu prověřuje formou zkoušky pro určení tepelné rovnováhy. Výpočet a zkouška se provádí pod dozorem určené klasifikační společnosti, která dané plavidlo klasifikovala.
- Součinitel prostupu tepla musí být uveden v dokumentu uloženém na palubě. Součinitel prostupu tepla se prověřuje při každé obnově schvalovacího osvědčení.
- 9.3.1.27.10 Osvědčení od uznané klasifikační společnosti potvrzující, že ustanovení uvedená v 9.3.1.24.1 až 9.3.1.24.3, 9.3.1.27.1 a 9.3.1.27.4 výše byla splněna, musí být předloženo spolu se žádostí o vydání nebo prodloužení platnosti schvalovacího osvědčení.
- 9.3.1.28 Postřikové zařízení**
- Pokud je v sloupci (9) tabulky C kapitoly 3.2 požadován postřik, musí být plavidlo v oblasti nákladu na palubě opatřeno postřikovým zařízením, kterým mohou být omezeny páry z nákladu.
- Zařízení musí být vybaveno přípojkou k napájení ze břehu. Trysky musí být zapojeny tak, aby uvolněné plyny mohly být bezpečně sráženy. Zařízení musí být možné spustit z kormidelny a z paluby. Kapacita postřikového zařízení musí být rozložena přinejmenším tak, aby při současném používání všech trysek bylo dosaženo 50 litrů za hodinu na 1 m² pokryté nákladní plochy v oblasti nákladu
- 9.3.1.29** -
- 9.3.1.30** (Vyhrazeno)
- 9.3.1.31 Motory**
- 9.3.1.31.1 Jsou povoleny pouze spalovací motory s palivem s bodem vzplanutí nad 55 °C. Toto ustanovení neplatí pro motory s vnitřním spalováním, které jsou součástí pohonných a pomocných systémů. Tyto systémy musí splňovat požadavky Kapitoly 30 a Přílohy 8, oddílu 1 Evropské normy, která stanoví technické požadavky pro plavidla vnitrozemské plavby (ES-TRIN) ve znění pozdějších předpisů².
- 9.3.1.31.2 Větrací otvory strojoven a sací otvory motorů, jestliže tyto nenasávají vzduch přímo ze strojovny, musí být vzdáleny minimálně 2,00 m od oblasti nákladu.
- 9.3.1.31.3 (Vypuštěno)
- 9.3.1.31.4 (Vypuštěno)
- 9.3.1.31.5 Větrání uzavřených strojoven je třeba uzpůsobit tak, aby při venkovní teplotě 20 °C střední teplota strojovny nepřesáhla 40 °C.
- 9.3.1.32 Palivové tanky**
- 9.3.1.32.1 Pokud je plavidlo vybaveno úložnými prostory, smí být dvojité dno v oblasti nákladu použito jako palivový tank, jestliže je jeho výška minimálně 0,6 m.
- Rozvody paliva a otvory těchto tanků v úložných prostorech jsou zakázány.
- 9.3.1.32.2 Odvětrávací potrubí všech palivových tanků musí být vyvedeny minimálně 0,50 m nad otevřenou palubou. Tyto otvory a vývody přepadových trubek, které vedou nad palubu, musí být chráněny mřížkou nebo děrovanou destičkou.
- 9.3.1.33** (Vyhrazeno)
- 9.3.1.34 Výfuková potrubí**
- 9.3.1.34.1 Výfukové plyny musí být odváděny do volného prostoru výfukovým potrubím skrz bok trupu. Výstupní otvor musí být vzdálen minimálně 2,00 m od oblasti nákladu. Výfuková potrubí z motorů musí být vedena tak, aby se plyny co nejrychleji vzdálily od plavidla. Výfukové potrubí nesmí být umístěno v oblasti nákladu.
- 9.3.1.34.2 Výfukové potrubí musí být opatřeno ochranou proti úniku jisker, např. lapačem jisker.

² Jak je přístupná na webových stránkách Comité Européen pour l'Élaboration de Standards dans le Domaine de Navigation Intérieure – CESNI, <https://www.cesni.eu/en/documents/es-trin/>

9.3.1.35 Zařízení pro drenážování a čerpání balastní vody

9.3.1.35.1 Drenážní čerpadla a čerpadla na balastní vodu pro prostory uvnitř oblasti nákladu musí být instalována v oblasti nákladu.

To neplatí pro:

- dvojité boky a dvojitá dna, pokud nemají žádnou společnou stěnu s nákladními tanky;
- kofrdamy a úložné prostory, jestliže balastování je prováděno vodním potrubím hasicího zařízení v oblasti nákladu a drenážování je prováděno pomocí ejektorů instalovaných v oblasti nákladu.

9.3.1.35.2 Při použití dvojitého dna jako palivového tanku nesmí být tento napojen na drenážní systém.

9.3.1.35.3 Pokud je balastní čerpadlo nainstalované v oblasti nákladu musí se výtlačné potrubí a jeho mimopalubní sací přípojka na odběr balastní vody nacházet uvnitř oblasti nákladu.

9.3.1.35.4 Prostor s čerpadly pod palubou musí v případě nouze být možné dočerpat zařízením v oblasti nákladu, které je nezávislé na všech ostatních zařízeních v oblasti nákladu. Tento dočerpávací systém musí být umístěn mimo prostor s čerpadly.

9.3.1.36

9.3.1.39 (Vyhrazeno)

9.3.1.40 Hasicí zařízení

9.3.1.40.1 Plavidlo musí být opatřeno hasicím zařízením.

Zařízení musí odpovídat následujícím požadavkům:

- musí být napájeno dvěma na sobě nezávislými požárními nebo balastními čerpadly. Tato čerpadla a rovněž jejich napájení a elektrozařízení se nesmí instalovat ve stejném prostoru;
- Musí být vybaven vodním potrubím s nejméně třemi hydranty v oblasti nákladu nad palubou. Musí mít tři vhodné a dostatečně dlouhé hadice s proudnicemi/rozstřikovacími hubicemi o průměru nejméně 12 mm. Alternativně jedna nebo více soustav hadic může být nahrazena směrovými proudnicemi/rozstřikovacími hubicemi o průměru nejméně 12 mm. Musí být možno dosáhnout kteréhokoli bodu paluby v oblasti nákladu současně nejméně dvěma proudy vody, které nevycházejí z téhož hydrantu.
Pružinový nevratný ventil musí zabránit tomu, aby plyny mohly vniknout hasicím systémem do obytných nebo provozních prostorů mimo oblast nákladu;
- kapacita zařízení musí být stanovena minimálně takovým způsobem, aby při současném použití dvou rozstřikovacích proudnic z každého místa na palubě plavidla byl dosažen dostřík, který odpovídá minimálně šířce plavidla;
- systém dodávky vody musí být schopen uvedení do provozu z kormidelny a z paluby;
- musí být provedena opatření proti zamrznutí hasicích prostředků a hydrantů.

9.3.1.40.2 Vedle toho musí být strojovny, prostor s čerpadly a všechny prostory obsahující zvláštní vybavení (ovládací panely, kompresory atd.) pro chladicí zařízení, pokud je, vybaveny pevně instalovaným hasicím systémem splňujícím následující požadavky.

9.3.1.40.2.1 *Hasiva*

K ochraně prostorů ve strojovnách, kotelnách a prostorech s čerpadly jsou dovoleny jen pevně instalované hasicí systémy používající následující hasiva:

- (a) CO₂ (oxid uhličitý);
- (b) HFC 227 ea (heptafluorpropan);
- (c) IG-541 (52 % dusíku, 40 % argonu, 8 % oxidu uhličitého);
- (d) FK-5-1-12 (dodekaftor-2-3-methylpentanon).
- (e) (Vyhrazeno);
- (f) K₂CO₃ (uhličitan draselný).

Jiná hasiva jsou dovolena jen na základě doporučení Administrativního výboru.

9.3.1.40.2.2 *Větrání, odsávání vzduchu*

- (a) Spalovací vzduch potřebný pro spalovací motory zajišťující pohon by se neměl dostat z prostorů chráněných pevně instalovanými hasicími systémy. Tento požadavek není povinný, pokud má plavidlo dvě nezávislé hlavní strojovny, plynotěsně oddělené, nebo pokud má kromě

hlavní strojovny oddělenou strojovnu, v níž je instalován přídové dokormidlovací zařízení, které může samo zajistit pohon v případě požáru v hlavní strojovně.

- (b) Všechny větrací systémy s nuceným větráním v prostoru, který se má chránit, se musí automaticky vypnout, jakmile se spustí hasicí systém.
- (c) Všechny otvory v prostoru, který se má chránit, umožňující vnikání vzduchu nebo unikání plynu musí být vybaveny prostředky, které je dovolí rychle uzavřít. Musí být jasné, zda jsou otevřené, nebo uzavřené.
- (d) Vzduch unikající z ventilů pro vyrovnávání tlaku tanků s tlakovým vzduchem, instalovaných ve strojovnách, musí být odváděn do ovzduší.
- (e) Přetlak nebo podtlak způsobený rozptýlením hasiva nesmí zničit podstatné části prostoru, který se má chránit. Musí být možno zajistit bezpečné vyrovnání tlaku.
- (f) Chráněné prostory musí být opatřeny prostředky pro odsávání hasiva a spalin. Tyto prostředky musí být ovladatelné z míst mimo chráněný prostor a takových, která nemohou být zneprístupněna požárem v těchto prostorech. Jsou-li instalována odsávací zařízení, nesmí být možno je spustit během hašení.

9.3.1.40.2.3 *Požární poplachový systém*

Prostor, který se má chránit, musí být monitorován vhodným požárním poplachovým systémem. Poplachový signál musí být slyšitelný v kormidelně, obytném prostoru a v prostoru, který se má chránit.

9.3.1.40.2.4 *Potrubní systém*

- (a) Hasivo musí být vedeno do prostoru, který se má chránit, a v něm rozváděno pomocí trvalého potrubního systému. Potrubí instalované v prostoru, který se má chránit, a armatury, které jsou jeho součástí, musí být vyrobeny z oceli. Toto neplatí pro spojovací nástavce tanků a kompenzátory, za podmínky, že použité materiály mají rovnocenné ohnivzdorné vlastnosti. Potrubí musí být zevnitřku i zevnějšku chráněno proti korozi.
- (b) Výpustné hubice musí být upraveny tak, aby zajistily rovnoměrné rozptýlení hasiva. Zejména hasivo musí být rovněž účinné pod podlahou.

9.3.1.40.2.5 *Spouštěcí zařízení*

- (a) Hasicí systémy uváděné do činnosti automaticky nejsou dovoleny.
- (b) Musí být možno uvést hasicí systém do činnosti z vhodného místa nacházejícího se vně prostoru, který se má chránit.
- (c) Spouštěcí zařízení musí být instalována tak, aby mohla být uvedena do činnosti v případě požáru, a tak, aby riziko jejich poruchy v případě požáru nebo výbuchu v prostoru, který se má chránit, bylo zmenšeno na nejmenší možnou míru.

Systémy, které nejsou uváděny do činnosti mechanicky, musí být napájeny ze dvou navzájem nezávislých energetických zdrojů. Tyto energetické zdroje musí být umístěny vně prostoru, který se má chránit. Ovládací vedení umístěné v prostoru, který se má chránit, musí být zkonstruováno tak, aby zůstalo ve funkčním stavu v případě požáru trvajících nejméně 30 minut. Elektrické instalace se považují za vyhovující tomuto požadavku, pokud odpovídají normě IEC 60331-21:1999.

Jsou-li spouštěcí zařízení umístěna tak, že nejsou viditelná, musí být na součásti, která je zakrývá, umístěn symbol „hasicího systému“ o stranách nejméně 10 cm s následujícím nápisem provedeným červenými písmeny na bílém podkladu:

Hasicí systém

- (d) Je-li hasicí systém určen k ochraně více prostorů, musí zahrnovat oddělené a jasně označené spouštěcí zařízení pro každý prostor.
- (e) U každého spouštěcího zařízení musí být umístěny pokyny, které musí být jasně viditelné a nesmazatelné. Pokyny musí být v jazyce, který velitel plavidla umí číst a rozumí mu a, pokud tímto jazykem není angličtina, francouzština nebo němčina, musí být v angličtině, francouzštině nebo němčině. Musí obsahovat tyto informace:
 - (i) spouštění hasicího systému;
 - (ii) nutnost přesvědčit se, že všechny osoby opustily prostor, který se má chránit;
 - (iii) činnost posádky při zapnutí systému a při vchodu do chráněného prostoru po zapnutí systému nebo zaplnění hasivem, zejména s ohledem na možnost přítomnosti nebezpečných látek;

- (iv) správné chování se posádky v případě, že hasicí systém správně nefunguje.
- (f) V pokynech musí být uvedeno, že se před uvedením hasicího systému do činnosti musí vypnout spalovací motory umístěné v prostoru nebo nasávající vzduch z prostoru, který se má chránit.

9.3.1.40.2.6 *Poplachové zařízení*

- (a) Pevně instalované hasicí systémy musí být vybaveny opticko-akustickým poplachovým zařízením.
- (b) Poplachové zařízení se musí spustit automaticky, jakmile se hasicí systém uvede poprvé do činnosti. Poplachové zařízení musí fungovat po vhodnou dobu předtím, než dojde k vypuštění hasiva; nesmí být možné je vypnout.
- (c) Poplachové signály musí být jasně viditelné v prostorech, které se mají chránit, a na přístupových místech k nim a musí být zřetelně slyšitelné za provozních podmínek odpovídajících nejvyšší možné hladině hluku. Musí být možno je zřetelně rozlišit od všech ostatních zvuků a vizuálních signálů v prostoru, který se má chránit.
- (d) Zvukové poplachy musí být zřetelně slyšitelné také v přilehlých prostorech se zavřenými spojovacími dveřmi a za provozních podmínek odpovídajících nejvyšší možné hladině hluku.
- (e) Pokud není poplachové zařízení samo o sobě chráněno proti zkratům, přerušeným vodičům a poklesům napětí, musí být možno monitorovat jeho činnost.
- (f) U vstupu do každého prostoru, kam může dosáhnout hasivo, musí být umístěna tabulka s následujícím nápisem provedeným červenými písmeny na bílém podkladu:

**POZOR, HASICÍ SYSTÉM!
OPUŠTE TENTO PROSTOR IHNEDE PO (popis) SIGNÁLU!**

9.3.1.40.2.7 *Tlakové tanky, armatury a potrubí*

- (a) Tlakové tanky, armatury a potrubí musí odpovídat požadavkům příslušného orgánu nebo, pokud nejsou takové požadavky, požadavkům uznané klasifikační společnosti.
- (b) Tlakové tanky musí být instalovány podle pokynů výrobce.
- (c) Tlakové tanky, armatury a potrubí nesmějí být instalovány v obytných prostorech.
- (d) Teplota skříní a úložných prostorů pro tlakové tanky nesmí překročit 50 °C.
- (e) Skříně a úložné prostory na palubě musí být bezpečně uloženy a musí mít odvětrávací otvory umístěny tak, aby v případě, že tlakový tank není plynotěsný, nemohl unikající plyn vniknout do plavidla. Přímé spojení s jinými prostory není dovoleno.

9.3.1.40.2.8 *Množství hasiva*

Je-li množství hasiva určeno pro více než jeden prostor, nemusí být disponibilní množství hasiva větší, než je množství vyžadované pro největší z takto chráněných prostorů.

9.3.1.40.2.9 *Instalace, údržba, kontrola a dokumentace*

- (a) Montáž nebo úprava systému smí být prováděna pouze společností specializovanou na hasicí systémy. Je nutno se řídit pokyny (technický list výrobku, bezpečnostní list) poskytnutými výrobcem hasiva nebo systému.
- (b) Systém musí být podroben inspekci provedené znalcem:
 - (i) před uvedením do provozu;
 - (ii) pokaždé, kdy se uvádí zpět do provozu po své aktivaci;
 - (iii) po každé úpravě nebo opravě;
 - (iv) pravidelně, nejméně každé dva roky.
- (c) Během inspekce musí znalec zkontrolovat, zda systém odpovídá požadavkům v 9.3.1.40.2.
- (d) Inspekce musí zahrnovat alespoň:
 - (i) vnější kontrolu celého systému;
 - (ii) kontrolu těsnosti potrubí;
 - (iii) kontrolu dobré funkce ovládacích a aktivizačních systémů;
 - (iv) kontrolu tlaku a obsahu tanků;
 - (v) kontrolu těsnosti uzavíracích zařízení prostoru, který se má chránit;
 - (vi) kontrolu požárního poplachového systému;
 - (vii) kontrolu poplachového zařízení.

- (e) Osoba provádějící inspekci musí vystavit, podepsat a opatřit datem osvědčení o inspekci;
- (f) V osvědčení o inspekci musí být uveden počet pevně instalovaných hasicích systémů.

9.3.1.40.2.10 *Hasicí systém s CO₂*

Kromě požadavků obsažených v 9.3.1.40.2.1 až 9.3.1.40.2.9 musí hasicí systémy používající jako hasivo CO₂ odpovídat následujícím ustanovením:

- (a) Tanky s CO₂ musí být uloženy v plynotěsném prostoru nebo skříní, které jsou odděleny od jiných prostorů. Dveře takových úložných prostorů a skříní se musí otevírat směrem ven; musí být možno je uzamknout a musí být na vnější straně opatřeny symbolem „Pozor, obecně nebezpečí“, nejméně 5 cm vysokým a „CO₂“ v téže barvě a téže velikosti;
- (b) Úložné skříně nebo prostory pro tanky s CO₂ umístěné pod palubou musí být přístupné pouze zvenku. Tyto prostory musí mít uměle vytvořený větrací systém s odsávacími kryty a musí být zcela nezávislé na ostatních větracích systémech nacházejících se na plavidle;
- (c) Stupeň plnění tanků s CO₂ nesmí překročit 0,75 kg/l. Pro objem stlačeného CO₂ se bere hodnota 0,56 m³/kg;
- (d) Koncentrace CO₂ v prostoru, který se má chránit, nesmí být menší než 40 % celkového objemu prostoru. Toto množství musí být vypuštěno do 120 sekund. Musí být možno kontrolovat, zda probíhá správně rozstřikování;
- (e) Otevírání ventilů tanku a ovládání rozstřikovacího ventilu musí odpovídat dvěma různými operacím;
- (f) Vhodná doba uvedená v 9.3.1.40.2.6 (b) nesmí být menší než 20 sekund. Spolehlivé zařízení musí zajistit načasování rozstřikování CO₂.

9.3.1.40.2.11 *Hasicí systém s HFC-227 ea (heptafluorpropanem)*

Kromě požadavků obsažených v 9.3.1.40.2.1 až 9.3.1.40.2.9 musí hasicí systémy používající jako hasivo HFC-227 ea odpovídat následujícím ustanovením:

- (a) Tam, kde je více prostorů s rozdílnými celkovými objemy, musí být každý prostor vybaven svým vlastním hasicím systémem;
- (b) Každý tank obsahující HFC-227 ea, umístěný v prostoru, který se má chránit, musí být vybaven zařízením k zamezení nadměrnému tlaku. Toto zařízení musí zajistit bezpečně rozptýlení obsahu tanku v prostoru, který se má chránit, jestliže je tank zachvácen požárem, když hasicí systém ještě nebyl uveden do provozu;
- (c) Každý tank musí být vybaven zařízením dovolujícím kontrolovat tlak plynu;
- (d) Stupeň plnění tanků nesmí překročit 1,15 kg/l. Pro měrný objem stlačeného HFC-227 ea se bere hodnota 0,1374 m³/kg;
- (e) Koncentrace HFC-227 ea v prostoru, který se má chránit, nesmí být menší než 8 % celkového objemu prostoru. Toto množství musí být vypuštěno do 10 sekund;
- (f) Tanky s HFC-227 ea musí být vybaveny zařízením kontroly tlaku, které spustí slyšitelný a viditelný poplach v kormidelně v případě mimořádné ztráty hnacího plynu. Pokud plavidlo nemá kormidelnu, musí být poplach spuštěn vně prostoru, který se má chránit;
- (g) Po vypuštění nesmí koncentrace v prostoru, který se má chránit, překročit 10,5 % (objemu);
- (h) Hasicí systém nesmí zahrnovat hliníkové součásti.

9.3.1.40.2.12 *Hasicí systém s IG-541*

Kromě požadavků obsažených v 9.3.1.40.2.1 až 9.3.1.40.2.9 musí hasicí systémy používající jako hasivo IG-541 odpovídat následujícím ustanovením:

- (a) Tam, kde je více prostorů s rozdílnými celkovými objemy, musí být každý prostor vybaven svým vlastním hasicím systémem;
- (b) Každý tank obsahující IG-541, umístěný v prostoru, který se má chránit, musí být vybaven zařízením k zamezení nadměrnému tlaku. Toto zařízení musí zajistit, aby se obsah tanku bezpečně rozptýlil v prostoru, který se má chránit, je-li tank postižen požárem, když systém k hašení požáru nebyl ještě uveden do činnosti;
- (c) Každý tank musí být vybaven zařízením dovolujícím kontrolovat obsah;
- (d) Plnicí tlak tanků nesmí překročit 200 barů při teplotě + 15 °C;
- (e) Koncentrace IG-541 v prostoru, který se má chránit, musí být nejméně 44 % a nejvýše 50 % celkového objemu prostoru. Toto množství musí být vypuštěno do 120 sekund;

9.3.1.40.2.13 *Hasicí systémy využívající FK-5-1-12*

Mimo požadavků uvedených v 9.3.1.40.2.1 -9.3.1.40.2.9 musí hasicí systémy využívající

FK-5-1-12 jako hasiva odpovídat těmto předpisům:

- (a) Při existenci několika prostor, majících různý celkový objem, musí být každý prostor vybaven vlastním hasicím systémem;
- (b) Každá nádrž s FK-5-1-12 umístěná v chráněném prostoru musí být vybavena zařízením, které zabraňuje vytvoření přetlaku. Toto zařízení musí bezpečným způsobem zajišťovat rozptyl obsahu nádrže v chráněném prostoru v případě, kdy tato nádrž je pod vlivem ohně v době, kdy hasicí systém není zapnut;
- (c) Každá nádrž musí být vybavena zařízením, umožňujícím kontrolovat tlak plynu;
- (d) Úroveň zaplnění nádrže nesmí přesáhnout 1,00 kg/l. Za specifický objem FK-5-1-12 ne pod tlakem se považuje hodnota rovná 0,0719 m³/kg;
- (e) Objem FK-5-1-12 předávaný do chráněného prostoru musí dosahovat nejméně 5,5 % celkového objemu daného prostoru. Vypouštění tohoto množství se musí provést za 10 sekund;
- (f) Nádrž s FK-5-1-12 musí být vybavena zařízením pro kontrolu tlaku, dávajícím opticko-akustický poplachový signál do kormidelny v případě přílišné ztráty hasiva. Když není kormidelna, tento poplachový signál musí být dáván vně chráněného prostoru;
- (g) Po rozptýlení nesmí koncentrace v chráněném prostoru přesahovat 10,0 %.

9.3.1.40.2.14

(Vyhrazeno)

9.3.1.40.2.15

Hasicí systémy používající jako hasivo K₂CO₃.

Vedle požadavků uvedených v 9.3.1.40.2.1 až 9.3.1.40.2.3, 9.3.1.40.2.5, 9.3.1.40.2.6, a 9.3.1.40.2.9, musí hasicí systémy používající jako hasivo K₂CO₃ splňovat následující ustanovení:

- (a) Hasicí systém musí být typu schváleného v souladu se Směrnicí 2014/90/EU³ nebo MSC/Circ. 1270⁴;
- (b) Každá místnost musí být vybavena vlastním hasicím systémem;
- (c) Hasivo musí být uskladněno ve k tomu určených nepřetlakových tancích v prostoru který má chránit. Tyto tanky musí být konstruovány tak, aby se hasivo v prostoru rozptýlilo rovnoměrně. Hasivo musí především působit také pod palubními deskami.
- (d) Každý tank je samostatně napojen na spouštěcí zařízení.
- (e) Množství hasiva, které vytváří suchý aerosol musí být v poměru k chráněnému prostoru minimálně 120 g/m³ čistého objemu tohoto prostoru. Tento čistý objem se počítá podle Směrnice 2014/90/EU³ nebo podle MSC/Circ. 1270⁴. Musí být možné dodat hasivo do 120 vteřin.

9.3.1.40.2.16

Stacionární hasicí systém pro fyzickou ochranu

K zajištění fyzické ochrany ve strojovnách, kotelnách a prostorech s čerpadly jsou dovoleny stacionární hasicí systémy jen na základě doporučení administrativního výboru.

9.3.1.40.3

Dva ruční hasicí přístroje zmíněné v 8.1.4 musí být umístěny v oblasti nákladu.

9.3.1.40.4

Hasivo v pevně instalovaném hasicím systému musí být vhodné a v dostatečném množství pro zdolání požárů.

9.3.1.41

Oheň a otevřené světlo

9.3.1.41.1

Vyústění komínů se musí nacházet v minimální vzdálenosti 2,00 m od oblasti nákladu. Musí existovat zařízení, která zabrání úniku jisker a průniku vody.

9.3.1.41.2

Topné, varné a chladicí přístroje nesmí být provozovány ani kapalnými pohonnými hmotami, zkapalněnými plyny, ani pevnými hořlavými látkami.

Pokud jsou topné přístroje nebo topné kotle umístěny do strojoven nebo do prostor, které jsou pro to zvláště vhodné, smí být provozovány kapalnými pohonnými hmotami, avšak s bodem vzplanutí vyšším než 55 °C.

Varné a chladicí zařízení jsou povolena pouze v obytných prostorech.

³ Úřední věstník Evropské unie č. L 257 z 28.8. 2014, str. 146.

⁴ Oběžník Mezinárodní námořní organizace MSC/Circ. 1270 a opravy — Revidované pokyny pro schválení stabilních aerosolových hasicích systémů odpovídajících stabilním plynovým hasicím systémům, jak je uvedeno v úmluvě SOLAS 1974, pro strojovny — přijaté 4.6.2008.

- 9.3.1.41.3 Jsou povoleny pouze elektrické lampy.
- 9.3.1.42** -
- 9.3.1.49** (Vyhrazeno)
- 9.3.1.50** (Vypuštěno)
- 9.3.1.51** **Povrchové teploty instalací a zařízení**
- (a) Povrchová teplota elektrických a neelektrických instalací a zařízení nesmí překročit 200 °C.
- (b) Povrchové teploty vnějších částí motorů a jejich přívody vzduchu a odsávacích potrubí nesmí překročit 200 °C;
- (c) Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, pro které jsou ve sloupci (15) tabulky C kapitoly 3.2 uvedeny teplotní třídy T4, T5 nebo T6, pak odpovídající povrchové teploty v rámci přiřazených zón nesmí překročit 135 °C (T4), 100 °C (T5) nebo 85 °C (T6);
- (d) (a) a (b) neplatí, jsou-li splněny tyto požadavky (viz také 7.2.3.51.4):
- (i) obytné prostory, kormidelná a provozní prostory, kde mohou být povrchové teploty vyšší, než ty uvedené v (a) a (b), jsou vybaveny větracím systémem podle 9.3.1.12.4 (b); nebo
- (ii) instalace a zařízení, která generují povrchové teploty vyšší, než jsou teploty uvedené v (a) nebo (b), musí být možné vypnout. Takové instalace a zařízení musí být označena červeně.
- 9.3.1.52** **Druh a umístění instalace elektrických zařízení a vybavení**
- 9.3.1.52.1 Elektrické instalace a zařízení musí být minimálně typ „omezené riziko výbuchu“;
- Toto ustanovení se neuplatňuje u:
- (a) instalací osvětlení v obytných prostorech a kormidelně, s výjimkou spínačů umístěných v blízkosti vchodů;
- (b) mobilních telefonů, pevných telefonních instalací a stacionárních a přenosných počítačů a zařízení pro kontrolu naložení v obytných prostorech nebo kormidelně;
- (c) elektrické instalace a zařízení která jsou, během pobytu v bezprostřední blízkosti nebo ve vyznačené pobřežní oblasti:
- (i) uhašena; nebo
- (ii) jsou umístěna v prostorech vybavených větracím systémem podle 9.3.1.12.4;
- (d) radiotelefonní zařízení a stanice vnitrozemského systému AIS (systémy automatické identifikace) v obytných prostorech a kormidelně, pokud se žádná část antény pro radiotelefonní zařízení nebo stanice AIS nenachází nad nebo do 2,00 m od oblastí nákladu.
- 9.3.1.52.2 V kofrdamech, prostorech s dvojitými boky, dvojitými dny a úložných prostorech jsou povoleny pouze hermeticky uzavřené ozvěňové hloubkoměry, jejichž kabely jsou vedeny silnostěnnými ocelovými trubkami s plynotěsnými spoji až k hlavní palubě.
- 9.3.1.52.3 Pevné elektrické instalace a zařízení, která nesplňují požadavky stanovené výše v 9.3.1.51 (a), 9.3.1.51 (b) a 9.3.1.52.1 a jejich spínače, musí být označeny červeně. Odpojení těchto zařízení musí být řízeno z centrálního místa na palubě.
- 9.3.1.52.4 Každá izolovaná distribuční síť musí být vybavena automatickým zařízením s optickým a akustickým signálem pro kontrolu úrovně izolace.
- 9.3.1.52.5 Jsou povoleny pouze distribuční systémy bez zpětného spojení s trupem. Toto ustanovení se neuplatňuje u:
- aktivní katodické ochrany proti korozi;
 - některých omezených částí instalací umístěných mimo oblast nákladu (např. připojení spouštěčů diesellových motorů);
 - přístroje pro kontrolu úrovně izolace podle 9.3.1.52.4.
- 9.3.1.52.6 Elektrický generátor, který je trvale poháněn motorem a který nespĺňuje výše uvedené požadavky 9.3.1.52.1, musí být vybaven vypínačem schopným vypnout generátor. V blízkosti spínače musí být zobrazena informační tabule s návodem k obsluze.

- 9.3.1.52.7 Porucha napájecího zdroje bezpečnostního a kontrolního zařízení musí být okamžitě signalizována optickými a akustickými signály v kormidelně a na palubě. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor.
- 9.3.1.52.8 Elektrické spínače, zásuvky a kabely na palubě musí být chráněny proti mechanickému poškození.
- 9.3.1.52.9 Zásuvky pro připojení signálních světel a osvětlení lávky musí být natrvalo zabudovány v plavidle v blízkosti signálního stožáru nebo lávky. Zásuvky používané v chráněné oblasti musí být provedeny tak, aby nebylo možné připojení nebo odpojení, s výjimkou případů, kdy nejsou pod napětím.
- 9.3.1.52.10 Akumulátory musí být umístěny mimo oblast nákladu.

9.3.1.53 *Typ a umístění elektrických a neelektrických instalací a zařízení určených pro použití v oblastech s nebezpečím výbuchu*

- 9.3.1.53.1 Na palubách plavidel, na která se vztahuje rozdělení zón definovaných v 1.2.1, musí elektrická a neelektrická zařízení a zařízení používaná v prostorách s nebezpečím výbuchu splňovat alespoň požadavky pro použití v dané oblasti.

Musí být vybírána na základě skupin/podskupin výbušnosti a teplotních tříd, do nichž patří látky, které mají být přepravovány (viz sloupce (15) a (16) tabulky C kapitoly 3.2).

Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, pro které jsou ve sloupci (15) tabulky C kapitoly 3.2 uvedeny teplotní třídy T4, T5 nebo T6, pak odpovídající povrchové teploty v rámci přiřazených zón nesmí překročit 135 °C (T4), 100 °C (T5) nebo 85 °C (T6);

Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, pro které jsou ve sloupci (15) tabulky C kapitoly 3.2 uvedeny teplotní třídy T1 nebo T2, pak odpovídající povrchové teploty v rámci přiřazených zón nesmí překročit 200 °C.

- 9.3.1.53.2 S výjimkou optických vláken musí být elektrické kabely v chráněné oblasti pancéřovány nebo umístěny v kovovém plášti nebo v ochranných trubkách.

Elektrické kabely pro aktivní katodickou ochranu obšívky musí být vedeny silnostěnnými ocelovými trubkami s plynotěsnými spoji až k hlavní palubě.

- 9.3.1.53.3 Pohyblivé elektrické kabely jsou v oblasti s rizikem výbuchu, s výjimkou elektrických kabelů pro jiskrově bezpečné elektrické obvody nebo pro připojení:

- (a) signálních pozičních světel a osvětlení lávek, pokud je spojovací bod (například zásuvka) trvale zabudován v plavidle v blízkosti signálního stožáru nebo lávky;
- (b) elektrické sítě na plavidle do pozemní elektrické sítě; pokud:
 - elektrické kabely a napájecí jednotka odpovídají platné normě (například EN 15869-03:2010);
 - jsou napájecí jednotka a konektory umístěny mimo oblast s rizikem výbuchu.

Je připojování a odpojování zásuvek/konektorů možné pouze tehdy, když nejsou pod napětím.

- 9.3.1.53.4 Elektrické kabely jiskrově bezpečných samojistících obvodů musí být odděleny od ostatních kabelů, které nejsou určeny pro použití v těchto obvodech, a musí být označeny (nesmějí být instalovány společně ve stejném svazku kabelů a nesmí být upevněny stejnými kabelovými svorkami).

- 9.3.1.53.5 Pro pohyblivé elektrické kabely povolené v souladu s 9.3.1.53.5 se smí používat pouze opláštěvané kabely typu H07RN-F-F v souladu s RN IEC-60245-4:2011⁵ nebo elektrické kabely přinejmenším srovnatelného provedení s vodiči o průřezu minimálně 1,50 mm².

9.3.1.54 *Uzemnění*

- 9.3.1.54.1 Kovové části elektrických instalací a zařízení v oblasti nákladu, které nejsou pod napětím, jakož i ochranné kovové trubky nebo kovové pláště kabelů (chráničky) v normálním provozu musí být uzemněny, pokud nejsou provedeny tak, aby byly automaticky uzemněny spojením s kovovou konstrukcí plavidla.

- 9.3.1.54.2 Ustanovení v 9.3.1.54.1 platí také pro instalace s napětím menším než 50 V.

- 9.3.1.54.3 Nezávislé nákladní tanky, kovové IBC a cisternové kontejnery musí být uzemněny.

- 9.3.1.54.4 Nádoby na zbytkové produkty musí být možné uzemnit.

⁵ Identická s EN 50525-2-21: 2011.

9.3.1.55 (Vyhrazeno)

9.3.1.56 (Vypuštěno)

9.3.1.57 -

9.3.1.59 (Vyhrazeno)

9.3.1.60 **Zvláštní vybavení**

Plavidlo musí být vybaveno sprchou a lázní pro oči a obličej na místě, které je přímo přístupné z oblasti nákladu. Voda musí odpovídat kvalitě pitné vody na palubě.

POZNÁMKA: Jsou povoleny další dekontaminační látky, aby se zabránilo poškození očí a kůže.

Je povoleno připojení tohoto speciálního zařízení s oblastí mimo oblast nákladu.

Musí být instalován pružinový zpětný ventil, který zabrání unikání plynů mimo oblast nákladu sprchou a systémem oční a obličejové lázně.

9.3.1.61 (Vyhrazeno)

9.3.1.62 **Ventil pro odplynování do sběrných zařízení**

Na potrubí, které slouží k odvádění vzduchu, musí být instalován pevný nebo přenosný pružinový nízkotlaký ventil používaný při odplynování do sběrných zařízení. Pokud seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 obsahuje látky, u nichž se požaduje ochrana proti explozi podle sloupce (17) tabulky C kapitoly 3.2, musí být tento ventil vybaven pojistkou proti prošlehnutí plamene, která je schopna odolat deflagraci. Pokud neprobíhá odplynování plavidla do sběrného zařízení, musí být ventil uzavřen slepou přírubou. Nízkotlaký ventil musí být instalován tak, aby za jiných normálních pracovních podmínek nebyl vakuový ventil aktivován.

POZNÁMKA: Odplynování je součástí normálních pracovních podmínek.

9.3.1.63 -

9.3.1.70 (Vyhrazeno)

9.3.1.71 **Vstup na plavidlo**

Tabule označující zákaz vstupu podle 8.3.3 musí být dobře čitelné z obou boků plavidla.

9.3.1.72 -

9.3.1.73 (Vyhrazeno)

9.3.1.74 **Zákaz kouření, zákaz ohně a otevřeného světla**

9.3.1.74.1 Tabule označující zákaz kouření podle 8.3.4 musí být dobře čitelné z obou boků plavidla.

9.3.1.74.2 V blízkosti vstupu do míst, kde kouření nebo používání ohně nebo otevřeného světla není vždy zakázáno, musí být umístěny tabule, které uvádějí okolnosti, za kterých tento zákaz platí.

9.3.1.74.3 V obytných prostorech a kormidelně musí být v blízkosti každého východu umístěn popelník.

9.3.1.75 -

9.3.1.91 (Vyhrazeno)

9.3.1.92 **Nouzový východ**

Prostory, jejichž přístupové a výstupní otvory budou v případě poškození částečně nebo zcela zaplaveny, musí být opatřeny nouzovým východem, který se nachází minimálně 0,10 m nad vodoryskou. To neplatí pro přední a zadní kolizní prostor.

9.3.1.93 -

9.3.1.99 (Vyhrazeno)

9.3.2 Předpisy pro stavbu tankových plavidel typu C

Předpisy 9.3.2.0 až 9.3.2.99 platí pro tanková plavidla typu C.

9.3.2.0 Stavební materiály

- 9.3.2.0.1 (a) Trup plavidla a nákladní tanky musí být postaveny z lodní oceli nebo z jiného, přinejmenším rovnocenného kovu.
- Pro nezávislé nákladní tanky mohou být použity i jiné, rovnocenné materiály. Tato rovnocennost se týká mechanických vlastností a odolnosti vůči vlivu teploty a ohně.
- (b) Všechny části plavidla včetně zařízení a vybavení, které se dostane do styku s nákladem, musí být z takových materiálů, které nemohou být nákladem rozleptány nebo nezpůsobí rozpad nákladu a ani s ním nemohou vytvořit nebezpečné a škodlivé sloučeniny. V případě že je nebylo možné vyzkoušet během klasifikace a inspekce plavidla, musí být uvedena relevantní výhrada v seznamu látek připuštěných k přepravě v plavidle podle 1.16.1.2.5.
- (c) Odvětrávací potrubí musí být chráněno proti korozi.
- 9.3.2.0.2 Používání dřeva, hliníkových slitin, plastů nebo pryže v oblasti nákladu je zakázáno, pokud to není výslovně povoleno v odstavci 9.3.1.0.3 nebo ve schvalovacím osvědčení.
- 9.3.2.0.3 Použití dřeva, slitin hliníku, plastů nebo pryže v oblasti nákladu je povoleno, jak je uvedeno v následující tabulce:

Použití dřeva, slitin hliníku, plastů nebo pryže je povoleno pouze pro:	(X značí povoleno)			
	Dřevo	Slitiny hliníku	Plasty	Pryž
Lávky	X	X	X	X
Vnější žebříky a průchody (lávky) *)		X	X	X
Úklidové prostředky, např. košťata	X		X	X
Pohyblivá zařízení, např. hasicí přístroje, přenosné detektory plynu, záchranné vrátky		X	X	X
Oděrky, Odrazníky	X		X	X
Vyvazovací lana a lanové odrazníky (fendry)			X	
Vybavení pro zajištění nákladních tanků nezávislých na trupu plavidla a zajištění zařízení a vybavení	X		X	
Stožáry a podobné kulatiny	X	X	X	
Části motoru		X	X	
Ochranné krytí motorů a čerpadel			X	
Části elektrických instalací		X	X	
Části nakládacího a vykládacího zařízení, např. těsnění		X	X	X
Boxy, skříňky nebo jiné nádoby umístěné na palubě pro skladování vybavení pro likvidaci úniků, čisticí prostředky, hasicí přístroje, požární hadice, odpady atd.		X	X	
Jakékoli podpěry a zarážky	X		X	
Ventilátory, včetně soustav hadic pro větrání		X	X	
Části postřikovacího zařízení, sprchy, oční a obličejové lázně		X	X	
Izolace nákladních tanků a potrubí pro nakládku a vykládku, odplynovacích potrubí a potrubí pro ohřev nákladu			X	X
Povrchová úprava nákladních tanků a potrubí pro nakládku a vykládku		X	X	X
Všechny druhy těsnění (např. pro kryty kupolí nebo poklopů)			X	X
Kabely elektrických zařízení			X	X

Použití dřeva, slitin hliníku, plastů nebo pryže je povoleno pouze pro:	(X značí povoleno)			
	Dřevo	Slitiny hliníku	Plasty	Pryž
Rohož pod soustavou hadic pro nakládací a vykládací potrubí			X	X
Požární hadice, vzduchové hadice, hadice pro čištění paluby atd.			X	X
Vybavení a lahve k odběru vzorků			X	
Fotokopie schvalovacího osvědčení podle 8.1.2.6 nebo 8.1.2.7 a osvědčení plavidla, cejchovní průkaz a osvědčení o členství v plavbě na Rýně		X	X	
Záchytné nádoby na úkapy			X	
(*) Zohledněte 9.3.1.0.5, 9.3.2.0.5 nebo 9.3.3.0.5, podle okolností				
Hliníkové měřicí tyče jsou povoleny, pokud jsou opatřeny mosaznými patkami nebo jiným způsobem chráněny proti jiskření.				

Všechny trvale upevněné materiály v obytném prostoru nebo kormidelně, s výjimkou nábytku, musí být z těžko hořlavého materiálu. Pokud nastane požár, nesmí uvolňovat výpary nebo toxické plyny v nebezpečných množstvích.

9.3.2.0.4 Barva použitá v oblasti nákladu, nesmí při nárazu nebo při podobném namáhání zapříčinit vznik jisker.

9.3.2.0.5 Záchraně čluny z plastů je povoleno použít pouze v případě, že jsou vyrobené z těžko hořlavého materiálu.

Použití slitin hliníku nebo plastů pro průchody (lávky) v oblasti nákladu je povoleno pouze v případě, že jsou z těžko hořlavého materiálu nebo elektricky nevodivého materiálu.

9.3.2.1 **Dokumentace plavidla**

POZNÁMKA: Pro účely tohoto odstavce má pojem „vlastník“ stejný význam jako v 1.16.0.

Dokumentace plavidla musí být uchovávána vlastníkem, který musí být schopen poskytnout tuto dokumentaci na požádání příslušného orgánu a uznané klasifikační společnosti.

Dokumentace plavidla musí být udržována a aktualizována po celou dobu životnosti plavidla a musí být uchována ještě po dobu 6 měsíců po vyřazení plavidla z provozu.

Pokud by došlo během životnosti plavidla ke změně vlastníka, musí být dokumentace plavidla předána novému vlastníkovi.

Kopie dokumentace plavidla nebo všech potřebných dokumentů musí být na požádání poskytnuta příslušnému orgánu pro vydání schvalovacího osvědčení a uznané klasifikační společnosti nebo inspekční organizaci pro první inspekci, periodickou inspekci, zvláštní inspekci nebo mimořádné kontroly.

9.3.2.2 -

9.3.2.7 (Vyhrazeno)

9.3.2.8 **Klasifikace**

9.3.2.8.1 Tankové plavidlo musí být postaveno pod dohledem uznané klasifikační společnosti podle pravidel stanovených touto klasifikační společností pro její nejvyšší třídu a tankové plavidlo musí být podle toho zatříděno.

Vyžaduje se zachování vyšší třídy plavidla.

Klasifikační společnost vydá osvědčení prokazující, že plavidlo odpovídá plavidlům tohoto oddílu (klasifikační osvědčení).

V osvědčení musí být uveden konstrukční tlak a zkušební tlak nákladních tanků.

Pokud má plavidlo nákladní tanky s rozdílnými tlaky pro otevření ventilů, musí být v osvědčení uveden konstrukční a zkušební tlak každého tanku.

Klasifikační společnost vystaví osvědčení, v němž uvede všechny nebezpečné věci připuštěné k přepravě tímto plavidlem (viz též 1.16.1.2.5).

9.3.2.8.2 (Vypuštěno)

9.3.2.8.3 (Vypuštěno)

9.3.2.8.4 (Vypuštěno)

9.3.2.9 (Vyhrazeno)

9.3.2.10 *Ochrana proti průniku nebezpečných plynů a šíření nebezpečných kapalin*

9.3.2.10.1 Plavidlo musí být postaveno tak, aby se zamezilo vniknutí nebezpečných plynů a kapalin do obytných prostor, kormidelny a provozních prostor. Žádné z oken v těchto prostorech nesmí být možné otevřít, pokud není zamýšleno jako nouzový východ a jako takové označeno.

9.3.2.10.2 Ve výšce vnějších přepážek nákladních tanků musí být na palubě namontovány vodotěsný ochranný sil, a to v maximální vzdálenosti 0,60 m od vnějších přepážek kofrdamu nebo přepážek na konci nákladního prostoru. Ochranný sil musí být umístěn buď po celé šířce plavidla, nebo musí být upevněn mezi podélnými jímacími silami, aby se zabránilo vniknutí kapalin do předního i zadního kolizního prostoru. Výška ochranných a jímacích silů musí být minimálně 0,075 m. Ochranný sil může odpovídat ochranné stěně předepsané v 9.3.1.10.3, pokud ochranná stěna stojí po celé šířce plavidla.

9.3.2.10.3 Pokud seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 bude zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, pak není povoleno použití instalací a zařízení, která nejsou alespoň typu „omezené riziko výbuchu“, během nakládky a vykládky v částech paluby mimo oblast nákladu, pokud tyto části nejsou chráněny proti vniknutí plynů plyno a vodotěsnou stěnou. Stěna musí buď probíhat od jedné strany plavidla k druhé, nebo obklopuvat oblasti, které mají být chráněny, ve tvaru písmene U. Stěna musí pokrýt celou šířku chráněné oblasti a nejméně 1,00 m ve směru opačném k oblasti nákladu (viz schema Rozdělení zón). Výška stěny musí být nejméně 1,00 m nad přilehlým prostorem nad palubou v oblasti nákladu. Vnější stěna a boční stěny obytného prostoru lze považovat za ochrannou stěnu, pokud v nich nejsou otvory a pokud jsou dodrženy rozměry.

Ochranná stěna není nutná tam, kde je vzdálenost mezi oblastmi, které mají být chráněny, a pojistným ventilem, pobřežním připojením nakládacích a vykládacích rozvodů a odvětrávacím potrubím, kompresorem na palubě a otevíráním nejbližších tlakových nádob minimálně 12,00 m.

9.3.2.10.4 Na palubě musí mít spodní hrany dveřních otvorů v bočních stěnách nástaveb a silů, vstupních otvorů a větracích otvorů prostorů umístěných pod palubou výšku nejméně 0,50 m nad palubou.

Tento požadavek se nevztahuje na přístupové otvory do prostor dvojitého trupu a dvojitých dnů.

9.3.2.10.5 Štítnice, okopnice, paty zábradlí atd. musí být vybaveny dostatečně velkými otvory umístěnými přímo nad palubou.

9.3.2.11 *Úložné prostory a nákladní tanky*

9.3.2.11.1 (a) Nejvyšší přípustný obsah nákladního tanku lze zjistit z následující tabulky:

$L \times B \times H$ v m ³	Nejvyšší přípustný obsah nákladního tanku v m ³
< 600	$L \times B \times H \times 0,3$
600 - 3 750	$180 + (L \times B \times H - 600) \times 0,0635$
> 3 750	380

Připouštějí se alternativní varianty stavby v souladu s částí 9.3.4.

V předchozí tabulce je $L \times B \times H$ násobkem hlavních rozměrů tankového plavidla v metrech (podle cejchovního průřezu). Je to:

- L = největší délka trupu plavidla v m;
- B = největší šířka trupu plavidla v m;
- H = nejmenší kolmá vzdálenost mezi spodní hranou lodního kýlu a nejnižším bodem paluby na straně plavidla (boční výška) v oblasti nákladu v m;

- (b) Konstrukce nákladního tanku musí být provedena takovým způsobem, aby byla zohledněna hustota přepravovaného materiálu. Maximální přípustná hustota musí být uvedena ve schvalovacím osvědčení.
- (c) Pokud je plavidlo vybaveno tlakovými tanky, musí být tyto tanky provedeny takovým způsobem, aby jejich provozní tlak byl minimálně 400 kPa (4 bary).
- (d) U plavidel s délkou do 50,00 m nesmí délka nákladních tanků přesáhnout 10,00 m.
U plavidel delších než 50,00 m nesmí délka tanků přesáhnout 0,20 L.
Toto ustanovení neplatí pro plavidla se zasazenými, cylindrickými nákladními tanky s poměrem délky k průměru do 7.
- 9.3.2.11.2 (a) Plavidlo musí být v oblasti nákladu (kromě kofrdamů) provedeno jako plavidlo s hladkou palubou a dvojitou obšívkou s dvojitými boky, dvojitým dnem a bez zvýšené paluby.
Nezávislé nákladní tanky a chlazené nákladní tanky smí být umístěny pouze do jednoho úložného prostoru, který je podle 9.3.2.11.8 tvořen dvojitými boky a dvojitým dnem. Nákladní tanky nesmí vyčnívat přes palubu.
- (b) Nezávislé nákladní tanky musí být zajištěny proti vyplavání.
Zařízení pro upevňování chlazených nákladních tanků musí odpovídat požadavkům klasifikační společnosti.
- (c) Jímka čerpadla nesmí mít obsah větší než 0,10 m³.
- (d) Boční výztuhy, které spojují nosné části bočních stěn plavidla s nosnými částmi podélné přepážky, nebo boční výztuhy, které spojují nosné části dna plavidla s dnem nákladního tanku nejsou přípustné.
- (e) Místní výklenek v palubě nákladních tanků, ohraničený ze všech stran, o hloubce větší než 0,1 m, který je určen pro umístění nákladního čerpadla, se povoluje v případě, že splňuje tyto požadavky:
- Výklenek nesmí být hlubší než 1,0 m;
 - Výklenek musí být umístěn minimálně 6,00 m od vstupů a otvorů do obytných a provozních prostor mimo oblast nákladu;
 - Minimální vzdálenost výklenku od boků se musí rovnat čtvrtině šířky plavidla;
 - Všechna potrubí spojující výklenek s nákladními tanky musí být vybavena uzavíracími zařízeními připevněnými přímo na přepážce;
 - Všechna ovládací zařízení pro zařízení umístěná ve výklenku se musí ovládat z paluby;
 - Výklenek musí být možné vypustit pomocí systému instalovaného na palubě v oblasti nákladu, který je nezávislý na jakémkoli dalším systému;
 - Výklenek musí být vybaven poplachovým zařízením pro měření úrovně plnění, který spouští odvodňovací systém a optický a akustický alarm v kormidelně a na palubě, když se na dně hromadí kapalina;
 - Pokud je výklenek umístěn nad kofrdamem, musí mít přepážka ve strojovně izolaci třídy „A-60“, jak je definována v SOLAS 74, kapitola II-2, předpis 3;
 - Pokud je v oblasti nákladu instalováno postřikování vodou, musí být elektrická zařízení umístěná ve výklenku chráněna proti průniku vody;
 - Potrubí spojující vybrání s trupem nesmí procházet nákladními tanky.
- (f) Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, a výklenek bude hlubší než 0,50 m, musí být vybaven vestavěným systémem detekce plynů, který díky čidlům okamžitého měření automaticky ukazuje přítomnost hořlavých plynů a aktivuje optický a akustický alarm, když koncentrace plynu dosáhne 20 % dolní meze výbušnosti nákladu nebo 20 % hodnoty dolní meze výbušnosti n-hexanu, podle toho, která hodnota je kritičtější. Čidla tohoto systému musí být umístěna ve vhodných polohách ve spodní části výklenku.
Měření musí probíhat nepřetržitě.
Akustická a optická poplachová zařízení musí být instalována v kormidelně a při spuštění alarmu musí být odstaven systém nakládky a vykládky. Jakákoli porucha systému detekce

plynu musí být okamžitě signalizována v kormidelně a na palubě optickým a akustickým varováním.

Pokud se poplach nevyhne, musí být automaticky předán do obytných prostor.

- 9.3.2.11.3 (a) Nákladní tanky musí být odděleny kofrdamem s minimální šířkou 0,60 m od strojoven, provozních a obytných prostor pod palubou mimo oblast nákladu nebo pokud tyto prostory na plavidle chybí, tak musí být odděleny od konců plavidla. Pokud jsou nákladní tanky postaveny v jednom úložném prostoru, musí být vzdáleny minimálně 0,50 m od koncových přepážek úložného prostoru. V takovém případě se koncová přepážka třídy „A-60“, jak je definována v SOLAS 74, kapitola II-2, předpis 3, považuje za ekvivalent kofrdamu. Odstup 0,50 m smí u tlakových tanků být zmenšen na 0,20 m.
- (b) Úložné prostory, kofrdamy a nákladní tanky musí být možné přezkušovat.
- (c) Všechny prostory v oblasti nákladu musí být větratelné. Musí být možné kontrolovat, že v nich není žádný plyn.

- 9.3.2.11.4 Přepážky, které ohraničují nákladní tanky, kofrdamy a úložné prostory musí být vodotěsné. Nákladní tanky a přepážky ohraničující oblast nákladu nesmějí mít žádné otvory nebo průchody pod palubou.

V přepážce mezi strojovnou a kofrdamem nebo provozním prostorem v oblasti nákladu nebo mezi strojovnou a úložným prostorem smějí být průchody, pokud odpovídají ustanovením uvedeným v 9.3.2.17.5.

V přepážce mezi nákladním tankem a prostorem s čerpadly pod palubou smějí být průchody, pokud odpovídají ustanovením uvedeným v 9.3.2.17.6. V přepážkách mezi nákladními tanky smějí být průchody, pokud jsou nakládací-vykládací potrubí opatřena uzavíracími zařízeními na nákladním tanku, z něhož vycházejí. Tato uzavírací zařízení se musí uvádět do činnosti z paluby.

- 9.3.2.11.5 Dvojitě boky a dvojitá dna smí být v oblasti nákladu zřízeny pouze pro příjem balastní vody. Dvojitá dna smí být zařízena jako palivové tanky, pouze pokud splňují předpisy 9.3.2.32.

- 9.3.2.11.6 (a) Kofrdam, střední část kofrdamu nebo jiný prostor pod palubou v oblasti nákladu, smí být zařízeny jako provozní prostor, pokud jsou stěny, které jej ohraničují, vedeny kolmo až na dno. Tento provozní prostor smí být přístupný jenom z paluby
- (b) Takový provozní prostor musí být s výjimkou přístupových a větracích otvorů vodotěsný.
- (c) V provozním prostoru, jmenovaném v bodě a), nesmí být žádné nakládací a vykládací potrubí.

V prostoru s čerpadly pod palubou smí být nakládací a vykládací potrubí, pokud tento prostor plně odpovídá předpisům 9.3.2.17.6.

- 9.3.2.11.7 U plavidel s dvojitou obšívku se spojeným integrovaným nákladním tankem musí být minimální vzdálenost mezi bokem plavidla a boční stěnou nákladního tanku 1,00 m. Zmenšení této vzdálenosti na 0,80 m je dovoleno jen tehdy, jestliže jsou oproti dimenzovaným předpisům podle stavebního předpisu klasifikační společnosti provedena následující zesílení:

- (a) zvýšení tloušťky okrajnice o 25 %;
- (b) zvýšení tloušťky bočních stěn o 15 %;
- (c) uspořádání podélného systému výtuzí na boku plavidla, přičemž výška žebra nesmí být menší než 0,15 m a podélné výtuzí (lem stojiny) musí mít průřez alespoň 7,00 cm².
- (d) boční nebo podélné vyztužení je provedeno pomocí rámu, které jsou podobné dnovým příčkám s odlehčením a jsou umístěny ve vzdálenosti maximálně 1,80 m. Tyto vzdálenosti mohou být zvětšeny, pokud je konstrukce odpovídajícím způsobem zesílena.

Při stavbě plavidla s příčným systémem vyztužení musí být namísto písmene c) umístěn podélný výtuzný systém. Vzdálenost podélných výtuzí nesmí být větší než 0,80 m a výška bočních výtuzí nesmí být při úplném napojení na žebra menší než 0,15 m. Průřez (lem stojiny) nesmí být stejně jako u písmene c) menší než 7,00 cm². Jsou-li žebra volně vystřižena, musí být výška palubního ochozu zvětšena o výšku výřezu výtuzí.

Výška dvojitě dna musí být v průměru minimálně 0,70 m, avšak na žádném místě nesmí být menší než 0,60 m.

Pod čerpacími jímkami smí být světlost snížena na 0,50 m.

Připouštějí se alternativní varianty stavby v souladu s oddílem 9.3.4.

- 9.3.2.11.8 Pokud stavba probíhá za použití nezávislých nebo chlazených tanků, pak pro dvojité boky úložného prostoru platí minimální výška 0,80 m a pro dvojité dno úložného prostoru minimální výška 0,60 m.
- 9.3.2.11.9 Provozní prostory, které se nacházejí v oblasti nákladu pod palubou, musí být uspořádány takovým způsobem, aby byly dobře přístupné a aby v nich obsažená provozní zařízení mohla být bezpečně obsluhována osobami, které mají osobní ochranné vybavení. Musí být postaveny takovým způsobem, aby z nich bylo možné bez zvláštních potíží vyprostit zraněné osoby a osoby v bezvědomí, případně s pomocí pevně zabudovaných zařízení.
- 9.3.2.11.10 Kofrdamy, dvojité boky, dvojitá dna, nákladní tanky, úložné prostory a jiné prostory, do kterých se vstupuje v oblasti nákladu, musí být uspořádány takovým způsobem, aby je bylo možné přiměřeně a kompletně uklízet a kontrolovat. S výjimkou dvojitých boků a dvojitého dna, pokud nemají žádnou společnou stěnu s nákladními tanky, musí vstupní otvory být zhotoveny tak, aby do prostoru mohla bez jakékoliv újmy vstoupit nebo tento opustit osoba s dýchacím přístrojem. Nejmenší velikost otvoru: 0,36 m²; nejmenší boční délka: 0,50 m. Vstupní otvory musí být postaveny takovým způsobem, aby z nich bylo možné bez zvláštních potíží vyprostit zraněné osoby a osoby v bezvědomí, případně s pomocí pevně zabudovaných zařízení. Odstup mezi zesíleními ve shora uvedených prostorech nesmí být menší než 0,50 m. Ve dvojitém dně smí tento odstup být zmenšen na 0,45 m.

Nákladní tanky smí být opatřeny kulatým otvorem s minimálním průměrem 0,68 m.

9.3.2.12 **Větrání**

- 9.3.2.12.1 V každém úložném prostoru musí být dva otvory, jejichž rozměr a uspořádání jsou takové, aby větrání na každém místě prostoru bylo účinné. Pokud tyto otvory neexistují, musí být možné úložné prostory inertizovat nebo plnit suchým vzduchem.
- 9.3.2.12.2 Dvojité boky a dvojité dno v oblasti nákladu, které nejsou zřízeny za účelem balastování a eventuální existující kofrdamy mezi strojovými a prostory s čerpadly musí být větratelné větracími zařízeními.
- 9.3.2.12.3 (a) Provozní prostor umístěný v oblasti nákladu pod palubou musí být vybaven systémem ventilace. Kapacita větráků musí být dostatečná pro zajištění 20 kompletních výměn vzduchu za hodinu na základě objemu provozního prostoru.
- Ventilační odsávací šachty musí sahát až do výšky 50 mm nad podlahou provozního prostoru. Vzduch musí být přiváděn potrubím v horní části provozního prostoru.
- (b) Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, musí být přívody vzduchu umístěny nejméně 2,00 m nad palubou, ve vzdálenosti nejméně 2,00 m od otvorů tanku a 6,00 m od výpustí pojistných ventilů.
- Prodlužovací potrubí, které může být nezbytné, může být zavěšené. Obytné a provozní prostory musí být větratelné.
- 9.3.2.12.4 (a) Obytné prostory, kormidelná a provozní prostory musí být vybaveny větráním.
- (b) Systém větrání v takových prostorech musí splňovat následující požadavky:
- (i) Sací otvory musí být umístěny co nejdále, a minimálně 6,00 m od chráněné oblasti, a minimálně 2,00 m nad palubou;
 - (ii) V prostorech se může udržovat přetlak nejméně 0,1 kPa (0,001 bar);
 - (iii) Je zabudováno poplachové zařízení pro případ poruchy;
 - (iv) Větrací systém, včetně poplachového zařízení pro případ poruchy, musí být minimálně typ „omezené riziko výbuchu“;
 - (v) Systém detekování plynu odpovídající níže uvedeným podmínkám 1 až 4 je připojen na větrací systém:
 1. Je vhodný pro použití minimálně v zóně 1, výbušné skupině IIC a teplotní třídě T6;
 2. Je vybaven čidly:
 - Na sacích otvorech větracího systému; a
 - Přímo pod vrchní hranou prahu vstupních dveří;
 3. Jeho čas t₉₀ je nižší nebo se rovná 4 s;
 4. Měření musí být neustálé;

- (vi) V provozních prostorách je větrací systém napojen na nouzové osvětlení, které musí být minimálně typ „omezené riziko výbuchu“;
Toto nouzové osvětlení není nutné, pokud je osvětlení v provozních prostorách minimálně typu „omezené riziko výbuchu“;
- (vii) Sání větracího systému a instalací a zařízení, která nesplňují požadavky uvedené v 9.3.2.51 (a) a (b) a 9.3.2.52.1 musí být uzavřeno, pokud je dosaženo koncentrace, která se rovná 20% dolní meze výbušnosti n-Hexanu;
Při vypnutí musí být v obytných prostorách a v prostoru kormidelny aktivována zvuková a světelná signalizace;
- (viii) V případě selhání větracího systému nebo instalací detekce plynu v obytných prostorách, musí být vypnuty instalace a zařízení v obytných prostorách, které nesplňují požadavky uvedené v 9.3.2.51 (a) a (b) a 9.3.2.52.1
Porucha musí být signalizována v obytných prostorech, kormidelně a na palubě vizuálními a zvukovými signály;
- (ix) V případě selhání větracího systému nebo instalací detekce plynu v kormidelně nebo provozních prostorech, musí být vypnuty instalace a zařízení v těchto prostorech, které nesplňují požadavky uvedené v 9.3.2.51 (a) a (b) a 9.3.2.52.1;
Porucha musí být viditelně a slyšitelně signalizována v prostoru kormidelny a na palubě; Pokud se poplach nevypne, musí být automaticky předán do obytných prostor;
- (x) Jakékoli vypnutí musí nastat okamžitě a automaticky a, je-li to nutné, musí aktivovat nouzové osvětlení;
Zařízení automatického vypínání musí být nastaveno tak, aby po dobu plavby automatické vypnutí nebylo možné;
- (c) Pokud v prostoru není větrací systém nebo větrací systém prostoru nesplňuje všechny požadavky uvedené výše v (b), musí existovat možnost vypnout všechny zařízení a přístroje, které se nenacházejí tomto prostoru, které svojí činností mohou přesáhnout povrchové teploty uvedené v 9.1.0.51 (a) a (b), nebo které nesplňují požadavky uvedené v 9.1.0.52.1.

9.3.2.12.5 (Vypuštěno)

9.3.2.12.6 Na větracích otvorech musí být umístěny tabulky uvádějící podmínky, za nichž mají být otvory uzavřeny. Všechny větrací otvory obytných prostor, kormidelny a provozních prostor vedoucích do venkovního prostoru mimo oblast nákladu musí být vybaveny zařízeními trvale upevněnými podle 9.3.2.40.2.2 (c), která umožňují jejich rychlé uzavření. Musí být jasné, zda jsou otevřené nebo zavřené.

Tyto větrací otvory musí být umístěny nejméně 2,00 m od oblasti nákladu.

V této oblasti mohou být umístěny větrací otvory provozních prostor v oblasti nákladu.

9.3.2.12.7 (Vypuštěno)

9.3.2.13 **Stabilita (obecně)**

9.3.2.13.1 Musí být prokázána dostatečná stabilita včetně stability v poškozeném stavu.

9.3.2.13.2 Základní hodnoty pro výpočet stability – hmotnost prázdného plavidla a poloha těžiště hmotnosti – musí být určeny buď pomocí nakládního pokusu nebo detailním výpočtem hmotnosti. Přitom se musí ověřit hmotnost prázdného plavidla měřením ponoru, přičemž se vypočtená hmotnost nesmí lišit více než o $\pm 5\%$ od hodnoty hmotnostního výtlačku určené ze změřeného ponoru.

9.3.2.13.3 Musí být prokázána dostatečná stabilita v nepoškozeném stavu pro všechna stadia nakládky a vykládky a pro konečný stav naložení pro všechny relativní hustoty přepravovaných látek uvedených v seznamu látek přípuštěných k přepravě v plavidle podle 1.16.1.2.5.

Pro každou nakládací operaci je třeba vzít v úvahu skutečná plnění a zaplavení nákladních cisteren, balastních nádrží a komor, nádrží na pitnou vodu a na odpad a nádrží obsahujících produkty pro provoz plavidla, plavidlo musí splňovat požadavky na nepoškozenou a poškozenou stabilitu.

Mezistavy během operací musí být též vzaty v úvahu.

Musí být prokázána dostatečná stabilita pro každou provozní, nakládací a balastní podmínku v příručce stability schválená relevantní klasifikační společností, která zařadila plavidlo. Jestli je to nepraktické pro předběžnou kalkulaci provozních, nakládacích a balastních podmínek, zařízení pro

kontrolu naložení schválené uznanou klasifikační společností, která klasifikuje plavidlo, musí být instalováno a použito, které je uvedeno v příručce stability.

POZNÁMKA: *Knížka stability musí být ve formě srozumitelné pro odpovědného velitele a obsahovat následující údaje:*

Všeobecný popis plavidla:

- *Všeobecné uspořádání a plány kapacity udávající schválené použití oddílů a prostor (nákladní nádrže, sklady, ubytování atd.);*
- *Nákres uvádějící polohu značek ponoru ve vztahu ke kolmicím plavidla;*
- *Schéma podpalubních balastních čerpacích a ochranných systémů zaplavení;*
- *Hydrostatické křivky nebo tabulky odpovídající konstrukčnímu vyvážení, a pokud se významné vyvažovací úhly předpokládají během normálního provozu plavidla, křivky nebo tabulky odpovídající takovému stupni vyvážení musí být uvedeny;*
- *Příčné křivky nebo tabulky stability vypočtené na volném vyvažovacím základě, pro stupně přemístění a vyvážení předvídané v normálních provozních podmínkách, s uvedením objemu, který byl uvažován pro výtlač;*
- *Cisternové tabulky nebo křivky ukazující kapacity, těžiště a údaj o volném prostoru všech nákladních nádrží, balastních nádrží a komor, nádrží na pitnou vodu a odpadní vodu a nádrží obsahující produkty pro provoz plavidla;*
- *Nezbytné údaje (hmotnost a těžiště) vycházející z odchýlné zkoušky nebo měření vlastní hmotnosti v kombinaci dílčím vážením hmotnosti nebo jinými přípustnými měřeními. Kde jsou výše uvedené informace odvozeny ze sesterského plavidla, odvolávka na sesterské plavidlo musí být jasně uvedena a kopie zprávy o schválené odchýlné zkoušce relevantního sesterského plavidla musí být zahrnuta;*
- *Kopie zprávy o schválené zkoušce musí být zahrnuta do knihy stability.*
- *Provozní nákladní podmínky s relevantními podrobnými údaji, jako:*
 - *Nezbytné údaje, plnění nádrží, sklady, posádka a jiné relevantní části na palubě (hmotnost a těžiště každé relevantní části na palubě, momenty volného povrchu pro kapalné náklady);*
 - *Ponory středu plavidla a při kolmicích;*
 - *Metacentrická výška korigovaná pro účinek volných povrchů;*
 - *Hodnoty směrové páky a křivka;*
 - *Podélné ohybové momenty a smykové síly na čitelných bodech;*
 - *Informace o otvorech (umístění, typ těsností, prostředky uzávěrů); a*
 - *Informace pro velitele.*
- *Výpočet vlivu balastní vody na stabilitu s informací, jestli pevně zabudované hladinoměry pro balastní nádrže a prostory musí být instalovány nebo jestli balastní nádrže nebo prostory musí být úplně plné nebo úplně prázdné, pokud je to jinak.*

9.3.2.13.4 Plovatelnost v poškozeném stavu musí být prokázána pro nejnepříznivější stav naložení. K tomuto účelu musí být předložen vypočtený důkaz dostatečné stability pro kritické mezistavy a pro konečný stav zaplavení.

9.3.2.14 Stabilita (v nepoškozeném stavu)

9.3.2.14.1 Požadavky na stabilitu v poškozeném stavu, vyplývající z výpočtu zaplavení, nesmí být překročeny.

9.3.2.14.2 Pro plavidla s nákladními tanky o šířce větší než 0,70 B musí být podán důkaz, že byly dodrženy následující požadavky na stabilitu:

- (a) V pozitivní ploše křivky ramene stability až do zanoření prvního nevodotěsného otvoru musí být rameno stability (GZ) nejméně 0,10 m;
- (b) Obsah pozitivní plochy křivky ramene stability až do zanoření prvního nevodotěsného otvoru a v každém případě až do úhlu náklonu $\leq 27^\circ$ musí být nejméně 0,024 m.rad;
- (c) Výška metacentra (GM) musí být nejméně 0,10 m.

Tyto podmínky musí být splněny, přičemž je nutno pamatovat na vliv všech volných hladin v tancích pro všechny fáze nakládky a vykládky.

9.3.2.14.3 Rozhodující pro plavidlo je přísnější z požadavků 9.3.2.14.1 a 9.3.2.14.2.

9.3.2.15 Stabilita (v případě poškození)

9.3.2.15.1 Pro případ poškození je třeba zohlednit následující:

- (a) rozsah poškození na jednom boku plavidla:

- podélný rozsah: nejméně 0,10 L, avšak ne méně než 5,00 m,
 příčný rozsah: 0,79 dovnitř od boku plavidla kolmo k podélné ose plavidla na úrovni roviny ponoru při maximálním ponoru nebo, pokud je to vhodné, vzdálenost povolenou oddílem 9.3.4, sníženou o 0,01 m;
- svislý rozsah: neohrazený od základní roviny vzhůru.
- (b) rozsah poškození dna:
 podélný rozsah: minimálně 0,10 L, avšak ne méně než 5,00 m,
 příčný rozsah: 3,00 m,
 svislý rozsah: 0,59 m vzhůru od základny kromě sacích jímek.
- (c) Všechny přepážky, spadající do oblasti poškození se považují za proražené, to znamená, že dělení přepážkami na úseky musí být voleno tak, aby bylo plavidlo plavby schopné i po zaplavení dvou nebo více přímo za sebou ležících úseků.

Přitom se musí dbát na následující:

- při poškození dna se považují i úseky ležící vedle sebe napříč plavidla za zaplavené;
- spodní hrany vodotěsně neuzavíratelných otvorů (např. dveří, oken, palubních poklopů), musí v konečné fázi zaplavení ležet nejméně 0,10 m nad rovinou ponoru;
- všeobecně se musí počítat s 95 % rozsahem zatopení. Je-li výpočtem prokázáno, že střední zaplavení v kterémkoli prostoru je menší než 95 %, může být dosazena vypočtená hodnota.

Dosazují se však následující minimální hodnoty:

- strojovny	85 %
- prostory pro posádku	95 %
- dvojité dno, olejové nádrže, balastní nádrže, atd. podle toho, zda je dle jejich určení lze považovat při maximálním ponoru za plné nebo prázdné	0 nebo 95 %.

Pro hlavní strojovny stačí prokázat schopnost plavby jen pro stav zaplavení jednoho úseku, t.j. konečné přepážky strojovny se nepovažují za poškozené.

9.3.2.15.2

Náklon plavidla v rovnovážné poloze (konečný sklon plavidla) nesmí přesahovat 12°. Otvory, které nejsou vodotěsně uzavíratelné, se mohou zanořovat teprve až po dosažení rovnovážné polohy. Pokud se zanořují dříve, považují se k nim příslušné prostory při poškození za zaplavené.

Nad rovnovážnou polohu musí pozitivní oblast křivky vztyčeného ramene stability vykazovat $\geq 0,05$ m ve spojení s plochou $\geq 0,0065$ m.rad. Minimální hodnoty stability musí být dodrženy až do zanoření prvních otvorů, které nejsou uzavřeny tak, aby odolávaly vlivům počasí, avšak před úhlem náklonu $\leq 27^\circ$. Zanoří-li se tyto otvory dříve, je třeba k nim náležící prostory při výpočtu považovat za zatopené.

9.3.2.15.3

Pokud otvory, jimiž mohou být dodatečně zaplaveny nepoškozené prostory, mohou být vodotěsně uzavřeny, musí tato uzavírací zařízení být odpovídajícím způsobem popsána.

9.3.2.15.4 Pokud jsou provedeny otvory pro přepouštění nebo zatopení pro snížení asymetrie, musí dojít k vyrovnání během 15 minut, pokud se v mezistavech prokáží dostatečné hodnoty stability v poškozeném stavu.

9.3.2.16 Prostory strojovny

9.3.2.16.1 Spalovací motory pro provoz plavidla, jakož i spalovací motory pomocných strojů, musí být umístěny mimo oblast nákladu. Přístup a další otvory do těchto prostor musí být umístěny v minimální vzdálenosti 2,00 m od oblasti nákladu.

9.3.2.16.2 Strojovny musí být přístupné z paluby plavidla. Přístupy nesmí být nasměrovány k oblasti nákladu. Pokud nejsou dveře umístěny do výklenku, jehož hloubka odpovídá alespoň šířce dveří, musí být závěsy dveří obráceny k oblasti nákladu.

9.3.2.17 Obytné a provozní prostory

9.3.2.17.1 Obytné prostory a kormidelna musí ležet mimo oblast nákladu před první kolmou rovinou vpředu nebo za nejzazší kolmou rovinou pod palubou se nacházející části oblasti. Okna kormidelny, která jsou umístěna minimálně 1,00 m nad podlahou kormidelny, smí být nakloněna dopředu.

9.3.2.17.2 Přístupy k prostorám a otvorům v nástavbách nesmí být nasměrovány k oblasti nákladu. Závěsy dveří, které se otevírají směrem ven a nejsou umístěny do výklenku, jehož hloubka odpovídá alespoň šířce dveří, musí být obráceny k oblasti nákladu.

9.3.2.17.3 Přístupy z paluby a otvory prostor do volného prostoru musí být možné uzavírat. Na přístupu do těchto prostor musí být přípevně následující upozornění:

**BĚHEM NAKLÁDKY, VYKLÁDKY A ODPLYNOVÁNÍ
NEOTEVÍRAT BEZ SVOLENÍ VELITELE PLAVIDLA.
OKAMŽITÉ OPĚT ZAVŘÍT.**

9.3.2.17.4 Vstupy a otevíratelná okna nástaveb a obytných prostor a také jiné otvory k těmto prostorům musí být vzdáleny minimálně 2,00 m od oblasti nákladu. Okna a dveře kormidelny smí být v rámci těchto 2,00 m umístěny jen tehdy, pokud neexistuje přímé spojení mezi kormidelnou a obytnými prostory.

9.3.2.17.5 (a) Hnací hřídele drenážních a balastních čerpadel v oblasti nákladu smí být vedeny skrze přepážku mezi provozním prostorem a strojovnou, pokud uspořádání provozního prostoru odpovídá předpisům 9.3.2.11.6.

(b) Vedení hřídele přepážkou musí být provedeno plynotěsně a schváleno uznanou klasifikační společností.

(c) Připojení musí obsahovat potřebné provozní pokyny.

(d) V přepážce mezi strojovnou a provozním prostorem v oblasti nákladu a mezi strojovnou a úložným prostorem smí být umístěna vedení elektrických kabelů, vedení hydrauliky a potrubí pro měřicí, řídicí a signální zařízení, pokud jsou provedeny plynotěsně a jsou schváleny uznanou klasifikační společností. Vedení přepážkou třídy „A-60“, jak je definována v SOLAS 74, kapitola II-2, předpis 3, musí mít protipožární ochranu stejné hodnoty.

(e) Přepážkou mezi strojovnou a provozním prostorem v oblasti nákladu smí být vedeny trubkové rozvody, pokud se přitom jedná o rozvody mezi strojními zařízeními ve strojovně a v provozním prostoru, které nemají ve strojovně žádné otvory.

(f) Bez ohledu na 9.3.2.11.4 smějí potrubí ze strojovny procházet provozním prostorem v oblasti nákladu nebo kofrdamem nebo úložným prostorem nebo prostorem dvojitých boků ven do volného prostoru za podmínky, že jsou tato potrubí uvnitř provozního prostoru nebo kofrdamu nebo úložného prostoru nebo prostoru dvojitých boků tlustostěnného typu a nemají žádné slepé příruby ani otvory.

(g) Pokud hnací hřídel pomocného stroje vede skrze stěnu, která je nad palubou, musí být toto provedení plynotěsné.

9.3.2.17.6 Provozní prostor, který se nachází pod palubou v oblasti nákladu, se nesmí používat jako prostor s čerpadly pro systém nakládky a vykládky, s výjimkou případů, kdy:

– Je prostor s čerpadly oddělený od strojovny nebo provozních prostor mimo oblast nákladu kofrdamem nebo přepážkou s izolací Třídy „A-60“, jak je popsáno v SOLAS 74, Kapitoly II-2, Ustanovení 3, nebo provozním nebo nákladovým prostorem;

– Výše požadovaná přepážka „A-60“ nemá prolomení podle 9.3.1.17.5 (a);

- Výstupní otvory větrání jsou rozmístěny ve vzdálenosti minimálně 6,00 m od vstupů a otvorů obytných prostor, kormidelny a provozních prostor mimo oblast nákladu;
 - Vstupní poklopy a větrací otvory jsou uzavíratelné zvenčí;
 - Všechna nakládací a vykládací potrubí, jakož i potrubí dočerpávacího systému jsou na sací straně čerpadla v prostoru s čerpadly přímo na přepážce vybaveny uzavíracími armaturami. Pořádná obsluha ovládacích zařízení v prostoru s čerpadly, spouštění čerpadel nebo kompresorů a regulace proudu kapaliny musí probíhat z paluby;
 - Jímka prostoru s čerpadly je vybavena zařízením k měření stavu plnění, které spustí optický a akustický poplach v kormidelně, pokud se v jímcě prostoru s čerpadly hromadí kapalina;
 - Prostor s čerpadly je opatřen vestavěným zařízením pro detekci kyslíku, které automaticky ukazuje množství kyslíku, a které při dosažení koncentrace kyslíku 19,5 % spustí viditelný a slyšitelný poplach. Čidla tohoto systému musí být umístěna ve vhodných polohách na podlaze a ve výšce 2,00 m. Měření musí probíhat nepřetržitě a musí být zobrazeno v blízkosti vchodu. Akustické a optické poplachové zařízení musí být instalovány v kormidelně a v prostoru s čerpadlem a při spuštění alarmu musí být systém nákladky a vykládky odstaven;
- Porucha systému pro měření kyslíku musí spustit optický a akustický poplach v kormidelně a na palubě. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor;
- Ventilační systém předepsaný v 9.3.2.12.3 má dostatečnou kapacitu, aby zajistil minimálně 30 výměn vzduchu za hodinu na základě celkového objemu provozního prostoru.

Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, musí být místnost s čerpadlem také vybavena vestavěným systémem detekce plynů, který automaticky ukazuje přítomnost hořlavých plynů a aktivuje optický a akustický alarm, když koncentrace plynu dosáhne 20 % dolní meze výbušnosti nákladu nebo 20 % hodnoty dolní meze výbušnosti n-hexanu, podle toho, která hodnota je kritičtější.

Čidla tohoto systému detekce plynu musí být umístěna ve vhodných polohách ve spodní části a přímo pod palubou. Měření musí probíhat nepřetržitě a musí být zobrazeno v blízkosti vchodu.

Akustická a optická poplachová zařízení musí být instalována v kormidelně a v prostoru s čerpadlem a při spuštění alarmu musí být odstaven systém nákladky a vykládky;

Jakákoliv porucha systému detekce plynu musí být okamžitě signalizována v kormidelně a na palubě optickým a akustickým varováním. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor.

9.3.2.17.7

Na vstupu do prostoru s čerpadly musí být připevněn následující nápis:

**PŘED VSTUPEM DO PROSTORU S ČERPADLY PŘEZKOUŠET NEPŘÍTOMNOST PLYNŮ
A TAKÉ DOSTATEK KYSLÍKU.
DVEŘE A VSTUPNÍ OTVORY NEOTEVÍRAT BEZ SVOLENÍ VELITELE PLAVIDLA.
PŘI POPLACHU IHNED OPUSTIT PROSTOR.**

9.3.2.18

Zařízení pro plnění inertního plynu

V případě předepsaného vytvoření inertního prostředí nebo polštáře musí být na plavidle zařízení pro plnění inertním plynem.

Toto zařízení musí umět udržovat stálý minimální tlak 7 kPa (0,07 bar) v prostorech, ve kterých musí být vytvořeno inertní prostředí. Mimo to, činnost zařízení pro plnění inertním plynem nesmí vést ke zvyšování tlaku v nákladním tanku nad tlak, pro který jsou nastaveny ventily zvýšení tlaku. Tlak, pro který je nastaven vakuový ventil, musí být 3,5 kPa (0,035 bar).

Množství inertního plynu, nutného pro nákladku nebo vykládku, se musí přepravovat nebo vyrábět na palubě plavidla, pokud není možnost jeho obdržení ze břehu. Mimo to, na palubě plavidla se musí nacházet dostatečné množství inertního plynu pro doplnění běžných ztrát, ke kterým dochází během přepravy.

Prostory, ve kterých musí být vytvořeno inertní prostředí, musí být vybaveny přípojkami pro plnění inertním plynem a kontrolním zařízením, zajišťujícím stálou kontrolu potřebného prostředí.

Když tlak nebo koncentrace inertního plynu v plynné fázi se snižují pod zadanou hodnotu, musí kontrolní zařízení dávat do kormidelny světelný a zvukový signál. Když v kormidelně není nikdo

přítomen, poplachový signál musí, mimo to, být k dispozici v místě, kde je přítomen jeden ze členů posádky.

9.3.2.19 (Vyhrazeno)

9.3.2.20 **Zařízení kofrdamů**

9.3.2.20.1 Kofrdamy nebo oddělení kofrdamů, které zůstanou po vybavení provozních prostor v souladu s 9.3.2.11.6, musí být přístupny přes vstupní otvor.

9.3.2.20.2 Musí být možné, pomocí čerpadla kofrdamy naplnit vodou a vodu zase odčerpát. Naplnění musí proběhnout během 30 minut. Tyto požadavky nejsou zapotřebí, jestliže přepážka mezi strojovnou a kofrdamem je opatřena protipožární izolací podle „A-60“ podle SOLAS 74, kapitola II-2, pravidlo 3, nebo pokud je kofrdam zřízen jako provoní prostor.

9.3.2.20.3 Kofrdamy nesmí být spojeny pevným potrubím s jiným potrubím na plavidle, které je umístěno mimo oblast nákladu.

9.3.2.20.4 Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, musí být větrací otvory kofrdamů vybaveny pojistkou proti prošlehnutí plamene, která je schopná odolat deflagraci. Pojistky proti prošlehnutí plamene musí být voleny podle skupin/podskupin výbušnosti látek, které mají být zahrnuty do seznamu látek na nádobě (viz sloupec (16) tabulky C kapitoly 3.2). Bezpečnostní a kontrolní zařízení.

9.3.2.21 **Bezpečnostní a kontrolní zařízení**

9.3.2.21.1 Každý nákladní tank musí být opatřen:

- (a) vnitřní značkou pro stupeň plnění na 95 %;
- (b) přístrojem, který ukazuje úroveň hladiny;
- (c) přístrojem, který upozorňuje na úroveň hladiny nejpozději při naplnění na 90 %;
- (d) čidlem mezní hodnoty, které spustí bezpečnostní pojistku proti přeplnění nejpozději při naplnění na 97,5 %;
- (e) zařízením na měření tlaku plynné fáze v nákladním tanku;
- (f) přístrojem pro měření teploty nákladu, je-li ve sloupci (9) tabulky C kapitoly 3.2 požadováno zařízení pro ohřev nákladu nebo se vyžaduje možnost ohřevu nákladu na palubě, nebo je-li uvedena maximální teplota ve sloupci (20) tabulky C kapitoly 3.2;
- (g) přípojkou pro připojení zařízení pro odběr vzorků uzavřeného nebo částečně uzavřeného typu, a/nebo alespoň jedním otvorem pro odběr vzorků, jak je požadováno ve sloupci (13) tabulky C kapitoly 3.2. Přípojka musí být vybavena uzavíracím zařízením odolným vůči vnitřnímu tlaku v připojení.;

Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, musí být pojistka proti zpětnému prošlehnutí plamene v otvoru pro odběr vzorků způsobila odolat trvalému hoření volena podle skupin/podskupin výbušnosti látek, které mají být zahrnuty do seznamu látek na nádobě (viz sloupec (16) tabulky C kapitoly 3.2).

9.3.2.21.2 Stupeň naplnění v % musí být zjištěl s přesností na 0,5 %. Vztahuje se na obsah celého nákladního tanku včetně expanzní šachty.

9.3.2.21.3 Přístroj, který ukazuje úroveň hladiny, musí být možné sledovat z místa obsluhy uzavíracích prvků příslušného nákladního tanku. Nejvýše přípustnou hladinu naplnění 95 % a 97 %, uvedenou v seznamu látek, je nutno uvádět na každém ukazateli úrovně.

Hodnoty přetlaku a vakua musí být viditelné v jakoukoliv dobu z toho místa, odkud je možné přerušit nakládku nebo vykládku. Maximálně přípustná hodnota přetlaku nebo vakua musí být vyznačena na každém ukazateli.

Údaje přístrojů musí být viditelné při každých povětrnostních podmínkách.

9.3.2.21.4 Výstražný přístroj úrovně hladiny, který spouští akustický a optický poplach musí být nezávislý na přístroji, který ukazuje úroveň hladiny.

9.3.2.21.5 (a) Čidlo mezních hodnot podle 9.3.1.21.1 (d) musí na plavidle spustit akustický a optický signál a zároveň aktivuje elektrický kontakt, který v podobě binárního signálu přeruší tok proudu z břehového zařízení a na břehu může zavést opatření proti přetečení při nakládce.

Signál musí být možné předat na břeh pomocí dvoupólového vodotěsného přístrojového konektoru zařízení, které zapojuje spoje, podle normy EN 60309-2:1999+A1:2007+A2:2012 pro stejnosměrný proud 40 až 50 V, barva označení bílá, poloha pomocného nosu šroubu 10 h.

Zásuvka musí být připevněna v bezprostřední blízkosti břehového zapojení nakládacího a vykládacího potrubí na plavidle.

Čidlo mezních hodnot musí být také schopné vypnout vlastní vykládací čerpadlo. Čidlo mezních hodnot musí být nezávislé na přístroji, který upozorňuje na úroveň hladiny, smí však být spojeno s přístrojem, který ukazuje úroveň hladiny.

- (b) Během vykládky pomocí čerpadla na plavidle musí být možno čerpadlo vypnout z břehového objektu. K tomuto účelu musí být nezávislé, samo o sobě bezpečné silnoprůdové vedení, napájené plavidlem, vypnuto z břehového objektu pomocí elektrického kontaktu.

Musí být možné přenést binární signál z břehového objektu pomocí vodotěsné dvoupólové zásuvky nebo konektorového zařízení podle normy EN 60309-2:1999+A1:2007+A2:2012, pro stejnosměrný proud 40 až 50 voltů, identifikační barva bílá, poloha pomocného nosu šroubu 10 h.

Tato zásuvka musí být trvale namontována na plavidle v blízkosti napojení vykládacích potrubí.

- (c) Plavidla, která mohou dovážet pro provoz plavidla nutné produkty, musí být vybavena překladním systémem, odpovídajícím evropskému standardu EN 12827:1999 a rychlouzavíracím zařízením, umožňujícím přerušit zásobování. Toto rychlouzavírací zařízení se musí uvádět do činnosti pomocí elektrického signálu, pocházejícího ze systému a zajišťujícího zamezení přelití. Elektrická spojení, uvádějící do činnosti rychlouzavírací zařízení, musí být jistěno v souladu s principem klidového proudu nebo s pomocí jiných odpovídajících způsobů zjišťování poruch. Pracovní stav elektrických propojení, které nelze ovládat na principu klidového proudu, musí být snadno prověřovatelný.

K dispozici musí být možnost uvedení do činnosti rychlouzavírací zařízení, nezávislé od elektrického signálu.

Rychlouzavírací zařízení musí uvádět do činnosti na plavidle poplachový optický nebo akustický signál.

- 9.3.2.21.6 Optické a akustické signály přístroje, který upozorňuje na úroveň hladiny a čidla mezních hodnot se od sebe musí zřetelně odlišovat.

Optické signály musí být vidět na každém obslužném místě uzavíracích armatur nákladních tanků. Funkce měřicího čidla a elektrického obvodu musí být lehce kontrolovatelná nebo musí stačit provedení "failsafe".

- 9.3.2.21.7 Jestliže tlak nebo teplota překročí stanovenou hodnotu, musí přístroje pro měření podtlaku nebo přetlaku plynné fáze v nákladním tanku nebo teploty nákladním tanku aktivovat optický a akustický poplach v kormidelně a na palubě. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor.

Jestliže tlak během nakládky a vykládky překročí stanovenou hodnotu, musí přístroj pro měření tlaku pomocí konektoru uvedeného výše v 9.3.2.21.5 okamžitě spustit elektrický kontakt, který spustí opatření k přerušení nakládky nebo vykládky. Pokud se používá vlastní vypouštěcí čerpadlo plavidla, musí být automaticky vypnuto.

Přístroj pro měření podtlaku nebo přetlaku musí spustit alarm nejpozději v momentě, kdy:

- (a) Když je přetlak roven 1,15 násobku otevíracího tlaku přetlakových ventilů/vysokorychlostních odvodušňovacích ventilů; nebo
(b) Je dosaženo spodního prahu hodnoty konstrukčního tlaku podtlakových ventilů, avšak podtlak nepřesahuje 5 kPa (0,05 bar).

Maximální přípustná teplota je uvedena ve sloupci (20) tabulky C kapitoly 3.2. Čidla pro alarmy uvedené v tomto odstavci mohou být připojeny k poplachovému zařízení čidla.

Je-li to předepsáno ve sloupci (20) tabulky C kapitoly 3.2, musí přístroj pro měření přetlaku plynné fáze v nákladním tanku spustit optický a akustický poplach v kormidelně, pokud přetlak během plavby překročí 40 kPa (0,4 bar). Pokud se poplach nevypne, musí být automaticky předán do obytných

prostor; Musí být možné odečítat měřidla v bezprostřední blízkosti ovládacího systému pro rozstřikování vody.

- 9.3.2.21.8 Pokud se ovládací prvky uzavíracích armatur nákladních tanků nachází v řídicím prostoru, musí být možné odpojení nákladních čerpadel z tohoto místa řízení, údaje ukazatele úrovně musí být viditelné na místě řízení a světelné a zvukové poplachové signály, které podává havarijně-poplachový signál úrovně čidlem vysoké úrovně podle 9.3.2.21.1(d), a přístroje pro měření tlaku a teploty nákladu, musí být vidět a slyšet na místě řízení a na palubě.

Musí být zajištěn dohled na oblast nákladu z kontrolního prostoru.

- 9.3.2.21.9 Plavidlo musí být vybaveno tak, aby nakládky nebo vykládky mohly být přerušeny pomocí vypínačů, tj. rychlouzavírací ventil umístěný na flexibilním vedení spojujícím plavidlo s během musí být schopen uzavření. Vypínače musí být umístěny na plavidle na dvou místech (vpředu a vzadu).

Toto ustanovení platí jen tehdy, je-li předepsáno ve sloupci (20) tabulky C kapitoly 3.2.

Přerušovací systém musí být zkonstruován podle principu ve stavu bez proudu.

- 9.3.2.21.10 V případě přepravy chlazených látek se určuje tlak poplachového systému konstrukcí nákladních tanků. V případě přepravy látek, které se musí přepravovat v chlazeném stavu, musí tlak funkčního poplachového systému být vyšší nejméně o 25 kPa (0,25 bar) maximálního tlaku vypočítaného v souladu s 9.3.2.27.

9.3.2.22 **Otvory nákladních tanků**

- 9.3.2.22.1 (a) Otvory nákladních tanků se musí nacházet nad palubou plavidla v oblasti nákladu.
- (b) Otvory nákladních tanků s příčným průřezem větším než 0,10 m² a otvory bezpečnostních zařízení, která zabraňují nepřípustným přetlakům, se musí nacházet minimálně 0,50 m nad palubou.
- 9.3.2.22.2 Otvory nákladních tanků musí být opatřeny plynotěsnými uzávěry schopnými odolat zkušebnímu tlaku podle 9.3.2.23.2.
- 9.3.2.22.3 Uzávěry, které se za normálních okolností používají během nakládky a vykládky, nesmí při ovládání vytvářet žádné jiskry.
- 9.3.2.22.4 (a) Každý nákladní tank nebo skupina nákladních tanků, které jsou spojeny společným odvětrávacím potrubím, musí být vybavena:
- Přípojkou pro bezpečný návrat plynů vypouštěných během nakládky na břeh;
 - Zařízení pro bezpečné snížení tlaku v nákladních tancích, na němž poloha uzavíracího ventilu zřetelně ukazuje, zda je otevřený nebo zavřený;
 - Bezpečnostní zařízení, která zamezí nepřípustnému přetlaku nebo podtlaku.
- Otevírací tlak pojistných ventilů musí být trvale vyznačen na ventilech;
- Nastavení přetlakových ventilů musí být takové, aby během přepravy reagovaly teprve, když bude dosaženo maximálního přípustného pracovního tlaku nákladních tanků;
- Plyny musí být vypouštěny směrem vzhůru;
- Výpustě přetlakových ventilů musí být umístěny nejméně 1,00 m nad palubou a ve vzdálenosti nejméně 6,00 m od otvorů obytných prostor, kormidelny a provozních prostorů mimo oblast nákladu. V okruhu o poloměru 1,00 m kolem výpustí přetlakového ventilu se nesmí nacházet žádná zařízení. Tato oblast musí být označena jako nebezpečná zóna;
- (b) Pokud seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 bude zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2:
- Přípojky ke každému nákladnímu tanku, odvětrávacímu potrubí a podtlakovému ventilu musí být vybaveny pojistkou proti prošlehnutí plamene, která je schopná odolat deflagraci; a
 - Zařízení pro bezpečné snížení tlaku v nákladních tancích musí být bezpečné proti deflagraci a musí být schopné odolat stálému hoření;
- (c) Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2,

nebo u kterých je ve sloupci (3b) tabulky C kapitoly 3.2 uvedeno T, musí být přetlakový ventil konstruován jako vysokorychlostní odvodušňovací ventil.

- (d) Má-li být mezi odvětrávací potrubí a nákladní tank namontováno uzavírací zařízení, musí být umístěno mezi nákladním tankem a pojistkou proti zpětnému prošlenutí plamene a každý nákladní tank musí být vybaven přetlakovými ventily;
- (e) Systém autonomní ochrany uvedený v (b) a (c) se volí podle skupin/podskupin výbušnosti látek předpokládaných pro zařazení na seznam látek na plavidle (viz sloupec (16) tabulky C kapitoly 3.2). Výpustě vysokorychlostních ventilů musí být umístěny nejméně 2,00 m nad palubou a ve vzdálenosti nejméně 6,00 m od otvorů obytných prostor, kormidelny a provozních prostorů mimo oblast nákladu. Tato výška může být snížena na 1,00 m, pokud se nenachází v okruhu 1,00 m okolo výstupu přetlakového ventilu žádné pohonné zařízení. Tato oblast musí být označena jako nebezpečná zóna;

Je-li požadováno, aby vysokotlaký odvodušňovací ventil, podtlakový ventil, pojistka proti zpětnému prošlenutí plamene a odvětrávací potrubí bylo možné ohřívát, musí být příslušná zařízení vhodná pro danou teplotu.

9.3.2.22.5 *Odvětrávací potrubí*

- (a) Pokud jsou ke společnému odvětrávacímu potrubí připojeny dva nebo více nákladní tanky, je dostačující, že je na společném odvětrávacím potrubí nainstalováno zařízení podle 9.3.2.22.4 (pojistné ventily pro prevenci nepřijatelného přetlaku a podtlaku, vysokorychlostní větrací ventil, podtlakový ventil chráněné proti deflagracím, bezpečnostní přetlakové zařízení pro nákladní nádrže chráněné proti deflagracím) (viz 7.2.4.16.7);
- (b) Jestliže je každý nákladní tank napojen na vlastní odvětrávací potrubí, každý nákladní tank nebo související odvětrávací potrubí musí být vybaven podle 9.3.2.22.4.

9.3.2.23 *Tlaková zkouška*

9.3.2.23.1 Nákladní tanky, zbytkové tanky, kofrdamy, nakládací a vykládací potrubí musí být prvotně přezkoušeny před uvedením do provozu a pak následně přezkušovány pravidelně v rámci předepsaných termínů.

Pokud v nákladních tancích existuje ohřevný systém, musí být prvotně před uvedením do provozu přezkoušeny hadice topení a pak následně přezkušovány pravidelně v rámci předepsaných termínů.

9.3.2.23.2 Zkušební tlak nákladních tanků a zbytkových tanků musí obsahovat minimálně 1,3násobek provozního tlaku. Zkušební tlak pro kofrdamy musí činit 10 kPa (0,10 barů) přetlaku.

9.3.2.23.3 Zkušební tlak nakládacích a vykládacích potrubí musí být minimálně 1000 kPa (10 barů) přetlaku.

9.3.2.23.4 Maximální termín pro opakované zkoušky činí jedenáct let.

9.3.2.23.5 Metoda tlakové zkoušky musí odpovídat předpisům, které byly vydány příslušným orgánem nebo uznanou klasifikační společností.

9.3.2.24 *Regulace tlaku a teploty látek*

9.3.2.24.1 Když celý systém udržení látek není vypočítán pro to, aby vydržel plný efektivní tlak páry nákladu v horních limitech výpočetních teplot okolního prostředí, tak tlak v tancích musí být udržován na úrovni níže maximálně přípustného tlaku činností pojistných ventilů za pomoci jednoho nebo více následujících prostředků:

- (a) systém pro regulaci tlaku v nákladních tancích využívající mechanické chlazení;
- (b) systém zajišťující bezpečnost v případě ohřevu nebo zvýšení tlaku nákladu. Izolace nebo výpočetní tlak nákladního tanku, nebo součin těchto dvou hodnot musí být takový, aby zůstávala dostatečná rezerva pevnosti s ohledem na dobu použití a předpokládaných teplot; v každém případě tento systém musí být považován za přijatelný uznanou klasifikační společností a musí zajišťovat bezpečnost v průběhu doby, delší nejméně trojnásobně lhůty doby provozu;
- (c) jiné systémy, které se považují za použitelné uznanou klasifikační společností.

9.3.2.24.2 Systémy předepsané v 9.3.2.24.1 musí být vyráběny, instalovány a kontrolovány tak, aby toto uznala klasifikační společnost. Materiály použité při jejich konstrukci, musí být kompatibilní s přepravovaným nákladem. V normálních podmínkách provozu horní hodnoty vypočtených teplot okolního prostředí musí být:

vzduch: + 30 °C;
voda: + 20 °C.

9.3.2.24.3 Systém ochrany nákladu musí být schopen snášet plný tlak par nákladu v horních vypočtených mezních teplot okolního prostředí, nezávisle na systému vybraného odpařovacího se plynu. Tento předpis je uveden formou poznámky 37 v sloupci (20) tabulky C kapitoly 3.2

9.3.2.25 Čerpadla a rozvody

9.3.2.25.1 Čerpadla a příslušná nakládací a vykládací potrubí musí být umístěna v oblasti nákladu. Nakládací čerpadla musí být možné vypínat z oblasti nákladu a dále z místa mimo tuto oblast. Nakládací čerpadla na palubě musí být umístěna minimálně 6,00 m od přístupů nebo otvorů obytných a provozních prostor, které jsou umístěny mimo oblast nákladu.

- 9.3.2.25.2
- (a) Nakládací a vykládací potrubí musí být nezávislé na jakýchkoliv jiných potrubích na plavidle. Pod palubou, s výjimkou vnitřku nákladních tanků a prostoru s čerpadly, nesmí být žádné nakládací a vykládací potrubí, určené pro náklad.
 - (b) Nakládací a vykládací potrubí musí být uspořádáno tak, aby při nakládce nebo vykládce v nich obsažená kapalina byla bezpečně odstraněna a mohla vtéci zpět buď do nákladních tanků nebo tanků na břehu.
 - (c) Nakládací a vykládací potrubí se od ostatních musí odlišovat, například barevným označením.
 - (d) Nakládací a vykládací potrubí na palubě, s výjimkou břehových přípojek, se musí nacházet minimálně v odstupech jedné čtvrtiny loďní šířky k obšívce.
 - (e) Břehové přípojky musí být od přístupů a otvorů obytných a také provozních prostor, ležících mimo oblast nákladu, vzdáleny minimálně 6,00 m.
 - (f) Všechny břehové přípojky odvětrávacího potrubí a nakládacího a vykládacího potrubí, kterými se nakládá a vykládá, musí být opatřeny uzavírací armaturou. Všechny břehové přípojky musí, pokud nejsou v provozu, být zaslepeny přírubou.
 - (g) (Vypuštěno)
 - (h) Příruby a ucpávky musí být vybaveny ochranným zařízením proti stříkající vodě.
 - (i) Nakládací-vykládací potrubí a rovněž přípojky odvětrávacího potrubí nesmí mít ohebná spojení s pohyblivými přípojkami.

9.3.2.25.3 (Vypuštěno)

- 9.3.2.25.4
- (a) Každá součást potrubí pro nakládku a vykládku musí být elektricky spojena s trupem plavidla.
 - (b) Nakládací potrubí musí být přivedeno až k podlaze nákladních tanků.

9.3.2.25.5 Musí být patrné, zda uzavírací armatury nebo jiná uzavírací zařízení nakládacích a vykládacích potrubí jsou zavřené nebo otevřené.

9.3.2.25.6 Nakládací a vykládací potrubí musí mít při zkušebním tlaku potřebnou pružnost, těsnost a odolnost vůči tlaku.

9.3.2.25.7 Nakládací-vykládací potrubí musí být vybaveno přístroji pro měření tlaku, umístěnými na výpusti čerpadel. Úroveň maximálně přípustného přetlaku nebo vakua musí být označen na každém zařízení. Údaje přístrojů musí být viditelné při jakýchkoliv povětrnostních podmínkách.

- 9.3.2.25.8
- (a) Pokud má být nakládacím a vykládacím systémem vedena voda k mytí tanků nebo balastní voda do nákladních tanků, musí se přípojky potřebné pro sání nacházet v oblasti nákladu, avšak mimo nákladní tanky.

Čerpadla, která slouží systémům k mytí tanků, musí s příslušnými přípojkami být umístěna mimo oblast nákladu, pokud je tlaková část tohoto systému konstruována takovým způsobem, že tímto potrubím nelze sát.

Pomocí pružinového zpětného ventilu se musí zajistit, aby se plyny nedostaly mycím systémem do prostoru mimo oblast nákladu.

- (b) Potrubí, které je určeno pro sání vody, musí být na místech spojení s nakládacím potrubím opatřeno zpětným ventilem.

9.3.2.25.9 Přípustné výkony nakládky a vykládky musí být vypočteny

Tyto výpočty se vztahují na maximálně přípustný výkon nakládky a vykládky na každý nákladní tank nebo skupiny nákladních tanků, dle dimenzování větracího systému. U těchto propočtů má být

zohledněno, že při neočekávaném uzavření plynového zpětného potrubí u zařízení na břehu, bezpečnostní zařízení v nákladních tancích zamezí tomu, že tlak v nákladních tancích překročí následně uvedené hodnoty:

přetlak: 1,15 násobek otevíracího tlaku přetlakového ventilu/vysokorychlostního ventilu;
podtlak: ne více než je konstrukční tlak, avšak nejvýše podtlak 5 kPa (0,05 barů).

Zvláště je třeba zohlednit následující faktory:

1. Rozměry větracího systému nákladních tanků;
2. Tvorba plynů během nakládky: tato je zohledněna vynásobením nejvyššího výkonu nakládky faktorem minimálně 1,25;
3. Hustota směsi par z nákladu, založení na směsi 50 obj. % páry a 50 obj. % vzduchu;
4. Ztráta tlaku ve větracím potrubí a ventily a fitinky. Zde se musí počítat se znečištěním ve výši 30 % pojistek proti průniku plamenů;
5. Nastavení přetlaku a podtlaku u bezpečnostních ventilů.

Pokyny týkající se maximálních přípustných nakládacích a vykládacích výkonů pro každý nákladní tank nebo každou skupinu nákladních tanků, musí být na palubě.

9.3.2.25.10 Stlačený vzduch produkovaný mimo oblast nákladu může být používán v oblasti nákladu, pokud je nainstalován pružinový zpětný uzávěr, aby se zajistilo, že žádné plyny nemohou uniknout z oblasti nákladu prostřednictvím systému stlačeného vzduchu do obytných prostor, kormidelní nebo provozních prostorů mimo oblast nákladu.

9.3.2.25.11 Pokud plavidlo přepravuje více nebezpečných látek, které mohou vzájemně nebezpečně reagovat, musí pro každou látku existovat zvláštní čerpadlo s příslušným nakládacím a vykládacím potrubím. Potrubí nesmí být vedeno nákladním tankem, který obsahuje nebezpečné látky, se kterými by látka mohla reagovat.

9.3.2.26 **Tanky na zbytky nákladu a nádoby na zbytky produktů**

9.3.2.26.1 Jsou-li plavidla vybavena tanky na zbytky produktů nebo nádobami na zbytky produktů, musí být umístěny v oblasti nákladu a musí splňovat ustanovení 9.3.2.26.2 a 9.3.2.26.3. Nádoby na zbytky produktů musí být umístěny pouze v oblasti nákladu na palubě a ne méně než jednu čtvrtinu šířky plavidla od obšívky.

9.3.2.26.2 Tanky na zbytky produktů musí mít následující vybavení:

- Indikátor úrovně hladiny;
- přípojky s uzavíracími armaturami pro potrubí a soustavy hadic;
- Přetlakový/podtlakový ventil;

Přetlakový ventil musí být dimenzován tak, aby se během přepravy při normálním provozu neotevřel. Tato podmínka je splněna, když otevírací tlak ventilu splňuje podmínky požadované ve sloupci (10) tabulky C kapitoly 3.2 pro přepravované látky.

V případě, že seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 bude obsahovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, pak podtlakový ventil musí být navržen tak, aby byl schopen odolat deflagraci. Deflagrační bezpečnost může být zajištěna také zachycovačem plamene.

V případě, že seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 bude obsahovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, nebo pro které je uvedeno T ve sloupci (3b) tabulky C kapitoly 3.2, potom pojistný ventil musí být navržen jako vysokorychlostní větrací ventil.

Přetlakový ventil musí být dimenzován tak, aby se během přepravy při normálním provozu neotevřel. Tato podmínka je splněna, když otevírací tlak ventilu splňuje podmínky vyžadované ve sloupci (10) tabulky C kapitoly 3.2 pro přepravovanou látku.

Vysokorychlostní větrací ventil a podtlakový ventil s deflagrační bezpečností musí být vybrán podle skupin/podskupin výbuchu látek uvedených v seznamu látek na plavidle (viz sloupec (16) tabulky C kapitoly 3.2).

Maximální přípustná kapacita je 30 m³.

9.3.2.26.3 Nádoby na zbytky musí mít následující vybavení:

- Možnost indikace stupně naplnění;
 - Přípojky s uzavíracími armaturami pro potrubí a soustavy hadic;
- Spojení umožňující bezpečný odvod plynů uvolňovaných během plnění.

9.3.2.26.4

(Vypuštěno)

9.3.2.27**Chladicí systém**

9.3.2.27.1

Chladicí systém podle 9.3.2.24.1 (a), musí být z jednoho nebo několika bloků, schopných udržovat tlak a teplotu nákladu na předepsané úrovni při horních hodnotách vypočtené teploty okolního prostředí. Nebude-li zvažován jakýkoliv jiný prostředek pro regulování tlaku a teploty nákladu, který se považuje za dostatečný uznanou klasifikační společností, musí být zvažováno s jedním nebo několika záložními bloky s kapacitou, která je nejméně rovná kapacitě největšího předepsaného bloku. Záložní blok musí obsahovat kompresor, jeho hnací jednotku, jeho řídicí zařízení a všechny pomocné mechanismy nutné pro to, aby mu bylo umožněno pracovat nezávisle na blocích, používaných při normálních podmínkách. Musí být zajištěn náhradní výměník tepla pro případ, kdy nadbytečná kapacita normálního výměníku tepla tohoto systému nepředstavuje nejméně 25 % nejvyšší předepsané kapacity. Není nutné uvažovat se zvláštním potrubím.

Nákladní tanky, potrubí a příslušenství musí být izolovány tak, aby v případě výpadku všech systémů si všechny náklad zachovával nejméně v průběhu 52 hodin teplotu nezpůsobující otevření pojistného ventilu.

9.3.2.27.2

Pojistná zařízení a spojovací potrubí chladicího systému musí být připojeny k nákladním tankům nad kapalnou fází nákladu, když jsou tanky naplněny do svého maximálního stupně plnění. Musí se nacházet v oblasti plynné fáze, i když náklon plavidla dosahuje 12°.

9.3.2.27.3

Když se různé náklady potřebující chlazení, jejichž chemická reakce může být nebezpečnou, přepravují společně, tak je nutno chladicímu systému věnovat zvláštní pozornost s cílem zamezit smíchání nákladu. V případě přepravy těchto nákladů musí být zabezpečeny oddělené chladicí systémy, z nichž každý musí obsahovat plný rezervní blok podle 9.3.2.27.1. Přitom, když se chlazení zajišťuje ne přímým, ale společným systémem a když průtok v tepelných výměnících v žádných předvídatelných situacích nemůže způsobit smíchání nákladu, tak není nutno zvažovat s rozdělenými chladicími bloky pro různé náklady.

9.3.2.27.4

Když se různé náklady potřebující chlazení nemohou jeden v druhém vzájemně rozpouštět, za podmínky přepravy tím způsobem, že tlak jejich par se sčítá při smíchání, je nutno systémům chlazení věnovat zvláštní pozornost, aby nedošlo k možnému smíchání nákladů.

9.3.2.27.5

V těch případech, kdy chladicí systémy vyžadují pro chlazení vodu, tak musí být podávána v dostatečném množství pomocí čerpadla nebo čerpadel, využívaných výhradně pro tyto účely. Toto čerpadlo nebo tato čerpadla musí mít nejméně dvě potrubí pro nasávání vody, připojené ke dvěma vodním přívodům, jedno na levém boku a jedno na pravém boku. Musí být k dispozici rezervní čerpadlo o dostatečné kapacitě; toto čerpadlo se může rovněž využívat i pro jiné účely s podmínkou, že jeho použití s cílem dodávky vody pro chlazení nepřekáží jiné základní práci.

9.3.2.27.6

Chladicí systém může mít jednu z následujících forem:

- (a) Přímý systém: páry nákladu se stlačují, kondenzují a vrací se do nákladního tanku. V případě některých nákladů, uvedených v tabulce C kapitoly 3.2, nesmí se tento systém používat. Tento požadavek je uveden formou poznámky 35 ve sloupci (20) tabulky C kapitoly 3.2.
- (b) Nepřímý systém: náklad nebo páry nákladu se ochlazují nebo kondenzují za pomoci chladicího média, ale nestlačují se.
- (c) Smíšený systém: páry nákladu se stlačují a kondenzují v tepelných výměnících náklad/ chladicí médium a vrací se do nákladních tanků. V případě některých nákladů, uvedených v tabulce C kapitoly 3.2, se nesmí tento systém používat. Tento požadavek je uveden formou poznámky 36 ve sloupci (20) tabulky C kapitoly 3.2.

9.3.2.27.7

Všechna primární a sekundární chladicí média musí být kompatibilní jeden s druhým a s nákladem, se kterým mohou přijít do styku. Tepelná výměna může probíhat buď v určité vzdálenosti od nákladního tanku nebo za využití chladicího šneku, umístěného uvnitř nebo vně nákladního tanku.

9.3.2.27.8

V těch případech, kdy chladicí systém je umístěn v odděleném provozním prostoru, tak tento provozní prostor musí odpovídat požadavkům v 9.3.2.17.6.

9.3.2.27.9

Pro všechny nákladní systémy součinitel prostupu tepla, používaný pro určení udržovací doby (7.2.4.16.16 a 7.2.4.16.17) se určuje výpočtem. Po ukončení stavby plavidla se správnost ukončení

výpočtů prověřuje cestou zkoušky pro určení tepelné rovnováhy. Výpočet a zkoušky se provádějí pod dohledem uznané klasifikační společnosti, která dané plavidlo klasifikovala.

Součinitel prostupu tepla musí být uveden v dokumentu uschovaném na palubě. Součinitel prostupu tepla se prověřuje při každé obnově schvalovacího osvědčení.

- 9.3.2.27.10 Osvědčení vydávané uznanou klasifikační společností potvrzující dodržení předpisů v 9.3.2.24.1 až 9.3.2.24.3, 9.3.2.27.1 a 9.3.2.27.4 uvedených výše, musí se předkládat spolu se žádostí o vydání nebo obnovu schvalovacího osvědčení.

9.3.2.28 Postřikové zařízení

Pokud je v sloupci (9) tabulky C kapitoly 3.2 požadován postřik, musí být plavidlo v oblasti nákladu na palubě opatřeno postřikovým zařízením, kterým mohou být plyny z nákladu sráženy nebo může být chlazena paluba nákladních tanků, aby se bezpečně zamezila reakce přetlakových ventilů/vysokorychlostních větracích ventilů při 50 kPa (0,5 bar).

Zařízení ke srážení plynů musí být vybaveno přípojkou pro možné zásobení ze břehu.

Trysky musí být zapojeny tak, aby se zajistilo plné smočení paluby nákladních tanků, resp. aby bezpečně byly sráženy uvolněné plyny.

Zařízení musí být možné spustit z kormidelní a z paluby. Kapacita postřikového zařízení musí být dimenzována přinejmenším tak, aby při současném používání všech trysek bylo dosaženo 50 litrů za hodinu na 1 m² pokryté nákladní plochy v oblasti nákladu.

9.3.2.29 (Vyhrazeno)

9.3.2.30 (Vyhrazeno)

9.3.2.31 Motory

- 9.3.2.31.1 Jsou povoleny pouze spalovací motory s palivem s bodem vzplanutí nad 55 °C. Toto ustanovení neplatí pro motory s vnitřním spalováním, které jsou součástí pohonných a pomocných systémů. Tyto systémy musí splňovat požadavky Kapitoly 30 a Přílohy 8, oddílu 1 Evropské normy, která stanoví technické požadavky pro plavidla vnitrozemské plavby (ES-TRIN) ve znění pozdějších předpisů².

- 9.3.2.31.2 Větrací otvory strojoven a sací otvory motorů, jestliže tyto nenasávají vzduch přímo ze strojovny, musí být vzdáleny minimálně 2,00 m od chráněné oblasti.

9.3.2.31.3 (Vypuštěno)

9.3.2.31.4 (Vypuštěno)

- 9.3.2.31.5 Větrání uzavřených strojoven je třeba uspořádat tak, aby při venkovní teplotě 20 °C střední teplota strojovny nepřesáhla hodnotu 40 °C.

9.3.2.32 Palivové tanky

- 9.3.2.32.1 Pokud je plavidlo vybaveno úložným prostorem, smí dvojité dno v této oblasti být zřízeno jako palivový tank, jestliže jeho výška činí minimálně 0,6 m.

Rozvody paliva a otvory těchto tanků v úložných prostorech jsou zakázány.

- 9.3.2.32.2 Odvětrávací potrubí všech palivových tanků musí být vyvedeny minimálně 0,50 m nad otevřenou palubou. Tyto otvory a vývody přepadových trubek, které vedou nad palubou, musí být chráněny mřížkou nebo děrovanou destičkou.

9.3.2.33 (Vyhrazeno)

9.3.2.34 Výfuková potrubí

- 9.3.2.34.1 Výfukové plyny musí být odváděny do volného prostoru výfukovým potrubím skrz bok trupu. Výstupní otvor musí být vzdálen minimálně 2,00 m od oblasti nákladu. Výfuková potrubí z motorů musí být vedena tak, aby se plyny co nejrychleji vzdálily od plavidla. Výfuková potrubí nesmí být umístěna uvnitř oblasti nákladu.

² Jak je přístupná na webových stránkách Comité Européen pour l'Élaboration de Standards dans le Domaine de Navigation Intérieure – CESNI, <https://www.cesni.eu/en/documents/es-trin/>

9.3.2.34.2 Výfukové potrubí musí být opatřeno ochranou proti úniku jisker, např. lapačem jisker.

9.3.2.35 Zařízení pro drenážování a čerpání balastní vody

9.3.2.35.1 Drenážní čerpadla a čerpadla na balastní vodu pro prostory uvnitř oblasti nákladu musí být instalována v oblasti nákladu.

To neplatí pro:

- dvojitě boky a dvojitá dna, pokud nemají žádnou společnou stěnu s nákladními tanky;
- kofrdamy, nákladové prostory a prostory dvojitého dna, jestliže je balastování prováděno vodním potrubím hasicího zařízení v oblasti nákladu a drenážování je prováděno pomocí ejektorů instalovaných v oblasti nákladu.

9.3.2.35.2 Při použití dvojitého dna jako palivového tanku nesmí být tento napojen na drenážní systém.

9.3.2.35.3 Pokud je balastní čerpadlo nainstalované v oblasti nákladu musí se výtlačné potrubí a jeho mimopalubní sací přípojka na odběr balastní vody nacházet uvnitř oblasti nákladu.

9.3.2.35.4 Prostor s čerpadly pod palubou musí v případě nouze být možné dočerpát zařízením v oblasti nákladu, které je nezávislé na všech ostatních zařízeních v oblasti nákladu. Tento dočerpávací systém musí být umístěn mimo prostor s čerpadly.

9.3.2.36

9.3.2.39 (Vyhrazeno)

9.3.2.40 Hasicí zařízení

9.3.2.40.1 Plavidlo musí být opatřeno hasicím zařízením. Zařízení musí odpovídat následujícím požadavkům:

- Musí být napájeno dvěma na sobě nezávislými požárními nebo balastními čerpadly; jedno z nich musí být vždy připraveno k provozu. Tato čerpadla a rovněž jejich napájení a elektrozařízení se nesmí instalovat ve stejném prostoru;
- Musí být vybaven vodním potrubím s nejméně třemi hydranty v oblasti nákladu nad palubou. Musí mít tři vhodné a dostatečně dlouhé hadice s proudnicemi/rozstřikovacími hubicemi o průměru nejméně 12 mm. Alternativně jedna nebo více soustav hadic může být nahrazena směrovými proudnicemi/rozstřikovacími hubicemi o průměru nejméně 12 mm. Musí být možno dosáhnout kteréhokoli bodu paluby v oblasti nákladu současně nejméně dvěma proudy vody, které nevycházejí z téhož hydrantu.
Pružinový nevratný ventil musí zabránit tomu, aby plyny mohly vniknout hasicím systémem do obytných nebo provozních prostorů mimo oblast nákladu;
- Kapacita zařízení musí být stanovena minimálně takovým způsobem, aby při současném použití dvou rozstřikovacích proudnic z každého místa na palubě plavidla byl dosažen dostřik, který odpovídá minimálně šířce plavidla;
- Systém dodávky vody musí být schopen uvedení do provozu z kormidelny a z paluby;
- Musí být provedena opatření proti zamrznutí hasicích prostředků a hydrantů.

9.3.2.40.2 Vedle toho musí být strojovny, prostor s čerpadly a všechny prostory obsahující zvláštní vybavení (ovládací panely, kompresory atd.) pro chladicí zařízení, pokud je, vybaveny pevně instalovaným hasicím systémem splňujícím následující požadavky:

9.3.2.40.2.1 *Hasiva*

K ochraně prostorů ve strojovnách, kotelnách a prostorech s čerpadly jsou dovoleny jen pevně instalované hasicí systémy používající následující hasiva:

- (a) CO₂ (oxid uhličitý);
- (b) HFC 227 ea (heptafluorpropan);
- (c) IG-541 (52 % dusíku, 40 % argonu, 8 % oxidu uhličitého);
- (d) FK-5-1-12 (dodekaftor-2-3-methylpentanon).
- (e) (Vyhrazeno);
- (f) K₂CO₃ (uhličitán draselný).

Jiná hasiva jsou dovolena jen na základě doporučení Administrativního výboru.

9.3.2.40.2.2 *Větrání, odsávání vzduchu*

- (a) Spalovací vzduch potřebný pro spalovací motory zajišťující pohon by se neměl dostat z prostorů chráněných pevně instalovanými hasicími systémy. Tento požadavek není povinný,

pokud má plavidlo dvě nezávislé hlavní strojovny, plynotěsně oddělené, nebo pokud má kromě hlavní strojovny oddělenou strojovnu, v níž je instalován příďové dokormidlovací zařízení, které může samo zajistit pohon v případě požáru v hlavní strojovně.

- (b) Všechny větrací systémy s nuceným větráním v prostoru, který se má chránit, se musí automaticky vypnout, jakmile se spustí hasicí systém.
- (c) Všechny otvory v prostoru, který se má chránit, umožňující vnikání vzduchu nebo unikání plynu musí být vybaveny prostředky, které je dovolí rychle uzavřít. Musí být jasné, zda jsou otevřené, nebo uzavřené.
- (d) Vzduch unikající z ventilů pro vyrovnávání tlaku tanků s tlakovým vzduchem, instalovaných ve strojovnách, musí být odváděn do ovzduší.
- (e) Přetlak nebo podtlak způsobený rozptýlením hasiva nesmí zničit podstatné části prostoru, který se má chránit. Musí být možno zajistit bezpečné vyrovnání tlaku.
- (f) Chráněné prostory musí být opatřeny prostředky pro odsávání hasiva a spalin. Tyto prostředky musí být ovladatelné z míst mimo chráněný prostor a takových, která nemohou být zneprístupněna požárem v těchto prostorech. Jsou-li instalována odsávací zařízení, nesmí být možno je spustit během hašení.

9.3.2.40.2.3 *Požární poplachový systém*

Prostor, který se má chránit, musí být monitorován vhodným požárním poplachovým systémem. Poplachový signál musí být slyšitelný v kormidelně, obytných prostorech a v prostoru, který se má chránit.

9.3.2.40.2.4 *Potrubní systém*

- (a) Hasivo musí být vedeno do prostoru, který se má chránit, a v něm rozváděno pomocí trvalého potrubního systému. Potrubí instalované v prostoru, který se má chránit, a armatury, které jsou jeho součástí, musí být vyrobeny z oceli. Toto neplatí pro spojovací nástavce tanků a kompenzátory, za podmínky, že použité materiály mají rovnocenné ohnivzdorné vlastnosti. Potrubí musí být zevnitř i zevnějšku chráněno proti korozi.
- (b) Výpustné hubice musí být upraveny tak, aby zajistily rovnoměrné rozptýlení hasiva. Zejména hasivo musí být rovněž účinné pod podlahou.

9.3.2.40.2.5 *Spouštěcí zařízení*

- (a) Hasicí systémy uváděné do činnosti automaticky nejsou dovoleny.
- (b) Musí být možno uvést hasicí systém do činnosti z vhodného místa nacházejícího se vně prostoru, který se má chránit.
- (c) Spouštěcí zařízení musí být instalována tak, aby mohla být uvedena do činnosti v případě požáru, a tak, aby riziko jejich poruchy v případě požáru nebo výbuchu v prostoru, který se má chránit, bylo zmenšeno na nejmenší možnou míru.

Systémy, které nejsou uváděny do činnosti mechanicky, musí být napájeny ze dvou navzájem nezávislých energetických zdrojů. Tyto energetické zdroje musí být umístěny vně prostoru, který se má chránit. Ovládací vedení umístěné v prostoru, který se má chránit, musí být zkonstruováno tak, aby zůstalo ve funkčním stavu v případě požáru trvajících nejméně 30 minut. Elektrické instalace se považují za vyhovující tomuto požadavku, pokud odpovídají normě IEC 60331-21:1999.

Jsou-li spouštěcí zařízení umístěna tak, že nejsou viditelná, musí být na součásti, která je zakrývá, umístěn symbol „hasicího systému“ o stranách nejméně 10 cm s následujícím nápisem provedeným červenými písmeny na bílém podkladu:

Hasicí systém

- (d) Je-li hasicí systém určen k ochraně více prostorů, musí zahrnovat oddělené a jasně označené spouštěcí zařízení pro každý prostor.
- (e) U každého spouštěcího zařízení musí být umístěny pokyny, které musí být jasně viditelné a nesmazatelné. Pokyny musí být v jazyce, který velitel plavidla umí číst a rozumět mu a, pokud tímto jazykem není angličtina, francouzština nebo němčina, musí být v angličtině, francouzštině nebo němčině. Musí obsahovat tyto informace:
 - (i) spouštění hasicího systému;
 - (ii) nutnost přesvědčit se, že všechny osoby opustily prostor, který se má chránit;
 - (iii) činnost posádky při zapnutí systému a při vchodu do chráněného prostoru po zapnutí systému, nebo zaplnění hasivem, zejména s ohledem na možnost přítomnosti nebezpečných látek;

- (iv) správné chování se posádky v případě, že hasicí systém správně nefunguje.
- (f) V pokynech musí být uvedeno, že se před uvedením hasicího systému do činnosti musí vypnout spalovací motory umístěné v prostoru nebo nasávající vzduch z prostoru, který se má chránit.

9.3.2.40.2.6 *Poplachové zařízení*

- (a) Pevně instalované hasicí systémy musí být vybaveny opticko-akustickým poplachovým zařízením.
- (b) Poplachové zařízení se musí spustit automaticky, jakmile se hasicí systém uvede poprvé do činnosti. Poplachové zařízení musí fungovat po vhodnou dobu předtím, než dojde k vypuštění hasiva; nesmí být možné je vypnout.
- (c) Poplachové signály musí být jasně viditelné v prostorech, které se mají chránit, a na přístupových místech k nim a musí být zřetelně slyšitelné za provozních podmínek odpovídajících nejvyšší možné hladině hluku. Musí být možno je zřetelně rozlišit od všech ostatních zvuků a vizuálních signálů v prostoru, který se má chránit.
- (d) Zvukové poplachy musí být zřetelně slyšitelné také v přilehlých prostorech se zavřenými spojovacími dveřmi a za provozních podmínek odpovídajících nejvyšší možné hladině hluku.
- (e) Pokud není poplachové zařízení samo o sobě chráněno proti zkratům, přerušeným vodičům a poklesům napětí, musí být možno monitorovat jeho činnost.
- (f) U vstupu do každého prostoru, kam může dosáhnout hasivo, musí být umístěna tabulka s následujícím nápisem provedeným červenými písmeny na bílém podkladu:

**POZOR, HASICÍ SYSTÉM!
OPUŠTE TENTO PROSTOR IHED PO (popis) SIGNÁLU!**

9.3.2.40.2.7 *Tlakové tanky, armatury a potrubí*

- (a) Tlakové tanky, armatury a potrubí musí odpovídat požadavkům příslušného orgánu nebo, pokud nejsou takové požadavky, požadavkům uznané klasifikační společnosti.
- (b) Tlakové tanky musí být instalovány podle pokynů výrobce.
- (c) Tlakové tanky, armatury a potrubí nesmějí být instalovány v obytných prostorech.
- (d) Teplota skříní a úložných prostorů pro tlakové tanky nesmí překročit 50 °C.
- (e) Skříně a úložné prostory na palubě musí být bezpečně uloženy a musí mít odvětrávací otvory umístěny tak, aby v případě, že tlakový tank není plynotěsný, nemohl unikající plyn vniknout do plavidla. Přímé spojení s jinými prostory není dovoleno.

9.3.2.40.2.8 *Množství hasiva*

Je-li množství hasiva určeno pro více než jeden prostor, nemusí být disponibilní množství hasiva větší, než je množství vyžadované pro největší z takto chráněných prostorů.

9.3.2.40.2.9 *Instalace, údržba, kontrola a dokumentace*

- (a) Montáž nebo úprava systému smí být prováděna pouze společností specializovanou na hasicí systémy. Je nutno se řídit pokyny (technický list výrobku, bezpečnostní list) poskytnutými výrobcem hasiva nebo systému.
- (b) Systém musí být podroben inspekci provedené znalcem:
 - (i) před uvedením do provozu;
 - (ii) pokaždé, kdy se uvádí zpět do provozu po své aktivaci;
 - (iii) po každé úpravě nebo opravě;
 - (iv) pravidelně, nejméně každé dva roky.
- (c) Během inspekce musí znalec zkontrolovat, zda systém odpovídá požadavkům v 9.3.2.40.2.
- (d) Inspekce musí zahrnovat alespoň:
 - (i) vnější kontrolu celého systému;
 - (ii) kontrolu těsnosti potrubí;
 - (iii) kontrolu dobré funkce ovládacích a aktivačních systémů;
 - (iv) kontrolu tlaku a obsahu tanků;
 - (v) kontrolu těsnosti uzavíracích zařízení prostoru, který se má chránit;
 - (vi) kontrolu požárního poplachového systému;
 - (vii) kontrolu poplachového zařízení.

- (e) Osoba provádějící inspekci musí vystavit, podepsat a opatřit datem osvědčení o inspekci.
- (f) V osvědčení o inspekci musí být uveden počet pevně instalovaných hasicích systémů.

9.3.2.40.2.10 *Hasicí systém s CO₂*

Kromě požadavků obsažených v 9.3.2.40.2.1 až 9.3.2.40.2.9 musí hasicí systémy používající jako hasivo CO₂ odpovídat následujícím ustanovením:

- (a) Tanky s CO₂ musí být uloženy v plynotěsném prostoru nebo skříní, které jsou odděleny od jiných prostorů. Dveře takových úložných prostorů a skříní se musí otevírat směrem ven; musí být možno je uzamknout a musí být na vnější straně opatřeny symbolem „Pozor, nebezpečí“, nejméně 5 cm vysokým a „CO₂“ v téže barvě a téže velikosti;
- (b) Úložné skříně nebo prostory pro tanky s CO₂ umístěné pod palubou musí být přístupné pouze zvenku. Tyto prostory musí mít uměle vytvořený větrací systém s odsávacími kryty a musí být zcela nezávislé na ostatních větracích systémech nacházejících se na plavidle;
- (c) Stupeň plnění tanků s CO₂ nesmí překročit 0,75 kg/l. Pro objem stlačeného CO₂ se bere hodnota 0,56 m³/kg;
- (d) Koncentrace CO₂ v prostoru, který se má chránit, nesmí být menší než 40 % celkového objemu prostoru. Toto množství musí být vypuštěno do 120 sekund. Musí být možno kontrolovat, zda probíhá správně rozstřikování;
- (e) Otevírání ventilů tanku a ovládání rozstřikovacího ventilu musí odpovídat dvěma různým operacím;
- (f) Vhodná doba uvedená v 9.3.2.40.2.6 (b) nesmí být menší než 20 sekund. Spolehlivé zařízení musí zajistit načasování rozstřikování CO₂.

9.3.2.40.2.11 *Hasicí systém s HFC-227 ea (heptafluoropropanem)*

Kromě požadavků obsažených v 9.3.2.40.2.1 až 9.3.2.40.2.9 musí hasicí systémy používající jako hasivo HFC-227 ea odpovídat následujícím ustanovením:

- (a) Tam, kde je více prostorů s rozdílnými celkovými objemy, musí být každý prostor vybaven svým vlastním hasicím systémem;
- (b) Každý tank obsahující HFC-227 ea, umístěný v prostoru, který se má chránit, musí být vybaven zařízením k zamezení nadměrnému tlaku. Toto zařízení musí zajistit bezpečně rozptýlení obsahu tanku v prostoru, který se má chránit, jestliže je tank zachvácen požárem, když hasicí systém ještě nebyl uveden do provozu;
- (c) Každý tank musí být vybaven zařízením dovolujícím kontrolovat tlak plynu;
- (d) Stupeň plnění tanků nesmí překročit 1,15 kg/l. Pro měrný objem stlačeného HFC-227 ea se bere hodnota 0,1374 m³/kg;
- (e) Koncentrace HFC-227 ea v prostoru, který se má chránit, nesmí být menší než 8 % celkového objemu prostoru. Toto množství musí být vypuštěno do 10 sekund;
- (f) Tanky s HFC-227 ea musí být vybaveny zařízením kontroly tlaku, které spustí slyšitelný a viditelný poplach v kormidelně v případě mimořádné ztráty hnacího plynu. Pokud plavidlo nemá kormidelnu, musí být poplach spuštěn vně prostoru, který se má chránit;
- (g) Po vypuštění nesmí koncentrace v prostoru, který se má chránit, překročit 10,5 % (objemu);
- (h) Hasicí systém nesmí zahrnovat hliníkové součásti.

9.3.2.40.2.12 *Hasicí systém s IG-541*

Kromě požadavků obsažených v 9.3.2.40.2.1 až 9.3.2.40.2.9 musí hasicí systémy používající jako hasivo IG-541 odpovídat následujícím ustanovením:

- (a) Tam, kde je více prostorů s rozdílnými celkovými objemy, musí být každý prostor vybaven svým vlastním hasicím systémem;
- (b) Každý tank obsahující IG-541, umístěný v prostoru, který se má chránit, musí být vybaven zařízením k zamezení nadměrnému tlaku. Toto zařízení musí zajistit, aby se obsah tanku bezpečně rozptýlil v prostoru, který se má chránit, je-li tank zachvácen požárem, když systém k hašení požáru nebyl ještě uveden do činnosti;
- (c) Každý tank musí být vybaven zařízením dovolujícím kontrolovat obsah;
- (d) Plnicí tlak tanků nesmí překročit 200 barů při teplotě +15 °C;
- (e) Koncentrace IG-541 v prostoru, který se má chránit, musí být nejméně 44 % a nejvýše 50 % celkového objemu prostoru. Toto množství musí být vypuštěno do 120 sekund;

9.3.2.40.2.13 *Hasicí systémy využívající FK-5-1-12*

Mimo požadavků uvedených v 9.3.2.40.2.1 až 9.3.2.40.2.9 musí hasicí systémy využívající FK-5-1-12

jako hasiva odpovídat těmto předpisům:

- (a) Při existenci několika prostor, majících různý celkový objem, musí být každý prostor vybaven vlastním hasicím systémem.
- (b) Každá nádrž s FK-5-1-2 umístěná v chráněném prostoru musí být vybavena zařízením, které zabráňuje vytvoření přetlaku. Toto zařízení musí bezpečným způsobem zajišťovat rozptyl obsahu nádrže v chráněném prostoru v případě, kdy tato nádrž je pod vlivem ohně v době, kdy hasicí systém není zapnut.
- (c) Každá nádrž musí být vybavena zařízením, umožňujícím kontrolovat tlak plynu.
- (d) Úroveň zaplnění nádrže nesmí přesáhnout 1,00 kg/l. Za specifický objem FK-5-1-12 ne pod tlakem se považuje hodnota rovná 0,0719 m³/kg.
- (e) Objem FK-5-1-12 předávaný do chráněného prostoru musí dosahovat nejméně 5,5 % celkového objemu daného prostoru. Vypouštění tohoto množství se musí provést za 10 sekund.
- (f) Nádrž s FK-5-1-12 musí být vybavena zařízením pro kontrolu tlaku, dávajícím opticko-akustický poplachový signál do kormidelny v případě přílišné ztráty hasiva. Když není kormidelna, tento poplachový signál musí být dáván vně chráněného prostoru.
- (g) Po rozptýlení nesmí koncentrace v chráněném prostoru přesahovat 10,0 %.

9.3.2.40.2.14

(Vyhrazeno)

9.3.2.40.2.15

Hasicí systémy používající jako hasivo K₂CO₃.

Vedle požadavků uvedených v 9.3.2.40.2.1 až 9.3.2.40.2.3, 9.3.2.40.2.5, 9.3.2.40.2.6, a 9.3.2.40.2.9, musí hasicí systémy používající jako hasivo K₂CO₃ splňovat následující ustanovení:

- (a) Hasicí systém musí být typu schváleného v souladu se Směrnicí 2014/90/EU³ nebo MSC/Circ. 1270⁴;
- (b) Každá místnost musí být vybavena vlastním hasicím systémem;
- (c) Hasivo musí být uskladněno ve k tomu určených nepřetlakových tancích ve chráněném prostoru. Tyto tanky musí být konstruovány tak, aby se hasivo v prostoru rozptýlilo rovnoměrně. Hasivo musí především působit také pod palubními deskami.
- (d) Každý tank je samostatně napojen na spouštěcí zařízení.
- (e) Množství hasiva, které vytváří suchý aerosol musí být v poměru k chráněnému prostoru minimálně 120 g/m³ čistého objemu tohoto prostoru. Tento čistý objem se počítá podle Směrnice 2014/90/EU³ nebo podle MSC/Circ. 1270⁴. Musí být možné dodat hasivo do 120 vteřin.

9.3.2.40.2.16

Stacionární hasicí systém pro fyzickou ochranu

K zajištění fyzické ochrany ve strojovnách, kotelnách a prostorech s čerpadly jsou dovoleny stacionární hasicí systémy jen na základě doporučení administrativního výboru.

9.3.2.40.3

Dva ruční hasicí přístroje, které jsou předepsány v 8.1.4, se musí nacházet v oblasti nákladu.

9.3.2.40.4

Hasicí prostředky a množství hasicích prostředků pevně nainstalovaných hasicích přístrojů musí být vhodné a dostatečné pro hašení požárů.

9.3.2.41

Oheň a otevřené světlo

9.3.2.41.1

Vyústění komínů se musí nacházet v minimální vzdálenosti 2,00 m od oblasti nákladu. Musí existovat zařízení, která zabrání úniku jisker a průniku vody.

9.3.2.41.2

Topné, varné a chladicí přístroje nesmí být provozovány ani kapalnými pohonnými hmotami, zkapalněnými plyny, ani pevnými hořlavými látkami.

Pokud jsou topné přístroje nebo topné kotle umístěny do strojoven nebo do prostor, které jsou pro to zvláště vhodné, smí být provozovány kapalnými pohonnými hmotami, avšak s bodem vzplanutí vyšším než 55 °C.

Varná a chladicí zařízení jsou povolena pouze v obytných prostorech.

³ Úřední věstník Evropské unie č. L 257 z 28.8. 2014, str.146.

⁴ Oběžník Mezinárodní námořní organizace MSC/Circ. 1270 a opravy — Revidované pokyny pro schválení stabilních aerosolových hasicích systémů odpovídajících stabilním plynovým hasicím systémům, jak je uvedeno v úmluvě SOLAS 1974, pro strojovny — přijaté 4.6.2008.

9.3.2.41.3 Jsou povoleny pouze elektrické lampy.

9.3.2.42 Zařízení pro ohřev nákladu

9.3.2.42.1 Ohřevné kotle, které slouží k ohřevu nákladu, musí být provozovány tekutým palivem se zápalným bodem větším než 55 °C. Musí být umístěny buď ve strojovně nebo pod palubou mimo oblast nákladu v prostoru, který je přístupný z paluby nebo ze strojovny.

9.3.2.42.2 Zařízení pro ohřev nákladu musí být uzpůsobena tak, aby se v případě netěsnosti do ohřevného kotle nemohl dostat náklad. Zařízení pro ohřev nákladu s umělým tahem musí být možné zapálit elektricky.

9.3.2.42.3 Zařízení pro větrání strojovny musí být dimenzována podle spotřeby vzduchu pro ohřevný kotel.

9.3.2.42.4 Pokud se zařízení pro ohřev nákladu musí používat během nakládky, vykládky nebo odplynování s koncentrací uvolňovanou nákladem o hodnotě 10 % dolní meze výbušnosti nebo výše, musí provozní prostor, ve kterém je toto zařízení umístěno, plně odpovídat předpisům 9.3.2.52.1. To neplatí pro sací otvory systému větrání. Tyto se musí nacházet minimálně 2,00 m od prostoru s nákladem a 6,00 m od otvorů nákladního a zbytkového tanku, nakládacích čerpadel na palubě, výstupních otvorů vysokorychlostních nebo přetlakových ventilů a břehových přípojek nakládacího a vykládacího potrubí a minimálně 2,00 m nad palubou.

Při vykládce látek s bodem vzplanutí ≥ 60 °C, pokud teplota produktu je minimálně 15 K pod bodem vzplanutí, nemusí být dodrženy předpisy podle 9.3.2.52.1.

9.3.2.43

9.3.2.49 (Vyhrazeno)

9.3.2.50 (Vypuštěno)

9.3.2.51 Povrchové teploty instalací a zařízení

- (a) Povrchová teplota elektrických a neelektrických instalací a zařízení nesmí překročit 200 °C.
- (b) Povrchové teploty vnějších částí motorů a jejich přívody vzduchu a odsávacích potrubí nesmí překročit 200 °C;
- (c) Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, pro které jsou ve sloupci (15) tabulky C kapitoly 3.2 uvedeny teplotní třídy T4, T5 nebo T6, pak odpovídající povrchové teploty v rámci přiřazených zón nesmí překročit 135°C (T4), 100°C (T5) nebo 85°C (T6);
- (d) (a) a (b) neplatí, jsou-li splněny tyto požadavky (viz také 7.2.3.51.4):
 - (i) Obytné prostory, kormidelna a provozní prostory, kde mohou být povrchové teploty vyšší, než ty uvedené v (a) a (b), jsou vybaveny větracím systémem podle 9.3.2.12.4 (b); nebo
 - (ii) Instalace a zařízení, která generují povrchové teploty vyšší, než jsou teploty uvedené v (a) nebo (b), musí být možné vypnout. Takové instalace a zařízení musí být označena červeně.

9.3.2.52 Typ a umístění elektrických instalací a zařízení

9.3.2.52.1 Elektrické instalace a zařízení musí být minimálně typ „omezené riziko výbuchu“;

Toto ustanovení se neuplatňuje u:

- (a) Instalací osvětlení v obytných prostorech a kormidelně, s výjimkou spínačů umístěných v blízkosti vchodů;
- (b) Mobilních telefonů, pevných telefonních instalací a stacionárních a přenosných počítačů a zařízení pro kontrolu naložení v obytných prostorech nebo kormidelně;
- (c) Elektrické instalace a zařízení která jsou, během pobytu v bezprostřední blízkosti nebo ve vyznačené pobřežní oblasti:
 - (i) Uhašena; nebo
 - (ii) Jsou umístěna v prostorech vybavených větracím systémem podle 9.3.2.12.4;
- (d) Radiotelefonní zařízení a stanice vnitrozemského systému AIS (systémy automatické identifikace) v obytných prostorech a kormidelně, pokud se žádná část antény pro radiotelefonní zařízení nebo stanice AIS nenachází nad nebo do 2,00 m od chráněné oblasti.

- 9.3.2.52.2 V kofrdamech, prostorech s dvojitými boky, dvojitými dny a úložných prostorech jsou povoleny pouze hermeticky uzavřené ozvěnové hloubkoměry, jejichž kabely jsou vedeny silnostěnnými ocelovými trubkami s plynotěsnými spoji až k hlavní palubě.
- 9.3.2.52.3 Pevné elektrické instalace a zařízení, která nesplňují požadavky stanovené výše v 9.3.2.51 (a), 9.3.2.51 (b) a 9.3.2.52.1 a jejich spínače, musí být označeny červeně. Odpojení těchto zařízení musí být řízeno z centrálního místa na palubě.
- 9.3.2.52.4 Každá izolovaná distribuční síť musí být vybavena automatickým zařízením s optickým a akustickým signálem pro kontrolu úrovně izolace.
- 9.3.2.52.5 Jsou povoleny pouze distribuční systémy bez zpětného spojení s trupem. Toto ustanovení se neuplatňuje u:
- Aktivní katodické ochrany proti korozi;
 - Některých omezených částí instalací umístěných mimo oblast nákladu (např. připojení spouštěčů diesellových motorů);
 - Přístroje pro kontrolu úrovně izolace podle 9.3.2.52.4.
- 9.3.2.52.6 Elektrický generátor, který je trvale poháněn motorem a který nesplňuje výše uvedené požadavky v 9.3.2.52.1, musí být vybaven vypínačem schopným vypnout generátor. V blízkosti spínače musí být zobrazena informační tabule s návodem k obsluze.
- 9.3.2.52.7 Porucha napájecího zdroje bezpečnostního a kontrolního zařízení musí být okamžitě signalizována optickými a akustickými signály v kormidelně a na palubě. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor.
- 9.3.2.52.8 Elektrické spínače, zásuvky a kabely na palubě musí být chráněny proti mechanickému poškození.
- 9.3.2.52.9 Zásuvky pro připojení signálních světel a osvětlení lavy musí být natrvalo zabudovány v plavidle v blízkosti signálního stožáru nebo lavy. Zásuvky používané v chráněné oblasti musí být provedeny tak, aby nebylo možné připojení nebo odpojení, s výjimkou případů, kdy nejsou pod napětím.
- 9.3.2.52.10 Akumulátory musí být umístěny mimo oblast nákladu.

9.3.2.53 *Typ a umístění elektrických a neelektrických instalací a zařízení určených pro použití v oblastech s nebezpečím výbuchu*

- 9.3.2.53.1 Na palubách plavidel, na která se vztahuje rozdělení zón definovaných v 1.2.1, musí elektrická a neelektrická zařízení a zařízení používaná v prostorách s nebezpečím výbuchu splňovat alespoň požadavky pro použití v dané oblasti.
- Musí být vybírána na základě skupin/podskupin výbušnosti a teplotních tříd, do nichž patří látky, které mají být přepravovány (viz sloupce (15) a (16) tabulky C kapitoly 3.2).
- Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, pro které jsou ve sloupci (15) tabulky C kapitoly 3.2 uvedeny teplotní třídy T4, T5 nebo T6, pak odpovídající povrchové teploty v rámci přiřazených zón nesmí překročit 135 °C (T4), 100 °C (T5) nebo 85 °C (T6);
- Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, pro které jsou ve sloupci (15) tabulky C kapitoly 3.2 uvedeny teplotní třídy T1 nebo T2, pak odpovídající povrchové teploty v rámci přiřazených zón nesmí překročit 200 °C.
- 9.3.2.53.2 S výjimkou optických vláken musí být elektrické kabely v chráněné oblasti pancéřovány nebo umístěny v kovovém plášti nebo v ochranných trubkách.
- Elektrické kabely pro aktivní katodickou ochranu obšívky musí být vedeny silnostěnnými ocelovými trubkami s plynotěsnými spoji až k hlavní palubě.
- 9.3.2.53.3 Pohyblivé elektrické kabely jsou v oblasti s rizikem výbuchu, s výjimkou elektrických kabelů pro jiskrově bezpečné elektrické obvody nebo pro připojení:
- (a) Signálních pozičních světel a osvětlení lavy, pokud je spojovací bod (například zásuvka) trvale zabudován v plavidle v blízkosti signálního stožáru nebo lavy;
 - (b) Elektrické sítě na plavidle do pozemní elektrické sítě; pokud:
 - Elektrické kabely a napájecí jednotka odpovídají platné normě (například EN 15869-03:2010);
 - Jsou napájecí jednotka a konektory umístěny mimo oblast s rizikem výbuchu.
- Je připojování a odpojování zásuvek/konektorů možné pouze tehdy, když nejsou pod napětím.

9.3.2.53.4 Elektrické kabely jiskrově bezpečných samojisticích obvodů musí být odděleny od ostatních kabelů, které nejsou určeny pro použití v těchto obvodech, a musí být označeny (nesmějí být instalovány společně ve stejném svazku kabelů a nesmí být upevněny stejnými kabelovými svorkami).

9.3.2.53.5 Pro pohyblivé elektrické kabely povolené v souladu s 9.3.2.53.5 se smí používat pouze opláštěvané kabely typu H07RN-F-F v souladu s RN IEC-60245-4:2011⁵ nebo elektrické kabely přinejmenším srovnatelného provedení s vodiči o průřezu minimálně 1,50 mm².

9.3.2.54 **Uzemnění**

9.3.2.54.1 Kovové části elektrických instalací a zařízení v oblasti nákladu, které nejsou pod napětím, jakož i ochranné kovové trubky nebo kovové pláště kabelů v normálním provozu musí být uzemněny, pokud nejsou provedeny tak, aby byly automaticky uzemněny spojením s kovovou konstrukcí plavidla.

9.3.2.54.2 Ustanovení v 9.3.2.54.1 platí také pro instalace s napětím menším než 50 V.

9.3.2.54.3 Nezávislé nákladní tanky, kovové IBC a cisternové kontejnery musí být uzemněny.

9.3.2.54.4 Nádobý na zbytkové produkty musí být možné uzemnit.

9.3.2.55 (Vyhrazeno)

9.3.2.56 (Vypuštěno)

9.3.2.57 -

9.3.2.59 (Vyhrazeno)

9.3.2.60 **Zvláštní vybavení**

Plavidlo musí být vybaveno sprchou a lázní pro oči a obličej na místě, které je přímo přístupné z oblasti nákladu. Voda musí odpovídat kvalitě pitné vody na palubě.

POZNÁMKA: Jsou povoleny další dekontaminační látky, aby se zabránilo poškození očí a kůže.

Je povoleno připojení tohoto speciálního zařízení s oblastí mimo oblast nákladu.

Musí být instalován pružinový zpětný ventil, který zabrání unikání plynů mimo oblast nákladu sprchou a systémem oční a obličejové lázně.

9.3.2.61 (Vyhrazeno)

9.3.2.62 **Ventil pro odplyňování do sběrných zařízení**

Na potrubí, které slouží k odvádění vzduchu, musí být instalován pevný nebo přenosný pružinový nízkotlaký ventil používaný při odplyňování do sběrných zařízení. Pokud seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 obsahuje látky, u nichž se požaduje ochrana proti explozi podle sloupce (17) tabulky C kapitoly 3.2, musí být tento ventil vybaven pojistkou proti prošlehnutí plamene, která je schopna odolat deflagraci. Pokud neprobíhá odplyňování plavidla do sběrného zařízení, musí být ventil uzavřen slepou přírubou. Nízkotlaký ventil musí být instalován tak, aby za jiných normálních pracovních podmínek nebyl vakuový ventil aktivován.

POZNÁMKA: Odplyňování je součástí normálních pracovních podmínek.

9.3.2.63 -

9.3.2.70 (Vyhrazeno)

9.3.2.71 **Vstup na plavidlo**

Tabule označující zákaz vstupu podle 8.3.3 musí být dobře viditelné z obou boků plavidla.

9.3.2.72 (Vyhrazeno)

9.3.2.73 (Vyhrazeno)

9.3.2.74 **Zákaz kouření, zákaz ohně a otevřeného světla**

9.3.2.74.1 Tabule označující zákaz kouření podle 8.3.4 musí být dobře viditelné z obou boků plavidla.

⁵ Identická s EN 50525-2-21: 2011.

9.3.2.74.2 V blízkosti vstupu do míst, kde kouření nebo používání ohně nebo otevřeného osvětlení není vždy zakázáno, musí být umístěny upozorňující tabule, které udávají okolnosti, za kterých tento zákaz platí.

9.3.2.74.3 V obytných prostorech a kormidelně musí být v blízkosti každého východu umístěn popelník.

9.3.2.75

-

9.3.2.91

(Vyhrazeno)

9.3.2.92

Nouzový východ

Prostory, jejichž přístupové a výstupní otvory budou v případě poškození částečně nebo zcela zaplaveny, musí být opatřeny nouzovým východem, který se nachází minimálně 0,10 m nad vodoryskou. To neplatí pro přední a zadní kolizní prostor.

9.3.2.93

-

9.3.2.99

(Vyhrazeno)

9.3.3 Předpisy pro stavbu tankových plavidel typu N

Předpisy 9.3.3.0 až 9.3.3.99 platí pro tanková plavidla typu N.

9.3.3.0 Stavební materiály

- 9.3.3.0.1 (a) Trup plavidla a nákladní tanky musí být postaveny z lodní oceli nebo z jiného, přinejmenším rovnocenného kovu.
- Pro nezávislé nákladní tanky mohou být použity i jiné, rovnocenné materiály. Tato rovnocennost se týká mechanických vlastností a odolnosti vůči vlivům teploty a ohně.
- (b) Všechny části plavidla včetně zařízení a vybavení, které se dostanou do styku s nákladem, se musí skládat z takových materiálů, které nemohou být nákladem rozleptány nebo nezpůsobí rozpad nákladu ani s ním nemohou vytvořit nebezpečné a škodlivé sloučeniny. V případě že je nebylo možné vyzkoušet během klasifikace a inspekce plavidla, musí být uvedena relevantní výhrada v seznamu látek připuštěných k přepravě v plavidle podle 1.16.1.2.5.
- (c) Vnitřní odvětrávací potrubí musí být chráněno proti korozi.
- 9.3.3.0.2 Používání dřeva, hliníkových slitin, plastů nebo pryže v oblasti nákladu je zakázáno, pokud to není výslovně povoleno v odstavci 9.3.1.0.3 nebo ve schvalovacím osvědčení.
- 9.3.3.0.3 Použití dřeva, slitin hliníku, plastů nebo pryže v oblasti nákladu je povoleno, jak je uvedeno v následující tabulce:

Použití dřeva, slitin hliníku, plastů nebo pryže je povoleno pouze pro:	(X značí povoleno)			
	Dřevo	Slitiny hliníku	Plasty	Pryž
Lávky	X	X	X	X
Vnější žebříky a průchody (lávky) *		X	X	X
Úklidové prostředky, např. košťata	X		X	X
Pohyblivá zařízení, např. hasicí přístroje, přenosné detektory plynu, záchranné vrátky		X	X	X
Oděrky, Odrazníky	X		X	X
Vyvazovací lana a lanové odrazníky (fendry)			X	
Vybavení pro zajištění nákladních tanků nezávislých na trupu plavidla a zajištění zařízení a vybavení	X		X

(*) Zohledněte 9.3.1.0.5, 9.3.2.0.5 nebo 9.3.3.0.5, podle okolností				
Hliníkové měřicí tyče jsou povoleny, pokud jsou opatřeny mosaznými patkami nebo jiným způsobem chráněny proti jiskření.				

9.3.3.0.3.1 Všechny trvale upevněné materiály v obytném prostoru nebo kormidelně, s výjimkou nábytku, musí být z těžko hořlavého materiálu. Pokud nastane požár, nesmí uvolňovat výpary nebo toxické plyny v nebezpečných množstvích.

9.3.3.0.4 Barva použitá v oblasti nákladu, nesmí při nárazu nebo při podobném namáhání zapříčinit vznik jisker. Záchranné čluny z plastů je povoleno použít pouze v případě, že jsou vyrobené z těžko hořlavého materiálu.

Použití slitin hliníku nebo plastů pro průchody (lávky) v oblasti nákladu je povoleno pouze v případě, že jsou z těžko hořlavého materiálu nebo elektricky nevodivého materiálu.

9.3.3.1 **Dokumentace plavidla**

POZNÁMKA: Pro účely tohoto odstavce má pojem „vlastník“ stejný význam jako v 1.16.0.

Dokumentace plavidla musí být uchovávána vlastníkem, který musí být schopen poskytnout tuto dokumentaci na požádání příslušného orgánu a uznané klasifikační společnosti.

Dokumentace plavidla musí být udržována a aktualizována po celou dobu životnosti plavidla a musí být uchována ještě po dobu 6 měsíců po vyřazení plavidla z provozu.

Pokud by došlo během životnosti plavidla ke změně vlastníka, musí být dokumentace plavidla předána novému vlastníkovi.

Kopie dokumentace plavidla nebo všech potřebných dokumentů musí být na požádání poskytnuta příslušnému orgánu pro vydání schvalovacího osvědčení a uznané klasifikační společnosti nebo inspekční organizaci pro první inspekci, periodickou inspekci, zvláštní inspekci nebo mimořádné kontroly.

9.3.3.2

9.3.3.7 (Vyhrazeno)

9.3.3.8 **Klasifikace**

9.3.3.8.1 Tankové plavidlo musí být postaveno pod dohledem uznané klasifikační společnosti podle pravidel stanovených touto klasifikační společností pro její nejvyšší třídu a tankové plavidlo musí být podle toho zatříděno.

Vyžaduje se zachování nejvyšší třídy plavidla.

Klasifikační společnost vydá osvědčení prokazující, že plavidlo odpovídá plavidlům tohoto oddílu (Klasifikační osvědčení).

V osvědčení musí být uveden konstrukční tlak a zkušební tlak nákladních tanků.

Pokud má plavidlo nákladní tanky s rozdílnými tlaky pro otevření ventilů, musí být v osvědčení uveden konstrukční a zkušební tlak každého tanku.

Klasifikační společnost vystaví osvědčení, v němž uvede všechny nebezpečné věci připuštěné k přepravě tímto plavidlem (viz též 1.16.1.2.5).

9.3.3.8.2 (Vypuštěno)

9.3.3.8.3 (Vypuštěno)

9.3.3.8.4 (Vypuštěno)

9.3.3.9 (Vyhrazeno)

9.3.3.10 *Ochrana proti průniku nebezpečných plynů a šíření nebezpečných kapalin*

9.3.3.10.1 Plavidlo musí být postaveno tak, aby se zamezilo vniknutí nebezpečných plynů a kapalin do obytných prostor, kormidelny a provozních prostor. Žádné z oken v těchto prostorech nesmí být možné otevřít, pokud není zamýšleno jako nouzový východ a jako takové označeno.

9.3.3.10.2 Ve výšce vnějších přepážek nákladních tanků musí být na palubě namontován vodotěsný ochranný sil, a to v maximální vzdálenosti 0,60 m od vnějších přepážek kofrdamu nebo přepážek na konci nákladního prostoru. Ochranný sil musí být umístěn buď po celé šířce plavidla, nebo musí být upevněn mezi podélnými jímacími silami, aby se zabránilo vniknutí kapalin do předního i zadního kolizního prostoru. Výška ochranných a jímacích silů musí být minimálně 0,075 m. Ochranný sil může odpovídat ochranné stěně předepsané v 9.3.1.10.3, pokud ochranná stěna stojí po celé šířce plavidla.

9.3.3.10.3 Pokud seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 bude zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, pak není povoleno použití instalací a zařízení, která nejsou alespoň typu „omezené riziko výbuchu“, během nakládky a vykládky v částech paluby mimo oblast nákladu, pokud tyto části nejsou chráněny proti vniknutí plynů plyno a vodotěsnou stěnou. Stěna musí buď probíhat od jedné strany plavidla k druhé, nebo obklopuvat oblasti, které mají být chráněny, ve tvaru písmene U. Stěna musí pokrýt celou šířku chráněné oblasti a nejméně 1,00 m ve směru opačném k oblasti nákladu (viz schema Rozdělení zón). Výška stěny musí být nejméně 1,00 m nad přilehlým prostorem nad palubou v oblasti nákladu. Vnější stěna a boční stěny obytného prostoru lze považovat za ochrannou stěnu, pokud v nich nejsou otvory a pokud jsou dodrženy rozměry.

Ochranná stěna není nutná tam, kde je vzdálenost mezi oblastmi, které mají být chráněny, a pojistným ventilem, pobřežním připojením nakládacích a vykládacích rozvodů a odvětrávacím potrubím, kompresorem na palubě a otevíráním nejbližších tlakových nádob minimálně 12,00 m.

9.3.3.10.4 Na palubě musí mít spodní hrany dveřních otvorů v bočních stěnách nástaveb a silů, vstupních otvorů a větracích otvorů prostorů umístěných pod palubou výšku nejméně 0,50 m nad palubou.

Tento požadavek se nevztahuje na přístupové otvory do prostor dvojitého trupu a dvojitých dnů.

9.3.3.10.5 Štítnice, okopnice, paty zábradlí apod. musí být opatřeny dostatečně velkými otvory, které jsou umístěny přímo nad palubou.

9.3.3.10.6 Typ plavidel N otevřený musí splňovat pouze požadavky 9.3.3.10.1 v případě, že plavidlo zůstane v bezprostřední blízkosti nebo ve vyznačené pobřežní oblasti.

9.3.3.11 *Úložné prostory a nákladní tanky*

9.3.3.11.1 (a) Nejvyšší přípustný obsah nákladního tanku lze zjistit z následující tabulky:

$L \times B \times H$ v (m^3)	Nejvyšší přípustný obsah nákladního tanku v (m^3)
< 600	$L \times B \times H \times 0,3$
600 - 3 750	$180 + (L \times B \times H - 600) \times 0,0635$
> 3 750	380

Připouštějí se alternativní varianty stavby v souladu s částí 9.3.4.

V předchozí tabulce je $L \times B \times H$ násobkem hlavních rozměrů tankového plavidla v metrech (podle cejchovního průkazu), kde:

L = největší délka trupu plavidla v m;

- B = největší šířka trupu plavidla v m;
 H = nejmenší kolmá vzdálenost mezi spodní hranou lodního kýlu a nejnižším bodem paluby na straně plavidla (boční výšky) v oblasti nákladu v m;

kde:

U tankových plavidel se zvýšenou palubou se H nahradí H' , kde H' vyplývá z následujícího vzorce:

$$H' = H + \left(ht \cdot \frac{bt}{B} \cdot \frac{lt}{L} \right)$$

kde:

- ht = výška zvýšení paluby (vzdálenost mezi zvýšenou palubou a hlavní palubou na straně zvýšení na $L/2$) v m;
 bt = šířka zvýšení v m;
 lt = délka zvýšení v m;

- (b) Konstrukce nákladního tanku musí být dimenzována tak, aby byla zohledněna hustota přepravovaného materiálu. Maximální přípustná hustota musí být uvedena ve schvalovacím osvědčení.
 (c) Pokud má plavidlo ve výbavě jiné tanky, musí být tyto tanky dimenzovány tak, aby jejich provozní tlak byl minimálně 400 kPa (4 bary).
 (d) U plavidel s délkou do 50,00 m nesmí délka nákladních tanků přesáhnout 10,00 m.

U plavidel delších než 50,00 m nesmí délka tanků přesáhnout 0,20 L.

Toto ustanovení neplatí pro plavidla se zasazenými, cylindrickými nákladními tanky s poměrem délky k průměru ≤ 7 .

- 9.3.3.11.2 (a) Nezávislé nákladní tanky musí být zajištěny proti vyplavání.
 Upevňovací zařízení chlazených nákladních tanků musí splňovat požadavky uznané klasifikační společnosti.
 (b) Jímka čerpadla nesmí mít obsah větší než 0,10 m³;
 (c) (Vyhrazeno);
 (d) Boční výtuhy spojující nebo nesoucí nosné komponenty boků plavidla s podélnými nosnými komponentami podélných stěn nákladních tanků a boční výtuhy spojující nosné komponenty dna plavidla s dnem tanku jsou zakázány.
- 9.3.3.11.3 (a) Nákladní tanky musí být odděleny kofrdamem s minimální šířkou 0,60 m od obytných prostor, strojoven a provozních prostor pod palubou mimo oblast nákladu nebo pokud tyto prostory na plavidle chybí, tak musí být odděleny od konců plavidla. Pokud jsou nákladní tanky postaveny v jednom úložném prostoru, musí být vzdáleny minimálně 0,50 m od koncových přepážek úložného prostoru. V takovém případě se koncová přepážka třídy „A-60“, jak je definována v SOLAS 74, kapitola II-2, předpis 3, považuje za ekvivalent kofrdamu. Odstup 0,50 m smí u tlakových tanků být zmenšen na 0,20 m.
 (b) Úložné prostory, kofrdamy a nákladní tanky musí být možné přezkušovat.
 (c) Všechny prostory v oblasti nákladu musí být větratelné. Musí být možné kontrolovat, že v nich není žádný plyn.

- 9.3.3.11.4 Přepážky, které ohraničují nákladní tanky, kofrdamy a úložné prostory musí být vodotěsné. Nákladní tanky a přepážky ohraničující oblast nákladu nesmějí mít žádné otvory nebo průchody pod palubou.

V přepážce mezi strojovnou a kofrdamem nebo provozním prostorem v oblasti nákladu smí být průchody, pokud odpovídají ustanovením, uvedeným v 9.3.3.17.5.

V přepážce mezi nákladním tankem a prostorem s čerpadly pod palubou smějí být průchody, pokud odpovídají ustanovením uvedeným v 9.3.3.17.6. V přepážkách mezi nákladními tanky smějí být průchody, pokud jsou nakládací a vykládací potrubí opatřena uzavíracími zařízeními na nákladním tanku, z něhož vycházejí. Tato potrubí musí být nejméně 0,60 m nad dnem.

- 9.3.3.11.5 Dvojité boky a dvojitá dna v oblasti nákladu musí být uzpůsobeny pouze pro plnění balastní vodou. Dvojitá dna však mohou být použita jako palivové tanky na naftu, pokud odpovídají ustanovením uvedeným v 9.3.3.32.
- 9.3.3.11.6 (a) Kofrdam, střední část kofrdamu nebo jiný prostor pod palubou v oblasti nákladu, smí být zařízeny jako provozní prostor, pokud jsou stěny, které jej ohraničují, vedeny kolmo až na dno. Tento provozní prostor smí být přístupný jenom z paluby.
- (b) Takový provozní prostor musí být s výjimkou přístupových a větracích otvorů vodotěsný.
- (c) V provozním prostoru zmíněném v 9.3.3.11.4 výše nesmí být žádné potrubí pro nakládku a vykládku.

V prostorech s čerpadly pod palubou smí být potrubí pro nakládku a vykládku jen tehdy, pokud odpovídá ustanovením uvedeným v 9.3.3.17.6.

- 9.3.3.11.7 Kde jsou závislé nákladní tanky užívány, nebo pro dvojité boky, kde jsou integrované nákladní tanky v konstrukci plavidla, musí být vzdálenost mezi stěnou plavidla a stěnou nákladních tanků minimálně 0,60 m.

Odstup mezi dnem úložného prostoru a dnem nákladního tanku musí činit minimálně 0,50 m. Pod čerpacími jímkami smí být světlá výška snížena na 0,40 m.

Odstup mezi čerpací jímkou nákladního tanku a dnovou výtuhou musí činit minimálně 0,10 m.

Je-li trup plavidla postaven v oblasti nákladu s dvojitými stěnami s nezávislými nákladními tanky umístěnými v úložných prostorech, platí výše uvedené hodnoty pro dvojitě stěny. Jestliže v tomto případě nejsou minimální hodnoty pro inspekce nezávislých tanků zmíněné v 9.3.3.11.9 proveditelné, musí být možné snadno demontovat nákladní tanky pro inspekci.

- 9.3.3.11.8 Provozní prostory, které se nacházejí v oblasti nákladu pod palubou, musí být uspořádány takovým způsobem, aby byly dobře přístupné a aby v nich obsažená provozní zařízení mohla být bezpečně obsluhována osobami, které mají osobní ochranné vybavení. Musí být postaveny takovým způsobem, aby z nich bylo možné bez zvláštních potíží vyprostit zraněné osoby a osoby v bezvědomí, případně s pomocí pevně zabudovaných zařízení.

- 9.3.3.11.9 Kofrdamy, dvojité boky, dvojitá dna, nákladní tanky, úložné prostory a jiné prostory, do kterých se vstupuje v oblasti nákladu, musí být uspořádány takovým způsobem, aby je bylo možné přiměřeně a kompletně uklízet a kontrolovat. S výjimkou dvojitých boků a dvojitého dna, pokud nemají žádnou společnou stěnu s nákladními tanky, musí vstupní otvory být zhotoveny tak, aby do prostoru mohla bez jakékoliv újmy vstoupit nebo jej opustit osoba s dýchacím přístrojem. Nejmenší velikost otvoru: 0,36 m²; nejmenší boční délka: 0,50 m. Vstupní otvory musí být postaveny takovým způsobem, aby z nich bylo možné bez zvláštních potíží vyprostit zraněné osoby a osoby v bezvědomí, případně s pomocí pevně zabudovaných zařízení. Odstup mezi zesíleními ve shora uvedených prostorech nesmí být menší než 0,50 m. Ve dvojitém dně smí tento odstup být zmenšen na 0,45 m.

Nákladní tanky smí být opatřeny kulatým otvorem s minimálním průměrem 0,68 m.

- 9.3.3.11.10 9.3.3.11.6 (c) výše neplatí pro typ N otevřená.

9.3.3.12 Větrání

- 9.3.3.12.1 V každém úložném prostoru musí být dva otvory, jejichž rozměr a uspořádání jsou takové, aby větrání na každém místě prostoru bylo účinné. Pokud tyto otvory neexistují, musí být možné úložné prostory inertizovat nebo plnit suchým vzduchem.

- 9.3.3.12.2 Dvojité boky a dvojitě dna v oblasti nákladu, které nejsou zřízeny za účelem balastování a eventuální existující kofrdamy mezi strojovny a prostory s čerpadly musí být větratelné větracími zařízeními.

- 9.3.3.12.3 (a) Provozní prostory v oblasti nákladu pod palubou musí být opatřeny systémem ventilace. Kapacita ventilátorů musí být dostatečná k zajištění 20 kompletních výměn vzduchu za hodinu na základě objemu provozního prostoru.

Ventilační odsávací šachty musí sahát až do výšky 50 mm nad podlahou provozního prostoru. Vzduch se musí přivádět potrubím v horní části provozního prostoru.

- (b) V případě, že seznam látek na plavidle podle 1.16.1.2.5 bude obsahovat látky, které vyžadují zajištění proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, potom přívody vzduchu musí být umístěny nejméně 2,00 m nad palubou, ve vzdálenosti nejméně 2,00 m od otvorů tanku a 6,00 m od výstupních otvorů pojistných ventilů.

- Prodlužovací potrubí, které může být nezbytné, může být závěsného typu.
- 9.3.3.12.4 (c) Na palubě plavidla typu N otevřeného, budou dostatečná jiná vhodná zařízení bez ventilátorů.
- (a) Obytné prostory, kormidelna a provozní prostory musí být vybaveny větráním.
- (b) Systém větrání v takových prostorech musí splňovat následující požadavky:
- (i) Sací otvory musí být umístěny co nejdále, a minimálně 6,00 m od chráněné oblasti, a minimálně 2,00 m nad palubou;
 - (ii) V prostorech se může udržovat tlak nejméně 0,1 kPa (0,001 bar);
 - (iii) Je zabudováno poplachové zařízení pro případ poruchy;
 - (iv) Větrací systém, včetně poplachového zařízení pro případ poruchy, musí být minimálně typ „omezené riziko výbuchu“;
 - (v) Systém detekování plynu odpovídající níže uvedeným podmínkám 1 až 4 je připojen na větrací systém:
 1. Je vhodný pro použití minimálně v zóně 1, výbušné skupině IIC a teplotní třídě T6;
 2. Je vybaven čidly:
 - Na sacích otvorech větracího systému; a
 - Přímou pod vrchní hranou prahu vstupních dveří;
 3. Jeho čas t_{90} je nižší nebo se rovná 4 s;
 4. Měření musí být neustálé;
 - (vi) V provozních prostorách je větrací systém napojen na nouzové osvětlení, které musí být minimálně typ „omezené riziko výbuchu“;

Toto nouzové osvětlení není nutné, pokud je osvětlení v provozních prostorách minimálně typu „omezené riziko výbuchu“;
 - (vii) Sání větracího systému a instalací a zařízení, která nesplňují požadavky uvedené v 9.3.3.51 (a) a (b) a 9.3.3.52.1 musí být uzavřeno, pokud je dosaženo koncentrace, která se rovná 20 % dolní meze výbušnosti n-hexanu;

Při vypnutí musí být v obytných prostorách a v prostoru kormidelny aktivována zvuková a světelná signalizace;
 - (viii) V případě selhání větracího systému nebo instalací detekce plynu v obytných prostorách, musí být vypnuty instalace a zařízení v ubytovacích prostorách, které nesplňují požadavky uvedené v 9.3.3.51 (a) a (b) a 9.3.3.52.1

Porucha musí být signalizována v obytných prostorech, kormidelně a na palubě vizuálními a zvukovými signály;
 - (ix) V případě selhání větracího systému nebo instalací detekce plynu v kormidelně nebo provozních prostorech, musí být vypnuty instalace a zařízení v těchto prostorech, které nesplňují požadavky uvedené v 9.3.3.51 (a) a (b) a 9.3.3.52.1;

Porucha musí být viditelně a slyšitelně signalizována v prostoru kormidelny a na palubě; Pokud se poplach nevypne, musí být automaticky předán do obytných prostor;
 - (x) Jakékoli vypnutí musí nastat okamžitě a automaticky a, je-li to nutné, musí aktivovat nouzové osvětlení;

Zařízení automatického vypínání musí být nastaveno tak, aby po dobu plavby automatické vypnutí nebylo možné;
- (c) Pokud v prostoru není větrací systém nebo větrací systém prostoru nesplňuje všechny požadavky uvedené výše v (b), musí existovat možnost vypnout všechny zařízení a přístroje, které se nenacházejí tomto prostoru, které svojí činností mohou přesáhnout povrchové teploty uvedené v 9.1.0.51 (a) a (b), nebo které nesplňují požadavky uvedené v 9.1.0.52.1.

9.3.3.12.5 (Vypuštěno)

9.3.3.12.6 Na větracích otvorech musí být umístěny tabulky uvádějící podmínky, za nichž mají být otvory uzavřeny. Všechny větrací otvory obytných prostor, kormidelny a provozních prostor vedoucích do venkovního prostoru mimo oblast nákladu musí být vybaveny zařízeními trvale upevněnými podle 9.3.3.40.2.2 (c), která umožňují jejich rychlé uzavření. Musí být jasné, zda jsou otevřené nebo zavřené.

Tyto větrací otvory musí být umístěny nejméně 2,00 m od oblasti nákladu.

V této oblasti mohou být umístěny větrací otvory provozních prostor v oblasti nákladu.

- 9.3.3.12.7 Typ plavidel N otevřený musí splňovat pouze požadavky 9.3.3.12.4 (b) nebo (c), jestliže plavidlo zůstane v bezprostřední blízkosti nebo ve vyznačené pobřežní oblasti.
- 9.3.3.12.8 9.3.3.12.6, s výjimkou stálého systému měření kyslíku a 9.3.3.12.7 neplatí pro typ N otevřená.

9.3.3.13 **Stabilita (obecně)**

- 9.3.3.13.1 Musí být prokázána dostatečná stabilita včetně stability v poškozeném stavu. Pro jednoplášťová plavidla se šířkou tanků menší nebo rovná se 0,70 B tento důkaz není zapotřebí.
- 9.3.3.13.2 Základní hodnoty pro výpočet stability – hmotnost prázdného plavidla a poloha těžiště hmotnosti – musí být určeny buď pomocí nakláněcího pokusu, nebo detailním výpočtem hmotnosti. Přitom se musí ověřit hmotnost prázdného plavidla měřením ponoru, přičemž se vypočtená hmotnost nesmí lišit více než o $\pm 5\%$ od hodnoty hmotnostního výtlaku určené ze změřeného ponoru.
- 9.3.3.13.3 Musí být prokázána dostatečná stabilita v nepoškozeném stavu pro všechna stádia nakládky a vykládky a pro konečný stav naložení pro všechny relativní hustoty přepravovaných látek uvedených v seznamu látek připuštěných k přepravě v plavidle podle 1.16.1.2.5.

Pro každou nakládací operaci je třeba vzít v úvahu skutečná plnění a zaplavení nákladních cisteren, balastních nádrží a komor, nádrží na pitnou vodu a na odpad a nádrží obsahujících produkty pro provoz plavidla, plavidlo musí splňovat požadavky na nepoškozenou a poškozenou stabilitu.

Mezistavy během operací musí být též vzaty v úvahu.

Musí být prokázána dostatečná stabilita pro každou provozní, nakládací a balastní podmínku v příručce stability schválená relevantní klasifikační společností, která zařadila plavidlo. Jestli je to nepraktické pro předběžnou kalkulaci provozních, nakládacích a balastních podmínek, zařízení pro kontrolu naložení schválené uznanou klasifikační společností, která klasifikuje plavidlo, musí být instalováno a použito, které je uvedeno v příručce stability.

POZNÁMKA: *Knížka stability musí být ve formě srozumitelné pro odpovědného velitele a obsahovat následující údaje:*

Všeobecný popis plavidla:

- *Všeobecné uspořádání a plány kapacity udávající schválené použití oddílů a prostor (nákladní nádrže, sklady, ubytování atd.);*
- *Nákres uvádějící polohu značek ponoru ve vztahu ke kolmicím plavidla;*
- *Schéma podpalubních balastních čerpacích a ochranných systémů zaplavení;*
- *Hydrostatické křivky nebo tabulky odpovídající konstrukčnímu vyvážení, a pokud se významné vyvažovací úhly předpokládají během normálního provozu plavidla, křivky nebo tabulky odpovídající takovému stupni vyvážení musí být uvedeny;*
- *Příčné křivky nebo tabulky stability vypočtené na volném vyvažovacím základě, pro stupně přemístění a vyvážení předvídané v normálních provozních podmínkách, s uvedením objemu, který byl uvažován pro výtlak;*
- *Cisternové tabulky nebo křivky ukazující kapacity, těžiště a údaj o volném prostoru všech nákladních nádrží, balastních nádrží a komor, nádrží na pitnou vodu a odpadní vodu a nádrží obsahující produkty pro provoz plavidla;*
- *Nezbytné údaje (hmotnost a těžiště) vycházející z odchylné zkoušky nebo měření vlastní hmotnosti v kombinaci dílčím vážením hmotností nebo jinými přípustnými měřeními. Kde jsou výše uvedené informace odvozeny ze sesterského plavidla, odvolávka na sesterské plavidlo musí být jasně uvedena a kopie zprávy o schválené odchylné zkoušce relevantního sesterského plavidla musí být zahrnuta;*
- *Kopie zprávy o schválené zkoušce musí být zahrnuta do knížky stability;*
- *Provozní nakládací podmínky s relevantními podrobnými údaji, jako:*
 - *Nezbytné údaje, plnění nádrží, sklady, posádka a jiné relevantní části na palubě (hmotnost a těžiště každé relevantní části na palubě, momenty volného povrchu pro kapalné náklady);*
 - *Ponory středu plavidla a při kolmicích;*
 - *Metacentrická výška korigovaná pro účinek volných povrchů;*
 - *Hodnoty směrové páky a křivka;*
 - *Podélné ohybové momenty a smykové síly na čitelných bodech;*
 - *Informace o otvorech (umístění, typ těsnosti, prostředky uzávěrů); a*

- *Informace pro velitele.*

- *Výpočet vlivu balastní vody na stabilitu s informací, jestli pevně zabudované hladinoměry pro balastní nádrže a prostory musí být instalovány nebo jestli balastní nádrže nebo prostory musí být úplně plné nebo úplně prázdné, pokud je to jinak.*

9.3.3.13.4 Plovatelnost v poškozeném stavu musí být prokázána pro nejnepříznivější stav naložení. K tomuto účelu musí být předložen vypočtený důkaz dostatečné stability pro kritické mezistavy a pro konečný stav zaplavení.

9.3.3.14 Stabilita (v nepoškozeném stavu)

9.3.3.14.1 Pro plavidla s nezávislými nákladními tanky a pro konstrukce dvojitých stěn s nákladními tanky integrovanými do kostry plavidla musí být požadavky na stabilitu v nepoškozeném stavu vyplývající z výpočtu stability v poškozeném stavu plně dodrženy.

9.3.3.14.2 Pro plavidla s nákladními tanky o šířce větší než 0,70 B musí být podán důkaz, že byly dodrženy následující požadavky na stabilitu:

- (a) V pozitivní ploše křivky ramene stability až do zanoření prvního nevodotěsného otvoru musí být rameno stability (GZ) nejméně 0,10 m;
- (b) Obsah pozitivní plochy křivky ramene stability až do zanoření prvního nevodotěsného otvoru a v každém případě až do úhlu náklonu $\leq 27^\circ$ musí být nejméně 0,024 m.rad;
- (c) Výška metacentra (GM) musí být nejméně 0,10 m.

Tyto podmínky musí být splněny, přičemž je nutno pamatovat na vliv všech volných hladin v tancích pro všechny fáze nakládky a vykládky.

9.3.3.15 Stabilita (v poškozeném stavu)

9.3.3.15.1 Pro plavidla s nezávislými nákladními tanky a pro plavidla s dvojitou obšívkou s nákladními tanky spojenými s konstrukcí plavidla, musí být vzaty v úvahu pro poškozený stav následující předpoklady:

- (a) Rozsah poškození boku:

podélný rozsah: nejméně 0,10 L, avšak nejméně 5,00 m;
 příčný rozsah: 0,59 dovnitř od boku plavidla kolmo k podélné ose plavidla na úrovni roviny ponoru při maximálním ponoru nebo, pokud je to vhodné, vzdálenost povolenou oddílem 9.3.4, sníženou o 0,01 m;
 svislý rozsah: neohraničený od základní roviny vzhůru.

- (b) Rozsah poškození dna:

podélný rozsah: nejméně 0,10 L, avšak nejméně 5,00 m;
 příčný rozsah: 3,00 m;
 svislý rozsah: 0,49 m vzhůru od základny, kromě sacích jímek.

- (c) Všechny přepážky v oblasti poškození se považují za poškozené, což znamená, že umístění přepážek musí být voleno tak, aby se zajistilo, že plavidlo zůstane schopné plavby i po zaplavení dvou nebo více přímo za sebou ležících úseků v podélném směru.

Platí následující ustanovení:

- při poškození dna se považují za zaplavené i úseky ležící vedle sebe ve směru napříč plavidla;
- spodní hrana všech nevodotěsných otvorů (např. dveří, oken, palubních průlezů) musí být v konečné fázi zaplavení nejméně 0,10 m nad rovinou ponoru;
- všeobecně se musí počítat s 95 % rozsahem zatopení. Jestliže se pro některý oddíl výpočtem zjistí střední zatopení menší než 95 %, může se použít tato získaná vypočtená hodnota.

Musí se však použít následující minimální hodnoty:

- strojovny: 85 %;
- obytné prostory: 95 %;
- dvojitá dna, palivové tanky na naftu, balastní tanky atd. v závislosti na tom, zda podle své funkce musí být považovány za plné nebo prázdné pro plavidlo plující při maximálním dovoleném ponoru: 0 % nebo 95 %.

Pro hlavní strojovnu je třeba vzít v úvahu jen stav zaplavení jednoho úseku, tj. koncové přepážky strojovny se musí považovat za nepoškozené.

9.3.3.15.2

Náklon plavidla v rovnovážné poloze (konečná fáze zaplavení) nesmí přesahovat 12° . Otvory, které nejsou vodotěsné, se nesmějí zaplavovat před dosažením rovnovážné polohy. Pokud se takové otvory zanořují před touto polohou, musí se odpovídající prostory považovat pro účely výpočtu stability za zaplavené.

Nad rovnovážnou polohou musí mít pozitivní oblast křivky ramene stability rameno stability $\geq 0,05$ m ve spojení s plochou pod křivkou $\geq 0,0065$ m.rad. Minimální hodnoty stability musí být dodrženy až zanoření prvního nevodotěsného otvoru a v každém případě až do úhlu náklonu $\leq 27^\circ$. Pokud se nevodotěsné otvory zanořují před touto polohou, musí se odpovídající prostory považovat pro účely výpočtu stability za zaplavené.

9.3.3.15.3

Pokud jsou otvory, jimiž mohou být nepoškozené oddíly dodatečně zaplaveny, schopny být vodotěsně uzavřeny, musí být uzavírací zařízení odpovídajícím způsobem označena.

9.3.3.15.4

Je-li plavidlo opatřeno otvory pro přepouštění nebo zaplavení ke snížení asymetrického zaplavení, nesmí doba pro vyrovnání překročit 15 minut, pokud byla během mezistavů zaplavení prokázána dostatečná stabilita.

9.3.3.16 Prostory strojovny

- 9.3.3.16.1 Spalovací motory pro provoz plavidla jakož i spalovací motory pomocných strojů musí být umístěny mimo oblast nákladu. Přístup a další otvory do těchto prostor musí být umístěny v minimální vzdálenosti 2,00 m od oblasti nákladu.
- 9.3.3.16.2 Prostory strojovny musí být přístupné z paluby plavidla. Přístupy nesmí být nasměrovány k oblasti nákladu. Pokud nejsou dveře umístěny do výklenku, jehož hloubka odpovídá alespoň šířce dveří, musí být závěsy dveří obráceny k oblasti nákladu.
- 9.3.3.16.3 Poslední věta 9.3.3.16.2 neplatí pro kalová plavidla a plavidla pro zásobování pohonnými hmotami.

9.3.3.17 Obytné a provozní prostory

- 9.3.3.17.1 Obytné prostory a kormidelna musí ležet mimo oblast nákladu před první kolmou rovinou vpředu nebo za nejzazší kolmou rovinou vzadu pod palubou se nacházející části oblasti nákladu. Okna kormidelny, která jsou umístěna minimálně 1,00 m nad podlahou kormidelny, smí být nakloněna dopředu.
- 9.3.3.17.2 Přístupy k prostorám a otvorům v nástavbách nesmí být nasměrovány k oblasti nákladu. Závěsy dveří, které se otevírají směrem ven a nejsou umístěny do výklenku, jehož hloubka odpovídá alespoň šířce dveří, musí být obráceny k oblasti nákladu.
- 9.3.3.17.3 Přístupy z paluby a otvory vnitřních prostor do volného prostoru musí být možné uzavírat. Na přístupu do těchto prostor musí být připevněno následující upozornění:

**BĚHEM NAKLÁDKY, VYKLÁDKY A ODPLYNOVÁNÍ
NEOTEVÍRAT BEZ SVOLENÍ VELITELE PLAVIDLA.
OKAMŽITĚ OPĚT ZAVŘÍT.**

- 9.3.3.17.4 Vstupy a otevíratelná okna nástaveb a obytné prostory a také jiné otvory k těmto prostorám musí být vzdáleny minimálně 2,00 m od oblasti nákladu. Okna a dveře kormidelny smí být v rámci těchto 2,00 m umístěny jenom tehdy, pokud neexistuje přímé spojení mezi kormidelnou a obytnými prostory.
- 9.3.3.17.5
- (a) Hnací hřídele drenážních a balastních čerpadel v oblasti nákladu smí být vedeny skrze přepážku mezi provozním prostorem a strojovnou, pokud uspořádání provozních prostor odpovídá 9.3.3.11.6.
 - (b) Vedení hřídele přepážkou musí být provedeno plynotěsně a schváleno uznanou klasifikační společností.
 - (c) Připojení musí obsahovat potřebné provozní pokyny.
 - (d) V přepážce mezi strojovnou a provozním prostorem v oblasti nákladu a mezi strojovnou a úložným prostorem smí být umístěna vedení elektrických kabelů, vedení hydrauliky a potrubí pro měřicí, řídicí a signální zařízení, pokud jsou provedeny plynotěsně a jsou schváleny uznanou klasifikační společností. Vedení přepážkou, které je opatřeno protipožární izolací „A-60“ podle SOLAS 74, kapitola II-2, pravidlo 3, musí mít stejně hodnotnou protipožární izolaci.
 - (e) Přepážkou mezi strojovnou a provozním prostorem v oblasti nákladu smí být vedeno potrubí, pokud se přitom jedná o rozvody mezi strojním zařízením ve strojovně a v provozní prostory, které nemají v provozním prostoru žádné otvory.
 - (f) Bez ohledu na 9.3.3.11.4 smějí potrubí ze strojovny procházet provozním prostorem v oblasti nákladu nebo kofrdamem nebo úložným prostorem nebo prostorem dvojitých boků ven do volného prostoru za podmínky, že jsou tato potrubí uvnitř provozního prostoru nebo kofrdamu nebo úložného prostoru nebo prostoru dvojitých boků tlustostěnného typu a nemají žádné slepé příruby ani otvory.
 - (g) Pokud hnací hřídel pomocného stroje vede skrze stěnu, která je nad palubou, musí být toto provedení plynotěsné.
- 9.3.3.17.6 Provozní prostor, který se nachází pod palubou v oblasti nákladu, se nesmí používat jako prostor s čerpadly pro systém nakládky a vykládky, s výjimkou případů, kdy:
- Je prostor s čerpadly oddělený od strojovny nebo provozních prostor mimo oblast nákladu kofrdamem nebo přepážkou s izolací Třídy „A-60“, jak je popsáno v SOLAS 74, Kapitoly II-2, Ustanovení 3, nebo provozním nebo nákladovým prostorem;
 - Výše požadovaná přepážka „A-60“ nemá prolomení podle 9.3.1.17.5 (a);
 - Výstupní otvory větrání jsou rozmístěny ve vzdálenosti minimálně 6,00 m od vstupů a otvorů obytných prostor, kormidelny a provozních prostor mimo oblast nákladu;
 - Vstupní poklopy a větrací otvory jsou uzavíratelné zvenčí;

- Všechny nakládací a vykládací rozvody, jakož i rozvody jsou na sací straně čerpadla v místnosti s čerpadly přímo na přepážce vybaveny uzavíracími armaturami. Potřebná obsluha ovládacích zařízení v prostoru s čerpadly, spouštění čerpadel nebo kompresorů a regulace proudu tekutiny musí probíhat z paluby;
- Jímka prostoru s čerpadly je vybavena zařízením k měření stavu plnění, které spustí optický a akustický poplach v kormidelně, pokud se v jímce prostoru s čerpadly hromadí kapalina;
- Prostor s čerpadly je opatřen vestavěným zařízením pro detekci kyslíku, které automaticky ukazuje množství kyslíku, a které při dosažení koncentrace kyslíku 19,5% spustí viditelný a slyšitelný poplach. Čidla tohoto systému musí být umístěna ve vhodných polohách na podlaze a ve výšce 2,00 m. Měření musí probíhat nepřetržitě a musí být zobrazeno v blízkosti vchodu. Akustické a optické poplachové zařízení musí být instalovány v kormidelně a v prostoru s čerpadlem a při spuštění alarmu musí být systém nakládky a vykládky odstaven;
Porucha systému pro měření kyslíku musí spustit optický a akustický poplach v kormidelně a na palubě. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor;
- Ventilační systém předepsaný v 9.3.3.12.3 má dostatečnou kapacitu, aby zajistil minimálně 30 výměn vzduchu za hodinu na základě celkového objemu provozního prostoru.

Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, musí být místnost s čerpadlem také vybavena vestavěným systémem detekce plynů, který automaticky ukazuje přítomnost hořlavých plynů a aktivuje optický a akustický alarm, když koncentrace plynu dosáhne 20% dolní meze výbušnosti nákladu nebo 20% hodnoty dolní meze výbušnosti n-hexanu, podle toho, která hodnota je kritičtější.

Čidla tohoto systému detekce plynu musí být umístěna ve vhodných polohách ve spodní části a přímo pod palubou. Měření musí probíhat nepřetržitě a musí být zobrazeno v blízkosti vchodu.

Akustická a optická poplachová zařízení musí být instalována v kormidelně a v prostoru s čerpadlem a při spuštění alarmu musí být odstaven systém nakládky a vykládky;

Jakákoli porucha systému detekce plynu musí být okamžitě signalizována v kormidelně a na palubě optickým a akustickým varováním. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor.

9.3.3.17.7 Na vstupu do prostoru s čerpadly musí být připevněn následující nápis:

***Před vstupem do prostoru s čerpadly
přezkoušet nepřítomnost plynů a také dostatek kyslíku.
Dveře a vstupní otvory neotevírat bez svolení velitele plavidla.
Při poplachu ihned opustit prostor.***

9.3.3.17.8 9.3.3.17.5 (g), 9.3.3.17.6 s výjimkou stálého systému měření kyslíku a 9.3.3.17.7 neplatí pro plavidla typu N otevřená.

9.3.3.17.2, poslední věta, 9.3.3.17.3, poslední věta a 9.3.3.17.4 neplatí pro kalové čluny a zásobovací plavidla.

9.3.3.18 Zařízení pro plnění inertního plynu

V případě předepsaného vytvoření inertního prostředí nebo polštáře musí být na plavidle zařízení pro plnění inertním plynem.

Toto zařízení musí umět udržovat stálý minimální tlak 7 kPa (0,07 bar) v prostorech, ve kterých musí být vytvořeno inertní prostředí. Mimo to, činnost zařízení pro plnění inertním plynem nesmí vést ke zvyšování tlaku v nákladním tanku nad tlak, pro který jsou nastaveny ventily zvýšení tlaku. Tlak, pro který je nastaven vakuový ventil, musí být 3,5 kPa (0,035 bar).

Množství inertního plynu, nutného pro nakládku nebo vykládku, se musí přepravovat nebo vyrábět na palubě plavidla, pokud není možnost jeho obdržení ze břehu. Mimo to, na palubě plavidla se musí nacházet dostatečné množství inertního plynu pro doplnění běžných ztrát, ke kterým dochází během přepravy.

Prostory, ve kterých musí být vytvořeno inertní prostředí, musí být vybaveny přípojkami pro plnění inertním plynem a kontrolním zařízením, zajišťujícím stálou kontrolu potřebného prostředí.

Když tlak nebo koncentrace inertního plynu v plynné fázi se snižují pod zadanou hodnotu, musí

kontrolní zařízení dávat do kormidelny světelný a zvukový signál. Když v kormidelně není nikdo přítomen, poplachový signál musí, mimo to, být k dispozici v místě, kde je přítomen jeden ze členů posádky.

9.3.3.19 (Vyhrazeno)

9.3.3.20 **Zařízení kofrdamů**

9.3.3.20.1 Kofrdamy nebo oddělení kofrdamů, které zůstaly po vybavení provozního prostoru v souladu s 9.3.3.11.6, musí být přístupny přes vstupní otvor.

9.3.3.20.2 Musí být možné, pomocí čerpadla kofrdamy naplnit vodou a vodu zase odčerpat. Naplnění musí proběhnout během 30 minut. Tyto požadavky nejsou zapotřebí, jestliže přepážka mezi strojovnou a kofrdamem je opatřena protipožární izolací podle „A-60“ podle SOLAS 74, kapitola II-2, pravidlo 3, nebo pokud je kofrdam zřízen jako provoní prostor.

Kofrdamy nesmějí být vybaveny napouštěcím ventilem.

9.3.3.20.3 Kofrdamy nesmí být spojeny pevným potrubím s jiným potrubím na plavidle, které je umístěno mimo oblast nákladu.

9.3.3.20.4 Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, musí být větrací otvory kofrdamů vybaveny pojistkou proti prošlehnutí plamene, která je schopná odolat deflagraci. Pojistky proti prošlehnutí plamene musí být voleny podle skupin/podskupin výbušnosti látek, které mají být zahrnuty do seznamu látek na nádobě (viz sloupec (16) tabulky C kapitoly 3.2).

9.3.3.20.5 9.3.3.20.2 výše se nevztahuje na kalové čluny a zásobovací plavidla.

9.3.3.21 **Bezpečnostní a kontrolní zařízení**

9.3.3.21.1 Každý nákladní tank musí být opatřen:

- (a) vnitřní značkou pro stupeň plnění na 97 %;
- (b) přístrojem, který ukazuje úroveň hladiny;
- (c) přístrojem, který upozorňuje na úroveň hladiny nejpozději při naplnění na 90 %;
- (d) čidlem mezní hodnoty, které spustí bezpečnostní pojistku proti přeplnění nejpozději při naplnění na 97,5 %;
- (e) zařízením na měření tlaku plynné fáze v nákladním tanku;
- (f) přístrojem pro měření teploty nákladu, je-li ve sloupci (9) tabulky C kapitoly 3.2 požadováno zařízení pro ohřev nákladu nebo se vyžaduje možnost ohřevu nákladu na palubě, nebo je-li uvedena maximální teplota ve sloupci (20) tabulky C kapitoly 3.2;
- (g) přípojkou pro připojení zařízení pro odběr vzorků uzavřeného nebo částečně uzavřeného typu, a/nebo alespoň jedním otvorem pro odběr vzorků, jak je požadováno ve sloupci (13) tabulky C kapitoly 3.2. Přípojka musí být vybavena uzavíracím zařízením odolným vůči vnitřnímu tlaku v připojení.;

Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, musí být pojistka proti zpětnému prošlehnutí plamene v otvoru pro odběr vzorků způsobilá odolat trvalému hoření volena podle skupin/podskupin výbušnosti látek, které mají být zahrnuty do seznamu látek na nádobě (viz sloupec (16) tabulky C kapitoly 3.2).

9.3.3.21.2 Stupeň naplnění v % musí být zjištělný s přesností na 0,5 %. Vztahuje se na obsah celého nákladního tanku včetně expanzní šachty.

9.3.3.21.3 Přístroj, který ukazuje úroveň hladiny, musí být možné sledovat z místa obsluhy uzavíracích prvků příslušného nákladního tanku. Nejvýše přípustnou hladinu naplnění 95 % a 97 %, uvedenou v seznamu látek, je nutno uvádět na každém ukazateli úrovně.

Hodnoty přetlaku a vakua musí být viditelné v jakoukoliv dobu z toho místa, odkud je možné přerušit nakládku nebo vykládku. Maximálně přípustná hodnota přetlaku nebo vakua musí být vyznačena na každém ukazateli.

Údaje přístrojů musí být viditelné při každých povětrnostních podmínkách.

9.3.3.21.4 Výstražný přístroj úrovně hladiny, který spouští akustický a optický signál, musí být nezávislý na přístroji, který ukazuje úroveň hladiny.

- 9.3.3.21.5 (a) Čidlo mezních hodnot podle 9.3.3.21.1 (d) spouští akustický a optický signál na palubě plavidla a zároveň aktivuje elektrický kontakt, který v podobě binárního signálu přerušuje tok proudu z břehového zařízení a na břehu zavede opatření proti přetečení při nakládce. Signál musí být možné na břeh předat pomocí dvoupólového vodotěsného přístrojového konektoru zařízení, které zapojuje spoje podle normy EN 60309-2:1999+A1:2007+A2:2012 pro stejnosměrný proud 40 až 50 V, barva označení bílá, poloha pomocného nosu šroubu 10 h.
- Zásuvka musí být instalována v bezprostřední blízkosti břehového zapojení nakládacího a vykládacího potrubí na plavidle.
- Čidlo mezních hodnot musí být také schopné vypnout vlastní vykládací čerpadlo.
- Čidlo mezních hodnot musí být nezávislé na přístroji, který upozorňuje na úroveň hladiny, smí však být spojeno s přístrojem, který ukazuje úroveň hladiny.
- (b) Na kalových plavidlech musí čidlo mezní hodnoty podle 9.3.3.21.1 (d) vyvolat optický a akustický signál a vypnout čerpadlo, které se používá k odsávání vody z nádní.
- (b) Plavidla pro zásobování pohonnými hmotami a jiná plavidla, která mohou dodávat nutné pro provoz plavidla zásoby, musí být vybavena podle Evropské normy EN 12827:1999 vykládacím systémem a mít rychlouzavírací zařízení, kterým tankování může být přerušeno. Toto rychlouzavírací zařízení musí být uváděno do činnosti pomocí elektrického signálu, který je podáván ze systému, zajišťujícího zamezení přelivu. Elektrické okruhy, uvádějící do činnosti rychlouzavírací zařízení, musí být zajištěno podle principu klidového proudu nebo s pomocí jiných odpovídajících způsobů zjištění chyb. Pracovní funkčnost elektrických okruhů, které nelze řídit na základě principu klidového proudu, musí být lehce kontrolovatelná.
- Musí být zajištěna možnost uvedení do činnosti rychlouzavírací zařízení, nezávisle od elektrického signálu.
- Rychlouzavírací zařízení musí uvádět do činnosti akustický a optický signál na plavidle.
- (d) Během vykládky pomocí čerpadla na plavidle musí být možno čerpadlo vypnout z břehového objektu. K tomuto účelu musí být nezávislé, samo o sobě bezpečné silnoproudé vedení, napájené plavidlem, vypnuto z břehového objektu pomocí elektrického kontaktu.
- Musí být možné přenést binární signál z břehového objektu pomocí vodotěsné dvoupólové zásuvky nebo konektorového zařízení podle normy EN 60309-2:1999+A1:2007+A2:2012, pro stejnosměrný proud 40 až 50 voltů, identifikační barva bílá, poloha pomocného nosu šroubu 10 h.
- Tato zásuvka musí být trvale namontována na plavidle v blízkosti napojení vykládacích potrubí.
- 9.3.3.21.6 Optické a akustické signály přístroje, který upozorňuje na úroveň hladiny, a čidla mezních hodnot se od sebe musí zřetelně odlišovat.
- Optické signály musí být vidět na každém obslužném místě uzavíracích armatur nákladních tanků. Funkce měřicího čidla a elektrického obvodu musí být lehce kontrolovatelná nebo musí stačit provedení "failsafe".
- 9.3.3.21.7 Jestliže tlak nebo teplota překročí stanovenou hodnotu, musí přístroje pro měření podtlaku nebo přetlaku plynné fáze v nákladním tanku nebo teploty nákladním tanku aktivovat optický a akustický poplach v kormidelně a na palubě. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor.
- Jestliže tlak během nakládky a vykládky překročí stanovenou hodnotu, musí přístroj pro měření tlaku pomocí konektoru uvedeného výše v 9.3.3.21.5 okamžitě spustit elektrický kontakt, který spustí opatření k přerušení nakládky nebo vykládky. Pokud se používá vlastní vypouštěcí čerpadlo plavidla, musí být automaticky vypnuto.
- Přístroj pro měření podtlaku nebo přetlaku musí spustit alarm nejdříve v momentě, kdy:
- (c) Když je přetlak roven 1,15 násobku otevíracího tlaku přetlakových ventilů/vysokorychlostních odvodušňovacích ventilů; nebo
- (d) Je dosaženo spodního prahu hodnoty konstrukčního tlaku podtlakových ventilů, avšak podtlak nepřesahuje 5 kPa (0,05 bar).
- Maximální přípustná teplota je uvedena ve sloupci (20) tabulky C kapitoly 3.2. Čidla pro alamy uvedené v tomto odstavci mohou být připojeny k poplachovému zařízení čidla.

Je-li to předepsáno ve sloupci (20) tabulky C kapitoly 3.2, musí přístroj pro měření přetlaku plynné fáze v nákladním tanku spustit optický a akustický poplach v kormidelně, pokud přetlak během plavby překročí 40 kPa (0,4 bar). Pokud se poplach nevypne, musí být automaticky předán do obytných prostor; Musí být možné odečítat měřidla v bezprostřední blízkosti ovládacího systému postřikových zařízení.

9.3.3.21.8 Pokud se ovládací prvky uzavíracích armatur nákladních tanků nachází v řídicím prostoru, musí být možné odpojení nákladních čerpadel z tohoto místa řízení, údaje ukazatele úrovně musí být viditelné na místě řízení a světelné a zvukové poplachové signály, které podává havarijně-poplachový signál úrovně čidlem vysoké úrovně podle 9.3.3.21.1 (d), a přístroji pro měření tlaku a teploty nákladu, musí být vidět a slyšet na místě řízení a na palubě.

Musí být zajištěn dohled na oblast nákladu z kontrolního prostoru.

9.3.3.21.9 Pododdíly 9.3.3.21.1 (e), 9.3.3.21.7 pokud jde o měření tlaku, se nevztahuje na otevřený typ N s pojistkou proti zpětnému šlehnutí plamene a na otevřený typ N.

Pododdíly 9.3.3.21.1 (b), (c) a (g), 9.3.3.21.3 a 9.3.3.21.4 se nevztahují na sběrná pravidla pro olejový odpad a na zásobovací pravidla.

Pojistka proti prošlehnutí plamene na otvorech pro odběr vzorků se nevyžadují na plavidlech otevřeného typu N.

Pododdíly 9.3.3.21.1 (f) a 9.3.3.21.7 se nevztahují na zásobovací pravidla.

Pododíl 9.3.3.21.5 (a) se nevztahuje na sběrná pravidla pro olejový odpad.

9.3.3.21.10 V případě přepravy chlazených látek se určuje tlak poplachového systému konstrukcí nákladních tanků. V případě přepravy látek, které se musí přepravovat v chlazeném stavu, musí tlak funkčního poplachového systému být vyšší nejméně o 25 kPa (0,25 bar) maximálního tlaku vypočítaného v souladu s 9.3.3.27.

9.3.3.22 **Otvory nákladních tanků**

9.3.3.22.1 (a) Otvory nákladních tanků se musí nacházet nad palubou plavidla v oblasti nákladu

(b) Otvory nákladních tanků s příčným průřezem větším než $0,10 \text{ m}^2$ ^a otvory bezpečnostních zařízení, které zabraňují nepřipustným přetlakům, se musí nacházet minimálně 0,50 m nad palubou.

9.3.3.22.2 Otvory nákladních tanků musí být opatřeny plynotěsnými uzávěry, které vydrží zkušební tlak podle 9.3.3.23.2.

9.3.3.22.3 Uzávěry, které se za normálních okolností používají během nakládky a vykládky, nesmí při své činnosti vytvářet žádné jiskry.

9.3.3.22.4 Každý nákladní tank nebo skupina nákladních tanků připojených ke společnému odvětrávacímu potrubí musí být vybaven:

Typ N otevřený:

– Zařízením pro prevenci nepřipustného přetlaku nebo podtlaku a musí být navržen tak, aby se zabránilo jakémukoliv hromadění vody a pronikání vody do nákladního tanku.

Typ N otevřený s pojistkou proti průniku plamene:

– Zařízení pro prevenci nepřipustného přetlaku nebo podtlaku, která jsou vybavena zachycovači plamene, které jsou schopné odolat trvalému hoření a jsou zkonstruovány tak, aby se zabránilo jakémukoliv hromadění vody a pronikání vody do nákladního tanku.

Typ N uzavřený:

(a) Spojení pro bezpečný návrat plynů uvolňovaných při nakládce na břeh;

(b) Bezpečné zařízení pro uvolnění tlaku pro nákladní tanky, na kterých poloha uzavíracího ventilu zřetelně ukazuje, zda je otevřený nebo zavřený;

(c) Pojistné ventily pro prevenci nepřijatelného přetlaku nebo podtlaku;

Otvírací tlak pojistných ventilů musí být na ventilech nesmazatelně vyznačen;

(d) V případě, že seznam látek na plavidle podle 1.16.1.2.5 bude obsahovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, potom:

- V přípojce na každý nákladní tank musí být odvětrávací potrubí vybaveno pojistkou proti prošlehnutí plamene, která je schopna odolat detonaci;
- Podtlakový ventil a zařízení pro bezpečné snižování tlaku pro nákladních tanky musí být bezpečné proti prošlehnutí plamene. Deflagrační bezpečnost může být zajištěna také pojistkou proti prošlehnutí plamene; a
- Zařízení pro uvolnění přetlaku musí být navrženo jako vysokorychlostní větrací ventil, s vývodem plynů směrem nahoru;

Nastavení přetlakových ventilů musí být takové, aby během přepravy nedošlo k vypuštění až do dosažení maximálního přípustného provozního tlaku nákladních tanků;

Systémy autonomní ochrany musí být vybrány podle skupin/podskupin výbuchu látek uvedených v seznamu látek na plavidle (viz sloupec (16) tabulky C kapitoly 3.2).

Jestliže se požaduje, aby vysokorychlostní větrací ventil, podtlakový ventil, pojistka proti prošlehnutí plamene a odvětrávací potrubí byly vyhřívatelné pro přepravu, příslušná bezpečnostní zařízení musí být vhodná pro příslušnou teplotu;

Otevírací tlak přetlakových ventilů, podtlakového ventilu a vysokorychlostního větrací ventilu musí být na ventilech nesmazatelně vyznačeny;

Pokud se uzavírací zařízení má montovat mezi odvětrávací potrubí a nákladní tank, musí být umístěno mezi nákladním tankem a zachycovačem plamene, a každý nákladní tank musí být vybaven pojistnými ventily;

- (e) Vývody zařízení pro uvolňování přetlaku / vysokorychlostních větracích ventilů musí být umístěny ne méně než 2,00 m nad palubou a ve vzdálenosti ne méně než 6,00 m od otvorů obytných prostor, kormidelny a provozních prostor mimo oblast nákladu. Tam, kde není žádné zařízení a kde se neprovádí žádná práce v okruhu 1,00 m okolo výstupu přetlakového ventilu, může být tato výška snížena na 1,00 m. Tato oblast musí být označena jako nebezpečná zóna.

9.3.3.22.5 *Odvětrávací potrubí*

- (a) Pokud jsou ke společnému odvětrávacímu potrubí připojeny dva nebo více nákladní tanky, je dostačující, že je na společném odvětrávacím potrubí nainstalováno zařízení podle 9.3.3.22.4 (pojistné ventily pro prevenci nepřijatelného přetlaku a podtlaku, vysokorychlostní větrací ventil, podtlakový ventil chráněné proti deflagracím, bezpečnostní přetlakové zařízení pro nákladní tanky chráněné proti deflagracím) (viz 7.2.4.16.7);
- (b) Jestliže je každý nákladní tank napojen na vlastní odvětrávací potrubí, každý nákladní tank nebo související odvětrávací potrubí musí být vybaven podle 9.3.3.22.4.

9.3.3.22.6 9.3.3.22.2 a 9.3.3.22.5 neplatí pro typ N otevřená s pojistkami proti průniku plamenů a typ N otevřená.
9.3.3.22.3 neplatí pro typ N otevřená.

9.3.3.23 *Tlaková zkouška*

9.3.3.23.1 Nákladní tanky, zbytkové tanky, kofrdamy, nakládací a vykládací potrubí, s výjimkou sacího potrubí, musí být před uvedením do provozu přezkoušeny a dále pak musí být přezkušovány pravidelně v rámci předepsaných termínů.

Pokud v nákladních tancích existuje ohřevný systém, musí být před uvedením do provozu přezkoušeny hadice topení a potom musí být přezkušovány pravidelně v rámci předepsaných termínů.

9.3.3.23.2 Zkušební tlak nákladních tanků včetně zbytkových musí činit minimálně 1,3násobek provozního tlaku. Zkušební tlak kofrdamů a otevřených nákladních tanků nesmí být nižší 10 kPa (0,10 barů) přetlaku.

9.3.3.23.3 Zkušební tlak nakládacích a vykládacích potrubí musí být minimálně 1000 kPa (10 barů) přetlaku.

9.3.3.23.4 Maximální termín pro opakované zkoušky činí jedenáct let.

9.3.3.23.5 Metoda tlakové zkoušky musí odpovídat předpisům, které byly vydány příslušným orgánem nebo uznanou klasifikační společností.

9.3.3.24 *Regulace tlaku a teploty látek*

9.3.3.24.1 Když celý systém udržení látek není vypočítán pro to, aby vydržel plný efektivní tlak páry nákladu v homích limitech výpočetních teplot okolního prostředí, tak tlak v tancích musí být udržován na úrovni

níže maximálně přípustného tlaku činnosti pojistných ventilů za pomoci jednoho nebo více následujících prostředků:

- (a) systém pro regulaci tlaku v nákladních tancích využívající mechanické chlazení;
- (b) systém zajišťující bezpečnost v případě ohřevu nebo zvýšení tlaku nákladu. Izolace nebo výpočetní tlak nákladního tanku, nebo součin těchto dvou hodnot musí být takový, aby zůstávala dostatečná rezerva pevnosti s ohledem na dobu použití a předpokládaných teplot; v každém případě tento systém musí být považován za přijatelný uznanou klasifikační společností a musí zajišťovat bezpečnost v průběhu doby, delší nejméně trojnásobně lhůty doby provozu;
- (c) jiné systémy, které se považují za použitelné uznanou klasifikační společností.

9.3.3.24.2 Systémy předepsané v 9.3.3.24.1 musí být vyráběny, instalovány a kontrolovány tak, aby toto uznala klasifikační společnost. Materiály použité při jejich konstrukci, musí být kompatibilní s přepravovaným nákladem. V normálních podmínkách provozu horní hodnoty vypočtených teplot okolního prostředí musí být:

vzduch: + 30 °C;
voda: + 20 °C.

9.3.3.24.3 Systém ochrany nákladu musí být schopen snášet plný tlak par nákladu v horních vypočtených mezních teplot okolního prostředí, nezávisle na systému vybraného odpařovacího se plynu. Tento předpis je uveden formou poznámky 37 v sloupci (20) tabulky C kapitoly 3.2

9.3.3.25 Čerpadla a rozvody

9.3.3.25.1 (a) Čerpadla a příslušné nakládací a vykládací potrubí se musí nacházet v oblasti nákladu.
(b) Nakládací čerpadla musí být možné vypínat z oblasti nákladu a dále z místa mimo tuto oblast.
(c) Nakládací čerpadla na palubě musí být umístěna minimálně 6,00 m od přístupů nebo otvorů obytných a provozních prostor, které jsou umístěny mimo oblast nákladu.

9.3.3.25.2 (a) Nakládací a vykládací potrubí musí být nezávislé na jakýchkoliv jiných potrubích na plavidle. Pod palubou, s výjimkou vnitřku nákladních tanků a prostor s čerpadly, nesmí být žádné nakládací a vykládací potrubí.

(b) Nakládací a vykládací potrubí musí být uspořádáno tak, aby při nakládce nebo vykládce v nich obsažená kapalina byla bezpečně odstraněna a mohla vtéci zpět buď do nákladních tanků nebo tanků na břehu.

(c) Nakládací a vykládací potrubí se od ostatních musí odlišovat, například barevným označením.

(d) (Vyhrazeno)

(e) Břehové přípojky musí být od přístupů a otvorů obytných a také provozních prostor, ležících v oblasti nákladu, vzdáleny minimálně 6,00 m.

(f) Všechny břehové přípojky odvětrávacího potrubí, nakládacích a vykládacích potrubí, kterými se nakládá a vykládá, musí být opatřena uzavírací armaturou a rychlouzavíracím ventilem. Všechny břehové přípojky musí být zaslepeny přírubou, pokud nejsou v provozu.

(g) (Vypuštěno)

(h) Nakládací a vykládací potrubí a rovněž odvětrávací potrubí nesmí mít ohebná spojení s pohyblivými spojkami.

9.3.3.25.3 (Vypuštěno)

9.3.3.25.4 (a) Všechny jednotlivé součásti nakládacích a vykládacích potrubí musí být spojeny elektrickým vodičem s trupem plavidla.

(b) Nakládací potrubí musí být přivedeno až k podlaze nákladních tanků.

9.3.3.25.5 Musí být patrné, zda uzavírací armatury nebo jiná uzavírací zařízení nakládacích a vykládacích potrubí jsou zavřené nebo otevřené.

9.3.3.25.6 Nakládací a vykládací potrubí musí při zkušebním tlaku vykazovat potřebnou elasticitu, nepropustnost a odolnost tlaku při zkušebním tlaku.

9.3.3.25.7 Nakládací-vykládací potrubí musí být vybaveno přístroji pro měření tlaku, umístěná na výpusti čerpadel. Úroveň maximálně přípustného přetlaku nebo vakua musí být označen na každém zařízení. Údaje přístrojů musí být viditelné při jakýchkoliv meteorologických podmínkách.

9.3.3.25.8 (a) Pokud má být nakládacím a vykládacím systémem vedena voda k mytí tanků nebo balastní voda do nákladních tanků, musí se potřebná zapojení pro sání nacházet v prostoru nákladu, avšak mimo nákladní tanky.

Čerpadla, která slouží systémům k mytí tanků, s příslušnými zapojeními mohou být umístěna mimo oblast nákladu, pokud je tlaková část tohoto systému konstruována takovým způsobem, že tímto potrubím nelze sát.

Pomocí pružinového zpětného ventilu se musí zajistit, aby se plyny nedostaly skrze mycí systém do prostoru mimo oblast nákladu.

(b) Potrubí, které je určeno pro odsátí vody, musí být na místech spojení s nakládacím potrubím opatřeno zpětným ventilem.

9.3.3.25.9 Přípustné výkony nakládky a vykládky na tankových plavidlech typu N uzavřené musí být vypočteny.

Tyto výpočty se vztahují na maximálně přípustné výkony nakládky a vykládky na každý nákladní tank nebo skupiny nákladních tanků, dle dimenzování větracího systému. U těchto propočtů má být zohledněno, že při neočekávaném uzavření plynového zpětného potrubí u zařízení na běhu bezpečnostní zařízení v nákladních tankách zamezí tomu, že tlak v nákladních tankách překročí následně uvedené hodnoty:

přetlak: 1,15 násobek otevíracího tlaku přetlakového ventilu/vysokorychlostního větracího ventilu;

podtlak: ne více než je konstrukční tlak, avšak nejvýše podtlak 5 kPa (0,05 barů).

Zvláště je třeba zohlednit následující faktory:

1. Rozměry větracího systému nákladních tanků;
2. Tvorba plynů během nakládky: tato je zohledněna vynásobením nejvyššího výkonu nakládky faktorem minimálně 1,25;
3. Hustota směsi par z nákladu, založení na směsi 50 obj.% páry a 50 obj.% vzduchu;
4. Ztráta tlaku ve větracím potrubí a ventilech a fitinkách. Zde se musí počítat se znečištěním ve výši 30 % pojistek proti průniku plamenů;
5. Nastavení přetlaku a podtlaku u bezpečnostních ventilů.

Pokyny týkající se maximálních přípustných nakládacích a vykládacích výkonů pro každý nákladní tank nebo každou skupinu nákladních tanků, musí být na palubě.

9.3.3.25.10 Stlačený vzduch produkovaný mimo oblast nákladu může být používán v oblasti nákladu, pokud je nainstalován pružinový zpětný uzávěr, aby se zajistilo, že žádné plyny nemohou uniknout z oblasti nákladu prostřednictvím systému stlačeného vzduchu do obytných prostor, kormidelní nebo provozních prostorů mimo oblast nákladu.

9.3.3.25.11 Pokud plavidlo přepravuje více nebezpečných látek, které vzájemně mohou vytvořit nebezpečnou reakci, musí být pro každou látku zvláštní čerpadlo a příslušné nakládací a vykládací potrubí. Potrubí nesmí být vedeno nákladním tankem, který obsahuje nebezpečné látky, se kterými by látka mohla reagovat.

9.3.3.25.12 9.3.3.25.1 (a) a (c), 9.3.3.25.2 (a), poslední věta a (e) a 9.3.3.25.4 (a) neplatí pro typ N otevřená, s výjimkou typ N otevřená, které přepravují látky s žíravými vlastnostmi (viz 3.2 tabulka C sloupec (5), nebezpečí 8).

9.3.3.25.4 (b) neplatí pro Typ N otevřená.

9.3.3.25.2 (f), poslední věta 9.3.3.25.2 (g), 9.3.3.25.8 (a), poslední věta a 9.3.3.25.10 neplatí pro kalové čluny a zásobovací plavidla.

9.3.3.25.9 neplatí pro kalové čluny.

9.3.3.25.2 (h) neplatí pro zásobovací plavidla.

9.3.3.26 Tanky na zbytky nákladu a nádoby na zbytky produktů

9.3.3.26.1 Jsou-li plavidla vybavena tanky na zbytky produktů nebo nádobami na zbytky produktů, musí být umístěny v oblasti nákladu a musí splňovat ustanovení 9.3.3.26.2 a 9.3.3.26.3. Nádoby na zbytky produktů musí být umístěny pouze v oblasti nákladu na palubě a ne méně než jednu čtvrtinu šířky plavidla od vnějšího pláště.

9.3.3.26.2 Tanky na zbytky produktů musí mít následující vybavení:

V případě otevřeného systému:

- Měřicí otvor;
- Přípojky s uzavíracími armaturami pro potrubí a soustavy hadic;
- Zařízení vyrovnávající tlaky.

V případě otevřeného systému s pojistkou proti průniku plamene:

- Měřicí otvor;
- Přípojky s uzavíracími armaturami pro potrubí a soustavy hadic;
- Zařízení vyrovnávající tlaky, zabezpečené proti průniku plamene, které je schopno odolávat trvalému hoření.

V případě uzavřeného systému:

(a) Ukazatel úrovně hladiny;

- Přípojky s uzavíracími armaturami pro potrubí a soustavy hadic;
- Podtlakový ventil a přetlakový ventil;

Přetlakový ventil musí být dimenzován tak, aby se během přepravy při normálním provozu neotevřel. Tato podmínka je splněna, když otevírací tlak ventilu splňuje podmínky vyžadované ve sloupci (10) tabulky C kapitoly 3.2 pro přepravovanou látku;

(b) V případě, že seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 bude obsahovat látky, které vyžadují ochranu proti explozi v souladu se sloupcem (17) tabulky C kapitoly 3.2, potom pojistný ventil musí být vysokorychlostní větrací ventil a podtlakový ventil musí být deflagračně bezpečný. Deflagrační bezpečnost může být zajištěna také pojistkou proti průniku plamene;

Vysokorychlostní větrací ventil a podtlakový ventil s deflagrační bezpečností musí být vybrán podle skupin/podskupin výbuchu látek uvedených v seznamu látek na plavidle (viz sloupec (16) tabulky C kapitoly 3.2).

Maximální přípustná kapacita je 30 m³.

9.3.3.26.3 Nádrže na zbytky produktů musí mít následující vybavení:

- Možnost indikace stupně naplnění;
- Přípojky s uzavíracími armaturami pro potrubí a soustavy hadic;

Spojení umožňující bezpečný odvod plynů uvolňovaných během plnění.

9.3.3.26.4 (Vypuštěno)

9.3.3.26.5 9.3.3.26.1, 9.3.3.26.2 (poslední věta) a 9.3.3.26.3 se nevztahuje na kalová plavidla.

9.3.3.27 Chladicí systém

9.3.3.27.1 Chladicí systém podle 9.3.3.24.1 (a), musí být z jednoho nebo několika bloků, schopných udržovat tlak a teplotu nákladu na předepsané úrovni při horních hodnotách vypočtené teploty okolního prostředí. Nebude-li zvažován jakýkoliv jiný prostředek pro regulování tlaku a teploty nákladu, který se považuje za dostatečný uznanou klasifikační společností, musí být zvažováno s jedním nebo několika záložními bloky s kapacitou, která je nejméně rovná kapacitě největšího předepsaného bloku. Záložní blok musí obsahovat kompresor, jeho hnací jednotku, jeho řídicí zařízení a všechny pomocné mechanismy nutné pro to, aby mu bylo umožněno pracovat nezávisle na blocích, používaných při normálních podmínkách. Musí být zajištěn náhradní výměník tepla pro případ, kdy nadbytečná kapacita normálního výměníku tepla tohoto systému nepředstavuje nejméně 25 % nejvyšší předepsané kapacity. Není nutné uvažovat se zvláštním potrubím.

Nákladní tanky, potrubí a příslušenství musí být izolovány tak, aby v případě výpadku všech systémů si všechny náklad zachovával nejméně v průběhu 52 hodin teplotu nezpůsobující otevření pojistného

ventilu.

- 9.3.3.27.2 Pojistná zařízení a spojovací potrubí chladicího systému musí být připojeny k nákladním tankům nad kapalnou fází nákladu, když jsou tanky naplněny do svého maximálního stupně plnění. Musí se nacházet v oblasti plynné fáze, i když náklon plavidla dosahuje 12°.
- 9.3.3.27.3 Když se různé náklady potřebující chlazení, jejichž chemická reakce může být nebezpečnou, přepravují společně, tak je nutno chladicímu systému věnovat zvláštní pozornost s cílem zamezit smíchání nákladu. V případě přepravy těchto nákladů musí být zabezpečeny oddělené chladicí systémy, z nichž každý musí obsahovat plný rezervní blok podle 9.3.3.27.1. Přitom, když se chlazení zajišťuje ne přímým, ale společným systémem a když průtok v tepelných výměnících v žádných předvídatelných situacích nemůže způsobit smíchání nákladu, tak není nutno zvažovat s rozdělenými chladicími bloky pro různé náklady.
- 9.3.3.27.4 Když se různé náklady potřebující chlazení nemohou jeden v druhém vzájemně rozpouštět, za podmínky přepravy tím způsobem, že tlak jejich par se sčítá při smíchání, je nutno systémům chlazení věnovat zvláštní pozornost, aby nedošlo k možnému smíchání nákladů.
- 9.3.3.27.5 V těch případech, kdy chladicí systémy vyžadují pro chlazení vodu, tak musí být podávána v dostatečném množství pomocí čerpadla nebo čerpadel, využívaných výhradně pro tyto účely. Toto čerpadlo nebo tato čerpadla musí mít nejméně dvě potrubí pro nasávání vody, připojené ke dvěma vodním přívodům, jedno na levém boku a jedno na pravém boku. Musí být k dispozici rezervní čerpadlo o dostatečné kapacitě; toto čerpadlo se může rovněž využívat i pro jiné účely s podmínkou, že jeho použití s cílem dodávky vody pro chlazení nepřekáží jiné základní práci.
- 9.3.3.27.6 Chladicí systém může mít jednu z následujících forem:
- (a) Přímý systém: páry nákladu se stlačují, kondenzují a vrací se do nákladního tanku. V případě některých nákladů, uvedených v tabulce C kapitoly 3.2, nesmí se tento systém používat. Tento požadavek je uveden formou poznámky 35 ve sloupci (20) tabulky C kapitoly 3.2.
 - (b) Nepřímý systém: náklad nebo páry nákladu se ochlazují nebo kondenzují za pomoci chladicího média, ale nestlačují se.
 - (c) Smíšený systém: páry nákladu se stlačují a kondenzují v tepelných výměnících náklad/ chladicí médium a vrací se do nákladních tanků. V případě některých nákladů, uvedených v tabulce C kapitoly 3.2, se nesmí tento systém používat. Tento požadavek je uveden formou poznámky 36 ve sloupci (20) tabulky C kapitoly 3.2.
- 9.3.3.27.7 Všechna primární a sekundární chladicí média musí být kompatibilní jeden s druhým a s nákladem, se kterým mohou přijít do styku. Tepelná výměna může probíhat buď v určité vzdálenosti od nákladního tanku nebo za využití chladicího šneku, umístěného uvnitř nebo vně nákladního tanku.
- 9.3.3.27.8 V těch případech, kdy chladicí systém je umístěn v odděleném provozním prostoru, tak tento provozní prostor musí odpovídat požadavkům v 9.3.3.17.6.
- 9.3.3.27.9 Pro všechny nákladní systémy součinitel prostupu tepla, používaný pro určení udržovací doby (7.2.4.16.16 a 7.2.4.16.17) se určuje výpočtem. Po ukončení stavby plavidla se správnost ukončení výpočtů prověřuje cestou zkoušky pro určení tepelné rovnováhy. Výpočet a zkoušky se provádějí pod dohledem uznané klasifikační společnosti, která dané plavidlo klasifikovala.
- Součinitel prostupu tepla musí být uveden v dokumentu uschovaném na palubě. Součinitel prostupu tepla se prověřuje při každé obnově schvalovacího osvědčení.
- 9.3.3.27.10 Osvědčení vydávané uznanou klasifikační společností potvrzující dodržení předpisů v 9.3.3.24.1 až 9.3.3.24.3, 9.3.3.27.1 a 9.3.3.27.4 uvedených výše, musí se předkládat spolu se žádostí o vydání nebo obnovu schvalovacího osvědčení.

9.3.3.28 Postřikové zařízení

Pokud je v sloupci (9) tabulky C kapitoly 3.2 požadován postřik, musí být plavidlo v oblasti nákladu na palubě opatřeno postřikovým zařízením, kterým může být paluba nákladních tanků chlazená, aby se bezpečně zamezilo reakci přetlakových ventilů/vysokorychlostních větracích ventilů při 10 kPa nebo jak je nastaveno.

Trysky musí být zapojeny tak, aby se zajistilo plné smočení paluby nákladních tanků resp. aby bezpečně byly sraženy uvolněné plyny.

Zařízení musí být spustitelné z kormidely a z paluby. Kapacita postřikového zařízení musí být rozložena přinejmenším tak, aby při současném používání všech trysek bylo dosaženo 50 litrů za hodinu na 1 m² pokryté palubní plochy v oblasti nákladu.

- 9.3.3.29** -
- 9.3.3.30** (Vyhrazeno)
- 9.3.3.31** **Motory**
- 9.3.3.31.1 Jsou povoleny pouze spalovací motory s palivem s bodem vzplanutí nad 55 °C. Toto ustanovení neplatí pro motory s vnitřním spalováním, které jsou součástí pohonných a pomocných systémů. Tyto systémy musí splňovat požadavky Kapitoly 30 a Přílohy 8, oddílu 1 Evropské normy, která stanoví technické požadavky pro plavidla vnitrozemské plavby (ES-TRIN) ve znění pozdějších předpisů².
- 9.3.3.31.2 Větrací otvory strojoven a sací otvory motorů, jestliže tyto nenasávají vzduch přímo ze strojovny, musí být vzdáleny minimálně 2,00 m od oblasti nákladu.
- 9.3.3.31.3 (Vypuštěno)
- 9.3.3.31.4 (Vypuštěno)
- 9.3.3.31.5 Větrání uzavřených strojoven je třeba provádět tak, aby při venkovní teplotě 20 °C střední teplota strojovny nepřestoupila 40 °C.
- 9.3.3.31.6 9.3.3.31.2 výše neplatí pro kalová plavidla a plavidla pro zásobování pohonnými hmotami.
- 9.3.3.32** **Palivové tanky**
- 9.3.3.32.1 Dvojitá dna v oblasti nákladu smí být použita jako palivové tanky, pokud je jejich výška minimálně 0,6 m.
Rozvody paliva a otvory těchto tanků v nákladních prostorech jsou zakázány.
- 9.3.3.32.2 Odvětrávací potrubí všech palivových tanků musí být vyvedeny minimálně 0,50 m nad otevřenou palubou. Tyto otvory a vývody přepadových trubek, které vedou nad palubou, musí být chráněny mřížkou nebo děrovanou destičkou.
- 9.3.3.33** (Vyhrazeno)
- 9.3.3.34** **Výfukové potrubí**
- 9.3.3.34.1 Výfukové plyny musí být odváděny do volného prostoru výfukovým potrubím skrz bok trupu. Výstupní otvor musí být vzdálen minimálně 2,00 m od oblasti nákladu. Výfuková potrubí z motorů musí být vedena tak, aby se plyny co nejrychleji vzdálily od plavidla. Výfukové potrubí nesmí být umístěno v oblasti nákladu.
- 9.3.3.34.2 Výfuková potrubí musí být opatřena ochranou proti úniku jisker, např. lapačem jisker.
- 9.3.3.34.3 Odstup, předepsaný v odstavci 9.3.3.34.1 neplatí pro kalová plavidla a plavidla pro zásobování pohonnými hmotami.
- 9.3.3.35** **Zařízení pro drenážování a čerpání balastní vody**
- 9.3.3.35.1 Drenážní čerpadla a čerpadla na balastní vodu pro prostory uvnitř oblasti nákladu musí být instalována v oblasti nákladu.
To neplatí pro:
- prostory dvojitých boků a dvojitého dna, pokud nemají žádnou společnou stěnu s nákladními tanky;
- kofrdamy, prostory dvojitých boků a dvojitého dna a úložné prostory, jestliže balastování je prováděno vodním potrubím hasícího zařízení v oblasti nákladu a drenážování je prováděno pomocí ejektorů instalovaných v oblasti nákladu.
- 9.3.3.35.2 Při použití dvojitého dna jako palivového tanku nesmí být tento napojen na drenážní systém.
- 9.3.3.35.3 Pokud je balastní čerpadlo nainstalované v oblasti nákladu musí se výtláčné potrubí a jeho mimopalubní sací přípojka na odběr balastní vody nacházet uvnitř oblasti nákladu.

² Jak je přístupná na webových stránkách Comité Européen pour l'Élaboration de Standards dans le Domaine de Navigation Intérieure – CESNI, <https://www.cesni.eu/en/documents/es-trin/>

- 9.3.3.35.4 Prostor s čerpadly pod palubou musí v případě nouze být možné dočerpat zařízením v oblasti nákladu, které je nezávislé na všech ostatních zařízeních v oblasti nákladu. Tento dočerpávací systém musí být umístěn mimo prostor s čerpadly.
- 9.3.3.36** -
- 9.3.3.39** (Vyhrazeno)
- 9.3.3.40 Hasicí zařízení**
- 9.3.3.40.1 Plavidlo musí být opatřeno hasicím zařízením. Zařízení musí odpovídat následujícím požadavkům:
- musí být napájeno dvěma na sobě nezávislými požárními nebo balastními čerpadly; jedno z nich musí být vždy připraveno k provozu. Tato čerpadla a rovněž jejich napájení a elektrozařízení se nesmí instalovat ve stejném prostoru;
 - musí být vybaven vodním potrubím s nejméně třemi hydranty v oblasti nákladu nad palubou. Musí mít tři vhodné a dostatečně dlouhé hadice s proudnicemi/rozstřikovacími hubicemi o průměru nejméně 12 mm. Alternativně jedna nebo více soustav hadic může být nahrazena směrovými proudnicemi/rozstřikovacími hubicemi o průměru nejméně 12 mm. Musí být možno dosáhnout kteréhokoli bodu paluby v oblasti nákladu současně nejméně dvěma proudy vody, které nevycházejí z téhož hydrantu.
Pružinový nevratný ventil musí zabránit tomu, aby plyny mohly vniknout hasicím systémem do obytných nebo provozních prostorů mimo oblast nákladu;
 - kapacita zařízení musí být stanovena minimálně takovým způsobem, aby při současném použití dvou rozstřikovacích proudnic z každého místa na palubě plavidla byl dosažen dostřik, který odpovídá minimálně šířce plavidla.
 - systém dodávky vody musí být schopen uvedení do provozu z kormidelny a z paluby;
 - musí být provedena opatření proti zamrznutí hasicích prostředků a hydrantů.
- 9.3.3.40.2 Vedle toho musí být strojovny, prostor s čerpadly a všechny prostory obsahující podstatné vybavení (ovládací panely, kompresory atd.) pro chladicí zařízení, pokud je, vybaveny pevně instalovaným hasicím systémem splňujícím následující požadavky:
- 9.3.3.40.2.1 **Hasiva**
- K ochraně prostorů ve strojovnách, kotelnách a prostorech s čerpadly jsou dovoleny jen pevně instalované hasicí systémy používající následující hasiva:
- (a) CO₂ (oxid uhličitý);
 - (b) HFC 227 ea (heptafluorpropan);
 - (c) IG-541 (52 % dusíku, 40 % argonu, 8 % oxidu uhličitého);
 - (d) FK-5-1-12 (dodekaftor-2-3-methylpentanon);
 - (e) (Vyhrazeno);
 - (f) K₂CO₃ (uhličitán draselný).
- Jiná hasiva jsou povolena jen na základě doporučení Administrativního výboru.
- 9.3.3.40.2.2 **Větrání, odsávání vzduchu**
- (a) Spalovací vzduch potřebný pro spalovací motory zajišťující pohon by se neměl dostat z prostorů chráněných pevně instalovanými hasicími systémy. Tento požadavek není povinný, pokud má plavidlo dvě nezávislé hlavní strojovny, plynotěsně oddělené, nebo pokud má kromě hlavní strojovny oddělenou strojovnu, v níž je instalován příďové dokormidlovací zařízení, které může samo zajistit pohon v případě požáru v hlavní strojovně.
 - (b) Všechny větrací systémy s nuceným větráním v prostoru, který se má chránit, se musí automaticky vypnout, jakmile se spustí hasicí systém.
 - (c) Všechny otvory v prostoru, který se má chránit, umožňující vnikání vzduchu nebo unikání plynu musí být vybaveny prostředky, které je dovolí rychle uzavřít. Musí být jasné, zda jsou otevřené, nebo uzavřené.
 - (d) Vzduch unikající z ventilů pro vyrovnávání tlaku tanků s tlakovým vzduchem, instalovaných ve strojovnách, musí být odváděn do ovzduší.
 - (e) Přetlak nebo podtlak způsobený rozptýlením hasiva nesmí zničit podstatné části prostoru, který se má chránit. Musí být možno zajistit bezpečné vyrovnání tlaku.
 - (f) Chráněné prostory musí být opatřeny prostředky pro odsávání hasiva a spalin. Tyto prostředky musí být ovladatelné z míst mimo chráněný prostor a takových, která nemohou být

znepřístupněna požárem v těchto prostorech. Jsou-li instalována odsávací zařízení, nesmí být možno je spustit během hašení.

9.3.3.40.2.3 *Požární poplachový systém*

Prostor, který se má chránit, musí být monitorován vhodným požárním poplachovým systémem. Poplachový signál musí být slyšitelný v kormidelně, obytných prostorech a v prostoru, který se má chránit.

9.3.3.40.2.4 *Potrubní systém*

- (a) Hasivo musí být vedeno do prostoru, který se má chránit, a v něm rozváděno pomocí trvalého potrubního systému. Potrubí instalované v prostoru, který se má chránit, a armatury, které jsou jeho součástí, musí být vyrobeny z oceli. Toto neplatí pro spojovací nástavce tanků a kompenzátory, za podmínky, že použité materiály mají rovnocenné ohnivzdorné vlastnosti. Potrubí musí být zvnitřku i zvenjšku chráněno proti korozi.
- (b) Výpustné hubice musí být upraveny tak, aby zajistily rovnoměrné rozptýlení hasiva. Zejména hasivo musí rovněž být aktivní pod podlahou.

9.3.3.40.2.5 *Spouštěcí zařízení*

- (a) Hasicí systémy uváděné do činnosti automaticky nejsou dovoleny.
- (b) Musí být možno uvést hasicí systém do činnosti z vhodného místa nacházejícího se vně prostoru, který se má chránit.
- (c) Spouštěcí zařízení musí být instalována tak, aby mohla být uvedena do činnosti v případě požáru, a tak, aby riziko jejich poruchy v případě požáru nebo výbuchu v prostoru, který se má chránit, bylo zmenšeno na nejmenší možnou míru.

Systémy, které nejsou uváděny do činnosti mechanicky, musí být napájeny ze dvou navzájem nezávislých energetických zdrojů. Tyto energetické zdroje musí být umístěny vně prostoru, který se má chránit. Ovládací vedení umístěné v prostoru, který se má chránit, musí být zkonstruováno tak, aby zůstalo ve funkčním stavu v případě požáru trvajících nejmeně 30 minut. Elektrické instalace se považují za vyhovující tomuto požadavku, pokud odpovídají normě IEC 60331-21:1999.

Jsou-li spouštěcí zařízení umístěna tak, že nejsou viditelná, musí být na součásti, která je zakrývá, umístěn symbol „hasicího systému“ o stranách nejmeně 10 cm s následujícím nápisem provedeným červenými písmeny na bílém podkladu:

Hasicí systém

- (d) Je-li hasicí systém určen k ochraně více prostorů, musí zahrnovat oddělené a jasně označené spouštěcí zařízení pro každý prostor.
- (e) U každého spouštěcího zařízení musí být umístěny pokyny, které musí být jasně viditelné a nesmazatelné. Pokyny musí být v jazyce, který velitel plavidla umí číst a rozumí mu a, pokud tímto jazykem není angličtina, francouzština nebo němčina, musí být v angličtině, francouzštině nebo němčině. Musí obsahovat tyto informace:
 - (i) spouštění hasicího systému;
 - (ii) nutnost přesvědčit se, že všechny osoby opustily prostor, který se má chránit;
 - (iii) činnost posádky při zapnutí systému a při příchodu do chráněného prostoru po zapnutí systému nebo naplnění hasivem, zejména s ohledem na možnost přítomnosti nebezpečných látek;
 - (iv) správné chování se posádky v případě, že hasicí systém správně nefunguje.
- (f) V pokynech musí být uvedeno, že se před uvedením hasicího systému do činnosti musí vypnout spalovací motory umístěné v prostoru nebo nasávající vzduch z prostoru, který se má chránit.

9.3.3.40.2.6 *Poplachové zařízení*

- (a) Pevně instalované hasicí systémy musí být vybaveny opticko-akustickým poplachovým zařízením.
- (b) Poplachové zařízení se musí spustit automaticky, jakmile se hasicí systém uvede poprvé do činnosti. Poplachové zařízení musí fungovat po vhodnou dobu předtím, než dojde k vypuštění hasiva; nesmí být možné je vypnout.;
- (c) Poplachové signály musí být jasně viditelné v prostorech, které se mají chránit, a na přístupových místech k nim a musí být zřetelně slyšitelné za provozních podmínek

odpovídajících nejvyšší možné hladině hluku. Musí být možno je zřetelně rozlišit od všech ostatních zvuků a vizuálních signálů v prostoru, který se má chránit.

- (d) Zvukové poplachy musí být zřetelně slyšitelné také v přilehlých prostorech se zavřenými spojovacími dveřmi a za provozních podmínek odpovídajících nejvyšší možné hladině hluku.
- (e) Pokud není poplachové zařízení samo o sobě chráněno proti zkratům, přerušeným vodičům a poklesům napětí, musí být možno monitorovat jeho činnost.
- (f) U vstupu do každého prostoru, kam může dosáhnout hasivo, musí být umístěna tabulka s následujícím nápisem provedeným červenými písmeny na bílém podkladu:

**POZOR, HASICÍ SYSTÉM!
OPUSŤTE TENTO PROSTOR IHNEDE PO (popis) SIGNÁLU!**

9.3.3.40.2.7 *Tlakové tanky, armatury a potrubí*

- (a) Tlakové tanky, armatury a potrubí musí odpovídat požadavkům příslušného orgánu nebo, pokud nejsou takové požadavky, požadavkům uznané klasifikační společnosti.
- (b) Tlakové tanky musí být instalovány podle pokynů výrobce.
- (c) Tlakové tanky, armatury a potrubí nesmějí být instalovány v obytných prostorech.
- (d) Teplota skříní a úložných prostorů pro tlakové tanky nesmí překročit 50 °C.
- (e) Skříně a úložné prostory na palubě musí být bezpečně uloženy a musí mít odvětrávací otvory umístěny tak, aby v případě, že tlakový tank není plynotěsný, nemohl unikající plyn vniknout do plavidla. Přímé spojení s jinými prostory není dovoleno.

9.3.3.40.2.8 *Množství hasiva*

Je-li množství hasiva určeno pro více než jeden prostor, nemusí být disponibilní množství hasiva větší, než je množství vyžadované pro největší z takto chráněných prostorů.

9.3.3.40.2.9 *Instalace, údržba, kontrola a dokumentace*

- (a) Montáž nebo úprava systému smí být prováděna pouze společností specializovanou na hasicí systémy. Je nutno se řídit pokyny (technický list výrobku, bezpečnostní list) poskytnutými výrobcem hasiva nebo systému.
- (b) Systém musí být podroben inspekci provedené znalcem:
 - (i) před uvedením do provozu;
 - (ii) pokaždé, kdy se uvádí zpět do provozu po své aktivaci;
 - (iii) po každé úpravě nebo opravě;
 - (iv) pravidelně, nejméně každé dva roky.
- (c) Během inspekce musí znalec zkontrolovat, zda systém odpovídá požadavkům v 9.3.3.40.2.
- (d) Inspekce musí zahrnovat alespoň:
 - (i) vnější kontrolu celého systému;
 - (ii) kontrolu těsnosti potrubí;
 - (iii) kontrolu dobré funkce ovládacích a aktivačních systémů;
 - (iv) kontrolu tlaku a obsahu tanků;
 - (v) kontrolu těsnosti uzavíracích zařízení prostoru, který se má chránit;
 - (vi) kontrolu požárního poplachového systému;
 - (vii) kontrolu poplachového zařízení.
- (e) Osoba provádějící inspekci musí vystavit, podepsat a opatřit datem osvědčení o inspekci.
- (f) V osvědčení o inspekci musí být uveden počet pevně instalovaných hasicích systémů.

9.3.3.40.2.10 *Hasicí systém s CO₂*

Kromě požadavků obsažených v 9.3.3.40.2.1 až 9.3.3.40.2.9 musí hasicí systémy používající jako hasivo CO₂ odpovídat následujícím ustanovením:

- (a) Tanky s CO₂ musí být uloženy v plynotěsném prostoru nebo skříní, které jsou odděleny od jiných prostorů. Dveře takových úložných prostorů a skříní se musí otevírat směrem ven; musí být možno je uzamknout a musí být na vnější straně opatřeny symbolem „Pozor, nebezpečí“, nejméně 5 cm vysokým a „CO₂“ v téže barvě a téže velikosti;
- (b) Úložné skříně nebo prostory pro tanky s CO₂ umístěné pod palubou musí být přístupné pouze zvenku. Tyto prostory musí mít uměle vytvořený větrací systém s odsávacími kryty a musí být zcela nezávislé na ostatních větracích systémech nacházejících se na plavidle;

- (c) Stupeň plnění tanků s CO₂ nesmí překročit 0,75 kg/l. Pro objem stlačeného CO₂ se bere hodnota 0,56 m³/kg;
- (d) Koncentrace CO₂ v prostoru, který se má chránit, nesmí být menší než 40 % celkového objemu prostoru. Toto množství musí být vypuštěno do 120 sekund. Musí být možno kontrolovat, zda probíhá správně rozstřikování;
- (e) Otevírání ventilů tanku a ovládání rozstřikovacího ventilu musí odpovídat dvěma různým operacím;
- (f) Vhodná doba uvedená v 9.3.2.40.2.6 (b) nesmí být menší než 20 sekund. Spolehlivé zařízení musí zajistit načasování rozstřikování CO₂.

9.3.3.40.2.11 *Hasicí systém s HFC-227 ea (heptafluoropropanem)*

Kromě požadavků obsažených v 9.3.3.40.2.1 až 9.3.3.40.2.9 musí hasicí systémy používající jako hasivo HFC-227 ea odpovídat následujícím ustanovením:

- (a) Tam, kde je více prostorů s rozdílnými celkovými objemy, musí být každý prostor vybaven svým vlastním hasicím systémem;
- (b) Každý tank obsahující HFC-227 ea, umístěný v prostoru, který se má chránit, musí být vybaven zařízením k zamezení nadměrnému tlaku. Toto zařízení musí zajistit bezpečně rozptýlení obsahu tanku v prostoru, který se má chránit, jestliže je tank zachvácen požárem, když hasicí systém ještě nebyl uveden do provozu;
- (c) Každý tank musí být vybaven zařízením dovolujícím kontrolovat tlak plynu;
- (d) Stupeň plnění tanků nesmí překročit 1,15 kg/l. Pro měrný objem stlačeného HFC-227 ea se bere hodnota 0,1374 m³/kg;
- (e) Koncentrace HFC-227 ea v prostoru, který se má chránit, nesmí být menší než 8 % celkového objemu prostoru. Toto množství musí být vypuštěno do 10 sekund;
- (f) Tanky s HFC-227 ea musí být vybaveny zařízením kontroly tlaku, které spustí slyšitelný a viditelný poplach v kormidelně v případě mimořádné ztráty hnacího plynu. Pokud plavidlo nemá kormidelnu, musí být poplach spuštěn vně prostoru, který se má chránit;
- (g) Po vypuštění nesmí koncentrace v prostoru, který se má chránit, překročit 10,5 % (objemu);
- (h) Hasicí systém nesmí zahrnovat hliníkové součásti.

9.3.3.40.2.12 *Hasicí systém s IG-541*

Kromě požadavků obsažených v 9.3.3.40.2.1 až 9.3.2.40.2.9 musí hasicí systémy používající jako hasivo IG-541 odpovídat následujícím ustanovením:

- (a) Tam, kde je více prostorů s rozdílnými celkovými objemy, musí být každý prostor vybaven svým vlastním hasicím systémem;
- (b) Každý tank obsahující IG-541 umístěný v prostoru, který se má chránit, musí být vybaven zařízením k zamezení nadměrnému tlaku. Toto zařízení musí zajistit bezpečně rozptýlení obsahu tanku v prostoru, který se má chránit, jestliže je tank zachvácen požárem, když hasicí systém ještě nebyl uveden do provozu;
- (c) Každý tank musí být vybaven zařízením dovolujícím kontrolovat obsah;
- (d) Plnicí tlak tanků nesmí překročit 200 barů při teplotě +15 °C;
- (e) Koncentrace IG-541 v prostoru, který se má chránit, musí být nejméně 44 % a nejvýše 50 % celkového objemu prostoru. Toto množství musí být vypuštěno do 120 sekund;

9.3.3.40.2.13 *Hasicí systémy používající FK-5-1-12*

Mimo požadavků, uvedených v 9.3.3.40.2.1 až 9.3.3.40.2.9, musí hasicí systémy používající FK-5-1-12 jako hasivo, odpovídat následujícím předpisům:

- (a) Při existenci několika prostor majících různý celkový objem musí každý z nich být vybaven vlastním hasicím systémem;
- (b) Každá nádrž FK-5-1-12 umístěná v chráněném prostoru musí být vybavena zařízením pro zamezení přetlaku. Toto zařízení musí bezpečným způsobem zajišťovat rozptýlení obsahu nádrže v chráněném prostoru v případě, kdy tato nádrž je zasažena ohněm v době, kdy hasicí systém není uveden do činnosti;
- (c) Každá nádrž musí být vybavena zařízením, umožňujícím kontrolu tlaku plynu;
- (d) Úroveň naplnění nádrže nesmí převyšovat 1,00 kg/l. Za specifický objem FK-5-1-12 bez natlakování se považuje jednotka rovná 0,0719 m³/kg;
- (e) Objem FK-5-1-12, dáváný do chráněného prostoru, musí dosahovat nejméně 5,5 % celkového objemu daného prostoru. Vypuštění tohoto množství musí být provedeno za 10 sekund;

- (f) Nádrže s FK-5-1-12 musí být vybaveny zařízením pro kontrolu tlaku, dávajícím opticko-akustický poplachový signál v kormidelně pro případ neúměrné ztráty hasiva. Když není kormidelna, tak se musí tento signál dávat zvenčí chráněného prostoru;
- (g) Po rozptýlení nesmí v chráněném prostoru koncentrace přesáhnout 10,0 %.

9.3.3.40.2.14 (Vyhrazeno)

9.3.3.40.2.15 *Hasicí systémy používající jako hasivo K₂CO₃.*

Vedle požadavků uvedených v 9.3.3.40.2.1 až 9.3.3.40.2.3, 9.3.3.40.2.5, 9.3.3.40.2.6, a 9.3.3.40.2.9, musí hasicí systémy používající jako hasivo K₂CO₃ splňovat následující ustanovení:

- (a) Hasicí systém musí být typu schváleného v souladu se Směrnicí 2014/90/EU³ nebo MSC/Circ. 1270⁴;
- (b) Každá místnost musí být vybavena vlastním hasicím systémem;
- (c) Hasivo musí být uskladněno ve k tomu určených nepřetlakových tancích v chráněném prostoru. Tyto tanky musí být konstruovány tak, aby se hasivo v prostoru rozptýlilo rovnoměrně. Hasivo musí především působit také pod palubními deskami.
- (d) Každý tank je samostatně napojen na spouštěcí zařízení.
- (e) Množství hasiva, které vytváří suchý aerosol musí být v poměru k chráněnému prostoru minimálně 120 g/m³ čistého objemu tohoto prostoru. Tento čistý objem se počítá podle Směrnice 2014/90/EU³ nebo podle MSC/Circ. 1270⁴. Musí být možné dodat hasivo do 120 vteřin.

9.3.3.40.2.16 *Stacionární hasicí systém pro fyzickou ochranu*

K zajištění fyzické ochrany ve strojovnách, kotelnách a prostorech s čerpadly jsou dovoleny stacionární hasicí systémy jen na základě doporučení Administrativního výboru.

9.3.3.40.3 Dva ruční hasicí přístroje, které jsou předepsány v 8.1.4, se musí nacházet v oblasti nákladu.

9.3.3.40.4 Hasicí prostředky a množství hasicích prostředků pevně nainstalovaných hasicích přístrojů musí být vhodné a dostatečné pro hašení požárů.

9.3.3.40.5 9.3.3.40 a 9.3.3.40.2 neplatí pro kalová plavidla a plavidla pro zásobování pohonnými hmotami.

9.3.3.41 **Oheň a otevřené světlo**

9.3.3.41.1 Vyústění komínů se musí nacházet v minimální vzdálenosti 2,00 m od oblasti nákladu. Musí existovat zařízení, která zabrání úniku jisker a průniku vody.

9.3.3.41.2 Topné, varné a chladicí přístroje nesmí být provozovány ani kapalnými pohonnými hmotami, zkapalněnými plyny, ani pevnými hořlavými hmotami.

Pokud jsou topné přístroje nebo topné kotle umístěny do strojoven nebo do prostor, které jsou pro to zvláště vhodné, smí být provozovány kapalnými pohonnými hmotami, avšak s bodem vzplanutí vyšším než 55 °C.

Varná a chladicí zařízení jsou povolena pouze v obytných prostorech.

9.3.3.41.3 Jsou povoleny pouze elektrické lampy.

9.3.3.42 **Zařízení pro ohřev nákladu**

9.3.3.42.1 Ohřevné kotle, které slouží k ohřevu nákladu, musí být provozovány tekutým palivem s bodem vzplanutí vyšším než 55 °C. Musí být umístěny buď ve strojovně nebo pod palubou mimo oblast nákladu v prostoru, který je přístupný z paluby a ze strojovny.

9.3.3.42.2 Ohřevná zařízení nákladu musí být provedena tak, aby se v případě netěsnosti nemohl do ohřevného kotle dostat náklad. Ohřevné zařízení nákladu s umělým tahem musí být možné zapálit elektricky.

9.3.3.42.3 Zařízení pro větrání strojovny musí být vypočítána podle spotřeby vzduchu pro ohřevný kotel.

9.3.3.42.4 Pokud se ohřevné zařízení nákladu musí používat během nakládky, vykládky nebo odplynování, musí provozní prostor, ve kterém je toto zařízení umístěno, plně odpovídat předpisům 9.3.3.52.1. To neplatí

³ Úřední věstník Evropské unie č. L 257 z 28.8. 2014, str.146.

⁴ Oběžník Mezinárodní námořní organizace MSC/Circ. 1270 a opravy — Revidované pokyny pro schválení stabilních aerosolových hasicích systémů odpovídajících stabilním plynovým hasicím systémům, jak je uvedeno v úmluvě SOLAS 1974, pro strojovny — přijaté 4.6.2008.

pro větrací otvory systému větrání. Tyto se musí nacházet minimálně 2 m od prostoru s nákladem a 6 m od otvorů nákladního a zbytkového tanku, nakládacích čerpadel na palubě, výstupních otvorů vysokorychlostních ventilů nebo přetlakových ventilů a břehových přípojek nakládacího a vykládacího potrubí a minimálně 2,00 m nad palubou.

Při vykládce látek s bodem vzplanutí 60 °C nebo více, pokud je teplota produktu minimálně 15 K pod bodem vzplanutí, nemusí být dodrženy předpisy podle 9.3.3.52.1.

9.3.3.43

-

9.3.3.49*(Vyhrazeno)***9.3.3.50***(Vypuštěno)***9.3.3.51*****Povrchové teploty zařízení***

- (a) Povrchové teploty elektrických a neelektrických zařízení nesmí překročit 200 °C;
- (b) Povrchové teploty vnějších částí motorů a jejich přívodů vzduchu a výfukových kanálů nesmí překročit 200 °C;
- (c) V případě, že seznam látek na plavidle podle 1.16.1.2.5 bude obsahovat látky, pro které je uvedena teplotní třída T4, T5 nebo T6 ve sloupci (15) tabulky C kapitoly 3.2, potom odpovídající povrchové teploty v přiřazených zónách nesmí překročit 135 °C, (T4), 100 °C (T5) nebo 85 °C (T6), v uvedeném pořadí;
- (d) (a) a (b) se nepoužijí, pokud jsou splněny následující požadavky (viz také 7.2.3.51.4):
 - (i) Obytné prostory, kormidelná a provozní prostory, kde se vyskytují povrchové teploty vyšší, než je uvedeno v (a) a (b), jsou vybaveny větracím systémem podle 9.3.3.12.4 (b); nebo
 - (ii) Zařízení, která vytvářejí povrchové teploty vyšší, než je uvedeno v (a) nebo (b), v tomto pořadí, musí být možno vypnout. Taková zařízení musí být označena červeně;
- (e) Typ pravidel N otevřený musí splňovat pouze požadavky (a), (b) a (d), jestliže pravidlo zůstane v bezprostřední blízkosti nebo ve vyznačené pobřežní oblasti.

9.3.3.52***Typ a umístění elektrických instalací a zařízení*****9.3.3.52.1**

Elektrické instalace a zařízení musí být minimálně typ „omezené riziko výbuchu“;

Toto ustanovení se neuplatňuje u:

- (a) Instalací osvětlení v obytných prostorech a kormidelně, s výjimkou spínačů umístěných v blízkosti vchodů;
- (b) Mobilních telefonů, pevných telefonních instalací a stacionárních a přenosných počítačů a zařízení pro kontrolu naložení v obytných prostorech nebo kormidelně;
- (c) Elektrické instalace a zařízení která jsou, během pobytu v bezprostřední blízkosti nebo ve vyznačené pobřežní oblasti:
 - (i) Uhašena; nebo
 - (ii) Jsou umístěna v prostorech vybavených větracím systémem podle 9.3.3.12.4;
- (d) Radiotelefonní zařízení a stanice vnitrozemského systému AIS (systémy automatické identifikace) v obytných prostorech a kormidelně, pokud se žádná část antény pro radiotelefonní zařízení nebo stanice AIS nenachází nad nebo do 2,00 m od chráněné oblasti.

9.3.3.52.2

V kofrdamech, prostorech s dvojitými boky, dvojitými dny a úložných prostorech jsou povoleny pouze hermeticky uzavřené ozvěnové hloubkoměry, jejichž kabely jsou vedeny silnostěnnými ocelovými trubkami s plynotěsnými spoji až k hlavní palubě.

9.3.3.52.3

Pevné elektrické instalace a zařízení, která nesplňují požadavky stanovené výše v 9.3.3.51 (a), 9.3.3.51 (b) a 9.3.3.52.1 a jejich spínače, musí být označeny červeně. Odpojení těchto zařízení musí být řízeno z centrálního místa na palubě.

9.3.3.52.4

Každá izolovaná distribuční síť musí být vybavena automatickým zařízením s optickým a akustickým signálem pro kontrolu úrovně izolace.

9.3.3.52.5

Jsou povoleny pouze distribuční systémy bez zpětného spojení s trupem. Toto ustanovení se neuplatňuje u:

- Aktivní katodické ochrany proti korozi;

- Některých omezených částí instalací umístěných mimo oblast nákladu (např. připojení spouštěčů diesellových motorů);
 - Přístroje pro kontrolu úrovně izolace podle 9.3.3.52.4.
- 9.3.3.52.6 Elektrický generátor, který je trvale poháněn motorem a který nesplňuje výše uvedené požadavky v 9.3.3.52.1, musí být vybaven vypínačem schopným vypnout generátor. V blízkosti spínače musí být zobrazena informační tabule s návodem k obsluze.
- 9.3.3.52.7 Porucha napájecího zdroje bezpečnostního a kontrolního zařízení musí být okamžitě signalizována optickými a akustickými signály v kormidelně a na palubě. Pokud se poplach nevypne, musí být automaticky předán do obytných prostor.
- 9.3.3.52.8 Elektrické spínače, zásuvky a kabely na palubě musí být chráněny proti mechanickému poškození.
- 9.3.3.52.9 Zásuvky pro připojení signálních světel a osvětlení lávky musí být natrvalo zabudovány v plavidle v blízkosti signálního stožáru nebo lávky. Zásuvky používané v chráněné oblasti musí být provedeny tak, aby nebylo možné připojení nebo odpojení, s výjimkou případů, kdy nejsou pod napětím.
- 9.3.3.52.10 Akumulátory musí být umístěny mimo oblast nákladu.
- 9.3.3.52.11 Typ plavidel N otevřený musí splňovat pouze požadavky 9.3.3.52.1 a 9.3.3.52.3 v případě, že plavidlo zůstane v bezprostřední blízkosti nebo uvnitř pevnině přiřazené zóny.
- 9.3.3.53 *Typ a umístění elektrických a neelektrických instalací a zařízení určených pro použití v oblastech s nebezpečím výbuchu***
- 9.3.3.53.1 Na palubách plavidel, na která se vztahuje rozdělení zón definovaných v 1.2.1, musí elektrická a neelektrická zařízení a zařízení používaná v prostorách s nebezpečím výbuchu splňovat alespoň požadavky pro použití v dané oblasti.
- Musí být vybírána na základě skupin/podskupin výbušnosti a teplotních tříd, do nichž patří látky, které mají být přepravovány (viz sloupce (15) a (16) tabulky C kapitoly 3.2).
- Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, pro které jsou ve sloupci (15) tabulky C kapitoly 3.2 uvedeny teplotní třídy T4, T5 nebo T6, pak odpovídající povrchové teploty v rámci přiřazených zón nesmí překročit 135 °C (T4), 100 °C (T5) nebo 85 °C (T6);
- Pokud bude seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 zahrnovat látky, pro které jsou ve sloupci (15) tabulky C kapitoly 3.2 uvedeny teplotní třídy T1 nebo T2, pak odpovídající povrchové teploty v rámci přiřazených zón nesmí překročit 200 °C.
- 9.3.3.53.2 S výjimkou optických vláken musí být elektrické kabely v chráněné oblasti pancéřovány nebo umístěny v kovovém plášti nebo v ochranných trubkách.
- Elektrické kabely pro aktivní katodickou ochranu obšívky musí být vedeny silnostěnnými ocelovými trubkami s plynotěsnými spoji až k hlavní palubě.
- 9.3.3.53.3 Pohyblivé elektrické kabely jsou v oblasti s rizikem výbuchu, s výjimkou elektrických kabelů pro jiskrově bezpečné elektrické obvody nebo pro připojení:
- (a) Signálních pozičních světel a osvětlení lávek, pokud je spojovací bod (například zásuvka) trvale zabudován v plavidle v blízkosti signálního stožáru nebo lávky;
 - (b) Elektrické sítě na plavidle do pozemní elektrické sítě; pokud:
 - Elektrické kabely a napájecí jednotka odpovídají platné normě (například EN 15869-03:2010);
 - Jsou napájecí jednotka a konektory umístěny mimo oblast s rizikem výbuchu.
- Je připojování a odpojování zásuvek/konektorů možné pouze tehdy, když nejsou pod napětím.
- 9.3.3.53.4 Elektrické kabely jiskrově bezpečných samojistících obvodů musí být odděleny od ostatních kabelů, které nejsou určeny pro použití v těchto obvodech, a musí být označeny (nesmějí být instalovány společně ve stejném svazku kabelů a nesmí být upevněny stejnými kabelovými svorkami).
- 9.3.3.53.5 Pro pohyblivé elektrické kabely povolené v souladu s 9.3.3.53.5 se smí používat pouze opláštěvané kabely typu H07RN-F-F v souladu s RN IEC-60245-4:2011⁵ nebo elektrické kabely přinejmenším srovnatelného provedení s vodiči o průřezu minimálně 1,50 mm².

⁵ Identická s EN 50525-2-21: 2011.

9.3.3.54 Uzemnění

9.3.3.54.1 Kovové části elektrických instalací a zařízení v oblasti nákladu, které nejsou pod napětím, jakož i ochranné kovové trubky nebo kovové pláště kabelů v normálním provozu musí být uzemněny, pokud nejsou provedeny tak, aby byly automaticky uzemněny spojením s kovovou konstrukcí plavidla.

9.3.3.54.2 Ustanovení v 9.3.3.54.1 platí také pro instalace s napětím menším než 50 V.

9.3.3.54.3 Nezávislé nákladní tanky, kovové IBC a cisternové kontejnery musí být uzemněny.

9.3.3.54.4 Nádoby na zbytkové produkty musí být možné uzemnit.

9.3.3.55 (Vyhrazeno)

9.3.3.56 (Vypuštěno)

9.3.3.57 -

9.3.3.59 (Vyhrazeno)

9.3.3.60 Zvláštní vybavení

Plavidlo musí být vybaveno sprchou a lázní pro oči a obličej na místě, které je přímo přístupné z oblasti nákladu. Voda musí odpovídat kvalitě pitné vody na palubě.

POZNÁMKA: Jsou povoleny další dekontaminační látky, aby se zabránilo poškození očí a kůže.

Je povoleno připojení tohoto speciálního zařízení s oblastí mimo oblast nákladu.

Musí být instalován pružinový zpětný ventil, který zabrání unikání plynů mimo oblast nákladu sprchou a systémem oční a obličejové lázně.

9.3.3.61 Ustanovení 9.3.3.60 neplatí pro kalová plavidla a zásobovací plavidla.

9.3.3.62 Ventil pro odplynování do sběrných zařízení

Na potrubí, které slouží k odvádění vzduchu, musí být instalován pevný nebo přenosný pružinový nízkotlaký ventil používaný při odplyňování do sběrných zařízení. Pokud seznam látek povolených pro přepravu na plavidle podle 1.16.1.2.5 obsahuje látky, u nichž se požaduje ochrana proti explozi podle sloupce (17) tabulky C kapitoly 3.2, musí být tento ventil vybaven pojistkou proti prošlehnutí plamene, která je schopna odolat deflagraci. Pokud neprobíhá odplyňování plavidla do sběrného zařízení, musí být ventil uzavřen slepou přírubou. Nízkotlaký ventil musí být instalován tak, aby za jiných normálních pracovních podmínek nebyl vakuový ventil aktivován.

POZNÁMKA: Odplyňování je součástí normálních pracovních podmínek.

9.3.3.63 -

9.3.3.70 (Vyhrazeno)

9.3.3.71 Vstup na plavidlo

Tabule označující zákaz vstupu podle 8.3.3 musí být dobře viditelné z obou boků plavidla.

9.3.3.72 -

9.3.3.73 (Vyhrazeno)

9.3.3.74 Zákaz kouření, zákaz ohně a otevřeného světla

9.3.3.74.1 Tabule označující zákaz kouření podle 8.3.4 musí být dobře viditelné z obou boků plavidla.

9.3.3.74.2 V blízkosti vstupu do míst, kde kouření nebo používání ohně nebo otevřeného osvětlení není vždy zakázáno, musí být umístěny upozorňující tabule, které udávají okolnosti, za kterých tento zákaz platí.

9.3.3.74.3 V obytných prostorech a kormidelně musí být v blízkosti každého východu umístěn popelník.

9.3.3.75 -

9.3.3.91 (Vyhrazeno)

9.3.3.92 Na tankových plavidlech zmíněných v 9.3.3.11.7 musí mít prostory, jejichž vchody nebo východy by mohly být v poškozeném stavu pravděpodobně částečně nebo úplně zanořeny, nouzový východ, který

je situován nejméně 0,10 m nad rovinou ponoru. Tento požadavek se nevztahuje na přední a zadní kolizní prostor.

9.3.3.93
9.3.3.99

-
(Vyhrazeno)

9.3.4 Alternativní varianty stavby

9.3.4.1 Obecná ustanovení

9.3.4.1.1 Maximální přípustný objem a délka nákladního tanku podle 9.3.1.11.1, 9.3.2.11.1 a 9.3.3.11.1 může být zvýšen a minimální vzdálenost v souladu s 9.3.1.11.2 a) a 9.3.2.11.7 se mohou lišit za předpokladu, že jsou splněny ustanovení tohoto oddílu. Kapacita nákladního tanku nesmí přesáhnout 1000 m³.

9.3.4.1.2 Tanková plavidla, u kterých je maximálně přípustná kapacita nákladních tanků přesáhnutá nebo vzdálenost mezi bočními stěnami a nákladními tanky je menší než vyžadovaná, musí být chráněny s pomocí boční konstrukce odolnější proti nárazu. Toto se musí prokázat cestou porovnání rizika, spojeného s využitím konvenční konstrukce (původní konstrukce), která odpovídá Pravidlům ADN, s rizikem konstrukce odolnější vůči nárazu (alternativní konstrukce).

9.3.4.1.3 Když riziko konstrukce odolnější vůči nárazu rovné nebo menší riziku konvenční konstrukce pak je prokázána ekvivalentní nebo vyšší bezpečnost. Ekvivalentní nebo vyšší úroveň bezpečnosti se musí prokazovat v souladu s pododílem 9.3.4.3.

9.3.4.1.4 Když je plavidlo postavené v souladu s ustanoveními tohoto oddílu, musí uznaná klasifikační společnost doloženě potvrdit použití postupu při výpočtu v souladu s pododílem 9.3.4.3 a předložit své závěry kompetentnímu orgánu ke schválení.

Kompetentní orgán si může vyžádat doplňující výpočty a důkazy.

9.3.4.1.5 Kompetentní orgán musí zahrnout tuto variantu stavby do schvalovacího osvědčení v souladu s 8.6.1.

9.3.4.2 Postup

9.3.4.2.1 Hlavními parametry jsou pravděpodobnost proražení nákladního tanku v důsledku nárazu a plocha okolo plavidla zasažená vyplaveným nákladem. Pro popis rizika se využívá následný vzorec:

$$R = P \cdot C$$

kde: R riziko [m²]

P pravděpodobnost proražení nákladního tanku []

C důsledek (rozsah poškození) proražením nákladního tanku [m²].

9.3.4.2.2 Pravděpodobnost *P* proražení nákladního tanku závisí od pravděpodobného rozložení kolizní energie, představované plavidly, působící na poškozené plavidlo, a způsobilosti postiženého plavidla, pohltit tuto energii bez poškození nákladního tanku. Snížení této pravděpodobnosti se může dosáhnout za pomoci boční konstrukce s vyšší odolností proti nárazům.

Důsledek *C* vyplavení nákladu po proražení nákladního tanku se vyjádří jako plocha znečištěné oblasti okolo poškozeného plavidla.

9.3.4.2.3 Postup podle 9.3.4.3 popisuje, jakým způsobem je třeba vypočítat pravděpodobnost poničení tanků a jakým způsobem je třeba určovat způsobilost bočních konstrukcí plavidla pohlcovat energii, vytvářenou při nárazu a zvýšení následků.

9.3.4.3 Postup při výpočtu

9.3.4.3.1 Postup při výpočtu se skládá ze 13 hlavních kroků. Výpočty v krocích 2-10 se musí provádět jak pro konvenční konstrukci, tak i pro konstrukci odolnou vůči nárazům. V následující tabulce jsou uvedeny výpočty vyvážené pravděpodobnosti proražení nákladního tanku:

9.3.4.3.1.1 *Krok 1*

Mimo alternativní konstrukci, používanou pro nákladní tanky překračující maximální přípustnou kapacitu nebo zmenšenou vzdálenosti mezi boční stěnou a nákladním tankem jako i boční konstrukcí odolnější proti nárazům, je nutno rozpracovat výchozí konstrukci s minimálně shodnými rozměry (délka, šířka, výška, výtlač). Tato výchozí konstrukce musí splňovat požadavky podle části 9.3.1 (typ G), 9.3.2 (typ C) nebo 9.3.3 (typ N) a odpovídat minimálním požadavkům stanovených uznanou klasifikační společností.

9.3.4.3.1.2 *Krok 2*

9.3.4.3.1.2.1 Je nutno určit příslušná typická kolizní místa při kolizi ($i = 1$), V tabulce v 9.3.4.3.1 je uveden obecný příklad, kdy je počet „n“ typických kolizních míst.

Počet typických kolizních závisí od konstrukce plavidla. Výběr kolizních míst musí být schválen uznanou klasifikační společností.

9.3.4.3.1.2.2 Kolizní místo ve vertikálním směru

9.3.4.3.1.2.2.1 *Tanková plavidla typu C a N*

9.3.4.3.1.2.2.1.1 Určení kolizních míst ve vertikálním směru závisí od rozdílů v ponoru mezi plavidlem, které způsobilo náraz a plavidlem, kterému byl náraz způsoben a které jsou omezeny hodnotami maximálního a minimálního ponoru obou plavidel a konstrukcí plavidla, kterému byl náraz způsoben. Graficky to lze vyjádřit formou plochy obdélníka ohraničeného hodnotami maximálního a minimálního ponoru jak plavidla, které náraz způsobilo, tak i plavidla, kterému byl náraz způsoben (viz uvedený obrázek).

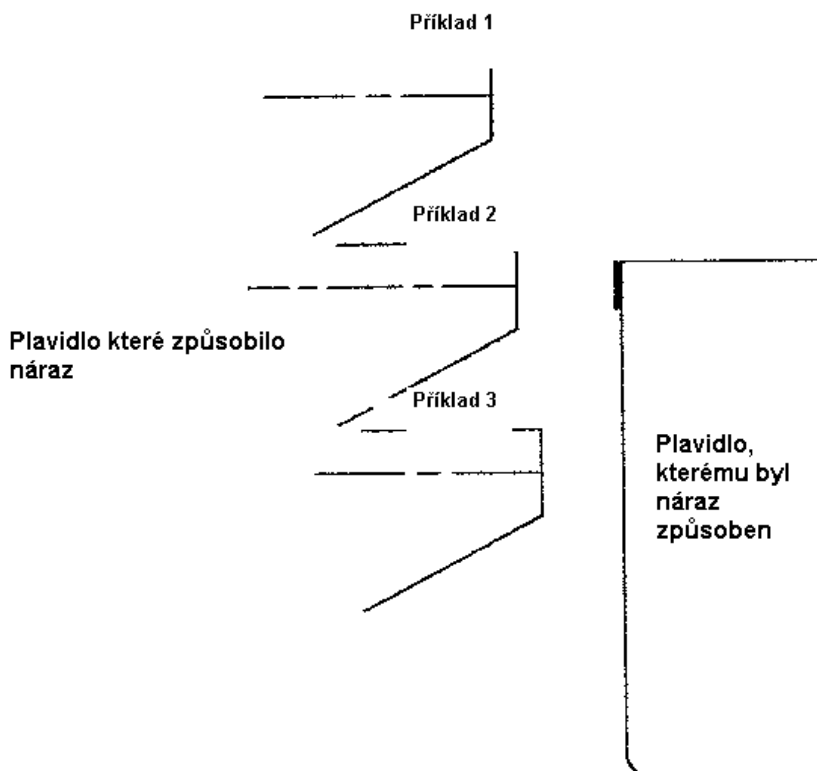

Určení kolizních míst ve vertikálním směru

9.3.4.3.1.2.2.1.2 Každý bod v této ploše představuje možnou kombinaci hodnot ponoru. T_{1max} – maximální ponor a T_{1min} – minimální ponor plavidla, které náraz způsobilo, a T_{2max} a T_{2min} – příslušný maximální a minimální ponor plavidla, kterému byl náraz způsoben. Každá kombinace hodnot ponoru má stejnou pravděpodobnost.

9.3.4.3.1.2.2.1.3 Body, které leží na každé šikmé linii, která je zobrazena na kresbě v 9.3.4.1.2.2.1.1 ukazují jeden a ten samý rozdíl v ponoru. Každá z těchto linií uvádí kolizní místo ve vertikálním směru. Na příkladu uvedeném v kresbě v 9.3.4.3.1.2.2.1.1 jsou určena tři místa nárazu ve vertikálním směru, ukázaná

jako tři zóny. P1 – bod ve kterém spodní hrana vertikální části přídě tlačného člunu nebo přídě plavidla se žebry tvaru V naráží na postižené plavidlo v úrovni paluby. Trojúhelníková plocha odpovídající případu nárazu je ohraničená bodem P1. Odpovídá místu nárazu ve vertikálním směru „náraz na úrovni paluby“. Trojúhelníková vrchní levá plocha obdélníku odpovídá místu nárazu ve vertikálním směru „náraz níže paluby“. Pro výpočty nárazu se musí použít rozdíl v ponoru ΔT_i , kde $i = 1, 2, 3$ (viz následující obrázek).

Příklad míst nárazu ve vertikální situaci

- 9.3.4.3.1.2.2.1.4 Pro výpočet hodnot energie nárazu se musí použít nejvyšší hodnota hmotnosti jak plavidla způsobující náraz, tak i plavidla, kterému je náraz způsoben (nejvyšší bod na každé příslušné diagonále ΔT_i).
- 9.3.4.3.1.2.2.1.5 V závislosti od konstrukce plavidla může uznaná klasifikační společnost vyžadovat určení doplňujícího místa nárazu.
- 9.3.4.3.1.2.2.2 *Tankové plavidlo typu G*
Pro tankové plavidlo typu G se předpokládá pouze náraz na úrovni poloviny výšky tanku. Uznaná klasifikační společnost může vyžadovat určení doplňujícího místa nárazu v jiných výškách. Toto musí být odsouhlaseno s uznanou klasifikační společností.
- 9.3.4.3.1.2.3 Místa nárazu v podélném směru
- 9.3.4.3.1.2.3.1 *Tankové plavidlo typu C a N*
Nutno uvažovat nejméně se třemi následujícími typickými kolizními místy v podélném směru:
- do přepážky,
 - mezi rámovými žebry a

- do rámových žeber.

9.3.4.3.1.2.3.2 Tankové plavidlo typu G

Pro tanková plavidla typu G nutno uvažovat nejméně se třemi následujícími typickými kolizními místy v podélném směru:

- do konce nákladní nádrže,
- mezi rámovými žebry a
- do rámových žeber.

9.3.4.3.1.2.4 Počet kolizních míst

9.3.4.3.1.2.4.1 Tanková plavidla typu C a N

V příkladu uvedeném v 9.3.4.3.1.2.2.1.3 a 9.3.4.3.1.2.3.1, dává kombinace kolizních míst ve vertikálním i podélném směru následující výsledek: $3 \times 3 = 9$ kolizních míst.

9.3.4.3.1.2.4.2 Tankové plavidlo typu G

V příkladu uvedeném v 9.3.4.3.1.2.2.2 a 9.3.4.3.1.2.3.2 dává kombinace kolizních míst ve vertikálním i podélném směru následující výsledek: $1 \times 3 = 3$ kolizní místa.

9.3.4.3.1.2.4.3 Doplňující sledování tankových plavidel typu G, C a N s vloženými nákladními tanky

Pro důkaz toho, že opory tanků a zařízení omezující plavbyschopnost nezpůsobují předčasné roztržení tanku, musí se provádět doplňující výpočty. Doplňující kolizní místa se musí odsouhlasit s uznanou klasifikační společností.

9.3.4.3.1.3 Krok 3

9.3.4.3.1.3.1 Pro každé typické kolizní místo se určuje váhový koeficient, ukazující relativní pravděpodobnost toho, že náraz bude způsoben v tom typickém místě. V tabulce v 9.3.4.3.1 jsou tyto koeficienty označeny jako wfloc(i) (sloupec J). Předpokládaná hodnota musí být odsouhlasena s uznanou klasifikační společností.

Váhový koeficient pro každé kolizní místo je výsledkem vynásobení koeficientu pro kolizní místo ve vertikálním směru s koeficientem pro kolizní místo v podélném směru.

9.3.4.3.1.3.2 Kolizní místo ve vertikálním směru

9.3.4.3.1.3.2.1 Tanková plavidla typu C a N

Váhové koeficienty pro různá místa nárazu ve vertikálním směru se určují v každém případě jako vztah mezi dílčí plochou pro příslušný případ nárazu a celkovou plochou obdélníku, jak ukazuje kresba v 9.3.4.3.1.2.2.1.1.

Například pro případ 1 nárazu (viz nákres v 9.3.4.3.1.2.2.1.3) se váhový koeficient rovná poměru mezi trojúhelníkovou spodní pravou plochou obdélníku a plochou obdélníku mezi minimální a maximální hodnotou ponoru plavidla způsobujícího náraz a plavidla, kterému byl náraz způsoben.

9.3.4.3.1.3.2.2 Tanková plavidla typu G

Váhový koeficient ve vertikálním směru se rovná 1,0, když se předpokládá pouze jedno kolizní místo. V případě, když uznaná klasifikační společnost požaduje určit doplňující kolizní místa, tak váhový koeficient musí být určen shodně se způsobem stanoveným pro tanková plavidla typu C a N.

9.3.4.3.1.3.3 Kolizní místo v podélném směru

9.3.4.3.1.3.3.1 Tanková plavidla typu C a N

Váhový koeficient pro každé kolizní místo v podélném směru se rovná poměru mezi „výpočetní délkou úseku“ a délkou tanku.

Výpočetní délka úseku se vypočítá takto:

- (a) náraz do přepážky:
0,2 × vzdálenost mezi rámovým žebrem a přepážkou, ale ne více 450 mm;
- (b) náraz do rámového žebra:
součet dvou součinitelů: 0,2 × vzdálenost mezi rámovými žebry, umístěnými od žebra směrem k zádi, ale ne více 450 mm, a
- (c) náraz mezi rámovými žebry;

délka nákladního tanku, s výčtem délky spojené s „nárazem do přepážky“ a délky, spojené s „nárazem do rámového žebra“.

9.3.4.3.1.3.3.2 Tanková plavidla typu G

Váhový koeficient pro každé kolizní místo v podélném směru se rovná poměru mezi „vypočtenou délkou úseku“ a délkou nákladového prostoru.

Výpočetní délka úseku se vypočítá takto:

- (a) náraz do podélné strany nákladního tanku:
vzdálenost mezi přepážkou a začátkem cylindrické části nákladního tanku;
- (b) náraz do rámového žebra:
součet dvou součinitelů: $0,2 \times$ vzdálenost mezi rámovými žebry, umístěnými od žebra směrem k přídi, ale ne více než 450 m a $0,2 \times$ vzdálenost mezi rámovými žebry, umístěnými od žebra směrem k zádi, ale ne více než 450 m, a
- (c) náraz mezi rámovými žebry:
délka nákladního tanku mínus délka „náraz do podélné strany nákladního tanku“ a délka „náraz do rámového žebra“.

9.3.4.3.1.4 Krok 4

9.3.4.3.1.4.1 Pro každé kolizní místo se vypočítává schopnost pohlcení energie nárazu. Ve vztahu k tomuto je schopnost pohlcení energie nárazu rovná množství energie nárazu, pohlcené konstrukcí plavidla do začátku proražení nákladního tanku (viz tabulka v 9.3.4.3.1 sloupec D: Eloc(i)). Na tento účel se použije metoda konečných prvků v souladu s 9.3.4.4.2.

9.3.4.3.1.4.2 Tyto výpočty se musí provádět pro dva scénáře kolizí v souladu s dále uvedenou tabulkou. Scénář kolize I. se analyzuje za předpokladu, že tlačný člun má čelo ve tvaru oblouku. Scénář kolize II. se analyzuje za předpokladu, že tlačný člun má čelo ve tvaru V. Tyto formy přídě jsou určeny v 9.3.4.4.8.

Tabulka: Koeficienty snížení rychlosti pro scénář I nebo scénář II s váhovými koeficienty

		Příčiny		
		Chyba spojená se špatnou viditelností	Technická závada	Lidská chyba
		0,50	0,20	0,30
Nejméně příznivý scénář	I	0,66	0,50	1,00
	II			
		0,20	0,30	1,00

Nejméně příznivý scénář	I		Příd' tlačného člunu, úhel nárazu 55°	0,80	0,66	0,50	1,00
	II		Příd' plavidla s žebry tvaru V úhel nárazu 90°	0,20			

9.3.4.3.1.5 Krok 5

9.3.4.3.1.5.1 Pro každou hodnotu způsobivosti pohlčení energie při kolizi $E_{loc(i)}$ je nutno připočítat příslušnou pravděpodobnost převýšení, tj. pravděpodobnost proražení nákladního tanku. Pro tento cíl se musí využít funkce hustoty pravděpodobnosti uvedeny (CPDF). Příslušné koeficienty se musí vzít z tabulky v 9.3.4.3.1.5.6 s ohledem efektivní hmotnosti plavidla, do kterého byl proveden náraz.

$$P_{x\%} = C_1(E_{loc(i)})^3 + C_2(E_{loc(i)})^2 + C_3 E_{loc(i)} + C_4$$

kde: $P_{x\%}$ pravděpodobnost proražení tanku
 C_{1-4} koeficient převzatý z tabulky 9.3.4.3.1.5.6
 $E_{loc(i)}$ způsobivost pohlčení energie kolize.

9.3.4.3.1.5.2 Efektivní hmotnost se musí rovnat veličině maximálního výtaku plavidla vynásobené koeficientem 1,4. Musí být uvažovány oba scénáře kolize (9.3.4.3.1.4.2).

9.3.4.3.1.5.3 V případě scénáře Kolize I (příď tlačného člunu, úhel nárazu 55°) se musí použít následující tři rovnice CPDF:

CPDF 50% (rychlost = 0,5 V_{max}),
 CPDF 66% (rychlost = 2/3 V_{max}),
 CPDF 100% (rychlost = V_{max}).

9.3.4.3.1.5.4 V případě scénáře Kolize II (příď plavidla se žebry tvaru V, úhel nárazu 90°) se musí použít následující dvě rovnice CPDF:

CPDF 30% (rychlost = 0,3 V_{max}),
 CPDF 100% (rychlost = V_{max}).

9.3.4.3.1.5.5 V tabulce v 9.3.4.3.1 (sloupec F) jsou tyto pravděpodobnosti příslušně označeny jako P50%, P66%, P100% a P30%, P100%.

9.3.4.3.1.5.6 Tabulka: Koeficienty pro rovnice složených funkcí pevnosti pravděpodobností – CPDF

Efektivní hmotnost plavidla, do kterého byl učiněn náraz (t)	rychlost = 1 × V_{max}				pásmo
	koeficienty				
	C_1	C_2	C_3	C_4	
14000	4.106E-05	-2.507E-03	9.727E-03	9.983E-01	4 < E_{loc} < 39

3000	7.902E-02	-7.546E-01	5.079E-01	9.218E-01	$1 < E_{loc} < 2$
1500	-1.031E+00	2.214E-01	1.891E-01	9.554E-01	$0,5 < E_{loc} < 1$

Pásmo, ve kterém se používá tato rovnice, je uvedeno ve sloupci 6. V případě, kdy hodnota E_{loc} je nižší než toto pásmo, pak pravděpodobnost $P_{x\%} = 1,0$. V případě, kdy je hodnota vyšší tohoto pásma, potom $P_{x\%} = 0$.

9.3.4.3.1.6

Krok 6

Musí se vypočítat vážené pravděpodobnosti proražení nákladního tanku $P_{wx\%}$ (tabulka v 9.3.4.3.1 (sloupec H) vynásobením každé z pravděpodobností proražení nákladního tanku $P_{x\%}$ (tabulka v 9.3.4.3.1, sloupec F) váhovými koeficienty $wf_{x\%}$, uvedenými v následující tabulce:

Tabulka: Váhové koeficienty pro každou charakteristiku rychlost kolize

			váhový koeficient
Scénář I	CPDF 50%	wf50%	0,2
	CPDF 66%	wf66%	0,5
	CPDF 100%	wf100%	0,3
Scénář II	CPDF 30%	wf30%	0,7
	CPDF 100%	wf100%	0,3

9.3.4.3.1.7

Krok 7

Musí se vypočítat všechna pravděpodobná místa proražení nákladního tanku $P_{loc(i)}$ (tabulka v 9.3.4.3.1, sloupec I) podle výsledků v 9.3.4.3.1.6 (krok 6) jako součet všech vážených pravděpodobností proražení nákladního tanku $P_{wx\%}$ (tabulka v 9.3.4.3.1, sloupec H) pro každé posuzované kolizní místo.

9.3.4.3.1.8

Krok 8

V každém případě je nutno vypočítat všechny vážené pravděpodobnosti proražení nákladního tanku $P_{wloc(i)}$ pro oba scénáře kolize vynásobením všech pravděpodobností proražení nákladního tanku $P_{loc(i)}$ pro každé kolizní místo s váhovými koeficienty $wf_{loc(i)}$, odpovídající danému koliznímu místu (viz 9.3.4.3.1.3 (krok 3) a tabulka v 9.3.4.3.1, sloupec J).

9.3.4.3.1.9

Krok 9

Součtem všech vážených pravděpodobností proražení nákladního tanku $P_{wloc(i)}$ je nutno vypočítat všechny specifické scénáře pravděpodobnosti proražení nákladního tanku $P_{scen I}$ a $P_{scen II}$ (tabulka v 9.3.4.3.1, sloupec L) jednotlivě pro každý scénář kolize I a II.

9.3.4.3.1.10 *Krok 10*

Nakonec je nutno vypočítat váženou hodnotu celkové pravděpodobnosti proražení nákladního tanku P_w podle rovnice uvedené níže (tabulka v 9.3.4.3.1, sloupec O):

$$P_w = 0,8 \times P_{\text{scen I}} + 0,2 \times P_{\text{scen II}}$$

9.3.4.3.1.11 *Krok 11*

Výsledná celková pravděpodobnost proražení nákladního tanku P_w pro alternativní konstrukci se označuje jako P_n . Výsledná celková pravděpodobnost proražení nákladního tanku P_w pro původní konstrukci se označuje jako P_r .

9.3.4.3.1.12 *Krok 12*

9.3.4.3.1.12.1 Je nutno určit vztah (C_n/C_r) mezi následky (rozměr poškození) C_n proražení nákladního tanku alternativní konstrukce a následky C_r proražení nákladního tanku původní konstrukce podle následujícího vzorce:

$$C_n/C_r = V_n/V_r,$$

Kde: C_n/C_r je poměr mezi následkem spojeným s alternativní konstrukcí a následkem spojeným s původní konstrukcí,

V_n maximální kapacita největšího nákladního tanku při alternativní konstrukci,

V_r maximální kapacita největšího nákladního tanku při původní konstrukci.

9.3.4.3.1.12.2 Tento vzorec byl získán pro charakteristické náklady, uvedené v následující tabulce:

Tabulka: Charakteristické náklady

	UN	Popis
Benzen	1114	Hořlavá kapalina Obalová skupina II Zdraví nebezpečná
Akrylnitril stabilizovaný ACN	1093	Hořlavá kapalina Obalová skupina I Toxická, stabilizovaná
n-Hexan	1208	Hořlavá kapalina Obalová skupina II
Nonan	1920	Hořlavá kapalina Obalová skupina III
Čpavek	1005	Toxický, žíravý plyn Zkapalněný pod tlakem
Propan	1978	Hořlavý plyn Zkapalněný pod tlakem

9.3.4.3.1.12.3 Pro nákladní tanky o objemu 380 m³ – 1000 m³, obsahující hořlavé, toxické a žíravé kapaliny nebo plyny je nutno vycházet z předpokladu, že zvýšení efektu se nachází v lineární závislosti na zvýšení objemu tanku (koeficient poměru 1,0).

9.3.4.3.1.12.4 Když se látky musí přepravovat tankovými pravidly prověřené v souladu s tímto postupem výpočtu, s předpokladem, že koeficient poměru mezi celkovou kapacitou nákladního tanku a znečištěnou plochou je vyšší než 1,0, jak se předpokládá v předcházejícím pododdíle, znečištěná plocha se musí určovat samostatným výpočtem. V tom případě se srovnání musí provádět samostatným výpočtem. V tom případě se porovnání popsané v 9.3.4.3.1.13 (krok 13) musí provádět s využitím této odlišné hodnoty velikosti znečištěné plochy.

9.3.4.3.1.13 *Krok 13*

Na závěr je nutno porovnat poměr $\frac{P_r}{P_n}$ mezi výslednou celkovou pravděpodobností proražení nákladního tanku při původní konstrukci P_r a výslednou celkovou pravděpodobností proražení nákladního tanku alternativní konstrukce P_n v poměru $\frac{C_n}{C_r}$ mezi následkem spojeným s alternativní

konstrukcí a následkem, spojeným s výchozí konstrukcí.

V případě $\frac{C_n}{C_r} \leq \frac{P_r}{P_n}$ je k dispozici důkaz podle 9.3.4.1.3 pro alternativní konstrukci.

9.3.4.4 Určení schopnosti pohlcení energie kolize

9.3.4.4.1 Obecná ustanovení

9.3.4.4.1.1 Určení schopnosti pohlcení energie kolize se musí provádět cestou analýzy metodou konečných prvků *Finite Element Analysis (FEA)*. Tato analýza se musí provádět s využitím přijatého konečně-elementárního komplexu (například LS-DYNA⁶, PAM-CRASH⁷, ABAQUS⁸ apod.), který umožňuje posuzovat jak geometrické efekty, tak i materiální nelineární vlivy. Takový komplex musí rovněž umožňovat realistické modelování proražení.

9.3.4.4.1.2 Skutečně využitý program a úroveň podrobnosti výpočtů musí být odsouhlasen s uznanou klasifikační společností.

9.3.4.4.2 Vytvoření modelů konečných prvků modelů FE

9.3.4.4.2.1 Je třeba postavit modely FE na konstrukci vyšší odolnosti proti nárazům a jeden model pro původní konstrukci. Každý model FE musí popisovat všechny plastické deformace, které mohou vzniknout ve všech posuzovaných případech kolize. Modelový sektor plochy oblasti nákladu musí být odsouhlasen s uznanou klasifikační společností.

9.3.4.4.2.2 Na obou koncích modelového sektoru musí být vymezeny všechny tři postupující stupně volnosti. Ve většině případů nemá kolize významný vliv na podélný průhyb trupu paliva. Pro zhodnocení energie plastické deformace, je dostatečné vzít na vědomí pouze polupalubník plavidla. V těchto případech příčný pohyb po diametrální linii (DL) musí být omezen. Po vytvoření modelu FE je nutno provést zkušební výpočet kolize, s cílem přesvědčit se o tom, že se nestala jakákoliv plastická deformace v blízkosti stanovených hranic. V opačném případě musí být rozšířen modelovaný prostor.

9.3.4.4.2.3 Konstrukční plochy zasažené během kolize, musí být modelovány dostatečně detailně, přičemž současně jiné části mohou být modelovány všeobecněji. Řídkost v konečné elementární síti musí být dostatečná pro závěrečný popis lokálních deformací posunu a pro realistickou demonstraci proražení částí.

9.3.4.4.2.4 Výpočet začátku proražení se musí zakládat na kritériích proražení, vycházejících pro používané elementy. Maximální rozměr elementu musí představovat méně než 200 mm na úsecích kolize. Poměr mezi delší a kratší hranou prvku obšívky nesmí převyšovat 3. Délka prvku L pro prvek obšívky je definována jako větší délka obou stran prvku. Vztah mezi délkou elementu a tloušťkou elementu musí být větší než 5. Jiné hodnoty musí být odsouhlaseny s uznanou klasifikační společností.

9.3.4.4.2.5 Plechové konstrukce, takové jako vnější obšívka, vnitřní těleso (těleso tanku v případě tankového plavidla pro přepravu plynů), žebra a rovněž stringery (vazníky), mohou být modelovány jako elementy vnější obšívky, a vztuhy jako prvky nosníků. Při modelování se musí zohledňovat výřezy a průřezy v úsecích kolize.

9.3.4.4.2.6 Při výpočtu FE se musí použít metoda penalizace vrchlů segmentu (*the node on segment penalty method*). Pro tyto cíle musí být zpracovány následující varianty:

- contact_automatc_single_surface v LS-DYNA,
- self impacting v PAMCRASH a
- analogické typy kontaktu v jiných programech FE.

⁸ SIMULIA, Rising Sun Mills, 166 Valley Street, Providence, RI 02909-2499 USA

9.3.4.4.3 *Vlastnosti materiálů*

9.3.4.4.3.1 Z důvodu extrémního chování materiálů a konstrukcí při kolizi, přičemž jak s geometrickým, tak i s nelineárním působením na materiály, musí se používat skutečný vztah „napětí-deformace“:

$$\sigma = C \cdot \varepsilon^n,$$

kde

$$n = \ln(1 + A_g),$$

$$C = R_m (e/n)^n,$$

A_g – maximální jednosložková deformace, spojená s hraničním napětím při roztržení R_m , a e – přirozená logaritmická konstanta.

9.3.4.4.3.2 Hodnoty A_g a R_m se určují tahovými zkouškami.

9.3.4.4.3.3 Jsou-li k dispozici jen konečná pevnost v tahu R_m pro lodní ocel mající horní mez pevnosti kluzu R_{eH} nejvýše 355 H/mm², musí se použít následující aproximace pro získání hodnoty A_g na základě známé hodnoty R_m [H/mm²]:

$$A_g = \frac{1}{0,24 + 0,01395 * R_m}$$

9.3.4.4.3.4 Když při zahájení výpočtů nejsou k dispozici údaje o vlastnostech materiálů obdržené z tahových zkoušek, pak se místo nich musí použít minimální hodnoty A_g a R_m , které jsou uvedené v Pravidlech uznané klasifikační společnosti. Pro lodní ocel s hranicí meze kluzu více než 355 H/mm², nebo jiné materiály než lodní ocel, musí být vlastnosti materiálů odsouhlaseny s uznanou klasifikační společností.

9.3.4.4.4 *Kritéria proražení*

9.3.4.4.4.1 První trhlinka prvku v FEA je definována hodnotou napětí, při kterém dochází k narušení. Jestliže vypočítané napětí, jako je napětí plastické deformace, nebo v případě prvků obšívky napětí ve směru tloušťky tohoto prvku, přesáhne svoji určenou hodnotu napětí, při které dochází k narušení, prvek se vyloučí z modelu FE a deformační energie se v tomto prvku v následujících výpočtových krocích už nebude měnit.

9.3.4.4.4.2 Pro výpočet deformace proražení se používá následující vzorec:

$$\varepsilon_f(l_e) = \varepsilon_g + \varepsilon_e * \frac{t}{l_e}$$

kde

ε_g = rovnoměrná deformace

ε_e = zúžení

t = tloušťka plechu

l_e = délka jednotlivého prvku.

9.3.4.4.4.3 Hodnoty rovnoměrné deformace a zúžení pro lodní ocel, která má hranici meze kluzu R_{eH} nejvýše 355 H/mm², se vezme z následující tabulky:

stav napětí	1-D	2-D
ε_g	0,079	0,056
ε_e	0,76	0,54
typ části	mřížový nosník	vnější obšívka

9.3.4.4.4.4 Jiné hodnoty ε_g a ε_e , vzaté z měření tloušťky při typických příkladech poškození a v průběhu experimentů se mohou použít se souhlasem uznané klasifikační společnosti.

9.3.4.4.4.5 Uznaná klasifikační společnost může souhlasit s jinými kritériem proražení, když budou doloženy důkazy získané v průběhu příslušných zkoušek.

9.3.4.4.4.6 *Tankové plavidlo typu G*

V případě tankového plavidla typu G se kritéria proražení vysokotlakového tanku zakládají na hodnotě, která je ekvivalentní plastické deformaci. V případě použití kritéria proražení musí být použita hodnota odsouhlasena s uznanou klasifikační společností. Hodnoty ekvivalentní plastické deformace, spojené se stlačením, se nezapočítávají.

9.3.4.4.5 Výpočet schopnosti pohltit energii nárazu

9.3.4.4.5.1 Schopnost pohltit energii nárazu je součet vnitřní energie (energie spojená s deformací konstrukčních prvků) a energie tření.

Koeficient tření μ_c se určuje jako:

$$\mu_c = FD + (FS - FD) * e^{-DC|v_{rel}|}$$

kde: $FD = 0,1$

$FS = 0,3$

$DC = 0,01$

V_{rel} = relativní rychlost tření.

POZNÁMKA: Pro lodní ocel se hodnoty stanovují jako výchozí.

9.3.4.4.5.2 Křivky síly průrazu, získané v důsledku výpočtu s využitím modelu FE musí být předloženy uznané klasifikační společnosti.

9.3.4.4.5.3 *Tankové plavidlo typu G*

9.3.4.4.5.3.1 Pro získání celkové schopnosti pohltit energii v případě tankového plavidla typu G se vypočítává energie pohlcená v procesu stlačení par při kolizi.

9.3.4.4.5.3.2 Energie E, pohlcená parami, se vypočítává takto:

$$E = \frac{p_1 * V_1 - p_0 * V_0}{1 - \gamma}$$

kde:

$\gamma = 1,4$

(Poznámka: hodnota 1,4 je stanovena jako výchozí veličinou c_p/c_v , kde v zásadě:

c_p = měrné teplo při stálém tlaku [J/(kgK)]

c_v = měrné teplo při stálém objemu [J/(kgK)]

p_0 = tlak na počátku stlačení [Pa]

p_1 = tlak na konci stlačení [Pa]

V_0 = objem na počátku stlačení [m³]

V_1 = objem na konci stlačení [m³]

9.3.4.4.6 Určení plavidla které náraz způsobilo a přídě, která náraz způsobila

9.3.4.4.6.1 Při výpočtu schopnosti pohltit energii kolize se používají přinejmenším dva typy tvaru přídě plavidla, které náraz způsobilo:

- tvar přídě I: přídě tlačného člunu (viz 9.3.4.4.8),
- tvar přídě II: přídě plavidla s žebry tvaru V bez bulby (viz 9.3.4.4.8).

9.3.4.4.6.2 Nakolik se ve většině případů kolize přídě plavidla způsobujícího náraz deformuje pouze nevýrazně ve srovnání s bočními konstrukcemi plavidla, kterému byl náraz způsoben, tak se přídě způsobující náraz určuje jako pevná. Pouze pro jednotlivé situace, kdy plavidlo, kterému byl náraz způsoben, má mimořádně pevné boční konstrukce ve srovnání s přídě způsobující náraz a chování konstrukce plavidla, kterému byl náraz způsoben počítuje vliv plastické deformace přídě způsobující náraz, tak narážející čelo se považuje za neformovatelné. V tom případě konstrukce přídě, způsobující náraz musí být rovněž modelována. Toto musí být odsouhlaseno s uznanou klasifikační společností.

9.3.4.4.7 Předpoklady pro případy kolize

Pro případy kolize je nutno vycházet z následujících předpokladů:

- (a) úhel nárazu mezi plavidlem, způsobujícím náraz a plavidlem, kterému byl náraz způsoben, představuje 90° v případě přídě plavidla tvaru V a 55° v případě přídě tlačného člunu;

- (b) plavidlo, kterému byl náraz způsoben, má nulovou rychlost a plavidlo, které náraz způsobilo, naráží na bok plavidla, kterému je náraz způsoben, se stálou rychlostí 10 m/s.

Rychlost nárazu 10 m/s je přijatou hodnotou použitou analýze FE.

9.3.4.4.8 *Typy tvaru přídě*

9.3.4.4.8.1 *Příd' tlačného člunu*

V následující tabulce jsou uvedeny charakteristické rozměry:

žebro	poloviční šířky			přední vazník	výšky		
	ohyb 1	ohyb 2	paluba		ohyb 1	ohyb 2	paluba
145	4.173	5.730	5.730	0.769	1.773	2.882	5.084
146	4.100	5.730	5.730	0.993	2.022	3.074	5.116
147	4.028	5.730	5.730	1.255	2.289	3.266	5.149
148	3.955	5.711	5.711	1.559	2.576	3.449	5.181
149	3.883	5.653	5.653	1.932	2.883	3.621	5.214
150	3.810	5.555	5.555	2.435	3.212	3.797	5.246
151	3.738	5.415	5.415	3.043	3.536	3.987	5.278
152	3.665	5.230	5.230	3.652	3.939	4.185	5.315
příčka	3.600	4.642	4.642	4.200	4.300	4.351	5.340

Pro ilustraci se uvádějí následující kresby.

Bilge radius = radius zaoblení skuly
 Cargo bulkhead = přepážka nákladního prostoru
 Deck at C.L. (straight line) = paluba v ose (přímá linie)
 Flat bottom = ploché dno
 Frame = žebro
 Framespacing = vzdálenost mezi žebry
 Stem transom = přední vazní příčka

9.3.4.4.8.2 V-příd'

V následující tabulce jsou uvedeny charakteristické rozměry:

Číslo pozice	x	y	z
1	0.000	3.923	4.459
2	0.000	3.923	4.852

Pro ilustraci se uvádějí následující kresby.

EVROPSKÁ HOSPODÁŘSKÁ KOMISE
Výbor pro vnitrozemskou dopravu

ADN

platná od 1. ledna 2021

Evropská dohoda o mezinárodní přepravě nebezpečných věcí po vnitrozemských vodních cestách

včetně Příloh, použitelné od 1. ledna 2021

Díl II

UNITED NATIONS
New York a Geneva, 2020

OBSAH**DÍL II**

Část 1	VŠEOBECNÁ USTANOVENÍ	Viz Díl I
Část 2	KLASIFIKACE	
Kapitola	2.1 Všeobecná ustanovení	
	2.1.1 Úvod	
	2.1.2 Zásady klasifikace	
	2.1.3 Klasifikace jmenovitě neuvedených látek, včetně roztoků a směsí (jako přípravky a odpady)	
	2.1.4 Zařazování zkušebních vzorků	
	2.1.5 Klasifikace předmětů jako předmětů obsahujících nebezpečné věci, j.n.	
	2.1.6 Klasifikace obalů, vyřazených, prázdných, nevyčištěných	
Kapitola	2.2 Zvláštní ustanovení pro třídy	
	2.2.1 Třída 1 Výbušné látky a předměty	
	2.2.2 Třída 2 Plyny	
	2.2.3 Třída 3 Hořlavé kapaliny	
	2.2.41 Třída 4.1 Hořlavé tuhé látky, samovolně se rozkládající látky, polymerizující látky a znečtivěné tuhé výbušné látky	
	2.2.42 Třída 4.2 Samozápalné látky	
	2.2.43 Třída 4.3 Látky, které ve styku s vodou vyvíjejí hořlavé plyny	
	2.2.51 Třída 5.1 Látky podporující hoření	
	2.2.52 Třída 5.2 Organické peroxidy	
	2.2.61 Třída 6.1 Toxické látky	
	2.2.62 Třída 6.2 Infekční látky	
	2.2.7 Třída 7 Radioaktivní látky	
	2.2.8 Třída 8 Žravé látky	
	2.2.9 Třída 9 Jiné nebezpečné látky a předměty	

Kapitola	2.3 Zkušební postupy	
	2.3.0 Všeobecně	
	2.3.1 Zkouška na výpotek pro trhaviny typu A	
	Zkoušky týkající se nitrovaných směsí celulózy třídy 1 a třídy 4.1	
	2.3.2 4.1	
	2.3.3 Zkoušky hořlavých kapalných látek tříd 3, 6.1 a 8	
	2.3.4 Zkouška ke stanovení tekutosti	
	2.3.5 Klasifikace organokovových látek do tříd 4.2 a 4.3	
Kapitola	2.4 Kritéria pro látky ohrožující vodní prostředí	
	2.4.1 Všeobecné definice	
	2.4.2 Definice a požadavky na údaje	
	2.4.3 Kategorie a kritéria klasifikace látek	
	2.4.4 Klasifikační kategorie a kritéria pro směsi	
Část 3	VYJMENOVÁNÍ NEBEZPEČNÝCH VĚCÍ, ZVLÁŠTNÍ USTANOVENÍ A VYNĚTÍ Z PLATNOSTI PRO OMEZENÁ MNOŽSTVÍ	
Kapitola	3.1 Všeobecně	
	3.1.1 Úvod	
	3.1.2 Oficiální pojmenování	
	3.1.3 Roztoky nebo směsi	
Kapitola	3.2 Seznam nebezpečných věcí	
	3.2.1 Tabulka A: Seznam nebezpečných věcí v číselném pořadí	
	3.2.2 Tabulka B: Abecední seznam látek	
	3.2.3 Tabulka C: Seznam nebezpečných věcí připuštěných k přepravě v tankových plavidlech v číselném pořadí	Viz Díl I
	3.2.4 Formy žádosti o zvláštní povolení pro přepravu v tankových plavidlech podle oddílu 1.5.2	Viz Díl I
Kapitola	3.3 Zvláštní ustanovení pro určité látky nebo předměty	

Kapitola	3.4 Vynětí z platnosti předpisů týkající se nebezpečných věcí balených v omezených množstvích	
	3.4.7 Značka kusů obsahujících omezená množství	
	3.4.8 Značka kusů obsahujících omezená množství podle části 3, kapitoly 4 Technických pokynů ICAO	
Kapitola	3.5 Nebezpečné věci balené ve vyňatých množstvích	
Část 4	USTANOVENÍ O POUŽÍVÁNÍ OBALŮ, CISTEREN A DOPRAVNÍCH JEDNOTEK S VOLNĚ LOŽENÝMI LÁTKAMI	Viz Díl I
Část 5	POSTUPY PŘI ODESLÁNÍ	Viz Díl I
Část 6	POŽADAVKY NA KONSTRUKCI A TESTOVÁNÍ OBALŮ, IBC, VELKÝCH OBALŮ, CISTEREN A KONTEJNERŮ PRO VOLNĚ LOŽENÉ LÁTKY	Viz Díl I
Část 7	PŘEDPISY PRO NAKLÁDKU, PŘEPRAVU, VYKLÁDKU A OSTATNÍ MANIPULACI S NÁKLADEM	Viz Díl I
Část 8	PŘEDPISY PRO POSÁDKY, VYBAVENÍ, PROVOZ PLAVIDEL A DOKUMENTACI	Viz Díl I
Část 9	PŘEDPISY PRO STAVBU PLAVIDEL	Viz Díl I

ČÁST 2
KLASIFIKACE

KAPITOLA 2.1

VŠEOBECNÁ USTANOVENÍ

2.1.1 Úvod

2.1.1.1 V ADN jsou následující třídy nebezpečných věcí:

Třída 1	Výbušné látky a předměty
Třída 2	Plyny
Třída 3	Hořlavé kapaliny
Třída 4.1	Hořlavé tuhé látky, samovolně se rozkládající látky, polymerizující látky a znečlivěně tuhé výbušné látky
Třída 4.2	Samozápalné látky
Třída 4.3	Látky, které ve styku s vodou vyvíjejí hořlavé plyny
Třída 5.1	Látky podporující hoření
Třída 5.2	Organické peroxidy
Třída 6.1	Toxické látky
Třída 6.2	Infekční látky
Třída 7	Radioaktivní látky
Třída 8	Žíravé látky
Třída 9	Jiné nebezpečné látky a předměty

2.1.1.2 Ke každé položce v různých třídách je přiřazeno UN číslo. Používají se následující druhy položek:

A. Samostatné položky pro přesně definované látky nebo předměty, včetně položek pokrývajících více isomerů, např.:

UN 1090	ACETON
UN 1104	AMYLACETÁTY
UN 1194	ETHYLNITRIT, ROZTOK

B. Druhové položky pro přesně definované skupiny látek nebo předmětů, které nejsou j.n. položkami, např.:

UN 1133	LEPIDLA
UN 1266	VÝROBKY KOSMETICKÉ
UN 2757	PESTICID KARBAMÁT, TUHÝ, TOXICKÝ
UN 3101	PEROXID ORGANICKÝ TYP B, KAPALNÝ

C. Specifické j.n. položky zahrnující skupiny látek nebo předmětů určité chemické nebo technické povahy, jinde nejmenované, např.:

UN 1477	DUSIČNANY, ANORGANICKÉ, J.N.
UN 1987	ALKOHOLY, J.N.

D. Všeobecné j.n. položky zahrnující skupiny látek nebo předmětů, mající jednu nebo více nebezpečných vlastností, jinde nejmenované, např.

UN 1325	LÁTKA HOŘLAVÁ, TUHÁ, ORGANICKÁ, J.N.
UN 1993	LÁTKA HOŘLAVÁ, KAPALNÁ, J.N.

Položky definované pod písmeny B, C a D se označují jako hromadné položky.

2.1.1.3 Pro účely balení jsou látky, kromě látek tříd 1, 2, 5.2, 6.2 a 7 a kromě samovolně se rozkládajících látek třídy 4.1, přiřazeny k obalovým skupinám v závislosti na svém stupni nebezpečí:

Obalová skupina I:	látky velmi nebezpečné
Obalová skupina II:	látky středně nebezpečné
Obalová skupina III:	látky málo nebezpečné

Obalová skupina (obalové skupiny), k nimž je látka přiřazena, je (jsou) uvedena(y) v tabulce A kapitoly 3.2.

Předměty nejsou přiřazeny k obalovým skupinám. Pro účely balení je jakýkoli požadavek na specifickou konstrukční úroveň obalu uveden v příslušném pokynu pro balení.

2.1.1.4 Pro účely přepravy v tankových lodích mohou být některé látky dále členěny.

2.1.2 Zásady klasifikace

2.1.2.1 Nebezpečné věci, které spadají pod název třídy, jsou definovány na základě svých vlastností dle pododdílu 2.2.x.1 odpovídající třídy. Zařazení nebezpečných věcí do určité třídy a přiřazení k obalové skupině se provádí podle kritérií uvedených ve stejném pododdílu 2.2.x.1. Přiřazení jednoho nebo více vedlejších nebezpečí nebezpečné látce nebo předmětu se provádí podle kritérií třídy nebo tříd odpovídajících těmto nebezpečím, jak je uvedeno v příslušném(y) pododdílu(ech) 2.2.x.1.

2.1.2.2 Všechny položky nebezpečných věcí jsou uvedeny v tabulce A kapitoly 3.2 v číselném pořadí UN čísel. Tato tabulka obsahuje odpovídající informace o uvedených věcech, jako pojmenování, třídu, obalovou(é) skupinu(y), bezpečnostní značku(y), která(é) musí být umístěna(y), jakož i ustanovení¹ o balení a přepravě. Látky jmenovitě uvedené ve sloupci (2) tabulky A kapitoly 3.2 musí být přepravovány podle své klasifikace v tabulce A, nebo za podmínek stanovených v 2.1.2.8.

2.1.2.3 Látka smí obsahovat technické nečistoty (například takové, které pocházejí z výrobního procesu) nebo přísady pro stabilizaci nebo jiné účely, které neovlivňují její klasifikaci. Avšak látka jmenovitě uvedená, tj. uvedená jako samostatná položka v tabulce A kapitoly 3.2, která obsahuje technické nečistoty nebo přísady pro stabilizaci nebo jiné účely ovlivňující její klasifikaci, musí být považována za roztok nebo směs (viz 2.1.3.3).

2.1.2.4 K přepravě nejsou připuštěny nebezpečné věci uvedené nebo definované v pododdílu 2.2.x.2 každé třídy.

2.1.2.5 Jmenovitě neuvedené nebezpečné věci, tj. věci, které nejsou uvedeny jako samostatné položky v tabulce A kapitoly 3.2 a které nejsou uvedeny ani definovány v jednom z výše uvedených pododdílů 2.2.x.2, musí být zařazeny do příslušné třídy podle postupu oddílu 2.1.3. Dále musí být stanoveno vedlejší nebezpečí (pokud je) a obalová skupina (pokud je). Po stanovení třídy, vedlejšího nebezpečí (pokud je) a obalové skupiny (pokud je), musí být určeno odpovídající UN číslo. Rozhodovací stromy uvedené v pododdílech 2.2.x.3 (seznam hromadných položek) na konci každé třídy uvádějí určující parametry pro výběr příslušné hromadné položky (UN čísla). Ve všech případech musí být vybrána nejspecifičtější hromadná položka zahrnující vlastnosti látky nebo předmětu v pořadí vyjádřeném v pododdílu 2.1.1.2 písmeny B, C a D. Pouze v tom případě, že látka nebo předmět nemohou být zařazeny pod položku typu B nebo C podle pododdílu 2.1.1.2, je možné je zařadit pod položku typu D.

2.1.2.6 Na základě zkušebních postupů kapitoly 2.3 a kritérií stanovených v pododdílech 2.2.x.1 jednotlivých tříd může být stanoveno, jak je to uvedeno ve zmíněných pododdílech, že látka, roztok nebo směs určité třídy, které jsou jmenovitě uvedeny v tabulce A kapitoly 3.2, nesplňují kritéria této třídy. V tomto případě nenáleží dotyčná látka, roztok nebo směs do této třídy.

2.1.2.7 Pro účely klasifikace jsou látky s bodem tání nebo počátkem tání 20 °C nebo nižším při tlaku 101,3 kPa (1,013 baru) považovány za kapalné látky. Viskózní látku, pro kterou nelze stanovit přesný bod tání, je třeba podrobit zkoušce dle ASTM D 4359-90 nebo zkoušce ke stanovení tekutosti (zkouška penetrometrem) předepsané v oddílu 2.3.4.

2.1.2.8 Odesílatel, který zjistil na základě výsledků zkoušek, že látka jmenovitě uvedená ve sloupci (2) tabulky A kapitoly 3.2 splňuje kritéria pro třídu, která není uvedena ve sloupci (3a) nebo (5) tabulky A kapitoly 3.2, smí se schválením příslušného orgánu zaslat tuto látku:

- pod nevhodnější hromadnou položkou uvedenou v pododdílu 2.2.x.3, která zahrnuje všechna nebezpečí; nebo
- pod tímtéž UN číslem a pojmenováním, ale s informacemi o dodatečném nebezpečí(ch) nutnými pro identifikaci jednoho nebo více dodatečných vedlejších nebezpečí (dokumentace, nápis, velká bezpečnostní značka), za podmínky, že třída zůstane nezměněna a že jakékoli jiné přepravní podmínky (např. omezené množství, ustanovení pro balení a cisterny), které by normálně platily

¹ **Poznámka sekretariátu:** Abecední seznam těchto položek byl připraven sekretariátem a je uveden v tabulce B kapitoly 3.2. Tato tabulka není oficiální částí ADN.

pro látky mající takovou kombinaci nebezpečí, jsou stejné jako přepravní podmínky platné pro tuto jmenovitě uvedenou látku.

POZNÁMKA 1: Příslušným orgánem udělujícím schválení smí být příslušný orgán kterékoli smluvní strany ADN, který smí také uznat schválení udělené příslušným orgánem země, která není smluvní stranou ADN, za podmínky, že toto schválení bylo uděleno v souladu s postupy platnými podle RID, ADR, ADN, IMDG Code nebo Technických pokynů ICAO.

POZNÁMKA 2: Jestliže příslušný orgán udělí taková schválení, měl by o tom informovat Podvýbor expertů pro přepravu nebezpečných věcí OSN a podat příslušný návrh změny k Seznamu nebezpečných věcí ve Vzorových předpisech OSN. Pokud by byla navrhovaná změna zamítnuta, měl by příslušný orgán své schválení stáhnout.

POZNÁMKA 3: K přepravě podle 2.1.2.8 viz též 5.4.1.1.20.

2.1.3 Klasifikace jmenovitě neuvedených látek, včetně roztoků a směsí (jako přípravky a odpady)

2.1.3.1 Látky, včetně roztoků a směsí, jmenovitě neuvedené, musí být zařazeny podle svého stupně nebezpečnosti na základě kritérií uvedených v pododdílu 2.2.x.1 jednotlivých tříd. Nebezpečí vyplývající z látky musí být určeno(a) na základě jejích fyzikálních, chemických a fyziologických vlastností. Tyto vlastnosti je nutno rovněž zohlednit, pokud praktické zkušenosti vedou k přísnějšímu zařazení.

2.1.3.2 Látka jmenovitě neuvedená v tabulce A kapitoly 3.2, která vykazuje jediné nebezpečí, musí být zařazena do příslušné třídy pod hromadnou položku uvedenou v pododdílu 2.2.x.3 této třídy.

2.1.3.3 Roztok nebo směs splňující klasifikační kritéria ADN složená z jedné převažující látky, jmenovitě uvedené v tabulce A kapitoly 3.2, a z jedné nebo více látek nepodléhající(ch) ADN, a/nebo stopových množství jedné nebo více látek jmenovitě uvedených v tabulce A kapitoly 3.2, musí být přiřazeny k UN číslu a oficiálnímu pojmenování pro přepravu převažující látky, jmenovitě uvedené v tabulce A kapitoly 3.2, ledaže:

- (a) roztok nebo směs je jmenovitě uveden(a) v tabulce A kapitoly 3.2;
- (b) pojmenování a popis látky jmenovitě uvedené v tabulce A kapitoly 3.2 výslovně vyjadřují, že se vztahují jen na čistou látku;
- (c) třída, klasifikační kód, obalová skupina nebo fyzikální stav tohoto roztoku nebo směsi jsou odlišné od třídy, klasifikačního kódu, obalové skupiny nebo fyzikálního stavu látky jmenovitě uvedené v tabulce A kapitoly 3.2; nebo
- (d) charakteristiky nebezpečnosti a vlastnosti roztoku nebo směsi vyžadují opatření v případě nehody nebo nouzové situace, která jsou odlišná od opatření vyžadovaných pro látku jmenovitě uvedenou v tabulce A kapitoly 3.2.

V těchto jiných případech, kromě případu popsaného pod písmenem (a), musí být roztok nebo směs zařazena jako jmenovitě neuvedená látka do odpovídající třídy a přiřazena pod hromadnou položku uvedenou v pododdílu 2.2.x.3 této třídy, se zohledněním případných vedlejších nebezpečí představovaných tímto roztokem nebo směsí, ledaže by roztok nebo směs neodpovídaly kritériím žádné třídy, a proto nepodléhaly předpisům ADN.

2.1.3.4 Roztoky a směsi obsahující látku spadající pod jednu z položek uvedených v 2.1.3.4.1 nebo 2.1.3.4.2 musí být zařazeny podle ustanovení těchto odstavců.

2.1.3.4.1 Roztoky a směsi, obsahující jednu z následujících jmenovitě uvedených látek, musí být vždy přiřazeny pod stejnou položkou, jako v nich obsažená látka, za podmínky, že tyto roztoky a směsi nemají nebezpečné vlastnosti uvedené v 2.1.3.5.3:

- Třída 3

UN 1921 PROPYLENIMIN, STABILIZOVANÝ;

UN 3064 NITROGLYCERIN, ROZTOK V ALKOHOLU s více než 1 %, ale nejvýše 5 % nitroglycerinu;

- Třída 6.1
 - UN 1051 KYANOVODÍK, STABILIZOVANÝ, obsahující méně než 3 % vody;
 - UN 1185 ETYLENIMIN, STABILIZOVANÝ;
 - UN 1259 TETRAKARBONYL NIKLU;
 - UN 1613 KYSELINA KYANOVODÍKOVÁ, VODNÝ ROZTOK (KYANOVODÍK, VODNÝ ROZTOK), obsahující nejvýše 20 % kyanovodíku;
 - UN 1614 KYANOVODÍK, STABILIZOVANÝ, obsahující méně než 3 % vody a nasáklý v porézní inertní hmotě;
 - UN 1994 PENTAKARBONYL ŽELEZA;
 - UN 2480 METHYLISOKYANÁT;
 - UN 2481 ETHYLISOKYANÁT;
 - UN 3294 KYANOVODÍK, ROZTOK V ALKOHOLU, obsahující nejvýše 45 % kyanovodíku;

- Třída 8
 - UN 1052 FLUROVOVODÍK, BEZVODÝ;
 - UN 1744 BROM nebo UN 1744 BROM, ROZTOK;
 - UN 1790 KYSELINA FLUROVOVODÍKOVÁ, roztok, obsahující více než 85 % fluorovodíku;
 - UN 2576 Bromid fosforYLU, Roztavený.

2.1.3.4.2 Roztoky a směsi obsahující látku spadající pod jednu z následujících položek třídy 9:

- UN 2315 BIFENYLY POLYCHLOROVANÉ, KAPALNÉ;
- UN 3151 BIFENYLY POLYHALOGENOVANÉ, KAPALNÉ;
- UN 3151 MONOMETHYLDIFENYLMETHANY HALOGENOVANÉ, KAPALNÉ
- UN 3151 TERFENYLY POLYHALOGENOVANÉ, KAPALNÉ;
- UN 3152 BIFENYLY POLYHALOGENOVANÉ, TUHÉ;
- UN 3152 MONOMETHYLDIFENYLMETHANY HALOGENOVANÉ, TUHÉ;
- UN 3152 TERFENYLY POLYHALOGENOVANÉ, TUHÉ; nebo
- UN 3432 BIFENYLY POLYCHLOROVANÉ, TUHÉ

musí být vždy přiřazeny pod tutéž položku třídy 9, pokud

- neobsahují žádnou další nebezpečnou složku, jinou než složky obalové skupiny III tříd 3, 4.1, 4.2, 4.3, 5.1, 6.1 nebo 8; a
- nemají nebezpečné vlastnosti uvedené v 2.1.3.5.3.

2.1.3.4.3 Použité předměty, např. transformátory a kondenzátory obsahující roztok nebo směs uvedenou v 2.1.3.4.2, musí být vždy klasifikovány pod stejnou položku třídy 9 za předpokladu, že:

(a) neobsahují žádnou další nebezpečnou látku kromě polyhalogenovaných dibenzodioxinů a dibenzofuranů ve třídě 6.1 nebo látky obalové skupiny III třídy 3, 4.1, 4.2, 4.3, 5.1, 6.1 nebo 8; a

(b) nemají nebezpečné vlastnosti uvedené v 2.1.3.5.3 (a) až (g) a (i).

2.1.3.5 Látky jmenovitě neuvedené v tabulce A kapitoly 3.2, mající více nebezpečných vlastností, jakož i roztoky a směsi splňující klasifikační kritéria ADN a obsahující více nebezpečných látek, musí být přiřazeny pod hromadnou položku (viz 2.1.2.5) a obalovou skupinou příslušné třídy v závislosti na svých nebezpečných vlastnostech. Takovéto zařazení podle nebezpečných vlastností musí být provedeno následovně:

2.1.3.5.1 Fyzikální, chemické a fyziologické charakteristiky musí být určeny měřením nebo výpočtem a zařazení látek, roztoků nebo směsí musí být provedeno podle kritérií uvedených v pododdíle 2.2.x.1 jednotlivých tříd.

2.1.3.5.2 Je-li toto určení možné jen s neúměrně vysokými náklady (např. u určitých druhů odpadů), musí být látka, roztok nebo směs zařazena do třídy komponentu, který představuje hlavní nebezpečí.

- 2.1.3.5.3 Pokud nebezpečné vlastnosti látky, roztoku nebo směsi spadají do více než jedné třídy nebo skupiny látek uvedených níže, potom látka, roztok nebo směs musí být zařazeny do třídy nebo skupiny látek odpovídající hlavnímu nebezpečí na základě následujícího pořadí přednosti:
- (a) látky třídy 7 (kromě radioaktivních látek ve vyjmutých kusech, pro něž, s výjimkou UN 3507 HEXAFLUORID URANU, RADIOAKTIVNÍ LÁTKA, VYJMUTÝ KUS, platí zvláštní ustanovení 290 kapitoly 3.3, u kterých převažují jiné nebezpečné vlastnosti);
 - (b) látky třídy 1;
 - (c) látky třídy 2;
 - (d) znečistivěné kapalné výbušné látky třídy 3;
 - (e) samovolně se rozkládající látky a znečistivěné tuhé výbušné látky třídy 4.1;
 - (f) pyroforní látky třídy 4.2;
 - (g) látky třídy 5.2;
 - (h) látky třídy 6.1 splňující kritéria toxicity při vdechnutí pro obalovou skupinu I [látky splňující klasifikační kritéria třídy 8 a mající toxicitu při vdechnutí prachů a mlhy (LC₅₀) v rozsahu obalové skupiny I, ale toxicita při požití nebo při dotyku s pokožkou jen v rozsahu obalové skupiny III nebo nižší, musí být zařazeny do třídy 8];
 - (i) infekční látky třídy 6.2.
- 2.1.3.5.4 Pokud nebezpečné vlastnosti látky spadají do více tříd nebo skupin látek, které nejsou uvedeny v 2.1.3.5.3, musí být látka zařazena stejným postupem, avšak odpovídající třída se vybere podle tabulky převažujících nebezpečí v pododdíle 2.1.3.10.
- Jestliže nebezpečné vlastnosti látky jsou takové, že může být přiřazena k UN číslu nebo identifikačnímu číslu, pak UN číslo má přednost.
- 2.1.3.5.5 Je-li látka, která se má přepravovat, odpadem se složením, které není přesně známo, smí být její přiřazení k UN číslu a obalové skupině podle 2.1.3.5.2 založeno na odesílatelově znalosti odpadu, včetně všech dostupných technických a bezpečnostních údajů, jak jsou vyžadovány platnou legislativou pro bezpečnost a životní prostředí².
- V případě pochybnosti musí být zvolena nejvyšší úroveň nebezpečí.
- Jestliže je však možno na základě znalosti složení odpadu a fyzikálních a chemických vlastností jeho identifikovaných složek dokázat, že vlastnosti odpadu neodpovídají vlastnostem obalové skupiny I, smí být odpad zařazen pod nevhodnější j.n. položku obalové skupiny II. Avšak je-li známo, že odpad má jen vlastnosti nebezpečné životnímu prostředí, může být přiřazen k obalové skupině III pod UN čísla 3077 nebo 3082.
- Tento postup nesmí být použit pro odpady obsahující látky zmíněné v 2.1.3.5.3, látky třídy 4.3, látky případu zmíněného v 2.1.3.7 ani pro látky, které nejsou připuštěny k přepravě podle pododdílu 2.2.x.2.
- 2.1.3.6** Je vždy nutno použít nejspecifičtější hromadnou položku (viz pododíl 2.1.2.5), tj. všeobecná j.n. položka se používá jen tehdy, pokud nelze použít druhovou položku nebo specifickou j.n. položku.
- 2.1.3.7** Roztoky a směsi látek podporujících hoření nebo látek, jejichž vedlejším nebezpečím je podpora hoření, mohou mít výbušné vlastnosti. V takovém případě nejsou připuštěny k přepravě, ledaže by splňovaly předpisy pro třídu 1. Pro hnojiva, která obsahují tuhý dusičnan amonný viz též 2.2.51.2.2, třináctý a čtrnáctý bod, a Příručka zkoušek a kritérií, část III, oddíl 39.
- 2.1.3.8** Látky tříd 1 až 6.2, 8 a 9, jiné než jsou látky přiřazené k UN číslům 3077 nebo 3082, splňující kritéria odstavce 2.2.9.1.10 se navíc ke svým nebezpečím tříd 1 až 6.2, 8 a 9 považují za látky ohrožující

² *Takovou legislativou je například Rozhodnutí Komise 2000/532/ ES z 3. května 2000 nahrazující Rozhodnutí 94/3/ ES, kterou se stanoví seznam odpadů na základě článku 1(a) Směrnice Rady 75/442/EEC o odpadech a Směrnice rady 94/904/ ES, kterou se stanoví seznam nebezpečných odpadů na základě článku 1(4) Směrnice Rady 91/689/EEC o nebezpečných odpadech (Úřední věstník Evropských společenství č. L 226 ze dne 6. září 2000, strana 3), ve znění pozdějších předpisů; a Směrnice Evropského parlamentu 2008/98/ ES a Rady ze dne 19. listopadu 2008 o odpadech a o zrušení některých Směrnic (Úřední věstník Evropské unie č. L312 ze dne 22. listopadu 2008, strany 3-30), ve znění pozdějších předpisů.*

životní prostředí. Jiné látky nesplňující kritéria žádné jiné třídy, nebo žádné jiné látky třídy 9, nýbrž jen kritéria odstavce 2.2.9.1.10, se přiřadí k UN číslům 3077 nebo 3082 nebo identifikačním číslům 9005 a 9006, jak je to náležité.

2.1.3.9

Odpady, které nesplňují kritéria pro zařazení do tříd 1 až 9, avšak spadají pod *Basilejskou úmluvu o kontrole pohybu nebezpečných odpadů přes hranice států a jejich zneškodňování*, se smějí přepravovat pod UN čísla 3077 nebo 3082.

2.1.3.10 Tabulka převažujících nebezpečí

SOL = tuhé látky a směsi
LIQ = kapalné látky, směsi a roztoky
DERMAL = toxicita při absorpci pokožkou
ORAL = toxicita při požití
INHAL = toxicita při vdechnutí
*) Třída 6.1 pro pesticidy.

POZNÁMKA 1: Příklady pro vysvětlení použití tabulky**Zařazení jediné látky**

Popis zařazované látky:

Amin, jmenovitě neuvedený, vyhovující kritériím pro třídu 3, obalovou skupinu II, jakož i kritériím pro třídu 8, obalovou skupinu I.

Postup:

Průsečík řádky 3 II se sloupcem 8 I dává 8 I.
Tento amin je tímto zařazen do třídy 8, a sice pod:

UN 2734 AMINY KAPALNÉ, ŽÍRAVÉ, HOŘLAVÉ, J.N. nebo UN 2734 POLYAMINY KAPALNÉ, ŽÍRAVÉ, HOŘLAVÉ, J.N., obalová skupina I.

Zařazení směsi

Popis zařazované směsi:

Směs skládající se z hořlavé kapaliny třídy 3, obalové skupiny III, toxické látky třídy 6.1, obalové skupiny II, a žíravé látky třídy 8, obalové skupiny I.

Postup:

Průsečík řádky 3 III se sloupcem 6.1 II dává 6.1 II.
Průsečík řádky 6.1 II se sloupcem 8 I dává 8 I LIQ.
Tato blíže nedefinovaná směs je tímto zařazena do třídy 8, a sice pod:

UN 2922 LÁTKA ŽÍRAVÁ, KAPALNÁ, TOXICKÁ, J.N., obalová skupina I.

POZNÁMKA 2: Příklady zařazení roztoků a směsí do třídy a obalové skupiny:

Roztok fenolu třídy 6.1, obalové skupiny II, v benzenu třídy 3, obalové skupiny II, musí být zařazen do třídy 3, obalové skupiny II. Tento roztok musí být na základě toxicity fenolu zařazen pod UN 1992 LÁTKA HOŘLAVÁ, KAPALNÁ, TOXICKÁ, J.N. třídy 3, obalové skupiny II.

Tuhá směs arzeničnanu sodného třídy 6.1, obalové skupiny II, a hydroxidu sodného třídy 8, obalové skupiny II, musí být zařazena pod UN 3290 LÁTKA TOXICKÁ, TUHÁ, ŽÍRAVÁ, ANORGANICKÁ, J.N. do třídy 6.1, obalové skupiny II.

Roztok surového nebo rafinovaného naftalenu třídy 4.1, obalové skupiny III, v benzínu třídy 3, obalové skupiny II, musí být zařazen pod UN 3295 UHLOVODÍKY, KAPALNÉ, J.N. do třídy 3, obalové skupiny II.

Směs uhlovodíků třídy 3, obalové skupiny III, a polychlorovaných bifenyků (PCB) třídy 9, obalové skupiny II, musí být zařazena pod UN 2315 BIFENYLY POLYCHLOROVANÉ, KAPALNÉ nebo UN 3432 BIFENYLY POLYCHLOROVANÉ, TUHÉ do třídy 9, obalové skupiny II.

Směs propyleniminu třídy 3 a polychlorovaných bifenyků (PCB) třídy 9, obalové skupiny II, musí být zařazena pod UN 1921 PROPYLENIMIN, STABILIZOVANÝ do třídy 3.

2.1.4 Zařazování zkušebních vzorků**2.1.4.1**

Jestliže třída látky není přesně známa a látka je přepravována k dalšímu zkoušení, musí být zařazena na základě znalostí odesílatele do předběžné třídy, pod předběžné oficiální pojmenování pro přepravu a pod předběžné UN číslo, a sice za použití:

- (a) klasifikačních kritérií kapitoly 2.2; a
- (b) ustanovení této kapitoly.

Musí se použít nejpřísnější obalové skupiny odpovídající zvolenému oficiálnímu pojmenování pro přepravu.

Při použití těchto předpisů musí být oficiální pojmenování pro přepravu doplněno slovem „VZOREK“ (např. „HOŘLAVÁ KAPALINA, J.N., VZOREK“). V některých případech, kdy pro vzorek, který vyhovuje určitým klasifikačním kritériím, existuje specifické oficiální pojmenování pro přepravu (např. VZOREK PLYNU, NESTLAČENÝ, HOŘLAVÝ, UN číslo 3167), musí být použito toto oficiální pojmenování pro přepravu. Pokud je pro přepravu vzorku použita j.n.. položka, nemusí být oficiální pojmenování pro přepravu doplněno technickým názvem, jak je vyžadováno zvláštním ustanovením 274 kapitoly 3.3.

2.1.4.2

Vzorek látky musí být přepravován v souladu s ustanoveními vztahujícími se na předběžné oficiální pojmenování pro přepravu za podmínky, že:

- (a) látka se nepovažuje za látku nepřipustěnou k přepravě podle pododdlílů 2.2.x.2 kapitoly 2.2 anebo podle kapitoly 3.2;
- (b) látka se nepovažuje za látku, která splňuje kritéria třídy 1, nebo se nepovažuje za látku infekční ani radioaktivní;
- (c) látka vyhovuje ustanovením 2.2.41.1.15 nebo 2.2.52.1.9, jde-li o samovolně se rozkládající látku nebo organický peroxid;
- (d) vzorek je přepravován ve skupinovém obalu s čistou (netto) hmotností jednoho kusu nejvýše 2,5 kg; a
- (e) vzorek není balen společně s jinými věcmi do jednoho kusu.

2.1.4.3

Vzorky energetických materiálů pro účely zkoušek

2.1.4.3.1

Vzorky organických látek, jejichž funkční skupiny jsou uvedeny v tabulkách A6.1 a/nebo A6.3 v příloze 6 (Screeningové postupy) Příručky zkoušek a kritérií smějí být přepravovány pod UN 3224 (Látka samovolně se rozkládající, tuhá, Typ C) nebo pod UN 3223 (Látka samovolně se rozkládající, kapalná, Typ C), jak je to náležité, třídy 4.1, pokud

- (a) Vzorky neobsahují žádné:
 - známé výbušniny;
 - látky vykazující při zkouškách výbušné účinky;
 - sloučeniny vytvořené za účelem vyvolání praktického výbušného nebo pyrotechnického účinku; nebo
 - komponenty sestávající ze syntetických prekursorů účelových výbušnin;
- (b) pro směsi, komplexní sloučeniny nebo soli anorganických látek podporujících hoření třídy 5.1 s organickým materiálem nebo organickými materiály je koncentrace anorganické látky podporující hoření:
 - nižší než 15 % (hm.), je-li přiřazena k obalové skupině I (velmi nebezpečné) nebo II (středně nebezpečné); nebo
 - nižší než 30 % (hm.), je-li přiřazena k obalové skupině III (málo nebezpečné);
- (c) disponibilní údaje nedovolují přesnější klasifikaci;
- (d) vzorek není zabalen společně s jinými věcmi; a
- (e) vzorek je zabalen podle pokynu pro balení P520 a zvláštních ustanovení pro balení PP94 nebo PP95 pododdlílu 4.1.4.1 ADR, jak je to náležité.

2.1.5 Klasifikace předmětů jako předmětů obsahujících nebezpečné věci, j.n.

POZNÁMKA 1: Může být použito pro předměty, které nemají vlastní oficiální pojmenování pro přepravu a které obsahují pouze nebezpečné věci v omezených množstvích uvedených ve sloupci (7a) tabulky A kapitoly 3.2, UN 3363 a zvláštní ustanovení 301 a 672 kapitoly 3.3.

2.1.5.1 Předměty obsahující nebezpečné věci mohou být přiřazeny, jak je stanoveno v ADN, k oficiálnímu pojmenování pro přepravu nebezpečných věcí, které obsahují, nebo mohou být klasifikovány podle tohoto oddílu.

Pro účely tohoto oddílu znamená „předmět“ stroj, přístroj nebo jiné zařízení obsahující jednu nebo více nebezpečných věcí (nebo jejich zbytky), které jsou nedílnou součástí předmětu, jsou nezbytné pro jeho funkčnost a nemohou být odňaty pro účely přepravy.

Vnitřní obal se nepovažuje za předmět.

2.1.5.2 Takové předměty smějí obsahovat navíc baterie. Lithiové baterie, které jsou nedílnou součástí předmětu, musí být ověřeno typu splňujícího zkušební požadavky Příručky zkoušek a kritérií, části III, pododdílu 38.3, pokud není v ADN stanoveno jinak (např. pro předvýrobní prototypové předměty obsahující lithiové baterie nebo pro malou výrobní sérii sestávající z nejvýše 100 takových předmětů).

2.1.5.3 Tento oddíl se nevztahuje na předměty, pro něž již existuje v tabulce A kapitoly 3.2 přesnější oficiální pojmenování pro přepravu.

2.1.5.4 Tento oddíl se nevztahuje na nebezpečné věci třídy 1, třídy 6.2, třídy 7 nebo radioaktivní látky obsažené v předmětech. Avšak tento oddíl se vztahuje na předměty obsahující výbušniny, které jsou vyloučeny ze třídy 1 v souladu s 2.2.1.1.8.2.

2.1.5.5 Předměty obsahující nebezpečné věci musí být přiřazeny k příslušné třídě určené podle přítomných nebezpečí za použití, kde je to aplikovatelné, tabulky převažujících nebezpečí v 2.1.3.10 pro každou z nebezpečných věcí obsažených v předmětu. Jsou-li v předmětu obsaženy nebezpečné věci klasifikované do třídy 9, musí být všechny ostatní nebezpečné věci obsažené v předmětu považovány za věci představující větší nebezpečí.

2.1.5.6 Vedlejší nebezpečí musí odrážet hlavní nebezpečí představovaná ostatními nebezpečnými věcmi obsaženými v předmětu. Je-li v předmětu obsažena jen jedna nebezpečná věc, musí být případné(á) vedlejší nebezpečí identifikováno(a) bezpečnostními značkami pro vedlejší nebezpečí uvedenými ve sloupci (5) tabulky A kapitoly 3.2. Jestliže předmět obsahuje více nebezpečných věcí a tyto by spolu mohly během přepravy nebezpečně reagovat, musí být každá z nich uzavřena odděleně (viz 4.1.1.6 ADR).

2.1.6 Klasifikace obalů, vyrazených, prázdných, nevyčištěných

Prázdné nevyčištěné obaly, velké obaly nebo IBC, nebo jejich částí, přepravované k likvidaci, recyklaci nebo rekuperaci jejich materiálu, s výjimkou jejich rekondicionování, opravy, běžné údržby, rekonstrukce nebo opětovného používání, smějí být přiřazeny k UN 3509, pokud splňují požadavky pro tuto položku.

KAPITOLA 2.2

ZVLÁŠTNÍ USTANOVENÍ PRO TŘÍDY

2.2.1 Třída 1 Výbušné látky a předměty

2.2.1.1 Kritéria

2.2.1.1.1 Pod název třídy 1 spadají:

- (a) výbušné látky: tuhé nebo kapalné látky (nebo směsi látek), které mohou chemickou reakcí vyvinout plyny takové teploty, takového tlaku a takové rychlosti, že mohou způsobit škody v okolním prostředí.

Pyrotechnické látky: látky nebo směsi látek určené k vyvolání tepelných, světelných, zvukových, plynových nebo dýmových efektů nebo jejich kombinaci pomocí nedetonačních, samovolně probíhajících exotermických chemických reakcí.

POZNÁMKA 1: Látky, které samy nejsou výbušnými látkami, ale mohou vytvořit směs plynu, páry nebo prachu schopnou výbuchu, nejsou látkami třídy 1.

POZNÁMKA 2: Z třídy 1 jsou vyjmuty: vodou nebo alkoholem navlhčené výbušniny, jejichž obsah vody nebo alkoholu překračuje udané mezní hodnoty, a výbušniny obsahující plastifikační prostředky – tyto výbušniny jsou zařazeny do třídy 3 nebo 4.1; vyjmuty jsou rovněž výbušniny, které jsou na základě svých převažujících nebezpečných vlastností zařazeny do třídy 5.2.

- (b) Výbušné předměty: předměty, které obsahují jednu nebo více výbušných nebo pyrotechnických látek.

POZNÁMKA: Zařízení, která obsahují výbušné nebo pyrotechnické látky v tak malém množství nebo takového druhu, že se jejich neúmyslný nebo náhodný zážeh nebo počín během přepravy neprojeví vně zařízením rozletem, ohněm, dýmem, teplem nebo silným zvukem, nepodléhají předpisům třídy 1.

- (c) Látky a předměty výše neuvedené, které byly vyrobeny k vyvolání praktického výbušného nebo pyrotechnického účinku.

Pro účely třídy 1 platí následující definice:

Flegmatizovaná znamená, že k výbušné látce byla přidána látka (nebo „flegmatizátor“) ke zvýšení její bezpečnosti při manipulaci a přepravě. Flegmatizátor činí výbušnou látku necitlivou nebo méně citlivou k těmto účinkům: teplo, otřes, náraz, úder nebo tření. Typické flegmatizační prostředky zahrnují mimo jiné: vosk, papír, vodu, polymery (jako jsou chlorfluoropolymery), alkohol a oleje (jako jsou vazelína a parafín).

2.2.1.1.2 Každá látka nebo předmět, které mají nebo by mohly mít výbušné vlastnosti, musí být posouzeny pro zařazení do třídy 1 na základě zkoušek, zkušebních postupů a kritérií stanovených v Příručce zkoušek a kritérií, částí I.

Látka nebo předmět zařazené do třídy 1 smějí být připuštěny k přepravě pouze tehdy, jsou-li přiřazeny k jednomu z pojmenování nebo k jedné z j.n. položek uvedených v tabulce A kapitoly 3.2 a splňují kritéria Příručky zkoušek a kritérií.

2.2.1.1.3 Látky a předměty třídy 1 musí být přiřazeny k UN číslu a pojmenování nebo k j.n. položce tabulky A kapitoly 3.2. Interpretace pojmenování látek a předmětů tabulky A kapitoly 3.2 musí být založena na glosáři uvedeném v 2.2.1.4.

Vzorky nových nebo již existujících výbušných látek nebo předmětů, s výjimkou třaskavin, které jsou přepravovány pro účely zkoušení, klasifikace, výzkumu a vývoje, kontroly kvality nebo jako obchodní vzorek mohou být přiřazeny k položce UN 0190 VZORKY, VÝBUŠNÉ.

Přiřazení výbušných látek a předmětů jmenovitě neuvedených v tabulce A kapitoly 3.2 k j.n. položce třídy 1 nebo k položce UN 0190 VZORKY, VÝBUŠNÉ, jakož i přiřazení určitých látek, jejichž přeprava podle zvláštních ustanovení uvedených ve sloupci (6) tabulky A kapitoly 3.2 podléhá zvláštnímu povolení příslušného orgánu, musí být provedeno příslušným orgánem země původu. Tento příslušný orgán musí také písemně schválit přepravní podmínky těchto látek a předmětů. Není-li země původu smluvní stranou ADN, musí být klasifikace a přepravní podmínky uznány příslušným orgánem prvního státu smluvní strany ADN, který přijde do styku se zásilkou.

2.2.1.1.4 *Látky a předměty třídy 1 musí být přiřazeny k některé podtřídě podle 2.2.1.1.5 a k některé skupině snášenlivosti podle 2.2.1.1.6. Podtřída musí být stanovena na základě výsledků zkoušek popsaných v oddíle 2.3.1 s použitím definic v 2.2.1.1.5. Skupina snášenlivosti musí být stanovena podle definic v 2.2.1.1.6. Číslo podtřídy spolu s písmenem skupiny snášenlivosti tvoří klasifikační kód.*

2.2.1.1.5 *Definice podtříd*

- Podtřída 1.1 Látky a předměty nebezpečné hromadným výbuchem (hromadný výbuch je takový výbuch, který postihne téměř celý náklad zdánlivě okamžitě).
- Podtřída 1.2 Látky a předměty nebezpečné rozletem, které však nejsou nebezpečné hromadným výbuchem.
- Podtřída 1.3 Látky a předměty nebezpečné prudkým ohněm, s malým nebezpečím od tlakové vlny nebo rozletu nebo oběma těmito účinky, které ale nejsou nebezpečné hromadným výbuchem:
- (a) které při hoření vydávají značné tepelné záření, nebo
 - (b) které hoří postupně za projevu malé tlakové vlny nebo rozletu nebo obou těchto účinků.
- Podtřída 1.4 Látky a předměty, které v případě jejich zážehu nebo počinu během přepravy vykazují pouze malé nebezpečí výbuchu. Účinky jsou převážně omezeny na kus bez rozletu úlomků větších rozměrů nebo do větší vzdálenosti. Vnější oheň nesmí vyvolat zdánlivě okamžitý výbuch téměř celého obsahu kusu.
- Podtřída 1.5 Velmi necitlivé látky schopné hromadného výbuchu, které jsou tak necitlivé, že pravděpodobnost jejich počinu nebo přechodu z hoření v detonaci je za normálních podmínek přepravy velmi nízká. Jako minimální požadavek pro tyto látky je stanoveno, že nesmějí detonovat při zkoušce ve vnějším ohni.
- Podtřída 1.6 Velmi málo citlivé předměty, které nejsou nebezpečné hromadným výbuchem. Předměty převážně obsahují velmi málo citlivé látky a pravděpodobnost jejich náhodného roznětu nebo přenosu výbuchu je velmi nízká.

POZNÁMKA: *Předměty podtřídy 1.6 vykazují nebezpečí, které je omezeno na výbuch pouze jednoho předmětu.*

2.2.1.1.6 *Definice skupin snášenlivosti látek a předmětů*

- A Třaskavina
- B Předmět obsahující třaskavinu, který má méně než dvě účinná pojistná zařízení. Zahrnuty jsou i některé předměty, jako rozbušky a počínová zařízení pro trhací práce a zápalky pro náboje, i když neobsahují třaskaviny.
- C Střelivina nebo jiná deflagrující výbušnina nebo předmět obsahující takovou výbušninu.
- D Trhavina, černý prach nebo předmět obsahující trhavinu, vždy bez roznětných prostředků a bez hnací náplně nebo předmět obsahující třaskavinu, který má nejméně dvě účinná pojistná zařízení.
- E Předmět, obsahující trhavinu, bez roznětných prostředků a s hnací náplní (jinou než takovou, která obsahuje hořlavou kapalinu nebo hořlavý gel nebo hypergoly).
- F Předmět obsahující trhavinu s vlastním roznětným prostředkem, s hnací náplní (jinou než takovou, která sestává z hořlavé kapaliny nebo hořlavého gelu nebo hypergolů) nebo bez hnací náplně.
- G Pyrotechnická látka nebo předmět obsahující pyrotechnickou látku nebo předmět obsahující jak výbušnou látku, tak i osvětlovací, zápalnou, slzotvornou nebo dýmotvornou látku (kromě

předmětů aktivovaných vodou nebo předmětů, které obsahují bílý fosfor, fosfidy, pyroforní látku, hořlavou kapalinu nebo hořlavý gel nebo hypergoly).

- H Předmět, který obsahuje výbušnou látku a bílý fosfor.
- J Předmět, který obsahuje výbušnou látku a hořlavou kapalinu nebo hořlavý gel.
- K Předmět, který obsahuje výbušnou látku a toxickou chemickou látku.
- L Výbušná látka nebo předmět obsahující výbušnou látku, které představují zvláštní nebezpečí (např. pro svoji aktivaci vodou nebo pro přítomnost hypergolů, fosfidů nebo pyroforní látky) a vyžadující oddělení jednotlivých druhů.
- N Předměty převážně obsahující velmi málo citlivé látky
- S Látka nebo předmět, který je zabalen nebo zkonstruován tak, aby všechny nebezpečné účinky vyvolané náhodným uvedením do činnosti zůstaly omezeny na vnitřek obalu, pokud nebyl obal poškozen požárem. V takovém případě musí zůstat účinky tlaku vzduchu a rozletu omezeny tak, aby opatření ke zdolání požáru nebo jiná nouzová opatření v bezprostřední blízkosti kusu nebyla podstatně omezena ani jim nebylo zabráněno.

POZNÁMKA 1: Každá látka nebo předmět ve specifikovaném obalu směji být přiřazeny jen k jedné skupině snášenlivosti. Protože kritérium skupiny snášenlivosti S je empirické povahy, je přiřazení k této skupině nutně vázáno na zkoušky k přidělení klasifikačního kódu.

POZNÁMKA 2: Předměty skupin snášenlivosti D nebo E směji být opatřeny vlastními roznětnými prostředky nebo s nimi být baleny společně za předpokladu, že tyto prostředky mají nejméně dvě účinná pojistná zařízení určená k zamezení výbuchu v případě náhodného uvedení roznětného prostředku do činnosti. Takové předměty a kusy se přiřadí ke skupině snášenlivosti D nebo E.

POZNÁMKA 3: Předměty skupin snášenlivosti D nebo E směji být baleny společně se svými vlastními roznětnými prostředky, které neobsahují dvě účinná pojistná zařízení (tj. s rozněcovači, které jsou přiřazeny ke skupině snášenlivosti B) za předpokladu, že je dodrženo zvláštní ustanovení MP21 oddílu 4.1.10 ADR. Takové kusy se přiřadí skupinám snášenlivosti D nebo E.

POZNÁMKA 4: Předměty směji být opatřeny svými vlastními roznětnými prostředky nebo s nimi být baleny společně za předpokladu, že se roznětné prostředky nemohou za normálních přepravních podmínek uvést v činnost.

POZNÁMKA 5: Předměty skupin snášenlivosti C, D a E směji být baleny společně. Takové kusy musí být přiřazeny ke skupině snášenlivosti E.

2.2.1.1.7 Přiřazení výrobků zábavní pyrotechniky k podtřídám

2.2.1.1.7.1 Výrobky zábavní pyrotechniky musí být obvykle přiřazeny k podtřídám 1.1, 1.2, 1.3 a 1.4 na základě dat získaných ze zkoušek série 6 Příručky zkoušek a kritérií. Avšak:

- (a) kaskády obsahující výbuškovou slož (viz Poznámka 2 v 2.2.1.1.7.5) musí být klasifikovány jako 1.1G, bez ohledu na výsledky Série zkoušek 6;
- (b) jelikož je počet druhů zábavné pyrotechniky velmi rozsáhlý a kapacita zkušebních zařízení může být omezená, přiřazení k podtřídám může být také provedeno v souladu s postupem uvedeným v 2.2.1.1.7.2.

2.2.1.1.7.2 Přiřazení výrobků zábavní pyrotechniky k UN číslům 0333, 0334, 0335 nebo 0336, a přiřazení předmětů UN 0431 použitým pro divadelní efekty, jenž splňují definici typu předmětu a klasifikaci podtřídy 1.4G v tabulce stanovených klasifikací výrobků zábavné pyrotechniky v 2.2.1.1.7.5, může být rovněž provedeno na základě analogie, bez zkoušek série 6, v souladu se stanovenou klasifikací výrobků zábavní pyrotechniky dle tabulky v 2.2.1.1.7.5. Takové přiřazení může být provedeno pouze se souhlasem příslušného orgánu. Výrobky neuvedené v této tabulce musí být klasifikovány na základě dat získaných ze zkoušek série 6.

POZNÁMKA 1: Zařazení nových druhů výrobků zábavní pyrotechniky do sloupce 1 tabulky v 2.2.1.1.7.5 může být provedeno pouze na základě výsledků všech předepsaných zkoušek postoupených Podvýboru expertů pro přepravu nebezpečných věcí OSN k posouzení.

POZNÁMKA 2: Výsledky zkoušek získané příslušnými orgány, které potvrzují nebo vyvracejí přiřazení výrobků zábavní pyrotechniky uvedených ve sloupci 4 tabulky v 2.2.1.1.7.5 k podtřídám ve sloupci 5, by měly být postoupeny Podvýboru expertů pro přepravu nebezpečných věcí OSN pro informaci.

2.2.1.1.7.3 Jestliže jsou výrobky zábavní pyrotechniky více než jedné podtřídy zabaleny ve stejném kusu, musí být klasifikovány jako nejnebezpečnější podtřída, pokud z dat získaných ze zkoušek série 6 nevyplyne jiná klasifikace.

2.2.1.1.7.4 Klasifikace uvedená v tabulce 2.2.1.1.7.5 platí pouze pro předměty zabalené v lepenkových bednách (4G).

2.2.1.1.7.5 *Tabulka stanovených klasifikací výrobků zábavní pyrotechniky¹*

POZNÁMKA 1: Odkazy na procenta v tabulce znamenají, není-li stanoveno jinak, hmotnost všech pyrotechnických látek (například raketových motorů, výmetné náložky, trhavé náložky a efektové náložky).

POZNÁMKA 2: „Výbušková slož“ v této tabulce se vztahuje na pyrotechnické látky v práškové formě nebo jako pyrotechnické díly v předmětech zábavní pyrotechniky, které jsou používány v kaskádách nebo k vytváření zvukového efektu, nebo jsou používány jako trhací nebo hnací náložka, ledaže

- (a) doba nárůstu tlaku při zkoušce HLS výbuškové slože v přípojku 7 Příručky zkoušek a kritérií je delší než 6 ms pro 0,5 g pyrotechnické látky; nebo
- (b) pyrotechnická látka dává při zkoušce US výbuškové slože v přípojku 7 Příručky zkoušek a kritérií negativní „-“, výsledek.“.

POZNÁMKA 3: Uvedené rozměry v mm se vztahují:

- pro kulové nebo válcové kombinované efektové pumy k průměru tělesa pumy,
- pro válcové efektové pumy k délce pumy,
- pro efektové pumy v moždíři, římské svíce, vystřelovací trubice nebo miny k vnitřnímu průměru trubice obsahující předmět zábavní pyrotechniky,
- pro sáčkovou nebo válcovou minu, k vnitřnímu průměru moždíře určeného pro minu.

¹ Tato tabulka obsahuje seznam klasifikace předmětů zábavní pyrotechniky, která může být použita bez zkoušek série 6, Příručky zkoušek a kritérií (viz 2.2.1.1.7.2)

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	Klasifikace
Puma, kulová nebo válcová	Kulová efekťová puma: výšková efekťová puma, barevná efekťová puma, kombinovaná více-efekťová puma, námořní puma, padáková efekťová puma, dýmová efekťová puma, hvězdicová efekťová puma, dělostřelecká pozdravná, zvukové efekťové pumy: třesková efekťová puma, hromová rána, pumová sestava	Zařízení s hnací náplní nebo bez ní, se zpoždovací zápalnicí a trhavou náložkou, pyrotechnickými dlihy nebo volně loženou pyrotechnickou látkou, určené k odpalování z moždíře	Všechny třeskové pumy Barevná puma: ≥ 180 mm Barevná puma: < 180 mm s > 25 % výbuškové složky, jako volný prášek a/nebo s třeskovým efektem Barevná puma: < 180 mm s ≤ 25 % výbuškové složky, jako volný prášek a/nebo s třeskovým efektem Barevná puma: ≤ 50 mm, nebo ≤ 60 g pyrotechnické látky, s ≤ 2 % výbuškové složky, jako volný prášek a/nebo s třeskovým efektem	1.1G 1.1G 1.1G 1.3G 1.4G
	Kombinovaná efekťová puma	Zařízení s dvěma nebo více kulovými efekťovými pumami ve společném obalu, s oddělenými vnějšími zpoždovacími zápalnicemi, vystřelované společnou hnací náplní	Nejnebezpečnější kulová efekťová puma určuje klasifikaci.	
	Přebíťý moždíř, puma v moždíři	Zařízení sestávající z kulové nebo válcové efekťové pumy umístěné v moždíři, který je určen k jejímu vystřelení	Všechny třeskové pumy Barevné pumy: ≥ 180 mm Barevná puma: s > 25 % výbuškové složky jako volný prášek a/nebo s třeskovým efektem Barevné pumy > 50 mm a < 180 mm Barevné pumy ≤ 50 mm, nebo s ≤ 60 g pyrotechnické látky, s ≤ 25 % zábleskové složky jako volný prášek a/nebo s třeskovým efektem	1.1G 1.1G 1.1G 1.2G 1.3G

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	Klasifikace
Puma kulová nebo válcová (pokračování)	Pumy v pumě (kulová) (Odkazy na procenta pro pumy v pumě se vztahují na hrubou hmotnost pyrotechnického předmětu)	Zařízení, bez hnací náplně se zpoždovací zápalnicí a s trhavou náložkou, obsahující třeskové pumy a inertní materiály, které je určeno k vystřelování z moždíře	> 120 mm	1.1G
		Zařízení, bez hnací náplně se zpoždovací zápalnicí a s trhavou náložkou, obsahující třeskové pumy s ≤ 25 g výbuškové složky a s ≥ 60 % inertního materiálu, které je určeno k vystřelování z moždířů	≤ 120 mm	1.3G
		Zařízení, bez hnací náplně se zpoždovací zápalnicí a trhavou náložkou, obsahující barevné pumy a/nebo pyrotechnické díly, které je určeno k vystřelování z moždířů	> 300 mm	1.1G
		Zařízení, bez hnací náplně se zpoždovací zápalnicí a trhavou náložkou, obsahující barevné pumy ≤ 70 mm a/nebo pyrotechnické díly s ≤ 25 % výbuškové složky a ≤ 60 % pyrotechnických látek, které je určeno k vystřelování z moždířů	> 200 mm a ≤ 300 mm	1.3G
		Zařízení, s hnací náplní, se zpoždovací zápalnicí a trhavou náložkou, obsahující barevné pumy ≤ 70 mm a/nebo pyrotechnické díly s ≤ 25 % výbuškové složky a ≤ 60 % pyrotechnických látek, které je určeno k vystřelování z moždířů	≤ 200 mm	1.3G
Baterie/kombinace	Přehradová palba, dělosífecká palba, prostorové efekty, květinové efekty, pumové koule, výbuchy, palebné baterie, palebné baterie se zábleskem, vzdušná pumová sestava	Sestava obsahující několik dílů buď stejného typu, nebo různých typů, které odpovídají jednomu z typů předmětu zábavní pyrotechniky uvedeného v této tabulce, má jedno nebo dvě místa zážehu	Nejnebezpečnější typ předmětu zábavní pyrotechniky určuje klasifikaci	

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	Klasifikace
Římská svíce	Efektová svíce, svíce, bombičky	Trubice obsahující sestavu pyrotechnických dílů, sestávající z podobných pyrotechnických látek, hnací a přenosové zápalnice	<p>≥ 50 mm vnitřního průměru, obsahující výbuškovou slož</p> <p>nebo < 50 mm s > 25 % výbuškové slože</p> <p>≥ 50 mm vnitřního průměru, neobsahující výbuškovou slož</p> <p>< 50 mm vnitřního průměru a s ≤ 25 % výbuškové slože</p> <p>≤ 30 mm vnitřního průměru každého pyrotechnického elementu ≤ 25 g a s ≤ 5 % výbuškové slože</p>	1.1G 1.2G 1.3G 1.4G
Jednoranná svíce	Jednoranná svíce	Trubice obsahující pyrotechnické díly sestávající z pyrotechnické látky, hnací náplně a přenosové zápalnice nebo bez ní	<p>≤ 30 mm vnitřního průměru a pyrotechnický element > 25 g, nebo s > 5 % a s ≤ 25 % výbuškové slože</p> <p>≤ 30 mm vnitřního průměru, pyrotechnický element ≤ 25 g a s ≤ 5 % výbuškové slože</p>	1.3G 1.4G
Raketa	Lavinové rakety, signální rakety, pískavé rakety, lahvové rakety, nebeské rakety, rakety typu střel, stolní rakety	Trubice obsahující pyrotechnickou látku a/nebo pyrotechnické díly, opatřená latí nebo jiným prostředkem stabilizace letu, která je určena k vysřelování do vzduchu	<p>Pouze s efektem výbuškové slože</p> <p>Výbušková slož s > 25 % pyrotechnické slože</p> <p>s > 20 g pyrotechnické látky s ≤ 25 % výbuškové slože</p>	1.1G 1.1G 1.3G
Mina	Povrchová mina, sačková mina, válcová mina	Trubice obsahující hnací náplň a pyrotechnické díly, která je určena k položení nebo upevnění na zem. Základním efektem je vymetení všech pyrotechnických dílů do vzduchu v jediném ohnivém prostorovém vizuálním a/nebo zvukovém efektu nebo: Tkaninový nebo papírový sáček nebo válec obsahující hnací náplň a pyrotechnické díly, určený k umístění do mořdře s funkcí miny	<p>s ≤ 20 g pyrotechnické látky, černého prachu, trhavé směsi a s ≤ 0,13 g výbuškové slože na ránu a ≤ 1 g celkové</p> <p>s > 25 % výbuškové slože, jako volný prášek a/nebo s třeskovými efekty</p> <p>≥ 180 mm a s ≤ 25 % výbuškové slože jako volný prášek a/nebo s třeskovými efekty</p> <p>< 180 mm a s ≤ 25 % výbuškové slože jako volný prášek a/nebo s třeskovými efekty</p>	1.1G 1.1G 1.3G

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	Klasifikace
			s ≤ 150 g pyrotechnické látky, obsahující ≤ 5 % výbuškové složky jako volný prášek a/nebo s třeskovým efektem. Každý pyrotechnický element ≤ 25 g, každý třeskový efekt < 2 g; každý hvizd, jestliže existuje ≤ 3 g	1.4G
Fontány	Sopky, ohňopády, osvětlovací pochodně, fontány, létající jiskry	Nekovové pouzdro obsahující lisovanou nebo zhutněnou pyrotechnickou látku vytvářející jiskry a plamen POZNÁMKA: Fontány určené k vytváření vertikální kaskády nebo ohněpádu se považují za kaskády (viz následující položku).	≥ 1 kg pyrotechnické látky < 1 kg pyrotechnické látky	1.3G 1.4G
Kaskáda	Bezpředmětné	pyrotechnická fontána určená k vytváření vertikální kaskády nebo ohněpádu	obsahující výbuškovou složku bez ohledu na výsledky zkoušky Série 6 (viz 2.2.1.1.7.1 (a)) neobsahující výbuškovou složku	1.1G 1.3G
Prskavky	Ruční prskavky, prskavky neurčené k držení v ruce, drátové prskavky	Tuhý drát částečně potažený (z jednoho konce) pomalu hořící pyrotechnickou látkou s nebo bez zapalovací špičky	Prskavky s chloristany: > 5 g na kus nebo > 10 kusů v balíčku Prskavky s chloristany: ≤ 5 g na kus a ≤ 10 kusů v balíčku; Prskavky s dusičnany: ≤ 30 g na kus	1.3G 1.4G
Bengálská tyčinka	Tlumená tyčinka	Nekovové tyčinky částečně potažené (z jednoho konce) pomalu hořící pyrotechnickou látkou, určené k držení v ruce	Prskavky s chloristany: > 5 g na kus nebo > 10 kusů v balíčku Prskavky s chloristany: ≤ 5 g na kus a ≤ 10 kusů v balíčku; Prskavky s dusičnany: ≤ 30 g na kus	1.3 G 1.4G

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	Klasifikace
Drobné předměty zábavní pyrotechniky s nízkou nebezpečností	Stolní bomby, bouchací kuličky, kapsle, dýmovnice, mlhovnice, hadi, červi, serpentina, práskací provázky, oslavné rány	Zařízení určené k vytváření velmi omezených vizuálních a/nebo zvukových efektů, které obsahuje malé množství pyrotechnické látky a/nebo výbušné složky	Bouchací kuličky a kapsle mohou obsahovat nejvýše 1,6 mg třaskavého stříbra; kapsle a oslavné rány mohou obsahovat nejvýše 16 mg směsi chlorečnanu draselného a červeného fosforu; jiné předměty mohou obsahovat nejvýše 5 g pyrotechnické látky, ale žádnou výbuškovou složku	1.4G
Kotouče	Vzdušný kotouč, helikoptéra, pozemní kotouč	Nekovová trubička nebo trubičky obsahující pyrotechnickou látku, která vytváří plyn nebo jiskry s nebo bez složky produkující zvuk, s nebo bez křídálek	Pyrotechnická látka v kusu > 20 g, obsahující ≤ 3 % výbuškové složky vytvářející třesk, nebo hvízdající složky ≤ 5 g	1.3G
Světelná kola	Saxon	Zařízení opatřené pohonnými jednotkami obsahujícími pyrotechnickou látku a vybavené přídavnými prostředky, které umožňují převést přímočarý pohyb v rotaci	Pyrotechnická látka v kusu ≤ 20 g, obsahující ≤ 3 % zábleskové složky vytvářející třesk, nebo hvízdavé složky ≤ 5 g	1.4G
Vzdušné kolo	Létající Saxon, UFO, vznášející se koruna	Trubice obsahující hnací náplně a pyrotechnické látky vytvářející jiskry, plamen a/nebo zvuk. Trubice jsou upevněny k nosnému kolu	≥ 1 kg pyrotechnické látky celkem, bez třaskavého efektu, každý hvízd (jestliže existuje) ≤ 25 g a ≤ 50 g hvízdavé složky v kole < 1 kg pyrotechnické látky celkem, bez třeskového efektu, každý hvízd (jestliže existuje) ≤ 5 g a ≤ 10 g hvízdavé složky v kole	1.3G 1.4G
			> 200 g pyrotechnické látky nebo > 60 g pyrotechnické látky v jednom elementu s ≤ 3 % výbuškové složky s třeskovými efekty, každý hvízd (jestliže existuje) ≤ 25 g a ≤ 50 g hvízdavé složky v jednom kole	1.3G

Typ	Zahrnuje/nazývá se:	Definice	Specifikace	Klasifikace
			<p>≤ 200 g pyrotechnické látky celkem a</p> <p>≤ 60 g pyrotechnické látky v jedné pohonné jednotce s ≤ 3 % výbuškové složky s třeskovými efekty, každý hvízd (jestliže existuje) ≤ 5 g a ≤ 10 g hvízdové složky v jednom kole</p>	1.4G
Výběrový balíček	Ukázková sestava, zahradní sestava, pokojová sestava	Balíček s více než jedním typem, který odpovídá jednomu z typu výrobku zábavní pyrotechniky uvedeného v této tabulce	Nejnebezpečnější výrobek zábavní pyrotechniky určuje klasifikaci	
Práskající sestava	Oslavná petarda, oslavná rulička	Sestava trubic (papírových nebo lepenkových) spojená pyrotechnickou zápalnicí. Každá trubice je určena k tvorbě zvukového efektu	Každá trubice ≤ 140 mg výbuškové složky nebo ≤ 1 g černého prachu	1.4G
Petarda	Pozdravná petarda, záblesková petarda, žertovná petarda	Nekovová trubice obsahující třeskovou složku určená k tvorbě zvukového efektu	> 2 g výbuškové složky v elementu	1.1G
			≤ 2 g výbuškové složky v elementu a ≤ 10 g ve vnitřním obalu	1.3G
			≤ 1 g výbuškové složky v elementu a ≤ 10 g ve vnitřním obalu nebo ≤ 10 g černého prachu v elementu	1.4G

2.2.1.1.8 Vyloučení ze třídy 1

2.2.1.1.8.1 Předmět nebo látka může být vyloučen(a) ze třídy 1 na základě výsledků zkoušek a definice třídy 1 se schválením příslušného orgánu kterékoli smluvní strany ADN, který může také uznat schválení udělené příslušným orgánem země, která není smluvní stranou ADN, za podmínky, že toto schválení bylo uděleno v souladu s postupy platnými podle RID, ADR, ADN, IMDG Code nebo ICAO Technical Instructions.

2.2.1.1.8.2 Se schválením příslušného orgánu podle 2.2.1.1.8.1 smí být předmět vyloučen ze třídy 1, jestliže tři nezabalené předměty, každý jednotlivě aktivovaný svými vlastními iniciačními nebo roznětnými prostředky nebo vnějšími prostředky tak, aby fungoval stanoveným způsobem, splní následující zkušební kritéria:

- (a) Žádný vnější povrch nesmí mít teplotu vyšší než 65 °C. Okamžitý nárůst teploty do 200 °C je akceptovatelný;
- (b) Žádné prasknutí nebo roztržení vnějšího pláště nebo pohyb předmětu nebo jeho uvolněných částí do vzdálenosti větší než jeden metr v kterémkoli směru;

POZNÁMKA: Pokud by celistvost předmětu mohla být ovlivněna v případě vnějšího požáru, musí být tato kritéria prověřena zkouškou vystavením ohni. Jedna z takových metod je popsána v normě ISO 14451-2 při rychlosti ohřevu 80 K/min.

- (c) Žádný akustický záznam překračující špičkovou hodnotu 135 dB(C) ve vzdálenosti jednoho metru;
- (d) Žádný záblesk nebo plamen schopný zažehnout materiál, jako je list papíru gramáže 80 ± 10 g/m², při dotyku s tímto předmětem; a
- (e) Žádné tvoření kouře, dýmu nebo prachu v takových množstvích, že viditelnost v komoře o velikosti jednoho kubického metru, vybavené vyfukovacími panely náležité velikosti, je snížena o více než 50 %, jak je naměřeno kalibrovaným fotometrem (luxmetrem) nebo radiometrem umístěnými ve vzdálenosti jednoho metru od konstantního světelného zdroje umístěného ve středu protilehlých stěn. Je možno použít též všeobecný návod ke zkoušení optické hustoty v normě ISO 5659-1 a všeobecný návod k fotometrickému systému popsanému v oddílu 7.5 normy ISO 5659-2 nebo je možno použít také podobné metody měření optické hustoty určené ke stejnému účelu. K minimalizaci účinků rozptýleného nebo pronikajícího světla, které není emitováno přímo světelným zdrojem, musí být použit vhodný kryt obklopující zadní a boční strany fotometru.

POZNÁMKA 1: Jestliže během zkoušek vztahujících se ke kritériím uvedeným pod písmeny (a), (b), (c) a (d) není zpozorován žádný nebo je zpozorován jen velmi malý kouř, je možno od zkoušky uvedené pod písmenem (e) upustit.

POZNÁMKA 2: Příslušný orgán zmíněný v 2.2.1.1.8.1 může vyžadovat provedení zkoušek v balené formě, je-li zjištěno, že předmět, jak je zabalen pro přepravu, může představovat větší riziko.

2.2.1.1.9 Klasifikační dokumentace

2.2.1.1.9.1 Příslušný orgán přiřazující předmět nebo látku do třídy 1 musí potvrdit tuto klasifikaci žadateli písemně.

2.2.1.1.9.2 Klasifikační dokument vydaný příslušným orgánem smí být v jakékoli formě a může sestávat z více než jedné stránky, pokud jsou stránky číslovány postupně. Dokument musí mít jediné jednacím číslo.

2.2.1.1.9.3 Informace obsažené v dokumentu musí být snadno identifikovatelné, čitelné a trvalé.

2.2.1.1.9.4 Příklady informací, které mohou být obsaženy v klasifikačním dokumentu jsou následující:

- (a) Název příslušného orgánu a ustanovení vnitrostátních předpisů, která zakládají jeho legitimitu;
- (b) Odvětvové nebo celostátní předpisy, k nimž se klasifikační dokument vztahuje;
- (c) Potvrzení, že klasifikace byla schválena, provedena nebo odsouhlasena podle Vzorových předpisů OSN nebo příslušných odvětvových předpisů;
- (d) Název a adresa právnické osoby, které byla klasifikace svěřena, a identifikační číslo společnosti, které jednoznačně identifikuje danou společnost nebo její pobočky podle vnitrostátních předpisů;
- (e) Pojmenování, pod kterým bude výbušná látka nebo předmět uveden(a) na trh nebo podáván(a) k přepravě;

- (f) Oficiální pojmenování pro přepravu, UN číslo, třída, podtřída a příslušná skupina snášenlivosti výbušné látky nebo předmětu;
- (g) Tam, kde je to patřičné, nejvyšší čistá (netto) hmotnost výbušné látky obsažené v kusu nebo předmětu;
- (h) Jméno, podpis, razítko, pečeť nebo jiná identifikace osoby pověřené příslušným orgánem k vydání klasifikačního dokumentu jsou jasně viditelné;
- (i) Pokud je bezpečnost při přepravě nebo podtřída považována za závislou na obalu, identifikace schválených:
 - vnitřních obalů
 - meziobalů
 - vnějších obalů;
- (j) Klasifikační dokument uvádí číslo součásti, skladové číslo nebo jakékoli jiné identifikační číslo, pod nímž bude výbušná látka nebo předmět uveden(a) na trh nebo podáván(a) k přepravě;
- (k) Název a adresa právnické osoby, která vyrábí výbušniny, a identifikační číslo společnosti, které jednoznačně identifikuje danou společnost nebo její pobočky podle vnitrostátních předpisů;
- (l) Jakákoli dodatečná informace týkající se příslušného pokynu pro balení a popřípadě zvláštních ustanovení pro balení, kde je to náležité;
- (m) Základna pro volbu klasifikace, tj. zda na základě výsledků, zkoušek, závady u zábavné pyrotechniky, analogie se zaříděnou výbušnou látkou nebo předmětem, definice uvedená v tabulce A kapitoly 3.2 atd.;
- (n) Jakékoli zvláštní podmínky nebo omezení, které příslušný orgán stanovil pro zajištění bezpečnosti přepravy výbušnin, sdělování nebezpečí a mezinárodní přepravu;
- (o) Datum vypršení platnosti klasifikačního dokumentu, pokud to příslušný orgán považuje za nutné.

2.2.1.2 Látky a předměty nepřipustěné k přepravě

2.2.1.2.1 *Výbušné látky, které vykazují podle kritérií Příručky zkoušek a kritérií, části I. nepřipustně vysokou citlivost, nebo u kterých může nastat samovolná reakce, jakož i výbušné látky a předměty, které nemohou být přiřazeny k pojmenování nebo j.n. položce uvedeným v tabulce A kapitoly 3.2, nejsou připuštěny k přepravě.*

2.2.1.2.2 *Předměty skupiny snášenlivosti K (1.2 K, UN číslo 0020 a 1.3 K, UN číslo 0021) nejsou připuštěny k přepravě.*

2.2.1.3 Seznam hromadných položek

Klasifikační kód (viz 2.2.1.1.4)	UN číslo	Pojmenování látek nebo předmětů
1.1 A	0473	LÁTKY VÝBUŠNÉ, J.N.
1.1 B	0461	SOUČÁSTI, ROZNĚTNÉ SYSTÉMY, J.N.

2.2.1.4

Glosář pojmenování

POZNÁMKA 1: Smyslem popisů v glosáři není náhrada zkušebních postupů, ani stanovení klasifikace látky nebo předmětu třídy 1. Rozhodnutí o zařazení do správné podtřídy a o tom, zda mohou být přiřazeny ke skupině snášenlivosti S, musí být založeno na zkouškách výrobku podle Příručky zkoušek a kritérií, části I, nebo na analogii s podobnými, již odzkoušenými výrobky, zařazenými podle postupů Příručky zkoušek a kritérií.

POZNÁMKA 2: Za pojmenováními jsou uvedena příslušná UN čísla (kapitola 3.2, tabulka A, sloupec 2). Pokud jde o klasifikační kód, viz 2.2.1.1.4.

BLESKOVICE, ohebná: UN čísla 0065, 0289

Předmět sestávající z duše z detonující výbušniny opředené textilním vláknem, buď s povlakem nebo bez povlaku z plastu nebo jiného materiálu. Povlak není potřebný, pokud je opředení z textilních vláken prachotěsné.

BLESKOVICE, s kovovým pláštěm: UN čísla 0102, 0290

Předmět sestávající z duše z detonující výbušniny v trubici z měkkého kovu s ochranným povlakem nebo bez ochranného povlaku.

BLESKOVICE, S MALÝM ÚČINKEM, s kovovým pláštěm: UN číslo 0104

Předmět sestávající z duše z detonující výbušniny v plášti z měkkého kovu s ochranným povlakem nebo bez ochranného povlaku. Množství výbušné látky je tak malé, že se vně bleskovice projevuje jen nepatrný účinek výbuchu.

BOJOVÉ HLAVICE, RAKETA, s trhací náplní: UN čísla 0286, 0287

Předměty sestávající z detonující výbušniny. Buď neobsahují roznětné prostředky, nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení. Jsou určeny pro připevnění k raketě. Pod toto pojmenování spadají také bojové hlavice pro řízené střely.

BOJOVÉ HLAVICE, RAKETA, s trhací náplní: UN číslo 0369

Předměty sestávající z detonující výbušniny. Obsahují roznětné prostředky, které nemají nejméně dvě účinná pojistná zařízení. Jsou určeny pro připevnění k raketě. Pod toto pojmenování spadají také bojové hlavice pro řízené střely.

BOJOVÉ HLAVICE, RAKETA, s trhavou náložkou nebo výmetnou náplní: UN číslo 0370

Předměty sestávající z nevýbušné užitečné zátěže a z malé nálože detonující nebo deflagrující výbušniny. Buď neobsahují roznětné prostředky, nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení. Jsou určeny pro připevnění k raketovému motoru k rozhozu nevýbušného materiálu. Pod toto pojmenování spadají také bojové hlavice pro řízené střely.

BOJOVÉ HLAVICE, RAKETA, s trhavou náložkou nebo výmetnou náplní: UN číslo 0371

Předměty sestávající z nevýbušné užitečné zátěže a malé nálože detonující nebo deflagrující výbušniny. Obsahují roznětné prostředky, které nemají nejméně dvě účinná pojistná zařízení. Jsou určeny pro připevnění k raketovému motoru k rozhozu nevýbušného materiálu. Pod toto pojmenování spadají také bojové hlavice pro řízené střely.

BOJOVÉ HLAVICE, TORPÉDO s trhací náplní: UN číslo 0221

Předměty sestávající z detonující výbušniny. Buď neobsahují roznětné prostředky, nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení. Jsou určeny pro připevnění k torpédu.

GRANÁTY, ruční nebo puškové, s trhací náplní: UN čísla 0284, 0285

Předměty, které jsou určeny k ručnímu vrhání nebo k vystřelování z pušek. Neobsahují roznětné prostředky nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

GRANÁTY, ruční nebo puškové, s trhací náplní: UN čísla 0292, 0293

Předměty, které jsou určeny k ručnímu vrhání nebo k vystřelování z pušek. Obsahují roznětné prostředky, které mají méně než dvě účinná pojistná zařízení.

GRANÁTY, CVIČNÉ, ruční nebo puškové: UN čísla 0110, 0318, 0372, 0452

Předměty bez hlavní trhací nálože, které jsou určeny k ručnímu vrhání nebo k vystřelování z pušek. Obsahují roznětný prostředek a mohou obsahovat značkovací náplň.

HEXOLIT (HEXOTOL), suchý nebo vlhčený méně než 15% hm. vody: UN číslo 0118

Látka sestávající z těsné směsi 1,3,5-trinitro-1,3,5-triazacyklohexanu (RDX) a trinitrotoluenu (TNT). Pod toto pojmenování spadá také „Composition B“.

HEXOTONAL: UN číslo 0393

Látka sestávající z těsné směsi z 1,3,5-trinitro-1,3,5-triazacyklohexanu (RDX), trinitrotoluenu (TNT) a hliníku.

HLOUBKOVÉ SONDY, VÝBUŠNÉ: UN čísla 0204, 0296

Předměty sestávající z nálože trhaviny s roznětnými prostředky, které nemají nejméně dvě účinná pojistná zařízení. Jsou shazovány z lodí a jsou uváděny v činnost při dosažení určené hloubky nebo po dopadu na dno.

HLOUBKOVÉ SONDY, VÝBUŠNÉ: UN čísla 0374, 0375

Předměty sestávající z nálože trhaviny bez roznětných prostředků nebo s roznětnými prostředky, které mají nejméně dvě účinná pojistná zařízení. Jsou shazovány z lodí a jsou uváděny v činnost při dosažení určené hloubky nebo po dopadu na dno.

KUMULATIVNÍ NÁLOŽE, PERFORAČNÍ, pro ropné vrty, bez rozbušky: UN čísla 0124, 0494

Předměty sestávající z ocelových trubek nebo kovových pouzder, do kterých jsou vloženy kumulativní nálože, které jsou propojeny bleskovicí. Neobsahují roznětné prostředky.

LÁTKY VÝBUŠNÉ, VELMI NECITLIVÉ (EVI), J.N.: UN číslo 0482

Látky nebezpečné hromadným výbuchem, které jsou tak necitlivé, že při normálních přepravních podmínkách je jen velmi malá pravděpodobnost jejich roznětu nebo přechodu z hoření v detonaci. Tyto látky musí obstát ve zkouškách série 5 dle Příručky zkoušek a kritérií.

MINY, s trhací náplní: UN čísla 0136, 0294

Předměty sestávající obvykle z obalu z kovu nebo kompozitních materiálů, které jsou naplněny detonující výbušninou, s roznětnými prostředky, které nemají nejméně dvě pojistná zařízení. Jsou určeny k uvedení v činnost při styku s plavidly, vozidly nebo osobami. Pod toto pojmenování spadají také „Bangalore torpedoes“.

MINY, s trhací náplní: UN čísla 0137, 0138

Předměty sestávající obvykle z kovových nebo kompozitních obalů, které jsou naplněny detonující výbušninou bez nebo s roznětnými prostředky, které mají nejméně dvě účinná pojistná zařízení. Jsou určeny k uvedení v činnost při styku s plavidly, vozidly nebo osobami. Pod toto pojmenování spadají také „Bangalore torpedoes“.

MUNICE, CVIČNÁ: UN čísla 0362, 0488

Munice, bez hlavní trhavé nálože, která obsahuje trhavou nebo výmetnou náložku. Obvykle obsahuje také rozněčovadlo a hnací náplň.

POZNÁMKA: GRANÁTY, CVIČNÉ nejsou zahrnuty pod toto pojmenování. Ty jsou v tomto glosáři uvedeny zvlášť.

MUNICE, DÝMOVÁ, S BÍLÝM FOSFOREM, s trhavou náložkou, výmetnou nebo hnací náplní: UN čísla 0245, 0246

Munice, která obsahuje bílý fosfor jako dýmotvornou látku. Kromě toho obsahuje jeden nebo více těchto komponentů: hnací náplň se zápalkou a zažehovačem; rozněcovadlo s trhavou nebo výmetnou náplní. Toto pojmenování zahrnuje též dýmové granáty.

MUNICE, DÝMOVÁ, s nebo bez trhavé náložky, výmetné nebo hnací náplně: UN čísla 0015, 0016, 0303

Munice, která obsahuje dýmotvornou látku; jako směs kyseliny chlorsulfonové, chlorid titaničitý, nebo dýmotvornou pyrotechnickou slož založenou na hexachlorethanu nebo červeném fosforu. Pokud není dýmotvorná látka sama výbušninou, obsahuje munice také jednu nebo více následujících složek: hnací náplň se zapalovačem a zažehovačem, rozněcovadlo s trhavou nebo výmetnou náplní. Toto pojmenování zahrnuje též dýmové granáty.

POZNÁMKA: *SIGNÁLNÍ PROSTŘEDKY, DÝMOVÉ nejsou zahrnuty pod toto pojmenování. Ty jsou v tomto glosáři uvedeny zvlášť.*

MUNICE, OSVĚTLOVACÍ, s nebo bez trhavé náložky, výmetné nebo hnací náplně: UN čísla 0171, 0254, 0297

Munice určená k vytvoření jednotlivého zdroje intenzivního světla k osvětlení prostoru. Toto pojmenování zahrnuje osvětlovací náložky, granáty, stěly a bomby osvětlovací a identifikující cíle.

POZNÁMKA: *Následující předměty nespádají pod toto pojmenování: NÁBOJE, SIGNÁLNÍ; PROSTŘEDKY SIGNÁLNÍ, TÍSŇOVÉ; PROSTŘEDKY SIGNÁLNÍ RUČNÍ; SVĚTLICE, LETECKÉ; SVĚTLICE, POZEMNÍ. Ty jsou v tomto glosáři uvedeny zvlášť.*

MUNICE, SLZOTVORNÁ, s trhavou náložkou, výmetnou nebo hnací náplní: UN čísla 0018, 0019, 0301

Munice obsahující slzotvornou látku. Kromě toho obsahuje jeden nebo více těchto komponentů: pyrotechnickou látku, hnací náplň se zápalkou a zažehovačem, rozněcovadlo s trhavou nebo výmetnou náplní.

MUNICE, ZÁPALNÁ S BÍLÝM FOSFOREM, s trhavou náložkou, výmetnou nebo hnací náplní: UN čísla 0243, 0244

Munice, která obsahuje jako zápalnou látku bílý fosfor. Kromě toho obsahuje jednu nebo více těchto složek: hnací náplň se zápalkou a zažehovačem, rozněcovadlo s trhavou nebo výmetnou náplní.

MUNICE, ZÁPALNÁ, s kapalinou nebo gelem, s trhavou náložkou, výmetnou nebo hnací náplní: UN číslo 0247

Munice, která obsahuje kapalnou nebo gelovitou zápalnou látku. Pokud není zápalná látka sama výbušninou, obsahuje munice kromě toho ještě jednu nebo více těchto složek: hnací náplň se zápalkou a zažehovačem, rozněcovadlo s trhavou náložkou nebo výmetnou náplní.

MUNICE, ZÁPALNÁ, s nebo bez trhavé náložky, výmetné nebo hnací náplně: UN čísla 0009, 0010, 0300

Munice, která obsahuje zápalnou slož. Pokud není zápalná slož sama výbušninou, obsahuje munice kromě toho jednu nebo více těchto složek: pohonnou náplň se zápalkou a zažehovačem, rozněcovadlo s trhavou nebo výmetnou náložkou.

MUNICE, ZKUŠEBNÍ: UN číslo 0363

Munice, která obsahuje pyrotechnické látky. Slouží ke zkoušce funkce nebo odolnosti nové munice, zbraňových dílů nebo zařízení.

NÁBOJE, MALORÁŽOVÉ: UN čísla 0012, 0339, 0417

Munice, která sestává z nábojnice se středovým nebo okrajovým zápalem, obsahující hnací náplň a pevnou střelou. Náboje jsou určeny k vystřelování ze zbraní o ráži nejvýše 19,1 mm. Pod toto pojmenování jsou zahrnuty také brokové náboje všech ráží.

POZNÁMKA: *NÁBOJE MALORÁŽOVÉ, CVIČNÉ nespádají pod toto pojmenování. Tyto jsou uvedeny zvlášť. Také některé vojenské malorážové náboje nespádají pod toto pojmenování. Tyto jsou uvedeny pod pojmenováním NÁBOJE PRO ZBRANĚ, S INERTNÍ STŘELOU.*

NÁBOJE PRO NÁRADÍ, SLEPÉ: UN číslo 0014

Předmět, používaný v náradí, sestávající z uzavřené nábojnice se středovým nebo okrajovým zápalem a s náplní bezdýmného nebo černého prachu nebo bez ní, ale bez střely.

NÁBOJE PRO ZBRANĚ CVIČNÉ, nebo NÁBOJE MALORÁŽOVÉ, CVIČNÉ: UN čísla 0014, 0327, 0338

Munice, která sestává z uzavřené nábojnice se středovým nebo okrajovým zápalem a náplně z bezdýmného nebo černého prachu. Náboje neobsahují střely. Jsou určeny k vystřelování ze zbraní o ráži nejvýše 19,1 mm a slouží k vyvolání silného zvukového efektu. Používají se pro cvičné účely, k pozdravné střelbě, jako hnací náplně, pro startovací pistole atd.

NÁBOJE PRO ZBRANĚ, CVIČNÉ: UN čísla 0014, 0326, 0327, 0338, 0413

Munice, která sestává z uzavřené nábojnice se středovým nebo okrajovým zápalem a z náplně bezdýmného nebo černého prachu. Náboje neobsahují střely. Předměty slouží k vyvolání silného zvukového efektu. Používají se pro cvičné účely, k pozdravné střelbě, jako hnací náplně, pro startovací pistole atd. Pod toto pojmenování spadá také munice, cvičná.

NÁBOJE PRO ZBRANĚ, S INERTNÍ STŘELOU: UN čísla 0012, 0328, 0339, 0417

Munice, která sestává ze střely bez trhaví nálože a z nábojky, s nebo bez zápalného šroubu. Předměty mohou obsahovat stopovku za předpokladu, že převažující nebezpečí představuje hnací náplň.

NÁBOJE PRO ZBRANĚ s trhaví náplní: UN 0005, 0007, 0348

Munice, která sestává ze střely s trhavinovou náplní s roznětnými prostředky, které nemají nejméně dvě účinná pojistná zařízení a hnací náplně, s nebo bez zápalného šroubu. Pojmenování zahrnuje jednotné náboje, částečně dělené náboje a dělené náboje, jestliže jsou jednotlivé díly baleny společně.

NÁBOJE PRO ZBRANĚ s trhaví náplní: UN 0006, 0321, 0412

Munice, která sestává ze střely s trhaví náplní bez roznětných prostředků nebo s roznětnými prostředky, které mají nejméně dvě účinná pojistná zařízení, a hnací náplně, s nebo bez zápalného šroubu. Pojmenování zahrnuje jednotné náboje, částečně dělené náboje a dělené náboje, jestliže jsou jednotlivé díly baleny společně.

NÁBOJE, SIGNÁLNÍ: UN čísla 0054, 0312, 0405

Předměty, které jsou určeny pro vytváření barevných světelných nebo jiných signálů. Jsou vystřelovány ze signálních pistolí apod.

NÁBOJE, ZÁBLESKOVÉ: UN čísla 0049, 0050

Předměty sestávají z pouzdra, zápalky a zábleskové složky. Všechny součásti jsou sestaveny do jednoho celku připraveného ke střelbě.

NÁBOJKY, PRO ROPNÉ VRTY: UN čísla 0277, 0278

Předměty, sestávají z tenkého pouzdra z lepenky, kovu nebo jiného materiálu, které obsahují pouze bezdýmný prach a slouží k vystřelování tvrzených střel k prorážení pažení ropných vrtů.

POZNÁMKA: *Následující předměty nespádají pod toto pojmenování: NÁLOŽE KUMULATIVNÍ. Ty jsou v tomto glosáři uvedeny zvlášť.*

NÁBOJNICE, PRÁZDNÉ, SE ZÁPALKOU: UN čísla 0055, 0379

Předměty, sestávající z nábojnice z kovu, plastu nebo jiného nehořlavého materiálu, jejichž jedinou výbušnou součástí je zápalka nebo zápalkový šroub.

NÁBOJNICE, SPALITELNÉ, PRÁZDNÉ, BEZ ZÁPALKY: UN čísla 0446, 0447

Předměty sestávající z nábojnice, která je z části nebo celá zhotovena z nitrocelulózy.

NÁLOŽE, DESTRUKČNÍ: UN číslo 0048

Předměty, sestávající z pouzdra z lepenky, plastu, kovu nebo jiného materiálu, které obsahuje náplň z detonující výbušniny. Neobsahují roznětné prostředky, nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

POZNÁMKA: *Následující předměty nespádají pod tento pojem: PUMY, MINY, STŘELY, atd. Tyto jsou v tomto glosáři uvedeny zvlášť.*

NÁLOŽE, KUMULATIVNÍ, bez rozbušky: UN čísla 0059, 0439, 0440, 0441

Předměty sestávající z pouzdra obsahujícího nálož detonující výbušniny s dutinou, která je vyložena tuhým materiálem. Předměty jsou určeny k vyvolání mohutného usměrněného průrazného efektu.

NÁLOŽE, KUMULATIVNÍ, OHEBNÉ, LINEÁRNÍ: UN čísla 0237, 0288

Předměty sestávající z duše z detonující výbušniny tvarované do „V“ opláštěvané pružnou hmotou.

NÁLOŽE POČINOVÉ, bez rozbušky: UN čísla 0042, 0283

Předměty sestávají z nálože výbušniny schopné detonace, bez roznětného prostředku. Jsou určeny k zesílení počínového účinku rozbušky nebo bleskovice.

NÁLOŽE POČINOVÉ, S ROZBUŠKOU: UN čísla 0225, 0268

Předměty sestávají z nálože výbušniny schopné detonace a roznětného prostředku. Jsou určeny k zesílení počínového účinku rozbušky nebo bleskovice.

NÁLOŽE, HLUBINNÉ: UN číslo 0056

Předměty sestávající z nálože výbušniny schopné detonace, umístěné v sudu nebo ve střele, bez roznětných prostředků nebo s roznětnými prostředky, které mají nejméně dvě pojistná zařízení. Předměty jsou určeny k detonaci pod vodou.

NÁLOŽE TRHACÍ, S PLASTICKÝM POJIVEM: UN čísla 0457, 0458, 0459, 0460

Předměty, sestávající z nálože specifického tvaru bez pouzdra, vyrobené z trhaviny s plastickým pojivem. Neobsahují roznětné prostředky. Používají se jako součást munice jako jsou bojové hlavice.

NÁLOŽE, VÝBUŠNÉ, PRŮMYSLOVÉ, bez rozbušky: UN čísla 0442, 0443, 0444, 0445

Předměty sestávající z nálože výbušniny schopné detonace, bez roznětného prostředku. Používají se ke svařování, plátování a tvarování výbuchem nebo pro jiné metalurgické procesy.

NÁBOJKY PRO TECHNICKÉ ÚČELY: UN čísla 0275, 0276, 0323, 0381

Předměty jsou určeny k vyvolání mechanických účinků. Sestávají z pouzdra s náloží z deflagrující výbušniny a roznětného prostředku. Plynné produkty deflagrace slouží k nafukování, k podélnému nebo rotačnímu pohybu nebo k aktivaci funkce přepážek, ventilů nebo spínačů nebo k vystřelování upevňovacích prvků nebo hasících prostředků.

NÁLOŽKY PŘÍDAVNÉ, VÝBUŠNÉ: UN číslo 0060

Předměty sestávající z malé odnímatelné počínové náložky umístěné v dutině střely mezi zapalovačem a trhavinovou náplní.

NÁPLNĚ HNACÍ: UN čísla 0271, 0272, 0415, 0491

Předměty sestávající z hnací náplně, v jakékoliv fyzikální formě, s pláštěm nebo bez pláště. Slouží jako součást raketových motorů nebo ke snížení odporu vzduchu u střel.

NÁPLNĚ HNACÍ, PRO DĚLA: UN čísla 0242, 0279, 0414

Hnací náplně, v jakékoli fyzikální formě, pro dělenou dělostřeleckou munici.

NÝTY, VÝBUŠNÉ: UN číslo 0174

Předměty sestávající z malé náplně výbušniny uvnitř kovového nýtu.

OKTOLIT (OKTOL) suchý, nebo vlhčený méně než 15% hm. vody: UN číslo: 0266

Látka sestávající z těsné směsi 1,3,5,7-tetranitro-1,3,5,7-tetrazacyklooktanu (HMX) a trinitrotoluenu (TNT).

OKTONAL: UN číslo 0496

Látka sestávající z těsné směsi 1,3,5,7-tetranitro-1,3,5,7-tetrazacyklooktanu, trinitrotoluenu (TNT) a hliníku.

PENTOLIT, suchý nebo vlhčený méně než 15% hm. vody: UN číslo 0151

Látka sestává z těsné směsi pentaeritroltetranitratu (PETN) a trinitrotoluenu (TNT).

POHONNÁ HMOTA, KAPALNÁ: UN čísla 0495, 0497

Látka, sestávající z deflagrující kapalné výbušniny, která se používá k reaktivnímu pohonu.

POHONNÁ HMOTA, TUHÁ: UN čísla 0498, 0499, 0501

Látka, sestávající z deflagrující pevné výbušniny, která se používá k reaktivnímu pohonu.

PRACH BEZDÝMNÝ: UN čísla 0160, 0161, 0509

Látka, s obsahem nitrocelulózy jako hlavní složkou, která se používá jako pohonná hmota. Tento pojem zahrnuje jednosložkové bezdýmné prachy (samotná nitrocelulóza (NC)), dvousložkové bezdýmné prachy (jako NC s nitroglycerinem (NG)) a trojsložkové bezdýmné prachy (jako NC/NG/nitroguanidin).

POZNÁMKA: *Bezdýmný prach litý, lisovaný nebo balený v pytlících je uveden pod pojmem NÁPLNĚ HNACÍ PRO DĚLA nebo SLOŽE HNACÍ.*

PRACH ČERNÝ, LISOVANÝ nebo PRACH ČERNÝ, V PELETÁCH: UN číslo 0028

Látka sestávající z tvarovaného černého prachu.

PRACH ČERNÝ, zrnitý nebo moučkový: UN číslo 0027

Látka sestávající z těsné směsi dřevěného uhlí nebo jiného zdroje uhlíku a dusičnanu draselného nebo dusičnanu sodného se sírou nebo bez ní.

PRACHOVINA SUROVÁ, VLNĚNÁ, nejméně 17% hm. alkoholu

PRACHOVINA SUROVÁ, VLNĚNÁ nejméně 25% hm. vody: UN čísla 0433, 0159

Látka sestávající z nitrocelulózy a nejvýše 60 % nitroglycerínu nebo jiné kapalné organické nitrolátky nebo jejich směsi.

PROSTŘEDKY SIGNÁLNÍ, DÝMOVÉ: UN čísla 0196, 0197, 0313, 0487, 0507

Předměty, které obsahují pyrotechnické látky a vyvíjejí dým. Mohou také obsahovat zařízení k vysílání akustických signálů.

PROSTŘEDKY SIGNÁLNÍ RUČNÍ: UN čísla 0191, 0373

Přenosné prostředky, které obsahují pyrotechnické látky, a které vydávají vizuální signály nebo výstražná znamení. Pod toto pojmenování spadají také malé světlice, jako dálniční světlice, železniční světlice nebo malé světlice pro lodě v tísni.

PROSTŘEDKY SIGNÁLNÍ, TÍŠŇOVÉ, lodní: UN čísla 0194, 0195, 0505, 0506

Předměty, které obsahují pyrotechnické látky a jsou určeny k vytváření signálů ve formě zvukového efektu, plamene nebo dýmu nebo kombinace těchto efektů.

PROSTŘEDKY ZÁCHRANNÉ, PYROTECHNICKÉ: UN číslo 0503

Prostředky, které obsahují pyrotechnické látky nebo nebezpečné věci jiných tříd a jsou používány ve vozidlech, plavidlech nebo letadlech ke zvýšení bezpečnosti osob. Příklady jsou: plynové generátory airbagů, moduly airbagů, předpínače bezpečnostních pásů a pyromechanické prostředky. Tyto pyromechanické prostředky jsou komponenty sestavené k zajištění, mimo jiné, funkcí oddělení, zablokování nebo zadržení cestujících.

PŘEDMĚTY, PYROFORICKÉ: UN číslo 0380

Předměty obsahující pyroforní látku, která je ve styku se vzduchem schopná samovznícení a výbušnou látku nebo složku. Toto pojmenování nezahrnuje předměty obsahující bílý fosfor.

PŘEDMĚTY PYROTECHNICKÉ, pro technické účely: UN čísla 0428, 0429, 0430, 0431, 0432

Předměty, které obsahují pyrotechnické látky. Jsou používány pro technické účely, jako je vývin tepla, vývin plynu nebo pro divadelní efekty apod.

POZNÁMKA: *Následující předměty nespádají pod toto pojmenování: všechny druhy munice; ZAŘÍZENÍ UVOLŇOVACÍ, VÝBUŠNÁ; VÝROBKY ZÁBAVNÉ PYROTECHNIKY; TŘASKAVKY, ŽELEZNIČNÍ; SVĚTLICE, POZEMNÍ; SVĚTLICE, LETECKÉ; NÁBOJE, SIGNÁLNÍ; ŘEZAČKY, KABELŮ, VÝBUŠNÉ; PROSTŘEDKY, SIGNÁLNÍ, RUČNÍ; PROSTŘEDKY, SIGNÁLNÍ, DÝMOVÉ; PROSTŘEDKY SIGNÁLNÍ, TÍŠŇOVÉ; NÝTY, VÝBUŠNÉ. Tyto předměty jsou v tomto glosáři uvedeny zvlášť.*

PUMY, S HOŘLAVOU KAPALINOU, s trhací náplní: UN čísla 0399, 0400

Předměty, které jsou shazovány z letadel. Sestávají z nádržky obsahující hořlavou kapalinu a trhací nálož.

PUMY, s trhací náplní: UN čísla 0033, 0291

Výbušné předměty, které jsou shazovány z letadel. Obsahují roznětné prostředky, které nemají nejméně dvě účinná pojistná zařízení.

PUMY, s trhací náplní: UN čísla 0034, 0035

Výbušné předměty, které jsou shazovány z letadel. Buď neobsahují roznětné prostředky, nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

PUMY, ZÁBLESKOVÉ: UN číslo 0037

Výbušné předměty, které jsou shazovány z letadel pro dosažení krátkodobě působícího intenzivního osvětlení pro fotografické účely. Obsahují nálož detonující výbušniny s roznětnými prostředky, které nemají nejméně dvě účinná pojistná zařízení.

PUMY, ZÁBLESKOVÉ: UN číslo 0038

Výbušné předměty, které jsou shazovány z letadel pro dosažení krátkodobě působícího intenzivního osvětlení pro fotografické účely. Obsahují nálož detonující výbušniny bez roznětných prostředků nebo s roznětnými prostředky, které mají nejméně dvě účinná pojistná zařízení.

PUMY, ZÁBLESKOVÉ: UN číslo 0039, 0299

Výbušné předměty, které jsou shazovány z letadel pro dosažení krátkodobě působícího intenzivního osvětlení pro fotografické účely. Obsahují zábleskovou slož.

PŘEDMĚTY, VÝBUŠNÉ, VELMI NECITLIVÉ (EEI): UN číslo 0486

Předměty, které převážně obsahují zvláště necitlivé látky, které při normálních přepravních podmínkách vykazují jen nepatrnou pravděpodobnost náhodného roznětu nebo přenosu detonace a obstály ve zkušební sérii 7 dle Příručky zkoušek a kritérií.

RAKETOVÉ MOTORY: UN čísla 0186, 0280, 0281, 0510

Předměty sestávající z výbušniny, obvykle tuhé pohonné hmoty, která je umístěna ve válci opatřeném jednou nebo více tryskami. Jsou určeny k pohonu raket nebo řízených střel.

RAKETOVÉ MOTORY S HYPERGOLY, s nebo bez výmetné náplně: UN čísla 0250, 0322

Předměty sestávající z válce s jednou nebo více tryskami, který obsahuje hypergolicou pohonnou látku. Jsou určeny k pohonu raket nebo řízených střel.

RAKETOVÉ MOTORY S KAPALNÝM PALIVEM: UN čísla 0395, 0396

Předměty sestávající z válce s jednou nebo více tryskami, který obsahuje kapalné palivo. Jsou určeny k pohonu raket nebo řízených střel.

RAKETY s inertní hlavicí UN čísla: 0183, 0502

Předměty sestávající z raketového motoru a nevýbušné hlavice. Toto pojmenování zahrnuje také řízené střely.

RAKETY, S KAPALNÝM PALIVEM s trhací náplní: UN čísla 0397, 0398

Předměty, sestávající z kapalného paliva a válce opatřeného jednou nebo více tryskami, ke kterým je připevněna bojová hlavice. Toto pojmenování zahrnuje také řízené střely.

RAKETY, s trhací náplní: UN čísla 0180, 0295

Předměty sestávající z raketového motoru a bojové hlavice s roznětnými prostředky, které nemají nejméně dvě účinná pojistná zařízení. Toto pojmenování zahrnuje také řízené střely.

RAKETY, s trhací náplní: UN čísla 0181, 0182

Předměty sestávající z raketového motoru a bojové hlavice bez roznětných prostředků nebo s roznětnými prostředky, které mají nejméně dvě účinná pojistná zařízení. Toto pojmenování zahrnuje také řízené střely.

RAKETY, s výmetnou náplní: UN čísla 0436, 0437, 0438

Předměty sestávající z raketového motoru a náložky sloužící k výmetu užitečného nákladu z hlavice rakety. Toto pojmenování zahrnuje také řízené střely.

RAKETY, TAHAČE LAN: UN čísla 0238, 0240, 0453

Předměty sestávající z raketového motoru, které jsou určeny k roztahování lan.

ROZBUŠKOVÉ SESTAVY, NEELEKTRICKÉ, pro trhací práce: UN čísla 0360, 0361, 0500

Neelektrické rozbušky opatřené prostředky, kterými jsou uváděny v činnost, jako jsou zápalnice, bleskovice, mikrobleskovice a detonační trubice. Mohou být mžikové nebo časované. Pod toto pojmenování spadají detonační zařízení s bleskovicí.

ROZBUŠKY, ELEKTRICKÉ pro trhací práce: UN čísla 0030, 0255, 0456

Předměty, které jsou určeny zejména k počínu průmyslových trhavin. Rozbušky mohou být mžikové i časované. Elektrické rozbušky se uvádějí v činnost elektrickým proudem.

ROZBUŠKY, ELEKTRONICKÉ programovatelné pro trhací práce: UN 0511, 0512, 0513

Rozbušky se zdokonalenými bezpečnostními a zabezpečovacími funkcemi využívající elektronické komponenty k přenosu vypalovacího signálu s ověřenými příkazy a zabezpečenou komunikací. Rozbušky tohoto typu nelze iniciovat jinými prostředky.

ROZBUŠKY, NEELEKTRICKÉ pro trhací práce: UN čísla 0029,00267, 0455

Předměty, které jsou určeny zejména k počínu průmyslových trhavin. Rozbušky mohou být mžikové i časované. Neelektrické rozbušky se uvádějí v činnost zápalnicí, bleskovicí, mikrobleskovicí, detonační trubici nebo jinými roznětnými prostředky. Pod toto pojmenování spadají detonační zařízení bez bleskovic.

ROZBUŠKY, PRO MUNICI: UN 0073, 0364, 0365, 0366.

Předměty sestávající z malého kovového nebo plastového pouzdra, které obsahuje výbušninu jako azid olovnatý, PETN nebo směs výbušnin. Jsou určeny k počínu detonačních zařízení.

ROZRUŠOVACÍ ZAŘÍZENÍ, VÝBUŠNÁ, pro ropné vrty, bez rozbušky: UN číslo 0099

Předměty sestávající z trhavinové nálože v pouzdře, bez roznětného prostředku. Používají se k rozrušení horniny v okolí vrtného otvoru, pro usnadnění výtoku ropy z horniny.

ŘEZAČKY KABELŮ, VÝBUŠNÉ: UN číslo 0070

Předměty sestávající ze zařízení s nožovým ostřím, které je vymršťováno malou náloží deflagrační výbušninou na kovadlinu.

SLOŽ PYROTECHNICKÁ, ZÁBLESKOVÁ: UN čísla 0094, 0305

Pyrotechnická slož, která po zážehu produkuje intenzivní světlo.

SOUČÁSTI ROZNĚTNÝCH ŘETĚZCŮ, J.N.: UN čísla 0382, 0383, 0384, 0461

Předměty, obsahující výbušninu, určené k přenosu detonace nebo deflagrace v zapalovačích municích.

STOPINA: UN číslo 0101

Předmět sestávající z bavlněných vláken obalených jemně zrněným černým prachem. Hoří vnějším plamenem a používá se k zážehu pyrotechnických předmětů atd. Může být uzavřena v papírové trubici pro získání okamžitého efektu.

STOPOVKY PRO MUNICI: UN čísla 0212, 0306

Uzavřené předměty, které obsahují pyrotechnické látky. Slouží k zviditelnění dráhy letu střely.

STŘELY, inertní se stopovkou: UN čísla 0345, 0424, 0425

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní, pušek nebo jiných malorážových střelných zbraní.

STŘELY, s trhací náplní: UN čísla 0167, 0324

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní. Obsahují roznětné prostředky, které nemají nejméně dvě účinná pojistná zařízení.

STŘELY, s trhací náplní: UN čísla 0168, 0169, 0344

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní. Neobsahují roznětné prostředky nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

STŘELY, s trhavou náložkou nebo výmetnou náplní: UN čísla 0346, 0347

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní. Střely neobsahují roznětné prostředky nebo obsahují roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení. Používají se k rozhozu značkovacího barviva nebo jiných nevýbušných látek.

STŘELY, s trhavou náložkou nebo výmetnou náplní: UN čísla 0426, 0427

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní. Střely obsahují roznětné prostředky, které nemají nejméně dvě účinná pojistná zařízení. Používají se k rozhozu značkovacího barviva nebo jiných nevýbušných látek.

STŘELY, s trhavou náložkou nebo výmetnou náplní: UN čísla 0434, 0435

Předměty jako granáty nebo střely, které jsou vystřelovány z děl nebo jiných dělostřeleckých zbraní, pušek nebo jiných malorážových střelných zbraní. Používají se k rozhozu značkovacího barviva nebo jiných nevýbušných látek.

SVĚTLICE, LETECKÉ: UN čísla 0093, 0403, 0404, 0420, 0421

Předměty, obsahující pyrotechnické látky, které jsou určeny ke shazování z letadel. Používají se k osvětlovacím, identifikačním, signálním nebo varovným účelům.

SVĚTLICE, POZEMNÍ: UN čísla 0092, 0418, 0419

Předměty, obsahující pyrotechnické látky, které jsou určeny k používání na zemi. Používají se k osvětlovacím, identifikačním, signálním nebo varovným účelům.

TORPÉDA, S KAPALNÝM PALIVEM, s nebo bez trhací nálože: UN číslo 0449

Předměty sestávající z kapalného výbušného pohonného systému k pohonu torpéda ve vodě, s nebo bez bojové hlavice; nebo předměty sestávající z kapalného nevýbušného pohonného systému k pohonu torpéda ve vodě a z bojové hlavice.

TORPÉDA, S KAPALNÝM PALIVEM s inertní hlavicí: UN číslo 0450

Předměty sestávající z kapalného výbušného pohonného systému k pohonu torpéda ve vodě a z inertní hlavice.

TORPÉDA, s trhací náplní: UN číslo 0329

Předměty sestávající z výbušného pohonného systému k pohonu torpéda ve vodě a z bojové hlavice. Bojová hlavice neobsahuje roznětné prostředky nebo obsahuje roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

TORPÉDA, s trhací náplní: UN číslo 0330

Předměty sestávající z výbušného nebo nevýbušného pohonného systému, k pohonu torpéda ve vodě a z bojové hlavice. Bojová hlavice obsahuje roznětné prostředky, které mají méně než dvě účinná pojistná zařízení.

TORPÉDA, s trhací náplní: UN číslo 0451

Předměty sestávající z nevýbušného pohonného systému, k pohonu torpéda ve vodě a z bojové hlavice. Bojová hlavice neobsahuje roznětné prostředky nebo obsahuje roznětné prostředky, které mají nejméně dvě účinná pojistná zařízení.

TRHAVÉ NÁLOŽKY, výbušné: UN číslo 0043

Předměty, sestávající z malé náložky výbušniny. Slouží k roztržení pláště střel nebo jiné munice, aby se mohla rozptýlit jejich náplň.

TRHAVINA, TYP A: UN číslo 0081

Látky sestávající z kapalných nitroesterů, takových jako nitroglycerin nebo směsi takových látek. Obsahují kromě toho jednu nebo více těchto složek: nitrocelulózu, dusičnan amonný nebo jiné anorganické dusičnany, aromatické nitrosloučeniny nebo hořlavé látky, jako dřevěnou moučku nebo hliníkový prášek. Kromě toho mohou obsahovat inertní součásti, jako je křemelina a přísady, jako barviva a stabilizátory. Trhaviny mají konzistenci práškovou, želatinovou, plastickou nebo poloplastickou. Pod toto pojmenování spadají také dynamity, trhací želatiny, želatinové dynamity.

TRHAVINA, TYP B: UN čísla 0082, 0331

Látky sestávající ze:

- (a) směsi dusičnanu amonného nebo jiných anorganických dusičnanů s výbušninami takovými jako trinitrotoluen (TNT), mohou také obsahovat jiné látky, jako dřevěnou moučku a hliníkový prášek; nebo
- (b) směsi z dusičnanu amonného nebo jiných anorganických dusičnanů s jinými hořlavými, nevýbušnými látkami.

V obou případech mohou trhaviny obsahovat inertní součásti, jako křemelinu a přísady, jako barviva a stabilizátory. Tyto trhaviny nesmějí obsahovat nitroglycerin nebo podobné kapalné nitroestery nebo chlorečnany.

TRHAVINA, TYP C: UN číslo 0083

Látky sestávající ze směsi chlorečnanu draselného nebo chlorečnanu sodného nebo chloristanu draselného nebo chloristanu sodného nebo chloristanu amonného a organických nitrosloučenin nebo hořlavých látek, jako dřevěná moučka, hliníkový prášek nebo uhlovodíky. Látky mohou kromě toho obsahovat inertní součásti jako křemelinu a přísady jako barviva a stabilizátory. Tyto trhaviny nesmějí obsahovat nitroglycerin nebo podobné kapalné nitroestery.

TRHAVINA, TYP D: UN číslo 0084

Látky sestávající ze směsi organických nitrosloučenin a hořlavých látek, jako uhlovodíků a hliníkového prášku. Látky mohou obsahovat inertní součásti, jako křemelinu a přísady, jako barviva a stabilizátory. Tyto trhaviny nesmějí obsahovat nitroglycerin nebo podobné kapalné nitroestery, chlorečnany a dusičnan amonný. Pod toto pojmenování spadají plastické trhaviny.

TRHAVINA, TYP E: UN čísla 0241, 0332

Látky sestávající z vody, jako hlavní součásti a vysokého podílu dusičnanu amonného nebo jiných oxidačních prostředků, které mohou být v roztoku. Ostatními součástmi mohou být nitrosloučeniny jako trinitrotoluen, uhlovodíky nebo hliníkový prášek. Mohou obsahovat inertní součásti, jako křemelinu a přísady, jako barviva a stabilizátory. Pod toto pojmenování spadají emulzní trhaviny, trhaviny typu slurry a „vodní gely“.

TRITONAL: UN číslo 0390

Látka sestává ze směsi trinitrotoluenu (TNT) a hliníku.

TŘASKAVKY, ŽELEZNIČNÍ: UN čísla 0192, 0193, 0492, 0493

Předměty, obsahující pyrotechnickou látku, které při nárazu vybuchují se silným zvukovým efektem. Předměty jsou určeny k umístění na železničních kolejích.

VÝROBKY ZÁBAVNÉ PYROTECHNIKY: UN čísla 0333, 0334, 0335, 0336, 0337

Pyrotechnické předměty určené pro zábavné účely.

VZORKY, VÝBUŠNÉ, kromě třaskavin: UN číslo 0190

Nové nebo již existující výbušné látky nebo předměty, které dosud nejsou přiřazeny k žádnému pojmenování v kapitole 3.2, tabulce A, které jsou přepravovány v malém množství v souladu s pokyny příslušného orgánu mimo jiné k pokusným, klasifikačním, výzkumným a vývojovým účelům, za účelem kontroly jakosti nebo jako obchodní vzorek.

POZNÁMKA: Výbušné látky nebo předměty, které již jsou jmenovitě uvedené v kapitole 3.2, tabulce A, pod tento pojem nespádají.

ZÁPALKOVÉ ŠROUBY UN čísla 0319, 0320, 0376

Předměty sestávající ze zápalky pro zážeh a přídatné náplně deflagrující výbušniny, jako je černý prach. Používají se k zážehu hnací náplně v nábojnicích pro děla atd.

ZÁPALKY, KALÍŠKOVÉ: UN čísla 0044, 0377, 0378

Předměty sestávající se z kovových nebo plastových kalíšků, které obsahují malé množství třaskavé složky, která se snadno zažehuje úderem. Slouží jako zážehový prostředek v malorážových nábojích a v nárazových zápalkách hnacích náplní.

ZÁPALNICE: UN číslo 0066

Předmět, který se buď sestává z textilních vláken obalených černým prachem, nebo jinou rychle hořící pyrotechnickou složkou a z pružného ochranného povlaku nebo z duše z černého prachu opředené pružnými textilními vlákny. Předmět hoří podélně otevřeným plamenem a slouží k přenosu zážehu z jednoho zařízení k náložce nebo k zažehovači.

ZÁPALNICE, BEZPEČNOSTNÍ: UN číslo 0105

Předmět, sestávající z duše z jemnozrného černého prachu, která je omotaná ohebným textilním vláknem. Je opatřený jedním nebo více ochrannými obaly a po zažehnutí hoří stanovenou rychlostí bez jakéhokoliv vnějšího výbušného účinku.

ZÁPALNICE, trubičková, s kovovým pláštěm: UN číslo 0103

Předmět sestávající z kovové trubičky s duší z deflagrující výbušniny.

ZAPALOVAČE, DETONAČNÍ: UN čísla 0106, 0107, 0257, 0367

Předměty, s výbušnými díly, určené k vyvolání detonace v munici. Obsahují mechanické, elektrické, chemické nebo hydrostatické zařízení k vyvolání detonace. Obvykle obsahují pojistná zařízení.

ZAPALOVAČE, DETONAČNÍ s pojistným zařízením: UN čísla 0408, 0409, 0410

Předměty, s výbušnými díly, určené k vyvolání detonace v munici. Obsahují mechanické, elektrické, chemické nebo hydrostatické zařízení k vyvolání detonace. Detonační zapalovače musí obsahovat nejméně dvě účinná pojistná zařízení.

ZAPALOVAČE, ZÁŽEHOVÉ: UN čísla 0316, 0317, 0368

Předměty, s třaskavými složkami, určené k vyvolání deflagrace v munici. Obsahují mechanické, elektrické, chemické nebo hydrostatické zařízení k vyvolání deflagrace. Obvykle obsahují pojistná zařízení.

ZAŘÍZENÍ, AKTIVOVATELNÁ VODOU, s trhavou náložkou, výmetnou nebo hnací náplní: UN čísla 0248, 0249

Předměty, jejichž funkce je závislá na fyzikálně-chemické reakci jejich složek s vodou.

ZAŘÍZENÍ UVOLŇOVACÍ, VÝBUŠNÁ: UN číslo 0173

Předměty sestávající z malé výbušné náložky s roznětným prostředkem a tyče nebo spojovacího dílu. Preražením tyče nebo spojovacího dílu se zařízení uvede rychle v činnost.

ZÁŽEHOVAČE: UN čísla 0121, 0314, 0315, 0325, 0454

Předměty, které obsahují jednu nebo více výbušných látek, které jsou určeny k vyvolání deflagrace ve výbušných zařízeních. Do činnosti mohou být uváděny chemicky, elektricky nebo mechanicky.

POZNÁMKA: Následující předměty nespádají pod tento pojem: ZÁPALNICE, ZÁPALNICE trubičková; ZÁPALNICE BEZPEČNOSTNÍ; ZÁPALKY KALÍŠKOVÉ; STOPINA; ZÁPALKOVÉ ŠROUBY; ZÁŽEHOVAČE ZÁPALNIC. Tyto jsou v tomto glosáři uvedeny zvlášť.

ZAŽEHOVAČE ZÁPALNIC: UN číslo 0131

Předměty různé konstrukce, které se uvádějí v činnost třením, úderem nebo elektricky a které slouží k zažehnutí zápalnice.

2.2.2 Třída 2 Plyny**2.2.2.1 Kritéria**

2.2.2.1.1 Název třídy 2 zahrnuje čisté plyny, směsi plynů, směsi jednoho nebo více plynů s jednou nebo více jiných látek, jakož i předměty, které takové látky obsahují.

Plyny jsou látky, které:

- (a) při 50 °C mají tenzi par vyšší než 300 kPa (3 bary); nebo
- (b) při 20 °C a standardním tlaku 101,3 kPa jsou zcela plynné.

POZNÁMKA 1: UN 1052 FLUOROVODÍK, BEZVODÝ je však látkou třídy 8.

POZNÁMKA 2: Čistý plyn smí obsahovat jiné složky, které pocházejí z výrobního procesu nebo které jsou přidávány, aby zachovaly stabilitu výrobku, za předpokladu, že tyto složky nemění jeho zařazení nebo jeho přepravní podmínky, jako stupeň plnění, plnicí tlak nebo zkušební tlak.

POZNÁMKA 3: J.N. položky v pododdíle 2.2.2.3 mohou zahrnovat čisté plyny, jakož i směsi plynů.

2.2.2.1.2 Látky a předměty třídy 2 jsou rozděleny následovně:

1. **Stlačený plyn:** plyn, který, je-li naplněn pod tlakem pro přepravu, je zcela plynný při teplotě – 50 °C; tato kategorie zahrnuje všechny plyny s kritickou teplotou – 50 °C nebo nižší;
2. **Zkapalněný plyn:** plyn, který, je-li naplněn pod tlakem pro přepravu, je částečně kapalný při teplotách nad – 50 °C. Rozlišuje se:
 - Vysokotlaký zkapalněný plyn:* plyn s kritickou teplotou nad – 50 °C a nejvýše + 65 °C; a
 - Nízkotlaký zkapalněný plyn:* plyn s kritickou teplotou nad + 65 °C;
3. **Hluboce zchlazený zkapalněný plyn:** plyn, který, je-li naplněn pro přepravu, je částečně zkapalněn v důsledku své nízké teploty;
4. **Rozpuštěný plyn:** plyn, který, je-li naplněn pod tlakem pro přepravu, je rozpuštěn v rozpouštědle kapalné fáze;
5. Aerosoly a malé nádoby obsahující plyn (plynové kartuše);
6. Jiné předměty obsahující plyn pod tlakem;
7. Plyny, které nejsou pod tlakem, podléhající zvláštním předpisům (vzorky plynů).
8. Chemické látky pod tlakem: kapaliny, pasty nebo prášky natlakované s hnací látkou, která splňuje definici stlačeného nebo zkapalněného plynu a jejich směsí.
9. Adsorbovaný plyn: plyn, který je, je-li zabalen pro přepravu, adsorbován v tuhém porézním materiálu, s výsledným vnitřním tlakem nádoby nižším než 101,3 kPa při 20 °C a nižším než 300 kPa při 50 °C.

2.2.2.1.3 Látky a předměty (kromě aerosolů a chemických látek pod tlakem) třídy 2 jsou podle svých nebezpečných vlastností přiřazeny k jedné z následujících skupin:

- A dusivé
- O podporující hoření
- F hořlavé

T	toxické
TF	toxické, hořlavé
TC	toxické, žíravé
TO	toxické, podporující hoření
TFC	toxické, hořlavé, žíravé
TOC	toxické, podporující hoření, žíravé.

Jestliže podle těchto kritérií mají plyny nebo směsi plynů nebezpečné vlastnosti, které lze přiřadit k více než jedné skupině, mají skupiny označené písmenem T přednost před všemi ostatními skupinami. Skupiny označené písmenem F mají přednost před skupinami označenými písmeny A nebo O.

POZNÁMKA 1: *Ve Vzorových předpisech OSN, v IMDG Code a v Technických instrukcích ICAO jsou plyny zařazovány na základě svého hlavního nebezpečí do jedné z následujících tří podtříd:*

Podtřída 2.1: Hořlavé plyny (odpovídá skupinám, které jsou označeny písmenem F);

Podtřída 2.2: Nehořlavé, netoxické plyny (odpovídá skupinám, které jsou označeny písmeny A nebo O);

Podtřída 2.3: Toxické plyny (odpovídá skupinám, které jsou označeny písmeny T (tj. T, TF, TC, TO, TFC a TOC).

POZNÁMKA 2: *Malé nádoby obsahující plyn (UN číslo 2037) musí být přiřazeny dle nebezpečí plynoucího z jejich obsahu ke skupinám A až TOC. K aerosolům (UN číslo 1950) viz 2.2.2.1.6. K chemickým látkám pod tlakem (UN čísel 3500 až 3505) viz 2.2.2.1.7.*

POZNÁMKA 3: *Žíravé plyny se považují za toxické, a proto se zařazují do skupiny TC, TFC nebo TOC.*

2.2.2.1.4 Pokud v kapitole 3.2, tabulce A jmenovitě uvedená směs třídy 2 odpovídá různým kritériím uvedeným v 2.2.2.1.2 a 2.2.2.1.5, je třeba tuto směs zařadit dle těchto kritérií a přiřadit ji k vhodné J.N. položce.

2.2.2.1.5 Látky a předměty (kromě aerosolů a chemických látek pod tlakem) třídy 2 jmenovitě neuvedené v kapitole 3.2, tabulce A je třeba přiřadit podle 2.2.2.1.2 a 2.2.2.1.3 k hromadné položce uvedené v pododdíle 2.2.2.3. Platí následující kritéria:

Dusivé plyny

Plyny nepodporující hoření, nehořlavé a netoxické, které zředují nebo vypuzují kyslík, který je za normálních podmínek přítomen v ovzduší.

Hořlavé plyny

Plyny, které při teplotě 20 °C a standardním tlaku 101,3 kPa:

- jsou zápalné ve směsi s nejvýše 13 % obj. plynu se vzduchem; nebo
- mají rozsah hořlavosti se vzduchem nejméně 12 procentních bodů bez ohledu na spodní mez hořlavosti.

Hořlavost musí být stanovena za pomoci zkoušek nebo výpočtů dle metod schválených ISO (viz normu ISO 10156:2017).

Pokud jsou pro použití těchto metod k dispozici pouze nedostatečné údaje, mohou být použity rovnocenné metody zkoušek, pokud jsou uznány příslušným orgánem země původu.

Není-li země původu smluvní stranou ADN, musí být tyto metody uznány příslušným orgánem prvního státu smluvní strany ADN, který přijde do styku se zásilkou.

Plyny podporující hoření

Plyny, které mohou obecně přívodem kyslíku způsobit nebo podpořit hoření jiných látek účinněji než vzduch. Jsou to čisté plyny nebo směsi plynů s oxidační mohutností větší než 23,5 %, určenou metodou uvedenou v ISO 10156:2017.

Toxické plyny

POZNÁMKA: Plyny, které kvůli své žíravosti částečně nebo úplně odpovídají kritériím pro toxicitu, musí být zařazeny jako toxické. K možnému vedlejšímu nebezpečí žíravosti, viz také kritéria pod nadpisem „Žíravé plyny“.

Plyny:

- (a) o nichž je známo, že mají takový toxický nebo žíravý účinek na člověka, že představují nebezpečí pro jeho zdraví; nebo
- (b) o kterých se předpokládá, že mají toxický nebo žíravý účinek na člověka, protože při zkouškách podle pododdílu 2.2.61.1 vykazují hodnotu LC₅₀ pro akutní toxicitu nejvýše 5000 ml/m³ (ppm).

Pro zařazení směsí plynů (včetně par látek jiných tříd) může být použit následující vzorec:

$$CL_{50} \text{ toxique (Mélange)} = \frac{1}{\sum_{i=1}^n \frac{f_i}{T_i}}$$

přičemž f_i = molární zlomek i-té části směsi.
 T_i = index toxicity i - té části směsi.
 Hodnota T_i odpovídá hodnotě LC₅₀ dle P200 pododdílu 4.1.4.1 ADR. Pokud hodnota LC₅₀ není v P200 pododdílu 4.1.4.1 ADR uvedena, je třeba použít hodnotu LC₅₀, která je uvedena ve vědecké literatuře. Pokud hodnota LC₅₀ není známa, vypočítá se index toxicity na základě nejnižší hodnoty LC₅₀ látek s podobnými fyziologickými a chemickými účinky, nebo, je-li to jediná možnost, na základě pokusů.

Žíravé plyny

Plyny nebo směsi plynů, které kvůli svým žíravým účinkům zcela odpovídají kritériím pro toxicitu, je třeba zařadit jako toxické s vedlejším nebezpečím žíravosti.

Směs plynů, která je z důvodu svých kombinovaných účinků žíravosti a toxicity považována za toxickou, představuje vedlejší nebezpečí žíravosti, jestliže je z lidské zkušenosti známo, že je směs škodlivá pro kůži, oči nebo sliznice, nebo je-li hodnota LC₅₀ žíravých částí směsi při výpočtu podle následujícího vzorce nejvýše 5000 ml/m³ (ppm):

$$CL_{50} \text{ corrosif (Mélange)} = \frac{1}{\sum_{i=1}^n \frac{f_{Ci}}{T_{Ci}}}$$

přičemž f_{Ci} = molární zlomek i- té žíravé části směsi.
 T_{Ci} = index toxicity i- té žíravé části směsi.
 Hodnota T_{Ci} odpovídá hodnotě LC₅₀ dle P200 pododdílu 4.1.4.1 ADR. Pokud hodnota LC₅₀ není v P200 pododdílu 4.1.4.1 ADR uvedena, je třeba použít hodnotu LC₅₀, která je uvedena ve vědecké literatuře. Pokud hodnota LC₅₀ není známa, vypočítá se index toxicity na základě nejnižší hodnoty LC₅₀ látek s podobnými fyziologickými a chemickými účinky, nebo, je-li to jediná možnost, na základě pokusů.

2.2.2.1.6 Aerosoly

Aerosoly (UN číslo 1950) se přiřazují k jedné z následujících skupin podle svých nebezpečných vlastností takto:

A	dusivé
O	podporující hoření
F	hořlavé
T	toxické
C	žravé
CO	žravé, podporující hoření
FC	hořlavé, žravé
TF	toxické, hořlavé
TC	toxické, žravé
TO	toxické, podporující hoření
TFC	toxické, hořlavé, žravé
TOC	toxické, podporující hoření, žravé.

Zařazení závisí na povaze obsahu aerosolového rozprašovače.

POZNÁMKA: Plyny, které vyhovují definici toxických plynů podle 2.2.2.1.5 a plynů identifikovaných v tabulce 2 pokynu pro balení P200 poznámkou c „Je považován za pyroforní“ v pododdílu 4.1.4.1 ADR, nesmějí být použity jako hnací náplň v aerosolovém rozprašovači. Aerosoly s obsahem splňujícím kritéria pro obalovou skupinu I z hlediska toxicity nebo žravosti nejsou připuštěny k přepravě (viz též 2.2.2.2.2).

Platí tato kritéria:

- Přiřazení ke skupině A se provede, pokud obsah nesplňuje kritéria pro žádnou jinou skupinu podle pododstavců b) až f) dále;
- Přiřazení ke skupině O se provede, pokud aerosol obsahuje plyn podporující hoření podle 2.2.2.1.5;
- Přiřazení ke skupině F se provede, jestliže obsah zahrnuje nejméně 85 % hm. hořlavých složek a chemické spalné teplo je nejméně 30 kJ/g.

Přiřazení se neprovede, jestliže obsah zahrnuje nejvýše 1 % hm. hořlavých složek a spalné teplo je menší než 20 kJ/g.

Jinak musí být aerosol odzkoušen na hořlavost zkouškami popsány v *Příručce zkoušek a kritérií*, části III, oddílu 31. Velmi hořlavé a hořlavé aerosoly musí být přiřazeny ke skupině F.

POZNÁMKA: Hořlavé složky jsou hořlavé kapaliny, hořlavé tuhé látky nebo hořlavé plyny a směsi plynů, jak jsou definovány v poznámkách 1 až 3 pododdílu 31.1.3 části III *Příručky zkoušek a kritérií*. Tento pojem nezahrnuje pyroforní látky, látky schopné samoohřevu ani látky reagující s vodou. Chemické spalné teplo se určí jedním z následujících postupů: ASTM D 240, ISO/FDIS 13943:1999 (E/F) 86.1 až 86.3 nebo NFPA 30B.

- Přiřazení ke skupině T se provede, pokud je obsah, s výjimkou hnací náplně aerosolového rozprašovače, zařazen do třídy 6.1, obalových skupin II nebo III;

- (e) Přiřazení ke skupině C se provede, pokud obsah, s výjimkou hnací náplně aerosolového rozprašovače, splňuje kritéria pro třídu 8, obalové skupiny II nebo III;
- (f) Pokud jsou splněna kritéria pro více než jednu skupinu mezi skupinami O, F, T a C, provede se přiřazení k příslušné skupině CO, FC, TF, TC, TO, TFC nebo TOC.

2.2.2.1.7**Chemické látky pod tlakem**

Chemické látky pod tlakem (UN čísel 3500 až 3505) se přiřazují k jedné z následujících skupin podle svých nebezpečných vlastností takto:

A	dusivé
F	hořlavé
T	toxické
C	žiravé
FC	hořlavé, žiravé
TF	toxické, hořlavé

Zařazení závisí na nebezpečných vlastnostech komponentů v různých stavech:

Hnací látka;

Kapalina; nebo

Tuhá látka.

POZNÁMKA 1: Plyny, které vyhovují definici toxických plynů nebo plynů podporujících hoření podle 2.2.2.1.5, nebo plyny identifikované v tabulce 2 pokynu pro balení P200 v 4.1.4.1 ADR poznámkou c „Je považován za pyroforní“, nesmějí být používány jako hnací látka pro chemické látky pod tlakem.

POZNÁMKA 2: Chemické látky pod tlakem, jejichž obsah splňuje kritéria pro obalovou skupinu I z hlediska toxicity nebo žiravosti, nebo jejichž obsah splňuje jak kritéria pro obalovou skupinu II nebo III z hlediska toxicity, tak i kritéria pro obalovou skupinu II nebo III z hlediska žiravosti, nesmějí být přijímány k přepravě pod těmito UN čísly.

POZNÁMKA 3: Chemické látky pod tlakem s komponentami odpovídajícími vlastnostem třídy 1; znečistlivěné výbušné kapaliny třídy 3; samovolně se rozkládající látky a znečistlivěné tuhé výbušné látky třídy 4.1; třída 4.2; třída 4.3; třída 5.1; třída 5.2; třída 6.2 nebo třída 7 nesmějí být používány pro přepravu pod těmito UN čísly.

POZNÁMKA 4: Chemické látky pod tlakem v aerosolovém rozprašovači musí být přepravovány pod UN číslem 1950.

Platí tato kritéria:

- (a) Přiřazení ke skupině A se provede, pokud obsah nesplňuje kritéria pro žádnou jinou skupinu podle pododstavců (b) až (e) dále;
- (b) Přiřazení ke skupině F se provede, jestliže jeden z komponentů, kterým může být čistá látka nebo směs, musí být klasifikován jako hořlavý. Hořlavé komponenty jsou hořlavé kapaliny a kapalně směsi, hořlavé tuhé látky a tuhé směsi nebo hořlavé plyny a směsi plynů splňující následující kritéria:
 - (i) Hořlavá kapalina je kapalina s bodem vzplanutí nejvýše 93 °C;
 - (ii) Hořlavá tuhá látka je tuhá látka, která splňuje kritéria uvedená v 2.2.41.1;
 - (iii) Hořlavý plyn je plyn, který splňuje kritéria uvedená v 2.2.2.1.5;

- (c) Přiřazení ke skupině T se provede, pokud je obsah, s výjimkou hnací látky, zařazen jako nebezpečné věci třídy 6.1, obalových skupin II nebo III;
- (d) Přiřazení ke skupině C se provede, pokud je obsah, s výjimkou hnací látky, zařazen jako nebezpečné věci třídy 8, obalových skupin II nebo III;
- (e) Pokud jsou splněna kritéria pro dvě skupiny mezi skupinami F, T a C, provede se přiřazení ke skupinám FC nebo TF, jak je to náležité.

2.2.2.2 Plyny nepřipustěné k přepravě

2.2.2.2.1 Chemicky nestálé plyny třídy 2 jsou připuštěny k přepravě jen tehdy, byla-li učiněna potřebná opatření k zabránění možnosti nebezpečného rozkladu nebo polymerizace za normálních podmínek přepravy, nebo jsou-li přepravovány podle zvláštního ustanovení pro balení (r) pokynu pro balení P200 (10) pododdílu 4.1.4.1 ADR, jak je to vhodné. K opatřením potřebným pro zabránění polymerizaci viz zvláštní ustanovení 386 kapitoly 3.3. Za tímto účelem je zvláště třeba dbát na to, aby nádoby a cisterny neobsahovaly žádnou látku, které by tyto reakce mohly podporovat.

2.2.2.2.2 Následující látky a směsi nejsou připuštěny k přepravě:

- UN 2186 - CHLOROVODÍK, HLUBOCE ZCHLAZENÝ, KAPALNÝ;
- UN 2421 – OXID DUSITÝ;
- UN 2455 - METHYLNITRIT;
- Hluboce zchlazené zkvalněné plyny, které nemohou být přiřazeny ke klasifikačním kódům 3A, 3O nebo 3F, s výjimkou látky s identifikačním číslem 9000 AMONIAK (ČPAVEK) BEZVODÝ, HLUBOCE ZCHLAZENÝ klasifikačního kódu 3TC v tankových plavidlech;
- rozpuštěné plyny, které nemohou být přiřazeny pod UN čísla 1001, 2073 nebo 3318;
- aerosoly, u nichž jsou jako hnací náplně použity plyny, které jsou toxické podle 2.2.2.1.5 nebo pyroforní podle pokynu pro balení P200 v pododdílu 4.1.4.1 ADR;
- aerosoly s obsahem splňujícím kritéria pro obalovou skupinu I z hlediska toxicity nebo žíravosti (viz oddíly 2.2.61 a 2.2.8);
- malé nádoby obsahující plyny, které jsou velmi toxické (LC₅₀ nižší než 200 ppm) nebo pyroforní podle pokynu pro balení P200 v pododdílu 4.1.4.1 ADR.

2.2.2.3

Seznam hromadných položek

2.2.3 Třída 3 Hořlavé kapaliny

2.2.3.1 Kritéria

2.2.3.1.1 Název třídy 3 zahrnuje látky, jakož i předměty, které obsahují látky této třídy, které:

- jsou kapalné podle odstavce (a) definice pojmu „kapalina“ v oddíle 1.2.1;
- mají při 50 °C tenzi par nejvýše 300 kPa (3 bary) a při 20 °C a standardním tlaku 101,3 kPa nejsou zcela plynné; a
- mají bod vzplanutí nejvýše 60 °C (viz 2.3.3.1 k odpovídající zkoušce).

Název třídy 3 zahrnuje také kapaliny a tuhé látky v roztaveném stavu s bodem vzplanutí nad 60 °C, které jsou podány k přepravě nebo přepravovány zahřáté na teplotu rovnající se jejich bodu vzplanutí nebo vyšší. Tyto látky jsou přiřazeny k UN číslu 3256.

Název třídy 3 zahrnuje také znečtivěné kapalné výbušné látky. Znečtivěné kapalné výbušné látky jsou látky, které jsou ve vodě nebo v jiných kapalinách rozpuštěny nebo rozptýleny tak, aby vytvořily homogenní kapalnou směs, která už nemá výbušné vlastnosti. V tabulce A kapitoly 3.2 jsou tyto položky pod UN číslu 1204, 2059, 3064, 3343, 3357 a 3379.

Pro účely přepravy v tankových lodích zahrnuje název třídy také následující látky, které:

- mají bod vzplanutí nad 60 °C a které jsou přepravovány nebo podávány k přepravě při teplotě v rozmezí do 15 K pod bodem vzplanutí;
- mají teplotu samovznícení 200 °C nebo nižší a nejsou jmenovány jinde.

POZNÁMKA 1: Látky s bodem vzplanutí vyšším než 35 °C, které za podmínek zkoušky hořením stanovených v Příručce zkoušek a kritérií, části III, pododdílu 32.2.5, samostatné nehoří, nejsou látkami třídy 3; jsou-li však tyto látky podány k přepravě nebo přepravovány zahřáté na teplotu rovnající se jejich bodu vzplanutí nebo vyšší, jsou látkami třídy 3.

POZNÁMKA 2: Odchytkou od 2.2.3.1.1 se považují paliva pro vznětové motory, plynový olej nebo topný olej (lehký) včetně synteticky vyrobených produktů s bodem vzplanutí nad 60 °C až do nejvýše 100 °C za látky třídy 3, UN čísla 1202.

POZNÁMKA 3: Hořlavé kapaliny, které jsou velmi toxické při vdechnutí, jak je definováno v 2.2.61.1.4 až 2.2.61.1.9, a toxické látky s bodem vzplanutí 23 °C nebo vyšším jsou látkami třídy 6.1 (viz 2.2.61.1). Kapaliny, které jsou velmi toxické při vdechnutí, jsou identifikovány jako „toxické při vdechnutí“ ve svém oficiálním pojmenování pro přepravu ve sloupci (2) nebo zvláštním ustanovením 354 ve sloupci (6) tabulky A kapitoly 3.2.

POZNÁMKA 4: Hořlavé kapalné látky a přípravky, používané jako pesticidy, které jsou velmi toxické, toxické nebo slabě toxické a mají bod vzplanutí 23 °C nebo vyšší, jsou látkami třídy 6.1 (viz 2.2.61.1).

POZNÁMKA 5: Pro účely přepravy v tankových lodích jsou látky s bodem vzplanutí nad 60 °C až do nejvýše 100 °C látkami třídy 9 (identifikační číslo 9003).

2.2.3.1.2 Látky a předměty třídy 3 jsou rozděleny následovně:

F Hořlavé kapaliny bez vedlejšího nebezpečí a předměty obsahující takové látky:

- F1 Hořlavé kapaliny s bodem vzplanutí nejvýše 60°C;
- F2 Hořlavé kapaliny s bodem vzplanutí nad 60°C, přepravované nebo podávané k přepravě při teplotě rovnající se jejich bodu vzplanutí nebo vyšší (zahřáté látky);
- F3 Předměty obsahující hořlavé kapaliny;
- F4 Látky s bodem vzplanutí nad 60°C, které jsou přepravovány nebo podávány k přepravě při teplotě v rozmezí do 15 K pod bodem vzplanutí;
- F5 Látky s teplotou samovznícení 200 °C nebo nižší a které nejsou jmenovány jinde.

FT Hořlavé kapaliny, toxické;

- FT1 Hořlavé kapaliny, toxické;
- FT2 Pesticidy;

- FC Hořlavé kapaliny, žíravé;
- FTC Hořlavé kapaliny, toxické, žíravé;
- D Znečitlivěné kapalné výbušné látky.

2.2.3.1.3

Látky a předměty zařazené do třídy 3 jsou uvedeny v tabulce A kapitoly 3.2. Látky, které nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2 musí být přiřazeny k příslušné položce pododdílu 2.2.3.3 a k odpovídající obalové skupině podle ustanovení tohoto oddílu. Hořlavé kapaliny musí být přiřazeny k jedné z následujících obalových skupin podle stupně nebezpečí, který představují pro přepravu:

Obalová skupina	Bod vzplanutí (uzavřený kelímek)	Teplota začátku varu
I	--	≤ 35 °C
II ^a	< 23 °C	> 35 °C
III ^a	≥ 23 °C a ≤ 60 °C	> 35 °C

^a Viz též 2.2.3.1.4

Pro kapalinu s vedlejším nebezpečím (vedlejšími nebezpečími) se musí zohlednit obalová skupina určená podle výše uvedené tabulky a obalová skupina vyplývající na závažnosti vedlejšího (vedlejších) nebezpečí; klasifikace a obalová skupina se potom určí podle tabulky převažujících nebezpečí v pododdílu 2.1.3.10.

2.2.3.1.4

Viskózní hořlavé kapaliny, jako jsou barvy, emaily, laky, fermeže, lepidla a leštidla, s bodem vzplanutí pod 23 °C smějí být přiřazeny k obalové skupině III podle postupů popsaných v *Příručce zkoušek a kritérií*, části III, pododdílu 32.3, za podmínky, že

- (a) viskozita² a bod vzplanutí odpovídají následující tabulce:

Kinematická viskozita (extrapolovaná) v (při stříhové rychlosti blízké 0) mm ² /s při 23 °C	Doba výtoku t v sekundách	Průměr výtokové trysky (mm)	Bod vzplanutí, uzavřený kelímek (°C)
20 < v ≤ 80	20 < t ≤ 60	4	nad 17
80 < v ≤ 135	60 < t ≤ 100	4	nad 10
135 < v ≤ 220	20 < t ≤ 32	6	nad 5
220 < v ≤ 300	32 < t ≤ 44	6	nad -1
300 < v ≤ 700	44 < t ≤ 100	6	nad -5
700 < v	100 < t	6	bez omezení

- (b) méně než 3 % vrstvy čirého rozpouštědla se oddělí při dělicí zkoušce rozpouštědla;
- (c) směs ani oddělené rozpouštědlo nesmějí splňovat kritéria pro třídu 6.1 nebo třídu 8;

POZNÁMKA: Tato ustanovení se vztahují také na směsi obsahující nejvýše 20 % nitrocelulózy s obsahem dusíku nejvýše 12,6 % v suché hmotě. Směsi obsahující více než 20 %, avšak nejvýše 55 % nitrocelulózy s obsahem dusíku nejvýše 12,6 % v suché hmotě, jsou látkami přiřazenými k UN číslu 2059 .

Směsi s bodem vzplanutí pod 23 °C a obsahující:

- více než 55 %, nitrocelulózy, s jakýmkoli obsahem dusíku; nebo
- nejvýše 55 %, nitrocelulózy s obsahem dusíku nad 12,6 % v suché hmotě

jsou látkami třídy 1 (UN 0340 nebo 0342) nebo třídy 4.1 (UN 2555, 2556 nebo 2557).

2

Stanovení viskozity: Jestliže předmětná látka nemá gravitační vlastnosti kapaliny nebo není-li metoda s použitím výtokového kelímku vhodná ke stanovení viskozity, musí být použit viskozimetr s proměnnou stříhovou rychlostí, aby mohly být stanoveny koeficienty dynamické viskozity látky při 23 °C u řady hodnot stříhových rychlostí. Zjištěné hodnoty v závislosti na stříhových rychlostech musí být extrapolovány na hodnotu stříhové rychlosti 0. Tímto způsobem stanovená dynamická viskozita dělena hustotou dává zdánlivou kinematickou viskozitu při stříhové rychlosti blízké 0.

2.2.3.1.5 Viskózní kapalné látky

2.2.3.1.5.1 S výhradou ustanovení uvedených v 2.2.3.1.5.2 viskózní kapalné látky

- mají bod vzplanutí nejméně 23 °C a nejvýše 60 °C;
- nejsou toxické, žíravé nebo ohrožující životní prostředí;
- obsahují nejvýše 20% nitrocelulózy, za podmínky, že nitrocelulóza obsahuje nejvýše 12,6 % dusíku v suché hmotě; a
- jsou zabaleny do nádob o vnitřním objemu nejvýše 450 litrů;

nepodléhají ADN, jestliže

- (a) při dělicí zkoušce rozpouštědla (viz Příručka zkoušek a kritérií, část III, pododdíl 32.5.1) výška oddělené vrstvy rozpouštědla činí méně než 3 % celkové výšky; a
- (b) doba výtoku při zkoušce viskozity (viz Příručka zkoušek a kritérií, část III, pododdíl 32.4.3) s tryskou o průměru 6 mm je nejméně:
 - (i) 60 sekund; nebo
 - (ii) 40 sekund, jestliže viskózní kapalina obsahuje nejvýše 60 % látek třídy 3.

2.2.3.1.5.2 Viskózní kapalné látky, které jsou také nebezpečné životnímu prostředí, avšak splňují všechna ostatní kritéria v 2.2.3.1.5.1, nepodléhají žádným jiným ustanovením ADN, jsou-li přepravovány v jednoduchých nebo skupinových obalech, které obsahují čisté množství nejvýše 5 litrů na jednoduchý nebo vnitřní obal, za podmínky, že obaly splňují všeobecná ustanovení uvedená v 4.1.1.1, 4.1.1.2 a 4.1.1.4 až 4.1.1.8 dohody ADR.

2.2.3.1.6 Spadají-li látky třídy 3 vlivem příměsí do jiných kategorií nebezpečnosti než těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, přiřadí se tyto směsi nebo roztoky k položkám, ke kterým na základě svého skutečného nebezpečí patří.

POZNÁMKA: *K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz také 2.1.3.*

2.2.3.1.7 Na základě zkušebních postupů podle oddílu 2.3.3.1 a 2.3.4 a kritérií uvedených v 2.2.3.1.1 se může také zjistit, zda je jmenovitě uvedený roztok nebo jmenovitě uvedená směs, popřípadě roztok nebo směs, který(á) obsahuje jmenovitě uvedenou látku, takové povahy, že tento roztok nebo tato směs nepodléhá ustanovením pro tuto třídu (viz také 2.1.3).

2.2.3.2 Látky nepřipustěné k přepravě

2.2.3.2.1 Látky třídy 3, které snadno peroxidují (jako ethery nebo určité heterocyklické kyslíkaté látky), smějí být přepravovány jen tehdy, jestliže jejich obsah peroxidu nepřekročí 0,3 % přepočítáno na peroxid vodíku (H₂O₂). Obsah peroxidu se stanoví podle pododdílu 2.3.3.3.

2.2.3.2.2 Chemicky nestálé látky třídy 3 jsou připuštěny k přepravě jen tehdy, byla-li učiněna potřebná opatření k zabránění možnosti nebezpečného rozkladu nebo polymerizace za normálních podmínek přepravy. K opatřením potřebným pro zabránění polymerizaci viz zvláštní ustanovení 386 kapitoly 3.3. Za tímto účelem je zvláště třeba dbát na to, aby nádoby a cisterny neobsahovaly žádné látky, které by tyto reakce mohly podporovat.

2.2.3.2.3 Znečitlivěné kapalné výbušné látky, které nejsou uvedeny v tabulce A kapitoly 3.2, nejsou připuštěny k přepravě jako látky třídy 3.

2.2.3.3 Seznam hromadných položek

Hořlavé kapaliny a předměty obsahující takové látky

		1133 LEPIDLA, s hořlavou kapalnou látkou
		1136 OLEJE DEHTOVÉ, HOŘLAVÉ
		1139 ROZTOK OCHRANNÉHO NÁTĚRU (včetně povrchových úprav nebo nátěrů používaných k průmyslovým nebo jiným účelům, jako ochranný nástřík spodků karoserií vozidel, vnitřní nátěry sudů)
		1169 EXTRAKTY AROMATICKÉ, KAPALNÉ
		1197 EXTRAKTY CHUŤOVÉ, KAPALNÉ
		1210 BARVA TISKAŘSKÁ hořlavá nebo
		1210 PŘÍSLUŠENSTVÍ TISKAŘSKÝCH BAREV, (včetně ředidel a rozpouštědel tiskařských barev), HOŘLAVÉ
		1263 BARVA (včetně barev, lakových barev, emailových laků, mořidel, šelakových roztoků, fermeží, leštících prostředků, kapalných plnidel a kapalných základů pro laky)
		1263 PŘÍSLUŠENSTVÍ BAREV (včetně ředidel a rozpouštědel)
		1266 VÝROBKY KOSMETICKÉ s hořlavými rozpouštědly
		1293 TINKTURY, LÉKAŘSKÉ
	F1	1306 PROSTŘEDKY OCHRANNÉ NA DŘEVO, KAPALNÉ
		1866 ROZTOK PRYSKYŘICE, hořlavý
		1999 DEHTY KAPALNÉ, včetně silničních olejů a ředěných asfaltů
		3065 NÁPOJE ALKOHOLICKÉ
		1224 KETONY KAPALNÉ, J.N.
		1268 DESTILÁTY ROPNÉ, J.N. nebo PRODUKTY ROPNÉ, J.N.
		1987 ALKOHOLY, J.N.
		1989 ALDEHYDY, J.N.
		2319 UHLOVODÍKY TERPENICKÉ, J.N.
		3271 ETHERY, J.N.
		3272 ESTERY, J.N.
		3295 UHLOVODÍKY, KAPALNÉ, J.N.
		3336 THIOLY (merkaptany), KAPALNÉ, HOŘLAVÉ, J.N. nebo
		3336 SMĚSI THIOLŮ (merkaptanů), KAPALNÉ, HOŘLAVÉ, J.N.
		1993 LÁTKA HOŘLAVÁ, KAPALNÁ, J.N.
	F2 Látky zahřáté	3256 LÁTKA ZAHŘÁTÁ, KAPALNÁ, HOŘLAVÁ, J.N., s bodem vzplanutí nad 60 °C
	F3 Předměty	3269 PRYSKYŘICE POLYESTEROVÉ, VÍCESLOŽKOVÉ, kapalný základní materiál
		3473 ZÁSOBNÍKY DO PALIVOVÝCH ČLÁNKŮ nebo
		3473 ZÁSOBNÍKY DO PALIVOVÝCH ČLÁNKŮ OBSAŽENÉ V ZAŘÍZENÍ nebo
		3473 ZÁSOBNÍKY DO PALIVOVÝCH ČLÁNKŮ BALENÉ SE ZAŘÍZENÍM
		3528 MOTOR, VNITŘNÍ SPALOVÁNÍ, POHÁNĚNÝ HOŘLAVOU KAPALINOU nebo
		3528 MOTOR, PALIVOVÝ ČLÁNEK, POHÁNĚNÝ HOŘLAVOU KAPALINOU nebo
		3528 STROJ, VNITŘNÍ SPALOVÁNÍ, POHÁNĚNÝ HOŘLAVOU KAPALINOU nebo
		3528 STROJ, PALIVOVÝ ČLÁNEK, POHÁNĚNÝ HOŘLAVOU KAPALINOU
		3540 PŘEDMĚTY OBSAHUJÍCÍ HOŘLAVOU KAPALINU, J.N.
	F4	9001 LÁTKY S BODEM VZPLANUTÍ NAD 60 °C, které jsou zahřívány na teplotu v rozmezí 15 K pod jejich bodem vzplanutí
	F5	9002 LÁTKY S TEPLOTOU SAMOVZŇICENÍ 200 °C A NIŽE, J.N.

		1228 THIOLY (merkaptany), KAPALNÉ, HOŘLAVÉ, TOXICKÉ, J.N. nebo 1228 SMĚSI THIOLU (merkaptanů), KAPALNÉ, HOŘLAVÉ, TOXICKÉ, J.N. 1986 ALKOHOLY, HOŘLAVÉ, TOXICKÉ, J.N. 1988 ALDEHYDY, HOŘLAVÉ, TOXICKÉ, J.N. 2478 ISOKYANÁTY, HOŘLAVÉ, TOXICKÉ, J.N. nebo 2478 ISOKYANÁT, ROZTOK, HOŘLAVÝ, TOXICKÝ, J.N. 3248 LÉČIVA KAPALNÁ, HOŘLAVÁ, TOXICKÁ, J.N. 3273 NITRILY, HOŘLAVÉ, TOXICKÉ, J.N. 1992 LÁTKA HOŘLAVÁ, KAPALNÁ, TOXICKÁ, J.N.
Toxické FT	FT1	2758 PESTICID-KARBAMÁT, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 2760 PESTICID NA BÁZI ARZÉNU, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 2762 PESTICID-ORGANICKÁ SLOUČENINA CHLORU, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 2764 PESTICID NA BÁZI TRIAZINU, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 2772 PESTICID NA BÁZI THIOKARBAMÁTU, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 2776 PESTICID NA BÁZI MĚDI, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 2778 PESTICID NA BÁZI RTUTI, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 2780 PESTICID-SUBSTITUOVANÝ NITROFENOL, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 2782 PESTICID NA BÁZI BIPYRIDILU, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 2784 PESTICID-ORGANICKÁ SLOUČENINA FOSFORU, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 3024 PESTICID-DERIVÁT KUMARINU, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 3346 PESTICID-DERIVÁT KYSELINY FENOXYOCTOVÉ, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 3350 PESTICID-PYRETHROID, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 3021 PESTICID KAPALNÝ, HOŘLAVÝ, TOXICKÝ, J.N.
	FT2	Pesticid (s bodem vzplanutí pod 23 °C) 2784 PESTICID-ORGANICKÁ SLOUČENINA FOSFORU, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 3024 PESTICID-DERIVÁT KUMARINU, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 3346 PESTICID-DERIVÁT KYSELINY FENOXYOCTOVÉ, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 3350 PESTICID-PYRETHROID, KAPALNÝ, HOŘLAVÝ, TOXICKÝ 3021 PESTICID KAPALNÝ, HOŘLAVÝ, TOXICKÝ, J.N.
		POZNAMKA: Přirazení pesticidu pod položku se provádí na základě aktivní složky, fyzikálního stavu pesticidu a podle všech možných vedlejších nebezpečí, která může představovat.
Žiravé	FC	3469 BARVA, HOŘLAVÁ, ŽÍRAVÁ (včetně laků, emailů, mořidel, šelaku a fermeží, leštidel a kapalných základových složek laků) nebo 3469 LÁTKA POMOČNÁ K VÝROBĚ BAREV, HOŘLAVÁ, ŽÍRAVÁ (včetně ředidel a složek odstraňovačů) 2733 AMINY, HOŘLAVÉ, ŽÍRAVÉ, J.N. nebo 2733 POLYAMINY, HOŘLAVÉ, ŽÍRAVÉ, J.N. 2985 CHLORSILANY, HOŘLAVÉ, ŽÍRAVÉ, J.N. 3274 ALKOHOLÁTY, ROZTOKY v alkoholu, J.N. 2924 LÁTKA HOŘLAVÁ, KAPALNÁ, ŽÍRAVÁ, J.N.
Toxické, žiravé	FTC	3286 LÁTKA HOŘLAVÁ, KAPALNÁ, TOXICKÁ, ŽÍRAVÁ, J.N.
Znečlivěné výbušné kapaliny	D	3343 NITROGLYCERIN, SMĚS, ZNEČLIVĚNÁ, KAPALNÁ, HOŘLAVÁ, J.N., s nejvýše 30 % hm. nitroglycerinu 3357 NITROGLYCERIN, SMĚS, ZNEČLIVĚNÁ, KAPALNÁ, J.N., s nejvýše 30 % hm. nitroglycerinu 3379 LÁTKA ZNEČLIVĚNÁ, VÝBUŠNÁ, KAPALNÁ, J.N.

2.2.41 Třída 4.1 Hořlavé tuhé látky, samovolně se rozkládající látky, polymerizující látky a znečitlivěné tuhé výbušné látky

2.2.41.1 Kritéria

2.2.41.1.1 Název třídy 4.1 zahrnuje hořlavé látky a předměty, znečitlivěné výbušné látky, které jsou tuhými látkami podle písmene a) definice "tuhý" uvedené v oddíle 1.2.1, jakož i samovolně se rozkládající kapalné nebo tuhé látky a polymerizující látky.

Třídě 4.1 jsou přiřazeny:

- lehce hořlavé tuhé látky a předměty (viz 2.2.41.1.3 až 2.2.41.1.8);
- samovolně se rozkládající tuhé nebo kapalné látky (viz 2.2.41.1.9 až 2.2.41.1.17);
- znečitlivěné tuhé výbušné látky (viz 2.2.41.1.18);
- látky příbuzné samovolně se rozkládajícím látkám (viz 2.2.41.1.19);
- polymerizující látky (viz 2.2.41.1.20 a 2.2.41.1.21).

2.2.41.1.2 Látky a předměty třídy 4.1 se dále dělí následovně:

F Hořlavé tuhé látky bez vedlejšího nebezpečí:

- F1 organické
- F2 organické, roztavené
- F3 anorganické
- F4 předměty

FO Hořlavé tuhé látky, podporující hoření

FT Hořlavé tuhé látky, toxické:

- FT1 organické, toxické
- FT2 anorganické, toxické

FC Hořlavé tuhé látky, žíravé:

- FC1 organické, žíravé
- FC2 anorganické, žíravé

D Znečitlivěné tuhé výbušné látky bez vedlejšího nebezpečí

DT Znečitlivěné tuhé výbušné látky, toxické

SR Samovolně se rozkládající látky:

- SR1 nevyžadující řízení teploty
- SR2 vyžadující řízení teploty.

PM Polymerizující látky:

- PM1 Nevyžadující řízení teploty
- PM2 Vyžadující řízení teploty.

Hořlavé tuhé látky

Definice a vlastnosti

2.2.41.1.3 *Hořlavé tuhé látky* jsou lehce hořlavé tuhé látky a tuhé látky, které se mohou zapálit třením.

Lehce hořlavé tuhé látky jsou práškovité, zrnité nebo pastovité látky, které jsou nebezpečné, jestliže se po krátkém styku se zápalným zdrojem, jako např. s hořící zápalkou, mohou snadno zapálit a plamen se po zapálení rychle rozšiřuje. Nebezpečí přitom nemusí vycházet jen z ohně, nýbrž také

z toxických zplodin hoření. Kovové prášky jsou kvůli obtížím při hašení ohně zvláště nebezpečné, protože normální hasící prostředky, jako oxid uhličitý nebo voda, mohou zvětšit nebezpečí.

Klasifikace

2.2.41.1.4 Látky a předměty zařazené jako hořlavé tuhé látky třídy 4.1 jsou uvedeny v tabulce A kapitoly 3.2. Přiřazení organických látek a předmětů, které nejsou v tabulce A kapitoly 3.2 jmenovitě uvedeny, pod příslušnou položku pododdílu 2.2.41.3, podle ustanovení kapitoly 2.1, se může provést na základě zkušenosti nebo na základě výsledků zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.2. Přiřazení jmenovitě neuvedených anorganických látek musí být provedeno na základě výsledků zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.2, přičemž musí být zohledněny rovněž zkušenosti, vedou-li k přísnějšímu zařazení.

2.2.41.1.5 Jestliže se jmenovitě neuvedené látky na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.2 přiřazují k jedné z položek uvedených v pododdíle 2.2.41.3, platí následující kritéria:

- (a) Práškovité, zrnité nebo pastovité látky, s výjimkou kovových prášků nebo prášků kovových slitin, se klasifikují jako lehce hořlavé látky třídy 4.1, jestliže se mohou snadno zapálit po krátkém styku se zápalným zdrojem (např. hořící zápalkou), nebo jestliže se plamen po zapálení rychle rozšiřuje, doba vyhoření je menší než 45 sekund na měrnou vzdálenost 100 mm, nebo rychlost vyhoření je větší než 2,2 mm/s.
- (b) Kovové prášky nebo prášky kovových slitin se přiřadí ke třídě 4.1, jestliže mohou být zapáleny při styku s plamenem a reakce se rozšíří na celou délku vzorku za 10 minut nebo méně.

Tuhé látky, které se mohou zapálit třením, se musí zařadit do třídy 4.1 analogicky k existujícím položkám (např. zápalkám) nebo v souladu s příslušným zvláštním ustanovením.

2.2.41.1.6 Na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.2 a kritérií uvedených v 2.2.41.1.4 a 2.2.41.1.5 se může také zjistit, zda je jmenovitě uvedená látka takové povahy, že nepodléhá předpisům pro tuto třídu.

2.2.41.1.7 Spadají-li látky třídy 4.1 vlivem příměsí do jiných kategorií nebezpečnosti než těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, přiřadí se tyto směsi k položkám, ke kterým na základě svého skutečného nebezpečí patří.

POZNÁMKA: *K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz také 2.1.3.*

Přiřazení k obalovým skupinám

2.2.41.1.8 Hořlavé tuhé látky zařazené pod různé položky tabulky A kapitoly 3.2 musí být přiřazeny k obalovým skupinám II nebo III na základě zkušebních postupů Příručky zkoušek a kritérií, části III, pododdílu 33.2 podle těchto kritérií:

- (a) Lehce hořlavé tuhé látky, které mají při zkoušce dobu vyhoření menší než 45 sekund na měrnou vzdálenost 100 mm, jsou přiřazeny k
 - obalové skupině II: proběhl-li plamen navlhčenou zónou;
 - obalové skupině III: jestliže navlhčená zóna zastaví šíření plamene po dobu nejméně 4 minut.
- (b) Kovové prášky nebo prášky kovových slitin jsou přiřazeny k
 - obalové skupině II: jestliže se reakce při zkoušce rozšíří po celé délce vzorku za 5 minut nebo méně;
 - obalové skupině III: jestliže se reakce při zkoušce rozšíří po celé délce vzorku za více než 5 minut.

U tuhých látek, které mohou vzplanout třením, musí být jejich přiřazení k obalové skupině provedeno v analogii k existujícím položkám nebo podle odpovídajícího zvláštního ustanovení.

Samovolně se rozkládající látky**Definice**

2.2.41.1.9 Pro účely ADN jsou *samovolně se rozkládající látky* tepelně nestálé látky, které se mohou i bez přítomnosti kyslíku (vzduchu) silně exotermicky rozkládat. Látky se nepovažují za samovolně se rozkládající látky třídy 4.1, jestliže:

- (a) jsou výbušnými látkami dle kritérií pro třídu 1;
- (b) jsou látkami podporujícími hoření podle přiřazovacího postupu pro třídu 5.1 (viz pododdíl 2.2.51.1), s výjimkou toho, že směsi látek podporujících hoření, které obsahují nejméně 5 % hořlavých organických látek, musí být podrobeny klasifikačnímu postupu definovanému v POZNÁMCE 2;
- (c) jsou organickými peroxidy podle kritérií pro třídu 5.2 (viz 2.2.52.1);
- (d) jejich rozkladné teplo je menší než 300 J/g; nebo
- (e) jejich teplota samourychlujícího se rozkladu (SADT) (viz POZNÁMKU 2 níže) je vyšší než 75 °C pro kus o hmotnosti 50 kg.

POZNÁMKA 1: Rozkladné teplo může být určeno libovolnou mezinárodně uznávanou metodou, např. dynamickou diferenční kalorimetrií a adiabatickou kalorimetrií.

POZNÁMKA 2: Směsi látek podporujících hoření splňující kritéria třídy 5.1, které obsahují nejméně 5 % hořlavých organických látek, ale které nesplňují kritéria uvedená výše pod písmeny (a), (c), (d) nebo (e), musí být podrobeny klasifikačnímu postupu pro samovolně se rozkládající látky.

Směs vykazující vlastnosti samovolně se rozkládající látky typu B až F musí být zařazena jako samovolně se rozkládající látka třídy 4.1.

Směs vykazující vlastnosti samovolně se rozkládající látky typu G podle zásady uvedené v pododdílu 20.4.3 (g) části II Příručky zkoušek a kritérií musí být posouzena pro zařazení jako látka třídy 5.1 (viz 2.2.51.1).

POZNÁMKA 3: Teplota samourychlujícího se rozkladu (SADT) je nejnižší teplota, při které může dojít k samovolnému rozkladu látky v obalu používaném během přepravy. Potřebné předpisy k určení této teploty jsou obsaženy v Příručce zkoušek a kritérií, části II, kapitole 20 a oddílu 28.4.

POZNÁMKA 4: Všechny látky, které vykazují vlastnosti samovolně se rozkládajících látek, musí být zařazeny jako takové, i když vykazují podle 2.2.42.1.5 pozitivní výsledek zkoušky pro zařazení do třídy 4.2.

Vlastnosti

2.2.41.1.10 Rozklad samovolně se rozkládajících látek může být vyvolán teplem, stykem s katalytickými nečistotami (např. kyselinami, sloučeninami těžkých kovů, zásadami), třením nebo nárazem. Rychlost rozkladu se zvyšuje se stoupající teplotou a je rozdílná podle druhu látky. Rozklad může mít, zvláště jestliže nedojde k zapálení, za následek vývin toxických plynů nebo par. U určitých samovolně se rozkládajících látek musí být teplota řízena. Některé samovolně se rozkládající látky se mohou především pod uzavřením výbušně rozkládat. Tato vlastnost může být zmenšena přidáním ředidel nebo použitím vhodných obalů. Určité samovolně se rozkládající látky prudce hoří. Samovolně se rozkládající látky jsou například určité sloučeniny níže uvedených typů:

alifatické azosloučeniny (-C-N=N-C-);
organické azidy (-C-N₃);
diazoniové soli (-CN₂⁺ Z⁻);
N-nitroso sloučeniny (-N-N=O); a
aromatické sulfonylhydrazidy (-SO₂-NH-NH₂).

Tento výčet není úplný; látky s jinými reaktivními skupinami a některé směsi látek mohou mít podobné vlastnosti.

Klasifikace

2.2.41.1.11 Samovolně se rozkládající látky jsou na základě svého stupně nebezpečnosti rozděleny do sedmi typů. Typy samovolně se rozkládajících látek začínají od typu A, který není připuštěn k přepravě v obalu, ve kterém byl zkoušen, až po typ G, který nepodléhá ustanovením pro samovolně se rozkládající látky třídy 4.1. Zařazení samovolně se rozkládajících látek typů B až F přímo závisí na největším přípustném množství v jednom obalu. Zásady pro zařazování, jeho postupy, zkušební metody a kritéria a vzor vhodného zkušebního protokolu jsou uvedeny v Příručce zkoušek a kritérií, části II.

2.2.41.1.12 Již zařazené samovolně se rozkládající látky, které jsou připuštěny k přepravě v obalech, jsou uvedeny v pododdílu 2.2.41.4, ty, které jsou již připuštěny k přepravě v IBC, jsou uvedeny v pododdílu 4.1.4.2 ADR, pokynu pro balení IBC520 a ty, které jsou již připuštěny k přepravě v cisternách podle kapitoly 4.2 ADR, jsou uvedeny v pododdílu 4.2.5.2 ADR, pokynu pro přemístitelné cisterny T23. Každá uvedená přípustná látka je přiřazena k druhové položce tabulky A kapitoly 3.2 (UN čísla 3221 až 3240) a udávají se příslušná vedlejší nebezpečí a poznámky obsahující příslušné informace pro přepravu.

Tyto hromadné položky udávají:

- typy samovolně se rozkládajících látek B až F, viz 2.2.41.1.11;
- skupenství (kapalně/tuhé); a
- řízení teploty (je-li vyžadováno), viz 2.2.41.1.17.

Klasifikace samovolně se rozkládajících látek uvedených v pododdíle 2.2.41.4 se provádí na základě technicky čisté látky (pokud není uvedena koncentrace menší než 100 %).

2.2.41.1.13 Klasifikaci samovolně se rozkládajících látek, které nejsou uvedeny v pododdílu 2.2.41.4, pododdílu 4.1.4.2 ADR, pokynu pro balení IBC520 nebo v pododdílu 4.2.5.2 ADR, pokynu pro přemístitelné cisterny T23, jakož i jejich přiřazení k hromadné položce musí provést příslušný orgán země původu na základě zkušebního protokolu. Osvědčení o schválení musí obsahovat klasifikaci a odpovídající přepravní podmínky. Jestliže země původu není smluvní stranou ADN, musí zařazení a přepravní podmínky uznat příslušný orgán prvního státu smluvní strany ADN, který přijde do styku se zásilkou.

2.2.41.1.14 Aktivační přísady, jako zinkové sloučeniny, se mohou přidat k některým samovolně se rozkládajícím látkám ke změně jejich reakční schopnosti. Podle druhu a koncentrace aktivační přísady může poklesnout tepelná stálost, což může mít za následek změnu výbušných vlastností. Pokud dojde ke změně jedné z těchto vlastností, je třeba nový přípravek posoudit podle klasifikačního postupu.

2.2.41.1.15 Vzorky samovolně se rozkládajících látek nebo přípravků samovolně se rozkládajících látek, které nejsou uvedeny v pododdíle 2.2.41.4, pro které není k dispozici úplná sada výsledků zkoušek a které je nutno přepravit k provedení dalších zkoušek a hodnocení, je třeba přiřadit k jedné z vhodných položek pro samovolně se rozkládající látky typu C, jestliže

- podle dostupných údajů není vzorek nebezpečnější než samovolně se rozkládající látka typu B;
- vzorek je zabalen podle způsobu balení OP2 pododdílu 4.1.4.1 ADR a množství na nákladní dopravní jednotku a dopravní jednotku nepřesahuje 10 kg;
- dostupné údaje ukazují, že řízená teplota, pokud je, je dostatečně nízká, aby se zabránilo nebezpečnému rozkladu a zároveň dostatečně vysoká, aby se předešlo nebezpečnému oddělování (separaci) fází.

Znecitlivění

2.2.41.1.16 Pro zajištění bezpečné přepravy samovolně se rozkládajících látek, jsou tyto v mnoha případech znecitlivěné ředidlem. Jestliže je pevně stanoven procentní podíl látky, vztahuje se k podílu hmotnosti, zaokrouhlenému na nejbližší celé číslo. Jestliže je použito ředidlo, musí být samovolně se rozkládající látka spolu s ředidlem vyzkoušena, a to v koncentraci a formě užívaných k přepravě. Ředidla, která mohou dovolit samovolně se rozkládající látce koncentrovat se na nebezpečný stupeň při úniku z obalu, se nesmějí používat. Každé použité ředidlo se musí snášet se samovolně se rozkládající látkou. Z toho hlediska jsou tuhá nebo kapalná ředidla snášitelná, jestliže nemají žádné nepříznivé účinky na tepelnou stálost a druh nebezpečnosti samovolně se rozkládající látky. Kapalná ředidla v přípravcích vyžadujících řízení teploty (viz 2.2.41.1.14) musí mít bod varu nejméně 60 °C a bod vzplanutí nejméně 5 °C. Bod varu kapaliny musí být o nejméně 50°C vyšší než řízená teplota samovolně se rozkládající látky.

Ustanovení o řízení teploty

- 2.2.41.1.17 Určité Samovolně se rozkládající látky se SADT nejvýše 55 °C musí být podrobeny během přepravy řízení teploty. Viz 7.1.7.

Znecitlivěné tuhé výbušné látky

- 2.2.41.1.18 Znecitlivěné tuhé výbušné látky jsou látky, které jsou navlhčeny vodou nebo alkoholy, nebo jsou zředěny jinými látkami tak, aby se potlačily jejich výbušné vlastnosti. Takové položky jsou v tabulce A kapitoly 3.2 označeny následujícími UN čísly: 1310, 1320, 1321, 1322, 1336, 1337, 1344, 1347, 1348, 1349, 1354, 1355, 1356, 1357, 1517, 1571, 2555, 2556, 2557, 2852, 2907, 3317, 3319, 3344, 3364, 3365, 3366, 3367, 3368, 3369, 3370, 3376, 3380 a 3474.

Látky příbuzné samovolně se rozkládajícím látkám

- 2.2.41.1.19 Látky, které:
- (a) jsou podle výsledků sérií zkoušek 1 a 2 předběžně přiřazeny ke třídě 1, avšak podle výsledků série zkoušek 6 jsou vyňaty z platnosti třídy 1;
 - (b) nejsou samovolně se rozkládajícími látkami třídy 4.1; a
 - (c) nejsou látkami třídy 5.1 nebo 5.2,
- jsou rovněž přiřazeny ke třídě 4.1, a to k položkám UN čísel 2956, 3241, 3242 a 3251.

Polymerizující látky*Definice a vlastnosti*

- 2.2.41.1.20 Polymerizující látky jsou látky, které jsou bez stabilizace schopné projít silnou exotermickou reakcí, jejímž výsledkem je tvoření větších molekul nebo tvoření polymerů za normálních podmínek přepravy. Takové látky jsou považovány za polymerizující látky třídy 4.1 jestliže:
- (a) jejich teplota samourychlující polymerace (SAPT) je nejvýše 75°C za podmínek (s chemickou stabilizací nebo bez ní při podávání k přepravě) a v obalu, IBC nebo cisterně, v němž (níž) má být látka nebo směs přepravována;
 - (b) mají reakční teplo větší než 300 J/g; a
 - (c) nesplňují žádné jiné z kritérií pro zařazení do tříd 1 až 8.
- Směs splňující kritéria pro polymerizující látku musí být klasifikována jako polymerizující látka třídy 4.1.

Ustanovení o řízení teploty

- 2.2.41.1.21 Polymerizující látky podléhají řízení teploty při přepravě, jestliže jejich teplota samourychlující polymerace (SAPT) je:
- (a) při podávání k přepravě v obalu nebo IBC nejvýše 50°C v obalu nebo IBC, v němž má být látka přepravována; nebo
 - (b) při podávání k přepravě v cisterně nejvýše 45°C v cisterně, v níž má být látka přepravována.

Viz 7.1.7.

POZNÁMKA: Látky splňující kritéria pro polymerizující látky a též pro zařazení do tříd 1 až 8 podléhají požadavkům zvláštního ustanovení 386 kapitoly 3.3.

2.2.41.2 Látky nepřipustěné k přepravě

- 2.2.41.2.1 Chemicky nestálé látky třídy 4.1 jsou připuštěny k přepravě pouze tehdy, pokud byla provedena potřebná opatření zabráňující jejich nebezpečnému rozkladu nebo polymeraci během přepravy. Za tímto účelem se musí dbát zvláště na to, aby nádoby a cisterny neobsahovaly žádné látky, které by tyto reakce mohly podporovat.
- 2.2.41.2.2 Hořlavé tuhé látky, podporující hoření, které jsou přiřazeny k UN číslu 3097, nejsou k přepravě připuštěny, ledaže by odpovídaly předpisům pro třídu 1 (viz také 2.1.3.7).

2.2.41.2.3

Následující látky nejsou k přepravě připuštěny:

- samovolně se rozkládající látky typu A [viz Příručku zkoušek a kritérií, část II, odstavec 20.4.2 (a)];
- sulfidy fosforu, které nejsou prosty žlutého nebo bílého fosforu;
- jiné, než v tabulce A kapitoly 3.2 uvedené znečtivěné tuhé výbušné látky;
- anorganické hořlavé látky v roztaveném stavu, s výjimkou UN 2448 SÍRA, ROZTAVENÁ;

^a Kovy a slitiny kovů v práškové nebo jiné hořlavé formě, které jsou samozápalné, jsou látkami třídy 4.2.

^b Kovy a slitiny kovů v práškové nebo jiné hořlavé formě, které ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3.

^c Hydridy kovů, které ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3. Tetrahydroboritan hlinitý nebo tetrahydroboritan hlinitý v přístrojích je látkou třídy 4.2, UN čísla 2870.

2.2.41.4 Seznam již zařazených samovolně se rozkládajících látek v obalech

Kódy „OP1“ až „OP8“ uvedené ve sloupci „Způsob balení“ se vztahují ke způsobům balení v 4.1.4.1 ADR, pokynu pro balení P520 (viz též 4.1.7.1 ADR). Samovolně se rozkládající látky, které se mají přepravovat, musí odpovídat klasifikaci a řízeným a kritickým teplotám (odvozeným od SADT), jak jsou uvedeny. K látkám, jejichž přeprava v IBC je povolena, viz 4.1.4.2 ADR, pokyn pro balení IBC520 a k látkám, jejichž přeprava je povolena v cisternách podle kapitoly 4.2 ADR, viz 4.2.5.2.6 ADR, pokyn pro přemístitelné cisterny T23. Přípravky uvedené v pokynu pro balení IBC520 v 4.1.4.2 ADR a v pokynu pro přemístitelné cisterny T23 v 4.2.5.2.6 ADR smějí být přepravovány též zabalené podle způsobu balení OP8 pokynu pro balení P520 v 4.1.4.1 ADR, s totožnými řízeními a kritickými teplotami, je-li to použitelné.

POZNÁMKA: Zařazení uvedené v této tabulce se zakládá na technicky čisté látce (s výjimkou případů, kde je udána koncentrace nižší než 100 %). Pro jiné koncentrace může být látka zařazena rozdílně podle postupů uvedených v části II Příručky zkoušek a kritérií a v 2.2.41.1.17.

SAMOVOLNĚ SE ROZKLÁDAJÍCÍ LÁTKA	Koncentrace (%)	Způsob balení	Řízená teplota (°C)	Kritická teplota (°C)	UN číslo	Poznámky

POZNÁMKY:

- (1) Azoformamid-přípravky, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (b). Řízená a kritická teplota musí být stanoveny postupem uvedeným v 7.1.7.3.1 až 7.1.7.3.6.
- (2) Vyžaduje se bezpečnostní značka označující vedlejší nebezpečí "VÝBUŠNÝ" podle vzoru č. 1 (viz 5.2.2.2.2).
- (3) Azoformamid-přípravky, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (c).
- (4) Azoformamid-přípravky, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (c). Řízená a kritická teplota musí být stanoveny postupem uvedeným v 7.1.7.3.1 až 7.1.7.3.6.
- (5) Azoformamid-přípravky, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (d).
- (6) Azoformamid-přípravky, které splňují kritéria Příručky zkoušek a kritérií, odstavce 20.4.2 (d). Řízená a kritická teplota musí být stanoveny postupem uvedeným v 7.1.7.3.1 až 7.1.7.3.6.
- (7) Se snášenlivým ředidlem s bodem varu nejméně 150°C.
- (8) Viz 2.2.41.1.15.
- (9) Tato položka platí pro směsi esterů kyseliny 2-diazo-1-naftol-4-sulfonové a kyseliny 2-diazo-1-naftol-5-sulfonové, které splňují kritéria *Příručky zkoušek a kritérií*, odstavce 20.4.2(d).
- (10) Tato položka se vztahuje na technickou směs v n-butanolu se specifickým koncentračním limitem pro (Z)isomer.

2.2.42 Třída 4.2 Samozápalné látky**2.2.42.1 Kritéria**

2.2.42.1.1 Název třídy 4.2 zahrnuje:

- pyroforní látky, což jsou látky včetně směsí a roztoků (kapalné nebo tuhé), které při styku se vzduchem již v malých množstvích vzplanou do 5 minut. Toto jsou látky třídy 4.2, které jsou nejvíce náchylné k samovznícení; a
- látky a předměty schopné samoohřevu, což jsou látky a předměty včetně směsí a roztoků, které jsou ve styku se vzduchem bez přívodu energie schopné se zahřívat. Tyto látky mohou vzplanout jen ve velkých množstvích (kilogramech) a po dlouhé době (hodiny nebo dny).

2.2.42.1.2 Látky a předměty třídy 4.2 se dělí následovně:

- S Samozápalné látky bez vedlejšího nebezpečí:
- S1 organické, kapalné
 - S2 organické, tuhé
 - S3 anorganické, kapalné
 - S4 anorganické, tuhé
 - S5 organokovové
 - S6 předměty
- SW Samozápalné látky, které ve styku s vodou vyvíjejí hořlavé plyny
- SO Samozápalné látky, podporující hoření
- ST Samozápalné látky, toxické
- ST1 organické, toxické, kapalné
 - ST2 organické, toxické, tuhé
 - ST3 anorganické, toxické, kapalné
 - ST4 anorganické, toxické, tuhé
- SC Samozápalné látky, žíravé
- SC1 organické, žíravé, kapalné
 - SC2 organické, žíravé, tuhé
 - SC3 anorganické, žíravé, kapalné
 - SC4 anorganické, žíravé, tuhé.

Vlastnosti

2.2.42.1.3 Samozahřívání látky je proces, při němž postupná reakce této látky s kyslíkem (ve vzduchu) vytváří teplo. Jestliže množství vytvořeného tepla překročí množství tepelných ztrát, potom bude teplota látky narůstat, což může vést po latentní periodě k samovznícení a hoření.

Klasifikace

2.2.42.1.4 Látky a předměty zařazené do třídy 4.2 jsou uvedeny v tabulce A kapitoly 3.2. Přiřazení látek a předmětů, které nejsou v tabulce A kapitoly 3.2 jmenovitě uvedeny, pod příslušnou specifickou J.N. položku pododdílu 2.2.42.3, podle ustanovení kapitoly 2.1, může být provedeno na základě zkušeností nebo na základě výsledků zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.4. Přiřazení k všeobecným J.N. položkám třídy 4.2 se musí provést na základě výsledků zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.4; přitom se musí přihlídnout také ke zkušenostem, jestliže vedou k přísnějšímu zařazení.

2.2.42.1.5 Jestliže se jmenovitě neuvedené látky nebo předměty na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.4 přiřazují k jedné z položek uvedených v pododdílu 2.2.42.3, platí následující kritéria:

- (a) samozápalné (pyroforní) tuhé látky se přiřadí ke třídě 4.2, jestliže vzplanou při pádu z výšky 1 m nebo do 5 minut poté; nebo
- (b) samozápalné (pyroforní) kapalné látky se přiřadí ke třídě 4.2, jestliže

- (i) nanesené na inertní nosný materiál vzplanou do 5 minut, nebo
 - (ii) v případě negativního výsledku zkoušky podle (i), po nanesení na vroubkovaný suchý filtrační papír (Whatman-filtr č. 3), tento do 5 minut zapálí nebo zuhelnatí;
- (c) látky, u nichž dojde u krychlového vzorku o straně 10 cm při zkušební teplotě 140 °C do 24 hodin k samovznícení nebo stoupnutí teploty nad 200 °C, se přiřadí ke třídě 4.2. Toto kritérium se zakládá na samozápalné teplotě dřevěného uhlí, která činí 50 °C pro krychlový vzorek 27 m³. Látky s vyšší samozápalnou teplotou než 50 °C pro objem 27 m³ se ke třídě 4.2 nepřijadí.

POZNÁMKA 1: Látky, které budou přepravovány v kusech o objemu nepřesahujícím 3 m³, nespádají do třídy 4.2, pokud při zkoušce provedené na krychlovém vzorku o straně 10 cm při teplotě 120 °C nedojde do 24 hodin k samovznícení nebo ke stoupnutí teploty nad 180 °C.

POZNÁMKA 2: Látky, které budou přepravovány v kusech o objemu nepřesahujícím 450 l, nespádají do třídy 4.2, pokud při zkoušce provedené na krychlovém vzorku o straně 10 cm při teplotě 100 °C nedojde do 24 hodin k samovznícení nebo ke stoupnutí teploty nad 160 °C.

POZNÁMKA 3: Jelikož organokovové látky mohou být v závislosti na svých vlastnostech zařazeny do třídy 4.2 nebo 4.3 s dodatečnými vedlejšími nebezpečími, je pro tyto látky uveden v oddílu 2.3.5 zvláštní klasifikační postupový diagram.

2.2.42.1.6 Spadají-li látky třídy 4.2 vlivem příměsí do jiných kategorií nebezpečnosti než těch, do kterých patří látky jmenovitě uvedené látky v tabulce A kapitoly 3.2, přiřadí se tyto směsi k položkám, ke kterým na základě svého skutečného nebezpečí patří.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz též 2.1.3.

2.2.42.1.7 Na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.4 a kritérií uvedených v 2.2.42.1.5 se může také zjistit, zda je jmenovitě uvedená látka takové povahy, že nepodléhá předpisům pro tuto třídu.

Přiřazení k obalovým skupinám

2.2.42.1.8 Látky a předměty zařazené pod různé položky tabulky A kapitoly 3.2 musí být přiřazeny k obalovým skupinám I, II nebo III na základě zkušebních postupů Příručky zkoušek a kritérií, části III, pododdílu 33.4 podle těchto kritérií:

- (a) samozápalné (pyroforní) látky se přiřadí k obalové skupině I;
- (b) látky a předměty schopné samoohřevu, u nichž dojde u krychlového vzorku o straně 2,5 cm při zkušební teplotě 140 °C do 24 hodin k samovznícení nebo ke stoupnutí teploty nad 200 °C, se přiřadí k obalové skupině II;
látky s teplotou samovznícení vyšší než 50 °C pro objem 450 l se nemusí přiřadit k obalové skupině II;
- (c) látky méně schopné samoohřevu, u nichž u krychlového vzorku o straně 2,5 cm nedojde za podmínek uvedených pod písmenem b) k jmenovaným jevům, ale u krychlového vzorku o straně 10 cm při zkušební teplotě 140 °C dojde do 24 hodin k samovznícení nebo ke stoupnutí teploty nad 200 °C, se přiřadí k obalové skupině III.

2.2.42.2 Látky nepřipustěné k přepravě

Následující látky nejsou připuštěny k přepravě:

- UN 3255 terc- BUTYLHYPOCHLORID; a
- tuhé látky schopné samoohřevu, podporující hoření, přiřazené k UN číslu 3127, ledaže by odpovídaly ustanovením pro třídu 1 (viz 2.1.3.7).

POZNÁMKA:

^a *Kovový prach a prášek, které nejsou toxické a nejsou v samozápalné formě, avšak ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3.*

2.2.43 Třída 4.3 Látky, které ve styku s vodou vyvíjejí hořlavé plyny

2.2.43.1 Kritéria

2.2.43.1.1 Název třídy 4.3 zahrnuje látky, které při reakci s vodou vyvíjejí hořlavé plyny, náchylné k vytváření výbušných směsí se vzduchem, jakož i předměty, které takové látky obsahují.

2.2.43.1.2 Látky a předměty třídy 4.3 se dělí následovně:

W Látky, které ve styku s vodou vyvíjejí hořlavé plyny, bez vedlejšího nebezpečí, jakož i předměty, které takové látky obsahují:

W1 kapalné
W2 tuhé
W3 předměty

WF1 Látky, které ve styku s vodou vyvíjejí hořlavé plyny, kapalné, hořlavé

WF2 Látky, které ve styku s vodou vyvíjejí hořlavé plyny, tuhé, hořlavé

WS Látky, které ve styku s vodou vyvíjejí hořlavé plyny, tuhé, schopné samoohřevu

WO Látky, které ve styku s vodou vyvíjejí hořlavé plyny, tuhé, podporující hoření

WT Látky, které ve styku s vodou vyvíjejí hořlavé plyny, toxické:

WT1 kapalné
WT2 tuhé

WC Látky, které ve styku s vodou vyvíjejí hořlavé plyny, žíravé:

WC1 kapalné
WC2 tuhé

WFC Látky, které ve styku s vodou vyvíjejí hořlavé plyny, hořlavé, žíravé.

Vlastnosti

2.2.43.1.3 Určité látky mohou ve styku s vodou vyvíjet hořlavé plyny, které mohou se vzduchem vytvářet výbušné směsi. Takové směsi se snadno zapálí všemi obvyklými zapalovacími zdroji, např. otevřeným ohněm, jiskrami pocházejícími z nářadí, nechráněnou lampou nebo žárovkou atd. Přitom vytvořená tlaková vlna a plameny mohou ohrozit lidi a životní prostředí. Ke zjištění, zda látka reaguje s vodou takovým způsobem, že se vytváří nebezpečné množství plynů, které mohou být hořlavé, se použije zkušební postup popsáný v 2.2.43.1.4. Tento zkušební postup nesmí být použit u pyroforních látek.

Klasifikace

2.2.43.1.4 Látky a předměty zařazené do třídy 4.3 jsou uvedeny v tabulce A kapitoly 3.2. Přiřazení látek a předmětů, které nejsou tabulce A kapitoly 3.2 jmenovitě uvedeny, k příslušné položce pododdílu 2.2.43.3, podle ustanovení kapitoly 2.1, se provede na základě výsledků zkušební postupu podle Příručky zkoušek a kritérií, části III, pododdílu 33.5; přitom musí být zohledněny i zkušenosti, pokud vedou k přísnějšímu zařazení.

2.2.43.1.5 Jestliže se jmenovitě neuvedené látky přiřazují na základě zkušební postupu podle Příručky zkoušek a kritérií, části III, pododdílu 33.5 k jedné z položek uvedených v pododdíle 2.2.43.3, platí následující kritéria:

Látka se přiřadí ke třídě 4.3, pokud:

- (a) se během některé fáze zkoušky uvolněný plyn sám vznítí; nebo
- (b) je rychlost uvolňování hořlavého plynu větší než 1 litr na kilogram zkoušené látky za hodinu.

POZNÁMKA: Jelikož organokovové látky mohou být v závislosti na svých vlastnostech zařazeny do třídy 4.2 nebo 4.3 s dodatečnými vedlejšími nebezpečími, je pro tyto látky uveden v oddílu 2.3.5 zvláštní klasifikační postupový diagram.

- 2.2.43.1.6 Pokud látky třídy 4.3 spadají vlivem příměsí do jiných kategorií nebezpečnosti než těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, je třeba tyto směsi přiřadit k položkám, ke kterým patří na základě svého skutečného nebezpečí.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz také 2.1.3.

- 2.2.43.1.7 Na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, pododdílu 33.5 a kritérií uvedených v 2.2.43.1.5 se může také zjistit, zda je jmenovitě uvedená látka takové povahy, že nepodléhá předpisům pro tuto třídu.

Přřazení k obalovým skupinám

- 2.2.43.1.8 Látky a předměty zařazené pod různé položky tabulky A kapitoly 3.2 musí být přiřazeny k obalovým skupinám I, II nebo III na základě zkušebních postupů Příručky zkoušek a kritérií, části III, pododdílu 33.5 podle těchto kritérií:

- (a) K obalové skupině I se přiřadí každá látka, která při teplotě okolí prudce reaguje s vodou, přičemž vyvinutý plyn se může sám vznítit, nebo jestliže při teplotě okolí snadno reaguje s vodou, přičemž množství vyvinutého hořlavého plynu je větší nebo se rovná 10 litrům na kg látky za 1 minutu.
- (b) K obalové skupině II se přiřadí každá látka, která při teplotě okolí snadno reaguje s vodou, přičemž nejvyšší množství vyvinutého hořlavého plynu je větší nebo se rovná 20 litrům na kg látky za hodinu, a nesplňuje kritéria pro obalovou skupinu I.
- (c) K obalové skupině III se přiřadí každá látka, která při teplotě okolí pomalu reaguje s vodou, přičemž nejvyšší množství vyvinutého hořlavého plynu je větší nebo se rovná 1 litru na kg látky za hodinu, a nesplňuje kritéria pro obalovou skupinu I nebo II.

2.2.43.2 Látky nepřípuštěné k přepravě

Tuhé látky reagující s vodou, podporující hoření, přiřazené k UN číslu 3133 nejsou přípuštěny k přepravě, ledaže by odpovídaly ustanovením pro třídu 1 (viz také 2.1.3.7).

2.2.43.3 Seznam hromadných položek

Látky, které ve styku s vodou vyvíjejí hořlavé plyny		1389 AMALGAM ALKALICKÝCH KOVŮ, KAPALNÝ 1391 DISPERSE ALKALICKÝCH KOVŮ nebo 1391 DISPERSE KOVŮ ALKALICKÝCH ZEMIN 1392 AMALGAM KOVŮ ALKALICKÝCH ZEMIN, KAPALNÝ 1420 SLITINY DRASLÍKU, KOVOVÉ, KAPALNÉ 1421 SLITINA ALKALICKÝCH KOVŮ, KAPALNÁ, J.N. 1422 SLITINY DRASLÍKU A SODÍKU, KAPALNÉ 3398 SLOUČENINA ORGANOKOVOVÁ, KAPALNÁ, REAGUJÍCÍ S VODOU, J.N. 3148 LÁTKA REAGUJÍCÍ S VODOU, KAPALNÁ, J.N.

- ^a Kovy a slitiny kovů, které ve styku s vodou nevyvíjejí hořlavé plyny a nejsou pyroforní nebo schopné samoohřevu, ale jsou lehce hořlavé, jsou látkami třídy 4.1. Kovy alkalických zemin a slitiny kovů alkalických zemin v pyroforní formě jsou látkami třídy 4.2. Kovový prach a prášek v pyroforní formě jsou látkami třídy 4.2. Kovy a slitiny kovů v pyroforní formě jsou látkami třídy 4.2. Sloučeniny fosforu s těžkými kovy, jako železem, mědi atd., nepodléhají ustanovením ADN.
- ^b Kovy a slitiny kovů v pyroforní formě jsou látkami třídy 4.2.
- ^c Chlorsilany s bodem vzplanutí pod 23 °C, které ve styku s vodou nevyvíjejí hořlavé plyny, jsou látkami třídy 3. Chlorsilany s bodem vzplanutí 23 °C nebo vyšším, které ve styku s vodou nevyvíjejí hořlavé plyny, jsou látkami třídy 8.

2.2.51 Třída 5.1 Látky podporující hoření**2.2.51.1 Kritéria**

2.2.51.1.1 Název třídy 5.1 zahrnuje látky, které ač samy nejsou nezbytně hořlavé, mohou všeobecně uvolňováním kyslíku vyvolat nebo podporovat hoření jiných látek, jakož i předměty, které takové látky obsahují.

2.2.51.1.2 Látky třídy 5.1, jakož i předměty, které takové látky obsahují, se dělí následovně:

O Látky podporující hoření bez vedlejšího nebezpečí nebo předměty, které takové látky obsahují:

O1 kapalně
O2 tuhé
O3 předměty

OF Látky podporující hoření, tuhé, hořlavé

OS Látky podporující hoření, tuhé, schopné samoohřevu

OW Látky podporující hoření, tuhé, které ve styku s vodou vyvíjejí hořlavé plyny

OT Látky podporující hoření, toxické

OT1 kapalně
OT2 tuhé

OC Látky podporující hoření, žíravé

OC1 kapalně
OC2 tuhé

OTC Látky podporující hoření, toxické, žíravé.

2.2.51.1.3 Látky a předměty zařazené do třídy 5.1 jsou uvedeny v tabulce A kapitoly 3.2. Látky a předměty, které nejsou jmenovitě uvedeny v této tabulce, mohou být přiřazeny k příslušné položce pododdílu 2.2.51.3 podle ustanovení kapitoly 2.1 na základě zkoušek, postupů a kritérií uvedených v 2.2.51.1.6 až 2.2.51.1.10 a podle Příručky zkoušek a kritérií, části III, oddílu 34.4 nebo pro hnojiva obsahující tuhý dusičnan amonný, oddílu 39, s výhradou omezení v 2.2.51.2.2, třináctá a čtrnáctá odrážka. Pokud se výsledky zkoušek liší od získaných zkušeností, musí se dát přednost získaným zkušenostem před výsledky zkoušek.

2.2.51.1.4 Spadají-li látky třídy 5.1 vlivem příměsí do jiných kategorií nebezpečnosti než těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, přiřadí se tyto směsi nebo roztoky k položkám, ke kterým patří na základě svého skutečného nebezpečí.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady), viz také oddíl 2.1.3.

2.2.51.1.5 Na základě zkušebních postupů podle Příručky zkoušek a kritérií, části III, oddílu 34.4 nebo pro hnojiva obsahující tuhý dusičnan amonný, oddílu 39 a kritérií uvedených v 2.2.51.1.6 až 2.2.51.1.10 se může také zjistit, zda je látka jmenovitě uvedená v tabulce A kapitoly 3.2 takové povahy, že nepodléhá předpisům pro tuto třídu.

Tuhé látky podporující hoření**Klasifikace**

2.2.51.1.6 Jestliže se tuhé látky podporující hoření, které nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2, přiřazují k jedné z položek uvedených v 2.2.51.3 na základě zkušebního postupu podle Příručky zkoušek a kritérií, části III, pododdílu 34.4.1 (zkouška O.1), nebo alternativně pododdílu 34.4.3 (zkouška O.3), platí následující kritéria:

(a) Při zkoušce O.1 je nutno tuhoun látku přiřadit ke třídě 5.1, jestliže zkoušený vzorek ve směsi s celulórou v hmotnostním poměru 4:1 nebo 1:1 vzplane nebo hoří, nebo vykazuje stejnou

- nebo kratší průměrnou dobu hoření, než je průměrná doba hoření směsi bromičnanu draselného s celulózu v hmotnostním poměru 3:7; nebo
- (b) Při zkoušce O.3 je nutno tuhou látku přiřadit ke třídě 5.1, jestliže zkoušený vzorek ve směsi s celulózu v hmotnostním poměru 4:1 nebo 1:1 vykazuje stejnou nebo větší průměrnou rychlost hoření, než je průměrná rychlost hoření směsi peroxidu vápníku s celulózu v hmotnostním poměru 1:2.

2.2.51.1.7 Odchylkou musí být hnojiva obsahující tuhý dusičnan amonný klasifikována postupem uvedeným v Příručce zkoušek a kritérií, části III, oddílu 39.

Přiřazení k obalovým skupinám

2.2.51.1.8 Tuhé látky podporující hoření zařazené pod různé položky v tabulce A kapitoly 3.2 musí být přiřazeny k obalovým skupinám I, II nebo III na základě zkušebních postupů Příručky zkoušek a kritérií, části III, pododdílu 34.4.1 (zkouška O.1) nebo pododdílu 34.4.3 (zkouška O.3) podle následujících kritérií:

- (a) Zkouška O.1:
- (i) Obalová skupina I: každá látka, která ve směsi s celulózu v hmotnostním poměru 4:1 nebo 1:1 vykazuje kratší průměrnou dobu hoření, než je průměrná doba hoření směsi bromičnanu draselného s celulózu v hmotnostním poměru 3:2;
 - (ii) Obalová skupina II: každá látka, která ve směsi s celulózu v hmotnostním poměru 4:1 nebo 1:1 vykazuje stejnou nebo kratší průměrnou dobu hoření, než je průměrná doba hoření směsi bromičnanu draselného s celulózu v hmotnostním poměru 2:3 a kritéria pro obalovou skupinu I nejsou splněna;
 - (iii) Obalová skupina III: každá látka, která ve směsi s celulózu v hmotnostním poměru 4:1 nebo 1:1 vykazuje stejnou nebo kratší průměrnou dobu hoření, než je průměrná doba hoření směsi bromičnanu draselného s celulózu v hmotnostním poměru 3:7 a kritéria pro obalové skupiny I a II nejsou splněna;
- (b) Zkouška O.3:
- (i) Obalová skupina I: každá látka, která ve směsi s celulózu v hmotnostním poměru 4:1 nebo 1:1 vykazuje větší průměrnou rychlost hoření, než je průměrná rychlost hoření směsi peroxidu vápníku s celulózu v hmotnostním poměru 3:1;
 - (ii) Obalová skupina II: každá látka, která ve směsi s celulózu v hmotnostním poměru 4:1 nebo 1:1 vykazuje stejnou nebo větší průměrnou rychlost hoření, než je průměrná rychlost hoření směsi peroxidu vápníku s celulózu v hmotnostním poměru 1:1 a kritéria pro obalovou skupinu I nejsou splněna;
 - (iii) Obalová skupina III: každá látka, která ve směsi s celulózu v hmotnostním poměru 4:1 nebo 1:1 vykazuje stejnou nebo větší průměrnou rychlost hoření, než je průměrná rychlost hoření směsi peroxidu vápníku s celulózu v hmotnostním poměru 1:2 a kritéria pro obalové skupiny I a II nejsou splněna.

Kapalné látky podporující hoření

Klasifikace

2.2.51.1.9 Jestliže se kapalné látky podporující hoření, které nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2, přiřazují k jedné z položek pododdílu 2.2.51.3 na základě zkušebního postupu podle Příručky zkoušek a kritérií, části III, pododdílu 34.4.2, platí následující kritéria:

Kapalnou látku je nutno přiřadit ke třídě 5.1, jestliže ve směsi s celulózu v hmotnostním poměru 1:1 vykazuje nárůst tlaku nejméně 2070 kPa (přetlak) a vykazuje stejnou nebo kratší průměrnou dobu zvyšování tlaku než směs 65 % vodného roztoku kyseliny dusičné s celulózu v hmotnostním poměru 1:1.

Přiřazení k obalovým skupinám

2.2.51.1.10 Kapalné látky podporující hoření zařazené pod různé položky tabulky A kapitoly 3.2 musí být přiřazeny k obalovým skupinám I, II nebo III na základě zkušebních postupů Příručky zkoušek a kritérií, části III, pododdílu 34.4.2 podle těchto kritérií:

- (a) Obalová skupina I : každá látka, která ve směsi s celulózu v hmotnostním poměru 1:1 se sama vznítí, nebo vykazuje kratší průměrnou dobu zvýšení tlaku než směs 50% kyseliny chloristé s celulózu v hmotnostním poměru 1:1;

- (b) Obalová skupina II : každá látka, která ve směsi s celulózu v hmotnostním poměru 1:1 vykazuje stejnou nebo kratší průměrnou dobu zvyšování tlaku než směs 40% vodného roztoku chlorečnanu sodného s celulózu v hmotnostním poměru 1:1, a kritéria pro obalovou skupinu I nejsou splněna;
- (c) Obalová skupina III: každá látka, která ve směsi s celulózu v hmotnostním poměru 1:1 vykazuje stejnou nebo kratší průměrnou dobu zvyšování tlaku než směs 65% vodného roztoku kyseliny dusičné s celulózu v hmotnostním poměru 1:1, a kritéria pro obalové skupiny I a II nejsou splněna.

2.2.51.2 **Látky nepřípuštěné k přepravě**

2.2.51.2.1 Chemicky nestálé látky třídy 5.1 jsou k přepravě přípuštěny jen tehdy, jestliže byla provedena potřebná opatření k zabránění jejich nebezpečnému rozkladu nebo polymeraci během přepravy. Za tímto účelem musí být dbáno zvláště na to, aby nádoby a cisterny neobsahovaly žádné látky, které by mohly tyto reakce podporovat.

2.2.51.2.2 Následující látky a směsi nejsou přípuštěny k přepravě:

- tuhé látky podporující hoření, schopné samoohřevu, přiřazené k UN číslu 3100, tuhé látky podporující hoření, reagující s vodou, přiřazené k UN číslu 3121 a tuhé látky podporující hoření, hořlavé, přiřazené k UN číslu 3137, ledaže by odpovídaly předpisům pro třídu 1 (viz také 2.1.3.7);
 - peroxid vodíku, nestabilizovaný nebo peroxid vodíku, vodné roztoky, nestabilizované, s více než 60 % peroxidu vodíku;
 - tetranitromethan, nezbavený hořlavých nečistot;
 - roztoky kyseliny chloristé s více než 72 % (hmot.) kyseliny nebo směsi kyseliny chloristé s jakoukoli kapalinou, kromě vody;
 - roztoky kyseliny chlorečné s více než 10 % kyseliny chlorečné nebo směsi kyseliny chlorečné s jakoukoli kapalinou, kromě vody;
 - halogenované sloučeniny fluoru, jiné než UN 1745 FLUORID BROMIČNÝ, UN 1746 FLUORID BROMITÝ a UN 2495 FLUORID JODIČNÝ třídy 5.1, jakož i UN 1749 FLUORID CHLORITÝ a UN 2548 FLUORID CHLORÉČNÝ třídy 2;
 - chlorečnan amonný a jeho vodné roztoky a směsi chlorečnanu s amonnou solí;
 - chloritan amonný a jeho vodné roztoky a směsi chloritanu s amonnou solí;
 - směsi chlornanu s amonnou solí;
 - bromičnan amonný a jeho vodné roztoky a směsi bromičnanu s amonnou solí;
 - manganistan amonný a jeho vodné roztoky a směsi manganistanu s amonnou solí;
 - dusičnan amonný s více než 0,2 % hořlavých látek (včetně všech organických látek počítaných jako uhlík), ledaže je složkou látek nebo předmětů třídy 1;
 - hnojiva obsahující dusičnan amonný se složením, které vede k výstupům 4, 6, 8, 15, 31 nebo 33 postupového diagramu odstavce 39.5.1 Příručky zkoušek a kritérií, části III, oddílu 39, pokud nebyla přiřazena k vhodnému UN číslu třídy 1;
 - hnojiva obsahující dusičnan amonný se složením, které vede k výstupům 20, 23 nebo 39 postupového diagramu odstavce 39.5.1 Příručky zkoušek a kritérií, části III, oddílu 39, pokud nebyla přiřazena k vhodnému UN číslu třídy 1, nebo za podmínky, že byla prokázána jejich vhodnost pro přepravu a toto bylo schváleno příslušným orgánem, do třídy 5.1, s výjimkou UN 2067;
- POZNÁMKA:** Pod pojmem „příslušný orgán“ se rozumí příslušný orgán země původu. *Není-li země původu smluvní stranou ADR, musí být klasifikace a podmínky přepravy uznány příslušným orgánem první smluvní strany ADR, do kterého zásilka dorazila.*
- dusitan amonný a jeho vodné roztoky a směsi anorganického dusitanu s amonnou solí;
 - směsi dusičnanu draselného, dusitanu sodného a amonné soli.

2.2.52 Třída 5.2 Organické peroxidy**2.2.52.1 Kritéria**

2.2.52.1.1 Název třídy 5.2 zahrnuje organické peroxidy a přípravky organických peroxidů.

2.2.52.1.2 Látky třídy 5.2 se dělí následovně:

- P1 Organické peroxidy, nevyžadující řízení teploty;
 P2 Organické peroxidy, vyžadující řízení teploty.

Definice

2.2.52.1.3 Organické peroxidy jsou organické látky, které obsahují dvojmocnou skupinu -O-O- a na které může být nahlíženo jako na deriváty peroxidu vodíku, ve kterých je nahrazen jeden nebo oba atomy vodíku organickými radikály.

Vlastnosti

2.2.52.1.4 Organické peroxidy se mohou exotermicky rozkládat při normální nebo zvýšené teplotě. Rozklad může být vyvolán působením tepla, třením, nárazem nebo stykem s nečistotami (např. kyselinami, sloučeninami těžkých kovů, aminy). Rychlost rozkladu stoupá s teplotou a závisí na složení organického peroxidu. Při rozkladu se mohou vyvíjet škodlivé nebo hořlavé plyny nebo páry. Pro některé organické peroxidy je povinné řízení teploty během přepravy. Některé organické peroxidy se mohou, zvláště pod uzavřením, rozkládat výbušným způsobem. Tato vlastnost se může změnit přidáním ředidel nebo použitím vhodných obalů. Mnoho organických peroxidů prudce hoří. Oči nesmějí přijít do styku s organickými peroxidy. Některé organické peroxidy mohou již po velmi krátkém styku způsobit vážné poškození rohovky nebo mohou mít žíravé účinky na pokožku.

POZNÁMKA: Zkušební postupy k určení hořlavosti organických peroxidů jsou obsaženy v Příručce zkoušek a kritérií, části III, pododdílu 32.4. Jelikož organické peroxidy mohou při zahřátí prudce reagovat, doporučuje se určit jejich bod vzplanutí za použití zkušebních vzorků malých rozměrů, jak je popsáno v normě ISO 3679:1983.

Klasifikace

2.2.52.1.5 Každý organický peroxid se pokládá za zařazený do třídy 5.2, ledaže by přípravek organického peroxidu:

- (a) neobsahoval více než 1,0 % aktivního kyslíku pro nejvýše 1,0 % peroxidu vodíku;
 (b) neobsahoval více než 0,5 % aktivního kyslíku pro více než 1,0 %, nejvýše však 7 % peroxidu vodíku.

POZNÁMKA: Obsah aktivního kyslíku (%) v přípravku organického peroxidu se vypočítá ze vzorce:

$$16x \sum (n_i x c_i / m_i)$$

kde:

- n_i = počet peroxy skupin na molekulu organického peroxidu i ;
 c_i = koncentrace (% hmotnosti) organického peroxidu i ;
 m_i = molekulová hmotnost organického peroxidu i .

2.2.52.1.6 Organické peroxidy se rozdělují na základě svého stupně nebezpečnosti do sedmi typů. Typy jsou v rozsahu od typu A, který není připuštěn k přepravě v obalu, v němž byl podroben zkoušce, až k typu G, který nepodléhá ustanovením pro třídu 5.2. Klasifikace typů B až F je v přímém vztahu k nejvyššímu dovolenému množství v jednom kusu. Zásady pro zařazování látek, které nejsou uvedeny v pododdíle 2.2.52.4, jsou obsaženy v Příručce zkoušek a kritérií, části II.

2.2.52.1.7 Již zařazené organické peroxidy, které jsou připuštěny k přepravě v obalech jsou uvedeny v pododdílu 2.2.52.4, ty, které jsou již připuštěny k přepravě v IBC, jsou uvedeny v pododdílu 4.1.4.2 ADR, pokyny pro balení IBC520 a ty, které jsou již připuštěny k přepravě v cisternách podle kapitol 4.2 a 4.3 jsou uvedeny v pododdílu 4.2.5.2 ADR, pokyny pro přemístitelné cisterny T23. Každá uvedená připuštěná

látky je přiřazena k druhové položce tabulky A kapitoly 3.2 (UN čísla 3101 až 3120) a udávají se příslušná vedlejší nebezpečí a poznámky obsahující příslušné informace pro přepravu.

Tyto druhové položky udávají:

- typ (B až F) organického peroxidu (viz 2.2.52.1.6);
- fyzikální stav (kapalný/tuhý); a
- řízenou teplotu (pokud se vyžaduje), viz 2.2.52.1.15 a 2.2.52.1.16.

Směsi těchto přípravků mohou být zařazeny shodně s typem organického peroxidu, který je nejnebezpečnějším komponentem směsi, a přepravovány podle podmínek platných pro tento typ. Jestliže však dva stabilní komponenty mohou vytvářet tepelně méně stabilní směs, je třeba určit teplotu samourychlujícího se rozkladu (SADT) směsi, a pokud je to nutné, řízenou teplotu a kritickou teplotu, odvozené od SADT podle 7.1.7.3.6.

2.2.52.1.8 Zařazení organických peroxidů, které nejsou uvedeny v pododdílu 2.2.54.4, pododdílu 4.1.4.2 ADR, pokynu pro balení IBC520 nebo pododdílu 4.2.5.2 ADR, pokynu pro přemístitelné cisterny T23, jakož i jejich přiřazení k hromadné položce musí být provedeno příslušným orgánem země původu. Osvědčení o schválení musí obsahovat klasifikaci a odpovídající přepravní podmínky. Jestliže země původu není smluvní stranou ADN, musí být klasifikace a přepravní podmínky uznány příslušným orgánem prvního státu smluvní strany ADN, který přijde do styku se zásilkou.

2.2.52.1.9 Vzorky organických peroxidů nebo přípravků organických peroxidů, které nejsou uvedeny v pododdíle 2.2.52.4, pro něž není k dispozici úplná sada výsledků zkoušek a které se přepravují za účelem dalších zkoušek nebo vyhodnocení, se přiřadí k jedné z vhodných položek pro organické peroxidy typu C za předpokladu, že:

- z údajů, které jsou k dispozici, vyplývá, že vzorek není nebezpečnější než organický peroxid typu B;
- vzorek je balen podle způsobu balení OP2 pododdílu 4.1.4.1 ADR a množství na nákladní dopravní jednotku není větší než 10 kg;
- z údajů, které jsou k dispozici, vyplývá, že řízená teplota, pokud je, je dostatečně nízká, aby se zabránilo nebezpečnému rozkladu a dostatečně vysoká, aby nedošlo k nebezpečné separaci fází.

Znecitlivění organických peroxidů

2.2.52.1.10 K zajištění bezpečnosti během přepravy se organické peroxidy často znecitlivují organickými kapalnými nebo tuhými látkami, anorganickými tuhými látkami nebo vodou. Jestliže je předepsán procentuální podíl látky, vztahuje se k podílu hmotnosti, zaokrouhlenému na nejbližší celé číslo. Všeobecně se znecitlivění musí provést tak, aby při úniku nemohlo dojít k nebezpečné koncentraci organického peroxidu.

2.2.52.1.11 Pokud není pro jednotlivý přípravek organického peroxidu stanoveno jinak, platí pro ředidla, která se použijí ke znecitlivění, následující definice:

- Ředidla typu A jsou organické kapaliny, snášelivé s organickým peroxidem, které mají bod varu nejméně 150 °C. Ředidla typu A se mohou používat pro znecitlivění všech organických peroxidů.
- Ředidla typu B jsou organické kapaliny, snášelivé s organickým peroxidem, které mají bod varu nižší než 150 °C, nejméně však 60 °C, a bod vzplanutí nejméně 5 °C.

Ředidla typu B se mohou používat pro znecitlivění všech organických peroxidů za podmínky, že bod varu kapaliny je nejméně o 60 °C vyšší než SADT v kusu o hmotnosti 50 kg.

2.2.52.1.12 Ředidla, která nepatří k typu A nebo B, smějí být přidána k přípravkům organických peroxidů uvedených v pododdíle 2.2.52.4, pokud jsou s nimi snášelivá. Avšak úplné nebo částečné nahrazení ředidla typu A nebo B jiným ředidlem s rozdílnými vlastnostmi vyžaduje nové přehodnocení přípravku organického peroxidu podle normálního klasifikačního postupu pro třídu 5.2.

2.2.52.1.13 Voda smí být přidávána ke znecitlivění jen těch organických peroxidů, u kterých je v pododdíle 2.2.52.4 nebo v povolení příslušného orgánu podle 2.2.52.1.8 uveden dovětek „s vodou“ nebo jako „jako stabilní disperse ve vodě“. Vzorky organických peroxidů nebo přípravků organických peroxidů, které nejsou uvedeny v pododdíle 2.2.52.4, smějí být rovněž znecitlivěny vodou za podmínky, že jsou splněny požadavky 2.2.52.1.9.

- 2.2.52.1.14 Organické a anorganické tuhé látky smějí být použity ke znečtivění organických peroxidů, pokud se s nimi snášejí. Kapalné a tuhé látky se považují za snášenlivé, pokud nepříznivě nepůsobí ani na tepelnou stabilitu, ani na druh nebezpečí přípravku organického peroxidu.

Ustanovení o řízení teploty

- 2.2.52.1.15 Tyto organické peroxidy musí být přepravovány při řízené teplotě:

- organické peroxidy typů B a C se SADT ≤ 50 °C;
- organické peroxidy typu D se SADT ≤ 50 °C, vykazující střední účinek při zahřívání v uzavřeném prostoru, nebo se SADT ≤ 45 °C, vykazující při zahřívání v uzavřeném prostoru malý nebo žádný účinek; a
- organické peroxidy typů E a F se SADT ≤ 45 °C.

POZNÁMKA: Předpisy pro stanovení účinků při zahřívání v uzavřeném prostoru jsou uvedeny v Příručce zkoušek a kritérií, části II, oddílu 20 a testem série E v oddílu 25.

Viz 7.1.7.

- 2.2.52.1.16 Řízené a kritické teploty jsou uvedeny v pododdílu 2.2.52.4. Skutečná teplota během přepravy smí být nižší než řízená teplota, avšak musí být stanovena tak, aby nedošlo k nebezpečnému oddělování (separaci) fází.

2.2.52.2 **Látky nepřípuštěné k přepravě**

Organické peroxidy typu A není podle ustanovení třídy 5.2 dovoleno přepravovat [viz Příručku zkoušek a kritérií, část II, odstavec 20.4.3 (a)].

2.2.52.3 Seznam hromadných položek

Organické peroxidy			
			PEROXID ORGANICKÝ TYP A, KAPALNÝ (není připuštěn k přepravě, viz 2.2.52.2)

2.2.52.4 Seznam již zařazených organických peroxidů v obalech

Kódy „OP1“ až „OP8“ uvedené ve sloupci „Způsob balení“ se vztahují ke způsobům balení v pododdílu 4.1.4.1 ADR, pokynu pro balení P520 (viz též 4.1.7.1 ADR). Organické peroxidy, které se mají přepravovat, musí odpovídat klasifikaci a řízeným a kritickým teplotám (odvozeným od SADT), jak jsou uvedeny. K látkám připuštěným v IBC viz 4.1.4.2 ADR, pokyn pro balení IBC520 a k látkám připuštěným v cisternách podle kapitol 4.2 a 4.3 ADR viz 4.2.5.2.6 ADR, pokyn pro přemístitelné cisterny T23. Přípravky uvedené v pokynu pro balení IBC520 v 4.1.4.2 ADR a v pokynu pro přemístitelné cisterny T23 v 4.2.5.2.6 ADR smějí být přepravovány též zabalené podle způsobu balení OP8 pokynu pro balení P520 v 4.1.4.1 ADR, s tožnými řízeními a kritickými teplotami, je-li to použitelné.

Poznámky k pododdílu 2.2.52.4

- 1) Ředidlo typu B může být vždy nahrazeno ředidlem typu A. Bod varu ředidla typu B musí být nejméně o 60 °C vyšší, než je SADT organického peroxidu.
- 2) Obsah aktivního kyslíku $\leq 4,7$ %.
- 3) Vyžaduje se bezpečnostní značka pro vedlejší nebezpečí "VÝBUŠNÝ" podle vzoru 1 (viz 5.2.2.2.2).
- 4) Ředidlo může být nahrazeno di-terc-butylperoxidem.
- 5) Obsah aktivního kyslíku ≤ 9 %.
- 6) Nejvýše 9 % peroxidu vodíku; obsah aktivního kyslíku ≤ 10 %.
- 7) Smí se použít pouze nekovových obalů.
- 8) Obsah aktivního kyslíku > 10 % a $\leq 10,7$ %, s vodou nebo bez vody.
- 9) Obsah aktivního kyslíku ≤ 10 %, s vodou nebo bez vody.
- 10) Obsah aktivního kyslíku $\leq 8,2$ %, s vodou nebo bez vody.
- 11) Viz 2.2.52.1.9.
- 12) Do 2000 kg na nádobu přiřazenou ORGANICKÉMU PEROXIDU TYPU F, na základě výsledků zkoušek ve velkém měřítku.
- 13) Vyžaduje se bezpečnostní značka pro vedlejší nebezpečí "ŽÍRAVÝ" podle vzoru č. 8 (viz 5.2.2.2.2).
- 14) Přípravky kyseliny peroxyoctové, které odpovídají kritériím Příručky zkoušek a kritérií, odstavce 20.4.3 d).
- 15) Přípravky kyseliny peroxyoctové, které odpovídají kritériím Příručky zkoušek a kritérií, odstavce 20.4.3 e).
- 16) Přípravky kyseliny peroxyoctové, které odpovídají kritériím Příručky zkoušek a kritérií, odstavce 20.4.3 f).
- 17) Přidáním vody k tomuto organickému peroxidu se zmenší jeho tepelná stabilita.
- 18) Pro koncentrace pod 80 % se nevyžaduje bezpečnostní značka pro vedlejší nebezpečí "ŽÍRAVÝ" podle vzoru č. 8 (viz 5.2.2.2.2).
- 19) Směsi s peroxidem vodíku, vodou a kyselinou(ami).
- 20) S ředidlem typu A, s vodou nebo bez vody.
- 21) S nejméně 25 % hm. ředidla typu A a k tomu ethylbenzen.
- 22) S nejméně 19 % hm. ředidla typu A a k tomu methylisobutylketon.
- 23) S méně než 6 % di-terc-butylperoxidu.
- 24) Do 8 % 1-isopropylhydroperoxy-4-isopropylhydroxybenzénu.
- 25) Ředidlo typu B s bodem varu vyšším než 110 °C.
- 26) Obsah hydroperoxidů $< 0,5$ %.
- 27) Pro koncentrace nad 56 % se vyžaduje bezpečnostní značka pro vedlejší nebezpečí "ŽÍRAVÝ" podle vzoru č. 8 (viz 5.2.2.2.2).
- 28) Obsah aktivního kyslíku $\leq 7,6$ % v ředidle typu A s bodem varu v rozmezí 200 °C až 260 °C.
- 29) Nepodléhá ustanovením ADN pro třídu 5.2.
- 30) Ředidlo typu B s bodem varu > 130 °C.
- 31) Aktivní kyslík $\leq 6,7$ %.

2.2.61 Třída 6.1 Toxické látky**2.2.61.1 Kritéria**

2.2.61.1.1 Název třídy 6.1 zahrnuje látky, o nichž je ze zkušenosti známo nebo o nichž lze na základě pokusů se zvířaty usuzovat, že jejich příjmem dýchacími cestami, pokožkou nebo zažívacími orgány při jednorázovém nebo krátkodobém působení v poměrně malém množství může dojít k poškození zdraví nebo ke smrti člověka.

POZNÁMKA: *Geneticky změněné mikroorganismy a organismy se musí přiřadit do této třídy, jestliže splňují podmínky pro tuto třídu.*

2.2.61.1.2 Látky třídy 6.1 jsou rozděleny následovně:

- T Toxické látky bez vedlejšího nebezpečí:
- T1 organické, kapalné
 - T2 organické, tuhé
 - T3 organokovové látky
 - T4 anorganické, kapalné
 - T5 anorganické, tuhé
 - T6 kapalné, používané jako pesticidy
 - T7 tuhé, používané jako pesticidy
 - T8 vzorky
 - T9 jiné toxické látky
 - T10 předměty
- TF Toxické látky, hořlavé:
- TF1 kapalné
 - TF2 kapalné, používané jako pesticidy
 - TF3 tuhé
- TS Toxické látky, schopné samoohřevu, tuhé
- TW Toxické látky, které ve styku s vodou vyvíjejí hořlavé plyny:
- TW1 kapalné
 - TW2 tuhé
- TO Toxické látky, podporující hoření:
- TO1 kapalné
 - TO2 tuhé
- TC Toxické látky, žíravé:
- TC1 organické, kapalné
 - TC2 organické, tuhé
 - TC3 anorganické, kapalné
 - TC4 anorganické, tuhé
- TFC Toxické látky, hořlavé, žíravé
- TFW Toxické látky, hořlavé, které ve styku s vodou vyvíjejí hořlavé plyny.

Definice

2.2.61.1.3 Pro účely ADN platí:

LD₅₀ (střední smrtelná dávka) pro akutní toxicitu při požití je statisticky odvozená jedna dávka látky, od níž lze očekávat, že způsobí během 14 dnů smrt 50 % mladých dospělých bílých krys, je-li podána orální cestou. Hodnota LD₅₀ se vyjadřuje jako podíl hmotnosti zkoušené látky ke hmotnosti pokusného zvířete (mg/kg).

LD₅₀-*Hodnota pro akutní toxicitu při absorpci pokožkou* je takové množství látky, které při nepřetržitém styku s holou pokožkou bílých králíků po dobu 24 hodin způsobí s největší pravděpodobností v průběhu 14 dnů smrt poloviny počtu skupiny zvířat. Počet zvířat, který je tomuto pokusu podroben, musí být dostatečně velký, aby byl získaný výsledek statisticky významný a odpovídal dobrým zvyklostem farmakologie. Výsledek se vyjadřuje v mg na kg tělesné hmotnosti.

LC₅₀-*Hodnota pro akutní toxicitu při vdechnutí* je taková koncentrace páry, mlhy nebo prachu, která při nepřetržitém vdechování mladými dospělými, samčími a samičími, bílými krysami po dobu jedné hodiny způsobí s největší pravděpodobností v průběhu 14 dnů smrt poloviny počtu skupiny zvířat. Tuhá látka musí být podrobena zkouškám, jestliže existuje nebezpečí, že nejméně 10 % celkové hmotnosti je složeno z prachu, který může být vdechnut, např. jestliže aerodynamický průměr této frakční částice činí nejvýše 10 μm. Kapalná látka musí být podrobena zkouškám, jestliže existuje nebezpečí, že se při netěsnosti obalu nebo cisterny, použitých pro přepravu, může vytvořit mlha. Jak u tuhých, tak i u kapalných látek se musí více než 90 % hmotnosti vzorku připraveného ke zkoušce sestávat z částic, které lze vdechnout, jak je výše popsáno. Výsledek se vyjadřuje v mg na litr vzduchu u prachu nebo mlhy a v ml na m³ vzduchu (ppm) u páry.

Klasifikace a přiřazení k obalovým skupinám

2.2.61.1.4 Látky třídy 6.1 musí být přiřazeny na základě svého stupně nebezpečí, které představují při přepravě, k následujícím obalovým skupinám:

Obalová skupina I: velmi toxické látky;
Obalová skupina II: toxické látky;
Obalová skupina III: slabě toxické látky.

2.2.61.1.5 Látky, směsi, roztoky a předměty zařazené do třídy 6.1 jsou uvedeny v tabulce A kapitoly 3.2. Přiřazení látek, směsí a roztoků, které nejsou v tabulce A kapitoly 3.2 jmenovitě uvedeny, k vhodné poloze pododdílu 2.2.61.3 a k příslušné obalové skupině podle ustanovení kapitoly 2.1 musí být provedeno podle následujících kritérií v 2.2.61.1.6 až 2.2.61.1.11.

2.2.61.1.6 Při posuzování stupně toxicity se musí vzít v úvahu zkušenosti z případů otrav osob, jakož i zvláštní vlastnosti posuzované látky, jako kapalný stav, vysoká těkavost, zvláštní pravděpodobnost příjmu pokožkou a zvláštní biologické účinky.

2.2.61.1.7 Pokud nejsou zkušenosti z pozorování učiněných na člověku, posoudí se stupeň toxicity z vyhodnocených výsledků pokusů na zvířatech podle následující tabulky:

	Obalová skupina	Toxicita při požití LD ₅₀ (mg/kg)	Toxicita při absorpci pokožkou LD ₅₀ (mg/kg)	Toxicita při vdechnutí prachu a mlhy LC ₅₀ (mg/l)
Velmi toxické	I	≤ 5	≤ 50	≤ 0,2
Toxické	II	> 5 a ≤ 50	> 50 a ≤ 200	> 0,2 a ≤ 2
Slabě toxické	III ^a	> 50 a ≤ 300	> 200 a ≤ 1000	> 2 a ≤ 4,0

^a Slizotvorné látky musí být přiřazeny k obalové skupině II, i když údaje o jejich toxicitě odpovídají kritériím obalové skupiny III.

2.2.61.1.7.1 Jestliže látka vykazuje při dvou nebo více různých způsobech příjmu různé hodnoty toxicity, použije se pro klasifikaci nejvyšší hodnota toxicity.

2.2.61.1.7.2 Látky, které splňují kritéria třídy 8 a vykazují toxicitu při vdechnutí prachu a mlhy (LC₅₀) odpovídající obalové skupině I, se mohou zařadit do třídy 6.1 jen tehdy, pokud zároveň toxicita při požití nebo při absorpci pokožkou odpovídá alespoň obalové skupině I nebo II. V opačném případě se látka, pokud je to potřeba, musí přiřadit ke třídě 8 (viz 2.2.8.1.4.5).

2.2.61.1.7.3 Tato kritéria pro toxicitu při vdechnutí prachu a mlhy spočívají na hodnotách LC₅₀ při době pokusu jedné hodiny a tyto hodnoty musí být také použity, pokud jsou k dispozici. Jsou-li však k dispozici jen hodnoty LC₅₀ 4-hodinového pokusu, mohou být takové hodnoty vynásobeny čtyřmi a výsledek pak může nahradit výše uvedené kritérium, tzn., že čtyřnásobná hodnota LC₅₀ (4 hodiny) se považuje za ekvivalentní hodnotě LC₅₀ (1 hodina).

Toxicita při vdechnutí par

2.2.61.1.8

Kapaliny, které vylučují toxické páry, je třeba přiřadit do následujících skupin, kde písmeno „V“ představuje koncentraci nasycené páry (prchavost) (v ml/m³ vzduchu) při 20 °C a normálním atmosférickém tlaku.

	Obalová skupina	
Velmi toxické	I	jestliže $V \geq 10 LC_{50}$ a $LC_{50} \leq 1000 \text{ ml/m}^3$
Toxické	II	jestliže $V \geq LC_{50}$ a $LC_{50} \leq 3000 \text{ ml/m}^3$ a kritéria pro obalovou skupinu I nejsou splněna
Slabě toxické	III ^a	jestliže $V \geq 1/5 LC_{50}$ a $LC_{50} \leq 5000 \text{ ml/m}^3$ a kritéria pro obalovou skupinu I a II nejsou splněna

^a Slizotvorné látky musí být přiřazeny k obalové skupině II, i když údaje o jejich toxicitě odpovídají kritériím obalové skupiny III.

Tato kritéria toxicity při vdechnutí par spočívají na hodnotách LC₅₀ při době pokusu 1 hodiny a tyto hodnoty musí být také použity, jsou-li k dispozici.

Jsou-li však k dispozici jen hodnoty LC₅₀ ze 4-hodinového pokusu, mohou být takové hodnoty vynásobeny dvěma a výsledek může pak nahradit výše uvedená kritéria, tzn. dvojnásobná hodnota LC₅₀ (4 hodiny) se považuje za ekvivalent k hodnotě LC₅₀ (1 hodina).

Dělicí čáry obalových skupin – toxicita při vdechnutí par

Na uvedeném vyobrazení jsou pro usnadnění zařazení kritéria znázorněna graficky. Z důvodů jen přibližné přesnosti grafického znázornění musí se však látky, které leží v blízkosti nebo přímo na dělicí čáře, přezkoušet pomocí číselných kritérií.

Směsi kapalných látek

2.2.61.1.9

Směsi kapalných látek, které jsou při vdechnutí toxické, je třeba přiřadit k obalovým skupinám podle těchto kritérií:

2.2.61.1.9.1

Je-li hodnota LC₅₀ pro každou toxickou látku, která je částí směsi, známa, lze určit obalovou skupinu následovně:

- (a) výpočet hodnoty LC
- ₅₀
- směsi:

$$LC_{50} \text{ (směs)} = \frac{1}{\sum_{i=1}^n \frac{f_i}{LC_{50i}}}$$

kde:

f_i = molární zlomek i-té části směsiLC_{50i} = střední smrtelná koncentrace i-té části v ml/m³

- (b) výpočet prchavosti každé části směsi:

$$V_i = P_i \times \frac{10^6}{101,3} \text{ v ml/m}^3$$

kde:

P_i = parciální tlak i-té části v kPa při 20 °C a při normálním atmosférickém tlaku

- (c) výpočet poměru prchavosti k hodnotě LC
- ₅₀
- :

$$R = \sum_{i=1}^n \frac{V_i}{LC_{50i}}$$

- (d) vypočítané hodnoty pro LC
- ₅₀
- (směs) a R pak slouží k určení obalové skupiny směsi:

Obalová skupina I: R ≥ 10 a LC₅₀ (směs) ≤ 1000 ml/m³Obalová skupina II: R ≥ 1 a LC₅₀ (směs) ≤ 3000 ml/m³ a jestliže směs nesplňuje kritéria obalové skupiny I;Obalová skupina III: R ≥ 1/5 a LC₅₀ (směs) ≤ 5000 ml/m³ a jestliže směs nesplňuje kritéria obalové skupiny I nebo II.

2.2.61.1.9.2 Není-li hodnota LC₅₀ toxických komponentů známa, lze směs přiřadit k jedné z obalových skupin na základě dále popsaných zjednodušených zkoušek prahové toxicity. V takovém případě musí být určena a pro přepravu směsi použita nejpřísnější obalová skupina.

2.2.61.1.9.3 Směs bude přiřazena k obalové skupině I jen tehdy, jestliže splňuje obě následující kritéria:

- (a) Vzorek kapalné směsi se rozpráší a rozředí se vzduchem tak, že vznikne zkušební ovzduší o 1000 ml/m³ rozprášené směsi ve vzduchu. 10 bílých krys (5 samečků a 5 samic) se nechá v tomto zkušebním ovzduší po dobu 1 hodiny a následně se budou 14 dnů pozorovat. Jestliže nejméně 5 pokusných zvířat v průběhu sledovaného období 14 dnů uhynie, lze se domnívat, že směs má hodnotu LC₅₀ rovnou nebo menší než 1000 ml/m³.
- (b) Vzorek páry v rovnováze s kapalnou směsí se zředí devítinásobným objemem vzduchu, čímž se vytvoří zkušební ovzduší. 10 bílých krys (5 samečků a 5 samic) se nechá v tomto zkušebním ovzduší po dobu 1 hodiny a následně se budou 14 dnů pozorovat. Jestliže nejméně 5 pokusných zvířat v průběhu sledovaného období 14 dnů uhynie, lze se domnívat, že směs má prchavost, která je rovna nebo větší než desetinasobná hodnota LC₅₀ směsi.

2.2.61.1.9.4 Směs bude přiřazena k obalové skupině II jen tehdy, jestliže splňuje obě následující kritéria, ne však kritéria pro obalovou skupinu I:

- (a) Vzorek kapalné směsi se rozpráší a rozředí se vzduchem tak, že vznikne zkušební ovzduší o 3000 ml/m³ rozprášené směsi ve vzduchu. 10 bílých krys (5 samečků a 5 samic) se nechá v tomto zkušebním ovzduší po dobu 1 hodiny a následně se budou 14 dnů pozorovat. Jestliže nejméně 5 pokusných zvířat v průběhu sledovaného období 14 dnů uhynie, lze se domnívat, že směs má hodnotu LC₅₀ rovnou nebo menší než 3000 ml/m³.
- (b) Vzorek páry v rovnováze s kapalnou směsí se použije k vytvoření zkušebního ovzduší. 10 bílých krys (5 samečků a 5 samic) se nechá v tomto zkušebním ovzduší po dobu 1 hodiny

a následně se budou 14 dnů pozorovat. Jestliže nejméně 5 pokusných zvířat v průběhu sledovaného období 14 dnů uhynie, lze se domnívat, že směs má prchavost, která je rovna nebo větší než hodnota LC₅₀ směsi.

2.2.61.1.9.5 Směs bude přiřazena k obalové skupině III jen tehdy, jestliže splňuje obě následující kritéria, ne však kritéria pro obalové skupiny I nebo II.

- (a) Vzorek kapalné směsi se rozpráší a rozředí se vzduchem tak, že vznikne zkušební ovzduší o 5000 ml/m³ rozprášené směsi ve vzduchu. 10 bílých krys (5 samečků a 5 samic) se nechá v tomto zkušebním ovzduší po dobu 1 hodiny a následně se budou 14 dnů pozorovat. Jestliže nejméně 5 pokusných zvířat v průběhu sledovaného období 14 dnů uhynie, lze se domnívat, že směs má hodnotu LC₅₀ rovnou nebo menší než 5000 ml/m³.
- (b) Změří se koncentrace par (prchavost) kapalné směsi; je-li rovna nebo větší než 1000 ml/m³, lze se domnívat, že směs má prchavost, která je rovna nebo větší než 1/5 hodnoty LC₅₀ směsi.

Metody výpočtu toxicity směsí při požití a při absorpci pokožkou

2.2.61.1.10 Pro zařazení směsí třídy 6.1 a jejich přiřazení k vhodné obalové skupině podle kritérií pro toxicitu při požití a při absorpci pokožkou (viz 2.2.61.1.3) je nutné vypočítat akutní hodnotu LD₅₀ směsi.

2.2.61.1.10.1 Pokud směs obsahuje pouze jednu účinnou látku, jejíž hodnota LD₅₀ je známa, lze při chybějících spolehlivých údajích o akutní toxicitě při požití a při absorpci pokožkou u směsi, která má být přepravována, vypočítat hodnotu LD₅₀ při požití a při absorpci pokožkou následovně:

$$LD_{50} \text{ přípravku} = \frac{LD_{50} \text{ účinné látky} \times 100}{\text{podíl účinné látky (\% hm.)}}$$

2.2.61.1.10.2 Pokud směs obsahuje více než jednu účinnou látku, mohou být použity tři možné metody pro výpočet hodnoty LD₅₀ při požití a při absorpci pokožkou. Je třeba upřednostnit metodu, kterou se získají spolehlivé údaje pro akutní toxicitu při požití a při absorpci pokožkou konkrétní směsi, která se má přepravovat. Pokud nejsou spolehlivé přesné údaje k dispozici, je třeba použít jedné z následujících metod:

- (a) zařadit přípravek podle nejnebezpečnější složky směsi, jako by tato složka byla přítomna ve stejné koncentraci jako je celková koncentrace všech účinných složek; nebo
- (b) použít vzorce

$$\frac{C_A}{T_A} + \frac{C_B}{T_B} + \dots + \frac{C_Z}{T_Z} = \frac{100}{T_M}$$

kde:

C = koncentrace v procentech složek A, B, ..., Z směsi;

T = hodnota LD₅₀ při požití složek A, B, ..., Z;

T_M = hodnota LD₅₀ při požití směsi.

POZNÁMKA: Tento vzorec lze také použít pro toxicitu při absorpci pokožkou, za předpokladu, že tyto informace jsou k dispozici ve stejné formě pro všechny složky. Použití tohoto vzorce nezohledňuje případné jevy stupňování nebo ochrany.

Klasifikace pesticidů

2.2.61.1.10 Všechny účinné látky pesticidů a jejich přípravky, u kterých jsou známy hodnoty LC₅₀ a/nebo LD₅₀ a které jsou zařazeny do třídy 6.1, musí být přiřazeny podle kritérií uvedených v 2.2.61.1.6 až 2.2.61.1.9 k odpovídajícím obalovým skupinám. Látky a přípravky, které vykazují vedlejší nebezpečí, musí být zařazeny podle tabulky převažujících nebezpečí v pododdíle 2.1.3.10 s přiřazením k odpovídajícím obalovým skupinám.

- 2.2.61.1.11.1 Není-li pro přípravek pesticidů známa hodnota LD₅₀ pro požití nebo absorpci pokožkou, avšak je známa hodnota LD₅₀ jeho účinné(ých) složky(ek), může být hodnota LD₅₀ přípravku zjištěna použitím postupu uvedeného v 2.2.61.1.10.

POZNÁMKA: Údaje o toxicitě týkající se hodnoty LD₅₀ určitého počtu běžných pesticidů lze nalézt v nejnovějším vydání dokumentu „The WHO Recommended Classification of Pesticides by Hazard and Guidelines to Classification“, který je možno si obstarat u Světové zdravotnické organizace (WHO) na adrese: International Programme on Chemical Safety, World Health Organisation (WHO), CH-1211, Geneva 27, Švýcarsko. Zatímco tento dokument může být použit jako zdroj dat pro hodnoty LD₅₀ pesticidů, jeho klasifikační systém není možno použít pro účely zařazování pesticidů pro přepravu nebo pro jejich přiřazení k obalovým skupinám, které musejí odpovídat ustanovením ADN.

- 2.2.61.1.11.2 Oficiální pojmenování pro přepravu pesticidu se volí na základě aktivní složky, fyzikálního stavu pesticidu a všech vedlejších nebezpečí, které by mohl představovat (viz 3.1.2).
- 2.2.61.1.12 Jestliže látky třídy 6.1 vlivem příměsí spadají do jiných kategorií nebezpečnosti než těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, přiřadí se tyto směsi nebo roztoky k položkám, ke kterým na základě svého skutečného nebezpečí patří.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady) viz také 2.1.3.

- 2.2.61.1.13 Na základě kritérií uvedených v 2.2.61.1.6 až 2.2.61.1.11 se může také zjistit, zda je jmenovitě uvedený roztok nebo jmenovitě uvedená směs, popřípadě roztok nebo směs, která obsahuje jmenovitě uvedenou látku, takové povahy, že tento roztok nebo tato směs nepodléhá ustanovením pro tuto třídu.
- 2.2.61.1.14 Látky, roztoky a směsi, s výjimkou látek a přípravků používaných jako pesticidy, které nejsou klasifikovány jako akutně toxické kategorie 1, 2 nebo 3 podle nařízení (ES) č. 1272/2008³, smejí být považovány za látky nepatřící do třídy 6.1.

2.2.61.2 Látky nepřípuštěné k přepravě

- 2.2.61.2.1 Chemicky nestálé látky třídy 6.1 jsou přípuštěny k přepravě jen tehdy, byla-li učiněna potřebná opatření k zabránění možnosti nebezpečného rozkladu nebo polymerizace za normálních podmínek přepravy. K opatřením potřebným pro zabránění polymerizaci viz zvláštní ustanovení 386 kapitoly 3.3. Za tímto účelem je zvláště třeba dbát na to, aby nádoby a cisterny neobsahovaly žádné látky, které by tyto reakce mohly podporovat.
- 2.2.61.2.2 Následující látky a směsi nejsou přípuštěny k přepravě:
- kyanovodík (bezvodý nebo v roztoku), který neodpovídá popisům UN čísel 1051, 1613, 1614 a 3294;
 - karbonyly kovů s bodem vzplanutí nižším než 23 °C, jiné než UN 1259 TETRAKARBONYL NIKLU a UN 1994 PENTAKARBONYL ŽELEZA;
 - 2,3,7,8-TETRACHLORDIBENZO-1,4-DIOXIN (TCDD) v koncentracích, které se považují podle kritérií v 2.2.61.1.7 za velmi toxické;
 - UN 2249 DICHLORDIMETHYLETHER, SYMETRICKÝ;
 - přípravky fosfidů bez přísad, které zabraňují vývinu toxických hořlavých plynů.

³ Nařízení (ES) č. 1272/2008 Evropského parlamentu a Rady z 16. prosince 2008 týkající se klasifikace, označování a balení látek a směsí, pozměňující a zrušující směrnici 67/548/EHS a 1999/45/ES; a pozměňující nařízení (ES) č. 1907/2006, uveřejněné v Úředním věstníku Evropské unie, L353, 31. prosince 2008, str. 1-1355.

2.2.61.3 Seznam hromadných položek

POZNÁMKY:

- a Látky a přípravky obsahující alkaloidy nebo nikotin používané jako pesticidy jsou přiřazeny pod UN 2588 PESTICID, TUHÝ, TOXICKÝ, J.N., UN 2902 PESTICID, KAPALNÝ, TOXICKÝ, J.N. nebo UN 2903 PESTICID, KAPALNÝ, TOXICKÝ, HOŘLAVÝ, J.N.
- b Účinné látky, jakož i přípravky nebo směsi látek určených pro laboratorní a pokusné účely, jakož i k výrobě farmaceutických výrobků, s jinými látkami musí být zařazeny podle své toxicity (viz 2.2.61.1.7 až 2.2.61.1.11).
- c Slabě toxické látky schopné samoohřevu a samozápalné organokovové sloučeniny jsou látkami třídy 4.2.
- d Slabě toxické látky reagující s vodou a organokovové sloučeniny reagující s vodou jsou látkami třídy 4.3.
- e Fulminát rtuťnatý, navlhčený, s nejméně 20 % hm. vody nebo směsi alkoholu a vody je látkou třídy 1, UN číslo 0135.
- f Ferikyanidy, feroxyanidy, jakož i thiokyanatany alkalické a amonné nepodléhají ustanovením ADN.
- g Olověné soli a olověná barviva, které smíchány v poměru 1:1000 s kyselinou chlorovodíkovou 0,07 M a míchány po dobu jedné hodiny při teplotě 23 °C ± 2 °C vykazují rozpustnost nejvýše 5 %, nepodléhají ustanovením ADN.
- h Předměty napuštěné tímto pesticidem, jako jsou lepenkové podložky, papírové proužky, kuličky vaty, plastové fólie, v hermeticky uzavřených obalech nepodléhají ustanovením ADN.
- i Směsi tuhých látek, které nepodléhají ustanovením ADN, a toxických kapalných látek mohou být přepravovány pod UN číslem 3243, bez toho, že by se předtím použila klasifikační kritéria pro třídu 6.1, za podmínky, že v době nakládky látky nebo uzavírání obalu, nebo nákladní dopravní jednotky není vidět žádná uvolněná kapalina. Každý obal musí odpovídat konstrukčnímu typu, který úspěšně obstál při zkoušce těsnosti pro obalovou skupinu II. Tato položka nesmí být použita pro tuhé látky, které obsahují kapalnou látku obalové skupiny I.
- j Velmi toxické a toxické hořlavé kapaliny látky s bodem vzplanutí pod 23 °C jsou látkami třídy 3, s výjimkou látek, které jsou velmi toxické při vdechnutí, jak je definováno v 2.2.61.1.4 až 2.2.61.1.9. Kapaliny, které jsou velmi toxické při vdechnutí, jsou identifikovány jako „toxické při vdechnutí“ ve svém oficiálním pojmenování pro přepravu ve sloupci (2) nebo zvláštním ustanovením 354 ve sloupci (6) tabulky A kapitoly 3.2.
- k Slabě toxické hořlavé kapalné látky s bodem vzplanutí od 23 °C do 60 °C, včetně limitních hodnot, s výjimkou látek a přípravků sloužících jako pesticidy, jsou látkami třídy 3.
- l Slabě toxické látky podporující hoření jsou látkami třídy 5.1.
- m Slabě toxické a slabě žíravé látky jsou látkami třídy 8.
- n Fosfidy kovů přiřazené k UN číslům 1360, 1397, 1432, 1714, 2011 a 2013 jsou látkami třídy 4.3.

2.2.62 Třída 6.2 Infekční látky**2.2.62.1 Kritéria**

2.2.62.1.1 Název třídy 6.2 zahrnuje látky schopné vyvolat nákazu. Pro účely ADN jsou infekčními látkami ty látky, o kterých je známo nebo lze důvodně předpokládat, že obsahují původce nemoci. Původci nemoci jsou definováni jako mikroorganismy (včetně bakterií, virů, parazitů a plísní) a jiní činitelé, jako jsou priony, které(kteří) mohou způsobit onemocnění u lidí nebo zvířat.

POZNÁMKA 1: *Geneticky změněné mikroorganismy a organismy, biologické produkty, diagnostické vzorky a záměrně infikovaná živá zvířata musí být přiřazeny do této třídy, jestliže splňují podmínky pro tuto třídu.*

Přeprava neúmyslně nebo přirozeně infikovaných živých zvířat podléhá jen platným pravidlům a předpisům příslušných zemí původu, tranzitu a určení.

POZNÁMKA 2: *Toxiny z rostlin, zvířat nebo bakterií, které neobsahují žádnou infekční látku nebo organismy, nebo které nejsou obsaženy v infekčních látkách nebo organismech, jsou látkami třídy 6.1, UN číslo 3172 nebo 3462.*

2.2.62.1.2 Látky třídy 6.2 jsou rozděleny následovně:

- I1 Infekční látky nebezpečné pro lidi
- I2 Infekční látky nebezpečné jen pro zvířata
- I3 Klinické odpady
- I4 Látky biologické, kategorie B

Definice

2.2.62.1.3 Pro účely ADN,

„*Biologické produkty*“ jsou produkty z živých organismů, které se vyrábějí a rozesílají v souladu s předpisy příslušných národních orgánů, které mohou uložit podmínku zvláštních povolení. Biologické produkty se používají buď pro prevenci, léčení nebo diagnostikování nemocí u lidí nebo zvířat, nebo pro vývojové, pokusné nebo výzkumné účely s tím spojené. Zahrnují hotové výrobky nebo meziprodukty, jako očkovací látky, ale nejsou na ně omezeny;

„*Kultury*“ jsou výsledkem procesu, při kterém se původci nemocí záměrně rozmnožují. Tato definice nezahrnuje lidské nebo zvířecí vzorky od pacientů, jak jsou definovány v tomto odstavci;

„*Medicínské nebo klinické odpady*“ jsou odpady pocházející z veterinárního ošetření zvířat, lékařského ošetření lidí nebo z biologického výzkumu.

„*Vzorky od pacientů*“ jsou ty, které byly odebrány přímo z lidí nebo zvířat včetně, avšak pouze, výkalů, výměšků, krve a jejich složek, tkáně a tkáňových tekutin a částí těl, které jsou přepravovány k takovým účelům, jako je výzkum, diagnostika, vyšetření, léčení nemocí a prevence.

Klasifikace

2.2.62.1.4 Infekční látky musí být zařazeny do třídy 6.2 a přiřazeny k UN číslům 2814, 2900, 3291, 3373 nebo 3549.

Infekční látky se dělí do těchto kategorií:

2.2.62.1.4.1 Kategorie A: Infekční látka, která je přepravována ve formě, která je schopna, dojde-li k vystavení jejímu účinku, způsobit jinak zdravých osob nebo zvířat trvalou invaliditu, nemoc ohrožující život nebo smrtelnou nemoc jinak zdravých lidí nebo zvířat. Informativní příklady látek, které splňují tato kritéria, jsou uvedeny v tabulce tohoto odstavce.

POZNÁMKA: *Vystavení účinku látky nastane, jestliže látka unikne ven z ochranného obalu a dojde k fyzickému kontaktu s lidmi nebo zvířaty.*

- (a) Infekční látky splňující tato kritéria, které způsobují nemoc u lidí, nebo u lidí i zvířat musí být přiřazeny k UN číslu 2814. Infekční látky, které způsobují nemoc jen u zvířat, musí být přiřazeny k UN číslu 2900;
- (b) Přiřazení k UN číslu 2814 nebo k UN číslu 2900 musí být založeno na známých lékařských chorobopisech a známých příznacích u lidí nebo zvířat, endemických místních podmínkách nebo odborném posouzení individuálního stavu člověka nebo zvířete.

POZNÁMKA 1: *Oficiální pojmenování pro přepravu UN čísla 2814 je LÁTKA INFEKČNÍ, NEBEZPEČNÁ PRO LIDI. Oficiální pojmenování pro přepravu UN čísla 2900 je LÁTKA INFEKČNÍ, NEBEZPEČNÁ pouze PRO ZVÍŘATA.*

POZNÁMKA 2: *Následující tabulka není vyčerpávající. Infekční látky, včetně nových nebo nově se objevivších původců nemocí, které nejsou uvedeny v tabulce, avšak které splňují stejná kritéria, musí být přiřazeny ke kategorii A. Kromě toho, je-li pochybnost, zda látka splňuje či nespĺňuje tato kritéria, musí být začleněna do kategorie A.*

POZNÁMKA 3: *Ty mikroorganismy, které jsou v následující tabulce napsány kurzívou, jsou bakterie nebo plísňe.*

JMENOVIÉ PŘÍKLADY INFEKČNÍCH LÁTEK ZAHRNUTÝCH DO KATEGORIE A V JAKÉKOLI FORMĚ, NENÍ-LI PŘÍMO UVEDENO JINAK (2.2.62.1.4.1)

JMENOVITÉ PŘÍKLADY INFEKČNÍCH LÁTEK ZAHRNUTÝCH DO KATEGORIE A V JAKÉKOLI FORMĚ, NENÍ-LI PŘÍMO UVEDENO JINAK (2.2.62.1.4.1)	
UN číslo a pojmenování	Mikroorganismus
UN 2900 Infekční látky nebezpečné jen pro zvířata	virus afrického moru prasat (pouze kultury) ptačí paramyxovirus typ 1 – Velogenový virus newcastleské choroby drůbeže (pouze kultury) virus klasického moru prasat (pouze kultury) virus slintavky a kulhavky (pouze kultury) virus nodulární dermatitidy skotu (pouze kultury) <i>Mycoplasma mycoides</i> – infekční hovězí pleuropneumonie (pouze kultury) virus moru malých přežvýkavců (pouze kultury) virus dobytčího moru (pouze kultury) virus ovčích neštovic (pouze kultury) virus kozích neštovic (pouze kultury) virus vezikulární stomatitidy prasat (pouze kultury) virus vezikulární stomatitidy (pouze kultury)

^a Jsou-li kultury určeny pro diagnostické nebo klinické účely, mohou být zařazeny jako infekční látky kategorie B.

2.2.62.1.4.2 Kategorie B: Infekční látka, která nesplňuje kritéria pro zařazení do kategorie A. Infekční látky v kategorii B musí být přiřazeny k UN číslu 3373.

POZNÁMKA: *Oficiální pojmenování pro přepravu UN čísla 3373 je „LÁTKY BIOLOGICKÉ, KATEGORIE B“.*

2.2.62.1.5 *Vynětí z platnosti*

2.2.62.1.5.1 Látky, které neobsahují infekční látky, nebo látky, u nichž není pravděpodobné, že způsobí nemoc u lidí nebo zvířat, nepodléhají ustanovením ADN, ledaže splňují kritéria pro zařazení do jiné třídy.

2.2.62.1.5.2 Látky obsahující mikroorganismy, které jsou nepatogenní vůči lidem nebo zvířatům, nepodléhají ustanovením ADN, ledaže splňují kritéria pro zařazení do jiné třídy.

2.2.62.1.5.3 Látky v takové formě, že všichni přítomní původci nemocí byli neutralizováni nebo deaktivováni, takže už nepředstavují zdravotní riziko, nepodléhají ustanovením ADN, ledaže splňují kritéria pro zařazení do jiné třídy.

POZNÁMKA: *Lékařské vybavení, které bylo zbaveno volné kapaliny, je považováno za splňující požadavky tohoto odstavce a nepodléhá ustanovením ADN.*

2.2.62.1.5.4 Látky, u nichž je koncentrace původců nemocí na stejné úrovni jako v přírodě (včetně vzorků potravin a vody) a které nejsou považovány za látky představující významné riziko infekce, nepodléhají ustanovením ADN, ledaže splňují kritéria pro zařazení do jiné třídy.

2.2.62.1.5.5 Suché krevní skvrny, získané odkápnutím krve na absorpční materiál, nepodléhají ustanovením ADN

2.2.62.1.5.6 Vzorky pro test okultního krvácení do stolice nepodléhají ustanovením ADN.

2.2.62.1.5.7 Krev nebo krevní složky, které byly shromážděny pro účely transfúze nebo pro přípravu krevních produktů k použití pro transfúze nebo transplantace a jakékoli tkáně nebo orgány určené k použití při transplantacích, jakož i vzorky odebrané ve spojení s takovými účely, nepodléhají ustanovením ADN.

2.2.62.1.5.8 Lidské nebo zvířecí vzorky, u nichž je minimální pravděpodobnost, že jsou v nich přítomni původci nemocí, nepodléhají ustanovením ADN, jsou-li vzorky přepravovány v obalu, který zabrání jakémukoli úniku a který je označen slovy „VYJMUTÝ LIDSKÝ VZOREK“ nebo „VYJMUTÝ ZVÍŘECÍ VZOREK“.

Obal je považován za obal vyhovující výše uvedeným požadavkům, jestliže splňuje následující podmínky:

(a) Obal sestává ze tří částí:

(i) jedné nebo více těsných primárních nádob;

- (ii) těsného sekundárního obalu; a
 - (iii) vnějšího obalu přiměřené pevnosti vzhledem k jeho vnitřnímu objemu, hmotnosti a zamýšlenému použití s alespoň jedním povrchem o rozměrech nejméně 100 x 100 mm;
- (b) Pro kapaliny musí být mezi primární nádobu(y) a sekundární obal vložen savý materiál v dostatečném množství, aby pohltil celý obsah tak, aby během přepravy žádný únik kapalné látky nezasáhl vnější obal a neporušil celistvost vycpávkového materiálu;
- (c) Je-li více křehkých primárních nádob vloženo do jednoho sekundárního obalu, musí být buď jednotlivě zabaleny, nebo navzájem odděleny, aby se zamezilo jejich vzájemnému dotyku.

POZNÁMKA 1: *K určení, zda je látka vyňata podle tohoto odstavce, se vyžaduje odborné posouzení. Toto posouzení by mělo být založeno na předchozích lékařských případech, příznacích a individuálních okolnostech zdroje, lidského nebo zvířecího, a na endemických místních podmínkách. Příklady vzorků, které mohou být přepravovány podle tohoto odstavce zahrnují:*

- vzorky krve nebo moči ke zjištění hladiny cholesterolu, hladiny cukru, hladiny hormonů nebo prostatických specifických protilátek (PSA);
- vzorky vyžadované k ověření funkce orgánů, jako srdce, jater nebo ledvin, u lidí nebo zvířat s neinfekčními chorobami, nebo pro terapeutickou kontrolu léků;
- vzorky odebrané na žádost pojišťovacích společností nebo zaměstnavatelů ke zjištění přítomnosti drog nebo alkoholu;
- vzorky odebrané pro těhotenské testy;
- biopsie ke zjištění rakoviny; a
- zjišťování protilátek u lidí nebo zvířat, pokud není žádná obava z infekce (např. vyhodnocení imunity vyvolané vakcínou, diagnostikování autoimunní nemoci atd.

POZNÁMKA 2: *Pro leteckou dopravu musí obaly pro vzorky vyňaté podle tohoto odstavce splňovat podmínky uvedené pod písmeny (a) až (c).*

2.2.62.1.5.9

S výjimkou:

- (a) medicínského odpadu (UN 3291 a 3549);
- (b) lékařských přístrojů nebo zařízení kontaminovaných nebo obsahujících infekční látky kategorie A (UN 2814 nebo UN 2900); a
- (c) lékařských přístrojů nebo zařízení kontaminovaných nebo obsahujících jiné nebezpečné látky, které vyhovují definici jiné třídy, lékařské přístroje nebo zařízení potenciálně kontaminované nebo obsahující infekční látky, které jsou přepravovány k desinfekci, čištění, sterilizaci, opravě nebo k ocenění zařízení nepodléhají jiným ustanovením ADN, než jsou ustanovení tohoto odstavce, jsou-li zabaleny do obalů konstruovaných a vyrobených takovým způsobem, že za normálních podmínek přepravy nemohou prasknout, být propíchnuty nebo propouštět svůj obsah. Obaly musí být konstruovány tak, aby splnily konstrukční požadavky uvedené v 6.1.4 nebo 6.6.4 ADR.

Tyto obaly musí splňovat všeobecná ustanovení pro balení v 4.1.1.1 a 4.1.1.2 ADR a být schopny zadržet lékařské přístroje a zařízení při pádu z výšky 1,2 m.

Obaly musí být označeny nápisem „**POUŽITÝ LÉKAŘSKÝ PŘÍSTROJ**“ nebo „**POUŽITÉ LÉKAŘSKÉ ZAŘÍZENÍ**“. Při použití přepravních obalových souborů musí být tyto soubory označeny stejným způsobem, kromě případů, kdy nápis zůstává viditelným.

2.2.62.1.6-

2.2.62.1.8

(Vyhrazeno)

2.2.62.1.9

Biologické produkty

Pro účely ADN se biologické produkty dělí do následujících skupin:

- (a) Produkty, které jsou vyrobeny a zabaleny v souladu s předpisy příslušných národních orgánů a jsou přepravovány za účelem jejich konečného zabalení nebo distribuce a k použití pro léčebné účely lékaři nebo jednotlivci. Látky této skupiny nepodléhají ustanovením ADN;
- (b) Produkty, které nespádají pod písmeno (a) a o kterých je známo nebo se o nich důvodně předpokládá, že obsahují infekční látky, a které splňují kritéria pro zařazení do kategorie A nebo kategorie B. Látky v této skupině se musí přiřadit k UN číslu 2814, 2900 nebo popřípadě 3373.

POZNÁMKA: U některých biologických produktů schválených pro uvedení na trh může biologické nebezpečí hrozit jen v určitých částech světa. V tomto případě mohou příslušné orgány požadovat, aby tyto biologické produkty vyhovovaly místním předpisům pro infekční látky nebo mohou uložit jiná omezení.

2.2.62.1.10 Geneticky změněné mikroorganismy a organismy

Geneticky změněné mikroorganismy, které neodpovídají definici infekční látky, musí být zařazeny podle oddílu 2.2.9.

2.2.62.1.11 Medicínské nebo klinické odpady

2.2.62.1.11.1 Medicínské nebo klinické odpady obsahující:

- (a) infekční látky kategorie A musí být přiřazeny pod UN 2814, UN 2900 nebo UN 3549, jak je to vhodné. Tuhé medicínské odpady obsahující infekční látky kategorie A pocházející z lékařského ošetření lidí nebo veterinárního ošetření zvířat mohou být přiřazeny pod UN 3549. Položka UN 3549 nesmí být použita pro odpady z biologického výzkumu nebo kapalné odpady;
- (b) infekční látky kategorie B musí být přiřazeny pod UN 3291.

POZNÁMKA 1: Oficiální pojmenování pro přepravu pro UN 3549 je „ODPAD MEDICÍNSKÝ, KATEGORIE A, OHROŽUJÍCÍ LIDI, tuhý“ nebo „ODPAD MEDICÍNSKÝ, KATEGORIE A, OHROŽUJÍCÍ pouze ZVÍŘATA, tuhý“.

POZNÁMKA 2: Medicínské nebo klinické odpady přiřazené k číslu 18 01 03 (Odpady z lékařské nebo veterinární zdravotní péče a/nebo s ní spojeného výzkumu – odpady z porodnic, diagnostiky, léčení nebo prevence nemocí u lidí – odpady, jejichž sběr a likvidace podléhá zvláštním požadavkům vzhledem k prevenci infekce) nebo 18 02 02 (Odpady z lékařské nebo veterinární zdravotní péče a/nebo s ní spojeného výzkumu – odpady z výzkumu, diagnostiky, léčení nebo prevence nemocí u zvířat – odpady, jejichž sběr a likvidace podléhá zvláštním požadavkům vzhledem k prevenci infekce) podle seznamu odpadů přiloženého k Rozhodnutí Komise 2000/532/ES⁴, se změnami, musí být zařazeny podle ustanovení uvedených v tomto odstavci, na základě lékařské nebo veterinární diagnózy týkající se pacienta nebo zvířete.

2.2.62.1.11.2 Medicínské nebo klinické odpady, u nichž je možno důvodně předpokládat malou pravděpodobnost, že obsahují infekční látky, musí být přiřazeny k UN číslu 3291. Pro přiřazení se mohou vzít v úvahu mezinárodní, regionální nebo vnitrostátní katalogy odpadů.

POZNÁMKA 1: Oficiální pojmenování pro přepravu UN čísla 3291 je „ODPAD KLINICKÝ, NESPECIFIKOVANÝ, J.N.“ nebo „ODPAD (BIO)MEDICÍNSKÝ, J.N.“ nebo „ODPAD MEDICÍNSKÝ REGULOVANÝ, J.N.“.

POZNÁMKA 2: Bez ohledu na výše uvedená klasifikační kritéria nepodléhají ustanovením ADR medicínské nebo klinické odpady přiřazené k číslu 18 01 04 (Odpady z lékařské nebo veterinární zdravotní péče a/nebo s ní spojeného výzkumu – odpady z porodnic, diagnostiky, léčení nebo prevence nemocí u lidí – odpady, jejichž sběr a likvidace nepodléhá zvláštním požadavkům vzhledem k prevenci infekce) nebo 18 02 03 (Odpady z lékařské nebo veterinární zdravotní péče a/nebo s ní spojeného výzkumu – odpady z výzkumu, diagnostiky, léčení nebo prevence nemocí u zvířat - odpady, jejichž sběr a likvidace nepodléhá zvláštním požadavkům vzhledem k prevenci infekce) podle seznamu odpadů přiloženého k Rozhodnutí Komise 2000/532/ES⁴, se změnami, nejsou předmětem ustanovení ADN.

2.2.62.1.11.3 Dekontaminované medicínské nebo klinické odpady, které dříve obsahovaly infekční látky, nepodléhají ustanovením ADN, ledaže splňují kritéria pro zařazení do jiné třídy.

2.2.62.1.11.4 (Vypuštěno)

⁴ Rozhodnutí Komise 2000/532/ES z 3. května 2000 nahrazující Rozhodnutí 94/3/ES zavádějící seznam odpadů k provádění článku 1(a) Směrnice Rady 75/442/EHS o odpadech nahrazena Směrnicí 2006/12/ES Evropského parlamentu a Rady (Úřední věstník Evropského společenství č. L 114 z 27. dubna 2006, strana 9) a Rozhodnutí Rady 94/904/ES zavádějící seznam nebezpečných odpadů k provádění článku 1(4) Směrnice Rady 91/689/EHS o nebezpečných odpadech (Úřední věstník Evropských společenství č. L 226 z 6.9.2000, strana 3).

2.2.62.1.12 *Infikovaná zvířata*

2.2.62.1.12.1 Živá zvířata smějí být použita k zaslání infekční látky, jen pokud nemůže být zaslána nějakým jiným způsobem. Živá zvířata, která byla záměrně infikována a je známo nebo je podezření, že obsahují infekční látku, smějí být přepravována jen za podmínek schválených příslušným orgánem.

POZNÁMKA: Schválení příslušných orgánů musí být vydávána na základě platných pravidel pro přepravu živých zvířat s přihlednutím k aspektům nebezpečných věcí. Orgány, které jsou příslušné ke stanovování těchto podmínek a pravidel pro schvalování musí být eglementovány na národní úrovni. Není-li k dispozici schválení vydané příslušným orgánem smluvní strany ADN, smí příslušný orgán smluvní strany ADN uznat schválení vydané příslušným orgánem země, která není smluvní stranou ADN.

Pravidla pro přepravu živých zvířat jsou obsažena např. v nařízení Rady (ES) č. 1/2005 z 22. prosince 2004 o ochraně zvířat během přepravy (Úřední věstník Evropské unie č. L3 z 5. ledna 2005) se změnami.

2.2.62.1.12.2 (Vypuštěno)

2.2.62.2 Látky nepřipustěné k přepravě

Živí obratlovci nebo bezobratlá zvířata nesmějí být použiti(a) k tomu, aby přepravovali(a) infekční látku, ledaže by tato látka nemohla být přepravena jiným způsobem nebo ledaže by tato přeprava byla schválena příslušným orgánem (viz 2.2.62.1.12.1).

2.2.62.3. Seznam hromadných položek**Infekční látky**

nebezpečné pro lidi	I1	2814	LÁTKA INFEKČNÍ, NEBEZPEČNÁ PRO LIDI
Infekční látky nebezpečné jen pro zvířata	I2	2900	LÁTKA INFEKČNÍ, NEBEZPEČNÁ pouze PRO ZVÍŘATA
Klinické odpady	I3	3291 3291 3291 3549 3549	ODPAD KLINICKÝ, NESPECIFIKOVANÝ, J.N. nebo ODPAD (BIO)MEDICÍNSKÝ, J.N. nebo ODPAD MEDICÍNSKÝ REGULOVANÝ, J.N. ODPAD MEDICÍNSKÝ, KATEGORIE A, OHROŽUJÍCÍ LIDI, tuhý nebo ODPAD MEDICÍNSKÝ, KATEGORIE A, OHROŽUJÍCÍ pouze ZVÍŘATA, tuhý
Diagnostické vzorky	I4	3373	LÁTKY BIOLOGICKÉ, KATEGORIE B

2.2.7 Třída 7: Radioaktivní látky

2.2.7.1 Definice

2.2.7.1.1 *Radioaktivní látky* jsou jakékoliv látky obsahující radionuklidy, ve kterých jak hmotnostní aktivita, tak i celková aktivita v zásilce převyšuje hodnoty uvedené v bodech 2.2.7.2.2.1 a 2.2.7.2.2.6.

2.2.7.1.2 Kontaminace

Kontaminace – přítomnost radioaktivní látky na povrchu v množstvích větších než 0,4 Bq/cm² pro beta a gama zářiče a nízkotoxické alfa zářiče, nebo 0,04 Bq/cm² pro všechny ostatní alfa zářiče.

Nefixovaná kontaminace – kontaminace, která může být odstraněna z povrchu za běžných podmínek během přepravy.

Fixovaná kontaminace – jakákoliv jiná kontaminace než nefixovaná kontaminace.

2.2.7.1.3 Definice specifických termínů

A₁ a A₂

A₁ – je hodnota aktivity radioaktivních látek zvláštní formy uvedená v tabulce 2.2.7.2.2.1 nebo odvozená podle 2.2.7.2.2.2, která se používá pro určení mezních hodnot aktivity pro účely předpisů ADN.

A₂ – je hodnota aktivity radioaktivních látek, jiných než jsou radioaktivní látky zvláštní formy, která je uvedena v tabulce 2.2.7.2.2.1 nebo odvozena podle pododdílu 2.2.7.2.2.2 a která se používá pro určení mezních hodnot aktivity pro účely předpisů ADN.

Látka s nízkou specifickou aktivitou (LSA) - je radioaktivní látka, která má ze své povahy omezenou specifickou aktivitu nebo radioaktivní látka, pro kterou platí mezní hodnoty odhadované střední specifické aktivity. Při stanovení odhadované střední specifické aktivity se neberou v úvahu vnější stínící materiály obklopující LSA.

Neozářené thorium – thorium, které obsahuje nejvýše 10⁻⁷ g uranu-233 na gram thoria-232,

Neozářený uran – uran, který obsahuje nejvýše 2×10³ Bq plutonia na gram uranu-235, nejvýše 9×10⁶ Bq štěpných produktů na gram uranu-235 a nejvýše 5×10⁻³ g uranu-236 na gram uranu-235.

Nízkodisperzní radioaktivní látka je buď tuhá radioaktivní látka, nebo tuhá radioaktivní látka v uzavřené kapsli, která má omezenou schopnost se rozptýlovat a není v práškovité formě.

Nízkotoxické alfa zářiče jsou: přírodní uran, ochuzený uran, přírodní thorium, uran-235 nebo uran-238, thorium-232, thorium-228 a thorium-230, jsou-li tyto obsaženy v rudách nebo fyzikálních nebo chemických koncentrátech, nebo alfa zářiče s poločasem rozpadu kratším než 10 dní.

Povrchově kontaminovaný předmět (SCO) - tuhý předmět, který sám není radioaktivní, ale na jehož povrchu je rozptýlena radioaktivní látka.

Radioaktivní látka zvláštní formy – je

- nerozptýlitelná tuhá radioaktivní látka; nebo
- těsně uzavřené pouzdro, obsahující radioaktivní látku.

Specifická aktivita radionuklidu – aktivita radionuklidu vztažená na jednotku hmotnosti tohoto nuklidu. Specifická aktivita látky je aktivita vztažená na jednotku hmotnosti této látky, ve které je radionuklid v podstatě rovnoměrně rozptýlen.

Štěpné nuklidy jsou uran-233, uran-235, plutonium-239 a plutonium-241. Štěpné látky jsou látky obsahující kterýkoli z těchto štěpných nuklidů. Vyjmuty z definice štěpných látek jsou následující:

- neozářený přírodní uran nebo neozářený ochuzený uran;
- přírodní uran nebo ochuzený uran, které byly ozářeny výhradně v tepelných reaktorech;
- materiál se štěpnými nuklidy o celkové hmotnosti menší než 0,25 g;

d) libovolná kombinace (a), (b) a/nebo (c).

Tyto výjimky jsou platné pouze tehdy, jestliže žádný další materiál se štěpnými nuklidy není obsažen v kusu, nebo v zásilce, je-li přepravován nebalený.

Uranem – přírodním, ochuzeným, obohaceným se rozumí:

Přírodní uran je uran (včetně chemicky separovaného), ve kterém se vyskytují izotopy uranu (v množství cca 99,28 % hmot. uranu-238, a cca 0,72 % hmot. uranu-235).

Ochuzený uran s menším hmotnostním podílem uranu-235 než má přírodní uran;

Obohacený uran s vyšším hmotnostním podílem uranu-235 než 0,72 % hmot.

Ve všech případech se vyskytuje nepatrný hmotnostní podíl uranu-234.

2.2.7.2 Klasifikace

2.2.7.2.1 Všeobecné předpisy

2.2.7.2.1.1 Radioaktivní látky musí být přiřazeny k jednomu z UN čísel specifikovanému v tabulce 2.2.7.2.1.1, v souladu s 2.2.7.2.4 a 2.2.7.2.5, s přihlédnutím k materiálovým charakteristikám stanoveným v 2.2.7.2.3.

Tabulka 2.2.7.2.1.1 Přiřazení UN čísel

UN číslo	Pojmenování a popis ^a
Vyjmuté kusy (1.7.1.5)	
UN 2908	LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS – PRÁZDNÝ OBAL
UN 2909	LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS – VÝROBKY Z PŘÍRODNÍHO URANU nebo OCHUZENÉHO URANU nebo PŘÍRODNÍHO THORIA
UN 2910	LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS – OMEZENÁ MNOŽSTVÍ
UN 2911	LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS – PŘÍSTROJE nebo VÝROBKY
UN 3507	LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, VYJMUTÝ KUS, obsahující méně než 0,1 kg láky na balení, jiná než štěpná nebo vyjmutá štěpná ^{b, c}
Látky s nízkou hmotnostní aktivitou (2.2.7.2.3.1)	
UN 2912	LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-I) jiná než štěpná nebo vyjmutá štěpná ^b
UN 3321	LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-II), jiná než štěpná nebo vyjmutá štěpná ^b
UN 3322	LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-III), jiná než štěpná nebo vyjmutá štěpná ^b
UN 3324	LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-II), ŠTĚPNÁ
UN 3325	LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-III), ŠTĚPNÁ
Povrchově kontaminované předměty (2.2.7.2.3.2)	
UN 2913	LÁTKA RADIOAKTIVNÍ, POVRCHOVĚ KONTAMINOVANÉ PŘEDMĚTY (SCO-I, SCO-II nebo SCO-III), jiné než štěpné nebo vyjmuté štěpné ^b
UN 3326	RADIOAKTIVNÍ LÁTKA, POVRCHOVĚ KONTAMINOVANÉ PŘEDMĚTY (SCO-I nebo SCO-II), ŠTĚPNÉ
Zásilky typu A (2.2.7.2.4.4)	
UN 2915	LÁTKA RADIOAKTIVNÍ, KUS TYPU A jiná než zvláštní formy, jiná než štěpná nebo vyjmutá štěpná ^b
UN 3327	LÁTKA RADIOAKTIVNÍ, KUS TYPU A, ŠTĚPNÁ, jiná než zvláštní formy
UN 3332	LÁTKA RADIOAKTIVNÍ, KUS TYPU A, ZVLÁŠTNÍ FORMY, jiná než štěpná nebo vyjmutá štěpná ^b
UN 3333	LÁTKA RADIOAKTIVNÍ, KUS TYPU A, ZVLÁŠTNÍ FORMY, ŠTĚPNÁ
Zásilky typu B(U) (2.2.7.2.4.6)	
UN 2916	LÁTKA RADIOAKTIVNÍ, KUS TYPU B (U), jiná než štěpná nebo vyjmutá štěpná ^b
UN 3328	LÁTKA RADIOAKTIVNÍ, KUS TYPU B (U), ŠTĚPNÁ

Zásilky typu B(M) (2.2.7.2.4.6)	
UN 2917	LÁTKA RADIOAKTIVNÍ, KUS TYPU B (M), jiná než štěpná nebo vyjmutá štěpná ^b
UN 3329	LÁTKA RADIOAKTIVNÍ, KUS TYPU B (M), ŠTĚPNÁ
Zásilky typu C (2.2.7.2.4.6)	
UN 3323	LÁTKA RADIOAKTIVNÍ, KUS TYPU C, jiná než štěpná nebo vyjmutá štěpná ^b
UN 3330	LÁTKA RADIOAKTIVNÍ, KUS TYPU C, ŠTĚPNÁ
Zvláštní podmínky (2.2.7.2.5)	
UN 2919	LÁTKA RADIOAKTIVNÍ, PŘEPRAVOVANÁ ZA ZVLÁŠTNÍCH PODMÍNEK, jiná než štěpná nebo vyjmutá štěpná ^b
UN 3331	LÁTKA RADIOAKTIVNÍ, PŘEPRAVOVANÁ ZA ZVLÁŠTNÍCH PODMÍNEK, ŠTĚPNÁ
Hexafluorid uranu (2.2.7.2.4.5)	
UN 2977	LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, ŠTĚPNÁ
UN 2978	LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, jiná než štěpná nebo vyjmutá štěpná ^b
UN 3507	LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, VYJMUTÝ KUS, obsahující méně než 0,1 kg láky na balení, jiná než štěpná nebo vyjmutá štěpná ^{b, c}

^a *Pojmenování pro přepravu lze nalézt ve sloupci „Pojmenování a popis“ a je omezeno na část napsanou velkými písmeny. V položkách pro UN 2909, UN 2911, UN 2913 a UN 3326, kde jsou alternativní oficiální pojmenování pro přepravu oddělena slovem „nebo“, musí být použita jen platná oficiální pojmenování pro přepravu.*

^b *Pojem „vyjmutá štěpná“ se vztahuje pouze na látku vyjmutou podle 2.2.7.2.3.5.*

^c *Pro UN 3507, viz též zvláštní ustanovení 369 v kapitole 3.3.*

2.2.7.2.2 Určení základních hodnot radionuklidů

2.2.7.2.2.1 V tabulce 2.2.7.2.2.1 jsou uvedeny následující základní hodnoty pro jednotlivé radionuklidy:

- (a) A1 a A2 v TBq;
- (b) mezní hodnoty koncentrace aktivity pro vyjmuté látky v Bq/g; a
- (c) mezní hodnoty aktivity pro vyjmuté zásilky v Bq.

Tabulka 2.2.7.2.2.1: Základní hodnoty aktivity jednotlivých radionuklidů

Radionuklid (atomové číslo)	A ₁ (TBq)	A ₂ (TBq)	Mezní hodnoty koncentrace aktivity pro vyjmuté látky (Bq/g)	Mezní hodnota aktivity pro vyjmuté zásilky (Bq)

- (c) Množství může být určeno pomocí měření doby rozpadu nebo měření příkonu dávkového ekvivalentu v předepsané vzdálenosti od zdroje.
- (d) Tyto hodnoty platí pouze pro sloučeniny uranu, které jak za normálních, tak i havarijních podmínek přepravy zachovávají chemickou podobu UF₆, UO₂F₂ a UO₂(NO₃)₂.
- (e) Tyto hodnoty platí pouze pro uranové sloučeniny, které jak za normálních, tak i havarijních podmínek přepravy zachovávají chemickou podobu UO₃, UF₄, UCl₄ a pro šestimocné sloučeniny.
- (f) Tyto hodnoty platí pro všechny uranové sloučeniny, kromě těch, které jsou uvedeny pod písmeny d) a e) výše.
- (g) Tyto hodnoty platí pouze pro neozářený uran.

2.2.7.2.2.2 Pro jednotlivé radionuklidy:

- (a) které nejsou uvedeny v tabulce 2.2.7.2.2.1, vyžaduje určení základních hodnot radionuklidů podle ustanovení v 2.2.7.2.2.1 vícestranné schválení. Pro tyto radionuklidy musí být meze hmotnostní aktivity pro vyjmutí látky a meze aktivity pro vyjmutí zásilky vypočteny v souladu s principy stanovenými v (dokumentu) Radiation Protection and Safety of Radiation Sources:

⁵ V případě Th-natural, je mateřský nuklid Th-232, v případě U-natural je mateřský nuklid U-238

International Basic Safety Standards", IAEA Řada bezpečnostních standardů č. GSR část 3, IAEA, Vídeň (2014). Je dovoleno použít hodnotu A_2 vypočtenou použitím dávkového koeficientu pro příslušný typ absorpce plícemi (retence), jak je doporučeno Mezinárodní komisí pro radiační ochranu (International Commission on Radiological Protection), je-li vzata v úvahu chemická forma každého radionuklidu jak při normálních podmínkách přepravy, tak za podmínek nehody při přepravě. Alternativně mohou být použity hodnoty v tabulce 2.2.7.2.2.2 bez obdržení schválení příslušného orgánu.

- (b) v přístrojích nebo výrobcích, ve kterých jsou radioaktivní látky uzavřeny nebo v nich obsaženy jako součást přístroje nebo jiného výrobku, a splňují-li tyto přístroje nebo výrobky požadavky v 2.2.7.2.4.1.3 (c), jsou povoleny alternativní základní hodnoty radionuklidů k hodnotám v tabulce 2.2.7.2.2.1 pro mezní hodnotu aktivity pro vyjmutou zásilku, avšak vyžadují vícestranné schválení. Takové alternativní mezní hodnoty aktivity pro vyjmuté zásilky musí být vypočteny v souladu s principy (dokumentu) GSR část 3.

Tabulka 2.2.7.2.2.2: Základní hodnoty aktivity radionuklidů pro neznámé radionuklidy a směsi

Radioaktivní obsah	A_1	A_2	Mezní hodnoty koncentrace aktivity pro vyjmuté látky	Meze aktivity pro vyjmuté zásilky
	[TBq]	[TBq]	[Bq/g]	[Bq]
Je známa pouze přítomnost radionuklidů emitujících záření beta nebo gama	0,1	0,02	1×10^1	1×10^4
Je známa přítomnost nuklidů emitujících záření alfa, ale není známa přítomnost neutronových zářičů	0,2	9×10^{-5}	1×10^{-1}	1×10^3
Je známa přítomnost neutronových zářičů nebo nejsou dostupné žádné údaje	0,001	9×10^{-5}	1×10^{-1}	1×10^3

2.2.7.2.2.3 Při stanovení hodnot A_1 a A_2 pro radionuklid neobsažený v tabulce 2.2.7.2.2.1 se jednoduše radioaktivní rozpadová řada, v níž jsou radionuklidy obsaženy v poměru, ve kterém se vyskytují v přírodě, a v níž žádný dceřiný radionuklid nemá poločas rozpadu delší než 10 dní, nebo delší než poločas rozpadu mateřského radionuklidu, považuje za jednotlivý radionuklid; v tomto případě je třeba vzít v úvahu aktivitu a použít hodnoty A_1 nebo A_2 odpovídající mateřskému nuklidu v řadě. U radioaktivní rozpadové řady, v níž má kterýkoli dceřiný nuklid poločas rozpadu buď delší než 10 dnů, nebo delší než mateřský radionuklid, je nutno považovat mateřský radionuklid a takové dceřiné nuklidy za směsi různých nuklidů.

2.2.7.2.2.4 Pro směsi radionuklidů, kde základní hodnoty jednotlivých radionuklidů jsou uvedeny v tabulce 2.2.7.2.2.1, platí vztah:

$$X_m = \frac{1}{\sum_i \frac{f(i)}{X(i)}}$$

kde:

- $f_{(i)}$ je podíl aktivity nebo specifické aktivity příslušného radionuklidu i ve směsi;
- $X_{(i)}$ je příslušná hodnota A_1 nebo A_2 nebo mez specifické aktivity pro vyjmutou látku nebo mez aktivity pro vyjmutou zásilku pro příslušný radionuklid i ; a
- X_m je odvozená hodnota z hodnot A_1 nebo A_2 nebo specifické aktivity pro vyjmutou látku nebo z meze aktivity pro vyjmutou zásilku v případě směsi.

2.2.7.2.2.5 Je-li známa identita každého radionuklidu, ale nejsou-li známy hodnoty aktivity některých radionuklidů, mohou být radionuklidy seskupeny do skupin a nejnižší hodnota aktivity v každé skupině může být použita při výpočtech podle vzorců uvedených v bodech 2.2.7.2.2.4 a 2.2.7.2.4.4. Skupiny mohou být

- vytvořeny na základě celkové alfa aktivity a celkové beta/gama aktivity, pokud jsou známy; k výpočtu se používá nejnižších hodnot jak pro zářiče alfa, tak pro zářiče beta/gama.
- 2.2.7.2.2.6 Pro jednotlivé radionuklidy nebo směsi radionuklidů, pro které nejsou k dispozici příslušné údaje, se použijí hodnoty uvedené v tabulce 2.2.7.2.2.2.
- 2.2.7.2.3 *Stanovení dalších materiálových charakteristik*
- 2.2.7.2.3.1 Látky s nízkou specifickou aktivitou (LSA)
- 2.2.7.2.3.1.1 *(Vyhrazeno)*
- 2.2.7.2.3.1.2 Látky LSA se rozdělují do tří skupin:
- (a) LSA-I
- (i) uranové a thoriové rudy, koncentráty těchto rud a další rudy obsahující přírodně se vyskytující radionuklidy;
- (ii) přírodní uran, ochuzený uran, přírodní thorium nebo jejich sloučeniny nebo směsi, které nebyly ozářeny a jsou tuhé nebo kapalné;
- (iii) radioaktivní látka, pro kterou je hodnota A_2 neomezena. Může obsahovat štěpnou látku pouze za předpokladu, že je vyjmuta podle 2.2.7.2.3.5;
- (iv) další radioaktivní látky, ve kterých je aktivita zcela rozptýlena a stanovená průměrná specifická aktivita nepřekračuje třicetinasobek hodnoty stanovené podle 2.2.7.2.2.1 až 2.2.7.2.2.6, Může obsahovat štěpnou látku pouze za předpokladu, že je vyjmuta podle 2.2.7.2.3.5.
- (b) LSA-II
- (i) voda s tritiem o koncentraci do 0,8 TBq/l;
- (ii) další látky, ve kterých je aktivita zcela rozptýlena a stanovená průměrná specifická aktivita nepřevyšuje 10^{-4} A₂/g pro tuhé látky a plyny a 10^{-5} A₂/g pro kapaliny;
- (c) LSA-III
- Tuhé látky (t.j. zpevněné odpady, aktivované materiály) s výjimkou prášků, v nichž současně:
- (i) radioaktivní látka je zcela rozptýlena v tuhé látce nebo v tuhých předmětech nebo je v podstatě rovnoměrně rozptýlena v kompaktní pojivě látce (jako je beton, bitumen a keramika);
- (ii) stanovená průměrná hmotnostní aktivita tuhé látky bez stínícího materiálu nepřekračuje 2×10^{-3} A₂/g.
- 2.2.7.2.3.1.3 *(Vypuštěno)*
- 2.2.7.2.3.1.4 Látky LSA-III se zkoušejí následovně:
- Vzorek tuhé látky představující úplný obsah kusu (ne méně) musí být na sedm dní ponořený do vody (ke stanovení vyluhovatelnosti) při pokojové teplotě. Objem vody použité ke zkoušce musí být takový, aby na konci sedmidenního zkušebního období zaručoval, že volný objem neabsorbované a nezreagované vody bude přinejmenším dosahovat 10 % objemu samotného vzorku tuhé látky. Voda musí mít počáteční pH 6 - 8 a maximální měrnou vodivost 1mS/m při 20 °C. Celková aktivita volného objemu vody musí být měřena po skončení sedmidenní zkoušky.
- 2.2.7.2.3.1.5 Důkaz o dodržení požadovaných kritérií podle 2.2.7.2.3.1.4 musí být v souladu s 6.4.12.1 a 6.4.12.2 ADR.

2.2.7.2.3.2 Povrchově kontaminovaný předmět (SCO)

SCO se zařazují do jedné ze tří skupin:

- (a) SCO-I, tuhý předmět, na kterém:
- (i) nefixovaná kontaminace na přístupném povrchu o ploše průměrně 300 cm² (nebo na celé ploše, je-li menší než 300 cm²) nepřekračuje 4 Bq/cm² u beta a gama zářičů a alfa zářičů s nízkou toxicitou, nebo 0,4 Bq/cm² u všech ostatních alfa zářičů; a
 - (ii) fixovaná kontaminace na přístupném povrchu o ploše průměrně 300 cm² (nebo na celé ploše, je-li menší než 300 cm²) nepřekračuje 4×10⁴ Bq/cm² u beta a gama zářičů a alfa zářičů s nízkou toxicitou, nebo 4×10³ Bq/cm² u všech ostatních alfa zářičů; a
 - (iii) součet nefixované a fixované kontaminace na nepřístupném povrchu větším než 300 cm² (nebo na celé ploše, je-li menší než 300 cm²) nepřekračuje 4×10⁴ Bq/cm² u beta a gama zářičů a alfa zářičů s nízkou toxicitou, nebo 4×10³ Bq/cm² u všech ostatních alfa zářičů;
- (b) SCO-II, tuhý předmět, na jehož povrchu překračuje fixovaná nebo nefixovaná kontaminace meze uvedené pro SCO-I v (a), a na kterém:
- (i) nefixovaná kontaminace na přístupném povrchu o ploše větší než 300 cm² (nebo na celé ploše, je-li menší než 300 cm²) nepřekračuje 400 Bq/cm² u beta a gama zářičů a alfa zářičů s nízkou toxicitou, nebo 40 Bq/cm² u všech ostatních alfa zářičů; a
 - (ii) fixovaná kontaminace na přístupném povrchu na ploše větší než 300 cm² (nebo na celé ploše, je-li menší než 300 cm²) nepřekračuje 8×10⁵ Bq/cm² u beta a gama zářičů a alfa zářičů s nízkou toxicitou nebo 8×10⁴ Bq/cm² u všech ostatních alfa zářičů; a
 - (iii) součet nefixované a fixované kontaminace na nepřístupném povrchu o ploše větší než 300 cm² (nebo na celé ploše, je-li menší než 300 cm²) nepřekračuje 8×10⁵ Bq/cm² u beta a gama zářičů a alfa zářičů s nízkou toxicitou nebo 8×10⁴ Bq/cm² u všech ostatních alfa zářičů.
- (c) SCO-III: velký tuhý předmět, který vzhledem ke své velikosti nemůže být přepravován v typu obalu uvedeném v ADN, a pro který platí:
- (i) všechny uzávěry jsou utěsněny, aby se zabránilo úniku radioaktivních látek za podmínek definovaných v 4.1.9.2.4 (e) ADR;
 - (ii) vnitřek objektu je, pokud možno, suchý;
 - (iii) nefixovaná kontaminace na vnějším povrchu nepřekračuje limity uvedené v 4.1.9.1.2 ADR; a
 - (iv) součet nefixované a fixované kontaminace na nepřístupném povrchu v průměru přes 300 cm² nepřekračuje 8 × 10⁵ Bq/cm² pro beta a gama zářiče a alfa zářiče s nízkou toxicitou, nebo 8 × 10⁴ Bq/cm² pro všechny ostatní alfa zářiče.

2.2.7.2.3.3 Radioaktivní látky zvláštní formy

2.2.7.2.3.3.1 Radioaktivní látka zvláštní formy musí mít alespoň jeden rozměr nejméně 5 mm. Pokud uzavřené pouzdro obsahuje část radioaktivní látky zvláštní formy, pouzdro musí být vyrobeno tak, aby je bylo možno otevřít pouze destrukcí. Vzor radioaktivní látky zvláštní formy vyžaduje jednostranné schválení.

2.2.7.2.3.3.2 Radioaktivní látka zvláštní formy musí být takové povahy, nebo musí být vyrobena tak, aby po provedených zkouškách podle 2.2.7.2.3.3.4 až 2.2.7.2.3.3.8 splňovala následující požadavky:

- (a) nepraskne nebo se nerozdrtí v průběhu zkoušek na náraz, tlak a ohyb podle 2.2.7.2.3.3.5 (a), (b), (c) a 2.2.7.2.3.3.6 (a);
- (b) neroztaví se nebo se neroztptílí při tepelných zkouškách specifikovaných v 2.2.7.2.3.3.5 (d) nebo 2.2.7.2.3.3.6 (b); a
- (c) aktivita vody při stanovení vyluhovatelnosti podle 2.2.7.2.3.3.7. a 2.2.7.2.3.3.8 nepřekročí 2 kBq; nebo u uzavřených zářičů rychlost objemového úniku při zkoušce hodnotící objemový únik, specifikovaný v publikaci Mezinárodní organizace pro standardizaci: „Radiační ochrana - uzavřené radioaktivní zářiče - metody zkoušek netěsnosti, jak je specifikováno v ISO 9978:1992“, nepřekročí příslušnou mez stanovenou příslušným orgánem.

- 2.2.7.2.3.3.3 Důkaz o dodržení požadovaných kritérií podle 2.2.7.2.3.3.2 musí být v souladu s 6.4.12.1 a 6.4.12.2. ADR.
- 2.2.7.2.3.3.4 Vzorky, které obsahují nebo simulují radioaktivní látku zvláštní formy, musí být podrobeny pádové zkoušce, zkoušce nárazem, ohýbací zkoušce a tepelné zkoušce podle 2.2.7.2.3.3.5 nebo alternativně zkoušce podle 2.2.7.2.3.3.6. Pro každou z těchto zkoušek může být použit jiný vzorek. Po každé zkoušce musí být provedeno stanovení vyluhovatelnosti nebo test rychlosti objemového úniku daného vzorku pomocí metody, která nesmí být méně citlivá než metody specifikované v 2.2.7.2.3.3.7 pro nerozptýlitelnou tuhou látku nebo podle bodu 2.2.7.2.3.3.8 pro zapouzdřenou látku.

- 2.2.7.2.3.3.5 Závazné zkušební metody jsou:
- (a) Pádová zkouška: Vzorek musí padnout na podložku (terč) z výšky 9 m. Podložka musí odpovídat definici v 6.4.14 ADR;
 - (b) Zkouška průrazem: vzorek musí být umístěn na plátu olova, podepřeném hladkou tuhou plochou a musí do něj narazit plochou přední stranou tyč z měkké oceli tak, aby způsobila náraz odpovídající důsledku nárazu hmoty 1,4 kg padající volným pádem z výšky 1 m. Spodní část tyče musí mít průměr 25 mm s hranami zaoblenými na poloměr $(3,0 \pm 0,3)$ mm. Olovo o tvrdosti 3,5 - 4,5 podle Vickersovy stupnice a o tloušťce nejvýše 25 mm musí překrývat plochu větší, než činí plocha vzorku. Pro každý náraz musí být použit nový olověný povrch. Tyč musí na vzorek narazit v místě předpokládaného největšího poškození;
 - (c) Zkouška ohybem se musí provádět pouze pro dlouhé a tenké zdroje, které mají minimální délku 10 cm a současně poměr délky k minimální šířce činí nejméně 10. Vzorek musí být pevně uchycen tak, aby jedna jeho polovina vyčnívala přes okraj uchycení. Orientace vzorku musí být taková, aby došlo k jeho maximálnímu poškození, když na jeho volný konec narazí přední plocha ocelové tyče. Ocelová tyč musí na vzorek narazit tak, aby způsobila náraz odpovídající důsledku nárazu hmoty 1,4 kg padající volným pádem z výšky 1 m. Spodní část tyče musí mít průměr 25 mm s hranami zaoblenými na poloměr $(3,0 \pm 0,3)$ mm;
 - (d) Tepelná zkouška: Vzorek musí být ohříván na vzduchu na teplotu 800 °C, na této teplotě musí být udržován 10 minut a poté se musí nechat vychladnout.
- 2.2.7.2.3.3.6 Vzorky, které obsahují nebo simulují radioaktivní látku uzavřenu v hermetickém pouzdru, nemusí být prověřovány:
- (a) zkouškami předepsanými v 2.2.7.2.3.3.5 (a) a (b) za předpokladu, že tyto vzorky jsou alternativně vystaveny zkoušce nárazem předepsané v normě ISO 2919:2012: "Radiation Protection - Sealed Radioactive Sources - General requirements and classification (Radiační ochrana – Uzavřené radioaktivní zářiče – Všeobecné požadavky a klasifikace), a to:
 - (i) zkoušce nárazem 4. třídy, pokud hmotnost radioaktivní látky zvláštní formy je rovna nebo menší než 200 g;
 - (ii) zkoušce nárazem 5. třídy, pokud hmotnost radioaktivní látky zvláštní formy je rovna nebo větší než 200 g, avšak menší než 500 g;
 - (b) zkouškou, předepsanou v 2.2.7.2.3.3.5 (d), za předpokladu, že alternativně jsou vystaveny teplotní zkoušce 6. třídy, předepsané v publikaci Mezinárodní organizace pro standardizaci: ISO 2919:2012 „Radiační ochrana – Uzavřené radioaktivní zářiče – Všeobecné požadavky a klasifikace“.
- 2.2.7.2.3.3.7 Pro vzorky obsahující nebo simulující nerozptýlitelnou tuhou látku, musí být stanovení vyluhovatelnosti prováděno následovně:
- (a) vzorek musí být na sedm dní ponořen do vody (ke stanovení vyluhovatelnosti) při pokojové teplotě. Objem vody použité ke zkoušce musí být takový, aby na konci sedmidenního zkušebního období zaručoval, že volný objem neabsorbované a nezreagované vody bude při nejmenším dosahovat 10% objemu samotného vzorku tuhé látky. Voda musí mít počáteční pH 6 - 8 a maximální vodivost 1 mS/m při 20 °C;
 - (b) voda a vzorek se musí poté ohřát na teplotu 50 ± 5 °C a tato teplota musí být udržována po dobu 4 hodin;
 - (c) potom musí být stanovena aktivita vody;
 - (d) nato musí být vzorek ponechán v klidném ovzduší po dobu sedmi dnů při minimální teplotě 30 °C a minimální relativní vlhkosti 90 %;
 - (e) následně musí být vzorek ponořen do vody o stejné specifikaci jako v bodě (a) výše a tato voda a vzorek se musí poté ohřát na teplotu 50 ± 5 °C a, tato teplota musí být udržována po dobu 4 hodin;
 - (f) nakonec musí být stanovena aktivita vody.
- 2.2.7.2.3.3.8 Pro vzorky obsahující nebo simulující radioaktivní látku uzavřenu v hermetickém pouzdru, musí být provedeno buď stanovení vyluhovatelnosti, nebo rychlosti objemového úniku, a to následujícím způsobem:
- (a) Vyluhovací zkouška musí sestávat z následujících kroků:

- (i) vzorek musí být ponořený do vody při pokojové teplotě. Voda musí mít počáteční pH 6 - 8 a maximální vodivost 1 mS/m při 20 °C;
 - (ii) voda se vzorkem se musí poté ohřát na teplotu 50 ± 5 °C a tato teplota musí být udržována po dobu 4 hodin;
 - (iii) potom musí být stanovena aktivita vody;
 - (iv) nato musí být vzorek ponechán v klidném ovzduší po dobu sedmi dnů při minimální teplotě 30 °C a minimální relativní vlhkosti 90 %;
 - (v) postup podle bodů (i), (ii) a (iii) musí být opakován.
- (b) Alternativní stanovení rychlosti objemového úniku musí zahrnovat kteroukoliv ze zkoušek, předepsaných v publikaci Mezinárodní organizace pro standardizaci: „Radiační ochrana - uzavřené radioaktivní zářiče - metody zkoušek netěsnosti, ISO 9987:1992, pokud jsou přijatelné pro příslušný orgán.

2.2.7.2.3.4 Radioaktivní látky s nízkou rozptýlitelností

2.2.7.2.3.4.1 Konstrukce radioaktivní látky s malou rozptýlitelností podléhá vícestrannému schválení. Radioaktivní látka s malou rozptýlitelností musí být takové povahy, aby celkové množství této radioaktivní látky v kusu, s přihlédnutím k ustanovením v 6.4.8.14 ADR, splnilo následující požadavky:

- (a) hodnota příkonu dávkového ekvivalentu ve vzdálenosti 3 m od nestíněné radioaktivní látky nesmí překročit hodnotu 10 mSv/h;
- (b) po provedení testů specifikovaných v 6.4.20.3 a 6.20.4 ADR, nesmí aktivita uvolněných aerosolů ve formě plynné nebo tuhých částic překročit, až do aerodynamického ekvivalentu průměru 100 μm, hodnotu 100 A₂. Pro každou zkoušku může být použit zvláštní vzorek; a
- (c) po provedení zkoušky podle 2.2.7.2.3.1.4, aktivita ve vodě nesmí nepřekročit 100 A₂. Při tomto testu musí být vzato v úvahu poškození v důsledku zkoušek uvedených v bodu (b).

2.2.7.2.3.4.2 Radioaktivní látka s malou rozptýlitelností musí být zkoušena následovně:

Vzorek obsahující nebo simulující radioaktivní látku s malou rozptýlitelností musí být podroben rozšířené tepelné zkoušce specifikované v 6.4.20.3 ADR a nárazové zkoušce specifikované v 6.4.20.4 ADR. Pro každou ze zkoušek může být použit jiný vzorek. Po každé zkoušce musí být vzorek podroben vyluhovací zkoušce specifikované v 2.2.7.2.3.1.4. Po každé zkoušce musí být stanoveno, zda jsou naplněny aplikovatelné požadavky uvedené v 2.2.7.2.3.4.1.

2.2.7.2.3.4.3 Důkaz o dodržení požadovaných kritérií podle 2.2.7.2.3.4.1 a 2.2.7.2.3.4.2 musí být v souladu s 6.4.12.1 a 6.4.12.2 ADR.

2.2.7.2.3.5 Štěpná látka

Štěpné látky a kusy obsahující štěpné látky musí být klasifikovány jako „ŠTĚPNÁ“ přiřazením pod příslušnou položku tabulky 2.2.7.2.1.1, ledaže by byly vyjmuty podle jednoho z ustanovení pododstavců (a) až (f) níže a přepravovány podle požadavků uvedených v 7.1.4.14.7.4.3. Všechna tato ustanovení se vztahují pouze na látky v kusech, které splňují požadavky v 6.4.7.2 ADR, pokud není nebalený materiál v ustanovení výslovně povolen.

- (a) uran obohacený maximálně na 1 hmot. % uranu-235 a s celkovým obsahem plutonia a uranu-233 nepřevyšujícím 1 hmot. % uranu-235 za předpokladu, že štěpné nuklidy jsou rozloženy zcela homogenně v celém objemu. Navíc, je-li uran-235 ve formě kovu, oxidu nebo karbidu, nesmí být uspořádán ve tvaru mříže;
- (b) kapalně roztoky dusičnanu uranylu s uranem obohaceným maximálně na 2 hmot. % uranu-235, přičemž celkový obsah plutonia a uranu-233 nesmí přesáhnout 0,002 % hmotnosti uranu a minimální poměr počtu atomů dusíku ku počtu atomů uranu (N/U) musí být 2;
- (c) Uran obohacený maximálně na 5 % hmot. izotopem 235U za předpokladu, že:
 - (i) hmotnost izotopu 235U není větší než 3,5 g na kus,
 - (ii) celkový obsah plutonia a izotopu 233U nepřekračuje 1 % hmotnosti izotopu 235U na kus,
 - (iii) pro přepravu kusu platí mez pro zásilku daná v 7.1.4.14.7.4.3 (c);

- (d) štěpné nuklidy s celkovou hmotností nepřevyšující 2 g na kus za předpokladu, že pro přepravu kusu platí meze pro zásilku daná v 7.1.4.14.7.4.3 (d);
- (e) štěpné nuklidy s celkovou hmotností nepřevyšující 45 g, buď v obalu, nebo nebalené, za předpokladu, že pro přepravu platí požadavky v 7.1.4.14.7.4.3 (e);
- (f) štěpné látky, které splňují požadavky uvedené v 7.1.4.14.7.4.3 (b), 2.2.7.2.3.6 a 5.1.5.2.1.

2.2.7.2.3.6 Štěpné látky vyjmuté z klasifikace jako „ŠTĚPNÁ“ na základě 2.2.7.2.3.5 (f) musí být v podkritickém stavu bez potřeby kontroly nahromadění za následujících podmínek:

- (a) ustanovení 6.4.11.1 (a) ADR;
- (b) shodných s podmínkami pro hodnocení kusů uvedenými v 6.4.11.12 (b) a 6.4.11.13 (b) ADR.

2.2.7.2.4 Klasifikace kusů nebo nebalené látky

Množství radioaktivní látky v kusu nesmí překročit příslušné meze, jak je uvedeno v následujícím.

2.2.7.2.4.1 Klasifikace jako vyjmutý kus

2.2.7.2.4.1.1 Kus může být klasifikován jako vyjmutý kus, splňuje-li jednu z následujících podmínek:

- (a) je prázdným obalem, který obsahoval radioaktivní látku;
- (b) obsahuje přístroje nebo výrobky nepřevyšující meze aktivity specifikované ve sloupcích (2) a (3) tabulky 2.2.7.2.4.1.2;
- (c) obsahuje výrobky vyrobené z přírodního uranu, ochuzeného uranu nebo přírodního thoria;
- (d) obsahuje radioaktivní látky nepřevyšující meze aktivity specifikované ve sloupci (4) tabulky 2.2.7.2.4.1.2; nebo
- (e) obsahuje méně než 0,1 kg hexafluoridu uranu nepřevyšující meze aktivity specifikované ve sloupci (4) tabulky 2.2.7.2.4.1.2.

2.2.7.2.4.1.2 Kus, který obsahuje radioaktivní látky, může být klasifikován jako vyjmutý kus, pokud příkon dávkového ekvivalentu na libovolném místě jeho vnějšího povrchu nepřevyšuje 5 $\mu\text{Sv/h}$.

Tabulka 2.2.7.2.4.1.2: Meze aktivity pro vyjmuté kusy

Fyzikální stav obsahu (skupenství)	Přístroj nebo výrobek		Látky – meze pro radioaktivní kusy ^a
	Meze pro předměty ^a	Meze pro radioaktivní kusy ^a	
Tuhé látky:			
zvláštní forma	$10^{-2}A_1$	A_1	$10^{-3}A_1$
jiné	$10^{-2}A_2$	A_2	$10^{-3}A_2$
Kapaliny	$10^{-3}A_2$	$10^{-1}A_2$	$10^{-4}A_2$
Plyny:			
Tritium	$2 \times 10^{-2}A_2$	$2 \times 10^{-1}A_2$	$2 \times 10^{-2}A_2$
zvláštní forma	$10^{-3}A_1$	$10^{-2}A_1$	$10^{-3}A_1$
jiné	$10^{-3}A_2$	$10^{-2}A_2$	$10^{-3}A_2$

^a Pro směsi radionuklidů, viz 2.2.7.2.2.4 až 2.2.7.2.2.6.

2.2.7.2.4.1.3 Radioaktivní látky, které jsou uzavřeny v přístroji nebo obsaženy ve výrobku, nebo tvoří součást těchto předmětů, mohou být klasifikovány jako UN 2911 LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS – PŘÍSTROJE nebo VÝROBKY, za předpokladu že:

- (a) příkon dávkového ekvivalentu ve vzdálenosti 10 cm od libovolného místa vnějšího povrchu nebaleného přístroje nebo výrobku není vyšší než 0,1 mSv/h;
- (b) každý přístroj nebo výrobek je opatřen na vnějším povrchu značkou „RADIOAKTIVNÍ“ („RADIOACTIVE“) s výjimkou:
 - (i) hodin nebo zařízení opatřených značením provedeným barvami světélkujícími na základě radioluminiscence;

- (ii) spotřebních výrobků majících povolení příslušného orgánu podle 1.7.1.4 (e) nebo jednotlivě nepřevyšují meze aktivity pro vyjmuté zásilky, specifikované v tabulce 2.2.7.2.2.1 (sloupec 5), za předpokladu, že takové výrobky jsou přepravovány v obalu, který je označen značkou „RADIOAKTIVNÍ“ na jeho vnitřním povrchu takovým způsobem, že toto upozornění na přítomnost radioaktivní látky je viditelné při otevření obalu;
 - (iii) ostatní přístroje nebo výrobky příliš malé, aby mohly být označeny značkou „RADIOAKTIVNÍ“ („Radioactive“), za předpokladu, že jsou přepravovány v obalu, který je označen značkou „RADIOAKTIVNÍ“ na jeho vnitřním povrchu takovým způsobem, že toto upozornění na přítomnost radioaktivní látky je viditelné při otevření obalu;
 - (c) radioaktivní látka je úplně uzavřena neaktivními součástmi (přítom zařízením, jehož jediným účelem je obsahovat radioaktivní látku nelze považovat za přístroj nebo výrobek ve výše uvedeném smyslu);
 - (d) platí limity specifikované ve sloupcích 2 a 3 tabulky 2.2.7.2.4.1.2 pro každou jednotlivou položku a každý kus;
 - (e) (Rezervováno);
 - (f) pokud kus obsahuje štěpné látky, platí jedno z ustanovení v 2.2.7.2.3.5 (a) až (f).
- 2.2.7.2.4.1.4 Radioaktivní látky v jiných formách, než jsou formy uvedené v 2.2.7.2.4.1.3, jejichž aktivita nepřekračuje meze stanovené ve sloupci 4 tabulky 2.2.7.2.4.1.2, může být klasifikována jako UN 2910 LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS - OMEZENÁ MNOŽSTVÍ, pokud:
- (a) Kus udrží svůj radioaktivní obsah za podmínek běžné přepravy;
 - (b) Kus je označen značkou „RADIOAKTIVNÍ“ („RADIOACTIVE“), buď:
 - (i) na vnitřním povrchu takovým způsobem, že upozornění na přítomnost radioaktivní látky je viditelné při otevření obalu, nebo
 - (ii) na vnějším povrchu kusu, je-li nepraktické takto označovat vnitřní povrch; a
 - (c) Pokud kus obsahuje štěpné látky, platí jedno z ustanovení v 2.2.7.2.3.5 (a) až (f).
- 2.2.7.2.4.1.5 Hexafluorid uranu nepřevyšující meze aktivity specifikované ve sloupci (4) tabulky 2.2.7.2.4.1.2 může být klasifikován jako UN 3507 RADIOAKTIVNÍ LÁTKA, HEXAFLUORID URANU, VYJMUTÝ KUS, obsahující méně než 0,1 kg látky na balení, jiná než štěpná nebo vyjmutá štěpná za předpokladu, že:
- (a) hmotnost hexafluoridu uranu v kusu je menší než 0,1 kg;
 - (b) jsou splněny podmínky 2.2.7.2.4.5.2 a 2.2.7.2.4.1.4 (a) a (b).
- 2.2.7.2.4.1.6 Výrobky vyrobené z přírodního uranu, ochuzeného uranu nebo přírodního thoria a výrobky, ve kterých jsou jedinými radioaktivními látkami neozářený přírodní uran, neozářený ochuzený uran nebo neozářené přírodní thorium, mohou být klasifikovány jako UN 2909 LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS - VÝROBKY Z PŘÍRODNÍHO URANU nebo OCHUZENÉHO URANU nebo PŘÍRODNÍHO THORIA za předpokladu, že vnější povrch uranu nebo thoria je uzavřen v neaktivním plášti z kovu nebo jiného tuhého materiálu.
- 2.2.7.2.4.1.7 Prázdný obal, který obsahoval radioaktivní látky, může být klasifikován jako UN 2908 LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS - PRÁZDNÝ OBAL, za předpokladu, že:
- (a) je v bezvadném stavu a je bezpečně uzavřen;
 - (b) vnější povrch každé jeho součásti z uranu nebo thoria je uzavřen neaktivním pláštěm z kovového nebo jiného tuhého materiálu;
 - (c) úroveň nefixované kontaminace na jeho vnitřním povrchu o ploše větší než 300 cm² nepřekračuje:
 - (i) 400 Bq/cm² pro beta a gama zářiče a nízkotoxické alfa zářiče; a
 - (ii) 40 Bq/cm² pro všechny ostatní alfa zářiče;
 - (d) veškeré bezpečnostní značky, které na něm mohly být umístěny v souladu s 5.2.2.1.11.1, jsou zakryty, znehodnoceny nebo odstraněny; a
 - (e) Pokud obal obsahoval štěpné látky, platí jedno z ustanovení v 2.2.7.2.3.5 (a) až (f) nebo jedno z ustanovení pro vynětí v 2.2.7.1.3.
- 2.2.7.2.4.2 Klasifikace jako látka s nízkou specifickou aktivitou (LSA)

Radioaktivní látka může být zaříděna jako látka LSA za předpokladu, že je splněna definice látky LSA v 2.2.7.1.3 a podmínky dle 2.2.7.2.3.1, 4.1.9.2 a 7.5.11 CV33 (2) ADR.

2.2.7.2.4.3 Klasifikace jako povrchově kontaminovaný předmět (SCO)

Radioaktivní látka může být zaříděna jako SCO za předpokladu, že je splněna definice SCO v 2.2.7.1.3 a podmínky dle 2.2.7.2.3.2, 4.1.9.2 a 7.5.11 CV33 (2) ADR.

2.2.7.2.4.4 Klasifikace jako kus typu A

Kusy obsahující radioaktivní látky mohou být zaříděny jako kus typu A za předpokladu dodržení následujících podmínek:

Kusy typu A nesmí obsahovat aktivity větší než jedna z následujících hodnot:

- (a) hodnotu A_1 ; pro radioaktivní látku zvláštní formy;
- (b) hodnotu A_2 ; pro všechny ostatní radioaktivní látky.

Pro směsi radionuklidů jejichž identita a příslušné aktivity jsou známy, platí následující podmínka pro radioaktivní látky kusu typu A:

$$\sum_i \frac{B(i)}{A_1(i)} + \sum_j \frac{C(j)}{A_2(j)} \leq 1$$

kde:

$B(i)$ je aktivita radionuklidu i jako radioaktivní látky zvláštní formy;

$A_1(i)$ je hodnota A_1 pro radionuklid i ;

$C(j)$ je aktivita radionuklidu j jako radioaktivní látky jiné než radioaktivní látka zvláštní formy;

$A_2(j)$ je hodnota A_2 pro radionuklid j .

2.2.7.2.4.5 Klasifikace hexafluoridu uranu

2.2.7.2.4.5.1 Kusy obsahující hexafluorid uranu nesmí obsahovat:

- (a) UN 2977, LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, ŠTĚPNÁ;
- (b) UN 2978, LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, jiná než štěpná nebo vyjmutá štěpná; nebo
- (c) UN 3507 LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU VYJMUTÝ KUS, obsahující méně než 0,1 kg látky na balení, jiná než štěpná nebo vyjmutá štěpná.

2.2.7.2.4.5.2 Obsah kusu obsahujícího hexafluorid uranu musí splňovat následující požadavky:

- (a) pro UN 2977 a UN 2978 nesmí být hmotnost hexafluoridu uranu odlišná od hmotnosti povolené typovým schválením kusu a pro UN 3507 musí být hmotnost hexafluoridu uranu menší než 0,1 kg;
- (b) hmotnost hexafluoridu uranu nesmí být větší než taková hodnota, která by umožňovala menší než 5 % volný objem při maximální teplotě kusu, jak je specifikována pro systémy toho zařízení, kde se bude kus používat; a
- (c) hexafluorid uranu musí být v pevném skupenství a vnitřní tlak nesmí být vyšší než tlak atmosférický při předání k přepravě.

2.2.7.2.4.6 Zařídění jako kusy typu B(U), typu B(M) nebo typu C

2.2.7.2.4.6.1 Kusy, které nejsou zaříděny podle 2.2.7.2.4 (2.2.7.2.4.1 až 2.2.7.2.4.5) musí být zaříděny v souladu s rozhodnutím o typovém schválení kusu vydaným příslušným orgánem v zemi původu nebo konstrukce vzoru.

2.2.7.2.4.6.2 Obsah kusů typu B(U), typu B(M) nebo typu C musí být takový, jak je specifikováno v rozhodnutí o typovém schválení kusu.

2.2.7.2.5

Zvláštní ujednání

Radioaktivní látka musí být zaříděna jako přepravovaná podle zvláštního ujednání, když je určena k přepravě v souladu s 1.7.4.

2.2.8 Třída 8 Žíravé látky**2.2.8.1 Definice, základní ustanovení a kritéria**

2.2.8.1.1 Žíravé látky jsou látky, které svým chemickým účinkem způsobí nevratné poškození kůže nebo v případě úniku mohou způsobit škody na jiných věcech nebo na dopravních prostředcích nebo je mohou zničit. Pod název této třídy spadají také látky, které teprve s vodou tvoří žíravé kapaliny, nebo které za přítomnosti přirozené vlhkosti vzduchu vytvářejí žíravé páry nebo mlhy.

2.2.8.1.2 Pro látky a směsi, které jsou žíravé pro kůži, jsou základní ustanovení klasifikace uvedena v pododdílu 2.2.8.1.4. Poleptání kůže vede k tvorbě nevratných poškození kůže, jmenovitě viditelná nekróza pokožky a škáry po expozici látky nebo směsi.

2.2.8.1.3 U kapalin a u tuhých látek, které mohou zkapalnět během přepravy, u nichž se předpokládá, že nejsou žíravé pro kůži, je třeba ještě zohlednit jejich schopnost způsobit korozi některých kovových povrchů v souladu s kritérii v 2.2.8.1.5.3 (c) (ii).

2.2.8.1.4 Základní ustanovení klasifikace

2.2.8.1.4.1 Látky a předměty třídy 8 jsou rozděleny následovně:

C1-C11 Žíravé látky bez vedlejšího nebezpečí a předměty obsahující takové látky:

C1 - C4	Kyselé látky
	C1 anorganické, kapalné
	C2 anorganické, tuhé
	C3 organické, kapalné
	C4 organické, tuhé
C5 - C8	Alkalické (zásadité) látky
	C5 anorganické, kapalné
	C6 anorganické, tuhé
	C7 organické, kapalné
	C8 organické, tuhé
C9-C10	Jiné žíravé látky
	C9 kapalné
	C10 tuhé
C11	Předměty
CF	Žíravé látky, hořlavé
	CF1 kapalné
	CF2 tuhé
CS	Žíravé látky, schopné samoohřevu
	CS1 kapalné
	CS2 tuhé
CW	Žíravé látky, které ve styku s vodou vyvíjejí hořlavé plyny
	CW1 kapalné
	CW2 tuhé
CO	Žíravé látky, podporující hoření
	CO1 kapalné
	CO2 tuhé
CT	Žíravé látky, toxické a předměty obsahující takové látky
	CT1 kapalné
	CT2 tuhé

CT3 předměty

CFT Žíravé látky, kapalné, hořlavé, toxické

COT Žíravé látky, podporující hoření, toxické.

2.2.8.1.4.2 Látky a směsi třídy 8 jsou na základě svého stupně nebezpečí, které představují při přepravě, přiřazeny k následujícím obalovým skupinám:

- (a) Obalová skupina I: velmi nebezpečné látky a směsi;
- (b) Obalová skupina II: látky a směsi představující střední nebezpečí;
- (c) Obalová skupina III: látky a směsi představující nízké nebezpečí.

2.2.8.1.4.3 Přiřazení látek uvedených v tabulce A kapitoly 3.2 k obalovým skupinám ve třídě 8 je založeno na získaných zkušenostech se zohledněním dalších faktorů, jako nebezpečí při vdechnutí (viz 2.2.8.1.4.5) a schopnost reagovat s vodou (včetně vytvoření nebezpečných produktů rozkladu).

2.2.8.1.4.4 Nové látky a směsi mohou být přiřazeny k obalovým skupinám na základě doby působení, která je nezbytná pro vyvolání nevratného poškození neporaněné kožní tkáně v souladu s kritérii uvedenými v 2.2.8.1.5. Pro směsi mohou být obdobně použita kritéria v 2.2.8.1.6.

2.2.8.1.4.5 Látka nebo směs, která splňuje kritéria třídy 8 a odpovídá toxicitou při vdechnutí prachu a mlhy (LC50) obalové skupině I, ale toxicitu při požití nebo absorpci kůží odpovídá jen obalové skupině III nebo nižší, musí být přiřazeny ke třídě 8 (viz 2.2.61.1.7.2).

2.2.8.1.5 Přiřazení látek a směsí k obalovým skupinám

2.2.8.1.5.1 První úroveň hodnocení představují data získaná z testování u lidí a zvířat, včetně informací z jednorázové nebo opakované expozice, neboť poskytují informace, které jsou přímo relevantní pro hodnocení účinků na kůži.

2.2.8.1.5.2 Při přiřazování látek k obalovým skupinám v souladu s pododdílem 2.2.8.1.4.4 se musí zohlednit zkušenosti získané při jejich náhodném působení. Jestliže takové zkušenosti chybí, je třeba klasifikaci provést na základě výsledků pokusů podle směrnice pro zkoušení OECD^{6, 7, 8, 9}. Látka nebo směs, která podle směrnice pro zkoušení OECD^{6, 7, 8, 9} není určena jako látka žíravá, smí být považována pro účely ADR bez dalšího zkoušení za látku, která není žíravá vůči pokožce. Pokud výsledky *in vitro* testu naznačují, že látka nebo směs je žíravá a není zařazena do obalové skupiny I, ale zkušební metoda neumožňuje rozlišení mezi obalovými skupinami II a III, považuje se za obalovou skupinu II.

2.2.8.1.5.3 Žíravé látky jsou přiřazeny k obalovým skupinám v souladu s následujícími kritérii (viz tabulka 2.2.8.1.5.3):

- (a) K obalové skupině I jsou přiřazeny látky, které během pozorovací doby 60 minut začínají působit po době působení 3 minut nebo kratší nevratné poškození neporaněné kožní tkáně;
- (b) K obalové skupině II jsou přiřazeny látky, které během pozorovací doby 14 dní začínají působit po době působení delší než 3 minuty, avšak nejvýše 60 minut, nevratné poškození neporaněné kožní tkáně;
- (c) K obalové skupině III jsou přiřazeny látky:
 - (i) které během pozorovací doby 14 dní začínají působit po době působení delší než 60 minut, nejvýše však 4 hodiny, nevratné poškození neporaněné kožní tkáně; nebo
 - (ii) u kterých se předpokládá, že nezpůsobí nevratné poškození neporaněné kožní tkáně, u kterých však rychlost koroze buď na ocelových, nebo hliníkových povrchích při zkušební teplotě 55 °C překračuje hodnotu 6,25 mm za rok, zkouší-li se na obou materiálech. Pro zkoušky je nutno použít ocel typu S235JR+CR (1.0037 resp. St 37-2), S275J2G3+CR(1.0144 resp. St 44-3), ISO 3574, Unifikovaný číslovací systém (UNS)

⁶ OECD Guideline for the testing of chemicals No. 404 „Acute Dermal Irritation/Corrosion“ 2015.

⁷ OECD Guideline for the testing of chemicals No. 435 „In Vitro Membrane Barrier Test Method for Skin Corrosion“ 2015.

⁸ OECD Guideline for the testing of chemicals No. 431 „In vitro skin corrosion: reconstructed human epidermis (RHE) test method“ 2016.

⁹ OECD Guideline for the testing of chemicals No. 430 „In Vitro Skin Corrosion: Transcutaneous Electrical Resistance Test Method (TER)“ 2015.

G10200 nebo SAE 1020 a pro zkoušky hliníku nepotažené typy 7075-T6 nebo AZ5GU-T6. Uznávaná zkouška je předepsána v Příručce zkoušek a kritérií, části III, oddílu 37.

POZNÁMKA: Pokud první zkouška buď na oceli, nebo hliníku ukáže, že je zkoušená látka korozivní, nevyžaduje se již následná zkouška na druhém kovu.

Tabulka 2.2.8.1.5.3 Tabulka sumarizující kritéria uvedená v 2.2.1.5.3

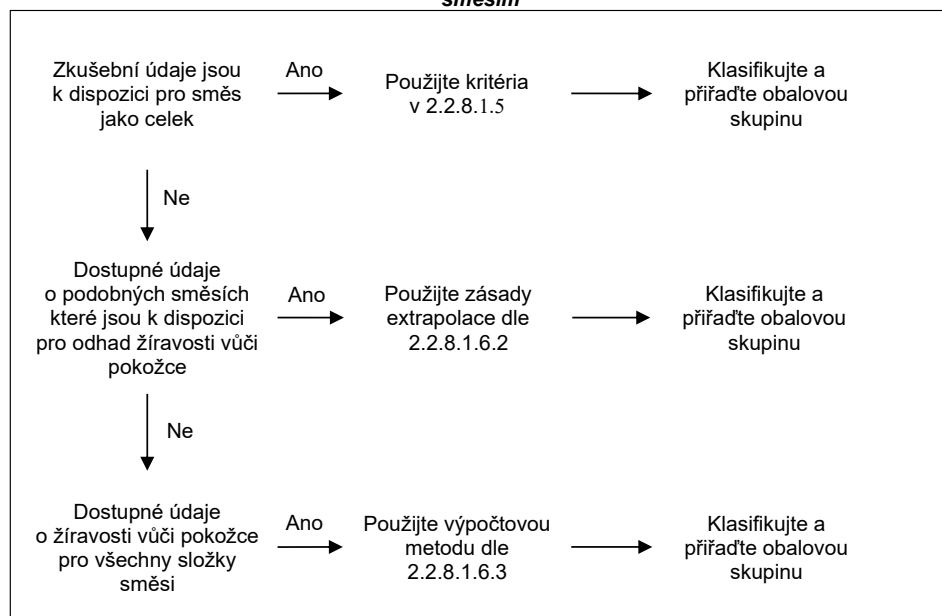

Obalová skupina	Doba působení	Pozorovací doba	Účinek
I	≤ 3 min	≤ 60 min	Nevratné poškození neporaněné kožní tkáně
II	> 3 min ≤ 1 h	≤ 14 d	Nevratné poškození neporaněné kožní tkáně
III	> 1 h ≤ 4 h	≤ 14 d	Nevratné poškození neporaněné kožní tkáně
III	-	-	Rychlost koroze buď na ocelových, nebo hliníkových površích překračuje 6,25 mm za rok při zkušební teplotě 55 °C, zkoušili se na obou materiálech

2.2.8.1.6 Alternativní metody přiřazování obalových skupin pro směsi: postupový přístup

2.2.8.1.6.1 Všeobecná ustanovení

U směsi je nezbytné získat nebo odvodit informace, které umožní využití kritérií pro klasifikaci a přiřazení obalových skupin. Přístup ke klasifikaci a přiřazení obalových skupin je odstupňován a je závislý na množství dostupných informací pro směs samotnou, pro podobné směsi a/nebo pro její složky. Postupový diagram na Obrázku 2.2.8.1.6.1 níže popisuje proces, který má být dodržen:

Obrázek 2.2.8.1.6.1: Postupový diagram klasifikace a přiřazení obalové skupiny žíravým směsím

2.2.8.1.6.2 Zásady extrapolace

Pokud směs nebyla podrobena zkoušce ke zjištění jejího potenciálu žíravosti pro kůži, ale existují dostatečné údaje o jednotlivých složkách a podobných zkoušených směsích tak, aby bylo možné směs klasifikovat a přiřadit k obalové skupině, budou tato data použita v souladu s následujícími zásadami extrapolace. Tím je zajištěno, že se v procesu klasifikace využívají k charakterizaci nebezpečí směsi dostupné údaje v největší možné míře.

- (a) Ředění: Pokud je testovaná směs zředěna ředidlem, které nesplňuje kritéria pro třídu 8 a neovlivňuje obalovou skupinu ostatních složek, smí být nová zředěná směs přiřazena ke stejné obalové skupině jako původní zkoušená směs.
- POZNÁMKA:** V určitých případech může zředění směsi nebo látky vést ke zvýšení žíravých vlastností. Pokud tomu tak je, tuto metodu extrapolace nelze použít.
- (b) Dávkování: Potenciál žíravosti pro kůži zkoušené výrobní šarže směsi smí být považován za rovnocenný jiné směsi – nezkoušené výrobní šarže téhož obchodního produktu, je-li vyráběn stejným výrobcem nebo pod kontrolou téhož výrobce, pokud není důvod se domnívat, že došlo k významné změně tak, že se potenciál žíravosti pro kůži nezkoušené výrobní šarže změnil. Pokud k tomu dojde, je nutná nová klasifikace.
- (c) Koncentrace směsí obalových skupin I: Je-li zkoušená směs splňující kritéria pro zařazení do obalové skupiny I koncentrovaná, pak více koncentrovaná nezkoušená směs smí být zařazena do obalové skupiny I bez dalších zkoušek.
- (d) Interpolace v rámci jedné obalové skupiny: Pro tři směsi (A, B a C) s identickými složkami, jestliže směsi A a B byly vyzkoušeny a jsou ve stejné obalové skupině, a jestliže nezkoušená směs C má tytéž složky třídy 8 jako směsi A a B, ale má koncentrace složek třídy 8 mezi koncentracemi ve směsích A a B, pak se předpokládá, že směs C je ve stejné obalové skupině jako směsi A a B.
- (e) Podobnost směsí: Jsou-li dány následující předpoklady:
- (i) dvě směsi: (A + B) a (C + B);
 - (ii) Koncentrace složky B je stejná v obou směsích;
 - (iii) Koncentrace složky A ve směsi (A + B) se rovná koncentraci složky C ve směsi (C + B);
 - (iv) Údaje o žíravosti složek A a C pro kůži jsou dostupné a jsou v podstatě ekvivalentní, to znamená, že jsou ve stejné obalové skupině a neovlivňují potenciál žíravosti pro kůži.

Pokud je směs (A + B) nebo (C + B) již klasifikována na základě údajů ze zkoušek, pak smí být další směs zařazena do stejné obalové skupiny.

2.2.8.1.6.3 Výpočtová metoda založená na klasifikaci látek

2.2.8.1.6.3.1 Pokud směs nebyla zkoušena za účelem stanovení jejího potenciálu žíravosti pro kůži a zároveň nejsou k dispozici ani dostatečné údaje o podobných směsích, považuje se za nutné klasifikovat žíravé vlastnosti látek ve směsi a přiřadit směs k obalové skupině.

Použití výpočtové metody je povoleno pouze tehdy, pokud neexistují žádné synergické efekty, které činí směs více žíravou než součet jejích látek. Toto omezení platí pouze tehdy, bude-li směs zařazena do obalové skupiny II nebo III.

2.2.8.1.6.3.2 Při použití výpočtové metody musí být vzaty v úvahu všechny složky třídy 8, které jsou přítomny v koncentraci $\geq 1\%$, nebo $<1\%$, jsou-li tyto složky stále relevantní pro klasifikaci směsi jako žíravé pro kůži.

2.2.8.1.6.3.3 Pro stanovení, zda směs obsahující žíravé látky musí být považována za žíravou směs a musí být přiřazena k obalové skupině, se použije výpočtová metoda uvedená v diagramu na Obrázku 2.2.8.1.6.3. Pro tuto metodu výpočtu se použijí obecné koncentrační limity, pokud se v prvním kroku pro posouzení látek v obalové skupině I použije 1 % látek a v dalších krocích 5 %.

2.2.8.1.6.3.4 Je-li v tabulce A kapitoly 3.2 nebo ve zvláštním ustanovení určité látky přiřazen specifický koncentrační limit (SCL), použije se tento limit namísto obecných koncentračních limitů (GCL).

2.2.8.1.6.3.5 Pro tento účel musí být sumární vzorec pro každý krok výpočtu přizpůsoben. To znamená, že tam, kde je to vhodné, se obecný koncentrační limit nahradí specifickým koncentračním limitem pro látku/y (SCL_i), a upravený vzorec je váženým průměrem různých přiřazených koncentračních limitů různých látek ve směsi:

$$\frac{PGx_1}{GCL} + \frac{PGx_2}{SCL_2} + \dots + \frac{PGx_i}{SCL_i} \geq 1$$

Kde:

$PG x_i$ = je koncentrace látky 1, 2, ... i ve směsi přiřazené k obalové skupině x (I, II nebo III)

GCL = obecný koncentrační limit

SCL_i = specifický koncentrační limit přiřazený látce i

Kritérium pro obalovou skupinu je splněno, když je výsledek výpočtu ≥ 1 . Obecné koncentrační limity, které se použijí pro hodnocení v každém kroku výpočtové metody, jsou uvedeny v Obrázku 2.2.8.1.6.3.

Příklady použití výše uvedeného vzorce naleznete v poznámce níže.

POZNÁMKA: Příklady použití výše uvedeného vzorce

Příklad 1: Směs obsahuje jednu žíravou látku v koncentraci 5% přiřazenou k obalové skupině I bez specifického koncentračního limitu:

Výpočet pro obalovou skupinu I: $5/(5 (GCL))=1 \rightarrow$ Zařadit do třídy 8, obalová skupina I.

Příklad 2: Směs obsahuje tři látky žíravé pro kůži; dvě z nich (A a B) mají specifické koncentrační limity; pro třetí (C) platí obecný koncentrační limit. Zbytek směsi není třeba brát v úvahu:

Látka X ve směsi a její obalová skupina v rámci třídy 8	Koncentrace (konc.) ve směsi v %	Specifický koncentrační limit (SCL) pro OS I	Specifický koncentrační limit (SCL) pro OS II	Specifický koncentrační limit (SCL) pro OS III
A, přiřazená k obalové skupině I	3	30%	žádný	žádný
B přiřazená k obalové skupině I	2	20%	10%	žádný
C, přiřazená k obalové skupině III	10	žádný	žádný	žádný

Výpočet pro obalovou skupinu I: $\frac{3 (konc A)}{30 (SCL PG I)} + \frac{2 (konc B)}{20 (SCL PG I)} = 0,2 < 1$

Kritérium pro obalovou skupinu I není splněno.

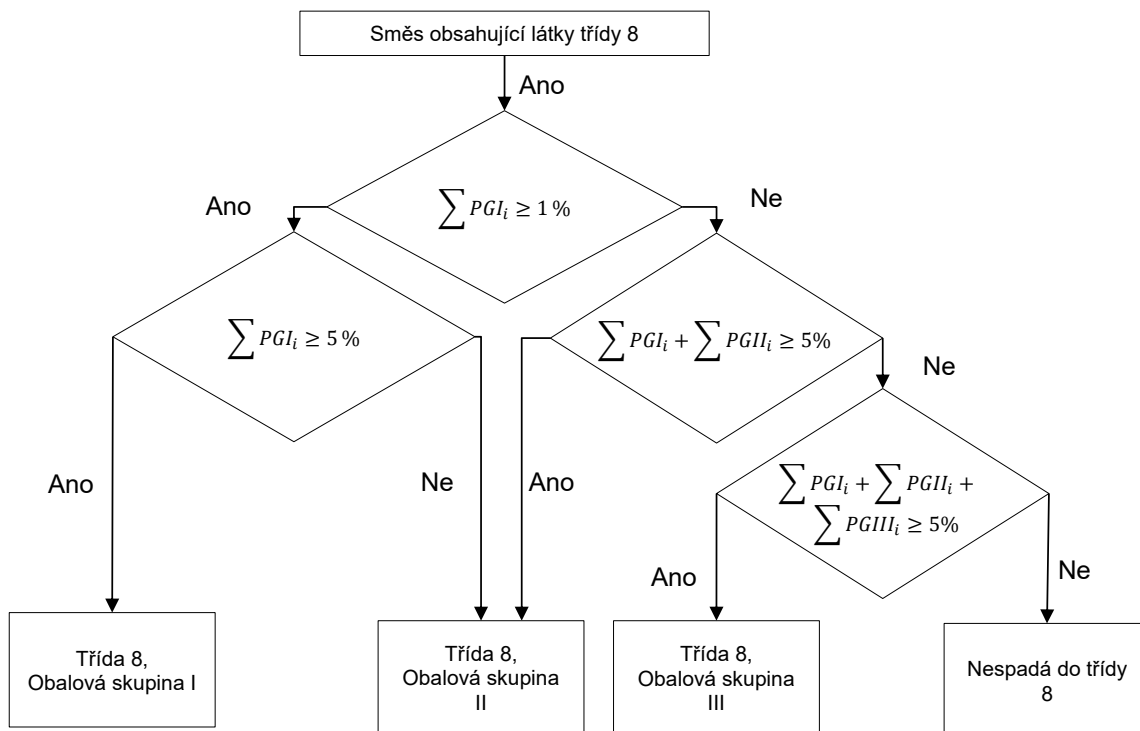

Výpočet pro obalovou skupinu II: $\frac{3 (konc A)}{5 (SCL PG II)} + \frac{2 (konc B)}{10 (SCL PG II)} = 0,8 < 1$

Kritérium pro obalovou skupinu I není splněno.

Výpočet pro obalovou skupinu III: $\frac{3 (konc A)}{5 (GCL PG III)} + \frac{2 (konc B)}{10 (GCL PG III)} + \frac{10 (konc C)}{5 (GCL PG III)} = 3 \geq 1$

Kritérium pro obalovou skupinu III je splněno, směs musí být zařazena do třídy 8, obalová skupina III.

Schéma 2.2.8.1.6.3: Výpočtová metoda

2.2.8.1.7 Jestliže látky třídy 8 vlivem příměsí spadají do jiných kategorií nebezpečnosti než do těch, do kterých patří látky jmenovitě uvedené v tabulce A kapitoly 3.2, přiřadí se tyto směsi nebo roztoky k položkám, ke kterým na základě svého skutečného nebezpečí patří.

POZNÁMKA: K zařazování roztoků a směsí (jako jsou přípravky a odpady), viz také oddíl 2.1.3.

2.2.8.1.8 Na základě kritérií uvedených v pododdílu 2.2.8.1.6 se může také zjistit, zda je jmenovitě uvedený roztok nebo jmenovitě uvedená směs, popřípadě roztok nebo směs obsahující jmenovitě uvedenou látku takové povahy, že tento roztok nebo tato směs nepodléhá ustanovením této třídy.

2.2.8.1.9 (Vypuštěno)

POZNÁMKA: UN 1910 OXID VÁPENATÝ a UN 2812 HLINITAN SODNÝ, které jsou uvedeny ve Vzorových předpisech OSN, nepodléhají předpisům ADR.

2.2.8.2 Látky nepřipustěné k přepravě

2.2.8.2.1 Chemicky nestálé látky třídy 8 jsou připuštěny k přepravě jen tehdy, byla-li učiněna potřebná opatření k zabránění možnosti nebezpečného rozkladu nebo polymerizace za normálních podmínek přepravy. K opatřením potřebným pro zabránění polymerizaci viz zvláštní ustanovení 386 kapitoly 3.3. Za tímto účelem je zvláště třeba dbát na to, aby nádoby a cisterny neobsahovaly žádné látky, které by tyto reakce mohly podporovat.

2.2.8.2.2 K přepravě nejsou připuštěny následující látky:

- UN 1798 KYSELINA DUSIČNÁ A CHLOROVODÍKOVÁ (solná), SMĚS;
- chemicky nestálé směsi odpadní kyseliny sírové;

- chemicky nestálé směsi nitrační kyseliny nebo směsi odpadní kyseliny sírové a dusičné, nedenitrované;
- kyselina chloristá, vodné roztoky s více než 72 % hm. čisté kyseliny nebo směsi kyseliny chloristé s jinými kapalnými látkami než s vodou.

2.2.8.3 Seznam hromadných položek

Žiravé látky bez vedlejšího nebezpečí
a předměty obsahující takové látky

Látky kyselé C1-C4	anorganické	kapalné C1	2584 KYSELINY ALKYLSULFONOVÉ, KAPALNÉ, obsahující více než 5 % volné kyseliny sírové nebo 2584 KYSELINY ARYLSULFONOVÉ, KAPALNÉ, obsahující více než 5 % volné kyseliny sírové 2693 HYDROGENSIŘIČITANY, VODNÝ ROZTOK, J.N. 2837 HYDROGENSULFÁTY, VODNÝ 3264 LÁTKA ŽÍRAVÁ, KAPALNÁ, KYSELÁ, ANORGANICKÁ, J.N.

^a Směsi tuhých látek, které nepodléhají předpisům ADR, s žíravými kapalnými látkami mohou být přepravovány pod UN číslem 3244, bez toho, aby předtím byla použita přiřazovací kritéria pro třídu 8, za předpokladu, že v době nakládky látky nebo uzavírání obalu, nebo nákladní dopravní jednotky není viditelná žádná volná kapalina. Každý obal musí odpovídat konstrukčnímu typu obalu, který obstál s úspěchem při zkoušce těsnosti pro obalovou skupinu II.

^b Chlorsilany, které s vodou nebo vlhkým vzduchem vyvíjejí hořlavé plyny, jsou látkami třídy 4.3.

^c Chlorformiáty s převažujícími toxickými vlastnostmi jsou látkami třídy 6.1.

^d Žíravé látky, které jsou podle odstavců 2.2.61.1.4 až 2.2.61.1.9 při vdechnutí velmi toxické, jsou látkami třídy 6.1.

^e UN 2505 FLUORID AMONNÝ, 1812 FLUORID DRASELNÝ, TUHÝ, UN 1690 FLUORID SODNÝ, TUHÝ, UN 2674 HEXAFUOROKŘEMIČITAN SODNÝ, UN 2856 HEXAFUOROKŘEMIČITANY, J. N., UN 3415 FLUORID SODNÝ, ROZTOK a UN 3422 FLUORID DRASELNÝ, ROZTOK jsou látkami třídy 6.1.

2.2.9 Třída 9 Jiné nebezpečné látky a předměty**2.2.9.1 Kritéria**

2.2.9.1.1 Název třídy 9 zahrnuje látky a předměty, které během přepravy představují jiné nebezpečí, než jsou nebezpečí ostatních tříd.

2.2.9.1.2 Látky a předměty třídy 9 jsou rozděleny následovně

- M1 Látky, které při vdechnutí jemného prachu mohou ohrozit zdraví
- M2 Látky a předměty, které mohou v případě požáru vytvářet dioxiny
- M3 Látky uvolňující hořlavé páry
- M4 Lithiové baterie
- M5 Záchranné prostředky
- M6-M8 Látky ohrožující životní prostředí
 - M6 Látky znečišťující vodu, kapalné
 - M7 Látky znečišťující vodu, tuhé
 - M8 Geneticky změněné mikroorganismy a organismy

M9-M10 Zahřáté látky

- M9 kapalné
- M10 tuhé
- M11 Jiné látky a předměty, které během přepravy představují nebezpečí a neodpovídají definici žádné jiné třídy.
- M12 Jiné látky a předměty představující nebezpečí během přepravy tankovými plavidly, které nesplňují definice jiné třídy

Definice a klasifikace

2.2.9.1.3 Látky a předměty zařazené do třídy 9 jsou uvedeny v tabulce A kapitoly 3.2. Přiřazení látek a předmětů, které nejsou jmenovitě uvedeny v tabulce A kapitoly 3.2, k odpovídající položce této tabulky nebo pododdílu 2.2.9.3 musí být provedeno v souladu s ustanoveními odstavců 2.2.9.1.4 až 2.2.9.1.8, 2.2.9.1.10, 2.2.9.1.11, 2.2.9.1.13 a 2.2.9.1.14.

Látky, které při vdechnutí jemného prachu mohou ohrozit zdraví

2.2.9.1.4 Látky, které při vdechnutí jemného prachu mohou ohrozit zdraví, zahrnují azbest a směsi obsahující azbest.

Látky a předměty, které mohou v případě požáru vytvářet dioxiny

2.2.9.1.5 Látky a předměty, které v případě požáru mohou vytvářet dioxiny, zahrnují polychlorované bifenylly (PCB) a terfenylly (PCT) a polyhalogenované bifenylly a terfenylly a směsi obsahující tyto látky, jakož i předměty, jako transformátory, kondensátory a jiné předměty, které tyto látky nebo směsi obsahují.

POZNÁMKA: Směsi s obsahem PCB nebo PCT nejvýše 50 mg/kg nepodléhají předpisům ADN.

Látky uvolňující hořlavé páry

2.2.9.1.6 Látky uvolňující hořlavé páry zahrnují polymery, které obsahují hořlavé kapaliny s bodem vzplanutí do 55 °C.

Lithiové baterie

2.2.9.1.7

Lithiové baterie musí splňovat následující požadavky, pokud není v ADN stanoveno jinak (např. pro prototypy a malé výrobní série baterií platí zvláštní ustanovení 310 nebo pro poškozené baterie zvláštní ustanovení 376).

Články a baterie, články a baterie obsažené v zařízení nebo články a baterie balené se zařízením, obsahující lithium v jakékoli formě, musí být přiřazeny k UN číslům 3090, 3091, 3480 nebo 3481, jak je to náležité. Smějí být přepravovány pod těmito položkami, jestliže splňují následující ustanovení:

POZNÁMKA: Pro UN 3536 BATERIE LITHIOVÉ ZABUDOVANÉ V NÁKLADNÍ DOPRAVNÍ (PŘEPRAVNÍ) JEDNOTCE, viz zvláštní ustanovení 389 v kapitole 3.3.

(a) Každý článek nebo baterie je typu, u něhož bylo prokázáno, že splňuje požadavky každé zkoušky uvedené v Příručce zkoušek a kritérií, části III, pododdílu 38.3;

POZNÁMKA: Baterie musí být typu, u něhož bylo prokázáno, že splňuje zkušební požadavky Příručky zkoušek a kritérií, části III, pododdílu 38.3, bez ohledu na to, zda jsou články, z nichž jsou baterie složeny, zkoušeného typu.

(b) Každý článek a baterie je opatřen(a) ochranným zařízením proti vnitřnímu přetlaku, nebo zkonstruován(a) tak, aby se zabránilo jejich prudkému roztržení za normálních podmínek přepravy;

(c) Každý článek a baterie je vybaven(a) účinným systémem k zabránění vnějším zkratům;

(d) Každá baterie s více články nebo sériemi článků s paralelním zapojením je vybavena účinným zařízením, které zabraňuje nebezpečným zpětným proudům (např. diody, pojistky atd.);

(e) Články a baterie musí být vyráběny pod programem řízení kvality, který zahrnuje:

- (i) Popis organizační struktury a odpovědností personálu s ohledem na konstrukci a kvalitu výrobku;
- (ii) Příslušné instrukce pro inspekce a zkoušky, kontrolu kvality, zajištění kvality a výrobní postup, které budou používány;
- (iii) Kontroly výroby, které by měly zahrnovat příslušné činnosti k zamezení a zjištění závad, pokud jde o vnitřní zkrat, během výroby článků;
- (iv) Záznamy o kvalitě, jako jsou inspekční zprávy, údaje ze zkoušek, kalibrační údaje a osvědčení. Údaje ze zkoušek musí být uchovávány a být na požádání poskytnuty příslušnému orgánu;
- (v) Audit k zajištění účinného fungování programu řízení kvality;
- (vi) Postup pro kontrolu dokladů a jejich revize;
- (vii) Způsoby kontroly článků nebo baterií, které neodpovídají typu vyzkoušenému podle ustanovení uvedených pod písmenem (a) výše;
- (viii) Školící programy a kvalifikační postupy pro příslušný personál; a
- (ix) Postupy garantující, že finální výrobek není poškozen.

POZNÁMKA: Mohou být akceptovány vlastní programy řízení kvality. Osvědčení od třetí strany se nevyžaduje, ale postupy uvedené pod (i) až (ix) výše musí být řádně zaznamenány a sledovatelné. Kopie programu řízení kvality musí být na požádání poskytnuta příslušnému orgánu.

(f) Lithiové baterie, obsahující jak primární lithiové kovové články, tak i dobíjecí lithium-iontové články, které nejsou konstruovány k externímu nabíjení (viz zvláštní ustanovení 387 kapitoly 3.3) musí splňovat následující podmínky:

- (i) dobíjecí lithium-iontové články mohou být nabíjeny jen z primárních lithiových kovových článků;
- (ii) přebití dobíjecích lithium-iontových článků je vyloučeno konstrukcí;
- (iii) baterie byla odzkoušena jako lithiová primární baterie;
- (iv) články jako součásti baterie musí být typu, který vyhověl příslušným zkušebním požadavkům Příručky zkoušek a kritérií, části III, pododdílu 38.3;

- (g) Výrobci a následně distributoři článků nebo baterií vyrobených po 30. červnu 2003 musí mít k dispozici zkušební protokol, jak je stanoveno v Příručce zkoušek a kritérií, části III, pododdílu 38.3, odstavci 38.3.5.

Lithiové baterie nepodléhají ustanovením ADN, jestliže splňují požadavky zvláštního ustanovení 188 kapitoly 3.3.

Záchranné prostředky

- 2.2.9.1.8 Záchranné prostředky zahrnují záchranné prostředky a díly motorových vozidel, které odpovídají definicím uvedeným ve zvláštních ustanoveních 235 nebo 296 kapitoly 3.3.

Látky ohrožující životní prostředí

- 2.2.9.1.9 (Vypuštěno)

Látky znečišťující vodu

- 2.2.9.1.10 *Látky ohrožující životní prostředí (znečišťující vodu)*

- 2.2.9.1.10.1 Pro přepravu v kusech nebo ve volně loženém stavu se látky, roztoky a směsi splňující kritéria pro Akutní 1, Chronická 1 nebo Chronická 2 v kapitole 2.4 (viz též 2.1.3.8) považují za ohrožující životní prostředí (vodní prostředí). Látky, které nemohou být přiřazeny k jiným třídám v ADN nebo k jiným položkám ve třídě 9 a které splňují tato kritéria, se přiřadí k UN 3077 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, TUHÁ, J.N. nebo UN 3082 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, KAPALNÁ, J.N. a k obalové skupině III.

- 2.2.9.1.10.2 Pro přepravu v tankových plavidlech se látky, roztoky a směsi zmíněné v 2.2.9.1.10.1 a látky, roztoky a směsi splňující kritéria pro Akutní 2, Akutní 3 nebo Chronická 3 v kapitole 2.4 považují za ohrožující životní prostředí.

Látky klasifikované jako ohrožující životní prostředí, které splňují kritéria pro kategorii Akutní 1 nebo Chronická 1 se přiřadí ke skupině „N1“.

Látky klasifikované jako ohrožující životní prostředí, které splňují kritéria pro kategorii Chronická 2 nebo 3 se přiřadí ke skupině „N2“.

Látky klasifikované jako ohrožující životní prostředí, které splňují kritéria pro kategorii Akutní 2 nebo 3 se přiřadí ke skupině „N3“.

Látky, které splňují kritéria uvedená v 2.2.9.1.10, se přiřadí k UN 3082 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, KAPALNÁ, J.N. nebo UN 3077 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, TUHÁ, J.N., ROZTAVENÁ. Látky, které splňují dodatečná kritéria v tomto odstavci, se přiřadí k identifikačním číslům 9005 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, TUHÁ, J.N., ROZTAVENÁ nebo 9006 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, KAPALNÁ, J.N.

- 2.2.9.1.10.3 Látky nebo směsi klasifikované jako látky ohrožující životní prostředí (vodní prostředí) na základě nařízení 1272/2008/ES³.

Bez ohledu na ustanovení v 2.2.9.1.10.1, nejsou-li k dispozici údaje pro klasifikaci podle kritérií v 2.4.3 a 2.4.4, látka nebo směs:

- (a) musí být klasifikována jako látka ohrožující životní prostředí (vodní prostředí), jestliže musí být přiřazena ke kategorii (kategoriím) Vodní akutní 1, Vodní chronická 1 nebo Vodní chronická 2 podle nařízení 1272/2008/ES³;
- (b) smí být považována za látku, která neohrožuje životní prostředí (vodní prostředí) pro přepravu v kusech nebo ve volně loženém stavu ve smyslu odstavce 2.2.9.10.1, jestliže nemusí být přiřazena k takové rizikové větě nebo kategorii podle uvedených směrnic nebo nařízení.

- 2.2.9.1.10.4 (Vyhrazeno)

- 2.2.9.1.10.5 Pro přepravu v tankových plavidlech jsou látky, roztoky a směsi považovány za plovoucí látky, roztoky a směsi (floaters), jestliže nemusí být přiřazena k takové kategorii podle uvedeného nařízení¹⁰.

Rozpustnost ve vodě	< 0,1 %
Tenze par	< 0,3 kPa
Relativní hustota	≤ 1,000.

Pro přepravu v tankových plavidlech jsou látky, roztoky a směsi považovány za látky, roztoky a směsi, které klesají pod hladinu (sinkers), jestliže splňují následující kritéria:

Rozpustnost ve vodě	< 0,1 %
Relativní hustota	≤ 1,000.

Geneticky změněné mikroorganismy nebo organismy

- 2.2.9.1.11 Geneticky změněné mikroorganismy (GMMO) a geneticky změněné organismy (GMO) jsou mikroorganismy a organismy, v nichž byl genetický materiál záměrně změněn genetickým inženýrstvím takovým způsobem, ke kterému v přírodě nedochází. Jsou přiřazeny ke třídě 9 (UN číslu 3245), pokud neodpovídají definici toxických látek nebo infekčních látek, ale jsou schopné měnit zvířata, rostliny nebo mikrobiologické látky způsobem, který není normálně výsledkem přirozené reprodukce.

POZNÁMKA 1: GMMO, které jsou infekční, jsou látkami třídy 6.2 (UN čísel 2814, 2900 a 3373).

POZNÁMKA 2: GMMO nebo GMO nepodléhají ustanovením ADN, jestliže byly schváleny pro používání¹¹ příslušnými orgány země původu, tranzitu a určení.

POZNÁMKA 3: Geneticky modifikovaná živá zvířata, která podle současného stavu vědeckých znalostí nemají žádné známé patogenní účinky na člověka, zvířata ani rostliny a jsou přepravována v klecích, které jsou vhodné pro bezpečné zamezení jak úniku zvířat, tak i nedovoleného přístupu k nim, nepodléhají ustanovením ADN. Ustanovení specifikovaná Mezinárodním sdružením leteckých dopravců (IATA) pro leteckou dopravu v „Předpisech pro živá zvířata, LAR“ mohou sloužit jako doporučení pro vhodné klece k přepravě živých zvířat.

POZNÁMKA 4: Živá zvířata nesmějí být používána k přepravě geneticky změněných mikroorganismů zařazených do třídy 9, ledaže by látka nemohla být přepravena jiným způsobem. Geneticky změněná živá zvířata musí být přepravována za podmínek stanovených příslušnými orgány země původu a určení.

- 2.2.9.1.12 (Vypuštěno)

Zahřáté látky

- 2.2.9.1.13 Zahřáté látky zahrnují látky, které jsou přepravovány nebo podávány k přepravě v kapalném stavu při teplotě 100 °C nebo vyšší a, pro látky, které mají bod vzplanutí, při teplotě pod jejich bodem vzplanutí. Zahrnují také tuhé látky, které jsou přepravovány nebo podávány k přepravě při teplotě 240 °C nebo vyšší.

POZNÁMKA 1: Zahřáté látky smějí být přiřazeny ke třídě 9 jen tehdy, jestliže nesplňují kritéria některé jiné třídy.

POZNÁMKA 2: Látky s bodem vzplanutí nad 60 °C, které jsou přepravovány nebo podávány k přepravě při teplotě v rozmezí do 15 K pod bodem vzplanutí, jsou látkami třídy 3, identifikačního čísla 9001.

Jiné látky, které během přepravy představují nebezpečí a neodpovídají definici žádné jiné třídy

¹⁰ Hodnoty relativní hustoty, tenze par a rozpustnosti ve vodě, které se mají použít podle modelu GESAMP, jsou hodnoty při 20 °C.

¹¹ Viz část C směrnice 2001/18/ES Evropského parlamentu a Rady o záměrném uvolňování geneticky modifikovaných organismů do životního prostředí a o zrušení směrnice Rady 90/220/EHS (Úřední věstník Evropských společenství č. L106 ze 17. dubna 2001, str. 8-14) a nařízení (ES) č. 1829/2003 Evropského parlamentu a Rady o geneticky modifikovaných potravinách a krmivech (Úřední věstník Evropské unie č. L268 z 18. října 2003, str. 1-23), které stanoví schvalovací postupy pro Evropskou unii.

2.2.9.1.14 Jiné látky a předměty, které během přepravy představují nebezpečí, ale neodpovídají definicím jiné třídy:

tuhé sloučeniny amoniaku (čpavku) s bodem vzplanutí pod 60 °C
méně nebezpečné dithioničitany
velmi lehce prchavé kapalné látky
látky vyvíjející škodlivé páry
látky obsahující alergeny
chemické testovací soupravy a soupravy první pomoci.
elektrické dvouvrstvé kondenzátory (s kapacitou akumulace energie větší než 0,3 Wh)
vozidla, motory a stroje, vnitřní spalování
předměty obsahující různé nebezpečné věci.

Následující různé látky, které neodpovídají definici jiné třídy, jsou přiřazeny ke třídě 9, pokud jsou přepravovány ve volně loženém stavu nebo v tankových lodích:

- UN 2071 HNOJIVA OBSAHUJÍCÍ DUSIČNAN AMONNÝ:
POZNÁMKA: *Pevná hnojiva na bázi dusičnanu amonného se klasifikují v souladu s postupy stanovenými v příručce zkoušek a kritérií, část III, oddíl 39.*
- UN 2216 MOUČKA RYBÍ, STABILIZOVANÁ (vlhkost mezi 5 % hm. a 12 % hmot. s nejvýše 15 % hm. tuhu); nebo
- UN 2216 ODPAD RYBÍ, STABILIZOVANÝ (vlhkost mezi 5 % hm. a 12 % hm. s nejvýše 15 % hm. tuhu);
- Identifikační číslo 9003 LÁTKY S BODEM VZPLANUTÍ NAD 60 °C, ALE NEPŘESAHUJÍCÍM 100 °C, které nemohou být přiřazeny k jiné třídě nebo jiné položce třídy 9. Jestliže mohou být tyto látky zařazeny k identifikačnímu číslu 9005 nebo identifikačnímu číslu 9006, pak má identifikační číslo 9003 přednost;
- Identifikační číslo 9004, 4,4' DIFENYLMETHAN DIISOKYANÁT;
- Identifikační číslo 9005 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, TUHÁ, J.N., ROZTAVENÁ, která nemůže být přiřazena k UN číslu 3077;
- Identifikační číslo 9006 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, KAPALNÁ, J.N., která nemůže být přiřazena k UN číslu 3082.

POZNÁMKA: *UN 1845 oxid uhličitý, tuhý (suchý led)¹², UN 2807 látky magnetizované, UN 3334 látka kapalná, která podléhá předpisům platným pro leteckou dopravu, j.n., UN 3335 Látka tuhá, která podléhá předpisům pro leteckou dopravu, j.n., uvedené ve Vzorových předpisech OSN, nepodléhají ustanovením ADN.*

Přiřazení k obalovým skupinám

2.2.9.1.15 Je-li to udáno ve sloupci (4) tabulky A kapitoly 3.2, jsou látky a předměty třídy 9 přiřazeny k jedné z následujících obalových skupin podle svého stupně nebezpečnosti:

Obalová skupina II: středně nebezpečné látky;
Obalová skupina III: málo nebezpečné látky.

2.2.9.2 Látky a předměty nepřípuštěné k přepravě

Následující látky a předměty nejsou k přepravě přípuštěny:

- Lithiové baterie, které neodpovídají příslušným podmínkám zvláštní ustanovení 188, 230, 310, 636 nebo 670 kapitoly 3.3;
- Nevyčištěné prázdné zadržovací vany pro přístroje, jako jsou transformátory, kondenzátory a hydraulické přístroje, které obsahují látky přiřazené k UN číslům 2315, 3151, 3152 nebo 3432.

¹² K UN 1845 oxid uhličitý, tuhý (suchý led), viz 5.5.3.

2.2.9.3 Seznam položek

Látky, které při vdechnutí

jemného prachu mohou ohrozit zdraví	M1	2212	AZBEST, AMFIBOL (amosit, tremolit, aktinolit, antofylit, krokydolit)

KAPITOLA 2.3

ZKUŠEBNÍ POSTUPY

2.3.0 Všeobecně

Pokud v kapitole 2.2 nebo v této kapitole není stanoveno jinak, je třeba pro klasifikaci nebezpečných věcí použít zkušební postupy uvedené v Příručce pro zkoušky a kritéria.

2.3.1 Zkouška na výpotek pro trhaviny typu A

2.3.1.1 Trhaviny typu A (UN číslo 0081) musí, pokud obsahují více než 40 % kapalného esteru kyseliny dusičné, navíc ke zkouškám uvedeným v Příručce zkoušek a kritérií, vyhovět ještě následující zkoušce na výpotek.

2.3.1.2 Přístroj pro zkoušku trhavin na výpotek (obrázky 1 až 3) se skládá z dutého bronzového válce. Tento válec, který je na jedné straně uzavřen deskou z téhož kovu, má vnitřní průměr 15,7 mm a hloubku 40 mm.

Ve stěně je po obvodu 20 otvorů o průměru 0,5 mm (4 řady po 5 otvorech). Bronzový píst tvaru válce o délce 48 mm, jehož celková délka činí 52 mm, vniká do svisle postaveného válce;

Tento píst, jehož průměr činí 15,6 mm, se zatíží závažím o hmotnosti 2220 g tak, že se vyvine tlak 120 kPa (1,2 bar) na dno válce.

2.3.1.3 Z 5 až 8 gramů trhaviny se vytvoří žmolek o délce 30 mm a průměru 15 mm, který se obalí velmi jemnou gázou a vloží se do válce; na něj se potom přiloží píst se závažím, aby byla trhavina vystavena tlaku 120 kPa (1,2 bar). Zaznamená se doba, která uplyne, než se ve vnějších otvorech ve válci objeví první olejové kapičky (nitroglycerin).

2.3.1.4 Trhavina se považuje za vyhovující, jestliže se při zkoušce provedené při teplotě 15 až 25 °C objeví první kapičky po časovém období delším než 5 minut.

Zkouška trhavin na výpotek

Obr. 1: Těleso závaží, tvaru zvonu; hmotnost 2220 g; pro zavěšení na bronzový píst

Obr. 2: Válcovitý bronzový píst, rozměry v mm

Obr. 3: Dutý bronzový válec, z jedné strany uzavřen, nárys a půdorys rozměry v mm

Obr. 1 až 3

- (1) 4 řady po 5 otvorech o průměru 0,5
- (2) Měď
- (3) Olověná deska se středovým kuželem na spodní straně
- (4) 4 otvory, cca 46 x 56, rozděleny rovnoměrně po obvodu

2.3.2 Zkoušky týkající se nitrovaných směsí celulózy třídy 1 a třídy 4.1

2.3.2.1 Za účelem stanovení kritérií pro nitrocelulózu se musí provést Bergmann-Junkův test nebo test pomocí methyl fialového papíru dle Příručky zkoušek a kritérií dodatku 10 (viz kapitola 3.3, zvláštní ustanovení 393 a 394). Pokud existují pochybnosti o tom, že teplota vznícení nitrocelulózy je výrazně vyšší než 132 °C v případě testu Bergmann-Junkova testu nebo vyšší než 134,5 °C v případě testu pomocí methyl fialového papíru, měla by se zkouška teploty vznícení, popsaná v 2.3.2.5, provést před provedením těchto zkoušek. Pokud je teplota vznícení směsí nitrocelulózy vyšší než 180 °C nebo teplota vznícení plastifikované nitrocelulózy vyšší než 170 °C, lze bezpečně provést Bergmann-Junkův test nebo test pomocí methyl fialového papíru.

2.3.2.2 Zkušební vzorky se musí před zkouškami podle pododdílu 2.3.2.5 sušit ve vakuovém exsikátoru, obsahujícím roztavený a zrnitý chlorid vápenatý, při okolní teplotě po dobu nejméně 15 hodin, přičemž musí být zkušební látka rozprostřena v tenké vrstvě; k tomuto účelu musí být látky, které nejsou práškovité ani vláknité, rozdrobeny, rozstrouhány nebo rozřezány na malé kousky. Tlak v exsikátoru se musí udržovat pod 6,5 kPa (0,065 bar).

2.3.2.3 Před sušením za podmínek uvedených v 2.3.2.2, plastifikovaná nitrocelulóza musí být předsušena v sušárně s dobrým provzdušněním při teplotě udržované na 70 °C tak dlouho, dokud úbytek hmotnosti za 15 minut není menší než 0,3 % původní hmotnosti.

2.3.2.4 Slabě nitrovaná nitrocelulóza podle pododdílu 2.3.2.1 je nejdříve podrobena předsušení podle podmínek uvedených v 2.3.2.3; sušení se dokončí ponecháním nitrocelulózy po dobu nejméně 15 hodin v exsikátoru obsahujícím koncentrovanou kyselinou sírovou.

2.3.2.5 Zápálná teplota (viz 2.3.2.1)

(a) Zápálná teplota se určí zahříváním 0,2 g látky uzavřené ve skleněné zkumavce, která je ponořena do lázně z Woodovy slitiny (kovové lázně). Zkumavka se ponoří do lázně, jakmile tato dosáhla teploty 100 °C. Teplota lázně se pak progresivně zvyšuje každou minutu o 5 °C.

(b) Zkumavky musí mít:

délku	125	mm
vnitřní průměr	15	mm
tloušťku stěny	0,5	mm

a musí být ponořeny do hloubky 20 mm;

(c) Zkouška se musí opakovat třikrát a pokaždé se musí zaznamenat teplota, při níž došlo k zapálení/vznícení látky, tj. k pomalému nebo rychlému shoření, deflagraci nebo výbuchu;

(d) Nejnižší teplota zaznamenaná při těchto třech zkouškách je zápalnou teplotou.

2.3.3 Zkoušky hořlavých kapalných látek tříd 3, 6.1 a 8

2.3.3.1 Stanovení bodu vzplanutí

2.3.3.1.1 Ke stanovení bodu vzplanutí hořlavých kapalin smějí být použity následující metody:

Mezinárodní normy:

ISO 1516 (Determination of flash/no flash – Closed cup equilibrium method)
(Zjišťování vzplanutí/nevzplanutí – Rovnovážná metoda s uzavřeným kelímkem)

ISO 1523 (Determination of flash point – Closed cup equilibrium method)
(Stanovení bodu vzplanutí – Rovnovážná metoda s uzavřeným kelímkem)

ISO 2719 (Determination of flash point – Pensky-Martens closed cup method)
(Stanovení bodu vzplanutí – Metoda Pensky-Martens s uzavřeným kelímkem)

ISO 13736 (Determination of flash point – Abel closed cup method)
(Stanovení bodu vzplanutí – Metoda Abel s uzavřeným kelímkem)

ISO 3679 (Determination of flash point – Rapid equilibrium closed cup method)
(Stanovení bodu vzplanutí – Rychlá rovnovážná metoda s uzavřeným kelímkem)

ISO 3680 (Determination of flash/no flash – Rapid equilibrium; closed cup method)
(Zjišťování vzplanutí/nevzplanutí – Rychlá rovnovážná metoda s uzavřeným kelímkem)

Vnitrostátní normy:

American Society for Testing Materials International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, Pennsylvania, USA 19428-2959:

ASTM D3828-07a, Standard Test Methods for Flash Point by Small Scale Closed-Cup Tester

ASTM D56-05, Standard Test Method for Flash Point by Tag Closed-Cup Tester

ASTM D3278-96(2004)e1, Standard Test Methods for Flash Point of Liquids by Small Scale Closed-Cup Apparatus

ASTM D93-08, Standard Test Methods for Flash Point by Pensky-Martens Closed-Cup Tester

Association française de normalisation, AFNOR, 11, rue de Pressensé, F-93571 La Plaine Saint-Denis Cedex:

Francouzská norma NF M 07-019

Francouzské normy NF M 07-011 / NF T 30-050 / NF T 66-009

Francouzská norma NF M 07-036

Deutsches Institut für Normung, Burggrafenstr. 6, D-10787 Berlin:

Norma DIN 51755 (body vzplanutí pod 65 °C)

State Committee of the Council of Ministers for Standardization, RUS-113813, GSP, Moscow, M-49 Leninsky Prospekt, 9:

GOST 12.1.044-84

2.3.3.1.2

Pro stanovení bodu vzplanutí nátěrových hmot, lepidel a podobných viskózních výrobků obsahujících rozpouštědla, smí být použito jen přístrojů a zkušebních metod, které jsou vhodné ke stanovení bodu vzplanutí viskózních kapalin podle těchto norem:

- (a) Mezinárodní norma ISO 3679:1983;
- (b) Mezinárodní norma ISO 3680:1983;
- (c) Mezinárodní norma ISO 1523:1983;
- (d) Mezinárodní normy EN ISO 13736 a EN ISO 2719, metoda B.

2.3.3.1.3

Normy uvedené v 2.3.3.1.1 se používají jen pro rozsahy bodu vzplanutí, které jsou v nich uvedené. Při výběru normy je třeba vzít v úvahu možnost chemických reakcí mezi látkou a zkušební nádobou. Přístroj je třeba, pokud to dovoluje bezpečnost, umístit na místě, které je chráněno před průvanem. Z bezpečnostních důvodů se používá pro organické peroxidy a samovolně se rozkládající látky (zvané

těž "energetické" látky) nebo pro toxické látky metoda, při níž se používá jen malý zkušební vzorek o objemu asi 2 ml.

2.3.3.1.4 Jestliže je bod vzplanutí stanovený nerovnovážnou metodou na $23\text{ °C} \pm 2\text{ °C}$ nebo $60\text{ °C} \pm 2\text{ °C}$, je třeba tento výsledek potvrdit pro každý teplotní rozsah jednou z rovnovážných metod.

2.3.3.1.5 Je-li zařazení hořlavé kapalně látky sporné, je směrodatné zařazení, které navrhl odesílatel, jestliže se výsledek kontrolní zkoušky pro stanovení bodu vzplanutí dotyčné kapaliny neliší o více než 2 °C od mezních hodnot (23 °C , popř. 60 °C) uvedených v pododdílu 2.2.3.1. Liší-li se výsledek kontrolní zkoušky o více než 2 °C , je nutno provést druhou kontrolní zkoušku a jako rozhodující platí nejnižší hodnota bodu vzplanutí zjištěná ve dvou kontrolních zkouškách.

2.3.3.2 Stanovení teploty počátku varu

Ke stanovení teploty počátku varu hořlavých kapalin smějí být použity:

Mezinárodní normy:

ISO 3924 (Petroleum products – Determination of boiling range distribution – Gas chromatography method)
(Ropné produkty – Stanovení rozložení destilačního rozmezí – Metoda plynové chromatografie)

ISO 4626 (Volatile organic liquids – Determination of boiling range of organic solvents used as raw materials)
(Těkavé organické kapaliny – Stanovení destilačního rozmezí organických rozpouštědel používaných jako suroviny)

ISO 3405 (Petroleum products – Determination of distillation characteristics at atmospheric pressure)
(Ropné produkty – Stanovení destilačních charakteristik při atmosférickém tlaku)

Vnitrostátní normy:

American Society for Testing Materials International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, Pennsylvania, USA 19428-2959:

ASTM D86-07a, Standard Test Method for Distillation of Petroleum Products at Atmospheric Pressure

ASTM D1078-05, Standard Test Method for Distillation Range of Volatile Organic Liquids

Další přípustné metody:

Metoda A.2 popsaná v části A přílohy k nařízení Komise (ES) č. 440/2008¹.

2.3.3.3 Zkouška pro stanovení obsahu peroxidu

Obsah peroxidu v kapalně látce se určuje následujícím postupem:

Množství p (asi 5 g s přesností vážení na 0,01 g) zkoušené kapaliny se nalije do Erlenmeyerovy baňky; přidá se 20 cm³ anhydridu kyseliny octové a asi 1 g tuhého jodidu draselného rozetřeného na prášek, obsah baňky se protřepe a po 10 minutách se ohřeje během 3 minut na cca 60 °C; poté se nechá chladnout po dobu 5 minut a přidá se 25 cm³ vody. Potom se nechá stát po dobu půl hodiny a poté se uvolněný jód titruje desetinným roztokem thiosíranu sodného bez přidání indikátoru. Úplné odbarvení značí konec reakce. Označíme-li potřebný počet cm³ roztoku sirnatanu písmenem n , vypočítá se procentní obsah peroxidu ve vzorku (počítán jako H₂O₂) podle vzorce:

$$\frac{17n}{100p}$$

¹ Nařízení Komise (ES) č. 440/2008 z 30. května 2008 stanoví zkušební metody v souladu s nařízením (ES) č. 1907/2006 Evropského parlamentu a Rady o registraci, hodnocení, povolování a omezování chemických látek (REACH) (Úřední věstník Evropské unie, č. L 142 ze dne 31.5.2008, str. 1-739 a č. L 143 ze dne 3.6.2008, str. 55).

2.3.4 Zkouška ke stanovení tekutosti

Ke stanovení tekutosti kapalných, viskózních nebo pastovitých látek a směsí se používá následující zkušební postup:

2.3.4.1 Zkušební přístroj

Obchodně běžný penetrometr podle normy ISO 2137:1985 s vodící tyčí o hmotnosti $47,5 \text{ g} \pm 0,05 \text{ g}$; děrovaný kotouč z duralu s kónickými otvory o hmotnosti $102,5 \text{ g} \pm 0,05 \text{ g}$ (viz obrázek 1); penetrační nádobka o vnitřním průměru 72 až 80 mm k jímání vzorku.

2.3.4.2 Zkušební postup

Vzorek se naplní do penetrační nádobky nejméně půl hodiny před začátkem měření. Nádobka se hermeticky uzavře a ponechá v klidu až do začátku měření. Vzorek se v hermeticky uzavřené penetrační nádobce ohřeje na $35 \text{ °C} \pm 0,5 \text{ °C}$ a teprve bezprostředně před měřením (nejvýše 2 minuty) se přemístí na stolek penetrometru. Nyní se na povrch kapaliny nasadí hrot S děrovaného kotouče a změř se hloubka průniku.

2.3.4.3 Vyhodnocení výsledků zkoušky

Látka je pastovitá, jestliže po nasazení hrotu S na povrch vzorku je hodnota penetrace odečtená na stupnici:

- (a) po době zatížení $5 \text{ s} \pm 0,1 \text{ s}$ je menší než $15 \text{ mm} \pm 0,3 \text{ mm}$, nebo
- (b) při době zatížení $5 \text{ s} \pm 0,1 \text{ s}$ je větší než $15 \text{ mm} \pm 0,3 \text{ mm}$, avšak dodatečná penetrace po dalších $55 \text{ s} \pm 0,5 \text{ s}$ je menší než $5,0 \text{ mm} \pm 0,5 \text{ mm}$.

POZNÁMKA: U vzorků majících bod tečení je často nemožné dosáhnout v penetrační nádobce stálého rovného povrchu a tím zajistit při nasazení hrotu S jednoznačné počáteční podmínky měření. Navíc může u některých vzorků nastat při nárazu děrovaného kotouče elastická deformace povrchu a v prvních vteřinách může dojít k naměření vyšších hodnot penetrace. Ve všech těchto případech může být vhodné vyhodnotit výsledky podle odstavce (b) výše.

Obrázek 1 - Penetrometr

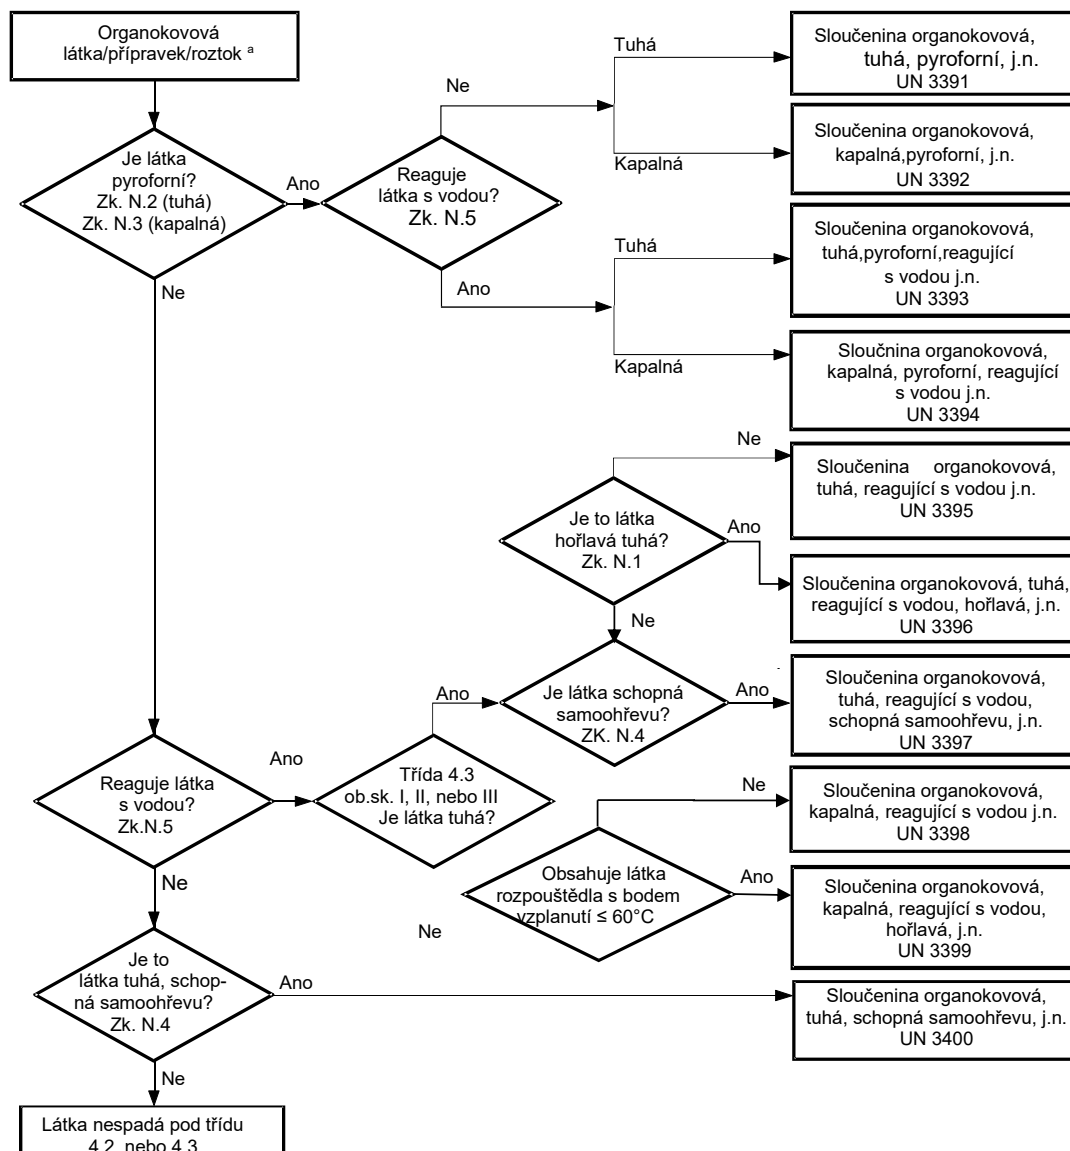

Pro míry bez udání tolerance platí $\pm 0,1 \text{ mm}$

2.3.5 Klasifikace organokovových látek do tříd 4.2 a 4.3

V závislosti na svých vlastnostech, určených na základě zkoušek N.1 až N.5 Příručky zkoušek a kritérií, části III, oddílu 33, mohou být organokovové látky zařazeny do třídy 4.2, popřípadě 4.3 podle postupového diagramu uvedeného na obrázku 2.3.5.

POZNÁMKA 1: *V závislosti na svých jiných vlastnostech a na přednosti v tabulce převažujících nebezpečí (viz 2.1.3.10) mohou být organokovové látky zařazeny do jiných tříd, jak je to vhodné.*

POZNÁMKA 2: *Hořlavé roztoky s organokovovými sloučeninami v koncentracích, které nejsou samozápalné, ani ve styku s vodou nevyvíjejí hořlavé plyny, jsou látkami třídy 3.*

Diagram 2.3.5: Postupový diagram pro klasifikaci organokovových látek do tříd 4.2 a 4.3 ^b

^a Pokud lze aplikovat a pokud je zkouška s přihlédnutím k reakčním vlastnostem odpovídající, určí se vlastnosti tříd 6.1 a 8 podle tabulky převažujícího nebezpečí v pododdíle 2.1.3.10.

^b Zkušební metody N. 1 až N. 5 jsou obsaženy v Příručce zkoušek a kritérií část III, oddíl 33.

KAPITOLA 2.4

KRITÉRIA PRO LÁTKY OHROŽUJÍCÍ VODNÍ PROSTŘEDÍ

2.4.1 Všeobecné definice

- 2.4.1.1 Látky ohrožující životní prostředí zahrnují, mimo jiné, kapalné nebo tuhé látky znečišťující vodní prostředí a roztoky a směsi takových látek (jako jsou přípravky a odpady). Pro účely této kapitoly „látko“ znamená chemické prvky a jejich sloučeniny v přírodním stavu nebo získané výrobním procesem, včetně jakékoli přísady potřebné k zachování stálosti produktu a jakýchkoli nečistot pocházejících z použitého procesu, ale s výjimkou jakéhokoli rozpouštědla, které může být odděleno bez ovlivnění stálosti látky nebo změny jejího složení.
- 2.4.1.2 Vodní prostředí může být posuzováno ve smyslu vodních organismů, které žijí ve vodě a vodního ekosystému, jehož jsou součástí¹. Proto je základem pro identifikaci nebezpečí vodní toxicita látky nebo směsi, i když tato může být modifikována dalšími informacemi o degradačním a bioakumulačním chování.
- 2.4.1.3 I když je následující klasifikační postup určen k použití pro všechny látky a směsi, uznává se, že v některých případech, např. u kovů nebo špatně rozpustných anorganických sloučenin, bude nutný speciální návod².
- 2.4.1.4 Pro akronymy nebo pojmy používané v tomto oddílu platí následující definice:

- BCF: Faktor biokoncentrace;
- BOD: Biochemická potřeba kyslíku;
- COD: Chemická potřeba kyslíku;
- GLP: Dobré laboratorní praktiky;
- EC_x: koncentrace spojená s X % reakcí;
- EC₅₀: účinná koncentrace látky, která způsobí 50 % maximální reakce;
- ErC₅₀: EC₅₀ ve smyslu brzdění růstu;
- K_{ow}: rozdělovací koeficient oktanol/voda;
- LC₅₀ (50% smrtelná koncentrace): koncentrace látky ve vodě, která způsobí smrt 50 % (poloviny) ve skupině pokusných zvířat;
- L(E)C₅₀: LC₅₀ nebo EC₅₀;
- NOEC (No Observed Effect Concentration): zkušební koncentrace, bezprostředně pod nejnižší zkoušenou koncentrací se statisticky významným škodlivým účinkem. NOEC nemá žádný statisticky významný škodlivý účinek ve srovnání se škodlivým účinkem zkoušky;
- Směrnice pro zkoušení OECD – Test Guidelines publikované Organizací pro ekonomickou spolupráci a rozvoj (OECD).

2.4.2 Definice a požadavky na údaje

- 2.4.2.1 Základními prvky pro klasifikaci látek ohrožujících životní prostředí (vodní prostředí) jsou:
- (a) akutní vodní toxicita;
 - (b) chronická vodní toxicita
 - (c) bioakumulační potenciál nebo aktuální bioakumulace; a

¹ To se netýká látek znečišťujících vodu, u nichž může být nutné posoudit účinky nad rámec vodního prostředí, jako jsou dopady na lidské zdraví atd.

² Tento návod je možno nalézt v příloze 10 GHS.

(d) degradace (biotická nebo abiotická) pro organické chemické látky.

2.4.2.2 Zatímco se upřednostňují údaje z mezinárodně harmonizovaných zkušebních metod, v praxi se smějí používat také údaje z vnitrostátních metod, kde jsou považovány za rovnocenné. Všeobecně bylo dohodnuto, že údaje o toxicitě sladkovodních a mořských druhů mohou být považovány za rovnocenné údaje a mají být přednostně získány za použití Směrnic pro zkoušení OECD nebo jejich ekvivalentu podle zásad dobrých laboratorních praktik (GLP). Nejsou-li takové údaje k dispozici, musí být klasifikace založena na nejlepších disponibilních údajích.

2.4.2.3 **Akutní vodní toxicita** je podstatná vlastnost látky, která je škodlivá vodním organismům při jejich krátkodobém vystavení působení této látky ve vodním prostředí.

Akutní (krátkodobé) nebezpečí pro účely klasifikace je nebezpečí chemické látky způsobené její akutní toxicitou pro organismus během jeho krátkodobého vystavení působení této chemické látky ve vodním prostředí.

Akutní vodní toxicita se normálně stanoví za použití rybích druhů 96 hodin LC₅₀ (Směrnice pro zkoušení OECD 203 nebo ekvivalent), koryšovitých druhů 48 hodin EC₅₀ (Směrnice pro zkoušení OECD 202 nebo ekvivalent) a/nebo vodních řas 72 nebo 96 hodin EC₅₀ (Směrnice pro zkoušení OECD 201 nebo ekvivalent). Tyto druhy se považují za náhradu pro všechny vodní organizmy a údaje z jiných druhů, jako je lemna, smějí být rovněž vzaty v úvahu, je-li vhodná zkušební metodologie.

2.4.2.4 **Chronická vodní toxicita** je podstatná vlastnost látky, vyvolávající škodlivé účinky na vodní organismy při jejich vystavení působení této látky ve vodním prostředí, které jsou určeny v relaci k životnímu cyklu těchto organismů.

Dlouhodobé nebezpečí pro účely klasifikace je nebezpečí chemické látky způsobené její chronickou toxicitou po dlouhodobém působení této chemické látky ve vodním prostředí.

Údaje o **chronické toxicitě** jsou méně dostupné než akutní údaje a rozsah zkušebních postupů je méně standardizován. Údaje získané podle Směrnice pro zkoušení OECD 210 (ryby v počátečním stádiu života) nebo 211 (rozmnožování dafnií) a 201 (zábrana růstu řas) mohou být akceptovány. Je dovoleno použít také jiné uznané a mezinárodně akceptované zkoušky. Musí být použity NOECs nebo jiné ekvivalentní ECx.

2.4.2.5 **Bioakumulace** znamená čistý výsledek absorpce, přeměny a vyloučení látky v organismu v důsledku vystavení jejímu působení všemi cestami (tj. vzduchem, vodou, usazeninou/půdou a potravou).

Bioakumulační potenciál se normálně stanoví za použití rozdělovacího koeficientu oktanol/voda, obvykle vyjadřovaného jako log K_{ow}, stanoveného podle Směrnice pro zkoušení OECD 107, 117 nebo 123. Zatímco toto představuje bioakumulační potenciál, poskytuje experimentálně zjištěný faktor biokonzentrace (BCF) lepší důkaz a musí být používán přednostně, pokud je k dispozici. BCF se stanoví podle Směrnice pro zkoušení OECD 305.

2.4.2.6 **Degradace** je rozklad organických molekul na menší molekuly a nakonec na oxid uhličitý, vodu a soli.

Environmentální degradace může být biotická nebo abiotická (např. hydrolyza) a použitá kritéria odrážejí tuto skutečnost. Snadná biodegradace se nejnadhěji definuje použitím zkoušek biologické odbouratelnosti (A-F) Směrnice pro zkoušení OECD 301. Překročení úrovně v těchto zkouškách smí být považováno za důkaz rychlé degradace ve většině prostředí. Toto jsou sladkovodní zkoušky a tak bylo zahrnuto také použití výsledků ze Směrnice pro zkoušení OECD 306, která je vhodnější pro mořská prostředí. Nejsou-li takové údaje k dispozici, potom se poměr BOD (5 dní)/COD $\geq 0,5$ považuje za důkaz rychlé degradace. Abiotická degradace, jako je hydrolyza, primární degradace, jak abiotická, tak i biotická, degradace v nevodních mediích a prokázaná rychlá degradace v životním prostředí smějí být všechny brány v úvahu při definování rychlé odbouratelnosti³.

Látky jsou považovány za rychle odbouratelné v životním prostředí, jsou-li splněna následující kritéria:

³ Zvláštní návod k interpretaci údajů poskytuje kapitola 4.1 a příloha 9 ke GHS.

- (a) Při pozorováních snadné biodegradace po dobu 28 dní je dosaženo následujících úrovní degradace:
- (i) zkoušky založené na rozpuštěném organickém uhlíku: 70 %;
 - (ii) zkoušky založené na ztrátě kyslíku nebo vyvíjení oxidu uhličitého: 60 % teoretického maxima;

Těchto úrovní biodegradace musí být dosaženo do 10 dní od počátku degradace, kteréhožto bodu je dosaženo v době, kdy bylo odbouráno 10 % látky, ledaže je látka identifikována jako komplexní, multikomponentní látka se strukturálně podobnými složkami. V tomto případě, a kde je pro to dostatečné ospravedlnění, smí být od podmínky časového intervalu 10 dnů upuštěno a předpokládá se, že požadované úrovně biodegradace je dosaženo do 28 dnů⁴; nebo

- (b) V těch případech, kdy jsou k dispozici pouze údaje BOD a COD, je-li poměr $BOD_5/COD \geq 0,5$; nebo
- (c) Je-li k dispozici jiný přesvědčivý vědecký důkaz, který může prokázat, že látka nebo směs může být odbourána (bioticky a/nebo abioticky) ve vodním prostředí na úroveň nad 70 % v období 28 dní.

2.4.3 Kategorie a kritéria klasifikace látek

POZNÁMKA: Kategorie Chronická 4 kapitoly 4.1 GHS se v tomto oddílu uvádí pro informaci, i když v kontextu ADN neplatí.

2.4.3.1 Následující látky se považují za látky ohrožující životní prostředí (vodní prostředí):

- (a) Pro přepravu v kusech látky, které splňují kritéria pro Akutní 1, Chronická 1 nebo Chronická 2, podle tabulky 2.4.3.1; a
- (b) Pro přepravu v tankových plavidlech látky, které splňují kritéria pro Akutní 1, Akutní 2 nebo Akutní 3, nebo Chronická 1, Chronická 2 nebo Chronická 3, podle tabulky 2.4.3.1.

Tabulka 2.4.3.1 Kategorie pro látky ohrožující vodní prostředí (viz POZNÁMKU 1)

(a) Akutní (krátkodobé) nebezpečí pro vodu

<u>Kategorie Akutní 1:</u> (viz POZNÁMKU 2)	
96 hodin LC ₅₀ (pro ryby)	≤ 1 mg/l a/nebo
48 hodin EC ₅₀ (pro koryšce)	≤ 1 mg/l a/nebo
72 nebo 96 hodin ErC ₅₀ (pro řasy nebo jiné vodní rostliny)	≤ 1 mg/l (viz POZN. 3)
<u>Kategorie Akutní 2:</u>	
96 hodin LC ₅₀ (pro ryby)	> 1 ale ≤ 10 mg/l a/nebo
48 hodin EC ₅₀ (pro koryšce)	> 1 ale ≤ 10 mg/l a/nebo
72 nebo 96 hodin ErC ₅₀ (pro řasy nebo jiné vodní rostliny)	> 1 ale ≤ 10 mg/l (viz POZN. 3)
<u>Kategorie Akutní 3:</u>	
96 hodin LC ₅₀ (pro ryby)	> 10 ale ≤ 100 mg/l a/nebo
48 hodin EC ₅₀ (pro koryšce)	> 10 ale ≤ 100 mg/l a/nebo
72 nebo 96 hodin ErC ₅₀ (pro řasy nebo jiné vodní rostliny)	> 10 ale ≤ 100 mg/l (viz POZN. 3)

⁴ Viz kapitolu 4.1 a přílohu 9, odstavec A9.4.2.2.3 GHS.

(b) Dlouhodobé nebezpečí pro vodu (viz též obr. 2.4.3.1)

- (i) Látky, které nejsou rychle odbouratelné (viz POZNÁMKU 4), pro něž jsou k dispozici dostatečné údaje o chronické toxicitě

<u>Kategorie Chronická 1:</u> (viz POZNÁMKU 2)	
Chronická NOEC nebo EC _x (pro ryby)	≤ 0,1 mg/l a/nebo
Chronická NOEC nebo EC _x (pro korýše)	≤ 0,1 mg/l a/nebo
Chronická NOEC nebo EC _x (pro řasy nebo jiné vodní rostliny)	≤ 0,1 mg/l
<u>Kategorie Chronická 2:</u>	
Chronická NOEC nebo EC _x (pro ryby)	≤ 1 mg/l a/nebo
Chronická NOEC nebo EC _x (pro korýše)	≤ 1 mg/l a/nebo
Chronická NOEC nebo EC _x (pro řasy nebo jiné vodní rostliny)	≤ 1 mg/l

- (ii) Rychle odbouratelné látky, pro něž jsou k dispozici dostatečné údaje o chronické toxicitě

<u>Kategorie Chronická 1:</u> (viz POZNÁMKU 2)	
Chronická NOEC nebo EC _x (pro ryby)	≤ 0,01 mg/l a/nebo
Chronická NOEC nebo EC _x (pro korýše)	≤ 0,01 mg/l a/nebo
Chronická NOEC nebo EC _x (pro řasy nebo jiné vodní rostliny)	≤ 0,01 mg/l
<u>Kategorie Chronická 2:</u>	
Chronická NOEC nebo EC _x (pro ryby)	≤ 0,1 mg/l a/nebo
Chronická NOEC nebo EC _x (pro korýše)	≤ 0,1 mg/l a/nebo
Chronická NOEC nebo EC _x (pro řasy nebo jiné vodní rostliny)	≤ 0,1 mg/l
<u>Kategorie Chronická 3:</u>	
Chronická NOEC nebo EC _x (pro ryby)	≤ 1 mg/l a/nebo
Chronická NOEC nebo EC _x (pro korýše)	≤ 1 mg/l a/nebo
Chronická NOEC nebo EC _x (pro řasy nebo jiné vodní rostliny)	≤ 1 mg/l

- (iii) Látky, pro něž nejsou k dispozici dostatečné údaje o chronické toxicitě

<u>Kategorie Chronická 1:</u> (viz POZNÁMKU 2)	
96 hodin LC ₅₀ (pro ryby)	≤ 1 mg/l a/nebo
48 hodin EC ₅₀ (pro korýše)	≤ 1 mg/l a/nebo
72 nebo 96 hodin ErC ₅₀ (pro řasy nebo jiné vodní rostliny)	≤ 1 mg/l (viz POZN. 3)
a látka není rychle odbouratelná a/nebo experimentálně zjištěný BCF ≥ 500 (nebo, není-li, log K _{ow} ≥ 4) (viz POZN. 4 a 5).	

Kategorie Chronická 2:

96 hodin LC ₅₀ (pro ryby)	> 1 ale ≤ 10 mg/l a/nebo
48 hodin EC ₅₀ (pro koryše)	> 1 ale ≤ 10 mg/l a/nebo
72 nebo 96 hodin ErC ₅₀ (pro řasy nebo jiné vodní rostliny)	> 1 ale ≤ 10 mg/l (viz POZN. 3)

a látka není rychle odbouratelná a/nebo experimentálně zjištěný BCF ≥ 500 (nebo, není-li, log K_{ow} ≥ 4)
(viz POZN. 4 a 5).

Kategorie Chronická 3:

96 hodin LC ₅₀ (pro ryby)	> 10 ale ≤ 100 mg/l a/nebo
48 hodin EC ₅₀ (pro koryše)	> 10 ale ≤ 100 mg/l a/nebo
72 nebo 96 hodin ErC ₅₀ (pro řasy nebo jiné vodní rostliny)	> 10 ale ≤ 100 mg/l (viz POZN. 3)

a látka není rychle odbouratelná a/nebo experimentálně zjištěný BCF ≥ 500 (nebo, není-li, log K_{ow} ≥ 4)
(viz POZN. 4 a 5).

(c) Klasifikace „Safety net“**Kategorie: Chronická 4**

Špatně rozpustné látky, pro které není zaznamenána žádná akutní toxicita na úrovních blízcích se rozpustnosti ve vodě, a které nejsou rychle odbouratelné a mají log K_{ow} ≥ 4, ukazující na bioakumulační potenciál, budou klasifikovány do této kategorie, ledaže existuje vědecký důkaz prokazující, že tato klasifikace není nutná. Takový důkaz by zahrnoval experimentálně zjištěný BCF < 500 nebo chronickou toxicitu NOECs > 1 mg/l nebo důkaz o rychlé degradaci v životním prostředí.

Látky, které spadají jen do kategorie Chronická 4, se nepovažují za látky ohrožující životní prostředí ve smyslu ADN.

POZNÁMKA 1: Organismy, ryby, koryši a řasy jsou testovány jako reprezentativní druhy pokrývající široký rozsah trofických úrovní a dávek a zkušební metody jsou ve vysoké míře standardizovány. Údaje o jiných organismech směřují být rovněž vzaty v úvahu, avšak za podmínky, že představují rovnocenné druhy a experimentální účinky.

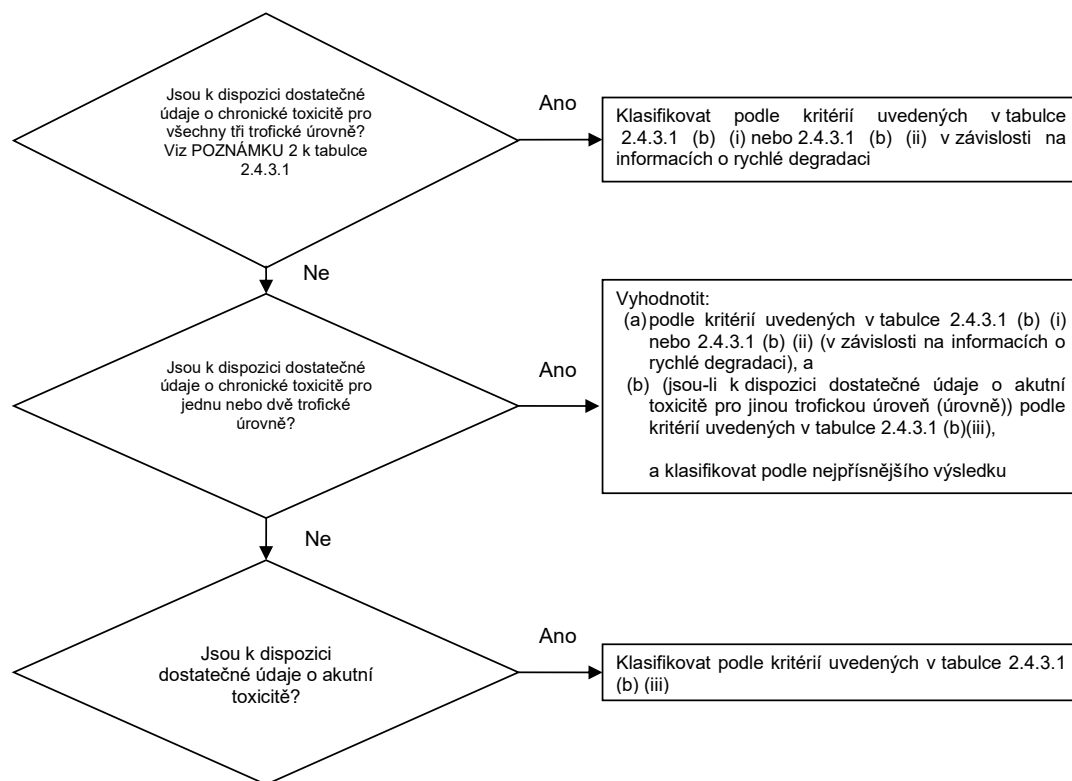

POZNÁMKA 2: Při klasifikaci látek jako Akutní 1 a/nebo Chronická 1 je třeba současně uvést náležitý součinitel M (viz 2.4.4.6.4) pro použití při součtové metodě.

POZNÁMKA 3: Pokud je toxicita pro řasy ErC₅₀ (= EC₅₀ (rychlost růstu)) více než 100 krát nižší než toxicita pro nejbližší nejcitlivější druh a povede ke klasifikaci založené pouze na tomto účinku, musí se uvážit, zda je tato toxicita reprezentativní pro toxicitu vůči vodním rostlinám. Pokud se může prokázat, že to není tento případ, musí znalec rozhodnout, zda klasifikaci provést. Klasifikace musí být založena na ErC₅₀. Za okolností, kdy podmínky pro určení EC₅₀ nejsou stanoveny a žádný ErC₅₀ není zaznamenán, musí být klasifikace založena na nejnižším disponibilním EC₅₀.

POZNÁMKA 4: Nedostatek rychlé odbouratelnosti je založen buď na nedostatku snadné biotické odbouratelnosti, nebo na jiných údajích ukazujících nedostatek rychlé degradace. Pokud nejsou k dispozici použitelné údaje o odbouratelnosti, buď údaje experimentálně zjištěné, nebo odhadnuté, musí být látka považována za látku, která není rychle odbouratelná.

POZNÁMKA 5: Bioakumulační potenciál, založený na experimentálně odvozeném BCF ≥ 500 nebo, není-li, log K_{ow} ≥ 4, za podmínky, že log K_{ow} je vhodným popisovačem pro bioakumulační potenciál látky. Naměřené hodnoty log K_{ow} mají přednost před odhadnutými hodnotami a naměřené hodnoty BCF mají přednost před hodnotami log K_{ow}.

Obrázek 2.4.3.1 Kategorie pro látky dlouhodobě nebezpečné vodnímu prostředí

2.4.3.2

Klasifikační schéma v tabulce 2.4.3.2 dále sumarizuje klasifikační kritéria pro látky.

Tabulka 2.4.3.2 Klasifikační schéma pro látky ohrožující vodní prostředí

Klasifikační kategorie			
Akutní nebezpečí (POZNÁMKA 1)	Dlouhodobé nebezpečí (POZNÁMKA 2)		
	Dostatečné údaje o chronické toxicitě jsou k dispozici		Dostatečné údaje o chronické toxicitě nejsou k dispozici (POZNÁMKA 1)
	Látky, které nejsou rychle odbouratelné (POZNÁMKA 3)	Rychle odbouratelné látky (POZNÁMKA 3)	
Kategorie: Akutní 1	Kategorie: Chronická 1	Kategorie: Chronická 1	Kategorie: Chronická 1
$L(E)C_{50} \leq 1,00$	NOEC nebo $EC_x \leq 0,1$	NOEC nebo $EC_x \leq 0,01$	$L(E)C_{50} \leq 1,00$ a nedostatek rychlé odbouratelnosti a/nebo $BCF \geq 500$ nebo, není-li, $\log K_{ow} \geq 4$
Kategorie: Akutní 2	Kategorie: Chronická 2	Kategorie: Chronická 2	Kategorie: Chronická 2
$1,00 < L(E)C_{50} \leq 10,0$	$0,1 < NOEC$ nebo $EC_x \leq 1$	$0,01 < NOEC$ nebo $EC_x \leq 0,1$	$1,00 < L(E)C_{50} \leq 10,0$ a nedostatek rychlé odbouratelnosti a/nebo $BCF \geq 500$ nebo, není-li, $\log K_{ow} \geq 4$
Kategorie: Akutní 3		Kategorie: Chronická 3	Kategorie: Chronická 3
$10,0 < L(E)C_{50} \leq 100$		$0,1 < NOEC$ nebo $EC_x \leq 1$	$10,0 < L(E)C_{50} \leq 100$ a nedostatek rychlé odbouratelnosti a/nebo $BCF \geq 500$ nebo, není-li, $\log K_{ow} \geq 4$
	Kategorie: Chronická 4 (POZNÁMKA 4) Příklad: (POZNÁMKA 5) Žádná akutní toxicita a nedostatek rychlé odbouratelnosti a $BCF \geq 500$ nebo, není-li, $\log K_{ow} \geq 4$, ledaže $NOECs > 1$ mg/l		

POZNÁMKA 1: Pásmo akutní toxicity založené na hodnotách $L(E)C_{50}$ v mg/l pro ryby, korýše a/nebo řasy nebo jiné vodní rostliny (nebo vyhodnocení QSAR (Quantitative Structure Activity Relationships), jestliže nejsou žádné experimentální údaje⁵).

POZNÁMKA 2: Látky jsou klasifikovány do různých chronických kategorií, pokud nejsou k dispozici dostatečné údaje o chronické toxicitě pro všechny tři trofické úrovně nad rozpustností ve vodě nebo nad 1 mg/l. („Dostatečný“ znamená, že údaje dostatečně pokrývají sledovaný rozsah. Obecně by to znamenalo naměřené údaje při zkoušce, aby se však vyhnulo zbytečnému zkoušení, je možno případ od případu použít údaje z vyhodnocení, např. QSAR, nebo pro jasné případy posudek experta).

POZNÁMKA 3: Pásmo chronické toxicity založené na NOEC nebo ekvivalentních hodnotách EC_x v mg/l pro ryby nebo korýše nebo jiných uznávaných měřeních chronické toxicity.

POZNÁMKA 4: Systém zavádí také klasifikaci „Safety net“ (uváděnou jako kategorie Chronická 4) k použití, jestliže disponibilní údaje nedovolují klasifikaci podle formálních kritérií, avšak přesto existují některé důvody k obavám.

POZNÁMKA 5: Pro špatně rozpustné látky, u nichž nebyla na mezi rozpustnosti prokázána žádná akutní toxicita, a jednak nejsou rychle odbouratelné a jednak mají bioakumulační potenciál, by se tato kategorie měla použít, ledaže může být prokázáno, že tato látka nevyžaduje klasifikaci z hlediska dlouhodobých nebezpečí pro vodu.

⁵ Zvláštní návod je uveden v kapitole 4.1, odstavci 4.1.2.13 a příloze 9, oddílu A9.6 GHS.

2.4.4 Klasifikační kategorie a kritéria pro směsi

POZNÁMKA: Kategorie Chronická 4 kapitoly 4.1 GHS se v tomto oddílu uvádí pro informaci, i když v kontextu ADN neplatí.

2.4.4.1 Klasifikační systém pro směsi zahrnuje klasifikační kategorie, které jsou používány pro látky, tj. kategorie Akutní 1 až 3 a Chronické 1 až 4. Za účelem využití všech disponibilních údajů pro klasifikaci nebezpečí směsi pro vodní prostředí se vychází z následujícího předpokladu, který se použije, kde je to nutné:

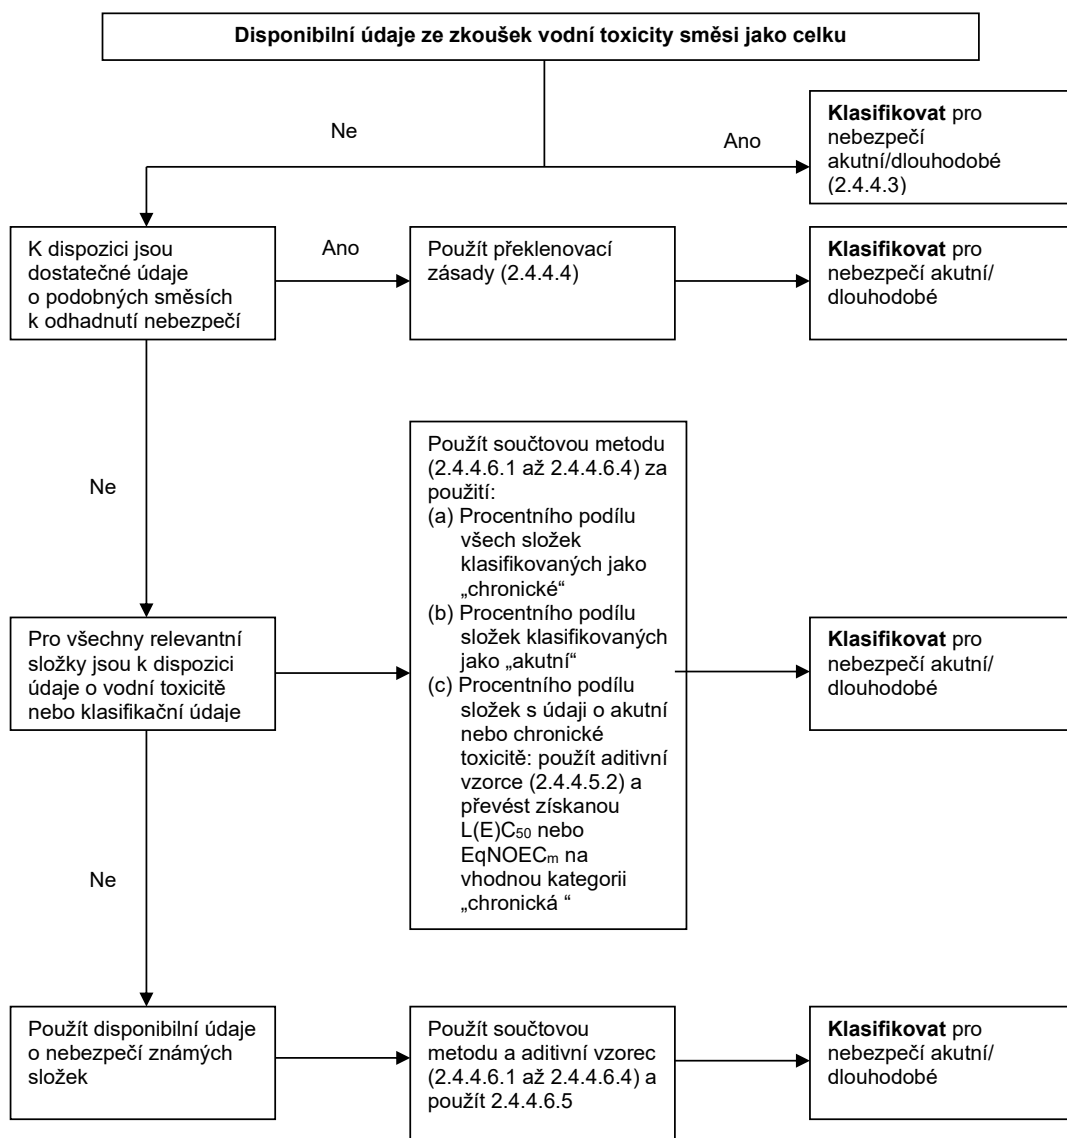

„Relevantní složky“ směsi jsou ty složky, které jsou přítomny v koncentraci 0,1 % (hm.) nebo vyšší pro složky klasifikované jako Akutní a/nebo Chronické 1 a 1 % (hm.) nebo vyšší pro jiné složky, pokud neexistuje domněnka (např. v případě velmi toxických složek), že složka přítomná v koncentraci nižší než 0,1 % může být přesto významná pro klasifikaci směsi z hlediska jejich nebezpečí pro vodní prostředí.

2.4.4.2 Přístup ke klasifikaci nebezpečí pro vodní prostředí je víceúrovňový a je závislý na druhu disponibilních informací pro vlastní směs a pro její složky. Prvky víceúrovňového přístupu zahrnují:

- (a) klasifikaci založenou na vyzkoušených směsích;
- (b) klasifikaci založenou na překlenovacích zásadách;
- (c) použití „součtu klasifikovaných složek“ a/nebo „aditivního vzorce“.

Dále uvedený obrázek 2.4.4.2 ukazuje postup, který je nutno dodržet:

Obrázek 2.4.4.2: Víceúrovňový přístup ke klasifikaci směsí z hlediska jejich akutních a dlouhodobých nebezpečí pro vodní prostředí

2.4.4.3 **Klasifikace směsí, jsou-li k dispozici údaje o toxicitě pro kompletní směs**

2.4.4.3.1 Pokud byla směs jako celek podrobena zkoušce za účelem zjištění její vodní toxicity, musí být tyto informace použity pro klasifikaci směsi podle kritérií, která byla schválena pro látky. Klasifikace je normálně založena na údajích pro ryby, korýše a řasy/rostliny (viz 2.4.2.3 a 2.4.2.4). Pokud se nedostává dostatečných akutních nebo chronických údajů pro směs jako celek, musí se použít „překlenovací zásady“ nebo „součtová metoda“ (viz 2.4.4.4 a 2.4.4.5).

2.4.4.3.2 Klasifikace směsí z hlediska dlouhodobého nebezpečí vyžaduje dodatečné informace o odbouratelnosti a v některých případech o bioakumulaci. Neexistují žádné údaje o odbouratelnosti a bioakumulaci pro směsi jako celek. Zkoušky odbouratelnosti a bioakumulace pro směsi se

nepoužívají, neboť je obvykle obtížné je vyhodnotit, a takové zkoušky mohou mít význam jen pro jednotlivé látky.

2.4.4.3.3 *Klasifikace do kategorií Akutní 1, 2 a 3*

- (a) Jsou-li k dispozici dostatečné údaje ze zkoušek akutní toxicity (LC_{50} nebo EC_{50}) pro směs jako celek ukazující $L(E)C_{50} \leq 100$ mg/l:

Klasifikovat směs jako Akutní 1, 2 nebo 3 podle tabulky 2.4.3.1 (a);

- (b) Jsou-li k dispozici údaje ze zkoušek akutní toxicity ($LC_{50}(s)$ nebo $EC_{50}(s)$) pro směs jako celek ukazující $L(E)C_{50}(s) > 100$ mg/l, nebo nad rozpustností ve vodě:

Není nutno klasifikovat z hlediska akutního nebezpečí pod ADN.

2.4.4.3.4 *Klasifikace do kategorií Chronická 1, 2 a 3*

- (a) Jsou-li k dispozici dostatečné údaje o chronické toxicitě (EC_x nebo NOEC) pro směs jako celek ukazující EC_x nebo NOEC zkoušené směsi ≤ 1 mg/l:

(i) klasifikovat směs jako Chronickou 1, 2 nebo 3 podle tabulky 2.4.3.1 (b) (ii) (rychle odbouratelná), pokud dostupné informace dovolují učinit závěr, že všechny relevantní složky směsi jsou rychle odbouratelné;

(ii) klasifikovat směs jako Chronickou 1, 2 nebo 3 ve všech ostatních případech podle tabulky 2.4.3.1 (b) (i) (není rychle odbouratelná);

- (b) Jsou-li k dispozici dostatečné údaje o chronické toxicitě (EC_x nebo NOEC) pro směs jako celek ukazující $EC_x(s)$ nebo NOEC(s) zkoušené směsi > 1 mg/l, nebo nad rozpustností ve vodě:

Není nutno klasifikovat z hlediska dlouhodobého nebezpečí pod ADN.

2.4.4.3.5 *Klasifikace do kategorie Chronická 4*

Jsou-li přesto důvody k obavám:

Klasifikovat směs jako Chronickou 4 (klasifikace „Safety net“) podle tabulky 2.4.3.1 (c).

2.4.4.4 ***Klasifikace směsí, nejsou-li k dispozici údaje o toxicitě pro kompletní směs: překlenovací zásady***

2.4.4.4.1 Pokud směs sama nebyla podrobena zkoušce ke zjištění jejího nebezpečí pro vodní prostředí, ale existují dostatečné údaje o jednotlivých složkách a podobných zkoušených směsích, aby přiměřeným způsobem charakterizovaly nebezpečí této směsi, musí se tyto údaje použít v souladu s následujícími schválenými překlenovacími pravidly. Tímto se zajišťuje, aby se při klasifikačním procesu využilo k charakteristice nebezpečí směsi v co největším možném rozsahu disponibilních údajů, bez nutnosti dodatečných zkoušek na zvířatech.

2.4.4.4.2 *Ředění*

Je-li nová směs vytvořena zředěním zkoušené směsi nebo látky ředidlem, které má stejnou nebo nižší klasifikaci z hlediska nebezpečí pro vodní prostředí než nejméně toxická původní složka, a od něhož se neočekává, že ovlivní nebezpečí pro vodní prostředí jiných složek, musí být výsledná směs klasifikována jako rovnocenná s původní zkoušenou směsí nebo látkou. Alternativně smí být použita metoda vysvětlená v 2.4.4.5.

2.4.4.4.3 *Dávkování*

Klasifikace zkoušené výrobní šarže směsi z hlediska nebezpečí pro vodní prostředí musí být považována za v podstatě rovnocennou klasifikaci jiné nezkoušené výrobní šarže téhož obchodního produktu, je-li vyráběn tímž výrobcem nebo pod kontrolou téhož výrobce, pokud není důvodu věřit, že došlo k významné změně, takže se změnila klasifikace nezkoušené šarže z hlediska jejího nebezpečí pro vodní prostředí. Pokud k tomuto dojde, je nutná nová klasifikace.

2.4.4.4.4 Koncentrace směsí, které jsou zařazeny do nejpřísnějších klasifikačních kategorií (chronická 1 a akutní 1)

Je-li zkoušená směs klasifikována jako chronická 1 a/nebo akutní 1 a složky směsi, které jsou klasifikovány jako chronická 1 a/nebo akutní 1, jsou ještě více koncentrovány, musí být více koncentrovaná nezkoušená směs zařazena do stejné klasifikační kategorie jako původní zkoušená směs bez dodatečných zkoušek.

2.4.4.4.5 Interpolace uvnitř jedné kategorie toxicity

Pro tři směsi (A, B a C) s identickými složkami, jestliže směsi A a B byly vyzkoušeny a jsou v téže kategorii toxicity a jestliže nezkoušená směs C má tytéž toxikologicky aktivní složky jako směsi A a B, ale má koncentrace toxikologicky aktivních složek mezilehlé mezi koncentracemi ve směsích A a B, potom se předpokládá, že směs C je v téže kategorii jako A a B.

2.4.4.4.6 V podstatě podobné směsi

Jsou-li dány následující předpoklady:

- (a) dvě směsi:
 - (i) A + B;
 - (ii) C + B;
- (b) koncentrace složky B je v podstatě stejná v obou směsích;
- (c) koncentrace složky A ve směsi (i) se rovná koncentraci složky C ve směsi (ii);
- (d) údaje o nebezpečích pro vodní prostředí pro A a C jsou k dispozici a jsou v podstatě rovnocenné, tj. jsou v téže kategorii nebezpečí a neočekává se, že ovlivní vodní toxicitu B.

Jestliže směs (i) nebo (ii) je již klasifikována na základě údajů ze zkoušek, potom může být té druhé směsi přiřazena tatáž kategorie nebezpečí.

2.4.4.5 **Klasifikace směsí, jsou-li k dispozici údaje o toxicitě pro všechny složky nebo jen pro některé složky směsi**

2.4.4.5.1 Klasifikace směsi je založena na součtu koncentrací jejích klasifikovaných složek. Procentní podíl složek klasifikovaných jako „Akutní“ nebo „Chronická“ bude zahrnut přímo do součtové metody. Detaily součtové metody jsou popsány v 2.4.4.6.1 až 2.4.4.6.4.

2.4.4.5.2 Směsi mohou být vytvořeny jak ze složek, které jsou klasifikovány (jako Akutní 1 až 3 a/nebo Chronická 1 až 4), tak i ze složek, pro které jsou k dispozici dostatečné údaje ze zkoušek toxicity. Jsou-li k dispozici dostatečné údaje o toxicitě pro více než jednu složku ve směsi, vypočte se celková toxicita těchto složek použitím následujících aditivních vzorců (a) nebo (b) v závislosti na povaze údajů o toxicitě:

- (a) Založeno na akutní vodní toxicitě:

$$\frac{\sum C_i}{L(E)C_{50m}} = \sum_n \frac{C_i}{L(E)C_{50i}}$$

kde:

C_i = koncentrace složky i (procento hmotnosti);

$L(E)C_{50i}$ = LC_{50} nebo EC_{50} pro složku i (mg/l);

n = počet složek, i se pohybuje od 1 do n ;

$L(E)C_{50m}$ = $L(E)C_{50}$ části směsi s údaji ze zkoušek.

Vypočtená toxicita se použije k tomu, aby se této části směsi přiřadila kategorie akutního nebezpečí, která se následně použije při aplikaci součtové metody;

(b) Založeno na chronické vodní toxicitě:

$$\frac{\sum C_i + \sum C_j}{EqNOEC_m} = \sum_n \frac{C_i}{NOEC_i} + \sum_n \frac{C_j}{0,1 \cdot NOEC_j}$$

kde:

C_i = koncentrace složky i (procento hmotnosti) pokrývající rychle odbouratelné složky;

C_j = koncentrace složky j (procento hmotnosti) pokrývající složky, které nejsou rychle odbouratelné;

$NOEC_i$ = NOEC (nebo jiná uznávaná měření chronické toxicity) pro složku i, pokrývající rychle odbouratelné složky, v mg/l;

$NOEC_j$ = NOEC (nebo jiná uznávaná měření chronické toxicity) pro složku j, pokrývající složky, které nejsou rychle odbouratelné, v mg/l;

n = počet složek, i a j se pohybují od 1 do n ;

$EqNOEC_m$ = ekvivalent NOEC části směsi s údaji ze zkoušek.

Ekvivalentní toxicita tak odráží skutečnost, že látky, které nejsou rychle odbouratelné, jsou klasifikovány o jednu úroveň kategorie nebezpečí „přísněji“ než rychle odbouratelné látky.

Vypočtená ekvivalentní toxicita se použije k tomu, aby se této části směsi přiřadila kategorie dlouhodobého nebezpečí podle kritérií pro rychle odbouratelné látky (tabulka 2.4.3.1 (b) (ii)), která se následně použije při aplikaci součtové metody.

- 2.4.4.5.3 Při použití aditivního vzorce pro část směsi je vhodnější vypočítat toxicitu této části směsi tak, že se pro každou složku použijí hodnoty toxicity, které se vztahují ke stejné systematické skupině (tj. rybám, korýšům nebo řasám), a pak se použije nejvyšší toxicita (nejnižší hodnota) (tj. použije se nejcitlivější z těchto tří skupin). Nejsou-li však k dispozici údaje o toxicitě pro každou složku od stejné systematické skupiny, musí být hodnota toxicity pro každou složku zvolena stejným způsobem, jakým jsou voleny hodnoty toxicity pro klasifikaci látek, tj. použije se nejvyšší toxicita (od nejcitlivějšího pokusného organismu). Vypočtená akutní a chronická toxicita se pak může použít pro klasifikaci této části směsi jako Akutní 1, 2 nebo 3 a/nebo Chronická 1,2, nebo 3 za použití stejných kritérií, jaká jsou popsána pro látky.
- 2.4.4.5.4 Jestliže je směs klasifikována více než jen jedním způsobem, musí se použít ta metoda, která dává nejkonzervativnější výsledek.
- 2.4.4.6 **Součtová metoda**
- 2.4.4.6.1 Klasifikační postupy
- Všeobecně převažuje přísnější klasifikace pro směsi nad méně přísnou klasifikací, např. klasifikace Chronická 1 převažuje nad klasifikací Chronická 2. V důsledku toho je klasifikační postup již ukončen, je-li výsledkem klasifikace kategorie Chronická 1. Přísnější klasifikace než Chronická 1 není možná, a proto není nutné podstupovat další klasifikační postup.
- 2.4.4.6.2 Klasifikace do kategorií Akutní 1, 2 a 3
- 2.4.4.6.2.1 Nejprve se posoudí všechny složky klasifikované jako Akutní 1. Je-li součet koncentrací (v %) těchto složek ≥ 25 %, musí být celá směs klasifikována jako Akutní 1. Je-li výsledkem výpočtu klasifikace směsi jako Akutní 1, klasifikační postup je ukončen.
- 2.4.4.6.2.2 V případech, kdy směs není klasifikována jako Akutní 1, uváží se klasifikace směsi jako Akutní 2. Směs je klasifikována jako Akutní 2, jestliže desetnásobek součtu všech složek klasifikovaných jako Akutní 1 plus součet všech složek klasifikovaných jako Akutní 2 je ≥ 25 %. Je-li výsledkem výpočtu klasifikace směsi jako Akutní 2, klasifikační postup je ukončen.
- 2.4.4.6.2.3 V případech, kdy směs není klasifikována ani jako Akutní 1, ani jako Akutní 2, uváží se klasifikace směsi jako Akutní 3. Směs je klasifikována jako Akutní 3, jestliže stonásobek součtu všech složek

klasifikovaných jako Akutní 1 plus desetinásobek součtu všech složek klasifikovaných jako Akutní 2 plus součet všech složek klasifikovaných jako Akutní 3 je $\geq 25\%$.

- 2.4.4.6.2.4 Klasifikace směsí z hlediska akutních nebezpečí založená na tomto součtu koncentrací klasifikovaných složek je sumarizována v tabulce 2.4.4.6.2.4 dále.

Tabulka 2.4.4.6.2.4: Klasifikace směsí z hlediska akutních nebezpečí, založená na součtu koncentrací klasifikovaných složek

Součet koncentrací (v %) složek klasifikovaných jako:	Směs klasifikována jako:
akutní 1 x M ^a $\geq 25\%$	Akutní 1
(M x 10 x Akutní 1) + Akutní 2 $\geq 25\%$	Akutní 2
(M x 100 x Akutní 1) + (10 x Akutní 2) + Akutní 3 $\geq 25\%$	Akutní 3

^a K vysvětlení součinitele M viz 2.4.4.6.4.

- 2.4.4.6.3 Klasifikace do kategorií Chronická 1,2, 3 a 4
- 2.4.4.6.3.1 Nejprve se berou v úvahu všechny složky klasifikované jako Chronická 1. Je-li součet koncentrací (v %) těchto složek $\geq 25\%$, musí být směs klasifikována jako Chronická 1. Je-li výsledkem výpočtu klasifikace směsí jako Chronická 1, klasifikační postup je ukončen.
- 2.4.4.6.3.2 V případech, kdy směs není klasifikována jako Chronická 1, uváží se klasifikace směsí jako Chronická 2. Směs je klasifikována jako Chronická 2, jestliže desetinásobek součtu koncentrací (v %) všech složek klasifikovaných jako Chronická 1 plus součet koncentrací (v %) všech složek klasifikovaných jako Chronická 2 je $\geq 25\%$. Je-li výsledkem výpočtu klasifikace směsí jako Chronická 2, klasifikační postup je ukončen.
- 2.4.4.6.3.3 V případech, kdy směs není klasifikována ani jako Chronická 1, ani jako Chronická 2, uváží se klasifikace směsí jako Chronická 3. Směs je klasifikována jako Chronická 3, jestliže stonásobek součtu všech složek klasifikovaných jako Chronická 1 plus desetinásobek součtu všech složek klasifikovaných jako Chronická 2 plus součet všech složek klasifikovaných jako Chronická 3 je $\geq 25\%$.
- 2.4.4.6.3.4 Jestliže směs není ještě klasifikována do kategorie Chronická 1, 2 nebo 3, není nutné pro účely ADN uvažovat o klasifikaci směsí jako Chronická 4. Směs je klasifikována jako Chronická 4, jestliže součet procentních podílů složek klasifikovaných jako Chronická 1, 2, 3 a 4 je $\geq 25\%$.
- 2.4.4.6.3.5 Klasifikace směsí z hlediska dlouhodobých nebezpečí založená na tomto součtu koncentrací klasifikovaných složek je sumarizována v tabulce 2.4.4.6.3.5 (dříve tabulka 2.4.4.6.3.4) dále.

Tabulka 2.4.4.6.3.5: Klasifikace směsí z hlediska dlouhodobých nebezpečí, založená na součtu koncentrací klasifikovaných složek

Součet koncentrací (v %) složek klasifikovaných jako:	Směs klasifikována jako:
Chronická 1 x M ^a $\geq 25\%$	Chronická 1
(M x 10 x Chronická 1) + Chronická 2 $\geq 25\%$	Chronická 2
(M x 100 x Chronická 1) + (10 x Chronická 2) + Chronická 3 $\geq 25\%$	Chronická 3
Chronická 1 + Chronická 2 + Chronická 3 + Chronická 4 $\geq 25\%$	Chronická 4

^a K vysvětlení součinitele M viz 2.4.4.6.4.

- 2.4.4.6.4 Směsi s velmi toxickými složkami

Složky Akutní 1 nebo Chronická 1 s akutními toxicitami značně pod 1 mg/l a/nebo chronickými toxicitami značně pod 0,1 mg/l (nejsou-li rychle odbouratelné) a 0,01 mg/l (jsou-li rychle odbouratelné) mohou ovlivnit toxicitu směsi a dává se jim při použití součtové metody zvýšená váha. Jestliže směs obsahuje složky klasifikované jako kategorie akutní 1 nebo chronická 1, musí se aplikovat vícevrstvý přístup popsany v odstavcích 2.4.4.6.2 a 2.4.4.6.3 za použití váženého součtu získaného vynásobením koncentrací složek kategorií Akutní 1 a Chronická 1 součinitelem, namísto jen pouhého sečtení procentních podílů. To znamená, že koncentrace „akutní 1“ v levém sloupci tabulky 2.4.4.6.2.4 a koncentrace „chronická 1“ v levém sloupci tabulky 2.4.4.6.3.4 se vynásobí příslušným násobným

součinitelem. Násobné součinitele, které se musí použít pro tyto složky, jsou definovány za použití hodnoty toxicity, jak je to sumárně uvedeno v tabulce 2.4.4.6.4 dále. Z tohoto důvodu musí být osoba klasifikující směs, která obsahuje složky akutní 1 a/nebo chronická¹, informována o hodnotě součinitele M, aby mohla použít součtovou metodu. Alternativně smí být použit aditivní vzorec (viz 2.4.4.5.2), pokud jsou k dispozici údaje o toxicitě pro všechny velmi toxické složky ve směsi a existuje přesvědčivý důkaz, že všechny ostatní složky, včetně těch, pro něž nejsou k dispozici specifické údaje o akutní a/nebo chronické toxicitě, mají malou nebo nemají žádnou toxicitu a nepřispívají významným způsobem k nebezpečí, které směs představuje pro životní prostředí.

Tabulka 2.4.4.6.4: Násobné součinitele pro velmi toxické složky směsí

Akutní toxicita	Součini- tel M	Chronická toxicita	Součini- tel M	Součini- tel M
Hodnota L(E)C ₅₀		Hodnota NOEC	Složky NRD ^a	Složky RD ^b
0,1 < L(E)C ₅₀ ≤ 1	1	0,01 < NOEC ≤ 0,1	1	-
0,01 < L(E)C ₅₀ ≤ 0,1	10	0,001 < NOEC ≤ 0,01	10	1
0,001 < L(E)C ₅₀ ≤ 0,01	100	0,0001 < NOEC ≤ 0,001	100	10
0,0001 < L(E)C ₅₀ ≤ 0,001	1 000	0,00001 < NOEC ≤ 0,0001	1 000	100
0,00001 < L(E)C ₅₀ ≤ 0,0001	10 000	0,000001 < NOEC ≤ 0,00001	10 000	1 000
(pokračuje v intervalech součinitele 10)		(pokračuje v intervalech součinitele 10)		

^a Nejsou rychle odbouratelné.

^b Rychle odbouratelné.

2.4.4.6.5

Klasifikace směsí se složkami bez použitelných informací

V případě, že nejsou pro jednu nebo více důležitých složek žádné použitelné informace o jejich akutní a/nebo chronické vodní toxicitě, usuzuje se, že směsi nemůže být přisouzena(y) definitivní kategorie nebezpečí (a). V této situaci se směs klasifikuje na základě známých složek.

ČÁST 3**SEZNAMY NEBEZPEČNÝCH VĚCÍ, ZVLÁŠTNÍ USTANOVENÍ
A VYNĚTÍ Z PLATNOSTI PRO OMEZENÁ A VYŇATÁ
MNOŽSTVÍ**

KAPITOLA 3.1

VŠEOBECNĚ

3.1.1 Úvod

Vedle ustanovení, která jsou uvedena v tabulkách této části, nebo na která se odkazuje, je nutno dbát všeobecných ustanovení každé části, kapitoly a/nebo oddílu. Tato všeobecná ustanovení nejsou v tabulkách uvedena. Jestliže všeobecné ustanovení je v rozporu se zvláštním ustanovením, má zvláštní ustanovení přednost.

3.1.2 Oficiální pojmenování pro přepravu

POZNÁMKA.: *K oficiálním pojmenováním používaným pro přepravu vzorků viz 2.1.4.1.*

3.1.2.1 Oficiální pojmenování pro přepravu je tou částí položky, která věci uvedené v tabulce A kapitoly 3.2 nejpřesněji popisuje, a je napsáno velkými písmeny (číslice, řecká písmena a údaje napsané malými písmeny "sec", "terc", "m", "n", "o", a "p" jsou nedílnou součástí pojmenování). Údaje týkající se tenze par (tp) a bodu varu (bv) ve sloupci (2) tabulky C v kapitole 3.2 jsou součástí oficiálního pojmenování pro přepravu. Za hlavním oficiálním pojmenováním pro přepravu může být uvedeno v závorkách alternativní oficiální pojmenování pro přepravu. V tabulce A je natištěno velkými písmeny v závorkách [např. ETHANOL (ETHYLALKOHOL)]. V tabulce C je natištěno jinými písmeny (např. ACETONITRIL (metalciánid)). Části názvu položky, které jsou psány malými písmeny, se nepovažují za součást oficiálního pojmenování pro přepravu, když není předtím uvedeno jinak.

3.1.2.2 Je-li pod jedním číslem UN uvedena kombinace několika odlišných oficiálních pojmenování, a tato jsou oddělena spojkami „a“ nebo „nebo“ malými písmeny nebo jsou oddělena čárkami, v přepravním dokladu a na značkách kusu musí být uvedeno jen to nevhodnější. Následující příklady znázorňují postup při výběru oficiálního pojmenování pro přepravu v takových případech:

- (a) UN 1057 ZAPALOVAČE nebo NÁDOBKY S NÁPLNÍ DO ZAPALOVAČŮ – jako oficiální pojmenování pro přepravu se použije to z uvedených pojmenování, které je nevhodnější:

ZAPALOVAČE
NÁDOBKY S NÁPLNÍ DO ZAPALOVAČŮ;

- (b) UN 2793 KOVY ŽELEZNÉ JAKO TŘÍSKY PŘI VRTÁNÍ, FRÉZOVÁNÍ, SOUSTRUŽENÍ, ODPADY ve formě schopné samoohřevu. Oficiální pojmenování pro přepravu je nevhodnější z následujících kombinací:

KOVY ŽELEZNÉ JAKO TŘÍSKY PŘI VRTÁNÍ
KOVY ŽELEZNÉ JAKO TŘÍSKY PŘI FRÉZOVÁNÍ
KOVY ŽELEZNÉ JAKO TŘÍSKY PŘI SOUSTRUŽENÍ
KOVY ŽELEZNÉ ODPADY

3.1.2.3 Oficiální pojmenování pro přepravu může být použito v jednotném nebo množném čísle, jak je to vhodné. Kromě toho, pokud oficiální pojmenování pro přepravu obsahuje blíže určující pojmy, je pořadí těchto pojmů v přepravním dokladu nebo na značkách kusů libovolné. Například smí být namísto "DIMETHYLAMIN, VODNÝ ROZTOK" alternativně udáno "VODNÝ ROZTOK DIMETHYLAMINU". Pro věci třídy 1 mohou být použity obchodní nebo vojenské názvy, které obsahují oficiální pojmenování pro přepravu doplněné dodatečným popisným textem.

3.1.2.4 Mnoho látek má položku jak pro kapalný, tak i tuhý stav (viz definice kapaliny a tuhé látky v 1.2.1), nebo pro tuhou látku a roztok. Jsou jim přidělena různá UN čísla, která nemusí nutně následovat po sobě¹.

¹ *Upřesnění jsou uvedena v abecedním seznamu (tabulka B, kapitola 3.2), např.:*

NITROXYLENY, KAPALNÉ	6.1	1665
NITROXYLENY, TUHÉ	6.1	3447

3.1.2.5 Je-li látka, která je podle definice uvedené v oddílu 1.2.1 látkou tuhou, podávána k přepravě v roztaveném stavu, doplní se oficiální pojmenování pro přepravu upřesňujícím slovem "ROZTAVENÝ", pokud toto slovo není již uvedeno velkými písmeny v pojmenování obsaženém v tabulce A nebo tabulce C kapitoly 3.2 (například ALKYLFENOL, TUHÝ, J.N., ROZTAVENÝ).

3.1.2.6 S výjimkou samovolně se rozkládajících látek a organických peroxidů, a pokud není slovo „STABILIZOVANÝ“ již velkými písmeny uvedeno v pojmenování obsaženém ve sloupci (2) tabulky A kapitoly 3.2, musí být toto slovo doplněno jako součást oficiálního pojmenování pro přepravu látky, která by bez stabilizace nebyla připuštěna k přepravě podle pododdílů 2.2.X.2 z důvodu své náchylnosti nebezpečně reagovat za normálních podmínek přepravy (např. LÁTKA TOXICKÁ, KAPALNÁ, ORGANICKÁ, J.N., STABILIZOVANÁ“).

Je-li ke stabilizaci takových látek použito řízení teploty k zamezení vzniku nebezpečného přetlaku, nebo vyvíjení nadměrného tepla, nebo je-li použita chemická stabilizace v kombinaci s řízením teploty, pak:

- (a) pro kapaliny a tuhé látky: je-li SAPT¹ (měřena s inhibitorem nebo bez něho, použije-li se chemická stabilizace) menší nebo rovna SAPT předepsané v 2.2.41.1.21, platí ustanovení v 2.2.41.1.17, zvláštní ustanovení 386 kapitoly 3.3, 7.1.7, zvláštní ustanovení V8 kapitoly 7.2 ADR, zvláštní ustanovení S4 kapitoly 8.5 ADR a požadavky kapitoly 9.6 ADR, s výjimkou toho, že pojem „SADT“ používaný v těchto odstavcích zahrnuje také „SAPT“, pokud je dotyčná látka náchylná k polymerizaci;
- (b) Pokud není již zahrnuto ve velkých písmenech v názvu uvedeném ve sloupci (2) tabulky A v kapitole 3.2, je nutno vložit jako součást oficiálního pojmenování slova „S ŘÍZENÍM TEPLoty“;
- (c) pro plyny: podmínky přepravy musí být schváleny příslušným orgánem.

3.1.2.7 Hydráty smějí být přepravovány pod oficiálním pojmenováním pro přepravu pro bezvodou látku.

3.1.2.8 Druhov^é položky nebo “ jinde nejmenované “ (J.N.) položky

3.1.2.8.1 Druhov^á a “J.N.” oficiální pojmenování pro přepravu, u nichž je ve sloupci (6) tabulky A kapitoly 3.2 uvedeno zvláštní ustanovení 274 nebo 318 nebo poznámka 27 ve sloupci (20) tabulky C v kapitole 3.2, musí být doplněna technickým názvem věci, pokud jeho zveřejnění nezakazují vnitrostátní předpisy nebo mezinárodní dohoda u látek podléhajících kontrole. Pro výbušné látky a předměty třídy 1 může být popis nebezpečných věcí doplněn dodatečným popisným textem uvádějícím obchodní nebo vojenské názvy. Technické názvy musí být uvedeny v závorkách hned za oficiálním pojmenováním pro přepravu. Rovněž je možno použít vhodný modifikátor, jako „obsahuje“ nebo „obsahující“, nebo jiná upřesňující slova, jako „směs“, „roztok“ atd., a procentní podíl technické složky. Např. „UN 1993 LÁTKA HOŘLAVÁ, KAPALNÁ, J.N. (OBSAHUJE XYLEN A BENZEN), 3,II“.

3.1.2.8.1.1 Technickým názvem musí být uznávaný chemický název nebo biologický název nebo jiný název běžně používaný ve vědeckých a technických publikacích, časopisech a textech. Obchodní názvy nesmějí být k tomuto účelu používány. U pesticidů se smějí používat jen obvyklé názvy ISO, jiné názvy uvedené v publikaci Světové zdravotnické organizace (WHO) Recommended Classification of Pesticides by Hazard and Guidelines to Classification anebo pojmenování jejich aktivní látky (aktivních látek).

3.1.2.8.1.2 Pokud je směs nebezpečných věcí nebo předmětů obsahujících nebezpečné věci popsána jedním z “J.N.” nebo “druhovými” položkami, kterým bylo přiděleno speciální ustanovení 274 ve sloupci (6) tabulky A v kapitole 3.2, není potřeba uvádět více než dvě složky, které převážně přispívají k nebezpečí nebo nebezpečím směsi nebo předmětů, kromě regulovaných látek, kdy jej jejich rozkrytí zakázáno vnitrostátním předpisem nebo mezinárodní smlouvou. Je-li kus, který směs obsahuje, opatřen značka nebezpečí, která označuje vedlejší nebezpečí, musí být jedním z obou v závorkách udaných technických názvů název komponentu, který vyžaduje použití značky nebezpečí pro vedlejší nebezpečí.

POZNÁMKA: Viz 5.4.1.2.2.

3.1.2.8.1.3 Následující příklady ukazují, jakým způsobem se u J.N. položek doplňují oficiální pojmenování pro přepravu technickým názvem věcí:

¹ K definici teploty samourychlující se polymerace (SAPT) viz 1.2.1.

UN 2902 PESTICID KAPALNÝ, TOXICKÝ, J.N. (drazoxolon).

UN 3394 LÁTKA ORGANOKOVOVÁ, KAPALNÁ, PYROFORNÍ, REAGUJÍCÍ S VODOU (trimethylgalium).

UN 3540 PŘEDMĚTY OBSAHUJÍCÍ HOŘLAVOU KAPALINU, J.N. (pyrolidin).

- 3.1.2.8.1.4 Pouze pro UN 3077 a 3082 může být technickým názvem pojmenování, které je uvedeno velkými písmeny ve sloupci 2 tabulky A kapitoly 3.2, za předpokladu, že tento název neobsahuje „J.N.“, a že látka nemá přiřazené zvláštní ustanovení 274. Musí být použito pojmenování, které nejhodněji popisuje látku nebo směs např.:

UN 3082 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, KAPALNÁ, J.N. (BARVA)

UN 3082 LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, KAPALNÁ, J.N., (VÝROBKY KOSMETICKÉ)

- 3.1.2.8.1.5 (Vypuštěno)

3.1.3 Roztoky nebo směsi

POZNÁMKA: *Je-li látka zvlášť jmenovitě uvedena v tabulce A kapitoly 3.2, musí být při přepravě identifikována oficiálním pojmenováním pro přepravu uvedeným ve sloupci (2) tabulky A kapitoly 3.2. Taková látka smí obsahovat technické nečistoty (například takové, které pocházejí z výrobního procesu) nebo přísady pro stabilizaci nebo jiné účely, které neovlivňují její klasifikaci. Avšak látka jmenovitě uvedená, která obsahuje technické nečistoty nebo přísady pro stabilizaci nebo jiné účely ovlivňující její klasifikaci, musí být považována za roztok nebo směs (viz 2.1.3.3).*

- 3.1.3.1 Roztok nebo směs nepodléhá ADN, jestliže charakteristiky, vlastnosti, forma nebo fyzikální stav roztoku nebo směsi jsou takové, že nesplňuje kritéria, včetně kritérií lidské zkušenosti, pro zařazení do některé třídy.

- 3.1.3.2 Roztok nebo směs splňující klasifikační kritéria ADN složená z jedné převažující látky, jmenovitě uvedené v tabulce A kapitoly 3.2, a z jedné nebo více látek nepodléhající(ch) ADN, a/nebo stopových množství jedné nebo více látek jmenovitě uvedených v tabulce A kapitoly 3.2, musí být přiřazeny k UN číslu a oficiálnímu pojmenování pro přepravu převažující látky, jmenovitě uvedené v tabulce A kapitoly 3.2, ledaže:

- roztok nebo směs je jmenovitě uveden(a) v tabulce A kapitoly 3.2;
- pojmenování a popis látky jmenovitě uvedené v tabulce A kapitoly 3.2 výslovně vyjadřují, že se vztahují jen na čistou látku;
- třída, klasifikační kód, obalová skupina nebo fyzikální stav tohoto roztoku nebo směsi jsou odlišné od třídy, klasifikačního kódu, obalové skupiny nebo fyzikálního stavu látky jmenovitě uvedené v tabulce A kapitoly 3.2; nebo
- charakteristiky nebezpečnosti a vlastnosti roztoku nebo směsi vyžadují opatření v případě nehody nebo nouzové situace, která jsou odlišná od opatření vyžadovaných pro látku jmenovitě uvedenou v tabulce A kapitoly 3.2.

Upřesňující slova jako „ROZTOK“ nebo „SMĚS“, jak je to náležité, musí být doplněna jako součást oficiálního pojmenování pro přepravu, například „ACETON, ROZTOK“. Kromě toho smí být uvedena za základním popisem směsi nebo roztoku také jejich koncentrace, například „ACETON, 75 % ROZTOK“.

- 3.1.3.3 Roztok nebo směs splňující klasifikační kritéria ADN, který (která) není jmenovitě uveden(a) v tabulce A kapitoly 3.2 a který (která) je složen(a) z jedné nebo více nebezpečných látek, musí být přiřazen(a) k položce, která má oficiální pojmenování pro přepravu, popis, třídu, klasifikační kód a obalovou skupinu, které nejpřesněji popisují roztok nebo směs.

KAPITOLA 3.2

SEZNAM NEBEZPEČNÝCH VĚCÍ

3.2.1 Tabulka A: Seznam nebezpečných věcí v číselném pořadí

Vysvětlivky k tabulce A:

Každý řádek v tabulce A se týká zpravidla látky (látek) nebo předmětu (předmětů), které jsou zahrnuty pod určité UN číslo nebo identifikační číslo. Jestliže však látky nebo předměty, které náleží ke stejnému UN číslu nebo identifikačním číslu, mají rozdílné chemické nebo fyzikální vlastnosti a/nebo přepravní podmínky, může být pro toto UN číslo nebo identifikační číslo použito více po sobě jdoucích řádků.

Každý ze sloupců tabulky A je věnován určitému tématu, jak je uvedeno v následujících vysvětlujících poznámkách. Průsečík sloupců a řádků (buňka) obsahuje informace týkající se tématu, o kterém se v tomto sloupci pojednává, pro látku(y) nebo předmět(y) tohoto řádku:

- první čtyři buňky identifikují látku(y) nebo předmět(y) patřící k tomuto řádku (dodatečné informace v tomto ohledu mohou být uvedeny ve zvláštních ustanoveních sloupce (6));
- následující buňky udávají platná zvláštní ustanovení, buď ve formě úplné informace, nebo ve formě kódu. Kódy odkazují na detailní informace, které je možno nalézt pod čísly uvedenými v následujících vysvětlujících poznámkách. Prázdná buňka znamená, buď že není žádné zvláštní ustanovení a že platí pouze všeobecná ustanovení, anebo že platí omezení přepravy uvedené v platných vysvětlujících poznámkách. Je-li v této tabulce použit alfanumerický kód začínající písmeny „ZU“ označuje zvláštní ustanovení kapitoly 3.3.

Jednotlivé buňky neobsahují odvolávky na platná všeobecná ustanovení.

Vysvětlující poznámky pro každý sloupec:

Sloupec (1) „UN číslo/identifikační číslo“

Tento sloupec obsahuje UN číslo nebo identifikační číslo:

- nebezpečné látky nebo předmětu, jestliže této látce nebo předmětu bylo přiděleno vlastní specifické UN číslo nebo identifikační číslo, nebo
- druhové položky nebo j.n. položky, k níž musí být přiřazeny jmenovitě neuvedené nebezpečné látky nebo předměty podle kritérií („rozhodovacích stromů“) části 2.

Sloupec (2) „Pojmenování a popis“

Tento sloupec obsahuje pojmenování látky nebo předmětu, napsané velkými písmeny, pokud této látce nebo předmětu bylo přiděleno vlastní specifické UN číslo nebo identifikační číslo, nebo pojmenování druhové položky nebo j.n. položky, ke které byly nebezpečné látky nebo předměty přiřazeny podle kritérií („rozhodovacích stromů“) části 2. Toto pojmenování musí být použito jako oficiální pojmenování pro přepravu, popřípadě jako část oficiálního pojmenování pro přepravu (pro další podrobnosti k oficiálnímu pojmenování pro přepravu viz 3.1.2).

Za oficiálním pojmenováním pro přepravu je malými písmeny připojen popisný text k upřesnění rozsahu platnosti položky, pokud mohou být klasifikace a/nebo přepravní podmínky látky nebo předmětu za určitých okolností rozdílné.

Sloupec (3a) „Třída“

Tento sloupec obsahuje číslo třídy, pod jejíž název spadá nebezpečná látka nebo předmět. Toto číslo třídy se přiřazuje podle postupů a kritérií části 2.

Sloupec (3b)	<p>„Klasifikační kód“</p> <p>Tento sloupec obsahuje klasifikační kód nebezpečné látky nebo předmětu.</p> <ul style="list-style-type: none"> - Pro nebezpečné látky nebo předměty třídy 1 sestává kód z čísla podtřídy a písmena skupiny snášenlivosti, které jsou přiřazeny podle postupů a kritérií uvedených v 2.2.1.1.4. - Pro nebezpečné látky nebo předměty třídy 2 sestává kód z číslice a písmena nebo písmen pro skupinu nebezpečných vlastností, které jsou vysvětleny v 2.2.2.1.2 a 2.2.2.1.3. - Pro nebezpečné látky nebo předměty tříd 3, 4.1, 4.2, 4.3, 5.1, 5.2, 6.1, 6.2 a 9 jsou kódy vysvětleny v 2.2.x.1.2¹⁾. - Pro nebezpečné věci nebo předměty třídy 8 jsou kódy vysvětleny v 2.2.8.1.4.1; - Nebezpečné látky nebo předměty třídy 7 nemají klasifikační kód.
Sloupec (4)	<p>„Obalová skupina“</p> <p>Tento sloupec obsahuje číslo(a) obalové skupiny (I, II nebo III), která je k nebezpečné látce přiřazena. Tato čísla obalových skupin jsou přiřazena na základě postupů a kritérií uvedených v části 2. Některým předmětům a látkám není přiřazena žádná obalová skupina.</p>
Sloupec (5)	<p>„Bezpečnostní značky“</p> <p>Tento sloupec obsahuje číslo vzoru bezpečnostních značek/ velkých bezpečnostních značek (viz 5.2.2.2 a 5.3.1.1.7), které se musí umístit na kusy, kontejnery, cisternové kontejnery, přemístitelné cisterny, MEGC, vozidla a železniční vozy. Avšak:</p> <ul style="list-style-type: none"> - pro látky nebo předměty třídy 7 znamená "7X" vzor bezpečnostní značky č. 7A, 7B, popř. 7C v závislosti na kategorii (viz 5.1.5.3.4 a 5.2.2.1.11.1) nebo velkou bezpečnostní značku č. 7D (viz 5.3.1.1.3 a 5.3.1.1.7.2). <p>Všeobecná ustanovení pro umístění bezpečnostních značek a velkých bezpečnostních značek (např. počet bezpečnostních značek nebo jejich umístění) jsou obsažena pro kusy v pododdílu 5.2.2.1 a pro kontejnery, cisternové kontejnery, MEGC, přemístitelné cisterny, vozidla a železniční vozy v oddílu 5.3.1.</p> <p>POZNÁMKA: Výše uvedená ustanovení o označování bezpečnostními značkami nebo velkými bezpečnostními značkami mohou být pozměněna zvláštními ustanoveními uvedenými ve sloupci (6).</p>
Sloupec (6)	<p>„Zvláštní ustanovení“</p> <p>Tento sloupec obsahuje číselné kódy zvláštních ustanovení, která je nutno dodržet. Tato ustanovení postihují široký okruh témat, která souvisejí hlavně s obsahem sloupců (1) až (5) (např. zákazy přepravy, vynětí z platnosti některých požadavků, vysvětlivky ke klasifikaci určitých forem dotyčných nebezpečných věcí, jakož i dodatečná ustanovení pro označování nápisy a bezpečnostními značkami), a jsou uvedena v kapitole 3.3 v číselném pořadí. Je-li sloupec (6) prázdný, neplatí pro dotyčné nebezpečné věci ve vztahu k obsahu sloupců (1) až (5) žádné zvláštní ustanovení. Zvláštní ustanovení specifická pro vnitrozemskou plavbu začínají od 800.</p>

¹⁾ X = číslo třídy nebezpečné látky nebo předmětu, popřípadě bez tečky.

Sloupec (7a)	„Omezená množství“
Sloupec (7b)	<p>Tento sloupec obsahuje nejvyšší množství na vnitřní obal nebo předmět pro přepravu nebezpečných věcí v omezených množstvích podle kapitoly 3.4.</p> <p>„Vyňatá množství“</p> <p>Tento sloupec obsahuje alfanumerický kód s následujícím významem:</p> <ul style="list-style-type: none">- „E0“ znamená, že pro nebezpečné věci zabalené ve vyňatých množstvích neplatí žádné vyloučení z platnosti ustanovení ADN;- všechny ostatní alfanumerické kódy začínající písmenem „E“ znamenají, že ustanovení ADN neplatí, pokud jsou splněny podmínky uvedené v kapitole 3.5
Sloupec (8)	<p>„Přeprava schválena“</p> <p>Tento sloupec obsahuje alfabetycké kódy týkající se dovolené formy přepravy vnitrozemskými plavidly.</p> <p>Je-li sloupec (8) prázdný, látka nebo předmět směřují být přepravovány jen v kusech.</p> <p>Obsahuje-li sloupec (8) kód „B“, přeprava je povolena v kusech nebo ve volně loženém stavu (viz 7.1.1.11).</p> <p>Obsahuje-li sloupec (8) kód „T“, přeprava je povolena v kusech a tankovými plavidly. V případě přepravy tankovými plavidly platí požadavky tabulky C (viz 7.2.1.21).</p>
Sloupec (9)	<p>„Požadovaná výbava“</p> <p>Tento sloupec obsahuje alfanumerické kódy pro výbavu požadovanou pro přepravu nebezpečných věcí nebo předmětů (viz 8.1.5).</p>
Sloupec (10)	<p>„Větrání“</p> <p>Tento sloupec obsahuje alfanumerické kódy zvláštních požadavků na větrání platných pro přepravu s tímto významem:</p> <ul style="list-style-type: none">- alfanumerické kódy začínající písmeny „VE“ znamenají, že se na přepravu vztahují zvláštní dodatečné podmínky. Tyto se nacházejí v 7.1.6.12 a stanoví zvláštní požadavky.
Sloupec (11)	<p>„Ustanovení pro nakládku, vykládku a přepravu“</p> <p>Tento sloupec obsahuje alfanumerické kódy zvláštních požadavků platných pro přepravu s tímto významem:</p> <ul style="list-style-type: none">- alfanumerické kódy začínající písmeny „CO“, „ST“ a „RA“ znamenají, že se zvláštní dodatečné podmínky vztahují na přepravu ve volně loženém stavu. Tyto se nacházejí v 7.1.6.11 a stanoví zvláštní požadavky.- alfanumerické kódy začínající písmeny „LO“ znamenají, že platí zvláštní dodatečné podmínky před nakládkou. Tyto se nacházejí v 7.1.6.13 a stanoví zvláštní požadavky.- alfanumerické kódy začínající písmeny „HA“ znamenají, že platí zvláštní dodatečné podmínky pro manipulaci a ukládání nákladu. Tyto se nacházejí v 7.1.6.14 a stanoví zvláštní požadavky.- alfanumerické kódy začínající písmeny „IN“ znamenají, že platí zvláštní dodatečné podmínky pro inspekci nákladových prostorů během přepravy nákladu. Tyto se nacházejí v 7.1.6.16 a stanoví zvláštní požadavky.

- Sloupec (12) „Počet modrých kuželů/světél“
- Tento sloupec obsahuje počet kuželů/světél, které by měly tvořit označení plavidla během přepravy této nebezpečné látky nebo předmětu (viz 7.1.5).
- Sloupec (13) „Dodatečné požadavky/Poznámky“
- Tento sloupec obsahuje dodatečné požadavky nebo poznámky týkající se přepravy této nebezpečné látky nebo předmětu.

3.2.2 Tabulka B: Abecední seznam nebezpečných věcí

Dále uvedená tabulka B obsahuje abecední seznam látek a předmětů, které jsou vyjmenovány v pořadí UN čísel v tabulce A oddílu 3.2.1. Netvoří nedílnou část ADN. Byl vypracován s potřebným úsilím sekretariátem Evropské hospodářské komise OSN k účelům usnadnění konzultací příloh A a B k ADN, ale nemůže v žádném případě nahradit ustanovení uvedeného předpisu, která v případě rozporu platí a která proto musí být pečlivě ověřena a dodržena.

POZNÁMKA 1: Pro účel určení abecedního pořadí čísel nebyla brána v úvahu řecká písmena, písmena „n“, „N“, „o“ (ortho), „m“ (meta), „p“ (para), zkratky „sec“ a „terc“ ani předložky, přestože jsou součástí oficiálního pojmenování pro přepravu. Nebyla brána v úvahu ani množná čísla ani zkratka „J.N“ (jinde nejmenované).

POZNÁMKA 2: Pojmenování látky nebo předmětu uvedené velkými písmeny je platné oficiální pojmenování pro přepravu (viz 3.1.2).

POZNÁMKA 3: Pojmenování látky nebo předmětu uvedené velkými písmeny, následované slovem „viz“ určuje možné alternativní oficiální pojmenování pro přepravu nebo část oficiálního pojmenování pro přepravu (kromě PCB) (viz 3.1.2.1).

POZNÁMKA 4: Je-li pojmenování látky nebo předmětu napsáno malými písmeny a je následováno slovem „viz“, nejde o oficiální pojmenování pro přepravu, nýbrž o synonymum.

POZNÁMKA 5: Je-li pojmenování částečně napsáno velkými písmeny a částečně malými písmeny, část napsaná malými písmeny se nepovažuje za součást oficiálního pojmenování pro přepravu (viz 3.1.2.1).

POZNÁMKA 6: Pro účely dokumentace a označování kusů je možno použít oficiální pojmenování pro přepravu v jednotném nebo množném čísle, jak je to vhodné (viz 3.1.2.3).

POZNÁMKA 7: K přesnému určení oficiálního pojmenování pro přepravu viz 3.1.2.

LÁTKA HOŘLAVÁ, TUHÁ, TOXICKÁ, ANORGANICKÁ, J.N.	3179	4.1	
LÁTKA HOŘLAVÁ, TUHÁ, TOXICKÁ, ORGANICKÁ, J.N.	2926	4.1	
LÁTKA HOŘLAVÁ, TUHÁ, ŽÍRAVÁ, ANORGANICKÁ, J.N.	3180	4.1	
LÁTKA HOŘLAVÁ, TUHÁ, ŽÍRAVÁ, ORGANICKÁ, J.N.	2925	4.1	
LÁTKA INFEKČNÍ, NEBEZPEČNÁ pouze PRO ZVÍŘATA	2900	6.2	
LÁTKA INFEKČNÍ, NEBEZPEČNÁ PRO LIDI	2814	6.2	
Látka kapalná, která podléhá předpisům platným pro leteckou dopravu, j.n.	3334	9	Není předmětem ADN
LÁTKA KOVOVÁ, REAGUJÍCÍ S VODOU, J.N.	3208	4.3	
LÁTKA KOVOVÁ, REAGUJÍCÍ S VODOU, SCHOPNÁ SAMOOHŘEVU, J.N.	3209	4.3	
LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, KAPALNÁ, J.N.	3082	9	

Pojmenování a popis	Číslo UN/ číslo látky	Třída	Dodatečné požadavky/ poznámky
LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, KAPALNÁ, J.N.	9006		Nebezpečná pouze pokud je přepravována v tankových plavidlech
LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, TUHÁ, J.N.	3077	9	
LÁTKA OHROŽUJÍCÍ ŽIVOTNÍ PROSTŘEDÍ, TUHÁ, J.N., ROZTAVENÁ	9005		Nebezpečná pouze pokud je přepravována v tankových plavidlech
LÁTKA PODPORUJÍCÍ HOŘENÍ, KAPALNÁ, J.N.	3139	5.1	
LÁTKA PODPORUJÍCÍ HOŘENÍ, KAPALNÁ, TOXICKÁ, J.N.	3099	5.1	
LÁTKA PODPORUJÍCÍ HOŘENÍ, KAPALNÁ, ŽÍRAVÁ, J.N.	3098	5.1	
LÁTKA PODPORUJÍCÍ HOŘENÍ, TUHÁ, HOŘLAVÁ, J.N.	3137	5.1	Přeprava zakázána
LÁTKA PODPORUJÍCÍ HOŘENÍ, TUHÁ, J.N.	1479	5.1	
LÁTKA PODPORUJÍCÍ HOŘENÍ, TUHÁ, REAGUJÍCÍ S VODOU, J.N.	3121	5.1	
LÁTKA PODPORUJÍCÍ HOŘENÍ, TUHÁ, SCHOPNÁ SAMOOHŘEVU, J.N.	3100	5.1	Přeprava zakázána
LÁTKA PODPORUJÍCÍ HOŘENÍ, TUHÁ, TOXICKÁ, J.N.	3087	5.1	
LÁTKA PODPORUJÍCÍ HOŘENÍ, TUHÁ, ŽÍRAVÁ, J.N.	3085	5.1	
LÁTKA PRO PŘÍPRAVU SLZNÉHO PLYNU, KAPALNÁ, J.N.	1693	6.1	
LÁTKA PRO PŘÍPRAVU SLZNÉHO PLYNU, TUHÁ, J.N.	3448	6.1	
LÁTKA PYROFORNÍ, KAPALNÁ, ANORGANICKÁ, J.N.	3194	4.2	
LÁTKA PYROFORNÍ, KAPALNÁ, ORGANICKÁ, J.N.	2845	4.2	
LÁTKA PYROFORNÍ, TUHÁ, ANORGANICKÁ, J.N.	3200	4.2	
LÁTKA PYROFORNÍ, TUHÁ, ORGANICKÁ, J.N.	2846	4.2	
LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, jiná než štěpná nebo vyjmutá štěpná	2978	7	
LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, ŠTĚPNÁ	2977	7	
LÁTKA RADIOAKTIVNÍ, HEXAFLUORID URANU, VYJMUTÝ KUS, obsahující méně než 0,1 kg látky na balení, jiná než štěpná nebo vyjmutá štěpná	3507	8	
LÁTKA RADIOAKTIVNÍ, KUS TYPU A, jiné než zvláštní formy, jiná než štěpná nebo vyjmutá štěpná	2915	7	
LÁTKA RADIOAKTIVNÍ, KUS TYPU A, ŠTĚPNÁ, jiné než zvláštní formy	3327	7	
LÁTKA RADIOAKTIVNÍ, KUS TYPU A, ZVLÁŠTNÍ FORMY, jiné než štěpná nebo vyjmutá štěpná	3332	7	
LÁTKA RADIOAKTIVNÍ, KUS TYPU A, ZVLÁŠTNÍ FORMY, ŠTĚPNÁ	3333	7	
LÁTKA RADIOAKTIVNÍ, KUS TYPU B (M), jiná než štěpná nebo vyjmutá štěpná	2917	7	
LÁTKA RADIOAKTIVNÍ, KUS TYPU B (M), ŠTĚPNÁ	3329	7	
LÁTKA RADIOAKTIVNÍ, KUS TYPU B (U), jiná než štěpná nebo vyjmutá štěpná	2916	7	
LÁTKA RADIOAKTIVNÍ, KUS TYPU B (U), ŠTĚPNÁ	3328	7	
LÁTKA RADIOAKTIVNÍ, KUS TYPU C, jiná než štěpná nebo vyjmutá štěpná	3323	7	
LÁTKA RADIOAKTIVNÍ, KUS TYPU C, ŠTĚPNÁ	3330	7	

Pojmenování a popis	Číslo UN/ číslo látky	Třída	Dodatečné požadavky/ poznámky
LÁTKA RADIOAKTIVNÍ, POVRCHOVĚ KONTAMINOVANÉ PŘEDMĚTY (SCO-I nebo SCO-II), ŠTĚPNÉ	3326	7	
LÁTKA RADIOAKTIVNÍ, POVRCHOVĚ KONTAMINOVANÉ PŘEDMĚTY (SCO-I, SCO-II nebo SCO-III), jiné než štěpné nebo vyjmuté štěpné	2913	7	
LÁTKA RADIOAKTIVNÍ, PŘEPRAVOVANÁ ZA ZVLÁŠTNÍCH PODMÍNEK, jiná než štěpná nebo vyjmutá štěpná	2919	7	
LÁTKA RADIOAKTIVNÍ, PŘEPRAVOVANÁ ZA ZVLÁŠTNÍCH PODMÍNEK, ŠTĚPNÁ	3331	7	
LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-I), jiná než štěpná nebo vyjmutá štěpná	2912	7	
LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-II), jiná než štěpná nebo vyjmutá štěpná	3321	7	
LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-II), ŠTĚPNÁ	3324	7	
LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-III), jiná než štěpná nebo vyjmutá štěpná	3322	7	
LÁTKA RADIOAKTIVNÍ, S NÍZKOU SPECIFICKOU AKTIVITOU (LSA-III), ŠTĚPNÁ	3325	7	
LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS - OMEZENÁ MNOŽSTVÍ	2910	7	
LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS - PRÁZDNÝ OBAL	2908	7	
LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS - PŘÍSTROJE nebo VÝROBKY	2911	7	
LÁTKA RADIOAKTIVNÍ, VYJMUTÝ KUS - VÝROBKY Z PŘÍRODNÍHO URANU nebo OCHUZENÉHO URANU nebo PŘÍRODNÍHO THORIA	2909	7	
LÁTKA REAGUJÍCÍ S VODOU, KAPALNÁ, J.N.	3148	4.3	
LÁTKA REAGUJÍCÍ S VODOU, KAPALNÁ, TOXICKÁ, J.N.	3130	4.3	
LÁTKA REAGUJÍCÍ S VODOU, KAPALNÁ, ŽÍRAVÁ, J.N.	3129	4.3	
LÁTKA REAGUJÍCÍ S VODOU, TUHÁ, HOŘLAVÁ, J.N.	3132	4.3	
LÁTKA REAGUJÍCÍ S VODOU, TUHÁ, J.N.	2813	4.3	
LÁTKA REAGUJÍCÍ S VODOU, TUHÁ, PODPORUJÍCÍ HOŘENÍ, J.N.	3133	4.3	Přeprava zakázána
LÁTKA REAGUJÍCÍ S VODOU, TUHÁ, SCHOPNÁ SAMOOHŘEVU, J.N.	3135	4.3	
LÁTKA REAGUJÍCÍ S VODOU, TUHÁ, TOXICKÁ, J.N.	3134	4.3	
LÁTKA REAGUJÍCÍ S VODOU, TUHÁ, ŽÍRAVÁ, J.N.	3131	4.3	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, KAPALNÁ, TYP B	3221	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, KAPALNÁ, TYP B, S ŘÍZENÍM TEPLoty	3231	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, KAPALNÁ, TYP C	3223	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, KAPALNÁ, TYP C, S ŘÍZENÍM TEPLoty	3233	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, KAPALNÁ, TYP D	3225	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, KAPALNÁ, TYP D, S ŘÍZENÍM TEPLoty	3235	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, KAPALNÁ, TYP E	3227	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, KAPALNÁ, TYP E, S ŘÍZENÍM TEPLoty	3237	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, KAPALNÁ, TYP F	3229	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, KAPALNÁ, TYP F, S ŘÍZENÍM TEPLoty	3239	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, TUHÁ, TYP B	3222	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, TUHÁ, TYP B, S ŘÍZENÍM TEPLoty	3232	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, TUHÁ, TYP C	3224	4.1	

Pojmenování a popis	Číslo UN/ číslo látky	Třída	Dodatečné požadavky/ poznámky
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, TUHÁ, TYP C, S ŘÍZENÍM TEPLoty	3234	4.1	
LÁTKA SAMOVOLNĚ SE ROZKLÁDAJÍCÍ, TUHÁ, TYP D	3226	4.1

TETRAHYDRIDOBORITAN HLINITÝ	2870	4.2	

Pojmenování a popis	Číslo UN/ číslo látky	Třída	Dodatečné požadavky/ poznámky
TETRAHYDRIDOBORITAN HLINITÝ V PŘÍSTROJÍCH	2870	4.2	
TETRAHYDRIDOBORITAN LITHNÝ	1413	4.3	
TETRAHYDRIDOBORITAN SODNÝ	1426	4.3	
TETRAHYDRIDOBORITAN SODNÝ A HYDROXID SODNÝ, ROZTOK, obsahující nejvýše 12 % hm. tetrahydridoboritanu sodného a nejvýše 40 % hm. hydroxidu sodného	3320	8	
TETRAHYDRIDOHLINITAN LITHNÝ	1410	4.3	
TETRAHYDRIDOHLINITAN LITHNÝ, V ETHERU	1411	4.3	
TETRAHYDRIDOHLINITAN SODNÝ	2835	4.3	
1,2,3,6-TETRAHYDROBENZALDEHYD	2498	3	
TETRAHYDROFTALANHYDRIDY, obsahující více než 0,05 % maleinanhydridu	2698	8	
TETRAHYDROFURAN	2056	3	
TETRAHYDROFURFURYLAMIN	2943	3	
1,2,3,6-TETRAHYDROPYRIDIN	2410	3	
TETRAHYDROTHIOFEN	2412	3	
1,1,1,2-TETRACHLORETHAN	1702	6.1	
TETRACHLORETHYLEN	1897	6.1	
TETRACHLORMETHAN	1846	6.1	
TETRACHLORSILAN (chlorid křemičitý)	1818	8	
TETRAKARBONYL NIKLU	1259	6.1	
TETRAMER PROPYLENU	2850	3	
TETRAMETHYLAMONIUMHYDROXID, ROZTOK	1835	8	
TETRAMETHYLAMONIUM-HYDROXID, TUHÝ	3423	8	
TETRAMETHYLSILAN	2749	3	
TETRANITROANILIN	0207	1	
TETRANITROMETHAN	1510	6.1	
TETRAPROPYLORTHOTITANÁT	2413	3	
1H-TETRAZOL	0504	1	
4-THIAPENTANAL	2785	6.1	
THIOFEN	2414	3	
THIOFENOL (fenylmerkaptan)	2337	6.1	
THIOFOSGEN	2474	6.1	
THIOGLYKOL	2966	6.1	
THIOKYANÁT RTUŤNATÝ	1646	6.1	
THIOLY (merkaptany), KAPALNÉ, HOŘLAVÉ, J.N. nebo SMĚS THIOLŮ (merkaptanů), KAPALNÁ, HOŘLAVÁ, J.N.	3336	3	
THIOLY (merkaptany), KAPALNÉ, HOŘLAVÉ, TOXICKÉ, J.N. nebo SMĚSI THIOLŮ (směsi merkaptanů), KAPALNÉ, HOŘLAVÉ, TOXICKÉ, J.N.	1228	3	
THIOLY (merkaptany), KAPALNÉ, TOXICKÉ, HOŘLAVÉ, J.N. nebo SMĚSI THIOLŮ (merkaptanů), KAPALNÉ, TOXICKÉ, HOŘLAVÉ, J.N.	3071	6.1	
TINKTURY, LÉKAŘSKÉ	1293	3	
TITAN - HOUBA, ČÁSTICE nebo TITAN - HOUBA, PRÁŠEK	2878	4.1	
TITAN, PRÁŠEK, SUCHÝ	2546	4.2	
TITAN, PRÁŠEK, VLHČENÝ nejméně 25 % vody	1352	4.1	
TOLUEN	1294	3	
TOLUENDIISOKYANÁT (2,4 - TOLUENDIISOKYANÁT)	2078	6.1	
TOLUIDINY, KAPALNÉ	1708	6.1	

Pojmenování a popis	Číslo UN/ číslo látky	Třída	Dodatečné požadavky/ poznámky
TOLUIDINY, TUHÉ	3451	6.1	
2,4-TOLUYLENDIAMIN, ROZTOK	3418	6.1	
2,4-TOLUYLENDIAMIN, TUHÝ	1709	6.1	
TORPÉDA, S KAPALNÝM PALIVEM, s inertní hlavicí	0450	1	
TORPÉDA, S KAPALNÝM PALIVEM, s nebo bez trhací náplně	0449	1	
TORPÉDA, s trhací náplní	0329	1	
TORPÉDA, s trhací náplní	0330	1	
TORPÉDA, s trhací náplní	0451	1	
TOXINY, ZÍSKANÉ Z ŽIVÝCH ORGANISMŮ, KAPALNÉ, J.N.	3172	6.1	
TOXINY, ZÍSKANÉ Z ŽIVÝCH ORGANISMŮ, TUHÉ, J.N.	3462	6.1	
Tremolit viz	2212	9	
TRHAVÉ NÁLOŽKY, výbušné	0043	1	
TRHAVINA, TYP A	0081	1	
TRHAVINA, TYP B	0082	1	
TRHAVINA, TYP B	0331	1	
TRHAVINA, TYP C	0083	1	
TRHAVINA, TYP D	0084	1	
TRHAVINA, TYP E	0241	1	
TRHAVINA, TYP E	0332	1	
TRIALLYLAMIN	2610	3	
TRIALLYLBORÁT	2609	6.1	
TRIBUTYLAMIN	2542	6.1	
TRIBUTYLFOSFAN	3254	4.2	
TRIETHYLAMIN	1296	3	
TRIETHYLBORÁT	1176	3	
TRIETHYLENTETRAMIN	2259	8	
TRIETHYLFOSFIT	2323	3	
TRIFLUORACETYLCHLORID	3057	2	
1,1,1-TRIFLUORETHAN (PLYN JAKO CHLADICÍ PROSTŘEDEK R 143a)	2035	2	
TRIFLUORMETHAN (PLYN JAKO CHLADICÍ PROSTŘEDEK R 23)	1984	2	
TRIFLUORMETHAN, HLUBOCE ZCHLAZENÝ, KAPALNÝ	3136	2	
2-TRIFLUORMETHYLANILÍN	2942	6.1	
3-TRIFLUORMETHYLANILÍN	2948	6.1	
TRICHLORACETYLCHLORID	2442	8	
TRICHLORBENZENY, KAPALNÉ	2321	6.1	
TRICHLORBUTEN	2322	6.1	
1,1,1-TRICHLORETHAN	2831	6.1	
TRICHLORETHYLEN	1710	6.1	
TRICHLORID VANADYLU (OXYCHLORID VANADIČITÝ)	2443	8	
TRICHLORSILAN	1295	4.3	
TRIISOBUTYLEN	2324	3	
TRIISOPROPYLBORÁT	2616	3	
TRIKRESYLFOSFÁT, s více než 3 % ortho-isomerů	2574	6.1	
TRIMETHYLACETYLCHLORID	2438	6.1	
TRIMETHYLAMIN, BEZVODÝ	1083	2	
TRIMETHYLAMIN, VODNÝ ROZTOK, s nejvýše 50 % hm. trimethylaminu	1297	3	

Pojmenování a popis	Číslo UN/ číslo látky	Třída	Dodatečné požadavky/ poznámky
1,3,5-TRIMETHYLBENZEN	2325	3	
TRIMETHYLBORÁT	2416	3	
TRIMETHYLCYKLOHEXYLAMIN	2326	8	
TRIMETHYLFOSFIT	2329	3	
TRIMETHYLHEXAMETHYLEN-DIAMINY	2327	8	
TRIMETHYLHEXAMETHYLEN-DIISOKYANÁT (a isomerní směsi)	2328	6.1	
TRIMETHYLCHLORSILAN	1298	3	
TRINITROANILIN (PIKRAMID)	0153	1	
TRINITROANISOL	0213	1	
TRINITROBENZEN, suchý nebo vlhčený méně než 30 % hm. vody	0214	1	
TRINITROBENZEN, VLNĚNÝ nejméně 30 % hm. vody	1354	4.1	
TRINITROBENZEN, vlhčený, nejméně 10 % hm. vody	3367	4.1	
TRINITROFENETOL	0218	1	
TRINITROFENOL (Kyselina pikrová), suchý nebo vlhčený méně než 30 % hm. vody	0154	1	
TRINITROFENOL (Kyselina pikrová), vlhčený (á) nejméně 10 % hm. vody	3364	4.1	
TRINITROFENOL, VLNĚNÝ nejméně 30 % hm. vody	1344	4.1	
TRINITROFENYLMETHYLNITRAMIN (TETRYL)	0208	1	
TRINITROFLUORENON	0387	1	
TRINITROCHLORBENZEN (PIKRYLCHLORID)	0155	1	
TRINITROCHLORBENZEN (PIKRYLCHLORID), vlhčený nejméně 10 % hm. vody	3365	4.1	
TRINITRO-m-KRESOL	0216	1	
TRINITRONAFTALEN	0217	1	
TRINITRORESORCIN (Kyselina styfnová), suchý nebo vlhčený méně než 20 % hm. vody nebo směsí alkoholu s vodou	0219	1	
TRINITRORESORCIN (Kyselina styfnová), VLNĚNÝ(-Á) nejméně 20 % hm. vody (nebo směsí alkoholu s vodou)	0394	1	
TRINITRORESORCINÁT OLOVNATÝ, VLNĚNÝ nejméně 20 % hm. vody nebo směsí alkoholu s vodou	0130	1	
TRINITROTOLUEN (TNT) A TRINITROBENZEN, SMĚS nebo TRINITROTOLUEN (TNT) A HEXANITROSTILBEN, SMĚS	0388	1	
TRINITROTOLUEN (TNT) VE SMĚSI S TRINITROBENZENEM A HEXANITROSTILBENEM	0389	1	
TRINITROTOLUEN (TNT), suchý nebo vlhčený méně než 30 % hm. vody	0209	1	
TRINITROTOLUEN (TNT), vlhčený nejméně 10 % hm. vody	3366	4.1	
TRINITROTOLUEN, VLNĚNÝ nejméně 30 % hm. vody	1356	4.1	
TRIPROPYLAMIN	2260	3	
TRIPROPYLEN	2057	3	
TRIPROPYLEN	2057	3	
TRIS-(1-AZIRIDINYL)-FOSFINOXID, ROZTOK	2501	6.1	
TRIS-(1-AZIRIDINYL)-FOSFINOXID, ROZTOK	2501	6.1

KAPITOLA 3.3

ZVLÁŠTNÍ USTANOVENÍ PRO URČITÉ LÁTKY NEBO PŘEDMĚTY

3.3.1

Dále jsou uvedena zvláštní ustanovení odpovídající číslům udaným ve sloupci (6) tabulky A kapitoly 3.2 pro látku nebo předmět, na které se tato zvláštní ustanovení vztahují. Pokud některé zvláštní ustanovení zahrnuje požadavek na značení kusů, musí být dodržena ustanovení uvedená v 5.2.1.2 (a) a (b). Jestliže je předepsaná značka ve formě zvláštního textu uvedeného v uvozovkách, např. jako „LITHIOVÉ BATERIE PRO LIKVIDACI“, musí být velikost značky nejméně 12 mm, není-li stanoveno jinak ve zvláštním ustanovení nebo jinde v ADN.

- 16 Vzorky nových nebo již existujících výbušných látek nebo předmětů, které jsou přepravovány mimo jiné k pokusným, klasifikačním, výzkumným a vývojovým účelům, k účelům kontroly kvality nebo jako obchodní vzorky, smějí být přepravovány podle požadavků příslušného orgánu (viz 2.2.1.1.3). Hmotnost výbušných vzorků, které nejsou navlhčeny nebo znečitlivěny, je omezena do 10 kg na malý kus podle požadavků příslušného orgánu. Hmotnost výbušných vzorků, které jsou navlhčeny nebo znečitlivěny, je omezena do 25 kg.
- 23 I když tato látka vykazuje nebezpečí hořlavosti, to se projeví jen v podmínkách velmi silného požáru v uzavřeném prostoru.
- 32 Tato látka nepodléhá předpisům ADN, pokud je v jakékoli jiné formě.
- 37 Tato látka nepodléhá předpisům ADN, jestliže je pokryta (potažena).
- 38 Tato látka nepodléhá předpisům ADN, jestliže obsahuje nejvýše 0,1 % křemíku vápenatého.
- 39 Tato látka nepodléhá předpisům ADN, jestliže obsahuje méně než 30 %, nebo nejméně 90 % křemíku.
- 43 Pokud jsou tyto látky podány k přepravě jako pesticidy, musí být přepravovány pod příslušnou položkou pro pesticidy a podle platných ustanovení pro pesticidy (viz 2.2.61.1.10 až 2.2.61.1.11.2).
- 45 Sulfidy a oxidy antimonu s obsahem nejvýše 0,5 % arzenu, vztaženo na celkovou hmotnost, nepodléhají předpisům ADN.
- 47 Ferrikyanidy a ferrokyanidy nepodléhají předpisům ADN.
- 48 Obsahuje-li tato látka více než 20 % kyanovodíku, není připuštěna k přepravě.
- 59 Tyto látky nepodléhají předpisům ADN, jestliže obsahují nejvýše 50 % hořčíku.
- 60 Činí-li koncentrace více než 72 %, není tato látka připuštěna k přepravě.
- 61 Technický název, kterým musí být doplněno oficiální pojmenování pro přepravu, musí být obvyklý název dovolený ISO (viz též normu ISO 1750: 1981 "*Pesticidy a jiné zemědělské chemikálie – obvyklé názvy*" v platném znění), jiné názvy uvedené v publikaci Světové zdravotnické organizace (WHO) "*Recommended Classification of Pesticides by Hazard and Guidelines to Classification*" anebo pojmenování aktivní látky (viz také 3.1.2.8.1 a 3.1.2.8.1.1).
- 62 Tato látka nepodléhá předpisům ADN, jestliže obsahuje nejvýše 4 % hydroxidu sodného.
- 65 Vodné roztoky peroxidu vodíku s méně než 8 % peroxidu vodíku nepodléhají předpisům ADN.
- 66 Rumělka nepodléhá ustanovením ADN.
- 103 Dusitaný amonný a směs anorganického dusitanu se solí amonnou nejsou připuštěny k přepravě.
- 105 Nitrocelulóza odpovídající popisům UN čísel 2556 nebo 2557 může být přiřazena ke třídě 4.1.

- 113 Chemicky nestálé směsi nejsou přípustněny k přepravě.
- 119 Chladicí stroje zahrnují stroje nebo jiná zařízení, které byly zkonstruovány ke specifickému účelu udržovat potraviny nebo jiné výrobky ve vnitřním prostoru na nízké teplotě, jakož i klimatizační jednotky. Chladicí stroje a součásti chladicích strojů nepodléhají předpisům ADN, pokud obsahují méně než 12 kg plynu třídy 2, skupiny A nebo O podle 2.2.2.1.3, nebo pokud obsahují méně než 12 litrů roztoku amoniaku (UN číslo 2672).
- 122 Vedlejší nebezpečí a popřípadě řízená teplota a kritická teplota, jakož i UN čísla (druhé položky) pro každý z již zařazených přípravků organických peroxidů jsou uvedeny v pododdílu 2.2.52.4, 4.1.4.2 pokynu pro balení IBC520 a 4.2.5.2.6 pokynu pro přemístitelné cisterny T23 ADR.
- 123 (Vyhrazeno)
- 127 Smí být použito jiné inertní látky nebo jiné inertní směsi látek, za předpokladu, že tyto látky mají stejné flegmatizační vlastnosti.
- 131 Flegmatizační látka musí být podstatně méně citlivá než suchý PETN.
- 135 Hydratovaná sodná sůl kyseliny dichlorisokyanurové nesplňuje kritéria pro zařazení do třídy 5.1 a nepodléhá ustanovením ADN, pokud nesplňuje kritéria pro zařazení do jiné třídy.
- 138 p-brombenzylkyanid nepodléhá předpisům ADN.
- 141 Látky, které byly podrobeny dostatečnému tepelnému zpracování tak, že během přepravy nepředstavují žádné nebezpečí, nepodléhají předpisům ADN.
- 142 Moučka sójových bobů, která je extrahovaná rozpouštědlem, obsahující nejvýše 1,5 % oleje a 11 % vlhkosti a neobsahující prakticky žádné hořlavé rozpouštědlo, nepodléhá předpisům ADN.
- 144 Vodný roztok s nejvýše 24 % obj. alkoholu nepodléhá předpisům ADN.
- 145 Alkoholické nápoje obalové skupiny III nepodléhají předpisům ADN, jestliže jsou přepravovány v nádobách o vnitřním objemu nejvýše 250 litrů.
- 152 Zařazení této látky závisí na velikosti částic a obalu, mezní hodnoty však dosud nebyly zkouškami určeny. Odpovídající zařazení musí být provedeno podle požadavků oddílu 2.2.1.
- 153 Tato položka platí jen, jestliže bylo na základě zkoušek prokázáno, že tyto látky ve styku s vodou nejsou hořlavé, nevykazují tendenci k samovznícení a vyvinutá směs plynů není hořlavá.
- 163 Látka jmenovitě uvedená v tabulce A kapitoly 3.2 nesmí být přepravována pod touto položkou. Látky, které jsou přepravovány pod touto položkou, smí obsahovat nejvýše 20 % nitrocelulózy, za podmínky, že nitrocelulóza neobsahuje více než 12,6 % dusíku (v suché hmotě).
- 168 Azbest, který je ponořen nebo fixován v přírodním nebo umělém pojivu (jako je cement, plast, asfalt, pryskyřice nebo minerály) tak, aby během přepravy nemohlo dojít k uvolnění nebezpečného množství vdechovatelných azbestových vláken, nepodléhá předpisům ADN. Hotové výrobky, které obsahují azbest a tento požadavek nesplňují, nepodléhají předpisům ADN, jestliže jsou zabaleny tak, že během přepravy nemůže dojít k uvolnění nebezpečného množství vdechovatelných azbestových vláken.
- 169 Anhydrid kyseliny ftalové v tuhém stavu a tetrahydroftalanhydridy s nejvýše 0,05 % maleinanhydridu nepodléhají předpisům ADN. Anhydrid kyseliny ftalové, roztavený při teplotě vyšší, než je jeho bod vzplanutí, s nejvýše 0,05 % maleinanhydridu, musí být přiřazen k UN číslu 3256.
- 172 Má-li radioaktivní látka vedlejší nebezpečí:
- (a) látka musí být přiřazena k obalové skupině I, II nebo III, pokud je to nutné, za použití kritérií pro obalové skupiny obsažených v části 2 podle povahy převažujícího vedlejšího nebezpečí;

- (b) kusy musí být označeny bezpečnostními značkami odpovídajícími každému vedlejšímu nebezpečí přestavovanému touto látkou; odpovídající velké bezpečnostní značky se umístí na nákladní dopravní (přepravní) jednotky podle příslušných ustanovení oddílu 5.3.1;
- (c) pro účely dokumentace a označování kusů musí být oficiální pojmenování pro přepravu doplněno pojmenováním složek, které převažujícím způsobem přispívají k tomuto (těmto) vedlejšímu (vedlejším) nebezpečí(m) a které musí být uvedeny v závorkách;
- (d) v přepravním dokladu pro nebezpečné věci musí být uvedeno(a) číslo(a) vzoru(ů) bezpečnostních značek odpovídající každému vedlejšímu nebezpečí, v závorkách za číslem třídy „7“ a tam, kde je přiřazena, také obalová skupina, jak je vyžadováno podle 5.4.1.1.1 (d).

K balení viz také 4.1.9.1.5 ADR.

- 177 Síran barya nepodléhá předpisům ADN.
- 178 Toto pojmenování smí být použito jen tehdy, není-li v tabulce A kapitoly 3.2 obsaženo jiné vhodné pojmenování a jen se souhlasem příslušného orgánu země původu (viz 2.2.1.1.3).
- 181 Kusy s touto látkou musí být opatřeny bezpečnostní značkou podle vzoru č.1 (viz 5.2.2.2.2), ledaže by příslušný orgán země původu souhlasil s odchylkou pro specifický obal, neboť usoudil na základě výsledků zkoušek, že látka v takovém obalu nemá výbušnou povahu (viz 5.2.2.1.9).
- 182 Skupina alkalických kovů zahrnuje prvky lithium, sodík, draslík, rubidium a cesium.
- 183 Skupina kovů alkalických zemin zahrnuje prvky hořčík, vápník, stroncium a baryum.
- 186 (Vypuštěno)
- 188 Články a baterie podávané k přepravě nepodléhají jiným ustanovením ADN, jestliže jsou splněny následující požadavky:
- (a) pro články s kovem lithia nebo slitinou lithia je obsah lithia nejvýše 1 g a pro články s ionty lithia je watt hodinová zatížitelnost nejvýše 20 Wh;
Poznámka: Pokud jsou lithiové baterie odpovídající 2.2.9.1.7 (f) přepravovány v souladu s tímto zvláštním ustanovením, nesmí celkový obsah lithia ve všech kovových lithiových článkách obsažených v baterii překročit 1,5 g a celková kapacita všech článků lithiových iontů v baterii nesmí překročit 10 Wh (viz zvláštní ustanovení 387).
 - (b) pro baterii s kovem lithia nebo slitinou lithia je celkový obsah lithia nejvýše 2 g a pro baterii s ionty lithia je watt hodinová zatížitelnost nejvýše 100 Wh. Baterie s ionty lithia podléhající tomuto ustanovení musí mít na vnější skříni vyznačenu watt hodinovou zatížitelnost, kromě těch, které byly vyrobeny před 1. lednem 2009;
Poznámka: Pokud jsou lithiové baterie odpovídající 2.2.9.1.7 (f) přepravovány v souladu s tímto zvláštním ustanovením, nesmí celkový obsah lithia ve všech kovových lithiových článkách obsažených v baterii překročit 1,5 g a celková kapacita všech článků lithiových iontů v baterii nesmí překročit 10 Wh (viz zvláštní ustanovení 387).
 - (c) každý článek nebo baterie splňuje ustanovení uvedená v 2.9.1.7 (a), (e), (f) jak je to nutné, a (g);
 - (d) články a baterie, s výjimkou těch, které jsou zabudovány v zařízeních, musí být zabaleny ve vnitřních obalech, které zcela uzavírají článek nebo baterii. Články a baterie musí být chráněny tak, aby se zamezilo zkratům. Toto zahrnuje ochranu proti dotyku s elektricky vodivými materiály uvnitř téhož obalu, který by mohl vést ke zkratu. Vnitřní obaly musí být zabaleny do pevných vnějších obalů, které vyhovují ustanovením pododdílů 4.1.1.1, 4.1.1.2 a 4.1.1.5 ADR;
 - (e) články a baterie, které jsou zabudovány v zařízeních, musí být chráněny před poškozením a zkratem a zařízení musí být vybaveno účinnými prostředky zabráňujícím jeho náhodnému uvedení do činnosti. Tento požadavek se nevztahuje na zařízení, která jsou záměrně aktivní v dopravě (vysílače vysokofrekvenční identifikace (RFID), hodiny, snímače atd.) a která nejsou schopna generovat nebezpečné vyvíjení tepla. Jsou-li baterie zabudovány v zařízeních, musí být tato zařízení zabalena do pevných vnějších obalů vyrobených z vhodného materiálu přiměřené pevnosti a konstrukce vzhledem

k vnitřnímu objemu obalů a jejich zamýšlenému použití, ledaže je baterii poskytnuta rovnocenná ochrana zařízení, v němž je obsažena;

- (f) Každý kus musí být označen příslušnou značkou pro lithiové baterie, zobrazenou v 5.2.1.9;

Tento požadavek neplatí pro:

- (i) kusy obsahující pouze knoflíkové baterie zabudované v zařízení (včetně obvodových desek); a
- (ii) kusy obsahující nejvýše čtyři články nebo dvě baterie zabudované v zařízení, pokud zásilka neobsahuje více než dva takové kusy.

Jsou-li kusy umístěny v přepravním obalovém souboru, musí být značka pro lithiové baterie buď zřetelně viditelná, nebo musí být umístěna na vnější straně přepravního obalového souboru a přepravní obalový soubor musí být označen slovy "PŘEPRAVNÍ OBALOVÝ SOUBOR". Výška písma označení "PŘEPRAVNÍ OBALOVÝ SOUBOR" musí být alespoň 12 mm.

Poznámka: Kusy obsahující lithiové baterie balené v souladu s ustanoveními části 4 kapitoly 11, pokynu pro balení 965 nebo 968 oddílu IB technických pokynů ICAO, které jsou opatřeny značkou uvedenou v 5.2.1.9 (značka pro lithiové baterie) a bezpečnostní značkou uvedenou v 5.2.2.2.2, vzor č. 9A se považuje za splňující ustanovení tohoto zvláštního ustanovení.

- (g) S výjimkou případů, kdy jsou články nebo baterie zabudovány v zařízeních, musí být každý kus schopen odolat zkoušce volným pádem z výšky 1,2 m ve všech orientacích bez poškození článků nebo baterií v něm obsažených, bez posunutí obsahu, které by dovolilo, aby se dostaly do styku baterie s baterií (nebo článek s článkem), a bez uvolnění obsahu; a
- (h) S výjimkou případů, kdy jsou články nebo baterie zabudovány v zařízeních nebo s nimi zabaleny, nesmějí kusy překročit 30 kg celkové (brutto) hmotnosti.

Ve výše uvedených požadavcích a v celé ADN se rozumí pod „obsahem lithia“ hmotnost lithia na anodě článku s kovem lithia nebo slitinou lithia. V tomto zvláštním ustanovení se výrazem „zařízení“ rozumí zařízení, pro které lithiové články nebo baterie poskytují elektrickou energii pro jeho provoz.

Existují zvláštní položky pro baterie s kovem lithia a pro baterie s ionty lithia, aby se usnadnila přeprava těchto baterií jednotlivými způsoby přepravy, a aby se umožnila aplikace rozdílných činností při zásazích v nouzových situacích.

Jednočlávková baterie, jak je definována v části III, pododdílu 38.3.2.3 *Příručky zkoušek a kritérií*, se považuje za „článek“ a musí být pro účely tohoto zvláštního ustanovení přepravována podle požadavků na „články“.

- 190 Aerosoly musí být opatřeny ochranou proti neúmyslnému vyprázdnění. Aerosoly o vnitřním objemu nejvýše 50 ml, které obsahují jen netoxické látky, nepodléhají předpisům ADN.
- 191 Malé nádobky (kartuše) na plyn o vnitřním objemu nejvýše 50 ml, které obsahují jen netoxické látky, nepodléhají předpisům ADN.
- 193 Tuto položku lze použít pouze pro směsná hnojiva na bázi dusičnanu amonného. Klasifikují se v souladu s postupem stanoveným v Příručce zkoušek a kritérií, část III, oddíl 39. Hnojiva splňující kritéria pro toto UN číslo podléhají požadavkům ADN pouze v případě, že jsou přepravována ve volně loženém stavu.
- 194 Řízená teplota a kritická teplota, pokud je, jakož i UN číslo (druhá položka) pro každou již zařazenou samovolně se rozkládající látku jsou uvedeny v pododdílu 2.2.41.4.
- 196 Pod touto položkou smějí být přepravovány přípravky, které při laboratorních zkouškách nedetonují v kavitovaném stavu ani nedeflagrují, které nevykazují žádný účinek při zahřívání v uzavřeném prostoru a které neprojevují žádnou výbušnou sílu. Přípravek musí být také tepelně stálý (tj. SADT je 60 oC nebo vyšší pro kus o 50 kg). Přípravky, které nespĺňují tato kritéria, musí být přepravovány podle ustanovení třídy 5.2 (viz 2.2.52.4).

- 198 Roztoky nitrocelulózy s nejvýše 20 % nitrocelulózy mohou být přepravovány jako barvy, kosmetické výrobky, popřípadě tiskařské barvy (viz UN čísla 1210, 1263, 1266, 3066, 3469 a 3470).
- 199 Sloučeniny olova, které, jsou-li jsou smíchány v poměru 1:1000 s kyselinou solnou 0,07 M a míchají se po dobu jedné hodiny při teplotě 23 ± 2 °C, přičemž vykazují rozpustnost nejvýše 5 %, (viz normu ISO 3711 :1990 „Barviva na bázi chromátu a chromomolybdatu olova – požadavky a zkoušky“) se považují za nerozpustné a nepodléhají předpisům ADN, pokud nesplňují kritéria pro zařazení do jiné třídy.
- 201 Zapalovače a nádoby s náplní do zapalovačů musí splňovat předpisy státu, v němž byly naplněny. Musí být opatřeny ochranou proti neúmyslnému vyprázdnění. Kapalná část plynu nesmí překročit 85 % vnitřního objemu nádoby při 15 °C. Nádoby včetně svých uzávěrů musí být schopny odolat vnitřnímu tlaku, který se rovná dvojnásobku tlaku zkapalněného ropného plynu při 55 °C. Ventilový mechanismus a zažehovací zařízení musí být bezpečným způsobem uzavřeny, přelepeny páskou nebo jinak upevněny, nebo zkonstruovány tak, aby se zamezilo činnosti nebo uniku obsahu během přepravy. Zapalovače nesmějí obsahovat více než 10 g zkapalněného ropného plynu. Nádoby s náplní do zapalovačů nesmějí obsahovat více než 65 g zkapalněného ropného plynu.
- POZNÁMKA:** *K odpadovým zapalovačům shromažďovaným jednotlivě viz kapitulu 3.3, zvláštní ustanovení 654.*
- 203 Tato položka nesmí být použita pro polychlorované bifenyly, kapalné, UN čísla 2315 a polychlorované bifenyly, tuhé, UN čísla 3432.
- 204 (Vypuštěno)
- 205 Tato položka nesmí být použita pro UN 3155 PENTACHLORFENOL.
- 207 Plastové polymery pro odlévání mohou být vyrobeny z polystyrénu, polymethylmethakrylátu nebo jiného polymerického materiálu.
- 208 Obchodně běžná forma hnojiva na bázi dusičnanu vápenatého, sestávající zejména z dvojitých solí (dusičnan vápenatý a dusičnan amonný), obsahující nejvýše 10 % dusičnanu amonného a nejméně 12 % krystalové vody, nepodléhá předpisům ADN.
- 210 Toxiny z rostlin, zvířat nebo bakterií, které obsahují infekční látky, nebo toxiny, které jsou obsaženy v infekčních látkách, musí být přiřazeny ke třídě 6.2.
- 215 Tato položka platí jen pro technicky čistou látku nebo přípravky s touto látkou, které mají SADT vyšší než 75 °C; neplatí proto pro přípravky, které jsou látkami samovolně se rozkládajícími (k samovolně se rozkládajícím látkám viz pododdíl 2.2.41.4). Homogenní směsi obsahující nejvýše 35 % hm. azodikarbonamidu a nejméně 65 % inertní látky nepodléhají ustanovením ADN, ledaže jsou splněna kritéria jiných tříd.
- 216 Směsi tuhých látek, které nepodléhají předpisům ADN, s hořlavými kapalinami smějí být přepravovány pod touto položkou bez toho, aby byla předtím použita klasifikační kritéria třídy 4.1, za podmínky, že v době nakládky věcí nebo v době uzavírání obalu, nebo nákladní dopravní (přepravní) jednotky není viditelná žádná volná kapalina. Zatavené balíčky a předměty obsahující méně než 10 ml hořlavé kapaliny obalové skupiny II nebo III, absorbované v tuhém materiálu, nepodléhají ADN, za podmínky, že v balíčku nebo předmětu není žádná volná kapalina.
- 217 Směsi tuhých látek, které nepodléhají předpisům ADN, s toxickými kapalinami smějí být přepravovány pod touto položkou bez toho, aby byla předtím použita klasifikační kritéria třídy 6.1, za podmínky, že v době nakládky věcí nebo v době uzavírání obalu, nebo nákladní dopravní (přepravní) jednotky není viditelná žádná volná kapalina. Tato položka nesmí být použita pro tuhé látky, které obsahují kapalinu obalové skupiny I.
- 218 Směsi tuhých látek, které nepodléhají předpisům ADN, s žravými kapalinami smějí být přepravovány pod touto položkou, bez toho, aby byla předtím použita klasifikační kritéria třídy 8, za podmínky, že v době nakládky věcí nebo uzavírání obalu, nebo nákladní dopravní (přepravní) jednotky není viditelná žádná volná kapalina.

- 219 Geneticky změněné mikroorganismy (GMMO) a geneticky změněné organismy (GMO) zabalené a označené podle pokynu pro balení P904 pododdílu 4.1.4.1 ADR nepodléhají žádným dalším ustanovením ADN.
- Jestliže GMMO a GMO splňují kritéria pro zařazení do třídy 6.1 nebo 6.2 (viz 2.2.61.1 a 2.2.62.1) vztahují se na ně ustanovení ADN pro přepravu toxických látek nebo infekčních látek.
- 220 Bezprostředně za oficiálním pojmenováním pro přepravu je nutno udat v závorce pouze technický název hořlavé kapaliny, která je součástí tohoto roztoku nebo směsi.
- 221 Látky, které spadají pod tuto položku, nesmějí náležet k obalové skupině I.
- 224 Látka musí zůstat za normálních přepravních podmínek kapalnou, ledaže by mohlo být zkouškami prokázáno, že látka není ve zmrzlém stavu citlivější než v kapalném stavu. Při teplotách vyšších než $-15\text{ }^{\circ}\text{C}$ nesmí zmrznout.
- 225 Hasicí přístroje, které spadají pod tuto položku, smějí být vybaveny ke svému uvedení do činnosti náložkami (náložky pro technické účely klasifikačního kódu 1.4C nebo 1.4 S) beze změny zařazení do třídy 2, skupiny A nebo O podle 2.2.2.1.3, za podmínky, že celkové množství deflagrační (hnací) výbušné látky nepřekročí 3,2 g na hasicí přístroj.
- Hasicí přístroje musí být vyrobeny, odzkoušeny, schváleny a označeny podle předpisů platných v zemi výroby.
- POZNÁMKA:** „Předpisy platné v zemi výroby“ znamená předpisy platné v zemi výroby nebo předpisy platné v zemi použití.
- Hasicí přístroje pod touto položkou zahrnují:
- (a) přenosné hasicí přístroje pro ruční manipulaci a použití;
 - (b) hasicí přístroje pro instalaci v letadlech;
 - (c) hasicí přístroje na kolech pro ruční manipulaci;
 - (d) protipožární zařízení nebo přístroje namontované na kolech nebo na kolovém podvozku nebo na dopravním prostředku podobném (malému) přívěsu; a
 - (e) hasicí přístroje sestávající z nepojízdného tlakového sudu a příslušenství a manipulované např. vidlicovým vozíkem nebo jeřábem, jsou-li nakládány nebo vykládány.
- POZNÁMKA:** Tlakové nádoby, které obsahují plyny pro použití ve výše uvedených hasicích přístrojích nebo pro použití ve stacionárních protipožárních zařízeních, musí splňovat požadavky kapitoly 6.2 ADR a všechny požadavky vztahující se na příslušné nebezpečné věci, jsou-li tyto tlakové nádoby přepravovány samostatně.
- 226 Přípravky této látky, které obsahují nejméně 30 % neprchavého, nehořlavého flegmatizačního prostředku, nepodléhají předpisům ADN.
- 227 Při znečistivění vodou a anorganickou inertní látkou nesmí obsah dusičnanu močoviny překročit 75 % hm. a směs nesmí být možno přivést k výbuchu zkouškami typu a) série 1 Příručky zkoušek a kritérií, částí I.
- 228 Směsi, které neodpovídají kritériím pro hořlavé plyny (viz 2.2.2.1.5), musí být přepravovány pod UN číslem 3163.
- 230 Lithiové články a baterie smějí být přepravovány pod touto položkou, jestliže splňují ustanovení uvedená v 2.2.9.1.7.
- 235 Tato položka platí pro předměty, které obsahují výbušné látky třídy 1 a které mohou obsahovat také nebezpečné věci jiných tříd. Tyto předměty jsou používány ke zvýšení bezpečnosti ve vozidlech, plavidlech nebo letadlech – např. plynové generátory airbagů, moduly airbagů, předpínače bezpečnostních pásů a pyromechanické prostředky.
- 236 Vícesložkové polyesterové pryskyřice sestávají ze dvou složek: základního materiálu (třídy 3 nebo třídy 4.1, obalové skupiny II nebo III) a aktivátoru (organický peroxid). Organický peroxid musí být typu D, E nebo F, nevyžadujícího řízení teploty. Obalová skupina musí být II nebo III podle kritérií buď pro třídu 3, nebo pro třídu 4.1, jak je to patřičné, vztahujících se na základní materiál. Množstevní limit uvedený ve sloupci (7a) tabulky A kapitoly 3.2 platí pro základní materiál.

- 237 Membránové filtry, včetně oddělovacích papírových listů, povlaků nebo zesilujících materiálů atd., tak jak jsou podávány k přepravě, nesmějí být schopné přenést výbuch, jsou-li podrobeny jedné ze zkoušek série 1, typu a) Příručky zkoušek a kritérií, části 1.
- Mimo to může příslušný orgán na základě výsledků vhodných zkoušek rychlosti hoření se zohledněním standardních zkoušek dle Příručky zkoušek a kritérií, části III, pododdílu 33.2 rozhodnout, že membránové filtry z nitrocelulózy ve formě, ve které jsou podávány k přepravě, nepodléhají platným ustanovením pro hořlavě tuhé látky třídy 4.1.
- 238 (a) Akumulátory se považují za bezpečné proti vytečení, jestliže jsou schopny odolat, bez úniku akumulátorové kapaliny, níže uvedené vibrační a tlakové zkoušky.
- Vibrační zkouška:** akumulátor je pevně přichycen na desce vibračního přístroje, která je vystavena jednoduchému sinusovému pohybu o amplitudě 0,8 mm (1,6 mm celkového výkyvu). Frekvence se bude měnit ve stupních po 1 Hz/min. mezi 10 Hz a 55 Hz. Celé pásmo frekvencí se projde v obou směrech v 95 ± 5 minutách pro každou upevňovací pozici akumulátoru (tj. pro každý směr vibrací). Akumulátor se zkouší ve třech vzájemně kolmých polohách (a zejména v poloze, při které se plnicí a odvzdušňovací otvory, pokud jsou, nacházejí v převrácené poloze) po tutéž dobu.
- Tlaková zkouška:** v návaznosti na vibrační zkoušku se akumulátor vystaví při teplotě $24 \text{ }^\circ\text{C} \pm 4 \text{ }^\circ\text{C}$ po dobu 6 hodin rozdílovému tlaku nejméně 88 kPa. Akumulátor se zkouší ve třech navzájem kolmých polohách (a zejména v poloze, při které se plnicí a odvzdušňovací otvory, pokud jsou, nacházejí v převrácené poloze) po dobu nejméně 6 hodin v každé poloze.
- (b) Akumulátory bezpečné proti vytečení nepodléhají předpisům ADN, jestliže při teplotě $55 \text{ }^\circ\text{C}$ elektrolyt nevyteče z rozbité nebo prasklé skříně a není žádná volná kapalina, která by mohla vytéct, a jsou-li póly akumulátorů, které jsou zabaleny pro přepravu, chráněny proti zkratu.
- 239 Akumulátory nebo články akumulátorů nesmějí obsahovat žádné nebezpečné látky kromě sodíku, síry nebo sloučenin sodíku (např. polysulfidů sodíku a tetrachlorhlinitanu sodného). Tyto akumulátory nebo články smějí být podány k přepravě při teplotě, při níž se může sodík v nich obsažený nacházet v kapalném stavu, pouze se schválením příslušného orgánu země původu a za podmínek jím stanovených. Není-li země původu smluvní stranou ADN, musí být schválení a stanovené podmínky uznány příslušným orgánem prvního státu smluvní strany ADN přicházejícího do styku se zásilkou.
- Články musí sestávat z hermeticky uzavřených kovových pouzder, které nebezpečné látky úplně obklopují a jsou zkonstruovány a uzavřeny tak, že je zabráněno jakémukoli úniku těchto nebezpečných látek za normálních podmínek přepravy.
- Akumulátory musí sestávat z článků, které jsou úplně uzavřeny a upevněny v kovové skříně, která je zkonstruována a uzavřena tak, že je zabráněno jakémukoli úniku těchto nebezpečných látek za normálních podmínek přepravy.
- 240 (Vypuštěno)
- 241 Přípravek musí být vyroben tak, že zůstává homogenní a že v průběhu přepravy nenastane žádné oddělování fází. Předpisům ADN nepodléhají přípravky s nízkým obsahem nitrocelulózy, které nevykazují nebezpečné vlastnosti, jestliže jsou podrobeny zkouškám pro určení jejich detonačních, deflagračních nebo výbušných schopností při zahřátí pod uzavřením podle zkoušek typu a) série 1 nebo typů b) nebo c) série 2 části I Příručky zkoušek a kritérií a nechovají se jako hořlavě tuhá látka, pokud jsou podrobeny zkoušce N.1 Příručky zkoušek a kritérií, části III, pododdílu 33.2.4 (pro tuto zkoušku musí být látka v destičkové formě, pokud je to nutné, rozdrvena a proseta, aby se velikost zrn zredukovala na méně než 1,25 mm).
- 242 Síra nepodléhá předpisům ADN, pokud je zformována do specifického tvaru (např. kuliček, pilulek, granulí, pastilek nebo vloček).
- 243 Benzin a palivo pro použití v zážehových motorech (např. v automobilech, stacionárních motorech a jiných motorech) musí být přiřazen k této položce bez ohledu na změny těkavosti.
- 244 Tato položka zahrnuje např. hliníkové stěry, hliníkové strusky, použité katody, použitou výstelku nádob a strusky hliníkových solí.

- 247 Alkoholické nápoje s více než 24 %, nejvýše však 70 % obj. alkoholu, smějí být přepravovány, pokud jde o přepravu v rámci výrobního procesu, v dřevěných sudech o vnitřním objemu větším než 250 litrů a nejvýše 500 litrů, které splňují všeobecné požadavky oddílu 4.1.1, pokud platí, za těchto podmínek:
- (a) dřevěné sudy musí být před naplněním zkontrolovány na těsnost,
 - (b) pro roztažení kapaliny musí být ponechán dostatečný volný plnicí prostor (nejméně 3 %),
 - (c) dřevěné sudy musí být přepravovány s otvory pro zátky směřujícími nahoru,
 - (d) dřevěné sudy musí být přepravovány v kontejnerech, které splňují požadavky Mezinárodní úmluvy o bezpečných kontejnerech (KBK), v jejím platném znění. Každý dřevěný sud musí být upevněn ve speciálním lůžku a zaklíněn pomocí vhodných prostředků tak, že je vyloučen jakýkoli jeho posun během přepravy.
- 249 Ferocer, stabilizovaný proti korozi, s obsahem železa nejméně 10 % nepodléhá předpisům ADN.
- 250 Tato položka smí být používána jen pro vzorky chemických látek, které jsou odebírány za účelem analýzy v souvislosti s použitím Úmluvy o zákazu vývoje, výroby, skladování a použití chemických zbraní a o jejich ničení. Přeprava látek, které pod tuto položku spadají, musí probíhat podle řetězového postupu pro ochranu a bezpečnost, který stanovila Organizace pro zákaz chemických zbraní.
- Chemický vzorek je možno přepravit až poté, co příslušný orgán nebo generální ředitel Organizace pro zákaz chemických zbraní udělil povolení pro přepravu a pokud vzorek odpovídá následujícím požadavkům:
- (a) musí být zabalen podle pokynu pro balení 623 Technických pokynů ICAO; a
 - (b) při přepravě musí být k přepravnímu dokladu připojen jeden exemplář povolení pro přepravu, ve kterém jsou uvedena množstevní omezení a požadavky na balení.
- 251 Položka SOUPRAVA testovací, chemická nebo SOUPRAVA první pomoci se vztahuje na skříňky, kazety atd., které obsahují malá množství různých nebezpečných věcí například pro lékařské, analytické nebo zkušební nebo opravářské účely. Tyto soupravy mohou obsahovat pouze nebezpečné věci, které je povoleno přepravovat ve:
- (a) Vyňatém množství nepřekračující množství uvedené ve sloupci (7b) Tabulky A kapitoly 3.2, za předpokladu, že čistá množství na vnitřní obal a čistá množství na kus jsou taková, jak je předepsáno v 3.5.1.2 a 3.5.1.3; nebo;
 - (b) Omezeném množství jak je uvedeno ve sloupci (7a) Tabulky A kapitoly 3.2, za předpokladu, že čisté množství na vnitřní obal nepřekročí 250 ml nebo 250 g
- Součástí těchto souprav nesmějí spolu nebezpečně reagovat (viz pojem "nebezpečná reakce" v oddílu 1.2.1). Celkové množství nebezpečných věcí v jedné soupravě nesmí být větší než 1 litr nebo 1 kg.
- Pro účely vyplnění přepravního dokladu jak je uvedeno v 5.4.1.1.1, musí být obalová skupina uvedená v dokladu nejpřísnější obalovou skupinou přiřazenou jakékoliv látce v soupravě. Pokud souprava obsahuje jen nebezpečné věci, jimž není přiřazena žádná obalová skupina, nemusí být v přepravním dokladu pro nebezpečné věci žádná obalová skupina uvedena.
- Soupravy, které jsou přepravovány na palubách plavidel pro účely první pomoci nebo pro provozní účely, nepodléhají předpisům ADN.
- Soupravy testovací, chemické a soupravy první pomoci obsahující nebezpečné věci ve vnitřních obalech, které nepřekračují limity hmotnosti pro omezená množství platné pro jednotlivé látky, jak je uvedeno ve sloupci (7a) tabulky A kapitoly 3.2, smějí být přepravovány podle kapitoly 3.4.
- 252 Vodné roztoky dusičnanu amonného s nejvýše 0,2 % hořlavých látek a s koncentrací nejvýše 80 % nepodléhají předpisům ADN, pokud dusičnan amonný zůstane za všech přepravních podmínek v roztoku.

- 266 Tato látka nesmí být přepravována, jestliže obsahuje méně alkoholu, vody nebo flegmatizačního prostředku než je stanoveno, ledaže by příslušný orgán udělil zvláštní povolení (viz pododdíl 2.2.1.1).
- 267 Trhavinny typu C obsahující chlorečnany musí být odděleny od výbušných látek, které obsahují dusičnan amonný nebo jiné amonné soli.
- 270 Vodné roztoky anorganických tuhých dusičnanů třídy 5.1 se považují za látky neodpovídající kritériím třídy 5.1, jestliže koncentrace látek v roztoku při nejnižší teplotě, které může být dosaženo během přepravy, nepřekročí 80 % meze nasycení.
- 271 Laktóza, glukóza nebo podobné látky smějí být používány jako flegmatizační prostředek za podmínky, že látka obsahuje nejméně 90% hm. flegmatizačního prostředku. Příslušný orgán může na základě zkoušek typu c) série 6 Příručky zkoušek a kritérií, části 1 oddílu 16, které se provedou nejméně na třech obalech připravených k přepravě schválit přiřazení těchto směsí ke třídě 4.1. Směsi s nejméně 98 % hm. flegmatizačního prostředku nepodléhají předpisům ADN. Kusy, které obsahují směsi s nejméně 90 % hm. flegmatizačního prostředku, nemusí být opatřeny bezpečnostní značkou podle vzoru č. 6.1.
- 272 Tato látka smí být přepravována podle ustanovení pro třídu 4.1 jen se zvláštním povolením příslušného orgánu (viz UN číslo 0143 nebo UN číslo 0150, jak je to náležité).
- 273 Maneb stabilizovaný a maneb, přípravky stabilizované proti samozahřátí nemusí být přiřazeny ke třídě 4.2, pokud je možné zkouškami prokázat, že objem 1 m³ látky samovolně nevzplane a že teplota uprostřed vzorku nepřesáhne 200 °C, jestliže je vzorek po dobu 24 hodin udržován na teplotě nejméně 75 + 2 °C.
- 274 Platí ustanovení pododdílu 3.1.2.8.
- 278 Tyto látky smějí být zařazeny a přepravovány pouze se souhlasem příslušného orgánu na základě výsledků zkoušek série 2 a série 6(c) Příručky zkoušek a kritérií, části I, provedených na kusech připravených k přepravě (viz 2.2.1.1). Příslušný orgán musí určit obalovou skupinu na základě kritérií oddílu 2.2.3 a typu obalu použitého pro zkoušku série 6(c).
- 279 Tato látka je klasifikována nebo přiřazena k obalové skupině na základě jejich známých účinků na člověka, spíše než striktním použitím klasifikačních kritérií uvedených v ADN.
- 280 Tato položka se vztahuje na záchranné prostředky pro vozidla, plavidla nebo letadla – např. plynové generátory airbagů, moduly airbagů, předpínače bezpečnostních pásů a pyromechanické prostředky, které obsahují nebezpečné věci třídy 1 nebo jiných tříd, jsou-li přepravovány jako montážní díly a pokud tyto předměty, tak jak jsou podávány k přepravě, byly vyzkoušeny podle série zkoušek 6 (c) části I Příručky zkoušek a kritérií, přičemž nedošlo k výbuchu prostředku, roztržení pouzdra prostředku nebo tlakové nádoby, a neexistuje nebezpečí rozletu úlomků ani tepelných účinků, které by významným způsobem bránily hašení požáru nebo záchranným operacím v bezprostředním sousedství. Tato položka se nevztahuje na prostředky pro záchranu života popsané ve zvláštním ustanovení 296 (UN čísla 2990 a 3072).
- 283 Předměty obsahující plyn, které slouží jako tlumiče pérování, včetně zařízení pohlcujících nárazovou energii, nebo vzduchové pružiny, nepodléhají předpisům ADN, za podmínky:
- že každý předmět má plynovou nádobu o vnitřním objemu nejvýše 1,6 litru a plnicí tlak nejvýše 280 barů, přičemž součin vnitřního objemu (v litrech) a plnicího tlaku (v barech) nepřekročí 80 (tj. plynová nádoba o vnitřním objemu 0,5 litru a plnicí tlak 160 barů nebo plynová nádoba o vnitřním objemu 1 litr a plnicí tlak 80 barů nebo plynová nádoba o vnitřním objemu 1,6 litru a plnicí tlak 50 barů nebo plynová nádoba o vnitřním objemu 0,28 litru a plnicí tlak 280 barů);
 - že každý předmět má minimální tlak při protržení čtyřikrát vyšší než plnicí tlak při 20 °C, pokud vnitřní objem plynové nádoby nepřekračuje 0,5 litru, a pětikrát vyšší než plnicí tlak, je-li vnitřní objem tlakové nádoby větší než 0,5 litru;
 - že každý předmět je zhotoven z výrobního materiálu, který se při protržení netříští;
 - že každý předmět je vyroben podle normy pro zajištění kvality přijatelné pro příslušný orgán; a

- (e) že konstrukční typ byl podroben zkoušce vystavení ohni, prokazující, že předmět je účinně chráněn proti vnitřnímu přetlaku pomocí tavné pojistky nebo jiného zařízení pro snižování tlaku tak, aby se předmět nemohl roztrhnout ani vylétnout.
- K provozní výstroji vozidla viz také pododdíl 1.1.3.2 (d) ADR.
- 284 Kyslíkový generátor chemický, který obsahuje látky podporující hoření, musí odpovídat následujícím požadavkům:
- (a) jestliže generátor obsahuje zařízení ke spuštění na bázi výbušné látky, smí být přepravován pod touto položkou, jen pokud je vyňat z třídy 1 podle poznámky k 2.2.1.1.1 (b);
- (b) generátor musí být schopen bez svého obalu odolat zkoušce volným pádem z výšky 1,8 m na tuhou, nepružnou, rovnou a horizontální plochu v poloze, ve které je pravděpodobnost poškození při pádu nejvyšší, bez ztráty svého obsahu a bez spuštění;
- (c) je-li generátor vybaven spouštěcím zařízením, musí mít nejméně dvě účinná bezpečnostní zařízení proti neúmyslnému spuštění.
- 286 Membránové filtry z nitrocelulózy spadající pod tuto položku, každý o hmotnosti nejvýše 0,5 g, nepodléhají předpisům ADN, jsou-li obsaženy jednotlivě v předmětu nebo v těsně uzavřeném balíčku.
- 288 Tyto látky mohou být klasifikovány a přepravovány pouze s povolením příslušného orgánu na základě výsledků zkoušek série 2 a zkoušky série 6 c) Příručky zkoušek a kritérií, části I, provedených na kusech připravených k přepravě (viz 2.2.1.1).
- 289 Záchrané prostředky, elektricky iniciované a záchrané prostředky, pyrotechnické namontované ve vozidlech, železničních vozech, plavidlech nebo letadlech nebo ve zkompletovaných dílech, jako jsou sloupky řízení, výplně dveří, sedadla atd. nepodléhají ustanovením ADN.
- 290 Když tato radioaktivní látka splňuje definice a kritéria jiných tříd, jak jsou definovány v části 2, musí být klasifikována podle následujících ustanovení:
- (a) Pokud látka splňuje kritéria pro nebezpečné věci ve vyňatých množstvích, jak je uvedeno v kapitole 3.5, musí být obaly v souladu s 3.5.2 a splňovat zkušební požadavky v 3.5.3. Všechny ostatní předpisy platné pro radioaktivní látky ve vyjmutých kusech, uvedené v 1.7.1.5, se musí použít bez odkazu na jinou třídu;
- (b) Pokud množství překračuje meze uvedené v 3.5.1.2, musí být látka klasifikována podle převažujícího vedlejšího nebezpečí. Přepravní doklad musí popsat tuto látku UN číslem a oficiálním pojmenováním pro přepravu platnými pro tuto jinou třídu, k nimž je nutno připojit pojmenování pro radioaktivní látku ve vyjmutém kusu podle sloupce (2) tabulky A kapitoly 3.2 a látka musí být přepravována podle ustanovení platných pro toto UN číslo. Příklad zápisu v přepravním dokladu je:
„UN 1993 Látka hořlavá, kapalná, j.n. (směs ethanolu a toluenu), Radioaktivní látka, vyjmutý kus – omezené množství látky, 3, OS II“.
- Kromě toho platí předpisy uvedené v odstavci 2.2.7.2.4.1;
- (c) Ustanovení kapitoly 3.4 pro přepravu nebezpečných věcí balených v omezených množstvích se nevztahují na látky klasifikované podle pododstavce (b);
- (d) Pokud látka splňuje zvláštní ustanovení, které vyjímá tuto látku ze všech ustanovení pro nebezpečné věci ostatních tříd, musí být klasifikována podle náležitého UN čísla třídy 7 a všechny požadavky uvedené v 1.7.1.5 musí být dodrženy.
- 291 Hořlavé zkapalněné plyny musí být obsaženy v součástech chladicího stroje. Tyto součásti musí být zkonstruovány tak, aby odolaly nejméně trojnásobku provozního tlaku stroje a musí být podrobeny odpovídajícím zkouškám. Chladicí stroje musí být zkonstruovány a vyrobeny tak, aby mohly obsahovat zkapalněný plyn a aby za normálních podmínek přepravy bylo vyloučeno nebezpečí protržení nebo popraskání součástí, které jsou vystaveny tlaku zkapalněného plynu. Chladicí stroje a součásti chladicích strojů, které obsahují méně než 12 kg plynu, nepodléhají předpisům ADN.
- 292 (Vypuštěno)

- 293 Pro zápalky platí tyto definice:
- (a) větrové zápalky jsou zápalky, jejichž hlavičky jsou zhotoveny ze zápalné složky citlivé na tření a pyrotechnické složky, které hoří malým plamenem nebo bez plamene, avšak s velkou teplotou;
 - (b) bezpečnostní zápalky jsou zápalky, které jsou spojeny nebo upevněny do knížečky, složky nebo krabičky a které je možno zapálit třením jen na připraveném povrchu;
 - (c) zápalky „zápalné kdekoli“ jsou zápalky, které mohou být zapáleny třením na pevném povrchu;
 - (d) voskové zápalky jsou zápalky, které mohou být zapáleny třením jak na připraveném, tak i na pevném povrchu.
- 295 Není nutné označovat každý jednotlivý akumulátor nápisy a bezpečnostními značkami, jsou-li odpovídající nápisy a bezpečnostní značky umístěny na paletě.
- 296 Tyto položky se vztahují na záchranné prostředky, jako jsou záchranné čluny, osobní plovací prostředky a samonafukovací skluzavky. UN číslo 2990 se vztahuje na samonafukovací prostředky a UN číslo 3072 se vztahuje na záchranné prostředky, které nejsou samonafukovací. Záchranné prostředky mohou obsahovat:
- (a) signální prostředky (třída 1), které mohou zahrnovat dýmotvorné a světelné signální prostředky, zabalené v obalech, které je chrání před neúmyslnou aktivací;
 - (b) jen UN číslo 2990 smí zahrnovat náložky pro technické účely podtřídy 1.4, skupiny snášlivosti S pro samonafukovací mechanismus a za podmínky, že množství výbušné látky na prostředek nepřekročí 3,2 g;
 - (c) stlačené nebo zkपालněné plyny třídy 2, skupiny A nebo O podle 2.2.2.1.3;
 - (d) elektrické akumulátory (třída 8) a lithiové baterie (třída 9);
 - (e) soupravy první pomoci nebo opravářské soupravy obsahující malá množství nebezpečných věcí (např. látky třídy 3, 4.1, 5.2, 8 nebo 9); nebo
 - (f) zápalky „zápalné kdekoli“ zabalené v obalech, které je chrání před neúmyslnou aktivací.
- Záchranné prostředky zabalené v pevných tuhých vnějších obalech o nejvyšší celkové (brutto) hmotnosti 40 kg, neobsahující žádné jiné nebezpečné věci než stlačené nebo zkपालněné plyny třídy 2, skupiny A nebo skupiny O, v nádobách o vnitřním objemu nejvýše 120 ml, které jsou v záchranných prostředcích obsaženy pouze za účelem jejich aktivace, nepodléhají ustanovením ADN.
- 300 Rybí moučka, rybí odpad a „krill“ moučka nesmějí být nakládány, jestliže teplota v době nakládky překračuje 35 °C, nebo je o 5 °C nad teplotou okolí, podle toho, která z těchto teplot je vyšší.
- 301 Tato položka se vztahuje na předměty jako stroje, přístroje nebo zařízení obsahující nebezpečné věci jako zbytky nebo jako integrální součást předmětu. Nesmí být použita pro předměty, pro které již existuje v tabulce A kapitoly 3.2 oficiální pojmenování pro přepravu. Předměty přepravované pod touto položkou smějí obsahovat pouze nebezpečné věci, které je dovoleno přepravovat podle ustanovení kapitoly 3.4 (Omezená množství). Množství nebezpečných věcí obsažených v předmětech nesmí překročit množství udaná ve sloupci (7a) tabulky A kapitoly 3.2 pro každou z nich. Jestliže předměty obsahují více než jednu nebezpečnou věc, musí být jednotlivé nebezpečné věci uzavřeny odděleně, aby se zamezilo jejich vzájemné nebezpečné reakci během přepravy (viz 4.1.1.6 ADR). Pokud je u kapalných nebezpečných věcí vyžadováno, aby zůstaly ve své určité poloze, musí být alespoň na dvou protilehlých bočních stranách umístěny orientační šipky směřující do správného směru podle 5.2.1.10.
- 302 Zaplynované nákladní dopravní (přepravní) jednotky, které neobsahují žádné jiné nebezpečné věci, podléhají pouze ustanovením oddílu 5.5.2.
- 303 Nádoby musí být přiřazeny ke klasifikačnímu kódu plynu nebo směsi plynů, který (kterou) obsahují, určenému podle ustanovení oddílu 2.2.2.

- 304 Tato položka smí být použita pouze pro přepravu neaktivovaných akumulátorů, které obsahují suchý hydroxid draselný a které jsou určeny k aktivaci před použitím přidáním patričního množství vody do jednotlivých článků.
- 305 Tyto látky nepodléhají předpisům ADN, pokud jsou v koncentracích nejvýše 50 mg/kg.
- 306 Tato položka smí být použita pouze pro látky, které jsou příliš necitlivé pro zařazení do třídy 1, pokud byly vyzkoušeny podle série zkoušek 2 (viz Příručku zkoušek a kritérií, část I).
- 307 Tato položka může být použita pouze pro hnojiva na bázi dusičnanu amonného. Musí být klasifikovány v souladu s postupem stanoveným v Příručce zkoušek a kritérií, část III, oddíl 39 s výhradou omezení uvedených ve třinácté a čtrnácté odrážce bodu 2.2.51.2.2. Při použití v uvedeném oddíle 39 se výrazem „příslušný orgán“ rozumí příslušný orgán země původu. Pokud země původu není smluvní stranou dohody ADN, klasifikaci a podmínky přepravy uzná příslušný orgán první smluvní strany dohody ADN, do které zásilka dorazí.
- 309 Tato položka se vztahuje na neznecitlivěné emulze, suspenze a gely sestávající v prvé řadě ze směsi dusičnanu amonného a paliva, určené k výrobě trhaviny typu E teprve po dalším zpracování před použitím.
- Směs pro emulze má obvykle toto složení: 60 – 85 % dusičnanu amonného; 5 – 30 % vody; 2 – 8 % paliva; 0,5 – 4 % emulgátoru; 0 – 10 % rozpustných omezovačů plamene a stopové přísady. Část dusičnanu amonného může být nahrazena jinými anorganickými nitrátovými solemi.
- Směs pro suspenze a gely má obvykle toto složení: 60 – 85 % dusičnanu amonného; 0 - 5 % chloristanu sodného nebo draselného; 0 – 17 % hexaminonitrátu nebo monomethylaminonitrátu; 5 – 30 % vody; 2 – 15 % paliva; 0,5 – 4 % zahušťovačů, 0 - 10 % rozpustných omezovačů plamene a stopové přísady. Část dusičnanu amonného může být nahrazena jinými anorganickými nitrátovými solemi.
- Tyto látky musí vyhovět kritériím pro klasifikaci jako emulze, suspenze nebo gel dusičnanu amonného, meziprojektu pro trhaviny (ANE) série zkoušek 8 Příručky zkoušek a kritérií, část I, oddílu 18 a musí být schváleny příslušným orgánem.
- 310 Zkušební předpisy uvedené v Příručce zkoušek a kritérií, části III, pododdílu 38.3 se nevztahují na výrobní série sestávající z nejvýše 100 článků nebo baterií, ani na předvýrobní prototypy článků nebo baterií, jestliže jsou tyto prototypy přepravovány ke zkouškám.
- Přepravní doklad musí obsahovat tento zápis: „Přeprava podle zvláštního ustanovení 310“.
- Poškozené nebo vadné články, baterie, nebo články a baterie obsažené v zařízeních musí být přepravovány podle zvláštního ustanovení 376 a zabaleny podle pokynu pro balení P908 pododdílu 4.1.4.1 nebo LP904 pododdílu 4.1.4.3 ADR, jak je to náležité.
- Články, baterie nebo články a baterie obsažené v zařízeních přepravované k likvidaci nebo recyklaci smějí být baleny podle zvláštního ustanovení 377 a pokynu pro balení P909 pododdílu 4.1.4.1 ADR.
- 311 Látky nesmějí být přepravovány pod touto položkou, ledaže to schválil příslušný orgán na základě výsledků příslušných zkoušek podle části I Příručky zkoušek a kritérií. Obal musí zajistit, aby procentní podíl ředidla neklesl v žádném okamžiku během přepravy pod procentní podíl uvedený ve schválení příslušného orgánu.
- 312 (Vypuštěno)
- 313 (Vypuštěno)
- 314 (a) Tyto látky jsou náchylné k exotermickému rozkladu při zvýšených teplotách. Rozklad může být vyvolán teplem nebo nečistotami (např. práškovými kovy (železo, mangan, kobalt, hořčík) a jejich sloučeninami);
- (b) Během přepravy musí být tyto látky chráněny před přímým slunečním svitem a všemi zdroji tepla a musí být uloženy na dostatečně odvětrávaných místech.
- 315 Tato položka nesmí být použita pro látky třídy 6.1, které splňují kritéria toxicity při vdechnutí pro obalovou skupinu I, uvedená v 2.2.61.1.8.

- 316 Tato položka se vztahuje pouze na chlornan vápenatý, suchý, pokud je přepravován ve formě nedrobných tablet.
- 317 „Štěpné-vyjmuté“ se vztahuje pouze na ty štěpné látky a kusy obsahující štěpné látky, které jsou vyjmuty podle 2.2.7.2.3.5.
- 318 Pro účely dokumentace musí být oficiální pojmenování pro přepravu doplněno technickým názvem (viz 3.1.2.8). Jsou-li infekční látky, které se mají přepravovat, neznámé, avšak existuje podezření, že splňují kritéria pro zařazení do kategorie A a přiřazení k UN číslu 2814 nebo 2900, musí být v přepravním dokladu uvedena v závorkách za oficiálním pojmenováním pro přepravu slova „podezření na infekční látku kategorie A“.
- 319 Látky zabalené a označené podle pokynu pro balení P650 nepodléhají žádným jiným ustanovením ADN.
- 321 Tyto akumulární systémy musí být vždy pokládány za systémy obsahující vodík.
- 322 Jsou-li tyto věci přepravovány ve formě nedrobných tablet, jsou přiřazeny k obalové skupině III.
- 323 (Vyhrazeno)
- 324 Tato látka musí být stabilizována, jestliže její koncentrace nepřekračuje 99 %.
- 325 V případě neštěpného nebo štěpného vyjmutého hexafluoridu uranu musí být látka zařazena pod UN číslo 2978.
- 326 V případě štěpného hexafluoridu uranu musí být látka zařazena pod UN číslo 2977.
- 327 Odpadové aerosoly a odpadové plynové kartuše zasílané podle 5.4.1.1.3 mohou být přepravované pod UN 1950 nebo 2037, jak je to vhodné, za účelem recyklace nebo likvidace. Nemusí být chráněny proti pohybu a neúmyslnému vyprázdnění za podmínky, že jsou učiněna opatření, aby se zamezilo nebezpečnému nárůstu tlaku a nebezpečné atmosféře. Odpadové aerosoly, s výjimkou těch, které jsou netěsné nebo silně deformované, musí být baleny podle pokynu pro balení P207 ADR a zvláštního ustanovení pro balení PP87 ADR nebo pokynu pro balení „LP200“ ADR a zvláštního ustanovení pro balení L2 ADR. Odpadové plynové kartuše, jiné než netěsné nebo závažně deformované, musí být balené podle pokynu pro balení P003 a zvláštního ustanovení pro balení PP17 a PP96 ADR, nebo pokynu pro balení LP200 a zvláštního ustanovení pro balení L2 ADR. Netěsné nebo silně deformované aerosoly a plynové kartuše musí být přepravovány v záchranných tlakových nádobách nebo záchranných obalech za podmínky, že jsou učiněna vhodná opatření k tomu, aby nedošlo k nebezpečnému nárůstu tlaku.
- POZNÁMKA: Pro přepravu po moři nesmějí být odpadové aerosoly a odpadové plynové kartuše přepravovány v uzavřených kontejnerech.
- Odpadové plynové kartuše, které byly naplněny nehořlavými, netoxickými plyny třídy 2, skupiny A nebo O a byly proraženy, nepodléhají ADN.
- 328 Tato položka se vztahuje na zásobníky do palivových článků včetně těch, které jsou obsaženy v zařízeních nebo jsou baleny se zařízeními. Zásobníky do palivových článků, které jsou zamontovány nebo jsou nedílnou součástí systému palivových článků, se považují za obsažené v zařízeních. Zásobník do palivových článků je nádoba, v níž je obsaženo palivo pro jeho vypouštění do palivového článku ventilem (ventily), který(é) řídí průtok paliva do palivového článku. Zásobníky do palivových článků, včetně těch, které jsou obsaženy v zařízeních, musí být zkonstruovány a vyrobeny tak, aby se zamezilo úniku paliva za normálních podmínek přepravy.
- Konstrukční typy zásobníků do palivových článků používajících jako paliva kapaliny musí projít zkouškou vnitřním tlakem při tlaku 100 kPa (přetlak) bez úniku obsahu.
- S výjimkou zásobníků do palivových článků obsahujících vodík v kovovém hydridu, které musí vyhovovat zvláštnímu ustanovení 339, musí každý konstrukční typ zásobníku do palivového článku dokázat projít zkouškou volným pádem z výšky 1,2 metru na tvrdý povrch v orientaci, při níž může nejpravděpodobněji dojít k selhání zádržného systému, bez jakéhokoliv úniku obsahu.

Jsou-li baterie s kovem lithia nebo baterie s ionty lithia obsaženy v systému palivových článků, musí být zásilka odeslána pod touto položkou a pod náležitými položkami pro UN 3091 BATERIE LITHIOVÉ KOVOVÉ OBSAŽENÉ V ZAŘÍZENÍ nebo UN 3481 BATERIE LITHIUM-IONTOVÉ OBSAŽENÉ V ZAŘÍZENÍ.

- 329 (Vyhrazeno)
- 331 (Vyhrazeno)
- 332 Dusičnan hořečnatý, hexahydrát nepodléhá předpisům ADN.
- 333 Směsi ethanolu a benzínu pro použití v zážehových motorech (např. v automobilech, stacionárních motorech a jiných motorech) musí být přiřazeny k této položce bez ohledu na změny těkavosti.
- 334 Zásobník do palivových článků smí obsahovat aktivátor, pokud je vybaven dvěma nezávislými prostředky k zamezení neúmyslného smíchání s palivem během přepravy.
- 335 Směsi tuhých látek, které nepodléhají předpisům ADN, a kapalin nebo tuhých látek ohrožujících životní prostředí musí být zařazeny pod UN 3077 a smějí být přepravovány pod touto položkou, pokud není viditelná žádná volná kapalina v době, kdy je látka nakládána, nebo v době, kdy je uzavírán obal nebo nákladní dopravní (přepravní) jednotka. Každé vozidlo, železniční vůz nebo kontejner musí být těsné, jsou-li použity pro přepravu látek ve volně loženém stavu. Je-li viditelná volná kapalina v době, kdy je směs nakládána, nebo v době, kdy je uzavírán obal nebo nákladní dopravní (přepravní) jednotka, musí být směs zařazena pod UN 3082. Těsně uzavřené balíčky a předměty obsahující méně než 10 ml kapaliny ohrožující životní prostředí, nasáklé v tuhém materiálu, ale bez volné kapaliny v balíčku nebo předmětu, nebo obsahující méně než 10 g tuhé látky ohrožující životní prostředí nepodléhají předpisům ADN.
- 336 Jeden kus s nehořlavou tuhou látkou LSA-II nebo LSA-III nesmí při přepravě leteckou dopravou obsahovat aktivitu větší než 3 000 A₂.
- 337 Kusy typu B(U) a typu B(M) nesmějí při přepravě leteckou dopravou obsahovat aktivity větší, než jsou ty následující:
- (a) pro nízkodisperzní radioaktivní látky: jak je dovoleno pro vzor kusu podle specifikace v osvědčení o schválení;
 - (b) pro radioaktivní látky zvláštní formy: 3 000 A₁ nebo 100 000 A₂, podle toho, která z těchto dvou hodnot je nižší;
 - (c) pro všechny ostatní radioaktivní látky: 3 000 A₂.
- 338 Každý zásobník do palivových článků přepravovaný pod touto položkou a zkonstruovaný k tomu, aby obsahoval zkपालněný hořlavý plyn, musí:
- (a) být schopen odolat bez úniku obsahu nebo prasknutí tlaku rovnajícimu se nejméně dvojnásobku rovnovážného tlaku obsahu při 55 °C;
 - (b) neobsahovat více než 200 ml zkपालněného hořlavého plynu, jehož tenze par nesmí překročit 1 000 kPa při 55 °C; a
 - (c) projít úspěšně zkouškou v lázni s horkou vodou předepsanou v 6.2.6.3.1. ADR.
- 339 Zásobníky do palivových článků obsahující vodík v kovovém hydridu přepravované pod touto položkou nesmějí mít hydraulický vnitřní objem větší než 120 ml.

Tlak v zásobníku do palivových článků nesmí překročit 5 MPa při 55 °C. Konstrukční typ musí odolat bez úniku obsahu nebo roztržení tlaku rovnajícimu se dvojnásobku výpočtového tlaku zásobníku při 55 °C, nebo tlaku o 200 kPa vyššímu než je výpočtový tlak zásobníku při 55 °C, podle toho, který z nich je vyšší. Tlak, při kterém se tato zkouška provádí, je zmíněn ve zkoušce volným pádem a ve vodíkové cyklační zkoušce jako „minimální tlak při roztržení pláště“.

Zásobníky do palivových článků musí být plněny podle postupů stanovených výrobcem. Výrobce musí ke každému zásobníku do palivových článků poskytnout následující informace:

- (a) inspekční postupy, které je třeba provést před prvním plněním a před opakovaným plněním zásobníku do palivových článků;
- (b) bezpečnostní opatření a potenciální nebezpečí, které je třeba si uvědomit;
- (c) metodu pro určení okamžiku, kdy bylo dosaženo jmenovitého vnitřního objemu;
- (d) minimální a maximální tlakový rozsah;
- (e) minimální a maximální teplotní rozsah; a
- (f) jakékoli další požadavky, které je třeba dodržet při prvním plnění a opakovaném plnění včetně druhu zařízení, které je třeba používat pro první plnění a opakované plnění.

Zásobníky do palivových článků musí být konstruovány a vyrobeny tak, aby se zamezilo úniku paliva za normálních podmínek přepravy. Každý konstrukční typ zásobníku, včetně zásobníků, které jsou nedílnou součástí palivového článku, musí být s úspěchem podroben následujícím zkouškám:

Zkouška volným pádem

Zkouška volným pádem z výšky 1,8 metru na tvrdý povrch ve čtyřech různých orientacích:

- (a) vertikálně, na konec obsahující montážní jednotku s uzavíracím ventilem;
- (b) vertikálně, na konec protilehlý montážní jednotce s uzavíracím ventilem;
- (c) horizontálně, na ocelový hrot o průměru 38 mm, s ocelovým hrotem v poloze nahoru;
a
- (d) pod úhlem 45° na konec obsahující montážní jednotku s uzavíracím ventilem.

Nesmí dojít k žádnému úniku, který se zjišťuje za použití roztoku mýdlových bublin nebo jinými rovnocennými prostředky na všech možných místech netěsnosti, když je zásobník naplněn na svůj jmenovitý plnicí tlak. Zásobník do palivových článků pak musí být hydrostaticky natlakován až do své destrukce. Zaznamenaný tlak při roztržení musí překročit 85 % minimálního tlaku při roztržení pláště.

Zkouška ohněm

Zásobník do palivových článků naplněný do svého jmenovitého vnitřního objemu vodíkem musí být podroben zkoušce vložením do ohně. Konstrukční typ zásobníku, který smí zahrnovat jako nedílnou součást pojistné odvětrávací zařízení, je považován za vyhovující při zkoušce ohněm, jestliže:

- (a) vnitřní tlak poklesne na nulový přetlak bez prasknutí zásobníku; nebo
- (b) zásobník odolá ohni po dobu nejméně 20 minut bez prasknutí.

Vodíková cyklační zkouška

Tato zkouška je určena k tomu, aby se zajistilo, že během používání zásobníku do palivových článků nebudou překročeny meze výpočtového napětí zásobníku.

Zásobník do palivových článků musí být podroben tlakovým cyklům od nejvýše 5 % jmenovité kapacity vodíku do nejméně 95 % jmenovité kapacity vodíku a zpět k nejvýše 5 % jmenovité kapacity vodíku. Pro plnění musí být použit jmenovitý plnicí tlak a teploty musí být udržovány v rozmezí provozních teplot. Musí být provedeno nejméně 100 tlakových cyklů.

Po cyklační zkoušce musí být zásobník do palivových článků naplněn a musí být změřen objem vody vytlačené zásobníkem. Konstrukční typ zásobníku se považuje za úspěšně prošlý vodíkovou cyklační zkouškou, jestliže objem vody vytlačené cyklováním zásobníkem nepřevyšuje objem vody vytlačené necyklováním zásobníkem naplněným do 95 % jmenovité kapacity a natlakovaným do 75 % minimálního tlaku při roztržení pláště.

Zkouška těsnosti ve výrobě

Každý zásobník do palivových článků musí být podroben kontrolní zkoušce těsnosti při $15\text{ }^{\circ}\text{C} \pm 5\text{ }^{\circ}\text{C}$ za natlakování na jeho jmenovitý plnicí tlak. Nesmí dojít k žádnému úniku, který

se zjišťuje za použití roztoku mýdlových bublin nebo jinými rovnocennými prostředky na všech možných místech netěsnosti.

Každý zásobník do palivových článků musí být trvale označen následujícími údaji:

- (a) jmenovitým plnicím tlakem v MPa;
 - (b) sériovým číslem výrobce zásobníků do palivových článků nebo unikátním identifikačním číslem; a
 - (c) datem ukončení použitelnosti založeném na maximální provozní životnosti (rok ve čtyřech číslicích; měsíc ve dvou číslicích).
- 340 Chemické soupravy, soupravy první pomoci a soupravy polyesterové pryskyřice obsahující nebezpečné věci ve vnitřních obalech, které nepřekračují množství limity pro vyňatá množství platné pro jednotlivé látky, jak je to udáno ve sloupci (7b) tabulky A kapitoly 3.2, smějí být přepravovány podle kapitoly 3.5. Látky třídy 5.2, i když nejsou jednotlivě dovoleny jako vyňatá množství ve sloupci (7b) tabulky A kapitoly 3.2, jsou dovoleny v takových soupravách a je jim přiřazen kód E2 (viz 3.5.1.2).
- 341 (Vyhrazeno)
- 342 Vnitřní nádoby ze skla (jako jsou ampule nebo kapsle) určené jen pro použití ve sterilizačních zařízeních, pokud obsahují méně než 30 ml ethylenoxidu na vnitřní obal s nejvýše 300 ml na vnější obal, smějí být přepravovány podle ustanovení v kapitole 3.5, bez ohledu na údaj „E0“ ve sloupci (7b) tabulky A kapitoly 3.2, za podmínky, že:
- (a) po naplnění byla každá vnitřní nádoba ze skla shledána hermetickou vložení vnitřní nádoby ze skla do lázně s horkou vodou při teplotě a na dobu, které jsou dostatečné k tomu, aby se zajistilo dosažení vnitřního tlaku rovnajícího se tenzi par ethylenoxidu při 55 °C. Každá vnitřní nádoba ze skla vykazující stopy netěsnosti, deformace nebo jiného poškození při této zkoušce nesmí být přepravována podle tohoto zvláštního ustanovení;
 - (b) kromě obalu vyžadovaného podle 3.5.2 je každá vnitřní nádoba ze skla vložena do zataveného pytle z plastu snášenlivého s ethylenoxidem a schopného zadržet obsah v případě rozbití nebo netěsnosti vnitřní nádoby ze skla; a
 - (c) každá vnitřní nádoba ze skla je chráněna prostředky proti propíchnutí pytle z plastu (např. pouzdry nebo vycpávkovým materiálem) v případě poškození obalu (např. promáčknutím).
- 343 Tato položka platí pro surovou ropu obsahující sirovodík v dostatečné koncentraci, takže páry uvolněné ze surové ropy mohou představovat nebezpečí při vdechování. Přiřazená obalová skupina se určí podle nebezpečí hořlavosti a nebezpečí při vdechování podle stupně představovaného nebezpečí.
- 344 Ustanovení uvedená v 6.2.6 ADR musí být dodržena.
- 345 Tento plyn obsažený v otevřených kryogenních nádobách o vnitřním objemu nejvýše 1 litr vyrobených s dvojitými stěnami ze skla, přičemž prostor mezi vnitřní a vnější stěnou je zbaven vzduchu (vakuová izolace), nepodléhá ustanovením ADN, pokud je každá nádoba přepravována ve vnějším obalu s vhodným fixačním nebo absorpčním materiálem, aby byla chráněna před poškozením při nárazu.
- 346 Otevřené kryogenní nádoby odpovídající požadavkům pokynu pro balení P203 pododdílu 4.1.4.1 ADR a neobsahující žádné nebezpečné věci mimo UN 1977 dusík, hluboce zchlazený, kapalný, který je plně absorbován v porézním materiálu, nepodléhají žádným jiným ustanovením ADN.
- 347 Tato položka se použije pouze tehdy, jestliže výsledky série zkoušek 6 (d) části I Příručky zkoušek a kritérií prokázaly, že jakékoli nebezpečné účinky vyvolané činnostmi jsou omezeny na vnitřek kusu.
- 348 Baterie vyrobené po 31. prosinci 2011 musí mít na vnější skříni vyznačenu jmenovitou energii ve watthodinách.
- 349 Směsi chlornanu s amonnou solí nejsou připuštěny k přepravě. UN 1791 chlornan, roztok je látkou třídy 8.

- 350 Bromičnan amonný a jeho vodné roztoky a směsi bromičnanu s amonnou solí nejsou připuštěny k přepravě.
- 351 Chlorečnan amonný a jeho vodné roztoky a směsi chlorečnanu s amonnou solí nejsou připuštěny k přepravě.
- 352 Chloritan amonný a jeho vodné roztoky a směsi chloritanu s amonnou solí nejsou připuštěny k přepravě.
- 353 Manganistan amonný a jeho vodné roztoky a směsi manganistanu s amonnou solí nejsou připuštěny k přepravě.
- 354 Tato látka je toxická při vdechování.
- 355 Kyslíkové láhve pro použití v nouzových situacích přepravované pod touto položkou směřjí zahrnovat zabudované spouštěcí náložky (náložky pro technické účely podtřídy 1.4, skupiny snášenlivosti C nebo S) beze změny klasifikace ve třídě 2, pokud celkové množství deflagrujících (hnacích) výbušných látek nepřekročí 3,2 g na kyslíkovou láhev. Láhve se zabudovanými spouštěcími náložkami připravené k přepravě musí mít účinné prostředky k zamezení nechtěné aktivity.
- 356 Zásobníkové systémy s hydridem kovu určené k zabudování do vozidel, železničních vozů, plavidel, strojů, motorů nebo letadel musí být schváleny příslušným orgánem země výroby¹ před přijetím k přepravě. Přepravní doklad musí obsahovat zápis, že kus byl schválen příslušným orgánem země výroby¹, nebo každou zásilku musí doprovázet kopie schválení příslušného orgánu země výroby¹.
- 357 Surová ropa obsahující sirovodík v dostatečné koncentraci, takže páry uvolněné ze surové ropy mohou představovat nebezpečí při vdechování, musí být přepravována pod položkou UN 3494 ROPA SUROVÁ, KYSELÁ, HOŘLAVÁ, TOXICKÁ.
- 358 Nitroglycerin, roztok v alkoholu, s více než 1 %, ale nejvýše 5 % nitroglycerinu, smí být zařazen do třídy 3 a přiřazen k UN číslu 3064, pokud jsou dodrženy všechny požadavky pokynu pro balení P300 v 4.1.4.1 ADR.
- 359 Nitroglycerin, roztok v alkoholu, s více než 1 %, ale nejvýše 5 % nitroglycerinu, musí být zařazen do třídy 1 a přiřazen k UN číslu 0144, pokud nejsou dodrženy všechny požadavky pokynu pro balení P300 v 4.1.4.1.
- 360 Vozidla, která jsou poháněna jen bateriemi s kovem lithia nebo bateriemi s ionty lithia, musí být přiřazena pod položku UN 3171 vozidlo na akumulátorový pohon. Lithiové baterie instalované v nákladních dopravních jednotkách, které jsou konstruovány pouze pro externí napájení dopravních jednotek, musí být zařazeny pod položku UN 3536 BATERIE LITHIOVÉ UMÍSTĚNÉ V NÁKLADNÍ DOPRAVNÍ JEDNOTCE lithium-iontové baterie nebo lithium-kovové baterie.
- 361 Tato položka platí pro elektrické dvouvrstvé kondenzátory s kapacitou akumulace energie větší než 0,3 Wh. Kondenzátory s kapacitou akumulace energie 0,3 Wh nebo menší, nepodléhají ADN. Kapacitou akumulace energie se rozumí energie zadržaná kondenzátorem, jak je vypočtena použitím jmenovitého elektrického napětí a kapacity. Všechny kondenzátory, pro něž tato položka platí, včetně kondenzátorů obsahujících elektrolyt, který nespĺňuje klasifikační kritéria žádné třídy nebezpečných věcí, musí splňovat následující podmínky:
- (a) kondenzátory, které nejsou zabudovány v zařízení, musí být přepravovány v nenabitém stavu. Kondenzátory, které jsou zabudovány v zařízení, musí být přepravovány buď v nenabitém stavu, nebo musí být chráněny proti zkratu;
 - (b) každý kondenzátor musí být chráněn proti potenciálnímu nebezpečí zkratu při přepravě takto:
 - (i) je-li kapacita akumulace energie kondenzátoru nejvýše 10 Wh, nebo je-li kapacita akumulace energie každého kondenzátoru v modulu nejvýše 10 Wh, musí být kondenzátor nebo modul chráněn proti zkratu nebo být opatřen kovovým páskem spojujícím svorky; a

¹ Není-li země výroby smluvní stranou ADN, musí být schválení uznáno příslušným orgánem smluvní strany ADN.

- (ii) je-li kapacita akumulace energie kondenzátoru nebo kondenzátoru v modulu větší než 10 Wh, musí být kondenzátor nebo modul opatřen kovovým páskem spojícím svorky;
- (c) kondenzátory obsahující nebezpečné věci musí být konstruovány tak, aby odolaly rozdílu tlaků 95 kPa;
- (d) kondenzátory musí být konstruovány a vyrobeny tak, aby mohl být bezpečně snížen tlak, který může narůst během jejich používání, pomocí větracího otvoru nebo slabého místa v plášti kondenzátoru. Jakákoli kapalina, která se uvolní při větrání, musí být zadržena obalem nebo zařízením, v němž je kondenzátor zabudován; a
- (e) na kondenzátorech musí být vyznačena jejich kapacita akumulace energie ve Wh.

Kondenzátory obsahující elektrolyt, který nesplňuje klasifikační kritéria žádné třídy nebezpečných věcí, i když jsou zabudovány v zařízení, nepodléhají jiným ustanovením ADN.

Kondenzátory obsahující elektrolyt, který splňuje klasifikační kritéria kterékoli třídy nebezpečných věcí, s kapacitou akumulace energie 10 Wh nebo méně, nepodléhají jiným ustanovením ADN, pokud jsou schopny v nezabaleném stavu odolat při zkoušce volným pádem z výšky 1,2 metru na pevný povrch bez ztráty obsahu.

Kondenzátory obsahující elektrolyt, splňující klasifikační kritéria kterékoli třídy nebezpečných věcí, které nejsou zabudovány v zařízení a s kapacitou akumulace energie větší než 10 Wh, podléhají ustanovením ADN.

Kondenzátory zabudované v zařízení a obsahující elektrolyt, který splňuje klasifikační kritéria kterékoli třídy nebezpečných věcí, nepodléhají jiným ustanovením ADN, pokud je zařízení zabaleno v pevném vnějším obalu vyrobeném z vhodného materiálu a přiměřené pevnosti a konstrukce ve vztahu k zamýšlenému použití a takovým způsobem, aby se zamezilo náhodnému uvedení kondenzátorů do činnosti během přepravy. Velké robustní zařízení obsahující kondenzátory smí být podáno k přepravě nezabalené nebo na paletách, je-li kondenzátorům poskytována rovnocenná ochrana zařízením, v němž jsou obsaženy.

POZNÁMKA: Kondenzátory, které svou konstrukcí udržují elektrické napětí na svorkách (např. asymetrické kondenzátory), nepatří pod tuto položku.

362 (Vyhrazeno)

363 Tuto položku lze použít pouze tehdy, jsou-li splněny podmínky tohoto zvláštního ustanovení. Neplatí žádné další požadavky ADN.

- (a) Tato položka platí pro motory nebo stroje poháněné palivy klasifikovanými jako nebezpečné věci pomocí systémů vnitřního spalování nebo palivových článků (např. spalovací motory, generátory, kompresory, turbíny, topné jednotky atd.), s výjimkou zařízení vozidel přiřazených k UN 3166 a zmíněných ve ZU 666.

POZNÁMKA: Tato položka se nevztahuje na zařízení uvedená v 1.1.3.2 (a), (d) a (e), 1.1.3.3 a 1.1.3.7.

- (b) Motory nebo stroje zbažené kapalných nebo plyných paliv a které neobsahují jiné nebezpečné věci nepodléhají ustanovením ADN.

POZNÁMKA 1: Motor nebo stroj se považuje za zbažený kapalného paliva, pokud byla nádrž na kapalné palivo vypuštěna a motor nebo stroj nemůže v důsledku nedostatku paliva pracovat. Součásti motoru nebo stroje, jako jsou palivová potrubí, palivové filtry a trysky, nemusí být vyčištěny, vymyty nebo propláchnuty, aby byly považovány za zbažené kapalných paliv. Kromě toho nemusí být nádrž na kapalné palivo vyčištěna ani vypláchnuta.

POZNÁMKA 2: Motor nebo stroj se považuje za zbažený plyných paliv, pokud byly plynové palivové nádrže zbažené kapaliny (pro zkapalněné plyny), tlak v nádržích nepřekračuje 2 bary a uzavírací ventil paliva nebo bezpečnostní ventil je uzavřen a zajištěn.

- (c) Motory a stroje obsahující paliva splňující klasifikační kritéria třídy 3 musí být přiřazeny k položkám UN 3528 MOTOR, VNITŘNÍ SPALOVÁNÍ, POHÁNĚNÝ HOŘLAVOU KAPALINOU nebo UN 3528 MOTOR, PALIVOVÝ ČLÁNEK, POHÁNĚNÝ HOŘLAVOU KAPALINOU nebo UN 3528 STROJ, VNITŘNÍ SPALOVÁNÍ,

POHÁNĚNÝ HOŘLAVOU KAPALINOU nebo UN 3528 STROJ, PALIVOVÝ ČLÁNEK, POHÁNĚNÝ HOŘLAVOU KAPALINOU, jak je to náležité.

- (d) Motory a stroje obsahující paliva splňující klasifikační kritéria pro hořlavé plyny třídy 2 musí být přiřazeny k položkám UN 3529 MOTOR, VNITŘNÍ SPALOVÁNÍ, POHÁNĚNÝ HOŘLAVÝM PLYNEM nebo UN 3529 MOTOR, PALIVOVÝ ČLÁNEK, POHÁNĚNÝ HOŘLAVÝM PLYNEM nebo UN 3529 STROJ, VNITŘNÍ SPALOVÁNÍ, POHÁNĚNÝ HOŘLAVÝM PLYNEM nebo UN 3529 STROJ, PALIVOVÝ ČLÁNEK, POHÁNĚNÝ HOŘLAVÝM PLYNEM, jak je to náležité.

Motory a stroje poháněné jak hořlavým plynem, tak i hořlavou kapalinou musí být přiřazeny k příslušné položce UN 3529.

- (e) Motory a stroje obsahující kapalná paliva splňující klasifikační kritéria uvedená v 2.2.9.1.10 pro látky ohrožující životní prostředí a nespňující klasifikační kritéria žádné jiné třídy musí být přiřazeny k položkám UN 3530 MOTOR, VNITŘNÍ SPALOVÁNÍ nebo UN 3530 STROJ, VNITŘNÍ SPALOVÁNÍ, jak je to náležité.

- (f) Motory nebo stroje smějí obsahovat jiné nebezpečné věci než paliva (např. akumulátory, hasicí přístroje, zásobníky stlačeného plynu nebo pojistná zařízení) potřebné pro jejich fungování nebo bezpečný provoz, aniž by podléhaly jakýmkoli jiným dodatečným požadavkům na tyto jiné nebezpečné věci, pokud není v ADN stanoveno jinak. Avšak lithiové baterie musí splňovat ustanovení pododdílu 2.2.9.1.7, pokud není stanoveno jinak ve zvláštním ustanovení 667.

- (g) Motor nebo stroj, včetně zádržných prostředků obsahujících nebezpečné věci, musí splňovat konstrukční požadavky stanovené příslušným orgánem země výroby²;

- (h) Všechny ventily nebo otvory (např. odvětrávací zařízení) musí být během přepravy uzavřeny;

- (i) Motory nebo stroje musí být orientovány tak, aby se zamezilo nechtěnému úniku nebezpečných věcí, a musí být zajištěny prostředky schopnými zabránit motorům nebo strojům v jakékoli pohybu během přepravy, který by mohl změnit jejich orientaci nebo způsobit jejich poškození;

- (j) Pro UN 3528 a UN 3530:

Pokud motor nebo stroj obsahuje více než 60 litrů kapalného paliva a má kapacitu více než 450 litrů, nejvýše však 3000 litrů, musí být označen na dvou protilehlých stranách podle 5.2.2.

Pokud motor nebo stroj obsahuje více než 60 litrů kapalného paliva a má kapacitu více než 3000 litrů, musí být označen na dvou protilehlých stranách velkými bezpečnostními značkami. Velké bezpečnostní značky musí odpovídat bezpečnostním značkám vyžadovaným ve sloupci (5) tabulky A kapitoly 3.2 a musí být ve shodě se specifikacemi uvedenými v 5.3.1.7. Velké bezpečnostní značky musí být vyvedeny na podkladu v kontrastní barvě, nebo musí být orámovány vytečkovanou nebo plnou čarou.

- (k) Pro UN 3529:

Pokud má palivová nádrž motoru nebo stroje hydraulický vnitřní objem větší než 450 litrů, nejvýše však 1000 litrů, musí být označen na dvou protilehlých stranách podle 5.2.2.

Pokud má palivová nádrž motoru nebo stroje hydraulický vnitřní objem větší než 1000 litrů, musí být označen na dvou protilehlých stranách velkými bezpečnostními značkami. Velké bezpečnostní značky musí odpovídat bezpečnostním značkám vyžadovaným ve sloupci (5) tabulky A kapitoly 3.2 a musí být ve shodě se specifikacemi uvedenými v 5.3.1.7. Velké bezpečnostní značky musí být vyvedeny na podkladu v kontrastní barvě, nebo musí být orámovány vytečkovanou nebo plnou čarou.

² Například dodržení příslušných ustanovení směrnice 2006/42/ES Evropského parlamentu a Rady ze 17. května 2006 o strojích a pozměňující směrnici 95/16/ES (Úřední věstník Evropské unie č. L 157z 9. června 2006, str. 0024-0086.

- (l) Pokud palivová nádrž motoru nebo stroje obsahuje více než 1 000 l kapalných paliv, pro UN 3528 a UN 3530, nebo má palivová nádrž hydraulický vnitřní objem vyšší než 1 000 l, pro UN číslo 3529.
- Je vyžadován přepravní doklad v souladu s 5.4.1. Tento přepravní doklad musí obsahovat následující dodatečné prohlášení "Přeprava v souladu se zvláštním ustanovením 363"
- (m) Požadavky uvedené v pokynech pro balení P005 pododdílu 4.1.4.1 ADR musí být splněny.
- 364 Tento předmět smí být přepravován podle ustanovení kapitoly 3.4, jestliže je kus ve stavu, jak je podáván k přepravě, schopen vyhovět při zkoušce podle Série zkoušek 6(d), části I Příručky zkoušek a kritérií, jak je stanoveno příslušným orgánem.
- 365 K vyrobeným nástrojům a předmětům obsahujícím rtuť viz UN číslo 3506.
- 366 Vyrobené nástroje a předměty obsahující nejvýše 1 kg rtuti nepodléhají ADN.
- 367 Pro účely dokumentace:
- Oficiální pojmenování pro přepravu „Látka pomocná k výrobě barev“ smí být použito pro zásilky kusů obsahujících „Barvu“ a „Látku pomocnou k výrobě barev“ v tomtéž kusu;
- Oficiální pojmenování pro přepravu „Látka pomocná k výrobě barev, žíravá, hořlavá“ smí být použito pro zásilky kusů obsahujících „Barvu, žíravou, hořlavou“ a „Látku pomocnou k výrobě barev, žíravou, hořlavou“ v tomtéž kusu;
- Oficiální pojmenování pro přepravu „Látka pomocná k výrobě barev, hořlavá, žíravá“ smí být použito pro zásilky kusů obsahujících „Barvu, hořlavou, žíravou“ a „Látku pomocnou k výrobě barev, hořlavou, žíravou“ v tomtéž kusu; a
- Oficiální pojmenování pro přepravu „Látka pomocná k výrobě tiskařských barev“ smí být použito pro zásilky kusů obsahujících „Barvu tiskařskou“ a „Látku pomocnou k výrobě tiskařských barev“ v tomtéž kusu.
- 368 V případě hexafluoridu uranu, jiného než štěpného nebo štěpného vyjmutého, se látka zařadí pod UN číslo 3507 nebo UN číslo 2978.
- 369 Podle odstavce 2.1.3.5.3 (a) je tato radioaktivní látka ve vyjmutém kusu, mající toxické a žíravé vlastnosti, zařazena do třídy 6.1 s vedlejšími nebezpečími radioaktivity a žíravosti.
- Hexafluorid uranu smí být zařazen pod tuto položku, jen pokud jsou splněny podmínky uvedené v 2.2.7.2.4.1.2, 2.2.7.2.4.1.5, 2.2.7.2.4.5.2 a pro vyjmuté štěpné látky v 2.2.7.2.3.5.
- Kromě ustanovení platných pro přepravu látek třídy 6.1 s vedlejším nebezpečím žíravosti platí ustanovení uvedená v 5.1.3.2, 5.1.5.2.2, 5.1.5.4.1 (b), 7.5.11 CV33 (3.1), (5.1) až (5.4) a (6) dle ADR.
- Nevyžaduje se umístění žádné bezpečnostní značky pro třídu 7.
- 370 Tato položka se vztahuje pouze na dusičnan amonný, který splňuje jedno z následujících kritérií:
- (a) dusičnan amonný s více než 0,2 % hořlavých látek, včetně jakékoli organické látky počítané jako uhlík, s vyloučením jakékoli přidané látky; nebo
 - (b) dusičnan amonný s nejvýše 0,2 % hořlavých látek, včetně jakékoli organické látky počítané jako uhlík, s vyloučením jakékoli přidané látky, který dává pozitivní výsledek, jestliže byl odzkoušen podle série zkoušek 2 (viz *Příručka zkoušek a kritérií, část I*). Viz též UN číslo 1942.
- Tato položka nesmí být použita pro dusičnan amonný, pro který již existuje oficiální pojmenování pro přepravu v tabulce A kapitoly 3.2, včetně dusičnanu amonného smíšeného s topným olejem (ANFO) nebo jakékoli obchodní třídy dusičnanu amonného.

- 371 (1) Tato položka se vztahuje také na předměty obsahující malé tlakové nádoby s vypouštěcím ventilem. Takové předměty musí splňovat následující požadavky:
- (a) Hydraulický vnitřní objem tlakové nádoby nesmí překročit 0,5 litru a provozní tlak nesmí překročit 25 barů při 15 °C;
 - (b) Minimální tlak při roztržení tlakové nádoby musí být roven nejméně čtyřnásobku tlaku plynu při 15 °C;
 - (c) Každý předmět musí být vyroben takovým způsobem, aby bylo vyloučeno neúmyslné vznícení nebo spuštění za normálních podmínek manipulace, balení, přepravy a použití. Toto může být splněno dodatečným uzamykacím zařízením spojeným s aktivátorem;
 - (d) Každý předmět musí být vyroben takovým způsobem, aby se předešlo nebezpečným rozletům tlakové nádoby nebo částí tlakové nádoby;
 - (e) Každá tlaková nádoba musí být vyrobena z materiálu, který se při jejím prasknutí nebude tříštit;
 - (f) Konstrukční typ předmětu musí být podroben zkoušce v ohni. Pro tuto zkoušku se použijí ustanovení odstavců 16.6.1.2, kromě písmene g, 16.6.1.3.1 až 16.6.1.3.6, 16.6.1.3.7 (b) a 16.6.1.3.8 Příručky zkoušek a kritérií. Musí být prokázáno, že předmět uvolňuje svůj tlak pomocí těsnění degradujícího působením ohně nebo pomocí jiného zařízení pro vyrovnávání tlaku takovým způsobem, že se tlaková nádoba neroztříští a že předmět nebo fragmenty předmětu neodletí dále než 10 metrů;
 - (g) Konstrukční typ předmětu musí být podroben následující zkoušce. Použije se stimulační mechanismus k iniciaci jednoho předmětu ve středu obalu. Nesmí dojít k nebezpečným účinkům vně kusu, jako je roztržení kusu, průnik kovových fragmentů nebo vlastní nádoby obalem.
- (2) Výrobce musí pořídit technickou dokumentaci konstrukčního typu, výroby, jakož i zkoušek a jejich výsledků. Výrobce musí použít postupy k zajištění toho, aby předměty v sériové výrobě byly vyráběny v dobré kvalitě, podle konstrukčního typu a byly schopny splnit požadavky uvedené v (1). Výrobce musí na požádání poskytnout takové informace příslušnému orgánu.

- 372 Tato položka platí pro asymetrické kondenzátory s kapacitou akumulace energie větší než 0,3 Wh. Kondenzátory s kapacitou akumulace energie 0,3 Wh nebo nižší nepodléhají ADN.

Kapacitou akumulace energie se rozumí energie zadržena kondenzátorem, jak je vypočtena podle následující rovnice:

$$Wh = 1/2C_N (U_R^2 - U_L^2) \times (1/3600),$$

za použití jmenovité kapacity (CN), jmenovitého napětí (UR) a jmenovité dolní meze napětí (UL).

Všechny asymetrické kondenzátory, pro něž tato položka platí, musí splňovat následující podmínky:

- (a) Kondenzátory nebo moduly musí být chráněny proti zkratu;
- (b) Kondenzátory musí být konstruovány a vyrobeny tak, aby mohl být bezpečně snížen tlak, který může narůst během jejich používání, pomocí větracího otvoru nebo slabého místa v plášti kondenzátoru. Jakákoli kapalina, která se uvolní při větrání, musí být zadržena obalem nebo zařízením, v němž je kondenzátor zabudován;
- (c) Na kondenzátorech musí být vyznačena jejich kapacita akumulace energie ve Wh; a
- (d) Kondenzátory obsahující elektrolyt splňující klasifikační kritéria kterékoli třídy nebezpečných věcí musí být konstruovány tak, aby odolaly rozdílu tlaků 95 kPa;

Kondenzátory obsahující elektrolyt, který nespĺňuje klasifikační kritéria žádné třídy nebezpečných věcí, i když jsou v sestavě modulu anebo jsou zabudovány v zařízení, nepodléhají jiným ustanovením ADN.

Kondenzátory obsahující elektrolyt, který splňuje klasifikační kritéria kterékoli třídy nebezpečných věcí, s kapacitou akumulace energie 20 Wh nebo méně, i když jsou v sestavě modulu, nepodléhají jiným ustanovením ADN, pokud jsou kondenzátory schopny

v nezabaleném stavu odolat při zkoušce volným pádem z výšky 1,2 metru na pevný povrch bez ztráty obsahu.

Kondenzátory obsahující elektrolyt, splňující klasifikační kritéria kterékoli třídy nebezpečných věcí, které nejsou zabudovány v zařízení a s kapacitou akumulace energie větší než 20 Wh, podléhají ustanovením ADN.

Kondenzátory zabudované v zařízení a obsahující elektrolyt, který splňuje klasifikační kritéria kterékoli třídy nebezpečných věcí, nepodléhají jiným ustanovením ADN, pokud je zařízení zabaleno v pevném vnějším obalu vyrobeném z vhodného materiálu a přiměřené pevnosti a konstrukce ve vztahu k zamýšlenému použití a takovým způsobem, aby se zamezilo náhodnému uvedení kondenzátorů do činnosti během přepravy. Velké robustní zařízení obsahující kondenzátory smí být podáno k přepravě nezabalené nebo na paletách, je-li kondenzátorům poskytována rovnocenná ochrana zařízením, v němž jsou obsaženy.

POZNÁMKA: Bez ohledu na ustanovení tohoto zvláštního ustanovení musí být nikel-uhlíkové asymetrické kondenzátory obsahující alkalické elektrolyty třídy 8 přepravovány jako UN 2795 AKUMULÁTORY (BATERIE), NAPLNĚNÉ ALKALICKÝM KAPALNÝM ELEKTROLYTEM, elektrická akumulace.

373 Detektory neutronového záření obsahující nestlačený plyn fluorid boritý smějí být přepravovány pod touto položkou, pokud jsou splněny následující podmínky:

- (a) Každý detektor neutronového záření musí splňovat následující podmínky:
- (i) Tlak v každém detektoru nesmí překročit 105 kPa (absolutní tlak) při 20 °C;
 - (ii) Množství plynu nesmí překročit 13 g na detektor;
 - (iii) Každý detektor musí být vyroben v registrovaném programu zajištění kvality;

POZNÁMKA: ISO 9001 smí být použita k tomuto účelu.

- (iv) Každý detektor neutronového záření musí být svařované kovové konstrukce s přechodovými konektory připojenými keramicko-kovovým pájením natvrdo. Tyto detektory musí mít minimální tlak při prasknutí 1800 kPa, jak je prokázáno při kvalifikační zkoušce konstrukčního typu; a
 - (v) Každý detektor musí být před naplněním odzkoušen na 1×10^{-10} cm³/s normy těsnosti.
- (b) Detektory neutronového záření přepravované jako samostatné komponenty musí být přepravovány následujícím způsobem:
- (i) Detektory musí být zabaleny do těsně uzavřených vložek z plastu sloužících jako meziobal, s dostatečným množstvím absorpčního nebo adsorpčního materiálu, aby absorboval nebo adsorboval celý plynný obsah;
 - (ii) Musí být zabaleny do pevného vnějšího obalu. Zkompletovaný kus musí být schopen odolat při zkoušce volným pádem z výšky 1,8 m bez jakéhokoliv úniku plynného obsahu z detektorů;
 - (iii) Celkové množství plynu ze všech detektorů na vnější obal nesmí překročit 52 g.
- (c) Zkompletované systémy měření neutronového záření obsahující detektory splňující podmínky odstavce (a) musí být přepravovány následujícím způsobem.
- (i) Detektory musí být uloženy v pevném těsně uzavřeném vnějším pouzdru;
 - (ii) Pouzdro musí obsahovat dostatečné množství absorpčního nebo adsorpčního materiálu, aby absorboval nebo adsorboval celý plynný obsah;
 - (iii) Zkompletované systémy musí být zabaleny do pevných vnějších obalů schopných odolat při zkoušce volným pádem z výšky 1,8 m bez úniku obsahu, pokud vnější pouzdro systému neposkytuje rovnocennou ochranu.

Pokyn pro balení P200 v 4.1.4.1 ADR se nepoužije.

Přepravní doklad musí obsahovat tento zápis: „Doprava podle zvláštního ustanovení 373“.

Detektory neutronového záření obsahující nejvýše 1 g fluoridu boritého, včetně těch, které mají těsnění z pájeného skla, nepodléhají ustanovením ADN, pokud splňují požadavky uvedené v odstavci (a) a jsou zabaleny podle odstavce (b). Systémy měření záření obsahující takové detektory nepodléhají ustanovením ADN, pokud jsou zabaleny podle odstavce (c).

- 374 (Vyhrazeno)
- 375 Tyto látky, pokud jsou přepravovány v samostatných nebo skupinových obalech obsahujících čisté množství na samostatný nebo vnitřní obal nejvýše 5 litrů pro kapaliny nebo mající čistou (netto) hmotnost na samostatný nebo vnitřní obal nejvýše 5 kg pro tuhé látky, nepodléhají žádným jiným ustanovením ADN, za podmínky, že obaly splňují všeobecná ustanovení uvedená v 4.1.1.1, 4.1.1.2 a 4.1.1.4 až 4.1.1.8 ADR.
- 376 Lithium-iontové články nebo baterie a lithiové kovové články nebo baterie, které jsou identifikovány jako poškozené nebo vadné tak, že neodpovídají typu odzkoušenému podle příslušných ustanovení Příručky zkoušek a kritérií, musí vyhovovat požadavkům tohoto zvláštního ustanovení.

Pro účely tohoto zvláštního ustanovení tyto články nebo baterie smějí zahrnovat, avšak nejsou omezeny jen na:

- články nebo baterie identifikované jako vadné z bezpečnostních důvodů;
- články nebo baterie, které vykazují známky úniku kapaliny nebo plynu;
- články nebo baterie, které nemohou být diagnostikovány před přepravou; nebo
- články nebo baterie, které utrpěly fyzické nebo mechanické poškození.

POZNÁMKA: Při posuzování, zda je článek nebo baterie poškozený nebo vadný, musí být provedeno posouzení nebo hodnocení na základě bezpečnostních kritérií od výrobce článku, baterie nebo produktu nebo od technického odborníka se znalostmi bezpečnostních prvků článku nebo baterie. Posouzení nebo hodnocení může mimo jiné zahrnovat následující kritéria:

- (a) Akutní nebezpečí jako je únik plynu, ohně, nebo elektrolytu;
- (b) Použití nebo zneužití článku nebo baterie;
- (c) Známky fyzického poškození, jako je deformace krytu článku nebo baterie nebo barvy na krytu;
- (d) Ochrana proti vnějšímu a vnitřnímu zkratu, jako je napěťové nebo izolační opatření;
- (e) Stav článku nebo bezpečnostních prvků baterie; nebo
- (f) Poškození jakýchkoliv vnitřních bezpečnostních částí jako je systém řízení baterie.

Články a baterie musí být přepravovány podle ustanovení vztahujících se na UN čísla 3090, 3091, 3480 a 3481, kromě zvláštního ustanovení 230, a jak je jinak stanoveno v tomto zvláštním ustanovení.

Kusy musí být označeny nápisem „POŠKOZENÉ/VADNÉ LITHIUM-IONTOVÉ BATERIE“ nebo „POŠKOZENÉ/VADNÉ LITHIOVÉ KOVOVÉ BATERIE“, jak je to náležité.

Články a baterie musí být baleny v souladu s pokyny pro balení P908 pododdílu 4.1.4.1 ADR nebo LP904 pododdílu 4.1.4.3 ADR, jak je to náležité.

Články a baterie, které jsou identifikovány jako poškozené nebo vadné a náchylné k rychlé demontáži, nebezpečné reakci, vzniku plamene nebo nebezpečnému vyvíjení tepla nebo nebezpečnému uvolňování toxických, žíravých nebo hořlavých plynů nebo par za normálních podmínek přepravy, musí být zabaleny a přepravovány v souladu s pokyny pro balení P911 bodu 4.1.4.1 ADR nebo LP906 bodu 4.1.4.3 ADR. Alternativní podmínky balení a / nebo přepravy mohou být povoleny příslušným orgánem kterékoliv smluvní strany ADN, který smí také uznat schválení udělené příslušným orgánem země, která není smluvní stranou ADN, za předpokladu, že toto schválení bylo uděleno v souladu s postupy platnými podle RID, ADR, ADN, IMDG Code nebo Technických pokynů ICAO. V obou případech jsou články a baterie přiřazeny k přepravní kategorii 0.

Kusy musí být označeny "POŠKOZENÉ/VADNÉ LITHIUM-IONTOVÉ BATERIE" nebo "POŠKOZENÉ/VADNÉ LITHIUM-KOVOVÉ BATERIE", jak je to vhodné.

Přepravní doklad musí obsahovat následující prohlášení "Přeprava v souladu se zvláštním ustanovením 376".

V případě potřeby musí být k přepravě přiložena kopie schválení příslušného orgánu.

- 377 Lithium-iontové a lithiové kovové články a baterie a zařízení obsahující takové články a baterie přepravované k likvidaci nebo recyklaci, buď balené spolu s nelithiovými bateriemi, nebo bez nich, smějí být baleny podle pokynu pro balení P909 v 4.1.4.1 ADR.

Tyto články a baterie nepodléhají ustanovením v 2.2.9.1.7 (a) až (g).

Kusy musí být označeny nápisem „LITHIOVĚ BATERIE K LIKVIDACI“ nebo „LITHIOVĚ BATERIE K RECYKLACI“.

Identifikované poškozené nebo vadné baterie musí být přepravovány podle zvláštního ustanovení 376.

- 378 Detektory záření obsahující tento plyn v tlakových nádobách na jedno použití, které nesplňují požadavky kapitoly 6.2 a pokynu pro balení P200 pododdílu 4.1.4.1 ADR, smějí být přepravovány pod touto položkou, pokud:

- (a) provozní tlak v každé nádobě nepřekročí 50 barů;
- (b) vnitřní objem nádoby nepřekročí 12 litrů;
- (c) každá nádoba má minimální tlak při roztržení roven nejméně trojnásobku provozního tlaku, pokud je nádoba opatřena zařízením pro vyrovnávání tlaku, a nejméně čtyřnásobku provozního tlaku, pokud je nádoba bez zařízení pro vyrovnávání tlaku;
- (d) každá nádoba je vyrobena z materiálu, který se při jejím roztržení neroztříští;
- (e) každý detektor je vyroben v registrovaném programu zajištění kvality;

POZNÁMKA: ISO 9001 smí být použita k tomuto účelu.

- (f) detektory jsou přepravovány v pevných vnějších obalech. Zkompletovaný kus musí být schopen odolat při zkoušce volným pádem z výšky 1,2 m bez poškození detektoru nebo prasknutí vnějšího obalu. Zařízení, které obsahuje detektor, musí být zabaleno do pevného vnějšího obalu, pokud toto samotné zařízení neposkytuje detektoru rovnocennou ochranu; a
 - (g) přepravní doklad obsahuje tento zápis: „Doprava podle zvláštního ustanovení 378“. Detektory záření, včetně detektorů v systémech měření záření, nepodléhají žádným jiným ustanovením ADN, pokud detektory splňují požadavky uvedené v odstavcích (a) až (f) výše a vnitřní objem nádoby detektoru nepřekračuje 50 ml.
- 379 Bezvodý amoniak (čpavek) adsorbovaný nebo absorbovaný v tuhé látce, obsažený v dávkovacích systémech amoniaku nebo nádobách určených k tomu, aby tvořily součást takových systémů, nepodléhají jiným ustanovením ADN, pokud jsou dodrženy následující podmínky:

- (a) Adsorpce nebo absorpce vykazuje tyto vlastnosti:
 - (i) Tlak při teplotě 20 °C v nádobě je nižší než 0,6 barů;
 - (ii) Tlak při teplotě 35 °C v nádobě je nižší než 1 bar;
 - (iii) Tlak při teplotě 85 °C v nádobě je nižší než 12 barů;
- (b) Adsorpční nebo absorpční materiál nesmí mít nebezpečné vlastnosti uvedené ve třídách 1 až 8;
- (c) Nádoba obsahuje nejvýše 10 kg amoniaku;
- (d) Nádobu obsahující adsorbovaný nebo absorbovaný amoniak musí splňovat následující podmínky:
 - (i) Nádobu musí být vyrobeny z materiálu snášenlivého s amoniakem, jak je uvedeno v normě ISO 11114-1:2012 + A1:2017;
 - (ii) Nádobu a jejich uzávěry musí být hermeticky uzavřeny a musí být schopné zadržet vyvíjený amoniak;

- (iii) Každá nádoba musí být schopna odolat tlaku vyvinutému při 85 oC s objemovou roztažností nejvýše 0,1 %;
- (iv) Každá nádoba musí být vybavena prostředkem, který dovolí vypuštění plynu, jakmile tlak překročí 15 barů, bez prudkého roztržení, výbuchu nebo rozletu;
- (v) Každá nádoba musí být schopna odolat tlaku 20 barů bez úniku obsahu, je-li zařízení pro vyrovnávání tlaku deaktivováno.

Jsou-li nádoby přepravovány v dávkovači amoniaku, musí být spojeny s dávkovačem takovým způsobem, aby bylo zaručeno, že tento celek má stejnou pevnost, jako jednotlivá nádoba.

Vlastnosti mechanické pevnosti zmíněné v tomto zvláštním ustanovení musí být vyzkoušeny za použití prototypu nádoby a/nebo dávkovače naplněné(ho) do jmenovitého vnitřního objemu zvyšováním teploty až do dosažení uvedených tlaků.

Výsledky zkoušky musí být zdokumentovány, musí být dohledatelné a musí být na požádání sděleny příslušným orgánům.

- 380 (Vyhrazeno)
- 381 (Vyhrazeno)
- 382 Polymerní kuličky mohou být vyrobeny z polystyrénu, polymethylmethakrylátu nebo jiného polymerního materiálu. Pokud může být prokázáno, že se žádná hořlavá pára vznikající v hořlavé atmosféře nevyvíjí při zkoušce U1 (Zkušební metoda pro látky uvolňující hořlavé páry) části III, pododdílu 38.4.4 Příručky zkoušek a kritérií, nemusí být polymerní kuličky, zpěňovatelné zařazeny pod toto UN číslo. Tato zkouška by se měla provádět, jen pokud se uvažuje s deklasifikací látky.“.
- 383 Míčky na stolní tenis vyrobené z celulóidu nepodléhají ustanovením ADN, jestliže čistá (netto) hmotnost každého míčku nepřekračuje 3,0 g a celková čistá (netto) hmotnost míčků nepřekračuje 500 g na kus.
- 384 (Vyhrazeno)
- 385 (Vypuštěno)
- 386 Jsou-li látky stabilizovány řízením teploty, platí ustanovení v 2.2.41.1.21, 7.1.7, zvláštní ustanovení V8 kapitoly 7.2 ADR, zvláštní ustanovení S4 kapitoly 8.5 ADR a požadavky kapitoly 9.6 ADR. Pokud se použije chemická stabilizace, musí osoba podávající obal, IBC nebo cisternu k přepravě zajistit, že úroveň stabilizace je dostatečná, aby zabránila látce v obalu, IBC nebo cisterně v nebezpečné polymerizaci při průměrné teplotě nákladu 50 °C, nebo v případě přemístitelné cisterny 45 oC. Pokud se chemická stabilizace stane při nižších teplotách během očekávané doby trvání přepravy neúčinnou, je nutné řízení teploty. Určujícími faktory, které je při tom třeba vzít v úvahu, jsou zejména vnitřní objem a geometrický tvar obalu, IBC nebo cisterny a účinnost jakékoli existující izolace, teplota látky při jejím podávání k přepravě, doba trvání jízdy a teplotní podmínky okolí typicky se vyskytující během jízdy (též s přihlédnutím k ročnímu období), účinnost a jiné vlastnosti použitého stabilizátoru, příslušné provozní kontroly prováděné na základě předpisů (např. požadavky na ochranu před zdroji tepla, včetně jiného nákladu přepravovaného při teplotě vyšší než je teplota okolí) a jakékoli jiné relevantní faktory.
- 387 Lithiové baterie podle 2.2.9.1.7 (f) obsahující jak primární lithiové kovové články, tak i dobíjecí lithium-iontové články musí být přiřazeny k UN číslům 3090 nebo 3091, jak je to vhodné. Jsou-li takové baterie přepravovány podle zvláštního ustanovení 188, nesmí celkový obsah lithia všech lithiových kovových článků obsažených v baterii překročit 1,5 g a celková kapacita všech lithium-iontových článků obsažených v baterii nesmí překročit 10 Wh.
- 388 Položky UN 3166 se vztahují na vozidla poháněná spalovacími motory s hořlavými kapalinami nebo hořlavými plyny nebo palivovými články.

Vozidla poháněná palivovými články musí být zařazena pod UN 3166 VOZIDLO, PALIVOVÝ ČLÁNEK, POHÁNĚNÝ HOŘLAVÝ PLYNEM nebo UN 3166 VOZIDLO, PALIVOVÝ ČLÁNEK, POHÁNĚNÝ HOŘLAVOU KAPALINOU. Tyto položky zahrnují hybridní elektrická vozidla poháněná jak palivovým článkem, tak spalovacím motorem s mokřými bateriemi, sodíkovými

bateriemi, lithium-kovovými bateriemi nebo lithium-iontovými bateriemi, které jsou přepravovány s instalovanou baterií(emi).

Ostatní vozidla, která obsahují spalovací motor, musí být zařazena pod UN číslo 3166 VOZIDLO, POHÁNĚNÉ HOŘLAVÝM PLYNEM nebo UN 3166 VOZIDLO, POHÁNĚNÉ HOŘLAVOU KAPALINOU, jak je to vhodné. Tyto položky zahrnují hybridní elektrická vozidla poháněná jak spalovacím motorem, tak mokřými bateriemi, sodíkovými bateriemi, lithiovými kovovými bateriemi nebo lithium-iontovými bateriemi, které jsou přepravovány s instalovanou baterií.

Je-li vozidlo poháněno spalovacím motorem s hořlavou kapalinou a hořlavým plynem, musí být zařazeno pod UN číslo 3166 VOZIDLO, POHÁNĚNÉ HOŘLAVÝM PLYNEM.

Položky UN 3171 se vztahují pouze na vozidla poháněná mokřými bateriemi, sodíkovými bateriemi, lithium-kovovými bateriemi nebo lithium-iontovými bateriemi a zařízení napájenými mokřými bateriemi nebo sodíkovými bateriemi, které jsou nainstalovány s těmito bateriemi.

Pro účely tohoto zvláštního ustanovení jsou vozidla samohybné přístroje určené k přepravě jedné nebo více osob nebo zboží. Příklady takových vozidel jsou automobily, motocykly, skútry, tříkolová a čtyřkolová vozidla nebo motocykly, nákladní automobily, lokomotivy, jízdní kola (šlapací kolo s motorem) a jiná vozidla tohoto typu (např. dopravní prostředky se samovyvažovacím zařízením nebo vozidla, která nejsou vybavená alespoň jedním sedadlem), invalidní vozíky, traktory na trávníky, zemědělské a stavební stroje s vlastním pohonem, lodě a letadla. Patří sem vozidla přepravovaná v obalu. V tomto případě mohou být některé části vozidla odpojeny od rámu, aby se vešly do obalu.

Příkladem zařízení jsou sekačky na trávu, čisticí stroje nebo modely lodí a modely letadel. Zařízení napájená lithiovými kovovými bateriemi nebo lithium-iontovými bateriemi musí být zařazena pod UN 3091 LITHIUM KOVOVÉ BATERIE OBSAŽENÉ V ZAŘÍZENÍ nebo UN 3091 LITHIUM KOVOVÉ BATERIE BALENÁ SE ZAŘÍZENÍM nebo UN 3481 LITHIUM IONTOVÉ BATERIE OBSAŽENÉ V ZAŘÍZENÍ nebo UN 3481 LITHIUM IONTOVÉ BATERIE BALENÁ SE ZAŘÍZENÍM, jak je to vhodné. Lithium-iontové nebo lithium-kovové baterie instalované v nákladních dopravních jednotkách, které jsou konstruovány pouze pro externí napájení dopravních jednotek, musí být zařazeny pod položku UN 3536 BATERIE LITHIOVÉ UMÍSTĚNÉ V NÁKLADNÍ DOPRAVNÍ JEDNOTCE lithium-iontové baterie nebo lithium-kovové baterie.

Nebezpečné věci, jako jsou baterie, airbasy, hasicí přístroje, akumulátory se stlačeným plynem, bezpečnostní zařízení a další nedílné součásti vozidla, které jsou nezbytné pro provoz vozidla nebo pro bezpečnost jeho provozovatele nebo cestujících, musí být bezpečně instalovány ve vozidle a vozidla jinak nepodléhají předpisům ADN. Lithiové baterie však musí splňovat ustanovení pododdílu 2.2.9.1.7, nestanoví-li zvláštní ustanovení 667 jinak.

Pokud je lithiová baterie instalovaná ve vozidle nebo zařízení poškozena nebo vadná, musí být vozidlo nebo zařízení přepravováno v souladu s podmínkami stanovenými ve zvláštním ustanovení 667 písm. c).

- 389 Tato položka se vztahuje pouze na nákladní dopravní (přepravní) jednotky, v nichž jsou zabudovány lithium-iontové baterie nebo lithium-kovové baterie, které jsou určeny jen pro dodávání energie mimo jednotku. Lithiové baterie musí splňovat ustanovení uvedená v 2.2.9.1.7 (a) až (g) a obsahovat potřebné systémy zabraňující přebití nebo nadměrnému vybití baterií.

Baterie musí být bezpečně připevněny k vnitřní konstrukci nákladní dopravní (přepravní) jednotky (např. pomocí uložení na poličky nebo do skříněk atd.) takovým způsobem, aby se zamezilo zkratům, náhodnému uvedení do činnosti a významnému relativnímu pohybu vůči nákladní dopravní (přepravní) jednotce v důsledku otřesů, namáhání a vibrací, ke kterým běžně dochází během přepravy. Nebezpečné věci potřebné k bezpečnému a řádnému provozu nákladní dopravní (přepravní) jednotky (např. systémy k hašení požáru a klimatizační systémy) musí být řádně zajištěny nebo zabudovány do nákladní dopravní (přepravní) jednotky a jinak nepodléhají ustanovením ADN. Nebezpečné věci, které nejsou potřebné k bezpečnému a řádnému provozu nákladní dopravní (přepravní) jednotky, nesmějí být v nákladní dopravní (přepravní) jednotce přepravovány.

Baterie uvnitř nákladní dopravní (přepravní) jednotky nepodléhají požadavkům na značení. Nákladní dopravní (přepravní) jednotka musí být opatřena oranžovými tabulkami podle

- 5.3.2.2 a velkými bezpečnostními značkami podle 5.3.1.1 na dvou protilehlých bočních stranách.
- 390 Pokud kus obsahuje kombinaci lithiových baterií obsažených v zařízení a lithiových baterií balených se zařízením, pro účely označení kusu a přepravního dokladu platí následující požadavky:
- (a) kus musí být označen „UN 3091“, nebo „UN 3481“, jak je to vhodné. Pokud kus obsahuje lithium-iontové baterie i lithium-kovové baterie balené se zařízením a obsažené v zařízení, musí být kus označen podle požadavků pro oba typy baterií. Knoflíkové baterie instalované v zařízení (včetně desek plošných spojů) však nemusí být brány v úvahu;
- (b) v přepravním dokladu musí být uvedeno „UN 3091 BATERIE LITHIOVÉ KOVOVÉ BALENÉ SE ZAŘÍZENÍM“ nebo „UN 3481 BATERIE LITHIUM-IONTOVÉ BALENÉ SE ZAŘÍZENÍMI“, jak je to vhodné. Pokud kus obsahuje jak lithium-kovové baterie a lithium-iontové baterie balené se zařízením tak i obsažené v zařízení, pak musí být v přepravním dokladu uvedeno oboje „UN 3091 BATERIE LITHIOVÉ KOVOVÉ BALENÉ SE ZAŘÍZENÍM“ a „UN 3481 BATERIE LITHIUM-IONTOVÉ BALENÉ SE ZAŘÍZENÍMI“.
- 391 (Vyhrazeno)
- 392 Pro přepravu plynových palivových soustav, zkonstruovaných a schválených pro zabudování do motorových vozidel obsahujících tento plyn, nemusí být použita ustanovení uvedená v 4.1.4.1 a v kapitole 6.2 ADR, jsou-li přepravovány za účelem likvidace, recyklace, opravy, inspekce, údržby nebo z místa, kde byly vyrobeny, do montážního závodu vozidel za předpokladu, že jsou splněny následující podmínky:
- (a) Plynové palivové soustavy musí splňovat požadavky norem nebo předpisů pro palivové nádrže určené pro motorová vozidla, jak je to náležité. Příklady platných norem a předpisů jsou:

Nádrže na LPG	
Předpis EHK č. 67, revize 2	Jednotná ustanovení týkající se schvalování: I. zvláštní výbavy vozidel kategorie M a N používajících zkapalněné ropné plyny ve svém pohonném systému; II. vozidel kategorie M a N opatřených zvláštní výbavou pro používání zkapalněných ropných plynů v jejich pohonném systému s ohledem na instalaci takové výbavy
Předpis EHK č. 115	Jednotná ustanovení týkající se schvalování: I. zvláštních systémů LPG (zkapalněný ropný plyn) pro dodatečnou montáž určených k zástavbě do motorových vozidel pro použití LPG v jejich pohonném systému; II. zvláštních systémů CNG (stlačený zemní plyn) pro dodatečnou montáž určených k zástavbě do motorových vozidel pro použití CNG v jejich pohonném systému
Nádrže na CNG a LNG	
Předpis EHK č. 110	Jednotná ustanovení týkající se schvalování: I. zvláštních součástí motorových vozidel, která ve svém pohonném systému používají stlačený zemní plyn (CNG) a/nebo zkapalněný zemní plyn (LNG); II. vozidel s ohledem na zástavbu zvláštních součástí schváleného typu pro použití CNG a/nebo LNG k jejich pohonu
Předpis EHK č. 115	Jednotná ustanovení týkající se schvalování: I. zvláštních systémů LPG (zkapalněný ropný plyn) pro dodatečnou montáž určených k zástavbě do motorových vozidel pro použití LPG v jejich pohonném systému; II. zvláštních systémů CNG (stlačený zemní plyn) pro dodatečnou montáž určených k zástavbě do motorových vozidel pro použití CNG v jejich pohonném systému
ISO 11439:2013	Láhve na plyny – Vysokotlaké láhve na zemní plyn používaný jako palivo v motorových vozidlech
ISO 15500 – Série	Silniční vozidla – Součásti palivového systému na stlačený zemní plyn (CNG) – různé použitelné části
ANSI NGV 2	Palivové nádrže vozidel poháněných stlačeným zemním plynem
CSA B51 Část 2:2014	Řád pro kotle, tlakové nádoby a tlaková potrubí – Část 2: Požadavky na vysokotlaké láhve sloužící pro uložení paliva v motorovém vozidle
Nádrže na vodík pod tlakem	

Globální technický předpis (GTR) č.13	Globální technický předpis o vozidlech s pohonem vodíkem a palivovými články (ECE/TRANS/180/Add.13)
ISO/TS 15869:2009	Plynný vodík a směsi plynného vodíku – Palivové nádrže pozemních vozidel
Nařízení (ES) č. 79/2009	Nařízení (ES) č. 79/2009 Evropského parlamentu a Rady ze dne 14. ledna 2009 o schvalování typu motorových vozidel na vodíkový pohon a o změně směrnice 2007/46/ES
Nařízení (EU) č. 406/2010	Nařízení Komise (EU) č. 406/2010 z 26. dubna 2010, kterým se provádí Nařízení (ES) č. 79/2009 Evropského parlamentu a Rady ze dne 14. ledna 2009 o schvalování typu motorových vozidel na vodíkový pohon
Předpis EHK č. 134	Jednotná ustanovení pro schvalování motorových vozidel a jejich konstrukčních částí z hlediska bezpečnostních vlastností vozidel poháněných vodíkem.
CSA B51 Část 2:2014	Řád pro kotle, tlakové nádoby a tlaková potrubí – Část 2: Požadavky na vysokotlaké láhve sloužící pro uložení paliva v motorovém vozidle

Plynové nádrže zkonstruované a vyrobené podle předchozích verzí příslušných norem a předpisů pro plynové nádrže do motorových vozidel, které platily v době homologace vozidel, pro něž byly plynové nádrže zkonstruovány a vyrobeny, smějí být dále přepravovány;

- (b) Plynové palivové soustavy musí být těsné a nesmějí vykazovat žádné známky vnějšího poškození, které by mohlo zhoršit jejich bezpečnost:

POZNÁMKA 1: Kritéria je možno nalézt v normě ISO 11623: 2015 Plynové lahve - Konstrukce z kompozitních materiálů - Periodická kontrola a zkoušení (nebo ISO 19078:2013 Láhve na plyn – Kontrola instalace lahví a revize vysokotlakých lahví instalovaných ve vozidlech pro uložení zemního plynu používaného jako palivo v motorových vozidlech).

POZNÁMKA 2: Nejsou-li plynové palivové soustavy těsné, nebo jestliže jsou nadměrně naplněné nebo vykazují poškození, které by mohlo zhoršit jejich bezpečnost (např. v případě vyřazení z provozu z důvodu bezpečnosti), smějí být přepravovány jen v záchranných tlakových nádobách podle ustanovení ADN.

- (c) Je-li plynová palivová soustava vybavena dvěma nebo více ventily namontovanými za sebou, musí být tyto dva ventily uzavřeny tak, aby byly plynotěsné za normálních podmínek přepravy. Jestliže existuje pouze jeden ventil, nebo pokud pouze jeden ventil funguje, musí být všechny otvory, s výjimkou otvoru zařízení pro vyrovnávání tlaku, uzavřeny tak, aby byly plynotěsné za normálních podmínek přepravy;
- (d) Plynové palivové soustavy musí být přepravovány takovým způsobem, aby se zamezilo ucpání zařízení pro vyrovnávání tlaku nebo jakémukoli poškození ventilů a jakékoli jiné natlakované části plynových palivových sestav a nechtěnému úniku plynu za normálních podmínek přepravy. Plynová palivová soustava musí být zajištěna, aby se zamezilo jejímu sklouznutí, valení nebo pohybu ve vertikálním směru;
- (e) Ventily musí být chráněny jednou z metod popsanych v 4.1.6.8 (a) až (e) ADR.
- (f) Kromě případu, kdy jsou plynové palivové soustavy přepravovány za účelem jejich likvidace, recyklace, opravy, inspekce nebo údržby, smějí být naplněny do nejvýše 20% svého jmenovitého stupně plnění nebo jmenovitého provozního tlaku, jak je to náležité;
- (g) Bez ohledu na ustanovení kapitoly 5.2, jsou-li plynové palivové soustavy odesílány v manipulačním prostředku, smějí být značky a bezpečnostní značky umístěny na manipulačním prostředku; a
- (h) Bez ohledu na ustanovení v 5.4.1.1.1 (f), smějí být informace o celkovém množství nebezpečných věcí nahrazeny následujícími informacemi:
- (i) počet plynových palivových soustav; a
 - (ii) v případě zkapalněných plynů celková čistá (netto) hmotnost (kg) plynu pro každou plynovou palivovou soustavu a v případě stlačených plynů celkový

hydraulický vnitřní objem (l) každé plynové palivové soustavy spolu s údajem jmenovitého provozního tlaku.

Příklady údajů v přepravním dokladu:

Příklad 1: „UN 1971 plyn zemní, stlačený, 2.1, 1 plynová palivová sestava o 50 l celkem, 200 barů“.

Příklad 2: „UN 1965 uhlovodíky plyné, směs, zkapalněná, j.n., 2.1, 3 plynové palivové sestavy, každá s 15 kg čisté (netto) hmotnosti plynu.“

- 393 Nitrocelulóza musí splňovat kritéria Bergmann-Junkova testu nebo testu pomocí methyl fialového papíru dle Příručky zkoušek a kritérií, dodatku 10. Zkoušky typu 3 (c) nemusí být použity.
- 394 Nitrocelulóza musí splňovat kritéria Bergmann-Junkova testu nebo testu pomocí methyl fialového papíru dle Příručky zkoušek a kritérií, dodatku 10.
- 395 Tato položka smí být použita pouze pro tuhé medicínské odpady kategorie A přepravované k likvidaci.
- 396-499 (Vyhrazeno)
- 500 (Vypuštěno)
- 501 Naftalen, roztavený, viz UN 2304.
- 502 UN 2006 plasty na bázi nitrocelulózy, schopné samoohřevu, j.n. a UN 2002 celulooid, odpad jsou látkami třídy 4.2.
- 503 Pro fosfor bílý, roztavený, viz UN 2447.
- 504 UN 1847 sulfid draselný, hydratovaný, obsahující nejméně 30 % krystalové vody, UN 1849 sulfid sodný, hydratovaný, obsahující nejméně 30 % krystalové vody a UN 2949 hydrogensulfid sodný, obsahující nejméně 25 % krystalové vody jsou látkami třídy 8.
- 505 UN 2004 amid hořečnatý je látkou třídy 4.2.
- 506 Kovy alkalických zemin a slitiny kovů alkalických zemin v pyroforní formě jsou látkami třídy 4.2.
UN 1869 hořčík nebo slitiny hořčíku s více než 50 % hořčíku, jako hrudky, třísky nebo pásy jsou látkami třídy 4.1.
- 507 UN 3048 pesticidy na bázi fosfidu hliníku s přísadami zamezujícími vyvíjení toxických hořlavých plynů jsou látkami třídy 6.1.
- 508 UN 1871 dihydrid titanu a UN 1437 hydrid zirkonia jsou látkami třídy 4.1. UN 2870 tetrahydridoboritan hlinitý je látkou třídy 4.2.
- 509 UN 1908 chloritan, roztok je látkou třídy 8.
- 510 UN 1755 kyselina chromová, roztok je látkou třídy 8.
- 511 UN 1625 dusičnan rtuťnatý, UN 1627 dusičnan rtuťný a UN 2727 dusičnan thallný jsou látkami třídy 6.1. Dusičnan thoričitý, tuhý, dusičnan uranylu hexahydrát, roztok a dusičnan uranylu, tuhý jsou látkami třídy 7.
- 512 UN 1730 chlorid antimoničný, kapalný, UN 1731 chlorid antimoničný, roztok, UN 1732 fluorid antimoničný a UN 1733 chlorid antimoničný jsou látkami třídy 8.
- 513 UN 0224 azid barnatý, suchý nebo vlhčený s méně než 50 % hm. vody je látkou třídy 1. UN 1571 azid barnatý, vlhčený s nejméně 50 % hm. vody je látkou třídy 4.1. UN 1854 slitiny barya, pyroforní, jsou látkami třídy 4.2. UN 1445 chlorečnan barnatý, tuhý, UN 1446 dusičnan barnatý, UN 1447 chloristan barnatý, tuhý, UN 1448 manganistan barnatý, UN 1449 peroxid barya, UN 2719 bromičnan barnatý, UN 2741 chlornan barnatý s více než 22 % aktivního chloru, UN 3405 chlorečnan barnatý, roztok a UN 3406 chloristan barnatý, roztok jsou látkami třídy 5.1. UN 1565 kyanid barnatý a UN 1884 oxid barnatý jsou látkami třídy 6.1.

- 514 UN 2464 dusičnan berylnatý je látkou třídy 5.1.
- 515 UN 1581 chlorpikrin a methylbromid, směs a UN 1582 chlorpikrin a methylchlorid, směs jsou látkami třídy 2.
- 516 UN 1912 methylchlorid a dichlormethan, směs je látkou třídy 2.
- 517 UN 1690 fluorid sodný, tuhý, UN 1812 fluorid draselný, tuhý UN 2505 fluorid amonný, UN 2674 hexafluorokřemičitan sodný a UN 2856 hexafluorokřemičitan, j.n., UN 3415 fluorid sodný, roztok a UN 3422 fluorid draselný, roztok jsou látkami třídy 6.1.
- 518 UN 1463 oxid chromový, bezvodý (kyselina chromová, tuhá) je látkou třídy 5.1.
- 519 UN 1048 bromovodík, bezvodý, je látkou třídy 2.
- 520 UN 1050 chlorovodík, bezvodý, je látkou třídy 2.
- 521 Tuhé chloritany a chlornany jsou látkami třídy 5.1.
- 522 UN 1873 kyselina chloristá, vodný roztok s více než 50 % hm., ale nejvýše 72 % hm. Čisté kyseliny, je látkou třídy 5.1. Kyselina chloristá, vodný roztok s více než 72 % hm. Čisté kyseliny, nebo směsi kyseliny chloristé s jinými kapalinami než vodou nejsou připuštěny k přepravě.
- 523 UN 1382 sulfid draselný, bezvodý a UN 1385 sulfid sodný, bezvodý, jakož i jejich hydráty s méně než 30 % krystalové vody, a UN 2318 hydrogensulfid sodný s méně než 25 % krystalové vody jsou látkami třídy 4.2.
- 524 UN 2858 hotové výrobky ze zirkonia s tloušťkou nejméně 18 µm jsou látkami třídy 4.1.
- 525 Roztoky anorganických kyanidů s celkovým obsahem iontů kyanidu vyšším než 30 % jsou přiřazeny k obalové skupině I, roztoky s celkovým obsahem iontů kyanidu vyšším než 3 %, nejvýše však 30 %, jsou přiřazeny k obalové skupině II a roztoky s celkovým obsahem iontů kyanidu vyšším než 0,3 %, nejvýše však 3 %, jsou přiřazeny k obalové skupině III.
- 526 UN 2000 celulozoid je přiřazen ke třídě 4.1.
- 527 (Vyhrazeno)
- 528 UN 1353 vlákna nebo tkaniny impregnované slabě nitrovanou celulózou, neschopné samoohřevu, jsou látkami třídy 4.1.
- 529 UN 0135 fulminát rtuťnatý vlhčený nejméně 20 % hm. vody nebo směsi alkohol/ voda je látkou třídy 1. Chlorid rtuťný (kalomel) je látkou třídy 6.1 (UN číslo 2025).
- 530 UN 3293 hydrazin, vodný roztok s nejvýše 37 % hm. hydrazinu je látkou třídy 6.1.
- 531 Směsi s bodem vzplanutí pod 23 °C, které obsahují více než 55 % nitrocelulózy s libovolným obsahem dusíku, nebo nejvýše 55 % nitrocelulózy s obsahem dusíku vyšším než 12,6 % (v suché hmotě) jsou látkami třídy 1 (viz UN číslo 0340 nebo 0342) nebo třídy 4.1. (UN čísel 2555, 2556 nebo 2557)
- 532 UN 2672 amoniak (čpavek), roztok s více než 10 %, ale nejvýše 35 % amoniaku je látkou třídy 8.
- 533 UN 1198 formaldehyd, roztok, hořlavý je látkou třídy 3. Formaldehydové roztoky, nehořlavé, obsahující méně než 25 % formaldehydu nepodléhají předpisům ADN.
- 534 Ačkoliv benzin může mít za určitých klimatických podmínek tenzi par při 50 °C větší než 110 kPa (1,10 bar), nejvýše však 150 kPa (1,50 bar), musí zůstat zařazen jako látka, která má při 50°C tenzi par nejvýše 110 kPa (1,10 bar).
- 535 UN 1469 dusičnan olovnatý, UN 1470 chloristan olovnatý, tuhý a UN 3408 chloristan olovnatý, roztok jsou látkami třídy 5.1.
- 536 Pro naftalen, tuhý, viz UN 1334.
- 537 UN 2869 chlorid titanitý, směs, nesamozápalná je látkou třídy 8.

- 538 Pro síru (v tuhém stavu), viz UN 1350.
- 539 Roztoky isokyanátů s bodem vzplanutí 230 C nebo vyšším jsou látkami třídy 6.1.
- 540 UN 1326 prášek hafniový, vlhčený, UN 1352 prášek titanový, vlhčený nebo UN 1358 prášek zirkoniový, vlhčený, s nejméně 25 % vody, jsou látkami třídy 4.1.
- 541 Směsi nitrocelulózy, jejichž obsah vody, alkoholu nebo plastifikačních činidel je nižší než předepsané mezní hodnoty, jsou látkami třídy 1.
- 542 Talek (mastek) s tremolitem a/nebo aktinolitem je látkou spadající pod tuto položku.
- 543 UN 1005 amoniak (čpavek), bezvodý, UN 3318 amoniak (čpavek), roztok s více než 50 % amoniaku a UN 2073 amoniak (čpavek), roztok s více než 35 %, avšak nejvýše 50 % amoniaku, jsou látky třídy 2. Roztoky amoniaku (čpavku) s nejvýše 10 % amoniaku nepodléhají předpisům ADN.
- 544 UN 1032 dimethylamin, bezvodý, UN 1036 ethylamin, UN 1061 methylamin, bezvodý a UN 1083 trimethylamin, bezvodý, jsou látkami třídy 2.
- 545 UN 0401 sulfid dipikrylu, vlhčený, s méně než 10 % hm. vody je látkou třídy 1.
- 546 UN 2009 zirkonium, suché, hotové plechy, pásy nebo stočený drát, o tloušťce menší než 18 µm, je látkou třídy 4.2. Zirkonium, suché, hotové plechy, pásy nebo stočený drát, o tloušťce nejméně 254 µm, nepodléhá předpisům ADN.
- 547 UN 2210 maneb nebo UN 2210 maneb, přípravky, ve formě schopné samoohřevu jsou látkami třídy 4.2.
- 548 Chlorsilany, které ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3.
- 549 Chlorsilany s bodem vzplanutí pod 23 °C, které ve styku s vodou nevyvíjejí žádné hořlavé plyny, jsou látkami třídy 3. Chlorsilany s bodem vzplanutí 23 °C nebo vyšším, které ve styku s vodou nevyvíjejí žádné hořlavé plyny, jsou látkami třídy 8.
- 550 UN 1323 cer, desky, pruty nebo tyče, je látkou třídy 4.1.
- 551 Roztoky těchto isokyanátů s bodem vzplanutí pod 23 °C jsou látkami třídy 3.
- 552 Kovy a slitiny kovů v práškové nebo jiné hořlavé formě, které jsou samozápalné, jsou látkami třídy 4.2. Kovy a slitiny v práškové nebo jiné hořlavé formě, které ve styku s vodou vyvíjejí hořlavé plyny, jsou látkou třídy 4.3.
- 553 Tato směs peroxidu vodíku a kyseliny peroctové nesmí při laboratorních zkouškách (viz Příručku zkoušek a kritérií, část II, oddíl 20) vybuchnout v kavitovaném stavu, ani deflagrovat a nesmí rovněž reagovat na zahřívání v uzavřeném prostoru, ani mít výbušnou sílu. Tento přípravek musí být tepelně stabilní (teplota samourchujícího se rozkladu 60 °C nebo vyšší pro kus o hmotnosti 50 kg) a musí obsahovat jako prostředek k znečistivění kapalinu, která se snáší s kyselinou peroctovou. Přípravky, které neodpovídají těmto kritériím, se považují za látky třídy 5.2 [viz Příručku zkoušek a kritérií, část II, odstavec 20.4.3 g].
- 554 Hydridy kovů, které ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3. UN 2870 tetrahydridoboritan hlinitý nebo UN 2870 tetrahydridoboritan hlinitý v přístrojích je látkou třídy 4.2.
- 555 Prach a prášek kovů, netoxické, v nesamozápalné formě, které však ve styku s vodou vyvíjejí hořlavé plyny, jsou látkami třídy 4.3.
- 556 (Vypuštěno)
- 557 Prach a prášek kovů v pyroforní formě jsou látkami třídy 4.2.
- 558 Kovy a slitiny kovů v pyroforní formě jsou látkami třídy 4.2. Kovy a slitiny kovů, které ve styku s vodou nevyvíjejí žádné hořlavé plyny, nejsou pyroforní ani schopné samoohřevu, ale snadno se zapálí, jsou látkami třídy 4.1.
- 559 (Vypuštěno)

- 560 Látka zahřátá, kapalná, j.n. přepravovaná při teplotě nejméně 100 °C (včetně roztavených kovů a roztavených solí) nebo látka s bodem vzplanutí, při teplotě pod jejím bodem vzplanutí, je látkou třídy 9 (UN číslo 3257).
- 561 Chlorformiáty s převažujícími žíravými vlastnostmi jsou látkami třídy 8.
- 562 Samozápalné organokovové sloučeniny jsou látkami třídy 4.2. Organokovové sloučeniny, hořlavé, reagující s vodou jsou látkami třídy 4.3.
- 563 UN 1905 kyselina selenová je látkou třídy 8.
- 564 UN 2443 trichlorid vanadylu, UN 2444 chlorid vanadičitý a UN 2475 chlorid vanaditý jsou látkami třídy 8.
- 565 K této položce jsou přiřazeny nespécifikované odpady, které pocházejí z lékařských/veterinárních ošetření lidí/zvířat nebo z biologického výzkumu, u kterých je malá pravděpodobnost, že obsahují látky třídy 6.2. Dekontaminované klinické odpady nebo odpady pocházející z biologického výzkumu, které dříve obsahovaly infekční látky, nepodléhají předpisům třídy 6.2.
- 566 UN 2030 hydrazin, vodný roztok s více než 37 % hm. hydrazinu je látkou třídy 8.
- 567 (Vypuštěno)
- 568 Azid barnatý s obsahem vody pod předepsanou mezní hodnotou je látkou třídy 1, UN čísla 0224.
- 569 – 579 (Vyhrazeno)
- 580 (Vypuštěno)
- 581 Tato položka zahrnuje směsi propadienu a 1 až 4 % methylacetylenu, jakož i následující směsi:

Směs	Obsah, % objemu			Dovolený technický název v 5.4.1.1
	Methylacetylen a propadien, nejvýše	Propan a propylen, nejvýše	Nasycené uhlovodíky C4 nejméně	
P1	63	24	14	„Směs P1“
P2	48	50	5	„Směs P2“

- 582 Tato položka zahrnuje mimo jiné směsi plynů označené písmenem R..., s následujícími vlastnostmi:

Směs	Maximální tenze par při 70 °C (MPa)	Minimální hustota při 50 °C (kg/l)	Dovolený technický název pro účely 5.4.1.1
F1	1,3	1,30	„Směs F1“
F2	1,9	1,21	„Směs F2“
F3	3,0	1,09	„Směs F3“

POZNÁMKA 1: Trichlorfluormethan (chladicí plyn R11), 1,1,2-trichlor-1,2,2-trifluorethan (chladicí plyn R113), 1,1,1-trichlor-2,2,2-trifluorethan (chladicí plyn R113a), 1-chlor-1,2,2-trifluorethan (chladicí plyn R133) a 1-chlor-1,1,2-trifluorethan (chladicí plyn R133b) nejsou látkami třídy 2. Mohou však být součástí směsí F1 až F3.

POZNÁMKA 2: Referenční hustoty odpovídají hustotám dichlorfluormethanu (1,30 kg/l), dichlor-difluormethanu (1,21 kg/l) a chlordinfluormethanu (1,09 kg/l).

583 Tato položka zahrnuje mimo jiné směsi plynů s následujícími vlastnostmi:

Směs	Maximální tenze par při 70 °C (MPa)	Minimální hustota při 50 °C (kg/l)	Dovolovaný technický název^a pro účely 5.4.1.1
A	1,1	0,525	„Směs A“ nebo „Butan“
A01	1,6	0,516	„Směs A01“ nebo „Butan“
A02	1,6	0,505	„Směs A02“ nebo „Butan“
A0	1,6	0,495	„Směs A0“ nebo „Butan“
A1	2,1	0,485	„Směs A1“
B1	2,6	0,474	„Směs B1“
B2	2,6	0,463	„Směs B2“
B	2,6	0,450	„Směs B“
C	3,1	0,440	„Směs C“ nebo „Propan“

^a Pro přepravu v cisternách smějí být obchodní názvy „Butan“ nebo „Propan“ používány jen jako doplněk.

584 Tento plyn nepodléhá předpisům ADN, jestliže:

- obsahuje nejvýše 0,5 % vzduchu v plynném stavu;
- je obsažen v kovových kapslích (sodors, sparklets), které jsou bez vad snižujících jejich pevnost;
- je zaručena těsnost uzávěrů kapslí;
- jedna kapsle obsahuje nejvýše 25 g tohoto plynu;
- jedna kapsle obsahuje nejvýše 0,75 g tohoto plynu na cm³ vnitřního objemu.

585 (Vypuštěno)

586 Prášky hafnia, titanu a zirkonia musí obsahovat viditelný přebytek vody. Prášky hafnia, titanu a zirkonia, navlhčené, mechanicky vyrobené, s velikostí částic nejmeně 53 µm, nebo chemicky vyrobené, s velikostí částic nejmeně 840 µm, nepodléhají předpisům ADN.

587 Baryumstearát a titaničitan barnatý nepodléhají předpisům ADN.

588 Bromid hlinitý a chlorid hlinitý v tuhé hydratované formě nepodléhají předpisům ADN.

589 (Vypuštěno)

590 Chlorid železitý, hexahydrát nepodléhá předpisům ADN.

591 Síran olovnatý s nejvýše 3 % volné kyseliny nepodléhá předpisům ADN.

592 Prázdné obaly, včetně prázdných IBC a prázdných velkých obalů, prázdná cisternová vozidla, prázdné snímatelné cisterny, prázdné přemístitelné cisterny, prázdné cisternové kontejnery a prázdné malé kontejnery, nevyčištěné, které obsahovaly tuto látku, nepodléhají předpisům ADN.

593 Tento plyn, který je určen ke chlazení např. lékařských nebo biologických vzorků, nepodléhá předpisům ADN, je-li obsažen ve dvoustěnných nádobách, které odpovídají ustanovením pododdílu 4.1.4.1 ADR, pokynu pro balení P 203, odstavci (6) pro otevřené kryogenní nádoby, pokud není stanoveno jinak v 5.5.3.

594 Následující předměty, vyrobené a naplněné podle předpisů platných v zemi výroby, nepodléhají ustanovením ADN:

- (a) UN 1044 hasicí přístroje vybavené ochranou proti nechtěnému uvedení do činnosti:
 - jsou-li zabaleny v pevném vnějším obalu; nebo
 - jde-li o velké hasicí přístroje, které splňují požadavky zvláštního ustanovení pro balení PP91 pokynu pro balení P003 v 4.1.4.1 ADR;
- (b) UN 3164 předměty pod pneumatickým nebo hydraulickým tlakem, které jsou konstruovány tak, aby vydržely větší namáhání, než je vnitřní tlak plynu na základě přenosu síly, strukturální pevnosti nebo konstrukce, když jsou zabaleny v pevném vnějším obalu.

POZNÁMKA: „Předpisy platné v zemi výroby“ znamená předpisy platné v zemi výroby nebo předpisy platné v zemi používání.

- 596 Kadmiová barviva, jako sulfidy kadmia, sulfoselenidy kadmia a kadmiové soli vyšších mastných kyselin (např. kadmiumstearát) nepodléhají předpisům ADN.
- 597 Kyselina octová, roztoky s nejvýše 10 % hm. čisté kyseliny nepodléhají předpisům ADN.
- 598 Následující předměty nepodléhají předpisům ADN:
- (a) Nové akumulátory, jestliže:
- jsou zajištěny proti posunu, pádu a poškození;
 - jsou opatřeny zařízením na přenášení, ledaže by byly stohovány, např. na paletách;
 - nevykazují na vnější straně nebezpečné stopy louhů nebo kyselin;
 - jsou chráněny proti zkratům.
- (b) Použité akumulátory, jestliže:
- jejich skříně nevykazují žádné poškození;
 - jsou zajištěny proti netěsnosti, posunu, pádu a poškození, např. stohováním na paletách;
 - nevykazují na vnější straně nebezpečné stopy louhů nebo kyselin;
 - jsou chráněny proti zkratům.
- “Použité akumulátory“ jsou takové, které jsou přepravovány za účelem recyklace po normálním používání.
- 599 (Vypuštěno)
- 600 Oxid vanadičný, roztavený a ztuhlý, nepodléhá předpisům ADN.
- 601 Farmaceutické výrobky (léky) připravené k použití, které jsou látkami vyrobenými a zabalenými pro maloobchodní prodej nebo pro distribuci pro osobní potřebu nebo pro domácnost, nepodléhají předpisům ADN.
- 602 Sulfid fosforu obsahující žlutý nebo bílý fosfor nejsou připuštěny k přepravě.
- 603 Kyanovodík, bezvodý, který neodpovídá popisu pro UN číslo 1051 nebo UN číslo 1614, není připuštěn k přepravě. Kyanovodík (kyselina kyanovodíková) s méně než 3 % vody je stabilní, jestliže jeho hodnota pH činí $2,5 \pm 0,5$ a kapalina je čirá a bezbarvá.
- 604 – 606 (Vypuštěno)
- 607 Směsi dusičnanu draselného a dusitanu sodného se solí amonnou nejsou připuštěny k přepravě.
- 608 (Vypuštěno)
- 609 Tetranitromethan, který obsahuje hořlavé nečistoty, není připuštěn k přepravě.
- 610 Tato látka není připuštěna k přepravě, jestliže obsahuje více než 45 % kyanovodíku.
- 611 Dusičnan amonný s více než 0,2 % hořlavých látek (včetně organických látek jako ekvivalentů uhlíku) není připuštěn k přepravě, ledaže je součástí látek nebo předmětů třídy 1.
- 612 (Vyhrazeno)
- 613 Roztok kyseliny chlorečné s více než 10 % kyseliny chlorečné a směsi kyseliny chlorečné s jakoukoli kapalinou kromě vody nejsou k přepravě připuštěny.
- 614 2,3,7,8 - tetrachlordibenzo-p-dioxin (TCDD) v koncentracích považovaných podle kritérií pododdílu 2.2.61.1 za velmi toxické není připuštěn k přepravě.
- 615 (Vyhrazeno)

- 616 Látky obsahující více než 40 % kapalných esterů kyseliny dusičné musí vyhovět při zkoušce na výpotek, uvedené v oddílu 2.3.1.
- 617 Dodatečně k typu trhavin je nutno uvést na kuse obchodní název dotyčné trhavin.
- 618 V nádobách s 1,2 butadienem nesmí obsah kyslíku v plynné fázi překročit 50 ml/m³.
- 619-622 (Vyhrazeno)
- 623 UN 1829 oxid sírový musí být stabilizován přidáním inhibitorů. Oxid sírový, čistoty nejméně 99,95 %, smí být přepravován bez inhibitoru v cisternách, za podmínky, že jeho teplota je udržována na nejméně 32,5 °C. Při přepravě této látky v cisterně při teplotě nejméně 32,5 °C musí být v přepravním dokladu zápis "Přeprava při nejnižší teplotě produktu 32,5 °C".
- 625 Kusy obsahující tyto předměty musí být zřetelně označeny nápisem "UN 1950 AEROSOLY".
- 626-631 (Vyhrazeno)
- 632 Tato látka se považuje za samozápalnou (pyroforní).
- 633 Kusy a malé kontejnery s touto látkou musí být opatřeny následující značkou: "Udržovat vzdálenost od zápalných zdrojů". Tato značka musí být v uvedena v úředním jazyce země odeslání a kromě toho, jestliže tento jazyk není anglický, francouzský ani německý, také v anglickém, francouzském nebo německém jazyce, pokud případné dohody uzavřené mezi státy dotčenými přepravou nestanoví něco jiného.
- 635 Kusy obsahující tyto předměty musí být opatřeny bezpečnostní značkou podle vzoru č. 9 pouze tehdy, jestliže jsou předměty plně uzavřeny v obalu, v latěni nebo jiných prostředcích, které brání rychlé identifikaci těchto předmětů.
- 636 Až do mezilehlého zpracovatelského objektu, lithiové články a baterie o celkové (brutto) hmotnosti nejvýše 500 g na každý článek nebo baterii nebo lithium-iontové články s watt hodinovou zatížitelností nejvýše 20 Wh, lithium-iontové baterie s watt hodinovou zatížitelností nejvýše 100 Wh, lithiové kovové články s obsahem lithia nejvýše 1 g a lithiové kovové baterie s celkovým obsahem lithia nejvýše 2 g, neobsažené v zařízení, shromážděné a podávané k přepravě za účelem jejich třídění, likvidace nebo recyklace, spolu s jinými nelithiovými články nebo bateriemi nebo bez nich, nepodléhají jiným ustanovením ADN, včetně zvláštního ustanovení 376 a 2.2.9.1.7, pokud splňují následující podmínky:
- (a) Články a baterie jsou baleny podle pokynu pro balení P909 pododdílu 4.1.4.1 ADR s výjimkou dodatečných požadavků 1 a 2;
- (b) Je zaveden systém zajištění kvality, který zabezpečuje, že celkové množství lithiových článků a baterií na jednu dopravní jednotku nepřesáhne 333 kg;
- POZNÁMKA:** Celkové množství lithiových článků a baterií ve smíšeném nákladu může být stanoveno pomocí statistické metody zahrnuté do systému zajištění kvality. Kopie záznamů ze zajištění kvality musí být na požádání poskytnuta příslušnému orgánu.
- (c) kusy jsou označeny nápisem "LITHIOVÉ BATERIE K LIKVIDACI" nebo "LITHIOVÉ BATERIE K RECYKLACI" jak je to vhodné.
- 637 Geneticky změněné mikroorganismy jsou takové, které nejsou nebezpečné pro člověka ani zvířata, které by však mohly zvířata, rostliny, mikrobiologické látky a ekosystémy změnit způsobem, který se nemůže v přírodě vyskytovat. Geneticky změněné mikroorganismy, pro které bylo uděleno povolení k volnému nasazení do životního prostředí³, nepodléhají předpisům třídy 9.
- Živých obratlovců ani bezobratlých živočichů nesmí být použito k tomu, aby přepravovali látky přiřazené pod toto UN číslo, ledaže by tyto látky nemohly být přepraveny jiným způsobem.

³ Viz zejména díl C směrnice Evropského parlamentu a Rady 2001/18/ES o záměrném uvolňování geneticky modifikovaných organismů do životního prostředí a o zrušení směrnice Rady 90/220/EHS (Úřední věstník Evropských společenství č. L 106 ze 17. dubna 2001, str. 1), v němž je stanoven schvalovací postup pro Evropská společenství.

Pro přepravu snadno zkazitelných látek pod tímto UN číslem je nutno udat patřičné informace, např. "Chladit na + 2°C/+4°C" nebo "Přepravovat ve zmrzlém stavu" nebo "Nenechat zmraznout".

- 638 Tyto látky jsou příbuzné samovolně se rozkládajícím látkám (viz 2.2.41.1.19).
- 639 Viz pododíl 2.2.2.3, klasifikační kód 2 F, UN 1965, poznámku 2.
- 640 Fyzikální a technické vlastnosti uvedené ve sloupci (2) tabulky A kapitoly 3.2 určují různé kódy cisteren pro přepravu látek téže obalové skupiny v cisternách odpovídajících kapitole 6.8 RID nebo ADR.

K identifikaci těchto fyzikálních a technických vlastností látky přepravované v cisterně je nutno údaje vyžadované v přepravním dokladu doplnit pouze v případě přepravy v cisternách odpovídajících kapitole 6.8 ADR nebo RID takto:

„**Zvláštní ustanovení 640X**“, kde „X“ je příslušné velké písmeno, které je uvedeno za odkazem na zvláštní ustanovení 640 ve sloupci (6) tabulky A kapitoly 3.2.

Od těchto doplňkových údajů je však možno upustit v případě přepravy v typu cisterny, který pro látku určité obalové skupiny určitého UN čísla splňuje alespoň nejpřísnější požadavky.

- 643 Litý asfalt nepodléhá předpisům platným pro třídu 9.
- 644 Přeprava této látky je povolena za podmínky, že:
- hodnota pH naměřená v 10 % vodném roztoku přepravované látky je mezi 5 a 7;
 - roztok neobsahuje hořlavé látky v množství větším než 0,2 % nebo sloučeniny chloru v takovém množství, že obsah chloru překročí 0,02 %.
- 645 Klasifikační kód uvedený ve sloupci (3b) tabulky A kapitoly 3.2 se smí použít jen se souhlasem příslušného orgánu smluvní strany ADN uděleným před přepravou. Schválení musí být vydáno písemně jako osvědčení o schválení klasifikace (viz 5.4.1.2.1 (g)) a musí být obdrženo jediné jednacím číslo. Je-li přiřazení k podtřídě provedeno podle postupu uvedeného v 2.2.1.1.7.2, může příslušný orgán požadovat, aby byla nedostatečná klasifikace ověřena na základě údajů získaných ze zkoušek série 6 Příručky zkoušek a kritérií, části I, oddílu 16.
- 646 Uhlí vyrobené parním aktivačním procesem nepodléhá předpisům ADN.
- 647 Přeprava octa a kyseliny octové potravinářské kvality s nejvýše 25 % hm. čisté kyseliny podléhá pouze těmto požadavkům:
- (a) Obaly, včetně IBC a velkých obalů, a cisterny musí být vyrobeny z nerezové oceli nebo z plastu, který je trvale odolný proti žíravosti octa/kyseliny octové potravinářské kvality.
 - (b) Obaly, včetně IBC a velkých obalů, a cisterny musí jejich vlastník podrobit nejméně jednou ročně vizuální inspekci. Výsledky inspekce musí být zaznamenány a záznamy uchovávány nejméně jeden rok. Poškozené obaly, včetně IBC a velkých obalů, a cisterny nesmějí být naplněny.
 - (c) Obaly, včetně IBC a velkých obalů, a cisterny musí být plněny tak, aby produkt nepřetekl a neulpěl na vnějším povrchu.
 - (d) Těsnění a uzávěry musí být odolné proti octu/kyselině octové potravinářské kvality. Obaly, včetně IBC a velkých obalů, a cisterny musí být hermeticky utěsněny baličem nebo plničem tak, aby za normálních podmínek přepravy nedošlo k úniku.
 - (e) Smějí se používat skupinové obaly s vnitřními obaly ze skla nebo plastu (viz pokyn pro balení P001 v 4.1.4.1 ADR), které splňují všeobecná ustanovení pro balení v pododílech 4.1.1.1, 4.1.1.2, 4.1.1.4, 4.1.1.5, 4.1.1.6, 4.1.1.7 a 4.1.1.8 ADR.
- Ostatní ustanovení ADN se nepoužijí.
- 648 Předměty napuštěné tímto pesticidem, jako jsou lepenkové podložky, papírové proužky, kuličky vaty, plastové fólie, v hermeticky uzavřených obalech nepodléhají ustanovením ADN.
- 649 (Vypuštěno)

- 650 Odpady sestávající ze zbytků obalů, ztuhlých a kapalných zbytků barev mohou být přepravovány za podmínek obalové skupiny II. Kromě ustanovení UN 1263, obalové skupiny II mohou být odpady baleny a přepravovány také za těchto podmínek:
- (a) Odpady mohou být baleny podle pokynu pro balení P002 pododdílu 4.1.4.1 ADR nebo pokynu pro balení IBC06 pododdílu 4.1.4.2 ADR;
 - (b) Odpady mohou být baleny do flexibilních IBC typů 13H3, 13H4 a 13H5 v přepravních obalových souborech s plnými stěnami;
 - (c) Zkoušení obalů a IBC uvedených pod písmeny (a) nebo (b) se může provádět podle ustanovení kapitol 6.1, popřípadě 6.5 ADR, pro tuhé látky na úrovni parametrů obalové skupiny II;
Zkoušky musí být provedeny na obalech a IBC naplněných reprezentativním vzorkem odpadů, jak jsou připraveny k přepravě;
 - (d) Přeprava ve volně loženém stavu je povolena v železničních vozech s plachtou, železničních vozech s otevíratelnou střechou/vozidlech s plachtou, uzavřených kontejnerech nebo velkých kontejnerech s plachtou, vesměs plnostěnných. Železniční vozy, kontejnery nebo nástavba vozidel musí být těsné nebo musí být utěsněny, např. pomocí vhodného a dostatečně pevného vnitřního vyložení;
 - (e) Jsou-li odpady přepravovány za podmínek tohoto zvláštního ustanovení, musí být podle 5.4.1.1.3 deklarovány v přepravním dokladu takto:
„UN 1263 ODPAD BARVA, 3, II“, nebo
„UN 1263 ODPAD BARVA, 3, OS II“.
- 651 Zvláštní ustanovení V2 (1) ADR platí jen pro čistý obsah výbušné látky větší než 3 000 kg (4 000 kg s přívěsem).
- 652 (Vyhrazeno)
- 653 Přeprava tohoto plynu v lahvích majících součin zkušebního tlaku a vnitřního objemu nejvýše 15,2 MPa.litr (152 bar.litr) nepodléhá ostatním ustanovením ADN, jsou-li splněny tyto podmínky:
- Ustanovení pro výrobu, zkoušení a plnění lahví jsou dodržena;
 - Láhve jsou zabaleny do vnějších obalů, které splňují alespoň požadavky části 4 pro skupinové obaly. Všeobecná ustanovení pro balení v 4.1.1.1, 4.1.1.2 a 4.1.1.5 až 4.1.1.7 ADR musí být dodržena;
 - Láhve nejsou baleny společně s jinými nebezpečnými věcmi;
 - Celková (brutto) hmotnost kusu nepřekračuje 30 kg; a
 - Každý kus je zřetelně a trvanlivě označen nápisem „UN 1006“ pro argon, stlačený, „UN 1013“ pro oxid uhličitý, „UN 1046“ pro helium, stlačené nebo „UN 1066“ pro dusík, stlačený. Tato značka musí být umístěna ve čtverci postaveném na vrchol, který je ohraničen čarou o rozměrech nejméně 100 x 100 mm.
- 654 Odpadové zapalovače shromažďované jednotlivě a zasílané podle 5.4.1.1.3 smějí být přepravovány pod touto položkou za účelem likvidace. Nemusí být chráněny proti neúmyslnému vyprázdnění za podmínky, že jsou učiněna opatření, aby se zamezilo nebezpečnému nárůstu tlaku a nebezpečné atmosféře.
- Odpadové zapalovače, s výjimkou těch, které jsou netěsné nebo silně deformované, musí být baleny podle pokynu pro balení P003 ADR. Kromě toho platí následující ustanovení:
- musí se používat jen tuhé obaly o maximálním vnitřním objemu 60 litrů;
 - obaly musí být naplněny vodou nebo jakýmkoli jiným vhodným ochranným materiálem, aby se předešlo zapálení;
 - za normálních podmínek přepravy musí být všechna zažehovací zařízení zapalovačů plně pokryta ochranným materiálem;
 - obaly musí být dostatečně odvětrávány, aby se předešlo vytvoření hořlavé atmosféry a nárůstu tlaku;

- kusy musí být přepravovány jen v odvětrávaných nebo nekrytých vozidlech nebo kontejnerech.

Netěsné nebo silně deformované zapalovače musí být přepravovány v záchranných obalech za podmínky, že jsou učiněna vhodná opatření k tomu, aby nedošlo k nebezpečnému nárůstu tlaku.

POZNÁMKA: Na odpadové zapalovače se nevztahuje zvláštní ustanovení 201 ani zvláštní ustanovení pro balení PP84 a RR5 pokynu pro balení P002 v 4.1.4.1. ADR

- 655 Láhve a jejich uzávěry zkonstruované, vyrobené, schválené a značené podle směrnice směrnice 97/23/EC4 nebo směrnice 2014/68/EU5 a používané pro dýchací přístroje smějí být přepravovány, aniž by odpovídaly kapitole 6.2 ADR, za podmínky, že jsou podrobovány inspekcím a zkouškám uvedeným v 6.2.1.6.1 ADR a interval mezi zkouškami uvedený v pokynu pro balení P200 v pododdílu 4.1.4.1 ADR není překročen. Tlak používaný při hydraulické tlakové zkoušce je tlak vyznačený na láhvi podle směrnice 97/23/ES4 nebo směrnice 2014/68/EU5.
- 656 (Vypuštěno)
- 657 Tato položka se použije jen pro technicky čistou látku; ke směsím komponent LPG viz UN číslo 1965 nebo viz UN číslo 1075 ve spojení s POZNÁMKOU 2 v 2.2.2.3.
- 658 UN číslo 1057 ZAPALOVAČE vyhovující normě EN ISO 9994:2019 „Zapalovače – Bezpečnostní specifikace“ a UN číslo 1057 NÁDOBKÝ S NÁPLNÍ DO ZAPALOVAČŮ smějí být přepravovány jen za dodržení ustanovení uvedených v 3.4.1 (a) až (f), 3.4.2 (s výjimkou celkové (brutto) hmotnosti 30 kg), 3.4.3 (s výjimkou celkové (brutto) hmotnosti 20 kg), 3.4.11 a 3.4.12, pokud jsou dodrženy následující podmínky:
- (a) celková (brutto) hmotnost každého kusu je nejvýše 10 kg;
 - (b) Ve vozidle nebo velkém kontejneru je přepravováno nejvýše 100 kg celkové (brutto) hmotnosti takových kusů; a
 - (c) každý vnější obal je zřetelně a trvanlivě označen nápisem „UN 1057 ZAPALOVAČE“ nebo „UN 1057 NÁDOBKÝ S NÁPLNÍ DO ZAPALOVAČŮ“, jak je to náležité.
- 659 Látky, pro které je ve sloupci (9a) a sloupci (11) tabulky A v kapitole 3.2 ADR uveden kód PP86 nebo TP7, a vyžadují tedy, aby byl z výparného prostoru odstraněn vzduch, nesmějí být přepravovány pod tímto UN číslem, nýbrž musí být přepravovány pod svými příslušnými UN čísly, jak jsou uvedeny v tabulce A kapitoly 3.2.
- POZNÁMKA:** Viz též 2.2.2.1.7.
- 660 (Vypuštěno)
- 661 (Vypuštěno)
- 662 Láhve neodpovídající ustanovením kapitoly 6.2, které jsou používány výlučně na plavidlech nebo v letadlech, smějí být přepravovány za účelem plnění nebo inspekce a následného návratu, pokud jsou láhve zkonstruovány a vyrobeny podle normy uznané příslušným orgánem země schválení a všechny ostatní příslušné požadavky ADN jsou dodrženy včetně:
- (a) Láhve musí být přepravovány s ochranou ventilů podle 4.1.6.8;
 - (b) Láhve musí být označeny nápisy a bezpečnostními značkami podle 5.2.1 a 5.2.2; a
 - (c) Všechny příslušné požadavky týkající se plnění v pokynu pro balení P200 v 4.1.4.1 ADR musí být dodrženy.
- Přepravní doklad musí obsahovat tento zápis: „Přeprava podle zvláštního ustanovení 662.
- 663 Tato položka smí být použita pouze pro obaly, velké obaly nebo IBC, nebo jejich části, které obsahovaly nebezpečné věci a které jsou přepravovány k likvidaci, recyklaci nebo rekuperaci jejich materiálu, s výjimkou jejich rekondicionání, opravy, běžné údržby, rekonstrukce nebo

⁴ Směrnice 97/23/ES Evropského parlamentu a Rady z 29. května 1997 o sblížení právních a správních předpisů členských států týkající se tlakových zařízení (PED) (Úřední věstník Evropských společenství č. L 181 z 9. července 1997, str.1-55).

⁵ Směrnice 2014/68/EU Evropského parlamentu a Rady z 15. května 2014 o sblížení právních a správních předpisů členských států týkající se uvádění na trh tlakových zařízení (PED) (Úřední věstník Evropské unie č. L 189 z 27. června 2014, str. 164 - 259).

opětovného používání, a které byly vyprázdněny do té míry, že obsahují při podávání k přepravě jen zbytky nebezpečných věcí, které ulpěly na částech obalu.

Rozsah platnosti:

Zbytky obsažené v obalech, vyřazených, prázdných, nevyčištěných smějí být jen od nebezpečných věcí tříd 3, 4.1, 5.1, 6.1, 8 nebo 9. Kromě toho to nesmějí být:

- látky přiřazené k obalové skupině I nebo ty, které mají ve sloupci (7a) tabulky A kapitoly 3.2 uvedenu „0“; nebo
- látky klasifikované jako znečlivěné výbušné látky třídy 3 nebo třídy 4.1; nebo
- látky klasifikované jako samovolně se rozkládající látky třídy 4.1; nebo
- radioaktivní látky; nebo
- azbest (UN 2212 a UN 2590), polychlorované bifenylly (UN 2315 a UN 3432) a polyhalogenované bifenylly, halogenované monomethylidifenylmethany nebo polyhalogenované terfenylly (UN 3151 a UN 3152).

Všeobecná ustanovení:

Obaly, vyřazené, prázdné, nevyčištěné se zbytky představujícími nebezpečí nebo vedlejší nebezpečí třídy 5.1 nesmějí být baleny společně s jinými obaly, vyřazenými, prázdnými, nevyčištěnými, nebo nakládány společně s jinými obaly, vyřazenými, prázdnými, nevyčištěnými do téhož kontejneru, železničního vozu, vozidla nebo kontejneru pro volně ložené látky.

V místech nakládky musí být použity dokumentované třídící postupy, aby se zajistilo dodržení ustanovení platných pro tuto položku.

POZNÁMKA: Všechna ostatní ustanovení ADN platí.

- 664 (Vyhrazeno)
- 665 Černé (kamenné) uhlí, koks a antracit splňující klasifikační kritéria třídy 4.2, obalové skupiny III, nepodléhají ustanovením ADN.
- 666 Vozidla a zařízení napájená z baterií podle zvláštního ustanovení 388, pokud jsou přepravována jako náklad, jakož i veškeré nebezpečné věci, které obsahují, a které jsou nezbytné pro jejich provoz nebo provoz jejich příslušenství, nepodléhají žádným jiným ustanovením ADN, pokud jsou splněny následující podmínky:
- (a) Pro kapalná paliva musí být všechny ventily mezi motorem nebo výbavou a palivovou nádrží během přepravy uzavřeny, pokud není podstatné, aby výbava zůstala funkční. Tam, kde je to patřičné, musí být vozidla naložena nastojato a musí být zajištěna proti pádu;
 - (b) Pro plynná paliva musí být ventil mezi plynovou nádrží a motorem uzavřen a elektrický kontakt přerušen pokud není podstatné, aby výbava zůstala funkční;
 - (c) Zásobníkové systémy s hydridem kovu musí být schváleny příslušným orgánem země výroby. Pokud není země výroby smluvní stranou ADN, musí být toto schválení uznáno příslušným orgánem smluvní strany ADN;
 - (d) Ustanovení uvedená v (a) a (b) se nevztahují na vozidla zbavená kapalných nebo plyných paliv.

POZNÁMKA 1: Vozidlo se považuje za zbavené kapalného paliva, pokud byla nádrž na kapalné palivo vypuštěna a vozidlo nemůže v důsledku nedostatku paliva fungovat. Součástí vozidla, jako jsou palivová potrubí, palivové filtry a trysky, nemusí být vyčištěny, vymyty nebo propláchnuty, aby byly považovány za zbavené kapalných paliv. Kromě toho nemusí být nádrž na kapalné palivo vyčištěna ani vypláchnuta.

POZNÁMKA 2: Vozidlo se považuje za zbavené plyných paliv, pokud byly plynové palivové nádrže zbaveny kapaliny (pro zkapalněné plyny), tlak v nádržích nepřekračuje 2 bary a uzavírací ventil paliva nebo bezpečnostní ventil je uzavřen a zajištěn.

- 667 (a) Ustanovení uvedené v 2.2.9.1.7 (a) neplatí, jsou-li předvýrobní prototypové lithiové články nebo baterie nebo lithiové články nebo baterie z malé výrobní série, sestávající z nejvýše 100 článků nebo baterií, zabudovány ve vozidle, motoru nebo stroji;
- (b) Ustanovení uvedené v 2.2.9.1.7 se nevztahují na lithiové články nebo baterie zabudované v poškozených nebo porouchaných vozidlech, motorech nebo strojích. V takových případech musí být splněny následující podmínky:
- (i) Pokud poškození nebo porucha nemá významný dopad na bezpečnost článku nebo baterie, smějí být poškozená a porouchaná vozidla, motory nebo stroje přepravovány za podmínek stanovených ve zvláštních ustanoveních 363 nebo 666, jak je to náležité;
- (ii) Pokud má poškození nebo porucha významný dopad na bezpečnost článku nebo baterie, musí být lithiový článek nebo baterie vyjmut(a) a přepravován(a) podle zvláštního ustanovení 376.
- Jestliže však není možné bezpečně vyjmout článek nebo baterii, nebo není-li možné ověřit stav článku nebo baterie, smí být vozidlo, motor nebo stroj odtazen nebo přepraven podle podmínek uvedených v (i).
- (c) Postupy popsané v písmenu b) platí také pro poškozené lithiové články nebo baterie ve vozidlech, motorech nebo strojích.
- 668 Zahřáté látky přepravované za účelem provádění dopravního značení nepodléhají ustanovením ADN, pokud jsou splněny následující podmínky:
- (a) Nesplňují kritéria žádné jiné třídy než třídy 9;
- (b) Teplota na vnějším povrchu kotle nepřekročí 70°C;
- (c) Kotel je uzavřen takovým způsobem, že se zamezí úniku produktu během přepravy;
- (d) Maximální kapacita kotle je omezena na 3000 litrů.
- 669 Každé přípojné vozidlo vybavené zařízením, poháněným kapalným nebo plyným palivem nebo systémem skladování a výroby elektrické energie, které je určeno k používání během přepravy prováděné tímto přípojným vozidlem jako součástí dopravní jednotky, musí být přiřazeno k UN číslům 3166 nebo 3171 a podléhat stejným podmínkám, jaké jsou stanoveny pro tato UN čísla, je-li přepravováno jako náklad na vozidle, pokud celkový vnitřní objem nádrží obsahujících kapalně palivo nepřekročí 500 litrů.
- 670 (a) Lithiové články a baterie obsažené v zařízeních ze soukromých domácností, shromážděné a podávané k přepravě za účelem jejich vyčištění, rozebrání, recyklace nebo likvidace, nepodléhají jiným ustanovením ADN, včetně zvláštního ustanovení 376 a odstavce 2.2.9.1.7, pokud:
- (i) tyto nejsou hlavním zdrojem energie pro činnost zařízení, v němž jsou obsaženy;
- (ii) zařízení, v němž jsou obsaženy, neobsahuje žádný jiný lithiový článek nebo baterii používaný(ou) jako hlavní zdroj energie; a
- (iii) jsou chráněny zařízením, v němž jsou obsaženy.
- Příklady článků a baterií spadajících pod tento odstavec jsou knoflíkové baterie používané pro uchování dat v přístrojích pro domácnost (např. chladničky, pračky, myčky nádobí) nebo v jiných elektrických nebo elektronických přístrojích;
- (b) Až do mezilehlého zpracovatelského objektu lithiové články a baterie obsažené v zařízeních ze soukromých domácností, které nesplňují požadavky uvedené pod (a), shromážděné a podávané k přepravě za účelem jejich vyčištění, rozebrání, recyklace nebo likvidace nepodléhají jiným ustanovením ADN, včetně zvláštního ustanovení 376 a odstavce 2.2.9.1.7, pokud jsou splněny následující podmínky:
- (i) Zařízení jsou balena podle pokynu pro balení P909 v 4.1.4.1 ADR, kromě dodatečných požadavků 1 a 2; nebo jsou balena v pevných vnějších obalech, např. speciálně zkonstruovaných sběrných nádobách, které splňují následující požadavky:
- Obaly musí být vyrobeny z vhodného materiálu a musí být přiměřené pevnosti a konstrukce vzhledem k vnitřnímu objemu obalu a jeho zamýšlenému použití. Obaly nemusí splňovat požadavky uvedené v 4.1.1.3 ADR;

- Musí být učiněna vhodná opatření k tomu, aby se minimalizovala poškození zařízení při plnění obalů a jejich manipulaci, např. použitím gumových podložek; a
 - Obaly musí být vyrobeny a uzavřeny tak, aby se zamezilo ztrátě obsahu během přepravy, např. pomocí vík, pevných vnitřních vložek, ochranných krytů pro přepravu. Otvory určené pro plnění jsou dovoleny v případě, že jsou konstruovány tak, aby zamezily ztrátě obsahu;
- (ii) Je zaveden systém zajištění kvality, aby se zajistilo, že celkové množství lithiových článků a baterií na dopravní jednotku nepřekročí 333 kg;
- POZNÁMKA:** Celkové množství lithiových článků a baterií v zařízeních ze soukromých domácností může být určeno pomocí statistické metody zahrnuté v systému zajištění kvality. Kopie záznamů o zajištění kvality musí být na požádání dány k dispozici příslušnému orgánu.
- (iii) Kusy jsou označeny nápisem „LITHIOVÉ BATERIE K LIKVIDACI“ nebo „LITHIOVÉ BATERIE K RECYKLACI“, jak je to vhodné. Jsou-li zařízení obsahující lithiové články nebo baterie přepravována bez obalu nebo na paletách podle pokynu pro balení P909 (3) v 4.1.4.1 ADR, smí být toto označení alternativně umístěno na vnějším povrchu vozidla nebo kontejneru.
- POZNÁMKA:** „Zařízení ze soukromých domácností“ jsou zařízení, která pocházejí ze soukromých domácností, a zařízení, která pocházejí z obchodních, průmyslových, institucionálních a jiných zdrojů a jež jsou vzhledem ke své povaze a množství podobná zařízením ze soukromých domácností. Zařízení, která budou pravděpodobně používána jak soukromými domácnostmi, tak i uživateli jinými, než jsou soukromé domácnosti, musí být v každém případě považována za zařízení ze soukromých domácností.
- 671 Pro účely vynětí z platnosti pro množství přepravovaná jednou dopravní jednotkou (viz 1.1.3.6) musí být přepravní kategorie určena ve vztahu k obalové skupině (viz odstavec 3 zvláštního ustanovení 251):
- přepravní kategorie 3 pro soupravy přiřazené k obalové skupině III;
 - přepravní kategorie 2 pro soupravy přiřazené k obalové skupině II;
 - přepravní kategorie 1 pro soupravy přiřazené k obalové skupině I.
- Soupravám obsahujícím pouze nebezpečné zboží, k nimž není přiřazena žádná obalová skupina, se přidělí přepravní kategorie 2 pro vyplnění přepravních dokladů a vynětí z platnosti pro množství přepravovaná plavidlem (viz 1.1.3.6).
- 672 Předměty, jako stroje, přístroje nebo zařízení přepravované pod touto položkou a v souladu se zvláštním ustanovením 301 nepodléhají žádným jiným ustanovením ADN, za podmínky, že jsou buď:
- zabaleny v pevném vnějším obalu vyrobeném z vhodného materiálu, přiměřené pevnosti a konstrukce vzhledem k vnitřnímu objemu obalu a jeho zamýšlenému použití a který splňuje příslušné požadavky uvedené v 4.1.1.1 ADR; nebo
 - přepravovány bez vnějšího obalu, pokud je předmět vyroben a zkonstruován tak, že poskytuje nádobám obsahujícím nebezpečné věci přiměřenou ochranu.
- 673 (Vyhrazeno)
- 674 Toto zvláštní ustanovení se vztahuje na periodické inspekce a zkoušky zalisovaných lahví, jak jsou definovány v 1.2.1.
- Zalisované lahve podléhající 6.2.3.5.3.1 ADR musí být podrobeny periodickým inspekcím a zkouškám podle 6.2.1.6.1 ADR modifikovaným následující alternativní metodou:
- nahradit zkoušku předepsanou v 6.2.1.6.1 d) ADR alternativními destruktivními zkouškami;
 - provést specifické dodatečné destruktivní zkoušky vztahující se k charakteristikám zalisovaných lahví.
- Postupy a požadavky této alternativní metody jsou popsány dále.
- Alternativní metoda:

(a) Všeobecně

Následující předpisy se vztahují na zalisované láhve vyráběné sériově a založené na svařovaných ocelových lahvích podle EN 1442:2017, EN 14140:2014 + AC:2015 nebo přílohy I, částí 1 až 3, k směrnici Rady 84/527/EHS. Konstrukce obalového pláště musí zabránit proniknutí vody k vnitřní ocelové láhvi. Transformace ocelové láhve na zalisovanou láhev musí odpovídat příslušným požadavkům EN 1442:2017 a EN 14140:2014 + AC:2015.

Zalisované láhve musí být opatřeny samouzavíracími ventily.

(b) Základní soubor

Základní soubor zalisovaných lahví je definován jako produkce lahví pouze od jednoho výrobce obalového pláště používajícího nové vnitřní láhve vyrobené pouze jedním výrobcem v témže kalendářním roce, založená na tomtéž konstrukčním typu, stejných materiálech a výrobních procesech.

(c) Podskupiny základního souboru

Uvnitř výše uvedeného základního souboru musí být zalisované láhve patřící různým vlastníkům rozděleny do zvláštních podskupin, jedna na vlastníka.

Je-li celý základní soubor vlastněn jedním vlastníkem, rovnají se podskupiny základnímu souboru.

(d) Dohledatelnost

Označení vnitřních ocelových lahví podle 6.2.3.9 ADR se musí opakovat na obalovém plášti. Navíc musí být každá zalisovaná láhev vybavena individuálním odolným elektronickým identifikačním prostředkem. Podrobné charakteristiky zalisovaných lahví musí být vlastníkem zaznamenány v centrální databázi. Databáze se musí využít k následujícím účelům:

- identifikovat zvláštní podskupinu;
- poskytnout inspekčním organizacím, plicím stanicím a příslušným orgánům zvláštní technické charakteristiky lahví zahrnující alespoň: sériové číslo, výrobní šarži ocelové láhve, výrobní šarži obalového pláště, datum zalisování;
- identifikovat láhev napojením elektronického prostředku na databázi pomocí sériového čísla;
- zkontrolovat historii každé láhve a stanovit opatření, které je třeba učinit (např. plnění, vzorkování, nová zkouška, vyřazení z provozu) ;
- zaznamenat provedená opatření, včetně data a místa, kde byla provedena.

Zaznamenané údaje musí být uchovávány vlastníkem zalisovaných lahví po celou dobu životnosti podskupiny.

(e) Výběr vzorků pro statistické vyhodnocení

Výběr vzorků musí být namátkový v podskupině, jak je definována v pododstavci (c). Velikost každého vzorku na podskupinu musí odpovídat tabulce v pododstavci (g).

(f) Zkušební postup pro destruktivní zkoušku

Inspekce a zkouška vyžadované podle 6.2.1.6.1 ADR musí být provedeny, s výjimkou zkoušky předepsané v pododstavci (d), která musí být nahrazena následujícím zkušebním postupem:

- zkouška na roztržení (podle EN 1442:2017 nebo EN 14140:2014 + AC:2015).

Kromě toho musí být provedeny tyto zkoušky:

- zkouška přilnavosti (podle EN 1442:2017 nebo EN 14140:2014 + AC:2015);
- zkouška stupně prorezavění a korozní zkouška (podle EN ISO 4628-3:2016).

Zkouška přilnavosti, zkouška stupně prorezavění, korozní zkouška a zkouška na roztržení musí být provedeny na každém odpovídajícím vzorku podle tabulky v pododstavci (g) a musí být provedeny po prvních 3 letech v provozu a poté každých 5 let.

- (g) Statistické vyhodnocení výsledků zkoušek – metoda a minimální požadavky

Postup statistického vyhodnocení podle odpovídajících kritérií pro odmítnutí vzorku je popsán dále.

Interval zkoušek (roky)	Druh zkoušky	Norma	Kritérium pro odmítnutí vzorku	Výběr vzorků z podskupiny
po 3 letech v provozu (viz (f))	Zkouška na roztržení	EN 1442:2017	Bod hodnoty tlaku při roztržení daného vzorku musí být vyšší než dolní mez tolerančního intervalu v grafu chování vzorku $\Omega_m \geq 1 + \Omega_s \times k3(n;p;1-\alpha)^a$ žádný výsledek jednotlivého testu nesmí být menší než zkušební tlak	$3\sqrt[3]{Q}$ nebo $Q/200$ (vybere se nižší hodnota), minimálně 20 z každé podskupiny (Q)
	Hodnocení stupně prorezavění	EN ISO 4628-3:2016	Nejvyšší stupeň koroze: Ri2	Q/1000
	Přilnavost polyuretanu	ISO 2859-1:1999 + A1:2011 EN 1442:2017 EN 14140:2014 + AC:2015	Hodnota přilnavosti > 0,5 N/mm ²	viz ISO 2859-1:1999 + A1:2011, aplikováno na Q/1000
poté každých 5 let (viz (f))	Zkouška na roztržení	EN 1442:2017	Bod hodnoty tlaku při roztržení daného vzorku musí být vyšší než dolní mez tolerančního intervalu v grafu chování vzorku $\Omega_m \geq 1 + \Omega_s \times k3(n;p;1-\alpha)^a$ žádný výsledek jednotlivého testu nesmí být menší než zkušební tlak	$6\sqrt[3]{Q}$ nebo $Q/100$ (vybere se nižší hodnota), minimálně 40 z každé podskupiny (Q)
	Hodnocení stupně prorezavění	EN ISO 4628-3:2016	Nejvyšší stupeň koroze: Ri2	Q/1000
	Přilnavost polyuretanu	ISO 2859-1:1999 + A1:2011 EN 1442:2017 EN 14140:2014 + AC:2015	Hodnota přilnavosti > 0,5 N/mm ²	viz ISO 2859-1:1999 + A1:2011, aplikováno na Q/1000

^a Bod hodnoty tlaku při roztržení (BHT) reprezentativního vzorku je používán pro vyhodnocení výsledků zkoušky za použití grafu chování vzorku:

Krok 1: Stanovení bodu hodnoty tlaku při roztržení (BHT) reprezentativního vzorku

Každý vzorek je reprezentován bodem, jehož souřadnicemi jsou střední hodnota výsledků zkoušky na roztržení a směrodatná odchylka výsledků zkoušky na roztržení, obě vztaheny na daný zkušební tlak.

$$BHT: \left(\Omega_s = \frac{s}{PH}; \Omega_m = \frac{x}{PH} \right)$$

kde

x: střední hodnota výsledků zkoušky vzorku;

s: směrodatná odchylka výsledků zkoušky vzorku;

PH: zkušební tlak

Krok 2: Vykreslení grafu chování vzorku

Každý BHT je zakreslen do grafu chování vzorku s těmito osami:

osa x : směrodatná odchylka výsledků zkoušky vzorku vztažená na zkušební tlak (Ω_s)

osa y : střední hodnota výsledků zkoušky vzorku vztažená na zkušební tlak (Ω_m)

Krok 3: Stanovení náležité dolní meze tolerančního intervalu v grafu chování vzorku

Výsledky tlaku při roztržení musí být nejprve ověřeny sdruženým (oboustranným) testem za použití hladiny významnosti $\alpha = 0,05$ (viz odstavec 7 normy ISO 5479:1997) pro zjištění zda výsledky každého vzorku mají nebo nemají normální rozdělení.

pro normální rozdělení výsledků se náležitá dolní mez tolerančního intervalu určí dle kroku 3.1

pro jiné než normální rozdělení výsledků se náležitá dolní mez tolerančního intervalu určí dle kroku 3.2

Krok 3.1 Dolní mez tolerančního intervalu pro výsledky vykazující normální rozdělení

V souladu s normou ISO 16269-6:2014, s ohledem na to že rozptyl je neznámý, má být uvažován jednostranný statistický toleranční interval pro interval spolehlivosti 95% a podíl souboru 99,9999%.

Po aplikaci do grafu chování vzorku je dolní mez tolerančního intervalu reprezentována čarou konstantní pravděpodobnosti přežití definovanou vzorcem:

$$\Omega_m = 1 + \Omega_s \times k3(n; p; 1 - \alpha)$$

kde

k3: prvek funkce n, p a $1-\alpha$;

p: zvolený podíl souboru pro toleranční interval (99,9999%);

$1 - \alpha$: koeficient spolehlivosti (95%);

n: velikost vzorku.

Hodnota k3 náležející normálnímu rozdělení se vyhledá v tabulce na konci kroku 3.

Krok 3.2 Dolní mez tolerančního intervalu pro výsledky nevykazující normální rozdělení

Jednostranný statistický toleranční interval musí být vypočten pro interval spolehlivosti 95% a podíl souboru 99,9999%.

Dolní mez tolerančního intervalu je reprezentována čarou konstantní pravděpodobnosti přežití definovanou vzorcem uvedeným v kroku 3.1 s prvky k3 založenými a vypočtenými podle vlastností Weibullova rozdělení.

Hodnota k3 náležející Weibullovu rozdělení se vyhledá v tabulce na konci kroku 3.

Tabulka hodnot k3 <i>p=99,9999% a (1-α) = 0,95</i>		
Velikost vzorku <i>n</i>	Normální rozdělení <i>k3</i>	Weibullovo rozdělení <i>k3</i>
20	6,901	16,021
22	6,765	15,722
24	6,651	15,472
26	6,553	15,258
28	6,468	15,072
30	6,393	14,909
35	6,241	14,578
40	6,123	14,321
45	6,028	14,116
50	5,949	13,947
60	5,827	13,683
70	5,735	13,485
80	5,662	13,329

Tabulka hodnot k3 <i>p=99,9999% a (1-α) = 0,95</i>		
Velikost vzorku <i>n</i>	Normální rozdělení <i>k3</i>	Weibullovo rozdělení <i>k3</i>
90	5,603	13,203
100	5,554	13,098
150	5,393	12,754
200	5,300	12,557
250	5,238	12,426
300	5,193	12,330
400	5,131	12,199
500	5,089	12,111
1000	4,988	11,897
∞	4,753	11,408

POZNÁMKA: Pokud leží velikost vzorku mezi dvěma hodnotami, vybere se nejbližší nižší velikost vzorku.

(h) Opatření, nejsou-li splněna kritéria pro přijetí

Jestliže výsledek zkoušky na roztržení, zkoušky hodnocení stupně prerezávání nebo zkoušky přilnavosti nespĺňuje kritéria uvedená podrobně v tabulce odstavce (g), musí být dotčená podskupina zalisovaných lahví vlastníkem segregována pro další zkoumání a nesmí být plněna ani být k dispozici pro přepravu a použití.

V dohodě s příslušným orgánem nebo organizací Xa, který(á) vydal(a) osvědčení o schválení konstrukčního typu, musí být provedeny dodatečné zkoušky ke zjištění hlavní příčiny nevyhovění.

Jestliže nemůže být prokázáno, že hlavní příčina nevyhovění je omezena jen na dotčenou podskupinu vlastníka, musí příslušný orgán nebo organizace Xa učinit opatření týkající se celého základního souboru a popřípadě jiných roků výroby.

Jestliže může být prokázáno, že hlavní příčina nevyhovění je omezena jen na část dotčené podskupiny, mohou být nedotčené části příslušným orgánem schváleny k vrácení do provozu. Musí být prokázáno, že žádná jednotlivá zalisovaná láhev vracející se do provozu není dotčena.

(i) Požadavky na plnicí stanice

Vlastník musí poskytnout příslušnému orgánu dokumentaci prokazující, že plnicí stanice:

- splňují ustanovení pokynu pro balení P200 (7) v 4.1.4.1 ADR a že požadavky normy pro kontrolu před plněním, uvedené v tabulce P200 (11) v 4.1.4.1 ADR, jsou dodrženy a správně aplikovány;
- mají vhodné prostředky k identifikaci zalisovaných lahví pomocí elektronického identifikačního prostředku;
- mají přístup k databázi, jak je definováno v (d);
- mají kapacitu k aktualizaci databáze;
- aplikují systém kvality podle normy ISO 9000 (série) nebo rovnocenný, certifikovaný akreditovanou nezávislou organizací uznanou příslušným orgánem.

- 675 Je zakázána společná nakládká kusů obsahujících tyto nebezpečné věci s látkami a předměty třídy 1, s výjimkou 1.4S.
- 800 Olejnatá semena, rozemletá semena a kalové koláče obsahující rostlinný olej, upravené rozpouštědly, která nejsou náchylná k samovznícení, jsou přiřazeny k UN číslu 3175. Tyto látky nepodléhají ADN, jestliže byly připraveny nebo upraveny tak, aby nemohly uvolňovat nebezpečné plyny v nebezpečných množstvích (žádné nebezpečí výbuchu) během přepravy a je-li to uvedeno v přepravním dokladu.
- 801 Ferosilicium s obsahem křemíku mezi 25 a 30% nebo více než 90% hm. je pro přepravu ve volně loženém stavu nebo bez obalu vnitrozemským plavidlem nebezpečnou látkou třídy 4.3.
- 802 Viz 7.1.4.10.

803 Černé uhlí, koks a antracit přepravované ve volně loženém stavu nepodléhají ustanovením ADN jestliže:

- (a) teplota nákladu byla zjištěna za použití vhodného postupu a není vyšší než 60 oC před nakládkou, během nakládky a bezprostředně po nakládce nákladního prostoru;
- (b) v závislosti na teplotě nákladu před nakládkou, během nakládky a bezprostředně po nakládce nákladního prostoru nepřekračuje očekávaná doba trvání přepravy bez měření teploty maximální počet dní uvedený v následující tabulce:

<i>Maximální teplota při nakládce (°C)</i>	<i>Maximální doba trvání přepravy (dny)</i>
60	10
50	18
40	32
30	57

- (c) pokud skutečná doba trvání přepravy překročí maximální dobu trvání uvedenou v pododstavci (b), provede se měření teploty první den po překročení maximální doby trvání. Potřebný měřicí přístroj musí být na plavidle od prvního dne přepravy po překročení maximální doby trvání plavby;
- (d) velitel plavidla obdrží v době nakládky prokazatelnou formou instrukce, jak postupovat, dojde-li k podstatnému zahřátí nákladu.

KAPITOLA 3.4

NEBEZPEČNÉ VĚCI BALENÉ V OMEZENÝCH MNOŽSTVÍCH

3.4.1

Tato kapitola obsahuje ustanovení platná pro přepravu nebezpečných věcí určitých tříd balených v omezených množstvích. Platný množství limit pro vnitřní obal nebo předmět je uveden pro každou látku ve sloupci (7a) tabulky A kapitoly 3.2. Kromě toho je v tomto sloupci uvedeno množství „0“ pro každou položku nebezpečných věcí, které není dovoleno přepravovat podle této kapitoly.

Nebezpečné věci balené v takových omezených množstvích, splňující ustanovení této kapitoly, nepodléhají žádným jiným ustanovením ADN, kromě příslušných ustanovení:

- (a) části 1, kapitol 1.1, 1.2, 1.3, 1.4, 1.5, 1.6, 1.8, 1.9;
- (b) části 2;
- (c) části 3, kapitol 3.1, 3.2, 3.3 (mimo zvláštní ustanovení 61, 178, 181, 220, 274, 625, 633 a 650 (e));
- (d) části 4, odstavců 4.1.1.1, 4.1.1.2, 4.1.1.4 až 4.1.1.8 ADR;
- (e) části 5, 5.1.2.1 (a)(i) a (b), 5.1.2.2, 5.1.2.3, 5.2.1.10, 5.4.2;
- (f) části 6, konstrukčních požadavků v 6.1.4 a odstavců 6.2.5.1 a 6.2.6.1 až 6.2.6.3 ADR;

3.4.2

Nebezpečné věci musí být zabaleny jen do vnitřních obalů uložených ve vhodných vnějších obalech. Smějí být použity meziobaly. Kromě toho musí být pro předměty podtřídy 1.4, skupiny snášenlivosti S, plně dodržena ustanovení oddílu 4.1.5 ADR. Použití vnitřních obalů však není nutné pro přepravu předmětů, jako jsou aerosoly nebo „nádobky, malé, obsahující plyn“. Celková (brutto) hmotnost kusu nesmí překročit 30 kg.

3.4.3

S výjimkou předmětů podtřídy 1.4, skupiny snášenlivosti S, podložky se smršťovací nebo průtažnou fólií splňující podmínky uvedené v 4.1.1.1, 4.1.1.2 a 4.1.1.4 až 4.1.1.8 ADR jsou dovoleny jako vnější obaly pro předměty nebo vnitřní obaly obsahující nebezpečné věci přepravované podle této kapitoly. Vnitřní obaly, které jsou náchylné k rozbití nebo snadnému propíchnutí, jako jsou ty, které jsou vyrobeny ze skla, porcelánu, kameniny nebo některých plastů, musí být uloženy ve vhodných meziobalech splňujících ustanovení uvedená v 4.1.1.1, 4.1.1.2 a 4.1.1.4 až 4.1.1.8 ADR a zkonstruovaných tak, aby splňovaly konstrukční požadavky uvedené v 6.1.4 ADR. Celková (brutto) hmotnost kusu nesmí překročit 20 kg.

3.4.4

Kapalné věci třídy 8, obalové skupiny II ve vnitřních obalech ze skla, porcelánu nebo kameniny musí být uzavřeny ve snášenlivém a tuhém meziobalu.

3.4.5

(Vyhrazeno)

3.4.6

(Vyhrazeno)

3.4.7

Značka kusů obsahujících omezená množství

3.4.7.1

S výjimkou letecké dopravy musí být kusy obsahující nebezpečné věci v omezených množstvích opatřeny značkou s znázorněnou na obr. 3.4.7.1:

Obr. 3.4.7.1

Značka pro kusy obsahující omezená množství

Tato značka musí být snadno viditelná, čitelná a schopna odolávat působení nepříznivého počasí bez podstatného snížení účinnosti.

Značka musí být ve tvaru čtverce postaveného na vrchol pod úhlem 45° (tvar diamantu). Horní a dolní část a obvodová čára musí být černé. Střední plocha musí být bílá nebo musí mít barvu dostatečně kontrastní vůči podkladu. Minimální rozměry musí být 100 mm x 100 mm a minimální tloušťka čáry tvořící čtverec postavený na vrchol musí být 2 mm. Pokud nejsou rozměry stanoveny, musí být všechny rozměry v přibližné proporci s uvedenými rozměry.

- 3.4.7.2 Jestliže to vyžaduje velikost kusu, smějí být minimální vnější rozměry znázorněné na obr. 3.4.7.1 zmenšeny na nejméně 50 mm x 50 mm, pokud tato značka zůstane zřetelně viditelná. Minimální tloušťka čáry tvořící čtverec postavený na vrchol smí být zmenšena na nejméně 1 mm.

3.4.8 Značka kusů obsahujících omezená množství podle části 3, kapitoly 4 Technických pokynů ICAO

- 3.4.8.1 Kusy obsahující nebezpečné věci zabalené podle ustanovení části 3, kapitoly 4 Technických pokynů ICAO musí být opatřeny značkou znázorněnou na obr. 3.4.8.1 k osvědčení souladu s těmito ustanoveními:

Obr. 3.4.8.1

Značka pro kusy obsahující omezená množství podle části 3, kapitoly 4 Technických pokynů ICAO

Tato značka musí být snadno viditelná, čitelná a schopna odolávat působení nepříznivého počasí bez podstatného snížení účinnosti.

Značka musí být ve tvaru čtverce postaveného na vrchol pod úhlem 45° (tvar diamantu). Horní a dolní část a obvodová čára musí být černé. Střední plocha musí být bílá nebo musí mít barvu dostatečně kontrastní vůči podkladu. Minimální rozměry musí být 100 mm x 100 mm a minimální tloušťka čáry tvořící čtverec postavený na vrchol musí být 2 mm. Symbol „Y“ musí být umístěn ve středu značky a musí být zřetelně viditelný. Pokud nejsou rozměry stanoveny, musí být všechny rozměry v přibližné proporcii s uvedenými rozměry.

3.4.8.2 Jestliže to vyžaduje velikost kusu, smějí být minimální vnější rozměry znázorněné na obr. 3.4.8.1 zmenšeny na nejméně 50 mm x 50 mm, pokud tato značka zůstane zřetelně viditelná. Minimální tloušťka čáry tvořící čtverec postavený na vrchol smí být zmenšena na nejméně 1 mm.

Symbol „Y“ musí zůstat v přibližné proporcii se symbolem znázorněným na obr. 3.4.8.1.

3.4.9 Kusy obsahující nebezpečné věci opatřené značkou uvedenou v 3.4.8, s nebo bez dodatečných bezpečnostních značek a nápisů pro leteckou dopravu, se považují za kusy splňující ustanovení oddílu 3.4.1, jak je to náležité, a oddílů 3.4.2 až 3.4.4 a nemusí být opatřeny značkou uvedenou v 3.4.7.

3.4.10 Kusy obsahující nebezpečné věci v omezených množstvích opatřené značkou uvedenou v 3.4.7 a odpovídající ustanovením Technických pokynů ICAO, včetně všech potřebných nápisů a bezpečnostních značek uvedených v částech 5 a 6, se považují za kusy splňující ustanovení oddílu 3.4.1, jak je to náležité, a oddílů 3.4.2 až 3.4.4.

3.4.11 Používání přepravních obalových souborů

Pro přepravní obalový soubor obsahující nebezpečné věci balené v omezených množstvích platí následující podmínky:

Pokud nejsou značky reprezentující všechny nebezpečné věci uložené v přepravním obalovém souboru viditelné, musí být přepravní obalový soubor:

- označen nápisem „PŘEPRAVNÍ OBALOVÝ SOUBOR“. Písmena na značce „PŘEPRAVNÍ OBALOVÝ SOUBOR“ musí být nejméně 12 mm vysoká. Značka musí být v úředním jazyce země původu, a pokud tímto jazykem není angličtina, francouzština nebo němčina, také v angličtině, francouzštině nebo němčině, pokud případné dohody uzavřené mezi zeměmi zúčastněnými na přepravě nestanoví jinak; a
- označen značkami vyžadovanými touto kapitolou.

S výjimkou letecké dopravy platí ostatní ustanovení uvedená v 5.1.2.1 pouze tehdy, jsou-li v přepravním obalovém souboru obsaženy i jiné nebezpečné věci, které nejsou zabaleny v omezených množstvích, a to pouze ve vztahu k těmto jiným nebezpečným věcem.

3.4.12 Před přepravou musí odesílatelé nebezpečných věcí balených v omezených množstvích předem informovat dopravce prokazatelnou formou o celkové (brutto) hmotnosti takových věcí, které se mají odesílat.

- 3.4.13**
- (a) Dopravní jednotky o největší povolené hmotnosti nad 12 tun přepravující nebezpečné věci balené v omezených množstvích musí být označeny podle 3.4.15 na přední a na zadní straně, s výjimkou případu, kdy dopravní jednotka obsahuje jiné nebezpečné věci, pro které je vyžadováno označení oranžovými tabulkami podle 5.3.2. V tomto posledním případě může být dopravní jednotka označena jen vyžadovaným označením oranžovými tabulkami, nebo jak označením oranžovými tabulkami podle 5.3.2, tak i značkami podle 3.4.15.
 - (b) Železniční vozy přepravující kusy s nebezpečnými věcmi v omezených množstvích musí být označeny podle 3.4.15 na obou bočních stranách, s výjimkou případů, kdy jsou již umístěny velké bezpečnostní značky podle 5.3.1.
 - (c) Kontejnery přepravující nebezpečné věci balené v omezených množstvích na dopravních jednotkách o největší povolené hmotnosti nad 12 tun musí být označeny podle 3.4.15 na všech čtyřech stranách, s výjimkou případu, kdy kontejner obsahuje jiné nebezpečné věci,

pro které je vyžadováno označení velkými bezpečnostními značkami podle 5.3.1. V tomto posledním případě může být kontejner označen jen vyžadovanými velkými bezpečnostními značkami, nebo jak velkými bezpečnostními značkami podle 5.3.1, tak i značkami podle 3.4.15.

Jsou-li kontejnery naloženy na dopravní jednotce nebo železničním voze, nemusí být dopravní jednotka nebo železniční vůz označen(a), s výjimkou případu, kdy značky umístěné na kontejneru nejsou viditelné zvnějšku dopravní jednotky nebo železničního vozu, kterými jsou přepravovány. V tomto případě musí být stejné značky umístěny na přední a na zadní straně dopravní jednotky nebo na obou bočních stranách železničního vozu.

3.4.14 Od značek uvedených v 3.4.13 může být upuštěno, jestliže celková (brutto) hmotnost přepravovaných kusů obsahujících nebezpečné věci balené v omezených množstvích nepřekračuje 8 tun na dopravní jednotku nebo železniční vůz.

3.4.15 Značky uvedené v 3.4.13 musí být stejné jako značky vyžadované v 3.4.7, s výjimkou toho, že jejich minimální rozměry musí být 250 mm x 250 mm. Tyto značky musí být odstraněny nebo zakryty, nejsou-li přepravovány žádné nebezpečné věci v omezených množstvích.

KAPITOLA 3.5

NEBEZPEČNÉ VĚCI BALENÉ VE VYŇATÝCH MNOŽSTVÍCH

3.5.1 Vyňatá množství

3.5.1.1 Vyňatá množství nebezpečných věcí určitých tříd, jiných než předmětů, splňující ustanovení této kapitoly nepodléhají žádným jiným ustanovením ADN s výjimkou:

- (a) předpisů o školení v kapitole 1.3;
- (b) klasifikačních postupů a kritérií pro obalové skupiny v části 2;
- (c) předpisů o balení v 4.1.1.1, 4.1.1.2, 4.1.1.4 a 4.1.1.6. ADR.

POZNÁMKA: V případě radioaktivních látek platí předpisy pro radioaktivní látky ve vyjmutých kusech v 1.7.1.5.

3.5.1.2 Nebezpečné věci, které smějí být přepravovány ve vyňatých množstvích podle ustanovení této kapitoly, jsou ukázány ve sloupci (7b) tabulky A kapitoly 3.2 pomocí následujícího alfanumerického kódu:

Kód	Nejvyšší čisté množství na vnitřní obal (v gramech pro tuhé látky a v ml pro kapaliny a plyny)	Nejvyšší čisté množství na vnější obal (v gramech pro tuhé látky a v ml pro kapaliny a plyny, nebo součet gramů a ml v případě smíšeného balení)
E0	Není dovoleno jako vyňaté množství	Není dovoleno jako vyňaté množství
E1	30	1000
E2	30	500
E3	30	300
E4	1	500
E5	1	300

Pro plyny se objemem udaným pro vnitřní obaly míní hydraulický vnitřní objem vnitřní nádoby a objemem udaným pro vnější obaly se míní celkový hydraulický vnitřní objem všech vnitřních obalů v jednom vnějším obalu.

3.5.1.3 Jsou-li nebezpečné věci ve vyňatých množstvích, jimž jsou přiděleny rozdílné kódy, baleny společně, musí být celkové množství na vnější obal omezeno na to množství, které odpovídá nejrestriktivnějšímu kódu.

3.5.1.4 Vyňatá množství nebezpečných věcí přiřazená ke kódům E1, E2, E4 a E5 s nejvyšším čistým množstvím nebezpečných věcí na vnitřním obal omezeným na 1 ml pro kapaliny a plyny a na 1 g pro tuhé látky a s nejvyšším čistým množstvím nebezpečných věcí na vnějším obal, které nepřevyšuje 100 g pro tuhé látky nebo 100 ml pro kapaliny a plyny, podléhají pouze:

- (a) ustanovením uvedeným v 3.5.2, s výjimkou toho, že se nevyžaduje meziobal v případě, že jsou vnitřní obaly bezpečně zabaleny ve vnějším obalu s fixačním materiálem takovým způsobem, že za normálních podmínek přepravy nemohou prasknout, být propíchnuty nebo propouštět svůj obsah; a pro kapaliny vnější obal obsahuje dostatečné množství absorpčního materiálu, aby absorboval celý obsah vnitřních obalů; a
- (b) ustanovením uvedeným v 3.5.3.

3.5.2 Obaly

Obaly používané pro přepravu nebezpečných věcí ve vyňatých množstvích musí splňovat následující požadavky:

- (a) Musí být vnitřní obal a každý vnitřní obal musí být vyroben z plastu (s minimální tloušťkou 0,2 mm, je-li používán pro kapaliny) nebo ze skla, porcelánu, kameniny, keramického materiálu

nebo kovu (viz též 4.1.1.2 ADR) a uzávěr každého vnitřního obalu musí být bezpečně držen na svém místě drátem, páskou nebo jiným účinným prostředkem; každá nádoba mající hrdlo s lisovanými šroubovými závity musí mít těsné víčko závitového typu. Uzávěr musí být odolný vůči obsahu;

- (b) Každý vnitřní obal musí být bezpečně zabalen do meziobalu s fixačním materiálem takovým způsobem, aby se za normálních podmínek přepravy nemohl rozbít, být proražen nebo propouštět svůj obsah. Pro kapaliny musí meziobal nebo vnější obal obsahovat dostatek absorpčního materiálu k pohlcení celého obsahu vnitřních obalů. Pokud je vložen do meziobalu, může být absorpční materiál fixačním materiálem. Nebezpečné věci nesmějí nebezpečně reagovat s fixačním materiálem, absorpčním materiálem nebo materiálem obalu, ani redukovat celistvost nebo funkčnost materiálů. Bez ohledu na svou polohu musí kus udržet svůj obsah v případě rozbití nebo úniku;
- (c) Meziobal musí být bezpečně zabalen do pevného tuhého vnějšího obalu (ze dřeva, lepenky nebo jiného stejně pevného materiálu);
- (d) Každý typ kusu musí vyhovovat ustanovením v 3.5.3;
- (e) Každý kus musí být takové velikosti, aby na něm byl dostatek místa pro všechny potřebné značky; a
- (f) Smějí se používat přepravní obalové soubory a smějí obsahovat také kusy s nebezpečnými věcmi nebo věci nepodléhající předpisům ADN.

3.5.3 Zkoušky pro kusy

3.5.3.1

Kompletní kus, tak jak je připraven k přepravě, s vnitřními obaly naplněnými do nejméně 95 % jejich vnitřního objemu pro tuhé látky nebo 98 % pro kapaliny, musí být schopen odolat, jak se dokáže zkouškou, která je náležitě zdokumentována, bez rozbití nebo úniku z kteréhokoli vnitřního obalu a bez významného snížení účinnosti:

- (a) pádům na pevný, nepružný, rovný a vodorovný povrch z výšky 1,8 m:
 - (i) má-li vzorek tvar bedny, musí padnout v každé z následujících orientací:
 - naplocho na dno;
 - naplocho na víko (horní stranu);
 - naplocho na nejdelší stranu;
 - naplocho na nejkratší stranu;
 - na roh;
 - (ii) má-li vzorek tvar sudu, musí padnout v každé z následujících orientací:
 - diagonálně na horní hranu, s těžištěm přímo nad bodem nárazu;
 - diagonálně na hranu dna;
 - naplocho na boční stranu;

POZNÁMKA: Každý z výše uvedených pádů může být proveden na různých, ale identických kusech.

- (b) síle působící na horní povrch po dobu 24 hodin, rovnající se celkové hmotnosti identických kusů, jsou-li nastohovány do výšky 3 m (včetně vzorku).

3.5.3.2

Pro účely zkoušení smějí být látky, které se mají přepravovat v obalu, nahrazeny jinými látkami, pokud by to neznehodnotilo výsledky zkoušek. Je-li v případě tuhých látek použita jiná látka, musí mít stejné fyzikální charakteristiky (hmotnost, velikost zrn atd.) jako látka, která se má přepravovat. Je-li při zkouškách pádem pro kapaliny použita jiná látka, měly by být její relativní hustota (měrná hmotnost) a viskozita obdobné relativní hustotě (měrné hmotnosti) a viskozitě látky, která se má přepravovat.

3.5.4 Značení kusů

3.5.4.1 Kusy obsahující vyňatá množství nebezpečných věcí připravené podle této kapitoly musí být trvanlivě a čitelně označeny značkou uvedenou v pododdílu 3.5.4.2. První nebo jediné číslo bezpečnostní značky udané ve sloupci (5) tabulky A kapitoly 3.2 pro každou z nebezpečných věcí obsažených v kusu musí být uvedeno na této značce. Pokud není název odesílatele nebo příjemce uveden jinde na kusu, musí být tato informace uvedena na této značce.

3.5.4.2 Značka pro vyňatá množství

Značka pro vyňatá množství

* Na tomto místě musí být uvedeno první nebo jediné číslo bezpečnostní značky udané ve sloupci (5) tabulky A kapitoly 3.2.

** Na tomto místě musí být uveden název odesílatele nebo příjemce, pokud není uveden jinde na kusu.

Značka musí být ve tvaru čtverce. Šrafování a symbol musí být stejné barvy, černé nebo červené, na bílém nebo vhodném kontrastním podkladu. Minimální rozměry musí být 100 mm x 100 mm. Pokud nejsou rozměry stanoveny, musí být všechny rozměry v přibližné proporci s uvedenými rozměry.

3.5.4.3 Používání přepravních obalových souborů

Pro přepravní obalový soubor obsahující nebezpečné věci balené ve vyňatých množstvích platí následující podmínky:

Pokud nejsou značky reprezentující všechny nebezpečné věci uložené v přepravním obalovém souboru viditelné, musí být přepravní obalový soubor:

- označen nápisem „PŘEPRAVNÍ OBALOVÝ SOUBOR“. Písmena na značce „PŘEPRAVNÍ OBALOVÝ SOUBOR“ musí být nejméně 12 mm vysoká. Značka musí být v úředním jazyce země původu, a pokud tímto jazykem není angličtina, francouzština nebo němčina, také v angličtině, francouzštině nebo němčině, pokud případné dohody uzavřené mezi zeměmi zúčastněnými na přepravě nestanoví jinak; a
- označen značkami vyžadovanými touto kapitolou.

Ostatní ustanovení uvedená v 5.1.2.1 platí pouze tehdy, jsou-li v přepravním obalovém souboru obsaženy i jiné nebezpečné věci, které nejsou zabaleny ve vyňatých množstvích, a to pouze ve vztahu k těmto jiným nebezpečným věcem.

3.5.5 Maximální počet kusů ve vozidle nebo kontejneru

Počet kusů ve voze nebo kontejneru nesmí překročit 1000.

3.5.6 Dokumentace

Jestliže nebezpečné věci ve vyňatých množstvích doprovází doklad(y) (jako jsou nákladový list, letecký nákladní list nebo nákladní list CMR/CIM), musí alespoň jeden z těchto dokladů obsahovat prohlášení „NEBEZPEČNÉ VĚCI VE VYŇATÝCH MNOŽSTVÍCH“ a údaj o počtu kusů.
